- Work with Shared Companies Screen

Work with Companies Screen

Purpose: Use this screen to change, delete, or display a company.

How to display this screen: Enter WCMP in the Fast Path field or select Work with Companies from a menu.

Field	Description
Company	A code representing a company. Numeric, 3 positions; optional.
Description	The name of the company. Alphanumeric, 30 positions; optional.

Screen Options	Procedure
Change a company	Select Change for a company to advance to the Change Company Screen.
Delete a company	Select Delete for a company to delete it.
Display a company	Select Display for a company to advance to the Display Company screen. You cannot change any information on this screen. See Change Company Screen for a description of the fields on this screen.
Work with phone numbers for computer telephony integration	Select Phone #s for a company to advance to the Work with Company Phone Numbers Screen.
Enter or change the return address for printing on customer return labels from the web storefront	Select Return address for a company to advance to the Work with Company Return Address Screen.
Define other companies that share inventory with the parent company	Select Shared Companies for a company to advance to the Work with Shared Companies Screen.
Work with user defined field	Select User Field for a company to advance to the Work with User Fields Screen.

Change Company Screen

Purpose: Use this screen to change a company on the system. .

How to display this screen: Select Change at the Work with Companies Screen

Field	Description
Company	The company code (001 - 999). Information throughout the system is segregated by company. You can assign or prohibit access to companies to users and user classes. See Working with User Records (WUSR), and Setting Up User Classes (WUCL). Numeric, 3 positions; display-only.
Description	The company's name or description, which appears on many screens and reports. **Note:** The system does not validate the company's address in the same way it validates a customer's address, as in order entry. For example, it does not validate that the state is associated with the SCF for the postal code. Alphanumeric, 30 positions; required.
Address	The company's address. Alphanumeric, two 32-position fields; optional.
City	The company's city. Alphanumeric, 25 positions; optional.
State	The code representing the company's state or province. Alphanumeric, 2 positions; optional.
Zip	The company's zip or postal code. Alphanumeric, 10 positions; optional.
Country	The company's country. Country codes are defined in and validated against the Country table. See Setting Up the Country Table (WCTY). Alphanumeric, 3 positions; optional.
Locale	The locale assigned to the company, identifying the language that the system uses for reports and HTML email templates. The locale defined in the DEFAULT_LOCALE property initially defaults, but you can override it. Available locales are: • English • French • German • Italian • Spanish The setting of the locale here controls the settings that are available for the BI Date and Separator Format, below. See: • Regional Settings for an overview. • Where are Date Formats Applied? for more information on which date format the system uses in different areas of the application. • Where are Number Format Applied? for more information on the decimal and thousand separators the system uses in different areas of the application. Required.

Field	Description
BI Date and Separator Format	The date and separator formats to use on reports generated through Oracle Analytics Cloud. See Reports and Forms Generated through Oracle Oracle Analytics Cloud for a listing of these reports, and see Oracle Analytics Cloud Date and Separator Formats for a listing of the formats applied on these reports through this setting. The Locale setting controls the BI Date and Separator Formats. If the Locale is set to: • English: Available BI Date and Separator Formats: – English (Australia) – English (Canada) – English (India) – English (Ireland) – English (New Zealand) – English (South Africa) – English (United Kingdom) – English (United States) (default) • French: Available BI Date and Separator Formats: – French (Belgium) – French (Canada) – French (France) (default) – French (Luxembourg) – French (Switzerland) • German: Available BI Date and Separator Formats: – German (Austria) – German (Germany) (default) – German (Luxembourg) – German (Switzerland) • Italian: Available BI Date and Separator Formats: – Italian (Italy) (default) – Italian (Switzerland) • Spanish: Available BI Date and Separator Formats: – Spanish (Argentina) – Spanish (Bolivia) – Spanish (Chile) – Spanish (Columbia) – Spanish (Costa Rica) – Spanish (Dominican Republic) – Spanish (Ecuador) – Spanish (El Salvador) – Spanish (Guatemala) – Spanish (Honduras) – Spanish (Mexico) – Spanish (Nicaragua) – Spanish (Panama) – Spanish (Paraguay) – Spanish (Peru) – Spanish (Puerto Rico) – Spanish (Spain) (default) – Spanish (Uruguay) – Spanish (Venezuela)

Field	Description
Date Format	The date format assigned to the company, identifying the format of the date that displays for the company on screens. The date format defined in the DEFAULT_DATE_FORMAT property initially defaults, but you can override it. Valid values are: • DDMMYY = The default date format for the company is DDMMYY; for example, if the date is December 25 2016, the date displays as 251216. • MMDDYY= The default date format for the company is MMDDYY; for example, if the date is December 25 2016, the date displays as 122516. • YYMMDD = The default date format for the company is YYMMDD; for example, if the date is December 25 2016, the date displays as 161225. **Note:** In order to have a consistent date format on all reports, the DEFAULT_DATE_FORMAT property and this setting should be the same. See: • Regional Settings for an overview. • Where are Date Formats Applied? for more information on which date format the system uses in different areas of the application. • Where are Number Format Applied? for more information on the decimal and thousand separators the system uses in different areas of the application. Required.
Phone number	The company's phone number. Numeric; one 3-position field (area code) and one 8-position field (phone number).
Fax Phone number	The company's fax number. Numeric; one 3-position field (area code) and one 8-position field (phone number).
From Email Alias	The alias to display with the “from” address for emails, for example, My Email Alias <no-reply@omni.retail.oraclecloud.com>. The actual “from” address is set by Oracle and cannot be changed. The system uses the following hierarchy in selecting the “from” email alias: 1. Order Type/Entity: If a *From email alias* is specified at the Create Entity Order Type Template Screen or Change Entity Order Type Template Screen, use this alias; otherwise, 2. Entity: If a *From email alias* is specified at the Work with Entity Email Overrides screen for the email notification type, use this alias; otherwise, 3. Company: If a *From email alias* is specified at the Change Company screen, use this alias; otherwise, 4. Display just the actual email address of no-reply@omni.retail.oraclecloud.com without including an alias The threshold monitor also uses the alias specified for the company. See Working with Threshold Values (WTHR). Alphanumeric, 50 positions; optional.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Cross company scan</td><td>Indicates whether you can scan for customers across companies in Order Entry, standard Order Inquiry, and Order Maintenance.

Valid values are:

Selected = You can scan for customers across companies, if both the “home” and “target” companies:

have selected the Cross company scan field
have the same value in the Active company field (that is, active companies can scan into other active companies; inactive companies can scan into other inactive companies)

Standard Order Inquiry and Order Maintenance

You can use cross-company scanning with the match code, postal code, postal code with company name, and postal code with customer name fields.See Setting Up Match Codes (MMCH) and Setting Up the Zip/City/State (Postal Code) Table (WZIP).

Order Entry

The source code field is at the top of the Select Customer Sold To Screen or the Customer Scan Screen, enabling cross-company scanning by source code, provided the user does not select to scan for a customer from the Customer Selection Screen.
Unselected = You cannot scan for customers across companies. The source code field is not on the Select Customer Sold To for Order screen.
</td></tr>
<tr><td>Active company</td><td>Indicates whether this company is currently active. This field works with the Cross company scan field to select or restrict the companies eligible for cross company scan. You might use this field to distinguish training or testing vs. “live” companies, to prevent users from inadvertently scanning into the wrong type of company. Also, if a company is flagged as inactive, the menu screen displays a message indicating This company is flagged as inactive and should not be used to process live orders.

Valid values are:

Selected = This company is active; you can scan across other active companies.
Unselected = This company is inactive; you can scan across other inactive companies. The Menu Driver Screen displays a message indicating This company is flagged as inactive and should not be used to process live orders.
</td></tr>
</table>

Field	Description
Cross company maintenance group	You assign a common cross company maintenance group code to a group of companies that share a portion of their customer base. By entering any group in this field, you enable the system to store information on the name or address of each customer you update in this company. You can then identify and update matching customer records within the maintenance group. This code can be any value that you define. Example: If you enter 5 in this field for companies 27, 123, and 495, you will be able to update customer records in companies 123 and 495 based on a change of address you process for the customer in company 27. If you enter B in this field for companies 44 and 66, you will be able to update customer records only across these two companies; the system will not update a record in company 44 based on an address change you process in company 27. In order for cross company maintenance to work between companies, both companies must use the same logic for composing match codes.See Setting Up Match Codes (MMCH) for more information on working with match codes.

Work with Company Phone Numbers Screen

Purpose: Use this screen to work with DNIS (dialed number identification service) phone numbers for computer telephony integration (CTI). The system uses the DNIS number for an incoming call to identify the company related to the call and to route the call appropriately.

The DNIS number is ordinarily the last four positions of the phone number that the customer calls; however, it is possible that the DNIS number is not the same as the actual phone number dialed. In this situation, you can create a company phone number that does not actually exist, but whose last four positions match the DNIS number that you will receive through your CTI application.

> **Note:**
>
> CTI is not currently implemented.

For more information: Contact your Order Administration representative for more information on implementing CTI.

Work with Company Return Address Screen

Purpose: Use this screen to create or edit the company address to print on return labels. The system uses this address only if your web storefront supports printing these labels for return authorizations when customers enter returns on the storefront.See the E-Commerce Interface for more information.

Entity return address overrides company address: If you define an return address for the entity associated with an order at the Work with Entity Return Address Screen, the system uses the entity return address instead.

If no entity or company return address: If a return address is not specified for the entity associated with the order or for the company, the system uses the address for the Default Warehouse (A04).

How to display this screen: Select Return address for a company at the Work with Companies Screen.

Completing this screen: Enter the address to appear on return labels for use when customers enter returns through your web storefront. To delete the return address, select Delete.

Work with Shared Companies Screen

Purpose: see this screen to define other companies that share inventory with the parent company. Companies display on this screen in shared company sequence.

Example: If company 555 is the company where the inventory is located, company 555 represents the parent company and any other company that shares inventory with this company is considered a shared company.

> **Note:**
>
> You do not need to define shared companies if you are using inventory sharing; see Inventory Sharing (A69) for an overview.

Copying items in the parent company to the shared companies: If you wish to add, update, or delete items in shared companies, based on an item copied in the parent company, you must define shared companies using this screen.See Copying Items for an overview.

To create: Enter a company code and select OK to create a shared company. The company code must be a valid company. You cannot select the company code that represents the parent company or the screen displays an error message: Shared company must not be the same as the parent company.

> **Note:**
>
> The system allows you to define a company as a shared company for more than one parent company. For example, you can define company 554 as a shared company for both company 555 and company 25. You can also define a shared company for a company that is also a shared company for another company. For example, you can define company 123 as a shared company for company 456, even if company 456 is a shared company for company 789.

To scan: Enter a company code and select OK to position to the shared company. If the company code does not exist as a shared company, the system creates it. The company code must be a valid company.

How to display this screen: Select Shared Companies for a company on the Work with Companies Screen.

Field	Description
Company	The code and name of the parent company. Code: Numeric, 3 positions; display-only. Description: Alphanumeric, 30 positions; display-only.

Field	Description
Cmp	A code representing a company that shares inventory with the parent company. If you prompt on this field, the system displays all valid Order Administration companies, not just the companies to which the user has authority. Numeric, 3 positions; display-only.
Description	The name of the company. Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Delete a shared company	Select Delete for a shared company to delete it. **Note:** Deleting a shared company does not delete the company; just the association between the company and the parent company.

Working with User Records (WUSR)

Purpose: Use Work with Users to update user records and control access to companies, menu options, secured features, alternate customer address formats and user-defined functions for individual users.

In this topic:

- Work with Users Screen
- Work with Company Authority Screen
- Work with Menu Option Authority Screen
- Work With Secure Feature Authority Screen
- Display User Option History Screen
- Work with User Tickler Group Screen

Work with Users Screen

Use this screen to change, delete and display a user record. You can also use this screen to assign authority to companies, menu options, secured features, user-defined functions or the screens that use an alternate customer address format.

How to display this screen: Enter WUSR in the Fast path field at the top of any menu or select Work with Users from a menu.

Field	Description
User	The ID of the user. Alphanumeric, 10 positions; optional.

Field	Description
Name	The user's name. Alphanumeric, 30 positions; optional.
Authority	The default menu option authority level for the user. Valid authority types are: • Allow • Exclude (default setting) Optional.

Screen Option	Procedure
Change a user record	Select Change for a user to advance to the Change User Record screen. See the Administration guide for a description of the fields on this screen.
Delete a user record	Select Delete for a user to delete it from Order Administration. **Note:** Deleting a user here does not delete the user from IDCS or OCI IAM. Also, you cannot delete a user record that has dependent data, such as a scheduled job.
Display a user record	Select Display for a user to advance to the Display User Record screen. You cannot change any fields on this screen. See the User Administration guide for a description of the fields on this screen.
Assign company authority to a user	Select Company Auth for a user to advance to the Work with Company Authority Screen.
Assign menu option authority to a user	Select Menu Option Auth for a user to advance to the Work with Menu Option Authority Screen.
Assign feature authority to a user	Select Feature Auth for a user to advance to the Work With Secure Feature Authority Screen.
Assign a tickler group to a user	Select Tickler Group for a user to advance to the Work with User Tickler Group Screen.
View on-line history that shows the options taken by the user	Select View History for a user to advance to the Display User Option History Screen.
Generate a multi-factor authentication code for a user	Select Generate MFA Code to open the Generate MFA Code window. This window is not currently enabled.
Advance to Work with User Classes menu option	Select User Classes to advance to the Work with User Classes Screen.

Work with Company Authority Screen

Purpose: Use this screen to allow or exclude this user from access to other companies defined on your system.

How to display this screen: Select Company Auth for a user at the Work with Users Screen.

Field	Description
Comp (Company code)	The code for the company. Numeric, 3 positions; optional.
Description	The description of the company. Alphanumeric, 30 positions; optional.
Authorized	This field indicates whether the user has access to this company. • Yes = This user has access to this company. • No = This user does not have access to this company.

Changing access to companies: To change this user's access to a company, move your cursor to the value in the Authorized field and change it as necessary.
Select OK to update the screen.

Work with Menu Option Authority Screen

Use this screen to override the default authority assigned to a user and assign or prohibit access to specific menu options, either in Order Administration (Classic View), or in Modern View if the menu option is available in **Modern View**.

Menu option assignment for Modern View: In Modern View, for the most part a user's access to menu options is available through the Tasks option or the Pin the Menu option, and is based on the user's Default menu assignment in Work with Users; there is no Fast Path available in Modern View. However, if the user has authority to an menu option not included in their default menu or one of its sub-menus, the option is available in Modern View through a menu title of Additional Options.

Example: If a user is assigned authority to the MULO (unlock suspended order or batch) menu option, but the user's default menu does not include MULO, or include a sub-menu that includes MULO, the MULO option in Modern View is available under the menu title of Additional Options.

How to display this screen: Select Menu Option Auth for a user at the Work with Users Screen.

About authority: If an authority level has been previously assigned to a user for this menu option, the level appears next to the menu option under the User authority field. If the authority level does not display, the system will use the authority in the User class authority field (if defined). Otherwise, the system takes the user's default authority.

When you exclude a user from a menu option, the user may still be able to access the same type of functionality through other menu options. For example, you might exclude a user from the Create Item Warehouse/Locations (MIWL) option, but the user will still be able to create an item warehouse or an item location through Work with Warehouses (WWHS) or Work with Items/SKUs (MITM).

Field	Description
Menu option	The short name for the menu option. Alphanumeric, 4 positions; optional.
Description	The menu option description. Alphanumeric, 60 positions; optional.

Field	Description
User authority	Allows you to enter the authority level. Valid authority types are: • Allow • Display • Exclude Optional.

To delete: Select Delete for the option. The screen refreshes itself and the authority level disappears.

This delete option only deletes authority from a specific menu option for this user; it does not affect authority at the user class or user record level.

To assign:

1. Display = Select Display for this menu option to limit this user's access to inquiry only.
2. Allow = Select Allow for the menu option to allow this user to perform this menu option.
3. Exclude = Select Exclude for the menu option to prohibit access to this menu option.

The authority level you entered appears next to the menu option.

Work With Secure Feature Authority Screen

Purpose: Use this screen to override the default authority defined in the secure feature record, and assign or prohibit access to a secured feature for an individual user.

A secured feature is a procedure or action that can be performed within a function by an individual user. For example, the ability to maintain batch totals and override prices in Order Entry are examples of secured features in the system.

An individual user might have access to Order Entry or the Purchase Order functions. However, within those functions, you might not want to give all who have access the authority to certain features, which the system has segregated as secured features.

Secured features can be created and maintained by using the Work with System Values/ Features function. See Setting Up Secured Features.

How to display this screen: Select Feature Auth for a user at the Work with Users Screen.

About authority: If an authority level has been previously assigned to a secured feature for this user, the level appears next to the feature under the User Authority field. If the authority level does not display, the system will use the authority in the User Class Authority field, if defined. See Work With User Class Feature Authority Screen. Otherwise, the system takes the default authority for the secure feature, which you set up at the Create Secure Feature Screen.

Field	Description
Appl (Application area)	The application area to which this secured feature belongs. Alphanumeric, 3 positions; optional.
Grp (Application group)	The application group to which this secured feature belongs. Alphanumeric, 3 positions; optional.

Field	Description
Secured feature	The description of the secured feature. Note: The system truncates the description to 55 positions. Alphanumeric, 60 positions; optional.
User authority	The authority level for this user. Valid authority levels are: • Allow • Display • Exclude Optional.

To delete: Select Delete for the feature. The screen refreshes itself and the authority level disappears.

This delete option only deletes authority from the specific secured feature for this user; it does not affect the authority assigned in the secure feature record.

To assign:

- Allow = Select Allow for the feature to allow this user to perform this secured feature, unless otherwise prevented by menu option authority.
- Display = Select Display for this feature to limit this user's access to inquiry only.
- Exclude = Select Exclude for the feature to prevent this user from accessing this secured feature.

The authority level you entered appears next to the secured feature.

Display User Option History Screen

Purpose: Use this screen to view the menu options selected by the user.

This information can help you reconstruct the options a user has taken if there is some type of problem.

The system adds the option to this screen if this is the first time the user has selected the option; otherwise, the system updates the Last run date and Last run time fields each time the user selects an option (instead of adding the option to the screen again).

How to display this screen: Select View History for a user at the Work with Users Screen.

Field	Description
User	The user ID and user name. The user ID is a code that identifies the user to the system. This code controls the user's access to menus, menu options, companies, features and user-defined functions. The user ID you enter must match the user's user control record ID. See Display User Option History Screen in the Administration Guide for more information. Alphanumeric, 10 positions; required.

Field	Description
Option	The fast path code for a menu option. The fast path code is a 4-position short name for an option. Alphanumeric, 4 positions; display-only.
Description	The description associated with the menu option, as defined in the Menu Options table. See Setting Up Menu Options (WOPT). Alphanumeric, 40 positions; display-only.
Last run date	The date on which the user last selected this option. Numeric, 6 positions (in user date format); display-only.
Last run time	The time of day at which the user last selected this option. Numeric, 6 positions (HHMMSS format); display-only.

Screen Option	Procedure
Submit a batch job that will purge the user option history for this user	Select Purge.

Work with User Tickler Group Screen

Purpose: Use this screen to assign a user to one or more tickler groups.

> **Note:**
>
> You should only assign users to tickler groups if you use workflow management; see Workflow Management Overview and Setup.

Tickler groups are groups of users that work with and resolve ticklers. You can define tickler groups using the Working with Tickler User Groups (WTUG) menu option.

To assign: Enter a tickler group in the Group ID field and select OK. The system assigns the user to the tickler group and displays the tickler group on the bottom half of the screen.

How to display this screen: Select Tickler Group for a user at the Work with Users Screen.

Field	Description
User	The user ID and description of the user assigned to one or more tickler groups. User ID: Alphanumeric, 10 positions; display-only. User description: Alphanumeric, 30 positions; display-only.

Field	Description
Group ID	A code for a group of users that work with ticklers. To assign: Enter a tickler group in this field and select OK. The system assigns the user to the tickler group and displays the tickler group on the bottom half of the screen. Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG). Alphanumeric, 10 positions; optional.
Description	A description of the tickler user group. Alphanumeric, 40 positions; optional.

Screen Option	Procedure
Remove a tickler group from the user's tickler group assignment	Select Delete for a tickler group to remove the tickler group from the user's tickler group assignment.

Setting Up User Classes (WUCL)

Purpose: Use Work with User Classes to create user classes. You can control access to companies, menus options, secured features and user defined options for a group of individual users by assigning them to the same user class.

For example, you may want all of your order entry operators to have the same access to specific menu options, secured features or user defined functions. You can create a user class for them and permit or deny access to the same menu options, secured features or user defined functions instead of assigning authority on an individual user level.

Even if you assign the same level of security to a group of users, you can generally tailor an individual user's record to fit the specific user by selecting the Work with Users function. The exception to this is when you define access to vendor records; you cannot override vendor access for individual users.

> **Note:**
>
> Work with User Classes is a system-wide function; the information you work with in this function is the same regardless of which company you are currently working in.

In this topic:

- Work with User Classes Screen
- Create User Class Screen
- Work With Company Authority Screen
- Work With User Class Menu Option Authority Screen
- Work With User Class Feature Authority Screen

- Work With User Class/Vendor Authority Screen

For more information: To group users into user classes, you must also establish the individual user records; see the Administration guide

Work with User Classes Screen

Purpose: Use this screen to create, change, copy, delete and display a user class. After you have created a user class, you can also use this screen to assign authority to companies, menu options, secured features, alternate address formats, user-defined functions and vendors for this user class.

How to display this screen:

- select Work with User Classes from a menu.
- enter WUCL in the Fast path field at the top of any menu.
- select W/W User Classes at the Work with Users Screen.

Field	Description
Class	A user class is a grouping of users (for example, all Order Entry operators). You can assign authority to companies, menu options, etc. at the user class level. Alphanumeric, 10 positions; optional.
Description	A description of the user class. Alphanumeric, 30 positions; optional.

Screen Options	Procedure
Create a user class	Select Create to advance to the Create User Class Screen.
Change a user class	Select Change for a user class to advance to the Change User Class screen. See Create User Class Screen for a description of the fields on this screen. You can change any of the fields on this screen except the User class field.
Delete a user class	Select Delete for a user class to delete it.
Display a user class	Select Display for a user class to advance to the Display User Class screen. You cannot change any information on this screen. See Create User Class Screen for a description of the fields on this screen.
Assign company authority to a user class	Select Company Auth to advance to the Work With Company Authority Screen.
Assign menu option authority to a user class	Select Menu Option Auth to advance to the Work With User Class Menu Option Authority Screen.
Assign feature authority to a user class	Select Feature Auth to advance to the Work With User Class Feature Authority Screen.
Assign vendor authority to a user class	Select Vendor Auth to advance to the Work With User Class/Vendor Authority Screen.
Work with menus	Select Work with Menus to advance to the Work with Menus Screen.

Create User Class Screen

Purpose: Use this screen to define the user class and description and assign a default menu and company to this user class.
Once you have created a user class, you can assign authority to companies, menu options, secured features, alternate address formats, user-defined options and vendor authority for this user class.

How to display this screen: Select Create at the Work with User Classes Screen.

Field	Description
User class	A user class is a grouping of users (for example, all Order Entry operators). You can assign authority to companies, menu options, etc. at the user class level. Alphanumeric, 10 positions. Create screen: required. Change screen: display-only.
Description	The description of this user class. Alphanumeric, 30 positions; required.
Each of the following fields are default values that you can override for individual users:	
Output queue	Not currently implemented. Alphanumeric, 10 positions; optional.
Default menu	The name of the menu to appear when this user class enters Order Administration. Menu names are defined in and validated against the Menu table. See Customizing Menus (WMNU). Alphanumeric, 10 positions; optional.
Default company	This code identifies the company where the user class primarily works. Company codes are defined in and validated against the Company table. You must define a default company for a user class in order to define vendor authority for the class. Numeric, 3 positions; optional.
Modern View Quick Link Menu	The name of the menu to display in the quick link area at the bottom of the Home page in Modern View for users in this class. Which menu options? The menu you specify here should include menu options that are available in Modern View. Any menu options included in the selected menu that are not available in Modern View are not displayed at the Modern View Home page. Also, any sub-menus are not displayed. See Customizing Menus (WMNU) for more information.

Work With Company Authority Screen

Purpose: Use this screen to allow or exclude this user class from having access to companies defined on your system.

How to display this screen: At the Work with User Classes Screen, select Company Auth.

Field	Description
Comp (Company code)	The code for a company. Numeric, 3 positions; optional.
Description	The description of the company. Alphanumeric, 30 positions; optional.
Authorized	Indicates whether the user class has access to this company. Valid values are: • Yes = This user class has access to this company. • No (default) = This user class does not have access to this company.

To change: Move your cursor to the value in the Authorized field, change it as necessary, and select OK.

Work With User Class Menu Option Authority Screen

Purpose: Use this screen to assign or prohibit access to specific menu options for a user class. Specifying access to a specific menu option on this screen will override the Default authority in an individual user's record (this is the default authority that you assign, in Working with User Records (WUSR), on the Create User Screen, not the User Authority that you define for a specific menu option on the Work with Menu Option Authority Screen).

For example, if an individual user within this user class has the default authority Allow in their user record, specifying Exclude next to a menu option will prevent any user within this class from performing the menu option.

How to display this screen: Select Menu Option Auth for a user class at the Work with User Classes Screen

About authority: If an authority level has been previously assigned to a menu option for this user class, the level appears next to the menu option under the Authority field. If the authority level does not display, the system uses the default authority defined in each individual user's record to determine a user's access.

When you exclude a user class from a menu option, the user class can still access the same type of functionality through other menu options. For example, you might exclude a user class from the Create Item Warehouse/Locations (MIWL) option, but the user class will still be able to create an item warehouse or an item location through Work with Warehouses (WWHS) or Work with Items/SKUs (MITM).

Field	Description
Menu option	The fast path for the menu option. Alphanumeric, 4 positions; optional.
Description	The description of the menu option. Alphanumeric, 60 positions; optional.

Field	Description
User Authority	Enter an authority level to display menu options that match your entry. Valid values are: • Allow • Display • Exclude Optional.

To delete: Select Delete for the option. The screen refreshes itself and the authority level disappears.

This delete option affects authority for this user class only; it does not affect authority at the user record level.

Assign authority: There are three levels of authority you can assign to a menu option for this user class:

1. Display = Select Display for the menu option to limit this user class' access to inquiry only.
2. Allow = Select Allow for the menu option to allow this user class to perform this menu option.
3. Exclude = Select Exclude for the menu option to prohibit access to this user class.

The authority level you entered appears next to the menu option.

Work With User Class Feature Authority Screen

Purpose: Use this screen to override the default authority defined in the secured feature record (See Setting Up Secured Features), and assign or prohibit access to a secured feature for a user class.

Typically, a secured feature is a procedure or action that can be performed within a function. The ability to maintain batch totals and override prices in Order Entry are examples of secured features in the system.

A user class might have access to Order Entry or the Purchase Order functions. However, within those functions, you might not want to give all who have access the authority to certain features, which the system has segregated as secured features.

You can create or maintain secured features through the Work with System Values/ Features function. See Setting Up Secured Features

How to display this screen: Select Feature Auth for a user class at the Work with User Classes Screen.

About authority: If you have assigned an authority level for a secured feature to this user class, the level displays next to the feature, under the Authority field; otherwise, the system uses the authority defined in the secure feature record.

The system checks for authority in this order:

1. User authority. See Working with User Records (WUSR). If blank, the system checks
2. User class authority. If blank, the system uses

3. Default (company-wide) authority, as defined in the System Control table. See Setting Up Secured Features.

Field	Description
Appl area (Application area)	The application area where the secured feature belongs. Alphanumeric, 3 positions; optional.
Appl grp (Application group)	The application group where this secured feature belongs. Alphanumeric, 3 positions; optional.
Secure feature	The name of the secured feature. Alphanumeric, 60 positions; optional.
Authority	The authority level you assign to this feature for the user class. Valid authority levels are: • Allow • Display • Exclude Optional.

Delete authority: Select Delete for the feature. The screen refreshes itself and the authority level disappears.

Assign authority: There are two levels of authority you can assign to a secured feature for this user class:

1. Allow = Select Allow for the feature to allow this user class to perform this secured feature, unless otherwise prevented by menu option authority.
2. Exclude = Select Exclude for the feature to prevent this user class from using this secured feature.

The authority level you entered appears next to the secured feature.

Work With User Class/Vendor Authority Screen

Purpose: Use this screen to restrict a class of users from particular vendors when the users select certain menu options. This might be useful to you if you want to grant vendors limited remote access to your system as a user, so that you can be sure they have access only to relevant information. Vendor authority is defined at the user class level only; you cannot override vendor authority for individual users.

The default authority for each vendor is always set to **Allow**; you define a user class's vendor authority by selecting which vendors it does not have access to, and setting them to **Exclude**.

System control value: The system checks a user's vendor authority only if the Check User Class/Vendor Authority (D88) system control value is selected.

> **Note:**
>
> You must define a default company for the user class in order to use this feature, so that the system knows where to locate the vendors for access restriction.

Menu options affected by vendor authority restriction:

Menu Option

- Working with Existing Items (MITM)
- Using Inventory Inquiry (DINI)
- Purchase Order Inquiry (MPOI)
- Printing Purchase Orders (MPRP)
- Working with Vendors (WVEN)
- Working with Vendor Items (WVNI)
- Working with Inventory Transactions (WITI)

Types of restrictions:

- the vendor record
- any purchase orders for the vendor
- any items that are assigned to this vendor by having the vendor number defined in the Item table
- any vendor items defined for the vendor (but not necessarily the item itself).

Information relative to restricted vendors does not display when you scan in any of the menu options affected by vendor authority restriction. If you attempt to work with a restricted record directly -- for example, by entering a purchase order number associated with a restricted vendor -- the system displays an error message. These restrictions are in effect for the menu options listed in the table only. It is possible to work with vendor information through other menu options in Order Administration, if the user has the proper menu option authority. See the discussion of this option in Setting Up General Usage Values.

How to display this screen: Select Vendor Auth for a user class at the Change User Class screen.

Field	Description
Vendor#	A code that defines a vendor on your system. Vendor numbers are defined in and validated against the Vendor table. See Working with Vendors (WVEN). Numeric, 7 positions; optional.
Vendor name	The name of the vendor. Alphanumeric, 30 positions; optional.
Authority	The class's authority to the vendor. Valid values are: • Allow • Display • Exclude Enter Exclude to display vendors that the user class is restricted from working with. Optional.

To change:

1. Select Allow for each currently excluded vendor that you want to give the user class authority to work with.

2. Select Exclude for each currently allowed vendor that you want to restrict the user class from working with.
3. The system changes the authority status of the vendor or vendors and updates the screen with the new information.

Working with Threshold Values (WTHR)

Purpose: Use this menu option to create statistics, such as tracking the number of held purchase orders, for the system to monitor.

In this topic:

Threshold values indicate the numbers and/or dollar values that trigger the system to generate an email when these values are breached.

Determining when a threshold is breached: For each threshold you define, the system compares the actual number value and/or dollar value for the threshold against the thresholds you define; and generates a Threshold Monitor Breach email if the threshold is breached.

The Comparison for the threshold determines when the threshold is breached. If the comparison is:

- Greater than: the threshold is breached when the actual number or dollar amount exceeds the threshold number or dollar amount. For example, the threshold is breached if the actual number is 241 and the threshold number is 200 (241 is greater than the threshold of 200).
- Less than: the threshold is breached when the actual number or dollar amount is less than the threshold number or dollar amount. For example, the threshold is breached if the actual dollar is $100 and the threshold dollar is $500 ($100 is less than $500).

If you define both a threshold number value and a dollar value, the system checks both values to determine when the threshold is breached.

Example: One of the system-delivered thresholds is Backorders (BO). This threshold monitors the number of open and held orders that contain at least one unit on backorder, and monitors the merchandise dollars of units on backorder included on open or held orders. You can use this threshold to send an email to the warehouse supervisor when there are more than 100 open and held orders that contain at least one unit on backorder. To do so, define 100 as the threshold number with a greater than comparison (the actual value must be greater than the threshold value). Once the actual number of open and held orders containing a backordered item is 101, the system sends an email to the warehouse supervisor.

Threshold Code and Description	Comparison	Number Value	Actual Number	Email address
BO: Backorders	Greater than (actual value is greater than the threshold value)	100	101	a.user@example.com

Updating Threshold Actual Values

The System Delivered Thresholds are defined in the Threshold Value table.

The Batch Order Control job (ORD_CONTRL) updates the actual threshold values and compares the threshold number value and/or threshold dollar value against the actual units and/or dollars for each threshold to determine if a threshold has been breached.

This job also updates the values in the Order Control Summary table. You can review order and merchandising summary information using the Operations Control Summary menu option. This menu option provides a high-level overview of the fulfillment process, identifies potential bottlenecks or problem areas, and delivers an audit trail of order activity. See Reviewing Operations Control Summary (FLSH).

Submitting the Batch Order Control job: The system submits the Batch Order Control job when:

- you select Update current totals in the Operations Control Summary (FLSH) menu option; see Reviewing Operations Control Summary (FLSH).
- you submit a periodic process that:
  - includes the Order Summary (ORDSUM) periodic function (program name PFR0062), OR
  - includes the Threshold (THRESHD) periodic function (program name PFTHRESHMO).

> **Note:**
>
> You can schedule a periodic process to run at a specified time; see Executing Periodic Processes (EPRO) for more information on defining a job schedule for a periodic process.

Batch Order Control processing: The Batch Order Control job:

updates all of the related fields in the Order Control Summary table for the current transaction date. You can review operations and merchandising summary values through the Reviewing Operations Control Summary (FLSH) menu option.

- generates the Operations Control Report, which lists the most recent operations and merchandising summary totals. **Note:** The system generates the report only if you submit the Batch Order Control job from the Operations Control Summary menu option or from the ORDSUM periodic function.
- updates the actual value fields and Last updated fields in the Threshold Values table. The system updates the actual value field regardless of whether you have defined a threshold.

- determines if a threshold is breached by comparing the defined threshold number or dollar value against the actual number value and/or actual dollar value. If you have not defined a threshold value for a threshold, the system does not monitor the threshold for a breach.
- if a threshold has been breached, the system sends a Threshold Monitor Breach Email to the email address for the threshold. **Note:** The system generates an email only if you submit the Batch Order Control job from the THRESHD periodic function.

Threshold Monitor Breach Email

If a threshold is breached the system sends a Threshold Monitor Breach email to the email address for the threshold.

> **Note:**
>
> You can define just one email address for each threshold. See Email Address Validation for information on how the system verifies that your entry is formatted correctly.

Email hour interval: The system sends a threshold monitor breach email only when:

- you submit the Batch Order Control job (see Updating Threshold Actual Values for more information on how to submit this job), and
- the number of hours from the Email interval for the threshold has passed. The system compares the system date and system time to the Last sent on date field and Last sent on time for the threshold to determine whether to send another email, and continues to send an email based on the hourly interval until the threshold is no longer breached.

Sample email:

From: cwjava@example.com

To: a.user@example.com

Subject: **ALERT** Threshold Monitor Breach

Backorders threshold exceeded.

Review Backorder Reports.

Co#: 7 Actual$: 26973 > Thresh$: 13700

Use WTHR to monitor this breach.

Contents

- From: The from email address is set to no-reply@omni.retail.oraclecloud.com and cannot be changed. The system uses the From email alias, such as My Email Alias <no-reply@omni.retail.oraclecloud.com>, if one is specified for the company through Working with Companies (WCMP)
- To: The Email address for the breached threshold.
- Subject: `**ALERT** Threshold Monitor Breach`
- First data: Indicates which threshold has been breached, for example: `Backorders threshold exceeded.`
- Second data: The text from the Action field for the breached threshold.

- Third data: The company, actual threshold value, and threshold comparison value defined for the breached threshold, for example: `Co#: 7 Actual$: 26973 > Thresh$: 13700.`
- Final data: `Use WTHR to monitor this breach.`

System Delivered Thresholds

The table below describes the system-delivered thresholds and how the system updates the threshold actual values. If have not already created these thresholds, the Batch Order Control job automatically creates them; however, you still need to define the threshold criteria; see Updating Threshold Actual Values.

Code	Name	Threshold Description
BO	Backorders	Monitors the number of open and held orders that contain at least one unit on backorder, and the total merchandise dollar value of these backordered units. The system determines if an item is on backorder by calculating open quantity on order line - reserved quantity on order line = backorder quantity. The system determines the open quantity by calculating order quantity - shipped quantity - cancelled quantity - soldout quantity = open quantity. Actual number value The total number of open and held orders that contain at least one unit on backorder, including the total number of ship-to addresses for orders with multiple ship-tos. For example, an order with two ship-to addresses updates the number of orders total by 2. This is the sum of the Future use 1 number and Future use 2 number from the Order Control Summary table for the most recent transaction date. Actual dollar value The sum of the Open backordered dollars and the Held backordered dollars from the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
HP	Purchase Orders On Hold	Monitors the number of held purchase orders and the merchandise dollar value of items on these purchase orders. Held purchase orders are POs that are in a held (H) status; this does not include drop ship POs. The PO line status can be open (O) or held (H) to be included in these totals. Actual number value The Held PO number from the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar total for held purchase orders from the PO Detail table, determined by subtracting the quantity received from the quantity ordered and multiplying by the PO price. This is the Held PO dollars from the Order Control Summary table for the most recent transaction date.
IB	Inventory On Backorder	Monitors the number of units on backorder that are on open or held orders and the total merchandise dollars of backordered units on these orders. Actual number value The sum of the Open quantity backordered and Held quantity backordered from the Order Control Summary table for the most recent transaction date. Actual dollar value The sum of the Open dollars backordered and the Held dollars backordered from the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
IP	Inventory Pending Putaway	Monitors the number of units received into a pending putaway warehouse and their merchandise dollar value. A pending putaway warehouse is a warehouse where you place inventory that is on its way to its final destination. You can define a warehouse as a pending putaway warehouse by assigning a warehouse location type of PP (pending putaway warehouse) to the warehouse in Working with Default Warehouse Locations (WWDL). The system increases these totals when you receive a PO line or a partial quantity on a PO line into a pending putaway warehouse. Actual number value The total number of units received into a pending putaway warehouse, from the Pending Putaway Detail table. This is the Pending putaway quantity from the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar value of items received into a pending putaway warehouse, from the Pending Putaway Detail table. The system multiplies the quantity pending for each pending putaway detail record by the PO cost to determine the merchandise dollar value for each pending putaway detail record (if a PO cost is not defined, the system uses the SKU cost from the SKU table). The system then sums the merchandise dollars for each pending putaway detail record to determine the total pending putaway merchandise dollars. This is the Pending putaway dollars from the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
IS	Inventory In Staging Whs	Monitors the number of units received into a staging warehouse and the merchandise dollars value of these units. A staging warehouse is a warehouse that represents an area within your actual warehouse where you keep stock that needs to be put away. You can designate a warehouse as a staging warehouse by entering the warehouse code in the Default Staging Warehouse (E15) system control value. The system increases these totals when you receive a PO line or a partial quantity on a PO line into a staging warehouse. Actual number value The total number of units received into a staging warehouse. To determine the number of units received into staging, the system totals the on-hand quantity for each item warehouse record in the staging warehouse. This is the Staging inventory quantity from the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar value of items received into a staging warehouse. To determine the merchandise dollars of items received into staging, the system multiplies the total on-hand quantity in the Item Warehouse table for the staging warehouse times the SKU cost. This is the Staging inventory dollars from the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
LP	LTD purchase dollars	Monitors the number of orders placed by a sold-to customer and their merchandise dollar value. The system monitors this threshold only when the sold-to customer places an order in order entry. If the Update Demand for Order Maintenance Transactions (C72) system control value is selected, the system increases a sold-to customer's LTD (life-to-date) orders number and dollars when you add an order line to an order in order maintenance. The system reduces a sold-to customer's LTD orders number and dollars when you cancel an order if the cancel reason you enter is set to update demand. **Note:** You must manually create this threshold value. Also, the threshold's actual number and actual value are not listed on the Work with Thresholds Screen since these values apply to a specific sold to customer. The system does not send an email when this threshold is breached; instead, a pop-up window opens in order entry. Customer Order History Window The Customer Order History Window opens in order entry when you enter an order for a customer whose LTD order dollars exceeds the threshold value. Actual number value The number of orders placed by a sold-to customer, not including any returns created through order entry or exchange items entered on an order. This is the Order number LTD in the Customer Sold To Order History table for the most recent transaction date. Actual dollar value The merchandise dollar value of the orders placed by a sold-to customer, including any backordered or soldout items, but not including any returns created through order entry. This is the Order dollars LTD from the Customer Sold To Order History table for the most recent transaction date.

Code	Name	Threshold Description
NP	Orders Rsvd/Not Printed	Monitors the number of reserved units on open and held orders and their total merchandise dollar value. Actual number value The sum of the Open unprinted quantity and Held unprinted quantity from the Order Control Summary table for the most recent transaction date. Actual dollar value The sum of the Open unprinted dollars and Held unprinted dollars from the Order Control Summary table for the most recent transaction date.
OH	Orders On Hold	Monitors the number of units on held orders and their total merchandise dollar value. This includes units regardless of whether they are on backorder or are printed, but does not include held order lines if the order itself is not held. Actual number value The sum of the Held backordered quantity, Held printed quantity, and Held Unprinted quantity from the Order Control Summary table for the most recent transaction date. Actual dollar value The sum of the Held backordered dollars, Held printed dollars, and Held unprinted dollars from the Order Control Summary table for the most recent transaction date.
OR	Pending Refund	Monitors the number of pending refunds and their total merchandise dollar value. Pending refunds are refunds in an open or held status that have not yet been processed; these totals do not include refunds that are in a pending cancelled, cancelled, pending write off, write off, or processed status. Actual number value The Refunds pending number from the Order Control Summary table for the most recent transaction date. Actual dollar value The Refunds pending dollars from the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
PC	Pending RA Credit	Monitors the number of pending return authorization credits and their total merchandise dollar value. Pending return authorization credits are return authorizations that have been received, but not yet credited. These totals include the returned units on return and exchange transactions, but not items ordered in exchange. Actual number value The total number of pending return authorization credits, regardless of whether the returns are on the same order. For example, an order with 2 pending RA credit order lines processed separately updates this total by 2; however, if the same 2 pending RA credit order lines on a single order are processed in the same transaction, the total updates by 1. The system determines the number of pending RA credits by totaling the number of RA header records whose date received is greater than 0 and date credited is 0. This is the Pending RA credit number from the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar total of items on pending return authorization credits, determined by multiplying the uncredited quantity by the order detail price. From the Pending RA credit dollars in the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
PD	Purchase Orders Past Due	Monitors the number of purchase orders that contain purchase order lines that are past due their merchandise dollar value. This does not include drop ship purchase orders. Past due purchase orders contain PO lines that have not yet been received and are past the expected due date (the Due date on the PO line is earlier than the current date). PO lines whose status is open (O) or held (H) are included in these totals. Actual number value The total number of open, held, and docked POs that include PO lines that are past due. This is the sum of the Open past due PO number, Held past due PO number, and Docked past due PO number from the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar total for items on open, held, and docked POs that are past due. This is the sum of the Open past due PO dollars, Held past due PO dollars, and Docked past due PO dollars from the Order Control Summary table for the most recent transaction date.
PK	Purchase Orders Docked	Monitors the number of docked purchase orders and their merchandise dollar value. Docked purchase orders are POs that are in a docked (D) status. PO lines on partially docked PO's whose status is (O) or held (H) are included in these totals. If you partially receive a docked PO, the system updates the PO status from docked (D) to open (O). Actual number value The Docked PO number from the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar total for docked purchase orders from the PO Detail table, determined by subtracting the quantity received from the quantity ordered and then multiplying by the PO price. This is the Docked PO dollars from the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
PO	Pending Pick Slips	Monitors the number of pending pick slips and their merchandise dollar value. Pending pick slips are pick slips that have not yet been billed, but does not include pick slips that are voided, waiting for authorization, or suspended. The system increases the pending pick slip number, units, and dollars for drop ship orders if the drop ship output defined for the vendor is drop ship pick slip; if the drop ship output defined for the vendor is drop ship purchase order or collaborative shipping, the system increases the total units and total dollars pending, but does not increase the total number pending. Actual number value The Pending picks number from the Order Control Summary table for the most recent transaction date. Actual dollar value The Open printed dollars and Held printed dollars from the Order Control Summary table for the most recent transaction date.
RA	Pending RA Receipt	Monitors the number of pending return authorization receipts and their merchandise dollar value. Pending return authorization receipts are return authorizations that have been entered, but not yet received. These totals include items returned on return and exchange transactions, not items ordered in exchange. Actual number value The total number of pending RA receipts, regardless of whether the returns are on the same order. For example, an order with 2 pending RA receipt order lines processed separately updates this total by 2; however, if the same 2 pending RA receipt order lines on a single order are processed in the same transaction, the total updates by 1.

Code	Name	Threshold Description
		The system determines the number of pending RA receipts by totaling the number of RA header records whose date received is 0. This is the Pending RA receipt number from the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar total of items on pending return authorization receipts, determined by multiplying the unreceived quantity by the order detail price. This is the Pending RA receipt dollars from the Order Control Summary table for the most recent transaction date.
RS	Suspended PO Receipts	Monitors the number of PO lines received into suspense and their merchandise dollar value. Actual number value The total number of PO lines received into suspense, including PO lines that have a partial quantity received into suspense. This is the Suspense receipts number from the Order Control Summary table for the most recent transaction date. Actual dollar value The Suspense receipts dollars from the Order Control Summary table for the most recent transaction date.
SB	Suspended Batches	Monitors the total number of order batches that are in a suspended status. The system does not monitor a threshold dollar value for suspended batches. Actual number value The system determines the number of order batches in a suspended status by totaling the number of orders in the Order Batch table whose Batch suspended field is set to Y. This is the Batches suspended number from the Order Control Summary table for the most recent transaction date.
SI	Suspended Inventory	Monitors the number of units received into suspense and their merchandise dollar value. Actual number value The Suspense receipts quantity from the Order Control Summary table for the most recent transaction date. Actual dollar value The Suspense receipts dollars from the Order Control Summary table for the most recent transaction date.

Code	Name	Threshold Description
SO	Suspended Orders	Monitors the number of suspended orders and their merchandise dollar value, regardless of whether the order is batched. Actual number value The total number of suspended orders, from the number of orders in a suspended status or error status in the Order Header table. This is the Orders suspended number in the Order Control Summary table for the most recent transaction date. Actual dollar value The merchandise dollar total of suspended orders, including orders in a suspended or error status. This is the sum of the merchandise dollars for suspended and orders in error in the Order Ship To table. This is the Orders suspended dollars from the Order Control Summary table for the most recent transaction date.
VC	Virtual Card Numbers	Monitors the number of stored value card numbers available to assign to a virtual stored value card. Actual number value The actual number of records in the Virtual Card Number Table (FLSVCA).

Work with Thresholds Screen

Purpose: Use this screen to review, create, change, or submit a command to process a threshold value.

How to display this screen: Enter WTHR in the Fast path field at the top of a menu or select Work with Threshold Values from a menu.

Field	Description
Description	A description of the threshold. See System Delivered Thresholds for a listing of system-delivered threshold values and the calculations performed. Alphanumeric, 30 positions; optional.
Threshold units	The number defined for the threshold. Numeric, 7 positions; display-only.
Threshold value	The dollar amount defined for the threshold. **Note:** You can enter a whole dollar amount, but no decimals. Numeric, 7 positions; display-only.

Field	Description
	Breached values are highlighted in red: A threshold's Actual units or Actual value, or both, are highlighted in red if they have breached the corresponding thresholds. The system considers a threshold breached if you have specified a Comparison setting for the threshold and either of the actual values is beyond the threshold, even if the threshold is zero. To avoid having a threshold flagged as breached, set the Comparison to unselected (blank).
Actual units	The actual current value for the threshold, such as the actual number of units on backorder. Numeric, 7 positions; display-only.
Actual value	The actual dollar amount for the threshold, such as the dollar value of units on backorder. **Note:** The system rounds the actual dollar amount down to the nearest whole dollar. Numeric, 7 positions; display-only.
Action	The message to include in the Threshold Monitor Breach Email to indicate the action to take if the threshold is breached; for example, if the OH (Orders on Hold) threshold is breached, the action may be GENERATE THE HELD ORDERS REPORT. Alphanumeric, 50 positions; display-only.

Screen Option	Procedure
Create a threshold	Select Create to advance to the Create Threshold Values Screen.
Change a threshold	Select Change next to a value to advance to the Change Threshold Values screen. At this screen you can change all fields except the Last update date and time, Threshold code, Actual unit value, Actual dollar value, and Last sent date and time. See Create Threshold Values Screen for field descriptions.
Delete a threshold	Select Delete next to a value to delete it.
Display a threshold	Select Display next to a value to advance to the Display Threshold Values screen. You cannot change any information on this screen. See Create Threshold Values Screen for field descriptions.
Show all thresholds or only breached thresholds	Select Show All/Breached. The system toggles between displaying all thresholds or only those thresholds that have been breached. **When is a threshold considered breached?** The system considers a threshold breached if you have specified a Comparison setting for the threshold and either of the actual values is beyond the threshold, even if the threshold is zero. To avoid having a threshold flagged as breached, set the Comparison to unselected (blank).

Create Threshold Values Screen

Purpose: Use this screen to create a threshold.

How to display this screen: Select Create at the Work with Thresholds Screen.

Field	Description
Threshold	The code and description that represents a threshold. See System Delivered Thresholds for a list of system-delivered thresholds. Threshold code: Alphanumeric 2 positions. Create screen: required. Change screen: display-only. Threshold description: Alphanumeric, 30 positions; required.
Last update	The date and time when the threshold was last updated. Date: Alphanumeric, 6 positions; display-only. Time: Alphanumeric, 6 positions; display-only.
Comparison	Defines how the system determines whether the threshold is breached. Valid values: • Greater than = The threshold is breached when the actual system value exceeds the threshold value. • Less than = The threshold is breached when the actual system value is less than the threshold value. **Note:** Leave this field blank (unselected) if you do not want the system to check whether the threshold is breached. Optional.
Value	The number that represents the threshold value. Numeric, 7 positions; optional.
$ Value	The dollar amount the represents the threshold value. **Note:** You can only enter a whole dollar amount. Numeric, 13 positions with a 2-place decimal; optional.
Actual value	The actual number for this threshold, updated by the system. Example: The actual number of units on backorder. Numeric, 7 positions; display-only.
$ actual value	The actual dollar amount for this threshold, updated by the system. Example: The dollar value of units on backorder. **Note:** The system rounds the actual dollar amount down to the nearest whole dollar. Numeric, 20 positions with a 2-place decimal; display-only.
Email address	The email address where the system delivers the Threshold Monitor Breach Email when the threshold is breached. **Note:** You can define just one email address for each threshold. See Email Address Validation for information on how the system verifies that your entry is formatted correctly. Alphanumeric, 50 positions; optional.
Email interval	The number of hours the system waits before sending another email for the breached threshold. Numeric, 3 positions; optional.
Last sent on/at	The last date and time when an email was sent for the threshold. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HHMMSS format); display-only.

Field	Description
Action	The message to include in the Threshold Monitor Breach Email, indicating the action to take if the threshold has been breached; for example, if the OH (Orders on Hold) threshold is breached, the action may be GENERATE THE HELD ORDERS REPORT. Alphanumeric, 50 positions; optional.
Code	A code for the application area associated with the threshold. Alphanumeric, 3 positions; required.
Group code	A code for the application group associated with the threshold. Alphanumeric, 3 positions; required.

Using the Menu Driver

Topics in this part: The following topics describe how to create and customize menus for individual or groups of users.

- Menu Driver Screen describes the features and functions of the Menu Driver.
- Setting Up Menu Options (WOPT) describes how to create and change menu options and their descriptions.
- Customizing Menus (WMNU) describes how to create and change menus, copy menus, and define menu details.
- Setting Up Application Areas describes how to create and change application areas and their descriptions.
- Setting Up Application Groups describes how to create and change application groups and their descriptions.
- Working with Announcements (WANN) describes how to set up the announcements to display on the home menu.

> **Note:**
>
> This part assumes that the individual performing the tasks described here has the appropriate security and authority to access all features and functions. For information on system and application security and authority setup, see Establishing Security.

The Menu Driver checks the initial security code provided by Order Management System at the time of installation. If a mismatch is found, the Menu Driver does not allow access to the software.

Setting Up Menu Options (WOPT)

Purpose: Use this screen to create a menu option and define its attributes.

In this topic:

- Create Menu Options Screen

Related sections: To create and tailor your own menus, see Customizing Menus (WMNU).

Work with Menu Options Screen

How to display this screen: Enter WOPT in the Fast path field at the top of a menu or select Work with Menu Options from a menu.

Field	Description
Option	The Fast Path name for a menu option. Alphanumeric, 4 positions; optional.
Description	The description of the menu option. Alphanumeric, 60 positions; optional.
Type	The menu option type. Valid types include: • Modern View: The option is available only in Modern View, including Contact Center options. Modern View options are not displayed in Classic View if they are included in a menu, and you cannot advance to them by entering the fast path. • Program: The option is available in Order Administration (Classic View). Also, certain programs are also available in Modern View, including OIOM, DBJS, MULO, ERHO, and MSVB. A Modern View Option flag in the Menu Option table controls whether a program option is also available in Modern View. • Process: The option initiates a process, such as running a periodic function. Optional.
Appl Area (Application Area)	The application area to which this menu option belongs. Application areas are defined in Setting Up Application Areas(WSYS). Alphanumeric, 3 positions; optional.
Appl Group (Application Group)	Allows you to enter the application group to which this menu option relates. Application groups are defined in Setting Up Application Groups(WSYS). Alphanumeric, 3 positions; optional.

Screen Option	Procedure
Create a menu option	Select Create to advance to the Create Menu Options Screen.
Change a menu option	Select Change to advance to the Change Menu Options screen. See Create Menu Options Screen for field descriptions. **Note:** The System Option field does not appear on the Change screen.
Delete a menu option	Select Delete to delete a menu option. **Note:** You cannot delete menu options that were delivered with the system and that exist on a menu, or if you do not have the authority required to perform this action.

Screen Option	Procedure
Display a menu option	Select Display to advance to the Display Menu Option screen. You cannot change any fields on this screen See Create Menu Options Screen for field descriptions. **Note:** The System Option field does not appear on the Display screen.
Display menu names on which an option appears	Select Usage to advance to a pop-up window that lists the menus that include this option.

Create Menu Options Screen

Purpose: Use this screen to create a menu option.

How to display this screen: Select Create at the Work with Menu Options Screen.

Field	Description
Option	The Fast Path name for this menu option. Each option on the system has a unique name, allowing you to access an option directly without selecting the option from a menu tree. Alphanumeric, 4 positions; required.
Description	The menu option's description to display on a menu in Order Administration (Classic View). The description you enter is used to find the option quickly when you enter it in the Description field to scan for a menu option. Alphanumeric, 60 positions; required.
Modern View Description	The menu option’s description to display in Modern View, both in the menu and at the tab when the option is open. Used only for Modern View options. If this field is blank, the Description is displayed in Modern View. **Note:** This description is not used as the page title in Modern View; also, it is displayed in Modern View only when the option is included in a menu for the user. Alphanumeric, 60 positions; optional.
Type	The code that indicates if the option represents a command, program, or processing function, and whether it is available in Modern View only. • Modern View: The option is available only in Modern View, including Contact Center options. This type should not be assigned to options that need to be available in Classic View. Modern View options are not displayed in Classic View if they are included in a menu, and you cannot advance to them by entering the fast path. • Program: The option is available in Order Administration (Classic View). Also, certain programs are also available in Modern View, including OIOM, DBJS, MULO, ERHO, and MSVB. A Modern View Option flag in the Menu Option table controls whether a program option is also available in Modern View. • Process: The option initiates a process, such as running a periodic function. Required.

Field	Description
Program Name	If you selected Program in the previous Type field, you must enter the program name. When this option is selected from a menu, it will initiate a program. Example: INR0029 This program will initiate the Inventory Inquiry program. Alphanumeric, 10 positions; required if you selected a Type of Program.
Process Name	If you selected Process in the previous Type field, you must enter the processing function name. When this option is selected from a menu, it will initiate a process that runs on a scheduled basis. Example: PROCESS#2 This process will initiate Daily Reports Processing. See Working with Periodic Processes (WPPR) for information on working with processes. Alphanumeric, 10 positions; required if you selected a Type of Process.
Authority Parameter	If this menu option is a program, this setting indicates whether the user's authority should be passed into the program. The Menu Driver passes the user's authority to the program. See Work with Menu Option Authority Screen. • Selected = Authority checking will be performed to ensure that this user has access to the program. • Unselected = All users will have access to this program.
Company Parameter	Indicates whether the company number is passed into the program. Company numbers are defined in Working with Companies (WCMP). • Selected = The company number is passed into the program. • Unselected = The company number is not passed into the program.
System Option	Indicates if this menu option is a system option. System options can either be supplied with the system, or when you create a menu option, you can define it as a system option. As with system-supplied options, once you define an option as a system option, you cannot delete or change it. • Selected = System menu option. You cannot delete or change this menu option once it has been defined as selected. • Unselected = This option is not a system option and can be deleted or changed. However, menu options that are supplied with the system cannot be deleted or changed. Only options that you create can be defined as unselected (not a system option).

Field	Description
Appl Area (Application Area)	The application area (for example, Order Entry) to which this option belongs. This designation can be used to group similar options. For example, Purchase Order Inquiry, Purchase Order Purge, Purchase Order Print are assigned to the application area P/O, as these are all Purchase Order options. For options that are supplied with the system or that you define as a system option, you cannot change the application area. Application area can be used as a Fast Path method of sorting options on a menu. Application Areas are discussed in Setting Up Application Areas. Alphanumeric, 3 positions; required.
Appl Group (Application Group)	The application group (for example, freight) related to this option. This designation can be used to group similar options. For example, Work With Dollar Chart by Offer and Work With Dollar Chart by Source can be assigned to the application group FRE, as these are menu options that define how freight is calculated by the system. Application groups can be used as a Fast Path method of sorting options on a menu. Application Groups are discussed in Setting Up Application Groups. Alphanumeric, 3 positions; required.

Customizing Menus (WMNU)

Purpose: Use Work with Menus to create and customize menus for an individual user or groups of users in either Order Administration (Classic View), Modern View, or both. For example, you might want to create a menu and customize it so that only customer service functions appear to the individual who performs customer service activities.

Menus can include sub-menus: You can create menus that include only individual menu options, and also create menus that include sub-menus that provide additional menu options. The system does not prevent you from assigning the same menu option at different levels in the menu hierarchy, such as including an option at the top level menu and again in a sub-menu.

Menu option assignment for Modern View: In Modern View, for the most part a user's access to menu options is available through the Tasks option or the Pin the Menu option, and is based on the user's Default menu assignment in Work with Users; there is no Fast Path available in Modern View. However, if the user has authority to an menu option not included in their default menu or one of its sub-menus, the option is available in Modern View through a menu title of Additional Options.

Example: If a user is assigned authority to the MULO (unlock suspended order or batch) menu option, but the user's default menu does not include MULO, or include a sub-menu that includes MULO, the MULO option in Modern View is available under the menu title of Additional Options.

Quick link menu: You can assign a menu as the Modern View Quick Link Menu for a user class. The menu options included in this menu are displayed automatically for users in the user class at the Modern View Home page, provided that the options are available in Modern View.

Classic View or Modern View? Some menu options are available only in Classic View, some are available only in Modern View, and some are available in both:

- Modern View only: Options that are available only in Modern View have a Type of MODERN VIEW in Setting Up Menu Options (WOPT). If you are using Classic View and select an option available only in Modern View, the screen displays an error.
- Classic View only: Certain menu options are available only in Classic View. Any options that are available only in Classic View are not displayed in Modern View through the user's Default menu or its sub-menus.
- Both Modern View and Classic View: Certain menu options are available in both Modern View and Classic View. These options, which have a Type of PROGRAM or PROCESS, are:
  - Order Inquiry/Maintenance (OIOM)
  - Stored Value Card Balance Inquiry (MSVB)
  - Unlock Stranded Order or Batch (MULO)
  - Display Order Control Summary (FLSH)
  - Sales Summary (DSSS)

In this topic:

- Work with Menus Screen
- Work with Menu Details Screen (Creating a Menu and Menu Details)
- Copy Menu Screen
- Work with Menu Details Screen (Changing Menu Details)

Related topics: If you plan on creating your own menu options, read Setting Up Menu Options (WOPT) before you begin working with menus. Menu options must exist before you can add them to a menu, whether you are creating a menu or customizing a standard menu.

Work with Menus Screen

How to display this screen:

- Enter WMNU in the Fast path field at the top of a menu or select Work with Menus from a menu.
- Select Work with Menus on the Work with User Classes Screen.

Field	Description
Menu	The name of the menu. Alphanumeric, 10 positions; optional.
Description	The menu description. Alphanumeric, 60 positions; optional.

Screen Options	Procedure
Create a menu	Select Create to a advance to the Work with Menu Details Screen (Creating a Menu and Menu Details).

Screen Options	Procedure
Change a menu description	Select Change for a menu to advance to the Change Menu screen. This screen only allows you to change a menu's description. See Work with Menu Details Screen (Creating a Menu and Menu Details) for a description of the fields on this screen. **Note:** To change a menu's details, see Work with Menu Details Screen (Changing Menu Details).
Copy a menu to create a new menu	Select Copy for a menu to advance to the Copy Menu Screen.
Delete a menu	Select Delete for a menu to delete it.
Work with menu details	Select Menu Details for a menu to advance to the Work with Menu Details Screen (Changing Menu Details). This screen shows the specific menu option, its description, option type, and authority level.
Print menu details	Select Print Details for a menu to print the menu details.
Display menu names on which a menu appears	Select Usage for a menu to advance to the Sub-Menu Usage window.

Work with Menu Details Screen (Creating a Menu and Menu Details)

Purpose: Use this screen to create a menu and menu details.

> **Note:**
>
> Include no more than 13 menu options in a menu, as this is the maximum number of menu options that fit in the Quick Find Options area of the Menu Driver Screen at one time.

Modern View options: Menu options with a Type of Modern View are not available in Order Administration Classic View. These options are available in Modern View only.

How to display this screen: Select Create on the Work with Menus Screen.

Field	Description
Menu	The name for this menu that will be used to display and scan for a menu. The name you assign is used to display the menu when you enter it in the Menu field at the top of any menu. Alphanumeric, 10 characters; required.
Description	The description you assign to the menu. The description is used to scan for the menu when you enter it in the Description field at a prompt screen. This description also displays at the top of the menu. Alphanumeric, 60 characters; required.

Field	Description
Position	Indicates in what order the option will appear on the menu. Example: If you assign 001 to a menu option, this option will appear first on the menu, 002 will appear second, 003 will appear third, etc. **Note:** Include no more than 13 menu options in a menu, as this is the maximum number of menu options that fit in the Quick Find Options area of the Menu Driver Screen at one time. Numeric, 3 position; required.
L/H Text (Left-hand text)	Allows you to categorize a group of options on a menu. This text appears on the left side of the menu. Example: If you are adding four maintenance options and three inquiry options to a menu, you could add the label Maintenance to identify the maintenance options and *Inquiry* to identify the inquiry options. Alphanumeric, 10 positions; optional. Complete either the **Option or Menu field; do not complete both fields on the same line.**
Option	Enter the Fast Path name for this menu option that will display on the menu. Each option on the system has a unique name, which allows you to access an option directly without selecting the option from a menu tree. You must enter an existing menu option name. See Setting Up Menu Options (WOPT). **Note:** Modern View menu options are not available in Order Administration Classic View, and should not be assigned to Order Administration Classic View menus. These options are available in Modern View only. Alphanumeric, 4 positions; required unless you enter a value in the Menu field.
Menu	Enter the name of the menu that will appear as an option on the menu you are creating. Each menu on the system has a unique name, allowing you to access a menu directly without selecting the menu from a menu tree. The menu you enter is validated against the Menu table. See Setting Up Menu Options (WOPT). Alphanumeric, 10 positions; required unless you enter a value in the Option field.

Screen Option	Procedure
Review all existing menu options	Select W/W Menu Options to advance to the Work with Menu Options Screen.

Screen Option	Procedure
Resequence the menu options on the screen	Select Resequence to expand the lengths of the options' current Positions, making it easier to insert a new menu option between two existing options. A zero is added to the end of the Position for each existing menu option, provided that the current Position is 2 positions long or fewer. Example: If the current Position is 2, it is resequenced to 20, and if the current Position is 20, it is resequenced to 200. If the Position is 200, the Resequence option does not change it.
Delete the menu details	Select Delete.

Copy Menu Screen

Purpose: Use this screen to create a menu by copying an existing menu. The new menu will have the same menu options as the menu you copied. You cannot copy a menu to another existing menu.

How to display this screen: Select Copy Menu for a menu at the Work with Menus Screen.

Field	Description
From menu	The existing menu that you are copying. Alphanumeric, 10 positions; display-only.
Description	The description of the menu you are copying. Alphanumeric, 60 characters; display-only.
To menu	The name of the new menu you want to create. This menu name must be unique; it cannot already exist on the system. Alphanumeric, 10 positions; required.
Description	The description of this menu. Alphanumeric, 60 positions; required.

Work with Menu Details Screen (Changing Menu Details)

To change: Select Menu Details for a menu at the Work with Menus Screen to advance to the Work with Menu Details screen. See Work with Menu Details Screen (Creating a Menu and Menu Details) for a description of the fields on this screen.

To add a menu option: To add an option without changing the order of the menu options, enter the menu option you want to add on the next available open line.

To add an option to the menu in between two menu options (such as adding an option between 003 and 004), select Resequence to resequence the menu options. The system automatically assigns each option a value of ten. (For example, 001 becomes 10, 002 becomes 20, etc.)

Position your cursor at the next available line. Add the option by assigning a value between 1 and 9. For example, to add an option between 4 and 5, enter a value between 41 and 49 in the POS field. When you select OK, the menu options will appear in numerical order, as they will appear on the completed menu.

When you have finished adding options, select OK to validate your entries.

> **Note:**
>
> Include no more than 13 menu options in a menu, as this is the maximum number of menu options that fit in the Quick Find Options area of the Menu Driver Screen at one time.

Modern View options: Menu options with a Type of Modern View are not available in Order Administration Classic View, and should not be assigned to Order Administration Classic View menus. These options are available in Modern View only, and include:

- Contact Center Order Entry (CCOE)
- Display Batch Job Statistics (DBJS)
- Enterprise Data Import History (EDIH)
- Manage External Application Access (MEAA)
- Narvar Order Export Errors (NOEE)
- Payment Configurations (WPMT)

Working with Announcements (WANN)

Purpose: Use this option to enter or change the announcements displayed at the menu screen, as well as the Home page in Modern View.

Change Announcements Screen

How to display this screen: Enter WANN in the Fast Path field at the top of any menu, or select Work with Announcements from a menu.

Completing this screen: Enter the announcements to display at the Classic View menu screen when the user logs into Order Management System. You can enter up to three lines of up to 50 positions each.Your entry(ies) are displayed at the Classic View menu screen or the Modern View Home page the next time a user advances to a Classic View menu screen or the Modern View Home page.
Line breaks: The menu screen in Classic View Order Management System retains the line breaks when displaying the announcements; however, the Home page in Modern View concatenates the lines into a single flow.

For more information: See Menu Driver Screen.

> **Important:**
>
> The menu screen might not display the full 50 positions entered, depending on the width of the individual characters. It is important to test your entry to confirm that the menu screen displays it correctly

System Control Values and Number Assignments

Topics in this part:

- System Control Table Components provides an overview of the System Control table and describes how to set up and change values in this table.
- Setting Up Order Entry Values provides a definition of each Order Entry system control value.
- Setting Up Inventory Values provides a definition of each Inventory system control value.
- Setting Up Fulfillment Values provides a definition of each Fulfillment system control value.
- Setting Up General Usage Values provides a definition of each system control value in the General Usage application area.
- Setting Up Purchase Order Values provides a definition of each Purchase Order system control value.
- Setting Up Customer Service Values provides a definition of each system control value in the Customer Service application area. These values control parameters that include credit card authorization and return transactions.
- Setting Up the Number Assignment Table (WNUM) provides an overview of the Number Assignment table and describes how to set up and change number assignments in this table.
- Setting Up E-Commerce Values provides a definition of each e-commerce system control value.
- Setting Up Interface Values provides a definition of each Interface system control value.

Setting Up the Number Assignment Table (WNUM)

Purpose: Use the Number Assignment table to establish the starting and ending number assignments used throughout the system for fields that require a unique identifier, such as an order number, purchase order number and customer number.

The system will automatically and sequentially assign the next number for each record defined in this table. Typically, this table is pre-loaded by . If, however, the Number Assignment table is empty, you must define each number assignment during system set up. See Available Number Assignments for a description of each number assignment

In this topic:

- Work with Number Assignment Screen
- Available Number Assignments
- Create Number Assignment Screen
- Copy Company Info Window (Copying a Number Assignment)
- Change Number Assignment Screen

Work with Number Assignment Screen

Purpose: Use this screen to change, copy, delete, or display a number assignment field.

How to display this screen: Enter WNUM in the Fast path field at the top of any menu or select Work with Number Assignment from a menu.

Field	Description
File code	A code to uniquely identify a number assignment. Alphanumeric, 3 positions; optional.
Description	The description of the number assignment. Alphanumeric, 40 positions; display-only.
Last #	The number most recently assigned for the number assignment. Numeric, 9 positions; optional.
Start #	The initial number for the number assignment. Numeric, 9 positions; optional.
End #	The highest possible number that can be used for a number assignment. The value in the Last # field rolls (begins at the value in the Start # field again) when it reaches the value in the End # field. Numeric, 9 positions; optional.
Reset date	The date on which you changed the value in the *Last #* field manually. Numeric, 6 positions (in user date format); optional.

Screen Options	Procedure
Change a number assignment	Select Change for a number assignment to advance to the Change Number Assignment Screen.
Copy a number assignment	Select Copy for a number assignment to advance to the Copy Company Info Window (Copying a Number Assignment).
Delete a number assignment	Select Delete for a number assignment to delete it. The screen displays a message if you try to delete a system supplied number: System supplied number file codes cannot be deleted.
Display a number assignment	Select Display for a number assignment to advance to the Display Number Assignment Screen.
Create a number assignment	Select Create advance to the Create Number Assignment Screen

Available Number Assignments

Purpose: This chart lists and describes all of the number assignment records that should be included in your system. If the number assignment table is empty when you install the system, you must define each number assignment during system installation.

Although 9 positions are available for the Start # and End # fields, actual field lengths vary. For example, the number assignment A01 (Order Batch) is a 5-digit field; therefore, the numbers in the Start # and End # fields cannot exceed 5 digits. Refer to this table for exact field lengths for each number assignment.

Code	Number Assignment	Description	Field name/length
A01	Order Batch	Assigns the next number when entering a new batch of mail orders during Order Entry.	OBA Batch # Numeric, 5 positions
A04	Purchase Order Header	Assigns the next number to a purchase order for merchandise.	POH PO # Numeric, 7 positions
A05	Order Header	Assigns the next number to uniquely identify a new customer order or quote.	OHD Order # Numeric, 8 positions
A06	P/O Receipt Control	Assigns the next number when receiving merchandise ordered on several purchase orders to distribute costs across all goods received.	POC Control # Numeric, 7 positions
A07	Customer Sold To	Assigns the next number to uniquely identify the customer who places an order or wants a catalog.	CST Customer # Numeric, 9 positions
A09	Suspense Placement Work	Assigns the next number to incoming inventory being held in suspense.	SPW Job # Numeric, 6 positions
A10	Customer Fraud	Assigns the next number to uniquely identify a fraudulent name and address.	CFF Seq # Numeric, 7 positions
A11	Customer Bill To	Assigns the next number to a bill to customer.	CBT Account # Numeric, 7 positions
A12	Short SKU	Assigns the next number to an item or SKU so that you can uniquely identify it when passing e-commerce information or when picking and packing it (the number is printed with a product's bar code on the pick slip).	SKU Short SKU Numeric, 7 positions
A13	PCH Billing Batch #	Assigns the next number to a batch of pick slips so that you may bill all pick slips in the batch in a single step.	PCH Billing Batch # Numeric, 7 positions
A14	Pick Slip Gen Opts #	Assigns a number to a pick slip generation procedure, such as one that generates pick slips by customer number.	PSO Seq # Numeric, 5 positions
A15	PCH Control #	Assigns the next number to uniquely identify each pick.	PCH Control # Numeric, 7 positions
A16	Billing Invoice #	Assigns the next number to an invoice which uniquely identifies a shipment.	IHD Invoice # Numeric, 7 positions
A17	RA Header #	Assigns the next number to a pre-authorized return.	RAH RA# Numeric, 3 positions
A18	Refund Check #	This number assignment is no longer implemented; the system uses the refund check number specified in the Bank table instead.	RRC Check # Numeric, 7 positions

Code	Number Assignment	Description	Field name/length
A21	Authorization Record		
A25	Call Tag #	Not currently implemented.	CTG Call Tag # Numeric, 7 positions
A26	Cart Batch #	Assigns the next number to a cart to be used for cart/bin picking.	PDL Cart Batch # Numeric, 3 positions
A27	Order Cross Reference	Assigns the next order number equivalent to an order number from another system.	OCR Cross Reference # Numeric, 9 positions
A28	Invoice Cross Reference	Assigns the next invoice number equivalent to an invoice number from another system.	ICR Cross Reference # Numeric, 9 positions
A29	Barcode Counter	Assigns the next barcode number that will print on the shipping label. This counter is used by TanData when you ship a miscellaneous package (not a order). This enables you to wand the barcode on the package and add it to the manifest.	(No field defined in Order Administration) Numeric, 9 positions
A30	Amex Deposit File Sequence #	Assigns the next sequence number to uniquely identify a deposit table transmitted to the American Express credit card authorization service	(No field defined in Order Administration) Numeric, 6 positions
A31	NaBanco Batch #	Assigns the next batch number to uniquely identify a deposit table transmitted to the NaBanco credit card authorization service	(No field defined in Order Administration) Numeric, 3 positions
A32	JCP Deposit File Batch #	Assigns the next batch number to uniquely identify a deposit table transmitted to the J.C. Penney credit card authorization service	(No field defined in Order Administration) Numeric, 3 positions
A33	JCP Deposit File Sequence #		
A34	Item #	Assigns the next item number in item entry if Auto assign item # in the System Control table = Selected.	(No field defined in Order Administration) Numeric, 9 positions maximum
A36	Item to Item Tfr ID#	Assigns the next number to identify an item to item transfer (item transaction code = G). The system uses the same ID number for both the "from" and "to" items.	ITH ID Numeric, 9 positions (the system adds an additional position to the beginning of the number containing the letter "**I**")
A38	Outlet Transfer	Assigns the next control number for items requested for replenishment by outlet warehouses.	ARD Control number Numeric, 9 positions

Code	Number Assignment	Description	Field name/length
A39	Cash Receipts Transaction ID	Assigns the next number to a new batch of payment transactions, whether you are using the Cash Receipts or the Batch Payment function.	(no field defined in Order Administration) Numeric, 9 positions maximum
A40	Internet Order Batch	Assigns the next control number when you process a batch of orders received through the internet interface.	Numeric, 5 positions
A41	GECC Batch Sequence #	Assigns the next sequence number to identify a deposit table transmitted to the GECC credit card authorization service.	(No field defined in Order Administration) Numeric, 9 positions
A42	PkMS Pick Number	Not currently implemented.	OCR B Number Numeric, 7 positions
A43	PkMS Case Number	Not currently implemented.	Case number Numeric, 10 positions
A47	Order Number Download	Not currently implemented.	(No field in Order Administration)
A48	Check Interface Download ID	Not currently implemented.	No field defined in Order Administration Numer ic, 7 positions
A49	PkMS Case Control Number	Not currently implemented.	Batch control number Numeric, 10 positions
A50	PkMS Item Control Number	Not currently implemented.	Batch control number Numeric, 10 positions
A51	PkMS Pick Control Number	Not currently implemented.	Batch control number Numeric, 10 positions
A52	PkMS PO/ASN Control Number	Not currently implemented.	Batch control number Numeric, 10 positions
A53	PkMS Vendor Control Number	Not currently implemented.	Batch control number Numeric, 10 positions
A57	SKU Quick Price Update Number	Assigns the next sequence number to each SKU/offer price created in Update SKU Offer Prices so that multiple users can create SKU/offer prices at one time.	Job number Numeric, 6 positions
A58	Vendor Number	Assigns the next sequence number when you create a new vendor, skipping over numbers already assigned to vendors.	Numeric, 7 positions
A60	Item File Transfer #	Not implemented.	No field defined in Order Administration Numeric, 6 positions
A61	Item Note File Transfer #	Not implemented.	No field defined in Order Administration Numeric, 6 positions

Code	Number Assignment	Description	Field name/length
A62	PO File Transfer #	Not implemented.	No field defined in Order Administration Numeric, 6 positions
A63	Vendor File Transfer #	Not implemented.	No field defined in Order Administration Numeric, 6 positions
A64	Returns File Transfer #	Not implemented.	No field defined in Order Administration Numeric, 6 positions
A65	Pick Ticket File Transfer #	Not implemented.	No field defined in Order Administration Numeric, 6 positions
A66	Stop Ship File Transfer #	Not implemented.	No field defined in Order Administration Numeric, 6 positions
A67	Immediate Need File Transfer #	Not currently implemented.	No field defined in Order Administration Numeric, 6 positions
A68	Transaction Sequence #	Assigns the next sequence number to the online authorization when you receive a response from the authorization service during online credit card authorization.	Transaction sequence # Numeric, 15 positions
A69	PkMS Immediate Need Control Number	Not currently implemented.	Batch control # Numeric, 10 positions
A71	Batch Auth File Trace Number	Assigns the next sequence number to the Reference ID field in the Integration Process Control table.	Reference ID Alphanumeric, 16 positions
A72	Tickler Number	Assigns the next sequence number to the Tickler number field for a newly created tickler.	Tickler number Numeric, 9 positions
A74	Alternate Customer #	Assigns the next sequence number to the Alternate customer number field whenever a new customer is created if the Assign Alternate Customer # (I88) system control value is selected.	Alt customer # Alphanumeric, 15 positions
C10	POS Customer #	Used with a series of other data to build a customer number for a point-of-sale (POS) system.	Customer id Numeric, 6 positions
C11	POS Transaction #	Sequential number that is used for sending activities to a POS system. The POS Transaction # is not related to a transaction but is required to pull sales transactions into the POS system.	Transaction id Numeric, 8 positions

Create Number Assignment Screen

Purpose: Use this screen to define the number assignments required for system installation. See Available Number Assignments.

How to display this screen: Select Create at the Work with Number Assignment Screen.

Field	Description
File code	A unique identifier assigned to each number assignment. Once a file code is assigned, it cannot be changed, only deleted. See Change Number Assignment Screen. Alphanumeric, 3 positions; display-only.
Last #	The most recent number automatically assigned by the system or set manually. The last number must be greater than or equal to the value in the Start # field. Numeric, 9 positions; required.
Start #	The initial value for a number assignment. Numeric, 9 positions; required.
End #	The highest possible number to be assigned for a number assignment. Numeric, 9 positions; required. Although 9 positions are available for the **Start # and End # fields, actual field lengths vary. For specific field lengths, refer to the table entitled** Available Number Assignments
Reset date	The date on which you changed the value in the Last # field manually. Enter a reset date each time you update the value in the Last # field. Numeric, 6 positions (in user date format); required (only if last number is changed manually).

Copy Company Info Window (Copying a Number Assignment)

Purpose: Use this window to copy a number assignment to one or all of the companies set up on your system.

How to display this screen: At the Work with Number Assignment Screen, select Copy for the number assignment you wish to copy.

Field	Description
Company code	A code to uniquely identify a company set up on your system. A company contains a single, isolated set of tables and data: it is an organization of financial information, inventory, and customers that is completely separate from another company. Numeric, 3 positions; required.

To copy to one company: Enter the company code to which you wish to copy a number assignment and Select OK.

To copy to all companies: Select All Companies.

Change Number Assignment Screen

To change: Select Change for the number assignment at the Work with Number Assignment Screen to advance to the Change Number Assignment screen. You can change all fields on this screen except the File code field.

See Create Number Assignment Screen for a description of the fields on this screen.

Display Number Assignment Screen

To display: Select Display for the number assignment at the Work with Number Assignment Screen to advance to the Display Number Assignment screen. You cannot change any information on this screen.

See Create Number Assignment Screen for a description of the fields on this screen.

Setting Up Secured Features

Setting Up Secured Features provides an overview of the Secured Features table and describes how to set up and change the values in this table.

Menu Driver Screen

Purpose: You can use any menu in the system to advance to a different menu or a menu option, scan for menus and menu options, display current order statistics, and advance to administrative options.

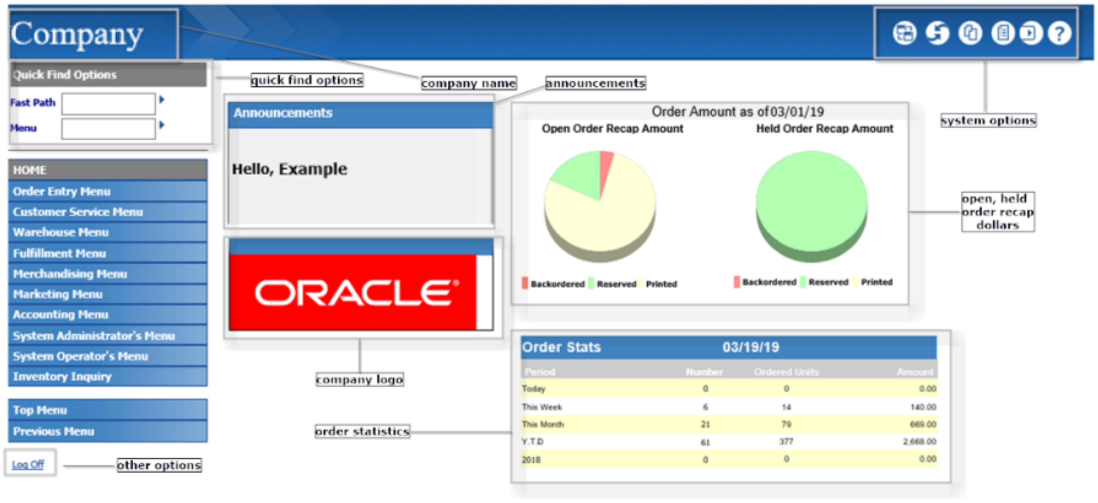
Some important features of the menu driver include:

- Quick Find Options: Fast Path, Menu selection, and menu advancement
- Link to log out of Order Administration
- Announcements
- Charts depicting open and held order dollar totals
- Company logo and default company image
- Order and shipment statistics for the day, week, month, year, and previous year, or a company-specific image for users who do not have authority to view this information
- Standard icons to change companies, advance to administration screens (My Docs, My Jobs, My Forms), or open the online help
- If the current company is not flagged as an Active company, the screen displays a message: This company is flagged as inactive and should not be used to process live orders. See the Change Company Screen for information on setting this flag.

Modern View: OACS Modern View is a separate component of Order Administration and includes the Contact Center. Your user configuration controls whether you advance automatically to Order Administration Classic View or Modern View when you first log in.

Contact Center: A component of Modern View that provides the ability to create, work with, or review orders.

The System Options provide an option to advance to Modern View.



> ✏ **Note:**
>
> When you sign on to the system, you advance to your default menu. To display the HOME menu (if it is not your default menu, or to return to it from a different menu), enter HOME in the Menu field.

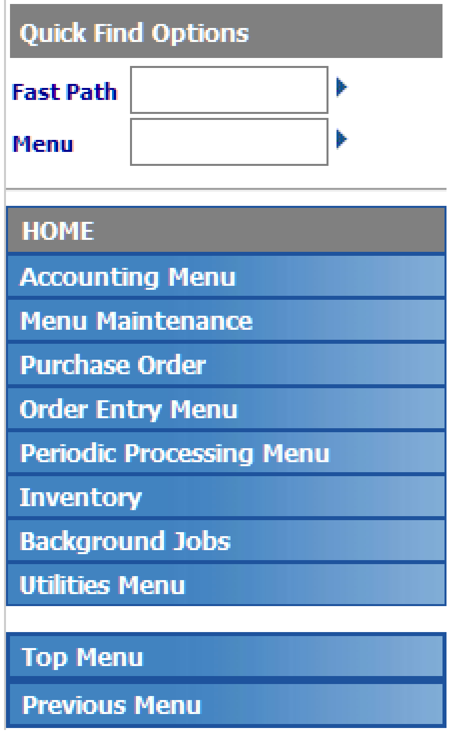
Quick Find Options

Purpose: Use the quick find options to advance to a menu option or a menu.



For more information: See Menu Driver Screen for the location of the quick find options, and links to other options available at the Menu Driver screen.

Field	Description
Fast Path	Use this field to enter a unique code for a menu option, providing direct access without advancing through the menus. Each option on the system has a Fast Path name. For example, if you enter MITM in the Fast Path field, you advance to Work with Items/SKUs. If you do not know the option name, you can click on the arrow. You advance to the Select Menu Options Window, where you can search and select the desired option. When accessible to the user, the Fast Path and Menu fields can be displayed or hidden by selecting Toggle Fast Path/Menu. The Fast Path setting in the user's record controls whether menus display the Fast Path field. See User Configuration in the Administration Guide. **Modern View options:** Menu options with a Type of Modern View are not available in Order Administration Classic View. If you enter the Fast Path for a Modern View option, the screen displays an error. Alphanumeric, 4 positions; optional.

Field	Description
Menu	Use this field to enter a unique menu name to advance it directly without advancing through the menu tree. For example, if you enter INVENTORY in the Menu field, you advance to the Inventory Menu. If you do not know the menu name, you can click on the arrow to advance to the Select Menu Window, where you can search and select the desired menu. The Fast Path setting in the user's record controls whether menus display the Menu field. See User Configuration in the Administration Guide. Alphanumeric, 10 positions; optional.
Menu	The short name of the current menu. Alphanumeric, 10 positions; display-only.
Menu names	Use the links below the current menu name to advance through the menu tree to select a different menu or a menu option. The description of each menu or menu option assigned to the current menu through the Customizing Menus (WMNU) option is available for selection. For example, the Periodic Processing menu is assigned to the HOME menu. If you select this menu, the menus and menu options assigned to the Periodic Processing menu (such as Work with Periodic Processes) are listed. See Customizing Menus (WMNU) for information on assigning menus and menu options to menus. **Modern View options:** Menu options with a Type of Modern View are not available in Order Administration Classic View, and are not displayed if they are included in the current menu. Menu description: alphanumeric, 20 positions; optional. Menu option description: alphanumeric, 40 positions; optional.
Top Menu	Use this option to return to the Default menu from your user profile, as set up though Working with User Records (WUSR). See User Configuration in the Administration Guide for background.
Previous Menu	Use this option to return to the previously displayed menu.

Announcements

Purpose: Working with User Records (WUSR)), and any announcements that you have set up through the Working with Announcements (WANN) menu option.

For more information: See Working with Announcements (WANN) for a discussion, and see Menu Driver Screen for the location of the announcements, and links to other options available at the Menu Driver screen.

Company Logo

Purpose: This area of the menu screen displays the company logo, if one has been set up; otherwise, the Oracle default company logo displays if you have not set up a company logo.

See Setting Up Company Logos for Menu Screens and the Modern View Home Page for setup information, and see the Menu Driver Screen for the location of the company logo on the screen, and for links to other options available at the Menu Driver screen.

System Options

Purpose: The upper right area of the menu screen includes various system options and information.

The system options, described below, are available at many other screens throughout Order Administration.

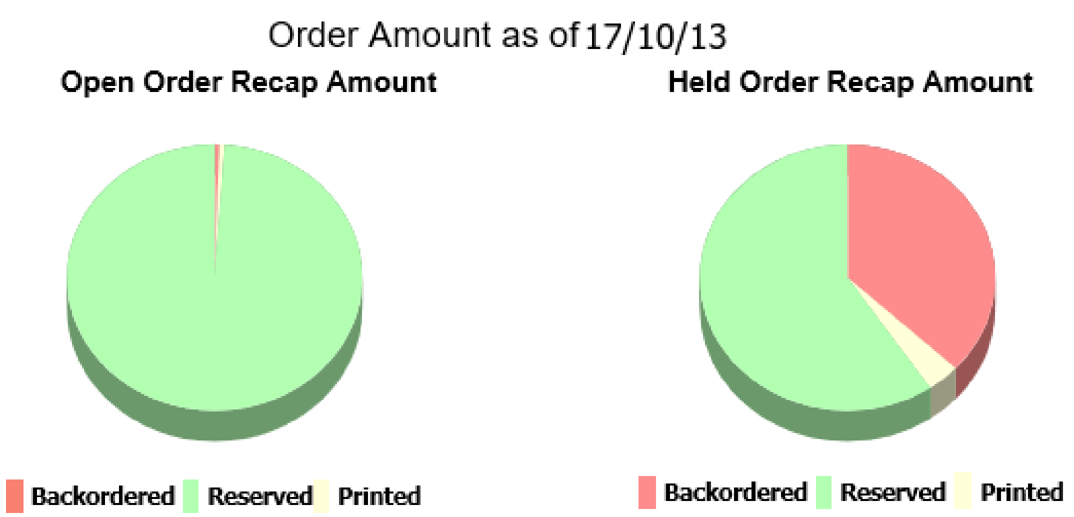
Option	Description
Modern View 	Select this option to advance to Modern View, including the Contact Center. This option is not available at all screens. For example, it is available at the menu screen and at the initial search screen in order inquiry, but not at any subsequent screens in order inquiry. **Retain company?** When you advance to Modern View, the currently selected company is retained. For example, if your default company is company 2 but you had previously selected company 1, when you advance to Modern View, company 1 is retained. However, if you select a different company in Modern View, when you return from Modern View to Order Administration Classic View, the company selected in Modern View is not retained. For example, if you were working in company 1 in Order Administration Classic View and then selected company 2 in Modern View, you return to company 1 in Order Administration Classic View. **Note:** If you do not have sufficient authority to review or work with orders, no customer or order search options are available. Contact your system administrator if this occurs.
Change Company 	Select this option to display the Select Company window, where you can select another company to work in. Your user profile controls the companies available for selection at this window; See User Configuration in the Administration Guide for more information. This option is not available at all screens. For example, it is available at the menu screen and at the initial search screen in order inquiry, but not at any subsequent screens in order inquiry.

Option	Description
My Docs	Select this option to advance to the Document Management (My Docs) screen.
My Jobs	Select this option to advance to the Job Management (My Jobs) screen.
My Forms	Select this option to advance to the Forms Management (My Forms) screen.
Help	Select this option to display the online help in a separate browser window. When you select this option from a menu screen, it displays the Contents page. **Trouble with online help**? If online help pages are slow to load or if the search function doesn't work correctly, try clearing the browser's cache or history.

For more information: See the Menu Driver Screen for the location of the system options, and links to other options available at the Menu Driver screen.

Open, Held Order Recap Amounts

Purpose: These pie charts on the menu screen provide a graphical "snapshot" of your open and held orders as of the last time the Batch Order Control (ORD_CONTRL) job ran on or since the displayed current date.



Operations Control totals: These totals are also available for review at the First Operations Control Summary Screen in the Reviewing Operations Control Summary (FLSH) menu option.

User authority to order totals: The Display Order Statistics and Recap (J03) secured feature controls whether a user sees these totals and the Order Statistics, a default company-specific image, or a blank area. See Setting Up Menu Driver Images for Companies for more information on setting up these images for users who do not have authority to view the open and held order totals.
Date displayed: The current date always displays in the user's date format.

Example: Today is August 27, and the charts display the Order Recap information from the First Operations Control Summary Screen as of the last time you ran the Batch Order Control job today. If the current time is 10:00 a.m. and you last ran the Batch Order Control job at 8:30 a.m., the charts display the totals from 8:30.

Updating the totals: If you use the Reviewing Operations Control Summary (FLSH) menu option to update current totals, the system submits the Batch Order Control job. Until this job has finished running, the totals will not be accurate. You can refresh (press F5) or review the job status at the Job Management (My Jobs) screen. There are also situations when the Batch Order Control job starts automatically; see Reviewing Operations Control Summary (FLSH) for an overview.

Totals mapping: Each of the totals that make up the pie charts is also listed on the bottom half of the First Operations Control Summary Screen:

- Open Order Recap Amount pie chart
  - Backordered = OBO (Open/backordered) amounts
  - Printed = Opn/Prt (Open/Printed) amounts
  - Reserved = Opn/Rsv (Open/reserved) amounts
- Held Order Recap Amount pie chart:
  - Backordered = HBO (Held/backordered) amounts
  - Printed = Hld/Prt (Held/printed) amounts
  - Reserved = Hld/Rsv (Held/reserved) amounts

For more information: See Reviewing Operations Control Summary (FLSH) for background on Order Control Summary processing, and see Menu Driver Screen for the location of the Open, Held Order Recap Amount pie charts, and links to other options available at the Menu Driver screen.

> **Note:**
>
> This area of the Home screen is blank when you select a company that does not yet have any existing orders.

Order Statistics

The setting of the FLASHPIECHARTS setting in Working with Customer Properties (PROP) defines the order statistics that display on the Menu Driver Screen.

- FLASHPIECHARTS = The order statistics section of the menu screen displays total numbers and amounts of orders created by the current date, current week, current month, year to date, and previous year. Use this setting if the Delay Billing Updates (K85) system control value is selected.

Order Stats	17/11/16		
Period	Number	Ordered Units	Amount
Today	0	0	0.00
This Week	0	0	0.00
This Month	0	0	0.00
Y.T.D	315	690	46,526.24
2016	86	141	2,062.42

- FLASHPIECHARTSFULL = The order statistics section of the menu screen displays total numbers and amounts of orders created and shipped by the current date, current week, current month, year to date, and previous year. Use this setting if the Delay Billing Updates (K85) system control value is unselected.

Order Stats	17/11/16			
	Ordered		Shipped	
Period	Number	Amount	Number	Amount
Today	7	4,764.14	0	0.00
This Week	70	122,397.86	0	0.00
This Month	102	159,222.07	19	5,541.54
Y.T.D	217	175,382.16	25	5,750.91
2016	108	20,620.85	31	7,465.33

User authority to order statistics: The Display Order Statistics and Recap (J03) secured feature controls whether a user sees these statistics and the Open, Held Order Recap Amounts, a default company-specific image, or a blank area. See Setting Up Menu Driver Images for Companies for more information on setting up these images for users who do not have authority to view order statistics.

Date displayed: The date always displays in the user's date format.
Continuous order updates: The background jobs update the totals displayed here throughout the day as you create and ship orders. This information corresponds to the Ord and Shp totals displayed on the top half of the First Operations Control Summary Screen in the Reviewing Operations Control Summary (FLSH) menu option. These totals do not include other types of order activity, such as cancels, returns, or selling out an existing order line.

Totals mapping: Each of the totals listed in the Order Statistics area is also listed on the top half of the First Operations Control Summary Screen:

- Ordered
  - Number = Ord (Orders) Orders
  - Amount = Ord (Orders) Amounts
- Shipped
  - Number = Shp (Shipped) Orders
  - Amount = Shp (Shipped) Amounts

See the First Operations Control Summary Screen for more information.

Calculation of time periods: The time periods listed in the Order Statistics area are calculated as follows:

Date	Description
Today	The current system date.
This week	The current week runs from Monday through Sunday, and the totals displayed include all days for this period. Week crosses months and years: The calculation of totals for This week occurs regardless of whether a new month starts during the week. Example: Today is Sunday June 3. The totals displayed under This week include Monday May 28 through the current date.
This month	The totals for the current month.
Y.T.D.	The totals year-to-date.
Previous year (field name varies depending on the current year)	The totals for the previous year.

For more information: See Reviewing Operations Control Summary (FLSH) for background on the calculation of these totals, and see Menu Driver Screen for the location of the Order Statistics and links to other options available at the Menu Driver screen. Also, see Sales Summary (DSSS) for a menu option you can use to review shipment totals by date, week, or month, including the current day's totals broken out by order type and entity.

Other Options

Purpose: These additional options are:

- Log Off: Use this option to exit Order Administration and display the login screen.
- My Profile: Use this option to advance to the User Control screen. From this screen, you can change other user control records if you have the proper authority. The My Profile option is not available if you are using Oracle Identity Cloud Service for password authentication.

9 Marketing

Setting Up Offer Information

Topics in this part: The following topics describe how to set up and change offer information:

- Introducing Offer and Source Codes provides an overview of the steps you need to follow and the basic information you need to set up an offer.
- Working with Offers (WOFR) describes how to create and change offer information, set up free gifts, freight charges, service charges, and discounts for an offer.
- Working with Season Codes (WSEA) describes how to create and change season information.
- Working with Promotions (WPRO) describes how to create and change promotion value information, which is used in Source Code reporting.
- Working with Source Categories (WSCT) describes how to create and change source categories, which are used for source code reporting.
- Working with Source Codes (WSRC) describes how to create and change source code information, review source code history, set up free gifts, freight charges, service charges, and discounts for a source code.
- Working with Dollar Chart by Offer (WDCO) describes how to establish dollar discounts by offer.
- Working with Dollar Chart by Source Code (WDCS) describes how to establish dollar discounts by source code.
- Initializing an Offer (MOFI) describes how to save and then delete order history for an offer, and transfer data from one offer to another.
- Working with Special Pricing by Source Code (WSPP) describes how to define special price breaks for multiple items and/or source code quickly.
- Generating Source Codes Using the Source Upload Table (WSRW) explains how to create an Order Administration source code using information from the Source Code Work file.

Working with Offers (WOFR)

Purpose: An offer represents the medium that you use to present merchandise to your customers, for example a catalog, space advertisement, television advertisement, or web site. Use Work with Offers to create and change offer information, define items as free gifts, and set up freight charges, service charges, and discounts for an offer.

Multiple currencies: You also must define a currency for the offer if you process orders in multiple currencies *(the Multi Currency by Offer (E03)* system control value is *selected*).

In this topic:

- *Work with Offers Screen*
- *Create Offer Screen*
- *Work with Offer Free Gifts Screen*
- *Work with Offer Dollar Discounts Screen*
- *Work with Linked Offers Screen*
  – *Linked Offers in Order Entry*
- *Copy Offer Freight Charges Window*

Work with Offers Screen

Purpose: Use this screen to work with information in existing offers or create a new offer.

How to display this screen: Enter *WOFR* in the Fast path field at the top of any menu or select Work with Offers from a menu.

Field	Description
Offer	The unique code that identifies the catalog, space, television advertisement or web site you use to accept orders. Alphanumeric, 3 positions; optional.
Description	The description of the offer. Alphanumeric, 30 positions; optional.
Type	The code that describes the type of offer. This is a user-defined code that is not validated against any table. Use offer type codes for reporting and analysis. Alphanumeric, 1 position; optional.
Begin (Begin date)	The first date when you can begin to accept orders for the offer. Numeric, 6 positions (in user date format); optional.
End (End date)	The last date that you can accept orders for the offer. Numeric, 6 positions (in user date format); optional.
Season	A code that represents a season to display offers; used for tracking and analysis. Alphanumeric, 3 positions; optional.

Screen Option	Procedure
Create an offer	Select *Create* to advance to the Create Offer Screen.

Screen Option	Procedure
Change an offer	Select *Change* for an offer to advance to the Change Offer screen. For field descriptions, see Create Offer Screen. You can change all of the information except the Offer code field.
Delete an offer	Select *Delete* for an offer to delete an offer. **Note:** You cannot delete an offer if there are any orders for this offer. You must use Initializing an Offer (MOFI).
Display an offer	Select *Display* for an offer to advance to the Display Offer screen. You cannot change any fields on this screen. For field descriptions, see Create Offer Screen.
Copy freight charges from one offer to another	Select *Copy freight charges* for an offer whose freight charges you want to copy to advance to the Copy Offer Freight Charges Window.
Define dollar discounts for an offer	Select *Dollar discount* for an offer to advance to the Work with Offer Dollar Discounts Screen.
Define items as free gifts for an offer	Select *Free Gifts* for an offer to advance to the Work with Offer Free Gifts Screen.
Define freight charges for an offer	Select *Freight Charges* for an offer to advance to the *Work with Dollar Chart by Offer Screen (Freight Charges)*.
Define a sub-offer for an offer	Select *Linked offers* for an offer to advance to the Work with Linked Offers Screen.
Define service charges for an offer	Select *Service Charges* for an offer to advance to the Work with Dollar Chart by Offer Screen (Service Charges).
Work with source codes for an offer	Select *Source Codes* for an offer to advance to the Work with Source Codes for Offer. This screen includes all the same options as the *Work with Source Codes Screen*, and also enables you to scan source codes for a particular offer rather than all source codes in your company. See the Work with Source Codes Screen for field descriptions and more information.
Define a user defined field	Select *User Field* for an offer to advance to the Work with User Fields screen. See Setting Up User-Defined Fields (WUDF).

Create Offer Screen

Purpose: Use this screen to create a new offer.

How to display this screen: Select *Create* on the Work with Offers Screen.

Field	Description
Offer	The unique code that identifies the catalog, space, television advertisement or web site you use to accept orders. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The description of this offer. Alphanumeric, 30 position; required.
Offer type	The code that describes the type of offer. This is a user-defined code that is not validated against any table. Use offer type codes for reporting and analysis. Alphanumeric, 1 position; required.
Offer date range	The start and end dates for the prices you define for this offer. Orders entered prior to the start date and after the end date will not use these prices. The system searches backwards by end date for the next most recent price and does not consider an offer with a start date greater than the order date. If the system can not find a price, it displays an invalid price message in Order Entry. If you process orders in multiple currencies, the system searches for a price only in offers with the same currency. See the *Currency of offer (when using multiple currency by offer)* field. Numeric 6 positions each (in user date format); required.
Currency of offer (when using alternate currency pricing)	The currency for orders you process for this offer when using alternate currency pricing. **Note:** Displayed only if the Use Alternate Currency Pricing (H89) system control value is *selected*. If you enter a currency code in this field, you must enter a conversion rate in the *Conversion rate (when using alternate currency pricing)* field or an error message indicates `Conversion rate required`. Leave this field blank if this offer is in your local currency (the currency code defined in the Local Currency Code (A55) system control value). When you enter a source code associated with this offer in order entry, the system searches for a price only among offers that share this currency. The currency and conversion rate used on an order are stored in the Order Header Extended table. Currency codes are defined in and validated against the Currency table; see Working with Currency (WCUR). See Using Alternate Currency Pricing for an overview and required setup. Alphanumeric, 3 positions; required if you enter a conversion rate.

Field	Description
Conversion rate (when using alternate currency pricing)	The rate at which the currency defined for the offer is converted to and from the local currency if you are using alternate currency pricing. **Note:** Displayed only if the Use Alternate Currency Pricing (H89) system control value is *selected*. If you enter a conversion rate in this field, you must enter a currency code in the Currency of offer (when using alternate currency pricing) field or an error message indicates `Offers require a currency when using multi-currency`. Leave this field blank if this offer is in your local currency (the currency code defined in the Local Currency Code (A55) system control value). The system multiplies the amount in the local currency by the conversion rate to determine the amount in the alternate currency. Likewise, the system divides the amount in the alternate currency by the conversion rate to determine the amount in the local currency. The local currency is the currency code defined in the Local Currency Code (A55) system control value. See Using Alternate Currency Pricing for an overview and required setup. Numeric, 13 positions with a 7-place decimal; required if you enter a currency of offer.
Season	The code that represents the season associated with this offer. Season codes are defined in and validated against the Season table. See *Working with Season Codes (WSEA)*. Season codes are used for reporting and analysis. Alphanumeric, 3 positions; optional.

Field	Description
Currency of offer (when using multiple currency by offer)	The currency for orders you process for this offer when using multiple currency by offer. **Note:** Displayed only if the *Multi Currency by Offer (E03)* system control value is *selected*. When you enter a source code associated with this offer in Order Entry, the system will search for a price only among offers that share this currency. Additionally, you cannot override the offer on an order detail line to one with a different currency. The currency used on an order is indicated by the bank code on various screens and reports, such as those having to do with refunds. This is because each currency must be associated with at least one unique bank. When you create a source code, you must specify a division which links to a bank code that is consistent with the currency of the offer. The currency code is defined in and validated against the Currency table. See *Working with Currency (WCUR).* Alphanumeric, 3 positions; required if it appears on the screen.
Conversion rate (when using multiple currency by offer)	The current conversion rate in effect for the currency, as specified in the Currency table. **Note:** Displayed only if the *Multi Currency by Offer (E03)* system control value is *selected*. The actual conversion rate displays only on the Change and Display Offer screens, once you have specified the currency for the offer. Numeric, 13 positions with a 7-place decimal; display-only.
Flat freight rate	The amount of freight charged to the customer on each order placed against this offer. The system uses this rate if the *Freight method* for the source code is set to *Flat Rt/Ship To*. Numeric, 13 positions with a 2-place decimal; optional.
Guaranteed order charge	The charge required to guarantee an order. If the Guaranteed Order Charge field in Order Entry is *selected*, the charge defined in this field will be added to the order as an additional charge. You can exclude the Guaranteed Order Charge at the source code level. See the *Excl serv chg (Exclude service charges)* field. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Additional charge code (for Guaranteed service charges)	If you defined a Guaranteed Order Charge in the previous field, you must enter a code in this field that identifies the type of charge. This code is validated against the Additional Charges Code table; see *Establishing Additional Charge Codes (WADC)*. Alphanumeric, 2 positions; required if Guaranteed order charge was entered.
Addl charge code (for Dollar chart charges)	A code that represents the type of additional charge on an order. The additional charge refers to a service charge, if you have set up a dollar chart through the *Work with Dollar Chart by Offer Screen (Service Charges)* screen or through *Working with Dollar Chart by Source Code (WDCS)*. This code is validated against the Additional Charges Code table; see *Establishing Additional Charge Codes (WADC)*. **Note:** The *Excl serv chg (Exclude service charges)* flag for the source code does not control whether to apply these service charges to an order. Alphanumeric, 2 positions; optional.
Date of 1st order	The date you process the first order for this offer. The system creates this record. Numeric, 6 positions (in user date format); display-only, defined by the system.
Default source	A source code the system defaults to an order. • If the Default Offer Source Code to Order Detail Line (G28) system control value is *selected*, the system defaults this source code to an order detail line when the offer on the detail line is not associated with the source code on the order header. • If the Default Unknown Source Code (I58) system control value contains a source code, the system defaults this source code to the order header if the original source code entered on the order matches the source code in this system control value. Additionally, if this system control value contains a source code, the system requires you to enter a default source for the offer. If you haven't created the source codes for the offer yet, you must enter a "dummy" source code until you create the actual default source code and then go back to the offer and enter the actual source code in the Default source field. Source codes are defined in and validated against the Source Code table. See Working with Source Codes (WSRC). Alphanumeric, 9 positions; required if the Default Unknown Source Code (I58) system control value contains a source code.

Work with Offer Free Gifts Screen

Purpose: Use this screen to define the items to add as free gifts to orders that amount to a required merchandise dollar total.

Free gifts applied when? In order entry, the system determines if the order is eligible for the free gift during repricing, the initial order accept, and the final order accept; if the order is eligible for the free gift, the system applies it to the order. See Applying Free Gifts.

Price override: The system uses the Default Price Override Reason (B35) system control value to add the free gift at no charge.

Things to note: The following factors influence how the system adds free gifts to the order:

- *Offer price or selling price?* To evaluate whether an order qualifies for a free gift, the system compares the total merchandise dollar value after applying any discounts or repricing (that is, the extended selling price of all items) with the $ required specified for the free gift.
- *Multiple gifts?*
- If the Allow multiple gifts flag is *selected*, the system adds the free gift defined for each dollar threshold met by the order total. For example, if a free gift is defined for an order total of $10.00, $15.00, and $20.00 and the customer orders $30.00 worth of merchandise, the system will add the free gifts for a $10.00, $15.00, and $20.00 order.
- If the Allow multiple gifts flag is *unselected*, the system adds the free gift defined for the highest dollar threshold met by the order total. For example, if a free gift is defined for an order total of $10.00, $15.00, and $20.00 and the customer orders $17.50 worth of merchandise, the system will add the free gift defined for a $20.00 order, because this is the highest level for which the order qualifies.
- *Source vs. offer free gifts:* You can also set up free gifts at the source code level using the *Work with Source Free Gifts Screen*; however, free gifts by source code override free gifts by offer. If an order would qualify for both the offer and source code free gifts, only the source code's free gift is added to the order.

How to display this screen: Select *Free Gifts* for an offer on the *Work with Offers Screen*.

Field	Description
Offer	The unique code and description for the catalog, space, television advertisement or web site from which you accept orders. Offer: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 30 positions; display-only.
Allow multiple gifts?	Indicates if a customer can receive more than one free gift on an order. • *Selected* = Apply more than one free gift on an order if the order qualifies. • *Unselected* = Apply only free gift with the highest dollar level for which the order qualifies.
$ Required	The merchandise dollar amount required on an order for the customer to be eligible for the free gift. You must enter a dollar amount of `$0.01` or higher. You cannot enter a negative amount. Numeric, 13 positions with a 2-place decimal; required.

Field	Description
Item	The item to add as a free gift. Alphanumeric, 12 positions; required.
Clr/Size/Wdth	If the specified item has SKUs, enter the SKU to add to qualifying orders. Alphanumeric, three 4-position fields; required if the item has SKUs.
Qty (Quantity)	The number of units of the free gift item to add to the order. Numeric, 5 positions; required.

Work with Offer Dollar Discounts Screen

Purpose: Use this screen to define standard and associate discounts for an offer.

Negative additional charge or prorate? If the Prorate Dollar Discounts and Coupons (D90)*Prorate Dollar Discounts and Coupons (D90)* system control value is *unselected*, the system adds these discounts to the order as a negative additional charge, or credit. If this system control value is *selected*, the dollar discount is applied on a pro-rata basis to each item on the order and is reflected in the selling price. This discount is calculated after all other discounts have been applied, and it is not related to the system's pricing hierarchy; it applies regardless of any other pricing method used.

Discount sale items? The *Exclude Sale Item When Prorating Discounts (I65)* system control value controls whether to include sale items in the pro-rata discount calculation. See that system control value for more information.

How to display this screen: On the *Work with Offers Screen*, select *Dollar discounts* for an offer.

Field	Description
Offer	The unique code and description for the catalog, space, television or web site advertisement from which you accept orders. Offer: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 3 position; display-only.
Merch amount	The merchandise total on the customer's order. When the merchandise total is equal to or greater than the dollar amount entered in this field, the customer is eligible for the standard and/or associate discount defined for this amount. When evaluating an order to see if it meets the required merchandise total, the system includes sale items (based on the setting of the Sale item flag for the Item Offer or the *Sale item* flag for the SKU Offer). The system does not include non-discountable items (based on the setting of the *Discountable* flag for the item). Numeric, 13 positions with a 2-place decimal; required.
Standard discount	The dollar amount to subtract from the customer's order when the merchandise total on the order is equal to or greater than the dollar amount entered in the *Merch amount* field. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Associate discount	The dollar amount to subtract from an associate customer's order when the merchandise total on the order is equal to or greater than the dollar amount entered in the *Merch amount* field. Customers are identified as associates in the Customer record; the Assoc field in Order Entry must be *selected* for this discount to be applied. Numeric, 13 positions with a 2-place decimal; optional.
Add'l code	A code that represents a type of additional charge on an order. The system uses this code only if the *Prorate Dollar Discounts and Coupons (D90)* system control value is *unselected*. In this case, the additional charge refers to a discount, or negative charge, applied against the order. This code is validated against the Additional Charges Code table; see *Establishing Additional Charge Codes (WADC)*. This table contains user-defined values to categorize the different types of charges that may be assessed or the discounts that may be applied against an order. If the *Prorate Dollar Discounts and Coupons (D90)* system control value is *selected*, the system does not use the additional charge code; instead, the discount amount is prorated against the order lines, as described in *Prorating Logic*. Alphanumeric, 2 positions; required if the *Prorate Dollar Discounts and Coupons (D90)* system control value is unselected.

To add: This screen displays in *Add* mode. The cursor is at the *Merch amount* field, so you can begin adding dollar discount information.

Each time you enter a dollar discount, the system arranges the dollar discounts in ascending order from the lowest to highest amounts.

To change: If any dollar discounts have been previously entered in this table, those discounts will display.

To change dollar discount information, select *Change* to switch to *Change* mode.

Place your cursor at the beginning of the field you wish to change. Erase the information and reenter it.

To delete: Select *Change* to switch to *Change* mode and display the discounts for this offer and select *Delete* for a dollar discount to delete it.

Work with Linked Offers Screen

Purpose: Use this screen to create, change, or delete one or more sub-offers for an offer.

Sub-offers for an offer allow you to analyze how certain pages in an offer perform from the rest of the offer. For example, you may want to create a sub-offer if the main offer contains insert pages, such as a section of items sold at a discounted price.

Linked Offers in Order Entry

When you add an item to an order, the system determines the price of the item using the following hierarchy:

- use the price defined for the item in the offer defined at the order detail line (the main offer).

- if a price has not been defined for the item in the main offer, the system uses the price defined for the item in the sub-offer associated with the main offer. If more than one active sub-offer is associated with the main offer, the system uses the first sub-offer in sequence number sequence.
- if a price has not been defined for the item in any sub-offers linked to the main offer, the system uses the price defined in the most current active offer.

How to display this screen: Select *Linked Offers* for an offer at the *Work with Offers Screen*.

Field	Description
Offer	The unique code and description for the catalog, space, or television advertisement from which you accept orders. Offer: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 30 position; display-only.
Linked offer	The code for the sub-offer associated with this offer. Alphanumeric, 3 positions; optional.
Sequence number	The sequence number determines the order in which the system looks at the sub-offers associated with this offer. Numeric, 3 positions; optional.
Description	The description of the sub-offer associated with this offer. Alphanumeric, 30 positions; display-only.

To create: Enter a valid offer code in the *Linked offer* field and a sequence number in the *Sequence number* field. The system displays the sub-offer you created on the bottom half of the screen.

An error message indicates if you enter an offer in the *Linked offer* field that is not a valid offer:

Offer not found.

An error message indicates if you enter a sequence number in the *Sequence number* field that is already associated with another sub-offer:

Sequence Number Already Exists.

To change: Select *Change* to make the *Sequence number* field enterable. You can only change the sequence number assigned to the sub-offer.

Screen Option	Procedure
Change between add mode and change mode	Select *Change*. The system toggles between making the *Sequence number* field enterable and display-only.

Copy Offer Freight Charges Window

Purpose: Use this window to copy the freight dollar chart charges from one offer to another.

How to display this window: Select *Copy freight charges* for an offer whose freight charges you want to copy. If the offer you select does not already have freight charges set up, the screen displays an error message. See *Work with Dollar Chart by Offer Screen (Freight Charges)* for information on how to set up and work with freight charges for an offer.

Completing this screen: Enter the code representing the offer to which you would like to copy the freight charges. Select *OK* at the Confirm prompt.

If the target offer already has freight charges set up, the system displays an error message:

Offer already has freight charges defined.

Working with Season Codes (WSEA)

Purpose: A season code represents a season, such as winter 2006. You use season codes to group offers together for reporting or querying. For example, you can group offers associated with the season code "spring 2006" in order to review how profitable the offers are for that specific year.

Season codes assigned to offers are also used when you define shipping date restrictions for weather-sensitive items such as plant stock. For example, the spring start date for shipping bare root plants would be different from the fall start date for shipping bare root plants. See *Shipping Zone Reservation Overview*, for more information on setting up shipping zone restrictions for weather-sensitive items.

You assign season codes to an offer in *Working with Offers (WOFR)*.

In this topic:

- *Work with Seasons Screen*
- *Create Season Screen*

Work with Seasons Screen

Purpose: Use the Work with Seasons screen to create, change, delete and display season codes.

How to display this screen: Enter *WSEA* in the Fast path field at the top of any menu or select Work with Seasons at a menu.

Field	Description
Season	A code that represents a season, such as WIN (winter). Alphanumeric, 3 positions; optional.
Description	The description of the season code. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a new code	Select *Create* to advance to the *Create Season Screen*.
Change a season code	Select *Change* for a season code to advance to the Change Season screen. At this screen you can change any information but the season code. For field descriptions, see *Create Season Screen*.

Screen Option	Procedure
Delete a season code	Select *Delete* for a season code to delete it. **Note:** You cannot delete a code if it is assigned to an offer. A message similar to the following displays informing you that season is assigned to a catalog: `Season (AUT AUTUMN) cannot be deleted - currently referenced by a catalog.`
Display a season code	Select *Display* for a season code to advance to the Display Season screen. You cannot change any information on this screen. For field descriptions, see *Create Season Screen*.

Create Season Screen

Purpose: Use this screen to create new season codes.

How to display this screen: At the *Work with Seasons Screen*, select **Create**.

Field	Description
Season	A code used to represent a season. You can assign a season to an offer through Work with Offers. Season codes assigned to offers are a required value for defining shipping date restrictions for weather-sensitive items such as plant stock. See *Shipping Zone Reservation Overview*. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The description of the season code. Alphanumeric, 30 positions; required.
Start date	The date you specify as the beginning of the season. The season start date can be used in order entry to control reservation of weather-sensitive items, which you designate by assigning zone reservation codes to the items. Zone reservation coded items ordered before the Start date for their season will be taken as future orders. See Shipping Zone Reservation Overview. Numeric, 6 positions, in user date format; optional.
End date	The date you specify as the end of the season. This date is informational only. Numeric, 6 positions, in user date format; optional.

Working with Promotions (WPRO)

Purpose: Use the Work with Promotion Values function to create and change promotions for reporting, analysis, discounting, or messages in order entry.

Note that these settings are not used when integration to Oracle Retail Promotion Engine (ORPE) is enabled (SCV M77).

A promotion code can perform either or both of the following functions:

- *Messaging:* Set up messages to appear in a pop-up window in order entry for orders using a source code assigned to a promotion.
- *Discounting:* You can use a promotion to:
- discount merchandise (percentage, prorated discount, or price override)
- apply a negative additional charge
- add free gifts
- discount freight
- discount additional freight
- override the ship via on an order

Available order criteria include:

- date range
- source code or offer
- total merchandise value on the order or within an item category or price code
- total order quantity or quantity within an item category or price code
- ship via priority
- ship-to country or SCF
- pay type
- first-time customers only
- customer group or specific customer

Additionally, you can use promotions for source code reporting and analysis purposes.

Promotion analysis report: You can use the Promotion Analysis Report to evaluate the promotions active within a range of dates, or a specific promotion. See Print Order Promotion Analysis Report (POPA) for more information.

In this topic:

- About Messaging Promotions
- About Discount Promotions
  - BOGO (Buy One/Get One) Discount or Free Gift by Item Category or Item
  - BOGO (Buy One/Get One) Discount or Free Gift by Price Code
  - Item Category Discount
  - Order Discount

Not in this topic: This topic does not describe promotional pricing. For more information on these menu options, see:

- Work with Promotional Pricing Groups (WPRG)
- Work with Promotional Pricing (WPRP)

Working with Source Categories (WSCT)

Purpose: You can use the Work with Source Categories function to create and change source categories. A source category identifies a grouping of names that points to a source code, for example, buyers, recipients, etc. You can use the source category assigned to the source code on the order as a criterion for pick slip generation.

You use the *Working with Source Codes (WSRC)* function to assign a category to a source.

In this topic:

- Work with Source Code Categories Screen
- Create Source Category Screen

Work with Source Code Categories Screen

How to display this screen: Enter *WSCT* in the Fast path field at the top of any menu or select this option from a menu.

Field	Description
Cat (Category)	Allows you to enter the code for the source category. Alphanumeric, 2 positions; optional.
Description	The description of the source category. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a source category	Select *Create* to advance to the *Create Source Category Screen*.
Change a source category	Select *Change* for a category to advance to the Change Source Category screen. For field descriptions, see *Create Source Category Screen.* You can only change the Description field on this screen.
Delete a source category	Select *Delete* for a category to delete it.
Display a source category	Select *Display* for a category to advance to the Display Source Category screen. You cannot change any fields on this screen. For field descriptions, see Create Source Category Screen.

Create Source Category Screen

To create: To create a source category, select *Create* at the *Work with Source Code Categories Screen*.

Field	Description
Source Category	The unique code that identifies the source category. Source categories are used to group names for a particular source code. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	A description of the source category. Alphanumeric, 30 positions; required.

Working with Source Codes (WSRC)

Purpose: You can use Work with Source Codes to create and change source code information, review source code history, set up free gifts, freight charges, service charges, and discounts for a source code.

Source codes are unique codes used to identify segments of your customer base or a rented list. Each source code is assigned to one offer and one division. Source codes control the freight and pricing method used on an order.

Other common uses of the source code include:

- Identifying the customer's geographic location at the time of an order
- Segmenting lists by source, previous buyers, market test cases, and so on.

Every order must have an identifying source code. These codes are essential to analyzing sales and determining the effectiveness of a particular advertisement or offer. Using source codes you can, for example:

- Analyze market trends
- Track success of offers
- Segment customer bases by criteria you define
- Test an alternate freight or pricing method

Track orders you receive through the ChannelAdvisor integration; see ChannelAdvisor Integration Overview.

Download to web storefront: Use the Downloading E-Commerce Offer Files (EOFR) menu option to select source codes for download; only source codes related to a selected offer are extracted. The extracted file includes company, source code, description, discount percent, and offer.

In this topic:

- *Work with Source Dollar Discounts Screen*
  - *Adding, Changing, and Deleting Dollar Discounts*
- *Copy Source Code Freight Charges Window*

Work with Source Codes Screen

Purpose: Use this screen to work with all existing source codes in your company.

> **Note:**
>
> To review all source codes for a particular offer, use the Source Codes option in *Working with Offers (WOFR)* to advance to the Work with Source Codes for Offer screen. This screen includes all the same options as the Work with Source Codes screen.

How to display this screen: Enter *WSRC* in the Fast path field at the top of any menu or select Work with Source Codes from a menu.

Field	Description
Source	A unique, user-defined code to identify a segment of your customer base and to analyze sales. The source code drives marketing, pricing, freight, and service charge information on an order. Alphanumeric, 9 positions; optional.
Description	The description of the source code. Alphanumeric, 30 positions; optional.
Division	A unique code for a profit center or area of financial reporting. Alphanumeric, 2 positions; optional.
Promotion	A code representing a way of grouping source codes for reporting and marketing purposes. You can also set up a promotion to: • display a pop-up message in order entry; • apply a merchandise, freight item category, BOGO (Buy One/Get One), or additional freight discount to eligible orders; • override the ship via on an order. Depending on your setup, the promotion you enter here might be automatically assigned to orders using the source code. See *Working with Promotions (WPRO)* for more information on setting up promotions and how the system determines whether to apply a promotion discount to an order. Alphanumeric, 7 positions; optional.

Field	Description
Offer	A code for a catalog, space, or television advertisement from which you accept orders. **Note:** To review all source codes for a particular offer, use the Source Codes option in *Working with Offers (WOFR)* to advance to the Work with Source Codes for Offer screen. This screen includes all the same options as the *Work with Source Codes Screen*. Alphanumeric, 3 positions; display-only.

Screen Option	Procedure
Create a source code	Select *Create* to advance to the *Create Source Code Screen (1 of 2)*.
Change a source code	Select *Change* for a source code to advance to the Change Source Code screens. For field descriptions, see *Create Source Code Screen (1 of 2)*. You can change any field on this screen except the source code.
Delete a source code	Select *Delete* for a source code to delete it. You can also delete a source code using *Initializing an Offer (MOFI)*. **Note:** You cannot delete a source code if there are open orders on the system with this source code.
Display a source code	Select *Display* for a source code to advance to the Display Source Code screens. You cannot change any fields on this screen. For field descriptions, see *Create Source Code Screen (1 of 2)*.
Define special pricing by source code	Select *Special pricing* for a source code to advance to the *Work with Special Source Price Screen*.
Define items as free gifts for a source code	Select *Free gifts* for a source code to advance to the *Work with Source Free Gifts Screen*.
Review sales history by source code	Select *History* for a source code to advance to the *Source Code History Screen*.
Define freight charges for a source code	Select *Freight charges* for a source code to advance to the *Work with Dollar Chart by Source Screen (Freight Charges)*.
Define service charges for a source code	Select *Service charges* for a source code to advance to the *Work with Dollar Chart by Source Screen (Service Charges)*.
Define dollar discounts for a source code	Select *Dollar discount* for a source code to advance to the *Work with Source Dollar Discounts Screen*.

Screen Option	Procedure
Copy freight charges from one source code to another	Select *Copy freight charges* for a source code whose freight charges you want to copy to advance to the *Copy Source Code Freight Charges Window*.
Work with user defined fields	Select *User field* for a source code to advance to the Work with User Fields Screen.

Create Source Code Screen (1 of 2)

Purpose: Use this screen to begin creation of a source code.

How to display this screen: Select *Create* on the *Work with Source Codes Screen*.

Field	Description
Source code	A unique, user-defined code to identify a segment of your customer base and to analyze sales. The source code drives marketing, pricing, freight, and service charge information on an order. Alphanumeric, 7 positions. Create screen: required. Change screen: display-only.
Description	The description of this source code. Alphanumeric, 30 positions; required.
Division	A unique code for a profit center or area of financial reporting. Division codes are defined in and validated against the Division table; see Working with Divisions (WDIV). Alphanumeric, 2 positions; required.
Offer	The code for the catalog, space, or television advertisement from which you accept orders. Offers are defined in and validated against the Offer table; see Working with Offers (WOFR). **Note:** If the Multi Currency by Offer (E03) system control value is set to *Y*, the system confirms that the division and the offer you select for a source code both point to the same currency. Alphanumeric, 3 positions; required.
Category	A code to categorize your source codes, such as buyers, recipients, or rented names. Source code categories are defined in and validated against the Source Code Category table. See Working with Source Categories (WSCT). Alphanumeric, 2 positions; optional.

Field	Description
Type	A code that specifies whether this source code should be used in the source code profit analysis calculations.

Valid values are:

1. *Known*
2. *Do not analyze*
3. *Unknown*

To total the sales on the Source Code Profit Analysis report, the system first calculates the percentage of the total sales for each type *K* source code. Sales for the type *U* source codes are then divided based on these percentages and added proportionately to the type *K* source codes. Type *N* (unknown) sales are not added.

The chart below illustrates how sales are calculated.

Source code	Type	Dollar	Percent
Raw Data:			
ABC100	K	300.000	33.000
ABC200	K	600.000	67.000
Subtotal sales	K	900.000	
ABC300	U	150	--
ABC400	U	150.000	--
ABC500	U	300.000	--
Subtotal sales	U	600.000	--
ABC600	N	175.000	--
Subtotal sales	N	175.000	--
Reported Data:			
ABC100	K	500.000	33.000
ABC200	K	1000.000	67.000
Total sales	K	1500.000	

In the table above, the sales for all type *K* source codes is 900.00. The percentage of total sales is 33% from source code ABC100 and 67% from source code ABC200.

The total sales for type *U* source codes is $600.00. 33% of type *U* sales ($200.00) is added to the sales from source code ABC100. 67% ($400.00) is added to the sales from source code ABC200.

The reported sales for sales from ABC100 becomes $500.00.

The reported sales from ABC200 becomes $1000.00.

The total type *K* reported sales becomes $1500.00.

Alphanumeric, 1 position; required.

Field	Description
Price method	A code that determines how the system prices items on orders using this source code. Valid values are: • *Use Item Cost* • *Regular Plus Reprice* • *No Charge* • *No Charge/No Cost* • *Regular Hierarchy* Each source code pricing method is described briefly below: **Use Item Cost** This pricing method uses the item's cost from the SKU table. Typically, this method is used for source codes established for employee sales or internal transfers of merchandise from warehouses to stores. This pricing method overrides any other pricing method. The item's cost is the price your company paid for the product. **Regular Plus Reprice** This is a header-level pricing method that uses the pricing hierarchy defined in the System Control table to determine the price on a line. When the price has been calculated, the system will reprice the line using any header-level discounts that may be in effect, such as Volume Discount Pricing. See Setting Up Order Entry Values. **No Charge** This pricing method indicates that items on orders with this source code will be given to the customer at “no charge,” but the cost of the item will be tracked to calculate the gross profit margin. For example, this pricing method may be used for source codes created to track external sales from stock liquidations.

Field	Description
	No Charge/No Cost This method indicates that items on orders with this source code will be given to the customer at no charge and the item cost will not be tracked. For example, this pricing method may be used for source codes created to track internal transfers of stock. **Reg Hierarchy** This is a line-level pricing method that uses the pricing hierarchy established in the System Control table to determine the item price. When the Best Way Pricing (A78) system control value is set to *N*, the system uses the first price it finds in the pricing hierarchy for the item. When this system control value is set to *Y*, the system searches through each level in the pricing hierarchy, finds a price at each level, and uses the best price for the item. **If You Do Not Use Repricing** If you do not use repricing during order entry, set the Price method for your source codes to *Regular Hierarchy* so that the system does not reprice the order. An error message displays if you select *Reprice* during order entry: `Repricing is not valid with current source price method`. By setting the Price method to *Regular Hierarchy*, you can eliminate repricing processing during order entry and improve order entry performance. Required.
Discount % (Discount percentage)	A discount for orders assigned to this source code. This discount does not apply to orders with a *Use Item Cost*, *No Charge*, or *No Charge/No Cost* pricing method, or to order lines with a price override reason code applied. This discount is applied in addition to any discounts resulting from other pricing methods. The discount is calculated during Order Entry or Order Maintenance. This discount applies only to items with a *Y* in the Discountable field in the Item or SKU table. Numeric, 5 positions with a 2-place decimal; optional.
Freight method	A code that determines how freight charges will be calculated for this source code. Order-level and line-level freight methods are below. See Freight Charges for a description of each freight method and set up instructions.

Order Methods	Line Methods
Dollar chart by offer	Flat rate by item
Dollar chart by source	Flat rate by quantity
Actual billing amount	Flat rate by item/source
Flat rate by ship-to	Item
Percentage by source	Weight
Percentage by ship via	State Shipping Matrix
Recipient	
By Offer Price	
By Order Weight	

Field	Description
	Order-level freight methods: *Dollar chart by offer* (*$ Chart by Ofr*): Allows you to charge freight based on the dollar amount of the merchandise ordered for each shipping address on an order. The dollar tier levels and the corresponding freight charges are defined for each offer. See Dollar chart by offer ($ Chart by Ofr) Freight for more information. *Dollar chart by source* (*$ Chart by Src*): Allows you to charge freight or service charges based on the dollar amount of the merchandise ordered for each shipping address on an order. The dollar tier levels and the corresponding freight or service charges are defined for each source code. See *Dollar chart by offer ($ Chart by Ofr) Freight* for more information. *Actual billing amount* (*Actual Bill Amt*): Uses the total weight of all the items on the order and the shipper to determine the actual freight charge during Confirmation or Billing. See Actual billing amount (Actual Bill Amt) freight for more information. *Flat rate by ship-to (Flat Rt/Ship To)*: Uses the flat freight fee defined for the source code *Flat freight rate* field) for the source code. See Flat rate by ship-to (Flat Rt/Ship To) freight for more information. *Percentage by source* (*% Source*): Multiplies the merchandise amount of the order by the percentage in the Freight% field for the source code. See *Percentage by source(%Source freight* for more information. *Percentage by ship via* (*% Ship Via*): Multiplies the merchandise amount of the order by the percentage in the Freight Percent field in the Ship Via table. See *Percentage by ship via ($ shipVia) freight* for more information. *Recipient*: Calculates freight by dollar based on the merchandise total of the order including all recipient orders. The Maximum number of ship to's field defined for the source code is checked. If the number of recipients on the order is less than or equal to this value, the Dollar Chart by Offer will determine the freight fee, based on the merchandise total. Once the maximum number of recipient orders is reached, the system includes a flat amount with the freight amount for each additional recipient order. See *Recipient freight* for more information. *Freight by offer price (By Offer Price):* Uses the Dollar Chart by Offer to calculate freight, based on the total merchandise value of the order. For this freight method, the merchandise value is calculated by adding the extended single-unit offer price for each item/SKU, disregarding any discounts, associate pricing, price overrides, quantity break pricing, etc. See *By Offer Price freight* for more information. *Freight by order weight (Order Weight):* This freight method is based on the total weight of the order and the number of cartons required to ship the order. See *Freight by order weight (Order Weight) freight* for more information.

Field	Description
	Line-level Freight Methods: *Flat rate by item* (*Flat Rt/Item*): Allows you to charge one freight amount per item, regardless of the quantity ordered of the item. The *Freight* is defined for each item in the associated Item Offer (default) or SKU Offer table. The freight total represents the accumulation of each item's flat freight fee. See *Flat rate by item (Flat Rt/Item) freight* for more information. *Flat rate by quantity* (*Flat Rt/Qty*): Allows you to charge a flat rate for a certain number of units ordered and add an additional charge for each unit thereafter. See *Flat rate by quantity (Flat Rt/Qty) freight* for more information. *Flat rate by item source* (*Flat Rt/Itm Src*): Uses a flat freight charge for each unit ordered multiplied by the number of units ordered. See *Flat rate by item source (Flat Rt/Itm Src) freight* for more information. *Item* (*By Item*): Uses the freight charge defined in the Item Offer record, multiplied by the quantity ordered. See *Item (By Item) freight* for more information. *Weight*: Uses the weight of each item (defined in the Item or SKU table) and the rate for the shipper. The weight of the item is multiplied by the quantity ordered to calculate the total weight for the order line. In order to determine the freight charge, the system references the associated rate chart for each line, based on the total weight and delivery zone. See *Weight freight* for more information. Required.
Flat amt (Flat amount)	A flat fee for freight, used in the following freight methods: • Flat Rate/Ship To (*F*) • Flat Rate/Quantity (*FQ*) • Flat Rate/Item Source (*FS*) • Recipient (*R*) Each freight method is described briefly below (see *Freight method* for more details): *Flat Rate/Ship To (F)*: This method uses the value in the Flat amt field in the Source Code table if any; otherwise, uses the flat fee defined for the Offer. The charge defined in the Flat amt field is used as the freight fee for orders assigned to this source code. *Flat Rate/Quantity (FQ)*: This method uses the Flat amt as the freight fee for a certain number of units on the order, and then an additional charge is added for each unit thereafter. *Flat Rate/Item Source (FS)*: This method uses the Flat amt multiplied by the quantity ordered. *Recipient (R):* This method includes the Flat amt in the freight bucket for any recipient added to an order that exceeds the number in the *Max shp tos-frt (Maximum ship to's, freight)* field. See *Recipient freight* for an example. Numeric, 13 positions with a 2 place decimal; optional.

Field	Description
Freight % (Freight percentage)	A percentage used to calculate freight on an order, based on the total merchandise amount on the order. Used in the Percentage by Source (PS) freight method. This method also considers the values in the Frt min and Frt max fields in the Source Code table. The system will limit the freight fee to the minimum or maximum amount you define if the results of the freight calculation exceed these values. **Note:** If the Include Handling in Freight Charge Calculation (D77) system control value is *selected*, the system will also include handling along with merchandise in the freight charge calculation. Numeric, 5 positions with a 2-place decimal; optional.
Secondary frt (Secondary freight)	Used in the Flat Rate/Quantity (*FQ*) freight method, in which you charge a flat rate for a certain number of units ordered and an additional charge for each unit thereafter. The calculation is: `Flat amt + ((Qty ord - Up to Frt qty) * Secondary frt)` The Flat amt and Up to frt qty fields are defined in the Source Code table. The secondary freight fee is added for each unit above the amount in the Up to frt qty field. Numeric, 13 positions with a 2-place decimal; optional.
Frt min (Freight minimum)	Used in the Percentage/Source (*PS*) freight method, in which the merchandise total is multiplied by the value in the Freight % field. **Note:** If the Include *Handling in Freight Charge Calculation (D77)* system control value is set to *Y*, the system will also include handling along with merchandise in the freight charge calculation. The system uses the freight charge in the Frt min field if the result of this calculation is less than the value in the Frt min field. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Frt max (Freight maximum)	Used in the Percentage/Source (*PS*) freight method, in which the total merchandise amount on the order is multiplied by the value in the Freight % field. The system will use the freight charge in the Frt max field if the result of this calculation is greater than the value in the Frt max field. **Note:** If the *Include Handling in Freight Charge Calculation (D77)*system control value is set to *Y*, the system will also include handling along with merchandise in the freight charge calculation. Numeric, 13 positions with a 2-place decimal; optional.
Up to frt qty (Up to freight quantity)	Used in the Flat Rate/Quantity (*FQ*) freight method. This method enables you to charge a flat rate for a certain number of units ordered and add an additional charge for each unit thereafter. The calculation is: `Flat amt + ((Qty ord - Up to Frt Qty) * Secondary frt)` The values in the Flat amt, Up to frt qty and Secondary frt fields are defined in this table. The secondary freight fee will be included in this calculation when the quantity ordered exceeds the value in the Up to frt qty field. Numeric, 5 positions; optional.
Max shp tos-frt (Maximum ship to's, freight)	Used in the Recipient (*R*) freight method, which uses *Working with Dollar Chart by Offer (WDCO)* to determine the freight fee, based on the total merchandise dollars on the buyer's order. • If the number of recipients on the order is less than or equal to the value in the Max ship to's - frt field, the dollar chart freight fee will be used as the freight charge on the order. • For any recipient added to an order that exceeds the number in this field, the system includes the Flat amt in the freight bucket along with the dollar chart freight fee. **Note:** If the *Include Handling in Freight Charge Calculation (D77)* system control value is *Y*, the system will also include handling along with merchandise in the freight charge calculation. See *Recipient freight* for an example. Numeric, 3 positions; optional.

Field	Description
Freight table	Defines the freight table to use when using the freight by order weight (*OW*) freight method. See Working with Weight Tables for Order Weight (WFTB) for more information on working with freight tables. Alphanumeric, 3 positions; required if using freight by order weight.
Mail date	The date the offer was mailed to this list. You can enter this date manually. Numeric, 6 positions; optional.
House acct code (House account code)	Specifies whether this list was generated from your company's own “house” list or from a broker's rented list. Valid values are: • *House Account* • *In House* Optional.
Mktg proj (Marketing projection)	The total projected amount of responses (sales) for this source code. User-defined and informational only. Numeric, 13 positions with a 2 place decimal; optional.
Proj names (Projected names)	The broker's projected number of names that will be generated from this source code. Informational only. Numeric, 5 positions; optional.
Reqs mailed (Requests mailed)	The total number of catalog requests mailed to this source code. The system updates this field when you select the Catalog Request Printing option. Numeric, 7 positions; optional.
Net circ (Net circulation)	The number of names rented or generated for the mailing, after duplicate names have been removed. The calculation is: `Gross circulation - Duplicate names` Numeric, 7 positions; optional.
List source	Not currently implemented. Alphanumeric, 7 positions; optional.
List cost	The cost to purchase this list from the broker. Informational only. Numeric, 13 positions with a 2-place decimal; optional.
Gross circ (Gross circulation)	The total number of names rented or generated for the mailing, including duplicate names. Informational only. Numeric, 7 positions; optional.
B/E amount (Break even amount)	A value that allows you to analyze the cost of an offer. The calculation is: `Break even amount / Net circulation = Cost per offer` Numeric, 13 positions with a 2-place decimal; optional.
List broker	The code for this list broker who provided the list of names. This code is used for source codes assigned to rented lists and is informational only. Numeric, 3 positions; optional.

Field	Description
Drop code	The number assigned to the catalog mailing to this list of customers. Drop codes are assigned to each mailing; some customers may be included in several drops of the same catalog, to spread out circulation and encourage purchases. Alphanumeric, 2 positions; optional.
Promo code (Promotional code)	A code to group source codes together. In the hierarchy of the system, Promotion Codes fit between Source Codes and Offers. Reporting can be performed at the Promotion Code level. You can also set up a promotion to: • display a pop-up message in order entry; • apply a merchandise, freight item category, BOGO (Buy One/Get One), or additional freight discount to eligible orders; • override the ship via on an order. A pop-up message you specify for the promotion displays in order entry only if you enter the promotion code here. Also, if an order is qualified for more than one promotion of a certain type, the promotion code you enter here takes first priority. If you enter a promotion code in this field the Exclude promotion field must be *unselected* or an error message indicates: `Promotion not allowed with Exclude promotions set to Y`. See *Working with Promotions (WPRO)*. Alphanumeric, 7 positions; optional.
Cover code	A code for the catalog cover mailed to this source code (group of names). Alphanumeric, 2 position; optional.
B/O priority (Backorder priority)	Determines the backorder priority to default to orders with this source code, where: • *9* = highest priority • *0* = lowest priority The Evaluate Backorders program runs in the background and matches available inventory (received through P.O. Receiving, Inventory Transactions, or any process that increases the on-hand quantity of an item) to backorders. The backorder priority defined at the source code level does not affect Immediate Reservation. See Working with the EBO_ASYNC Job for more information on the Evaluate Backorders function. Numeric, 1 position, optional.

Field	Description
Flex pay code (Flexible payment code)	Represents a deferred or installment flexible payment option for orders with this source code. An error message similar to the following indicates if you enter a code in this field and also enter *Y* in the Exclude FPO field: `Flexible Payment Option and Exclude FPO both cannot be entered.` Flexible payment codes are defined in and validated against the Flexible Payment Option table. See Working with Flexible Payment Options (WFPO) for more information on deferred and installment payment plans. Alphanumeric, 5 positions; optional.
Con/Bus (Consumer/ Business)	Used in list segmentation that identifies the targets of the list as consumers or businesses. Informational only. Valid values are: • *Consumer* • *Business* Optional.
Price table	Represents a table containing repricing and premium information for orders with this source code. Price table codes are defined in and validated against the Price Table table. See *Working with Price Tables (WPTB)*. Alphanumeric, 5 positions; optional.
Display on O/E (Display in Order Entry)	Determines whether this source code appears when you prompt on the Source field during Order Entry/Maintenance or when entering a catalog request. Valid values are: • *selected* = The source code displays in the Select Source pop-up window • *unselected* = (default): The source code does not display in the Select Source pop-up window
Promo pricing (Promotional pricing)	Indicates whether orders for this source code are eligible for any of the promotional pricing methods, which define bonus items or discounts based on the order, the dollar amount of the order, the items ordered from the same price group, or specific items ordered. Promotional pricing is controlled by the order type used on the order. In the Order Type table you can suppress promotional pricing windows from appearing, for example, when entering mail or fax orders. See *Setting Up Pricing Information*. • *selected* = An order with this source code is eligible for promotional pricing. • *unselected* = An order with this source code is not eligible for promotional pricing.

Field	Description
Restricted	Restricts the use of a source code. Restricting a source code prevents it from being assigned to an order. This restriction is useful for identifying source codes you no longer use, but cannot delete since there are still open orders outstanding. Set to *N* when the source code is created. During Offer Initialization, you have the option to restrict all sources codes associated with a particular offer; the source codes you restrict are not copied to the offer being initialized. See *Initializing an Offer (MOFI)*. Valid values are: • *selected* = This source code cannot be used. • *unselected* = (default): This source code can be used.
Excl FPO (Exclude flexible payment option)	Determines whether the source code is excluded from deferred and installment payment plans. Valid values are: • *selected* = Exclude this source code from deferred and installment payment plans. If an order contains a source code that is excluded from deferred and installment payment plans, the entire order is excluded from the payment plan. An error message similar to the following indicates if you try to assign a payment plan to an order containing a source code that is excluded from a payment plan: `Order is not eligible for deferred/ installment billing plan.` • *unselected* = Do not exclude this item from deferred and installment payment plans. An error message similar to the following indicates if you do not select this field and also enter a code in the Flexible payment code field: `Flexible Payment Option and Exclude FPO both cannot be entered.` See Deferred/Installment Billing Overview for more information on deferred and installment payment plans.
Excl serv chg (Exclude service charges)	Indicates whether any service charges by ship via or guaranteed service charges by offer can be added to orders. • *selected* = Add ship via service charges and guaranteed service charge by offer to orders with this source code. • *unselected* = Do not add ship via service charges or guaranteed service charge by offer to orders with this source code. See Working with Ship Via Codes (WVIA) for information on establishing a service charge dollar chart for a shipper, and see *Working with Offers (WOFR)* for information on setting up a guaranteed service charge by offer. **Note:** This field does not control whether to add service charges by offer that you set up through a dollar chart.

Field	Description
Excl promotion (Exclude promotion)	Indicates if this source code is excluded from any promotions you create using the *Work with Promotions (WPRO)* menu option. You may want to exclude a source code from promotions if you want to establish a promotion by offer, but exclude certain source codes. Valid values: • *selected* = Exclude this source code from promotions. • *unselected* (default) = Include this source code in promotions if the source code qualifies. If you select this field, you cannot enter a promotion code in the Promotion code field or an error message indicates: `Promotion not allowed with Exclude promotions set to Y.` If you select this field, you receive an error message if you enter this source code in the Qualifying source field on the *Create Promotion Screen* or Change Promotion Screen: `Source code flagged to exclude promotions.` **Note:** You can only exclude promotions created using the Work with Promotion Values menu option. This field does not apply to promotions created using the Work with Promotional Pricing (WPRP) menu option. See *Working with Promotions (WPRO)* for more information on setting up promotions.
Pop up wind msgs (Pop up window messages #1 - #4)	Use these fields to enter messages that display in Order Entry automatically for orders using this source code. You may enter up to 4 short messages for this source code. Pop-up window messages appear in Order Entry only if the order type allows promotional pricing windows. For example, you can suppress messages from displaying when entering mail or fax orders. If you set up promotional windows, using options on the Pricing menu, these source code-related windows appear before the promotional pricing windows. If you set up customer informational windows in the Customer table, these windows appear before the source code windows. Alphanumeric, 30 positions each line; optional.

Create Source Code Screen (2 of 2)

How to display this screen: Select *OK* on the *Create Source Code Screen (1 of 2)*.

Field	Description
Source code	Displays the new source code, which is used to identify a segment of your customer base and analyze sales. The source code drives marketing, pricing, freight, and service charge information on an order. Alphanumeric, 9 positions; display-only.
% net fill (Percent net fill)	The percent of goods actually shipped for this source code, after cancels and returns. Numeric, 5 positions with a 2-place decimal; optional.
% margin (Percent margin)	The profit margin for this source code, expressed as a percentage. The calculation is: `Retail price - Cost of goods sold` Numeric, 5 positions with a 2-place decimal; optional.
Cost per order	The operations expense associated with taking an order for this source code. Numeric, 13 positions with a 2-place decimal; optional.
Recency code	Not currently implemented. Alphanumeric, 4 positions; optional.
Variable ad expense (Variable advertising expense)	The cost of producing and mailing a catalog. Numeric, 13 positions with a 2-place decimal; optional.
User def % fld (User defined percentage field)	A field for you to enter a percentage for your own usage, such as for entry of a commission rate for the source code. You can use this field for reporting or querying purposes. Numeric, 5 positions with a 2-place decimal; optional.
Warranty required	Defines whether the system displays the Customer Warranty Information screen in order entry and order maintenance. The Customer Warranty Information screen is used to enter warranty information for a warranty product on the order. See Working with Customer Warranty Information (WCST). Valid values are: • *selected* = The system displays the Customer Warranty Information screen in order entry and order maintenance. • *unselected* = The system does not display the Customer Warranty Information screen in order entry and order maintenance.
Employee discount	Defines whether this source code is used for employee orders. Informational only. • *selected* = The source code is used for employee orders. • *unselected* = The source code is not used for employee orders.

Field	Description
Bypass credit check	Indicates whether orders containing this source code bypass the credit check process. Valid values are: • *selected* = Orders containing this source code bypass credit check. The system writes a message to order transaction history indicating that credit checking was bypassed. • Note: Orders that bypass credit checking are still eligible for credit card authorization. • *unselected* = Orders containing this source code do not bypass credit check. If a user does not have authority to the Maintenance of Bypass Credit Check Field in Source Code File (A87) secured feature, an error message similar to the following indicates if the user tries to change the value defined in this field: Unauthorized to change Credit Check flag.
User fields 1-6	Six extra fields for you to enter additional information about this source code. You can use these fields for reporting or querying purposes. Alphanumeric, 30 positions; optional.

Work with Special Source Price Screen

Purpose: Use this screen to define special pricing for an item that is ordered from this source code. The system applies the item discount automatically when the customer orders an item in the required quantity from this source code. You can define discounted prices for regular customers and associate customers. No pop-up window appears in Order Entry to inform the customer of this discount; however, the system updates the order line with **Special Source Price* as the pricing method.

> **Note:**
>
> To enter multiple item special prices by source code, you can also use *Working with Special Pricing by Source Code (WSPP)*.

Uploading special source prices from an external system: You can also upload special source price records from an external system; see *Work with Pricing Upload (WPUP)* for an overview.

Related system control values:

- If the Perform Source Pricing Validation (D62) system control value is *selected* and there are any source special pricing records set up for the source code on the order header, the system prevents you from adding any items to the order if they are not included in the special source pricing.
- The Pricing Values (B31) system control value controls the order in which the system evaluates pricing options for the order, based on the priority assigned to the Special by Source Sequence # (A82) system control value.

How to display this screen: At the Work with Source Codes Screen, select *Special pricing* for a source code.

Field	Description
Item	An item that is eligible for special source pricing. Alphanumeric, 12 positions; optional.
Qty (Quantity)	The quantity of the item that must be purchased to receive the special price. Numeric, 5 positions; optional.
Price	The price at which the item will be sold if quantity and source code requirements are met Numeric, 13 positions with a 2-place decimal; optional.
Assoc price (Associate price)	The price at which the item will be sold to associate customers if quantity and source code requirements are met. Numeric, 13 positions with a 2-place decimal; optional.
Tax inclusive price	The price at which the item will be sold to customers if the order is subject to VAT and if the quantity and source code requirements are met. Displayed only if the Tax Included in Price (E70) system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.
Tax-inclusive associate price	The price at which the item will be sold to associate customers if the order is subject to VAT and if the quantity and source code requirements are met. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Create an item special price by source record	Select *Create* to advance to the *Create Special Source Price Screen*.
Change an item special price by source record	Select *Change* for an item to advance to the Change Special Source Price screen. For field descriptions, see *Create Special Source Price Screen*. You can change only the price fields.
Delete an item special price by source record	Select *Delete* for an item to delete special source pricing.
Display an item special price by source record	Select *Display* for an item to advance to the Change Special Source Price screen. You cannot change any fields on this screen. For field descriptions, see *Create Special Source Price Screen*.

Create Special Source Price Screen

Purpose: Use this screen to create a special source price for a source code.

How to display this screen: Select *Create* at the *Work with Special Source Price Screen*.

Field	Description
Source	A unique user-defined code assigned to a group of customer names that make up a mailing list for an offer or advertisement. Alphanumeric, 9 positions; display-only.

Field	Description
Item	A code that represents a unit of inventory. Item codes are defined in and validated against the Item table. **Note:** If this item has SKUs, the prices defined here will apply to all SKUs associated with this item. Alphanumeric, 12 positions. Create screen: required. Change screen: display-only.
Quantity	The quantity of the item that the customer must purchase to receive this price break. Numeric, 5 positions. Create screen: required. Change screen: display-only.
Price	The selling price of the item when an order meets the defined source code and quantity requirements. This price applies to all SKUs of the item on the order. Numeric, 13 positions with a 2-place decimal; required.
Tax inclusive price	The selling price of the item when an order meets the defined source code and quantity requirements and the order is subject to VAT. This price applies to all SKUs of the item on the order. Displayed only if the Tax Included in Price (E70)system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.
Assoc price (Associate price)	The selling price of this item when an order meets the defined source code and quantity requirements and the customer is an associate. Customers are eligible for associate price breaks if they are identified as associate customers in the Customer table and if Assoc = *Selected* in Order Entry. Numeric, 13 positions with a 2-place decimal; optional.
Tax inclusive associate price	The selling price of this item when an order meets the defined source code and quantity requirements, the customer is an associate, and the order is subject to VAT. Customers are eligible for associate price breaks if they are identified as associate customers in the Customer table and if Assoc = *Selected* in Order Entry. Displayed only if the *Tax Included in Price (E70)*system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Work with Source Free Gifts Screen

Free gifts applied when? In order entry, the system determines if the order is eligible for the free gift during repricing, the initial order accept, and the final order accept; if the order is eligible for the free gift, the system applies it to the order. See Applying Free Gifts.

Price override: The system uses the Default Price Override Reason (B35) system control value to add the free gift at no charge.

Things to note: The following factors influence how the system adds free gifts to the order:

- *Offer price or selling price?* To evaluate whether an order qualifies for a free gift, the system compares the total merchandise dollar value after applying any discounts or repricing (that is, the extended selling price of all items) with the $ required specified for the free gift.
- *Multiple gifts?*
  - If the Allow multiple gifts flag is *selected*, the system adds the free gift defined for each dollar threshold met by the order total. For example, if a free gift is defined for an order total of $10.00, $15.00, and $20.00 and the customer orders $30.00 worth of merchandise, the system will add the free gifts for a $10.00, $15.00, and $20.00 order.
  - If the Allow multiple gifts flag is *unselected*, the system adds the free gift defined for the highest dollar threshold met by the order total. For example, if a free gift is defined for an order total of $10.00, $15.00, and $20.00 and the customer orders $17.50 worth of merchandise, the system will add the free gift defined for a $20.00 order, because this is the highest level for which the order qualifies.
- *Source vs. offer free gifts:* You can also set up free gifts at the offer level using the *Work with Offer Free Gifts Screen*; however, free gifts by source code override free gifts by offer. If an order would qualify for both the offer and source code free gifts, only the source code's free gift is added to the order.

How to display this screen: Select *Free gifts* for a source code at the *Work with Source Codes Screen.*

Field	Description
Source code	The unique user-defined code for the source and description of the source code. (Source) Alphanumeric, 9 positions; display-only. (Description) Alphanumeric, 30 positions; display-only.
Allow multi gifts? (Allow multiple gifts?)	Indicates if a customer can receive more than one free gift on an order. • *Selected* = Apply more than one free gift on an order if the order qualifies. • *Unselected* = Apply only free gift with the highest dollar level for which the order qualifies.
$ Required (Dollars required)	The merchandise dollar amount required on an order for the customer to be eligible for the free gift. You must enter a dollar amount of `$0.01` or higher. You cannot enter a negative amount. Numeric, 13 positions with a 2-place decimal; required.
Item	The item to add as a free gift. Alphanumeric, 12 positions; required.
SKU (Stock keeping unit)	If the specified item has SKUs, enter the SKU to add to qualifying orders. Alphanumeric, three 4-position fields; required if the item has SKUs.

Field	Description
Qty (Quantity)	The number of units of the free gift item to add to the order. Numeric, 5 positions; required.

Source Code History Screen

Purpose: Use this screen to review life-to-date totals for orders, sales, cancellations, returns, exchanges, and soldouts with this source code, and to review life-to-date averages for dollars per book and average order value. The fields on this screen are updated by the system; you cannot change any of these fields.

How to display this screen: On the *Work with Source Codes Screen,* selecting *History* for a source code. You can also advance to this screen by selecting *History* on the *Change Source Code screen.*

Field	Description
Source code	A code used to identify a segment of your customer base. Alphanumeric, 9 positions; display-only.
First order date	The date the first order was placed against this source code. Numeric, 6 positions (in user date format); display-only.
Last order date	The date of the most recent order for this source code. Numeric, 6 positions (in user date format); display-only.
Response % (Response percentage)	The percentage of response from this source code. If you have received orders from this source code, the calculation is: `Orders / Net circulation` If you have not received orders from this source code, the calculation is: `# of catalog requests mailed / Net circulation` The net circulation value in both calculations is described in the next field. Numeric, 5 positions with a 2 place decimal; display-only.
Net circulation	The number of names rented from another company or generated from your own customer base (house list) for the catalog mailing, after duplicate names have been removed. This total includes customers who received catalogs because they requested them. The calculation is: `Gross circulation - Duplicate names` Numeric, 7 positions; display-only.

Field	Description
Requests mailed	The total number of responses by this source code to an offer. The Catalog Request Print program updates this field when you use ***PCAT*** *Processing Catalog Requests (PCAT).* This number reflects the total number of requests rather than the number of copies; for example, if a customer requests 3 copies of a catalog, the system increases the Requests mailed by 1, not 3. When you reset the Printed flag at the Change Catalog Request Screen in order to reprint the catalog request label, the system decreases this total. When you reprint the label, the system increases this total again. Numeric, 7 positions; display-only.
Dollars per book	Average value of orders per catalog distributed. The calculation is: `Total dollar value of orders / Net Circulation` Numeric, 20 positions with a 2-place decimal; display-only.
Avg $ ordered (Average dollars ordered)	The average value of an order. The calculation is: `Total dollars for orders/ Total orders` Numeric, 20 positions with a 2-place decimal; display-only.
These fields contain life-to-date totals:	
Orders # (Number of orders)	The total number of orders for this source code, including orders which include only sold out items or non-inventory items. This total does not include: • batch orders that have not yet been accepted. Once the batch has been accepted, the system updates the total number of orders by the number of orders in the batch for this source code. • returns processed by negative quantities in order entry. • order lines added to an existing order through order maintenance, regardless of the setting of the Update Demand for Order Maintenance Transactions (C72) system control value. If an order includes more than one ship-to address, the entire order is considered one order. For example, an order with two ship to addresses updates the number of orders total by 1. If the source code on all order detail lines is overridden to a different source code than the one on the order header, the orders are included in the total number of orders for the detail-level source code. Numeric, 7 positions; display-only.

Field	Description
Orders $ (Order dollars)	The total amount of all items ordered for this source code, including: • the merchandise dollar total of soldout items or non-inventory items. • the merchandise dollars for items added to an exiting order through order maintenance if the *Update Demand for Order Maintenance Transactions (C72)* system control value is *selected*. This total does not include: • merchandise dollars for items returned during order entry. • merchandise dollars for batch orders that have not yet been accepted. • merchandise dollars for items added to an existing order through order maintenance if the *Update Demand for Order Maintenance Transactions (C72*) system control value is *unselected*. If the source code on all order detail lines is overridden to a different source code than the one on the order header, the order dollars are included in the total for the detail-level source code. Numeric, 20 positions with a 2-place decimal; display-only.
Sales # (Number of sales)	The number of shipments for this source code, including: • shipments confirmed; the system updates the number of sales for each confirmed shipment. • non-inventory items confirmed during billing. • orders that are expressed billed. This total is not decreased by returns or exchanges. Numeric, 7 positions; display-only.
Sales $ (Sales dollars)	The merchandise total of shipped items for this source code, including: • shipments confirmed; the system updates the dollar total as each confirmed shipment. • non-inventory items confirmed during billing. • dollars on orders that are expressed billed. This total does not include dollars for returns processed in order entry. Numeric, 20 positions with a 2-place decimal; display-only.
Cancels # (Number of cancellations)	The number of orders cancelled (orders in *Cancelled* status; all order lines have been cancelled) for this source code. **Note:** The system only increments this number for orders cancelled with a cancel reason code whose Reduce demand field is *unselected*. Numeric, 7 positions; display-only.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Cancels $ (Dollars canceled)</td><td>The merchandise total of orders cancelled (orders in Cancelled status; all order lines have been cancelled) for this source code.

Note:
The system only increments this number for orders cancelled with a cancel reason code whose Reduce demand field is unselected.

Numeric, 20 positions with a 2-place decimal; display-only.</td></tr>
<tr><td>Returns # (Number of returns)</td><td>The total number of return transactions processed and credited for this source code.
You can enter a return in:
• order entry (via negative quantity ordered)
• order maintenance
• Work with Return Authorizations (this total increases only when you process the credit)
This total includes simple returns only, as opposed to exchanges.
Numeric, 7 positions; display-only.</td></tr>
<tr><td>Returns $ (Return dollars)</td><td>The merchandise total of return transactions processed and credited for this source code.
You can enter a return in:
• order entry (via negative quantity ordered)
• order maintenance
• Work with Return Authorizations (this total increases only when you process the credit)
This total includes simple returns only, as opposed to exchanges.
Numeric, 20 positions with a 2-place decimal; display-only.</td></tr>
<tr><td>Exchanges # (Number of exchanges)</td><td>The total number of exchange transactions processed for this source code.
You can enter an exchange in:
• order maintenance
• Work with Return Authorizations (this total increases only when you process the credit)
Numeric, 7 positions; display-only.</td></tr>
<tr><td>Exchanges $ (Exchange dollars)</td><td>The merchandise total of returned items on exchange transactions processed for this source code.
You can enter an exchange in:
• order maintenance
• Work with Return Authorizations (this total increases only when you process the credit)
Numeric, 20 positions with a 2-place decimal; display-only.</td></tr>
</table>

Field	Description
Soldouts # (Number of soldouts)	The total number of items sold out for this source code. The total number of soldout orders, including orders for which all order lines are soldout, or at least one order line is soldout and all other order lines have been cancelled using any cancel reason code. This does not include order lines that are sold out if other order lines exist on the order that are not sold out or cancelled. The system considers an order line sold out if you process soldout order lines in order entry, order maintenance, or the Processing Auto Soldout Cancellations (MASO) menu option. Numeric, 7 positions; display-only.
Soldouts $ (Soldout dollars)	The merchandise total of items sold out for this source code. The system considers an order line sold out if you process soldout order lines in order entry, order maintenance, or the Processing Auto Soldout Cancellations (MASO) menu option. Numeric, 20 positions with a 2-place decimal; display-only.

Work with Source Dollar Discounts Screen

Purpose: Use the Work with Source Dollar Discounts screen to define standard and associate discounts for a source code.

Negative additional charge or prorate? If the Prorate Dollar Discounts and Coupons (D90) system control value is *unselected*, these discounts are added to the order as an additional charge, or credit. If this system control value is *selected*, the dollar discount is applied on a pro-rata basis to each item on the order and is reflected in the selling price. This discount will be determined after all other discounts have been applied; it applies regardless of the Pricing method defined in the Source Code table.

Applied when? In order entry, the system determines if the order is eligible for the source dollar discount during repricing, the initial order accept, and the final order accept; if the order is eligible for the source dollar discount, the system applies it to the order.

Discount sale items? The Exclude Sale Item When Prorating Discounts (I65) system control value controls whether to include sale items in the pro-rata discount calculation. See that system control value for more information.

How to display this screen: At the *Work with Source Codes Screen,* select *Dollar discounts* for the source code you want to work with.

Field	Description
Source	The code and description for a segment of your customer base to whom you mail an offer. (Source) Alphanumeric, 9 positions; display- only. (Description) Alphanumeric, 30 positions; display-only.

Field	Description
Merch amount (Merchandise amount)	The merchandise dollar amount required to be eligible for the discount. When evaluating an order to see if it meets the required merchandise total, the system includes sale items (based on the setting of the Sale item flag for the Item Offer or the *Sale item* flag for the SKU Offer) but does not include non-discountable items (based on the setting of the Discountable flag for the item). Numeric, 13 positions with a 2-place decimal; required.
Standard discount	The dollar amount of the discount subtracted from the merchandise total on the order if the order is eligible for the source discount. Numeric, 13 positions with a 2-place decimal; optional.
Associate discount	The dollar amount of the discount subtracted from the merchandise total on the order if: • the order is eligible for the source discount, and • the customer is identified as an associate customer (Associate = *Selected* in the Customer table) Numeric, 13 positions with a 2-place decimal; optional.
Add'l code (Additional charge code)	A code that identifies why the discount was applied to the order. The system uses this code only if the Prorate Dollar Discounts and Coupons (D90) system control value is *unselected*. Additional charge codes are defined in and is validated against the Additional Charges Code table; see Establishing Additional Charge Codes (WADC). This table contains codes to categorize the different types of charges or credits that may be added to an order. If the *Prorate Dollar Discounts and Coupons (D90)* system control value is *selected*, the system does not use the additional charge code; instead, the discount amount is prorated against the order lines, as described in Prorating Logic. Alphanumeric, 2 positions; required if the *Prorate Dollar Discounts and Coupons (D90)* system control value is unselected.

Adding, Changing, and Deleting Dollar Discounts

To add: Initially, this screen displays in *Add* mode with the cursor in the Merch amount field.

A pop-up window appears automatically if you add a dollar discount without entering an additional charge code and the Prorate Dollar Discounts and Coupons (D90) system control value is *unselected*. *Select* the appropriate additional charge code, such as *D* = Dollar Discount.

To change: Any existing dollar discounts for this source code display on the screen in *Change* mode. To update a dollar discount or to review these records, select *Change* to switch to Change mode.

To delete: Select *Change* to switch to *Change* mode and display the discounts for this source code and select *Delete* for a dollar discount to delete it.

Copy Source Code Freight Charges Window

Purpose: Use this window to copy the freight dollar chart charges from one source code to another.

How to display this window: Select *Copy freight charges* for a source code whose freight charges you want to copy. The source code you select must have freight charges already set up, and the *Freight method* for the source code must be *$ Chart by Src*, or the system displays the following message:

Freight method is not Dollar Chart.

See *Work with Dollar Chart by Source Screen (Freight Charges)* for information on how to set up and work with freight charges for a source code.

Completing this screen: Enter the source code to which you would like to copy the freight charges. The source code you enter must also have a freight method of *$ Chart by Src*, or the system displays the following message:

Freight method is not Dollar Chart.

Also, if the target source code already has freight charges defined, the system displays the following message:

Source already has freight charges defined.

Select *OK* at the Confirm prompt to complete the copy.

Working with Dollar Chart by Offer (WDCO)

Purpose: You can use the Work with Dollar Chart by Offer function to establish freight or service charges by offer.

Service charges are additional charges that are added to an order if the merchandise amount on the order is equal to or exceeds an amount specified in this table. Service charges can also be defined at the source code level.

You can also define freight and service charges for an offer using *Working with Offers (WOFR)*.

> **Note:**
>
> - If you plan to set up service charges, you should complete the *Addl charge code (for Dollar chart charges)* in the Offer table.
> - The *Excl serv chg (Exclude service charges)* flag for the source code does not control whether to apply service charges you set up through these screens to orders.

In this topic:

- *First Work with Dollar Chart by Offer Screen (Select Offer and Type)*
- *Work with Dollar Chart by Offer Screen (Freight Charges)*
- *Create Dollar Chart by Offer Screen (Freight Charges)*
- *Work with Dollar Chart by Offer Screen (Service Charges)*
- *Create Dollar Chart by Offer Screen (Service Charges)*

First Work with Dollar Chart by Offer Screen (Select Offer and Type)

How to display this screen: Enter *WDCO* in the Fast path field on a menu or select this option from a menu.

Field	Description
Offer	Enter the code for the offer for which you want to set up a freight or service charge. An offer is a code that identifies the catalog, space, or television advertisement from which you accept orders. Offers are defined in and validated against the Offer table; see *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
Freight or service	Enter *F* if you want to set up a freight charge for this offer, or Enter *S* if you want to set up a service charge for this offer. Alphanumeric, 1 position; required.

Completing this screen: Complete the Offer field and enter either *F* or *S* in the Freight or service field.

- If you enter *F*, you advance to the Work with Dollar Chart by Offer Screen (Freight Charges).
- If you enter *S*, you advance to the Work with Dollar Chart by Offer Screen (Service Charges).

Work with Dollar Chart by Offer Screen (Freight Charges)

Purpose: Use this screen to work with freight charges for this offer. The screens and fields you use to work with freight and service dollar charts are nearly identical.

How to display this screen: Complete the *First Work with Dollar Chart by Offer Screen (Select Offer and Type)*. You can also display this screen by selecting *Freight charges* for an offer on the *Work with Offers Screen*.

Field	Description
Offer	The unique code and description for the catalog, space, television advertisement or web site from which you accept orders. Offer: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 3 positions; display-only.
Dollar amount	The total dollar amount on the customer's order that is subject to freight charges. This amount includes all merchandise on the order; if the ***SETTING UP ORDER ENTRY VALUES*** *Include Handling in Freight Charge Calculation (D77)* system control value is *selected*, then handling is also included. When this total is equal to or greater than the dollar amount defined here, the system applies the freight charge from the *Freight charge* field, the *Pct (Percentage)* field, or the *Maximum charge* field to the customer's order. You can define a dollar amount where the system stops charging freight by entering a $0.00 freight charge in the *Freight charge* or *Pct (Percentage)* fields. This is helpful if you wish to stop charging freight when a customer reaches a certain merchandise level on the order. Numeric, 13 positions with a 2-place decimal; optional.
Freight charge	The flat dollar amount of freight to apply to a customer's order when the order total subject to freight is equal to or greater than the amount from the *Dollars (amount)* field. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Pct (Percentage)	The percentage of freight to charge when the order total subject to freight is equal to or greater than the amount from the *Dollars (amount)* field. Numeric, 5 positions with a 2-place decimal; optional.
Maximum charge	The maximum dollar amount of freight that can be charged, regardless of the result of the freight calculation. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Create a dollar chart	Select *Create* to advance to the *Create Dollar Chart by Offer Screen (Freight Charges)*.
Change a dollar chart	Select *Change* for a dollar chart to advance to the Change Dollar Chart by Offer screen. See *Create Dollar Chart by Offer Screen (Freight Charges)* for field descriptions. You can change all of the information except the Offer code field.
Delete a dollar chart	Select *Delete* for a dollar chart to delete it.
Display a dollar chart	Select *Display* for a dollar chart to advance to the Display Dollar Chart by Offer screen. You cannot change any fields on this screen. For field descriptions, see *Create Dollar Chart by Offer Screen (Freight Charges)*.

Create Dollar Chart by Offer Screen (Freight Charges)

Purpose: Use this screen to create a freight dollar chart for an offer.

How to display this screen: Select *Create* on the *Work with Dollar Chart by Offer Screen (Freight Charges)*.

Field	Description
Offer	The unique code and description for the catalog, space or television advertisement or web site from which you accept orders. See *Working with Offers (WOFR)*. Offer: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 3 positions; display-only.

Field	Description
Dollars (amount)	The dollar amount on the customer's order that is subject to freight. This amount includes the merchandise total; it also includes any handling charges on the order if the Include *Handling in Freight Charge Calculation (D77)* system control value is *selected*. When the total amount subject to freight on an order is equal to or greater than the dollar amount you define here, the system applies the freight charge defined in the *Freight amount* field, the *Freight percent* field, or the *Maximum freight amount* field to the customer's order. You can define a dollar amount where the system stops charging freight by entering a $0.00 freight charge in the *Freight amount* or *Freight percent* fields. This is helpful if you wish to stop charging freight when a customer reaches a certain merchandise level on the order. Numeric, 13 positions with a 2-place decimal. Create screen: required. Change screen: display-only.
Freight amount	Enter the freight charge to apply to a customer's order when the order total subject to freight is equal to or greater than the amount from the *Dollars (amount)* field. *Example:* If you enter 100.00 in the *Dollars (amount)* field, and 4.95 in the *Freight amount* field, the system adds $4.95 to the order as freight when the total amount subject to freight is $100.00 or less. Numeric, 13 positions with a 2-place decimal; optional.
Freight percent	Enter the percentage to use to calculate freight. The system multiplies this percentage by the total amount on the order subject to freight. *Example:* If you enter 50.00 in the *Dollars (amount)* field, and 5.00 in the *Freight percent* field, the system applies $2.50 to the order as freight when the total amount subject to freight is $50.00 or less. Numeric, 5 positions with a 2-place decimal; optional.
Maximum freight amount	The maximum dollar amount of freight to charged, regardless of the result of the freight calculation. You need to complete this field only if you are calculating freight by percentage (if you have entered a percentage in the Pct field.) Numeric, 13 positions with a 2-place decimal; optional.

Work with Dollar Chart by Offer Screen (Service Charges)

Purpose: Use this screen to work with service charges for this offer. The screens and fields you use to work with freight and service dollar charts are nearly identical.

How to display this screen: Complete the *First Work with Dollar Chart by Offer Screen (Select Offer and Type)*. You can also advance to this screen by selecting *Service charges* for an offer at the *Work with Offers Screen*.

Field	Description
Offer	The unique code and description for the catalog, space, or television advertisement from which you accept orders. Offer: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 3 positions; display-only.
Dollar amount	The merchandise dollar amount on the customer's order. When the merchandise total is equal to or greater than the dollar amount you enter, the system applies service charge defined in the *Service amount* field, the *Service percent* field, or the *Maximum service amount* field to the customer's order. You can define a dollar amount where the system stops charging a service charge by entering a $0.00 service charge in the *Service amount* or *Service percent* fields. This is helpful if you wish to stop charging a service charge when a customer reaches a certain merchandise level on the order. Numeric, 13 positions with a 2-place decimal; optional.
Service charge	The flat dollar amount of service to apply to a customer's order when the merchandise dollar amount on the order is equal to or greater than the amount defined in the *Dollars (amount)* field. Numeric, 13 positions with a 2-place decimal; optional.
Pct (Percentage)	The percentage of the merchandise total to apply to a customer's order as service charge when the merchandise dollar amount on the order is equal to or greater than the amount defined in the *Dollars (amount)* field. Numeric, 5 positions with a 2-place decimal; optional.
Maximum charge	The maximum dollar amount of service charge to add to an order, regardless of the result of the freight calculation. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Create an offer	Select *Create* to advance to the *Create Dollar Chart by Offer Screen (Service Charges)*.
Change an offer	Select *Change* for a dollar chart to advance to the Change Dollar Chart by Offer screen. For field descriptions, see *Create Dollar Chart by Offer Screen (Service Charges)*. You can change all of the information except the Offer code field.
Delete an offer	Select *Delete* for a dollar chart to delete it.
Display an offer	Select *Display* for a dollar chart to advance to the Display Dollar Chart by Offer screen. You cannot change any fields on this screen. For field descriptions, see *Create Dollar Chart by Offer Screen (Service Charges)*.

Create Dollar Chart by Offer Screen (Service Charges)

Purpose: Use this screen to create a service dollar chart for an offer.

How to display this screen: Select *Create* at the *Work with Dollar Chart by Offer Screen (Service Charges)*.

This screen requires that you define a service charge by entering a dollar amount in the *Service amount* field or a percentage in the *Service percent* field, which the system will calculate on the merchandise total. Optionally, you can enter a maximum charge to as a cap, if the percentage you define results in a dollar amount that is greater than the maximum charge.

Field	Description
Offer	The unique code and description for the catalog, space, or television advertisement from which you accept orders. See *Working with Offers (WOFR)*. Offer: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 3 positions; display-only.
Dollars (amount)	The merchandise dollar amount of the customer's order. When the merchandise total is equal to or greater than the dollar amount you enter, the system applies the service charge defined in the *Service amount* field, the *Service percent* field, or the *Maximum service amount* field to the customer's order. *Example:* If the merchandise total is between and including .01 and 30.99, the customer will be charged 2.95. If the merchandise total is between and including 51.00 and 90.99, the charge will be 5.95. If the merchandise total is 200.00 or over, the charge will be 5 percent of the merchandise total, but not greater than 30.00. You can define a dollar amount where the system stops charging a service charge by entering a $0.00 service charge in the *Service amount* or *Service percent* fields. This is helpful if you wish to stop charging a service charge when a customer reaches a certain merchandise level on the order. Numeric, 13 positions with a 2-place decimal. Create screen: required. Change screen: display-only.
Service amount	The flat dollar amount of the service charge to apply to a customer's order when the merchandise amount on the order is equal to or greater than the amount defined in the *Dollars (amount)* field. Numeric, 13 positions with a 2-place decimal; required if you did not define a percentage in the Pct field.
Service percent	The percentage of the merchandise total to apply to a customer's order as a service charge when the merchandise dollar amount on the order is equal to or greater than the amount defined in the *Dollars (amount)* field. Numeric, 5 positions with a 2-place decimal; required if you did not define a dollar amount in the Service charge field.
Maximum service amount	The maximum dollar amount of the service charge to apply, regardless of the result of the service charge calculation. You need to complete this field only if you are calculating service charges on the merchandise dollar amount by percentage (if you have entered a percentage in the *Service percent* field.) Numeric, 13 positions with a 2-place decimal; required.

Working with Dollar Chart by Source Code (WDCS)

Purpose: Use the Work with Dollar Chart by Source Code function to establish and exclude freight or service charges by source code.

Service charges are additional charges that are added to an order if the merchandise amount on the order is equal to or greater than an amount specified in this table.

You can also define freight and service charges for a source using the Work with Source Code menu option; see *Working with Source Codes (WSRC)*.

> **Note:**
>
> If you plan to establish service charges, you should complete the *Addl charge code (for Dollar chart charges)* in the Offer table.

In this topic:

- *First Work with Dollar Chart by Source Screen (Select Source and Type)*
- *Work with Dollar Chart by Source Screen (Freight Charges)*
- *Create Dollar Chart by Source Screen (Freight Charges)*
- *Work with Dollar Chart by Source Screen (Service Charges)*
- *Create Dollar Chart by Source Screen (Service Charge)*

First Work with Dollar Chart by Source Screen (Select Source and Type)

How to display this screen: Select the Work with Dollar Chart by Source option from a menu or enter *WDCS* in the Fast path field at the top of any menu.

Field	Description
Source	A code to identify a segment of your customer base. Alphanumeric, 9 positions; required.
Freight or service	Indicates the type of dollar chart for the source code. Valid values are: *Freight* = Set up freight charges for the source code *Service* = Set up service charges for the source code Required.

Completing this screen: Complete the Source field and enter *F* or *S* in the Freight or service field. If you select *Freight*, you advance to the *Work with Dollar Chart by Source Screen (Freight Charges)*. If you select *Service*, you advance to the *Work with Dollar Chart by Source Screen (Service Charges)*.

Work with Dollar Chart by Source Screen (Freight Charges)

Purpose: Use this screen to define freight charges for this source code. The system uses this table if the Freight method defined for the source code is *$ Chart by Src*.

How to display this screen: Complete the *First Work with Dollar Chart by Source Screen (Select Source and Type)* or select *Freight charges* for a source code on the *Work with Source Codes Screen*. The following message displays if you have not defined a freight method at the source code level:

```
Freight method is not Dollar Chart.
```

Field	Description
Dollar amount	The dollar amount for the dollar chart. If the merchandise total for on order is less than or equal to this dollar amount, the system applies the Freight charge or the Percentage associated with this dollar amount. **Note:** If the [Include Handling in Freight Charge Calculation (D77)](#) system control value is *selected*, the system will also include handling along with merchandise in the freight charge calculation. Numeric, 13 positions with a 2-place decimal; optional.
Freight charge	The shipping charge associated with the Dollar amount. Numeric, 13 positions with a 2-place decimal; optional.
Pct (Percentage)	A percentage of the order's merchandise total used to calculate the freight or service charge. **Note:** If the *Include Handling in Freight Charge Calculation (D77)* system control value is *selected*, the system will also include handling along with merchandise in the freight charge calculation. Numeric, 5 positions with a 2-place decimal; optional.
Maximum charge	The maximum amount to charge for shipping. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Update the freight charge or maximum freight amount for a tier on the dollar chart for this source code	Select *Change* for a tier on the dollar chart by source to advance to the Change Dollar Chart by Source screen (Freight Charges). For field descriptions, see *Create Dollar Chart by Source Screen (Freight Charges)*. You can change all fields except the Source code and Dollars fields.
Delete a tier in the dollar chart for this source code	Select *Delete* for a tier on the dollar chart by source to delete it.

Screen Option	Procedure
Review information for a tier on the dollar chart for this source code	Select *Display* for a tier on the dollar chart by source to advance to the Display Dollar Charge by Source screen (Freight Charges). You cannot change any fields on this screen. For field descriptions, see *Create Dollar Chart by Source Screen (Freight Charges)*.
Create a new tier on the dollar chart by source	Select *Create* to advance to the *Create Dollar Chart by Source Screen (Freight Charges)*.

Create Dollar Chart by Source Screen (Freight Charges)

Purpose: Use this screen to create a freight chart for a source code.

How to display this screen: Select *Create* at the Work with Dollar Chart by Source Screen (Freight Charges) .

You must define a freight charge by entering a dollar amount in the Freight charge field or a percentage of the dollar amount in the Pct field. Optionally, you can enter a maximum charge to use.

Field	Description
Source	The code and description for a group of customers to whom you mail an offer. See *Working with Source Codes (WSRC)*. (Source) Alphanumeric, 9 positions; display-only. (Description) Alphanumeric, 30 positions; display-only.
Dollars	The merchandise dollar amount on the customer's order. When the merchandise total is equal to or greater than the dollar amount you enter, the freight charge defined in the Freight charge field, the Pct field, or the Maximum charge field will be applied to the customer's order. **Note:** If the *Include Handling in Freight Charge Calculation (D77)* system control value is *selected*, the system will also include handling along with merchandise in the freight charge calculation. Numeric, 13 positions with a 2-place decimal. Create screen: required. Change screen: display-only.

Field	Description
Freight amount	The flat dollar amount of freight to apply to a customer's order when the merchandise dollar amount on the order is equal to or greater than the amount defined in the Dollar amount field. For example, If you enter 100.00 in the Dollar amount field, and 4.95 in the Freight charge field, the system adds $4.95 to the order as freight when the total order amount subject to freight is $100.00 or less. **Note:** If the *Include Handling in Freight Charge Calculation (D77)* system control value is *selected*, the system will also include handling along with merchandise in the freight charge calculation. Numeric, 13 positions with a 2-place decimal; required if you do not define a percentage in the Pct field.
Freight percent	The percentage of the merchandise total to apply to a customer's order as freight when the merchandise dollar amount on the order is equal to or greater than the amount defined in the Dollar amount field. For example, If you enter 50.00 in the Dollar amount field, and 5.00 in the Pct field, the system applies $2.50 to the order as freight when the total amount subject to freight is $50.00 or less. **Note:** If the *Include Handling in Freight Charge Calculation (D77)* system control value is *selected*, the system will also include handling along with merchandise in the freight charge calculation. Numeric, 5 positions with a 2-place decimal; required if you do not define a dollar amount in the Freight charge field.
Maximum freight amount	The maximum dollar amount of freight to charge, regardless of the result of the freight calculation. You need to complete this field only if you are calculating freight on the merchandise dollar amount by percentage (if you have entered a percentage in the Pct field.) Numeric, 13 positions with a 2-place decimal; optional.

Work with Dollar Chart by Source Screen (Service Charges)

Purpose: Use this screen to define service charges for a source code. Service charges are additional charges that are added to an order if the merchandise amount on the order is equal to or greater than an amount specified in this table.

> **Note:**
>
> If you are setting up service charges, you should complete the Additional charge code field for Dollar chart charges in the Offer table.

How to display this screen: Complete the *First Work with Dollar Chart by Source Screen (Select Source and Type)*. You can also display this screen by select *Service charges* for a source code at the *Work with Source Codes Screen*.

Field	Description
Dollar amount	Allows you to enter a dollar amount for the service charge chart. Numeric, 13 positions with a 2-place decimal; optional.
Freight charge	Allows you to enter a dollar amount for the service charge chart. Numeric, 13 positions with a 2-place decimal; optional.
Pct (Percentage)	Allows you to enter a percentage of the order's total merchandise dollar amount that is used to calculate the service charge. Numeric, 5 positions with a 2-place decimal; optional.
Maximum charge	Allows you to enter the maximum amount to charge for service charges. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Update a service charge amount or percent for a tier on the service charge chart	Select *Change* for a tier on the service chart by source to advance to the Change Dollar Chart by Source screen (Service Charges). For field descriptions, see *Create Dollar Chart by Source Screen (Service Charge)*. You can change all fields except the Source code and Dollars fields.
Delete a tier in the service charge chart for this source code	Select *Delete* for a tier on the dollar chart by source to delete it.
Review information for a tier on the service charge chart for this source code	Select *Display* for a tier on the dollar chart by source to advance to the Display Dollar Chart by Source screen (Service Charges). You cannot change any fields on this screen. For field descriptions, see *Create Dollar Chart by Source Screen (Service Charge)*.
Create a new tier on the service charge chart by source	Select *Create* to advance to the *Create Dollar Chart by Source Screen (Service Charge)*.

Create Dollar Chart by Source Screen (Service Charges)

Purpose: Use this screen to create a service charge for a source code.

How to display this screen: Select *Create* at the *Work with Dollar Chart by Source Screen (Service Charges)*.

You must define a service charge by entering a dollar amount in the Service amount field or a percentage of the dollar amount in the Service pct field. Optionally, you can enter a maximum charge to use.

Field	Description
Source	The unique user-defined code and description for a segment of your customer base to whom you mail an offer. See *Working with Source Codes (WSRC)*. (Source) Alphanumeric, 9 positions; display-only. (Description) Alphanumeric, 30 positions; display-only.
Dollars	The merchandise dollar amount on the customer's order. When the merchandise total is equal to or greater than the dollar amount you enter, the service charge defined in the Service charge field, the Service percent field, or the Maximum service amount field will be applied to the customer's order. For example, if the merchandise total is between and including .01 and 25.00, the service charge will be 3.00. If the merchandise total is between and including 26.00 and 50.00, the service charge will be 5.00. If the merchandise total is 50.01 or over, the service charge will be 6% of the merchandise dollar amount, up to $7.00. Numeric, 13 positions with a 2-place decimal. Create screen: required. Change screen: display-only.
Service amount	The flat dollar amount of a service charge that will be applied to a customer's order when the merchandise dollar amount on the order is equal to or greater than the amount defined in the Dollars field. Numeric, 13 positions with a 2-place decimal; required if you do not define a percentage in the Service percent field.
Service percent	The percentage of the merchandise total that will be applied to a customer's order as a service charge when the merchandise dollar amount on the order is equal to or greater than the amount defined in the Dollars field. Numeric, 5 positions with a 2-place decimal; required if you do not define a dollar amount in the Service amount field.
Maximum service amount	The maximum dollar amount of a service charge, regardless of the result of the service charge calculation. You only need to complete this field if you are calculating the service charge on the merchandise dollar amount by percentage (if you have entered a percentage in the Service percent field.) Numeric, 13 positions with a 2-place decimal; optional.

Initializing an Offer (MOFI)

Purpose: Initializing an offer is used to:

- Delete an offer you are no longer using.
- Initialize an offer without transferring data.
- Transfer data from one offer to another, initializing the "copy to offer" without deleting the "copy from offer."

For more information: See *Working with Offers (WOFR)*.

Offer Initialization Screen

How to display this screen: Enter *MOFI* in the Fast path field or select this option from a menu.

Field	Description
Copy from offer	The code for the offer from which you want to merge item and pricing data into another offer. If you only wish to initialize an offer, enter the offer code in this field and leave the Copy to offer field blank. Numeric, 3 positions; required.
Copy to offer	The code for the offer to which you want to transfer item and pricing data. Numeric, 3 positions; optional.
Res off source codes (Restrict offer's source codes)	Indicates whether you wish to restrict the use of a source code. Restricting a source code prevents it from being assigned to an order. This is useful for source codes you no longer use, but cannot delete since there are still open orders outstanding. *Unselected* when the source code is created. During Offer Initialization, you have the option to restrict all sources codes associated with a particular offer; the source codes you restrict are not copied to the offer being initialized. *Selected* = The source codes will not be copied to the offer being initialized. *Unselected* = The source code will be copied to the offer being initialized.

Instructions: Follow the steps listed below to initialize an offer.

- Complete the required fields and select *Accept* to accept your entries and initialize the offer.

Working with Special Pricing by Source Code (WSPP)

Purpose: Use the Work with Source Special Pricing function to create special price breaks for items by source code. The special pricing you define can include quantity breaks and associate pricing.

In addition to this menu option, you can also use the *Special Pricing* option in *Working with Source Codes (WSRC)* or the *Source Prices* option in Work with Items (see *Entering Additional Item Information*). Using Work with Source Special Pricing makes the task easier if you are entering special pricing for multiple items and/or source codes.

For example, you can use the Special Pricing by Source Code function to enter two source codes (SOURCE1 and SOURCE2) and two quantity breaks for the same item ($10 for 1 of ITEM1 and $9 for 5 of ITEM1). The function will create the following four special prices by source code:

- $10 for 1 of ITEM1 for SOURCE1
- $9 for 5 of ITEM1 for SOURCE1
- $10 for 1 of ITEM1 for SOURCE2
- $9 for 5 of ITEM1 for SOURCE2

You cannot create special pricing by source code for different SKUs of an item. You must define special pricing for the base item, and the pricing will apply to all SKUs.

Related system control values:

- If the *Perform Source Pricing Validation (D62)* system control value is *selected* and there are any source special pricing records set up for the source code on the order header, the system prevents you from adding any items to the order if they are not included in the special source pricing.
- The *Pricing Values (B31)* system control value controls the order in which the system evaluates pricing options for the order, based on the priority assigned to the *Special by Source Sequence # (A82)* system control value.

In this topic:

- *Work with Sources for Special Pricing Screen*
- *Work with Items for Special Pricing Screen*
- *Change Item Special Price Screen*
- *Duplicate Special Pricing by Source Report*

Work with Sources for Special Pricing Screen

Purpose: Use this screen to enter source codes to receive special pricing for certain items.

How to display this screen: Enter *WSPP* in the Fast path field at the top of any menu or select Work with Source Special Pricing from a menu.

Field	Description
Source code	A code representing a group of customers. Source codes are defined in and validated against the Source Code table; see *Working with Source Codes (WSRC)*. Alphanumeric, 9 positions; required.
Description	The description of a source code. Alphanumeric, 30 positions; display-only.

Instructions:

- Enter a source code in the source code field at the top of the screen. The system clears the data from the source code field and lists the source code and description in the middle of the screen.
- Continue entering additional source codes as in step 1. The system adds each new source code to the beginning of the source code and description list.
- When you have entered all the source codes to receive the item special pricing, select *Accept* to accept. You advance to the *Work with Items for Special Pricing Screen*.

Screen Option	Procedure
Delete a source code	Select *Delete* for a source code.
Accept the source code list and advance to the *Work with Sources for Special Pricing Screen*	Select *Accept*.
Reject the source code list and return to the previous screen	Select *Reject*.

Work with Items for Special Pricing Screen

Purpose: Use this screen to enter the items, quantities and prices that apply to each of the source codes you entered on the *Work with Items for Special Pricing Screen.*

How to display this screen: Select *Accept* to accept a list of source codes at the *Work with Sources for Special Pricing Screen*.

Field	Description
Item	A code representing a unit of inventory. Item codes are defined in and validated against the Item table. You cannot enter a SKU at this screen. If an item has SKUs, you must define special pricing for the base item, and the pricing will apply to all SKUs. Alphanumeric, 12 positions; required.
Description	The description associated with an item. Alphanumeric, 20 positions; display-only.
Quantity	The quantity of the item a customer must order to receive the special pricing. Numeric, 5 positions; required.
Price	The special price for the item, quantity and source codes. Numeric, 13 positions with a 2-place decimal; required.
Assoc price (Associate price)	The special price of the item for associate customers. You can define a customer as an associate or member who is eligible for additional special pricing through the Work with Customer Sold To function (see *Selecting Customers*). Numeric, 13 positions with a 2-place decimal; optional.
Tax inclusive price	The special price of the item if the order is subject to VAT. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.
Tax inclusive assoc (Tax-inclusive associate price)	The special price of the item for associate customers if the order is subject to VAT. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Instructions: Follow the steps below to enter items and quantities for special source code pricing.

- Complete the item, quantity and price fields, plus the associate price field if necessary. If you attempt to enter more than one special price for a quantity of an item, the system displays a message: `Item work already exists.`
- The system clears the data from the top of the screen and displays the special pricing for the item and quantity in the center of the screen.
- Enter as many item/quantity special pricing combinations as you need by repeating the first steps. The system adds each additional item/quantity special pricing combination to the top of the list.
- Select *Accept* to accept. The system returns you to a menu and submits a job called *SPEC_PRIC*. This job creates special pricing by item and quantity for each source code you entered on the *Work with Sources for Special Pricing Screen*.

> **Note:**
>
> If you return to the Work with Special Pricing by Source Code function while the *SPEC_PRIC* job is running, the information you entered previously is still on the screen. The system clears this information when the job is complete.

If there are any duplicate special pricing records, the system creates the *Duplicate Special Pricing by Source Report*.

Screen Option	Procedure
Change a special price	Select *Change* for a special price to advance to the *Change Item Special Price Screen*.
Delete a special price	Select *Delete* for a special price.
Return to the *Work with Sources for Special Pricing Screen*	Select *Source Entry*.
Accept your entries and create the special pricing by source code	Select *Accept*.
Reject the special pricing by source code list and return to the previous screen	Select *Reject*.

Change Item Special Price Screen

Purpose: Use this screen to change the special price or special associate price for a quantity of an item. The tax-inclusive prices display only if the *Tax Included in Price (E70)* system control value is *selected*. For field descriptions, see *Work with Items for Special Pricing Screen*.

How to display this screen: Select *Change* for an special price at the *Work with Items for Special Pricing Screen*.

Generating Source Codes Using the Source Upload Table (WSRW)

Purpose: You can create a Order Administration source code using information from the *Source Upload Table (IXSRCE)*.

Transferring data into the Source Upload table:

- Use the *File Storage API* to upload the file, and then run the *UPSRCCD Upload Source Code File* (Program name *PFR0134*, Parameter *IXSRCE*) periodic function; or
- Use the *Work with File Uploads (WUPL)* menu option to upload records to the Source Upload table.

> **Note:**
>
> The database does not allow an empty (null) value in any field, so in order to populate the *Source Upload Table (IXSRCE)* without error for fields that you do not want to populate in the created source code records, enter a zero (for a numeric field) or a space (for an alphanumeric field).

You can use the sample data below to create a Source Code upload file.

```
7|SOURCECD7|C|$O|H|D|K|SOURCECD7 SOURCE CODE DESCRIPT|500.00|.00|.00|CD|

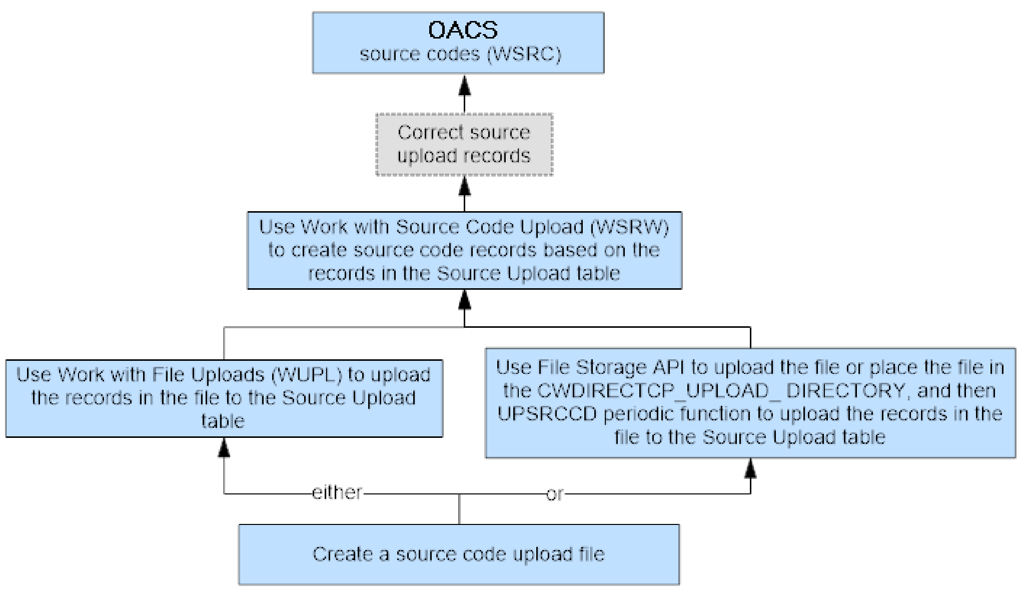
Once you upload records to the Source Upload table, you can use the Work with Source Code Upload File (WSRW) menu option to change, delete, or display source upload records and then transfer the records to the Source Code table.

When you transfer the source code records, the system validates each record in the Source Upload table:

- If a source upload record contains any errors, the system flags the record with a status of *E* and includes the record on the *Source Code Upload File Exception Report*. You can correct source upload records that are in an error status by selecting *OK* on the *Change Source Code Upload File Screen (1 of 2)*.
- If a source upload record does not contain any errors, the system transfers the record to the Source Code table and displays the record on the *Source Code Upload File Processed Listing*. See *Working with Source Codes (WSRC)*.
- **Source code upload process:** The following flowchart explains how the system creates a Order Administration source code using information defined in the Source Upload table.



In this topic:

- *Work with Source Code Upload File Screen*
- *Change Source Code Upload File Screen (1 of 2)*

- *Display Source Code Upload File Screen*
- *Source Code Upload File Processed Listing*
- *Source Code Upload File Exception Report*

Work with Source Code Upload File Screen

Purpose: This screen displays all of the records in the *Source Upload Table (IXSRCE)*. Use this screen to review, change, delete and transfer source code work records.

How to display this screen: Enter *WSRW* in the Fast path field at the top of any menu or select Work with Source Code Upload from a menu.

Field	Description
Source (Source code)	A unique, user-defined code to identify a segment of your customer base and to analyze sales. The source code drives marketing, pricing, freight, and service charge information on an order. See *Working with Source Codes (WSRC)*. Alphanumeric, 9 positions; optional.
Description	The description of this source code. Alphanumeric, 30 positions; optional.
Div (Division code)	A unique code for a profit center or area of financial reporting. Alphanumeric, 2 positions; optional.
Promo (Promotional code)	A code to group source codes together. See *Working with Promotions (WPRO)*. Alphanumeric, 7 positions; optional.
Offer	The code for the catalog, space, or advertisement from which you accept orders. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.
Status (Source code work file status)	A code used to indicate whether this source code work record contains an error. Valid values are: *E* = the source code work record contains an error. blank = the source code work record does not contain an error. Alphanumeric, 1 position; optional.

Instructions:

Select *Process File* to submit the transfer from the Source Upload table to the Source Code table. A message indicates that the source code transfer has been submitted.

The job validates that:

- The value defined in the Source code field is unique for the company you are working in.
- The Company, Consumer/business, Freight method, House account code, Price method, Type, Description, Breakeven amount, Restricted, Display on O/E select, Division, and Offer fields contain information.
- The Consumer/business, Freight method, House account code, Price method, Type, Exclude service charge, Promotion pricing, Display on O/E select, Exclude from flexible option, Exclude promotion, Division, Promotion code, Offer, Source category, Freight table, FPO payment code, and Price table fields contain valid values.

If a record passes all of the edits performed, the system:

- prints the source upload record on the *Source Code Upload File Processed Listing*. This report lists all source codes created through the source code upload.
- creates a Order Administration source code. You can review or maintain the source code in *Working with Source Codes (WSRC)*.
- deletes the record from the Source Upload table.

If a record does not pass all of the edits performed, the system:

- prints the source upload record on the *Source Code Upload File Exception Report*. This report lists all of the source upload records that contain errors.
- retains the source upload record in the Source Upload table until the record is fixed or deleted. You can correct errors that exist on a source upload record on the *Change Source Code Upload File Screen (1 of 2)*.

Screen Option	Procedure
Change a source upload record	Select *Change* for a source upload record to advance to the *Change Source Code Upload File Screen (1 of 2)*.
Delete a source upload record	Select *Delete* for a source upload record to delete it.
Display a source upload record	Select *Display* for a source upload record to advance to the *Display Source Code Upload File Screen*.
Submit the upload process	Select *Process File*. See above.

Change Source Code Upload File Screen (1 of 2)

Purpose: Use this screen to change information defined for a source upload record.

When you select *OK* on this screen, the system highlights any fields that are in error so that you can correct them. You cannot transfer a source upload record to the Source Code table if it contains any errors.

How to display this screen: On the *Work with Source Code Upload File Screen*, select *Change* for a source upload record.

See *Create Source Code Screen (1 of 2)* for a description of the fields on this screen.

Change Source Code Upload File (2 of 2)

How to display this screen: Select *OK* on the *Change Source Code Upload File Screen (1 of 2)*.

See *Create Source Code Screen (1 of 2)* for a description of the fields on this screen.

Display Source Code Upload File Screen

How to display this screen: Select *Display* for a source upload record at the *Work with Source Code Upload File Screen* to advance to the Display Source Code Upload File screen. You cannot change any information on this screen. For field descriptions, see *Create Source Code Screen (1 of 2)*.

Source Upload Table (IXSRCE)

Purpose: You can use the Work with Source Code Upload (WSRW) menu option to create source codes in your company based on the data in this table. See *Generating Source Codes Using the Source Upload Table (WSRW).*

Field	Attributes	Field Description
Company	Numeric, 3 positions; required	Order Administration company. This is a key field.
Source code	Alphanumeric, 9 positions; required	Order Administration source code. The source code must be a unique code within the Source Code table. This is a key field.
Consumer/ business	Alphanumeric, 1 position; required	Valid values are: *B* = business *C* = consumer
Freight method	Alphanumeric, 2 positions; required	Valid values are: *$O* = dollar chart/offer *$S* = dollar chart/source *A* = actual billing amount *F* = flat rate/ship to *FI* = flat rate/item *FQ* = flat rate/quantity *FS* = flat rate/item source *I* = by item *OW* = order weight *PS* = percentage/source *PV* = percentage/ship via *R* = recipient *W* = weight
House account code	Alphanumeric, 1 position; required	Valid values are: *H* = house account blank = in-house list
Price method	Alphanumeric, 1 position; required	Valid values are: *C* = use item cost *D* = regular plus reprice *N* = no charge *O* = no charge/no cost *P* = regular hierarchy
Type	Alphanumeric, 1 position; required	Valid values are: *N* = do not analyze *K* = known *U* = unknown
Description	Alphanumeric, 30 positions; required	The source code description. This is a user defined field.
Breakeven amount	Numeric, 13 positions with a 2-place decimal; required	User defined field.
List broker code	Numeric, 3 positions	User defined field.
List cost	Numeric, 13 positions with a 2-place decimal	User defined field.
Cover code	Alphanumeric, 2 positions	User defined field.

Field	Attributes	Field Description
Discount %	Numeric, 5 positions with a 2-place decimal	User defined field.
Drop code	Alphanumeric, 2 positions	User defined field.
Exclude service	Alphanumeric, 1 position	Valid values are: *N* = no *Y* = yes blank = no value defined
Flat freight amount	Numeric, 13 positions with a 2-place decimal	User defined field.
Freight minimum	Numeric, 13 positions with a 2-place decimal	User defined field.
Freight maximum	Numeric, 13 positions with a 2-place decimal	User defined field.
Freight percent	Numeric, 5 positions with a 2-place decimal	User defined field.
Backorder priority	Numeric, 1 position	User defined field.
Gross circulation	Numeric, 7 positions	Informational only.
Mail date	Numeric, 7 positions (CYYMDD format)	NA
Marketing projection	Numeric, 13 positions with a 2-place decimal	User defined field.
Net circulation	Numeric, 7 positions	NA
Pop up window #1	Alphanumeric, 30 positions	User defined field.
Pop up window #2	Alphanumeric, 30 positions	User defined field.
Pop up window #3	Alphanumeric, 30 positions	User defined field.
Pop up window #4	Alphanumeric, 30 positions	User defined field.
Projected names	Numeric, 5 positions	User defined field.
Requests mailed	Numeric, 7 positions	NA
Secondary freight	Numeric, 13 positions with a 2-place decimal	User defined field.
Up to freight quantity	Numeric, 5 positions	User defined field.
Maximum ship tos-freight	Numeric, 3 positions	User defined field.
Promo pricing	Alphanumeric, 1 position	Valid values are: *N* = no *Y* = yes blank

Field	Attributes	Field Description
Restricted	Alphanumeric, 1 position; required	Valid values are: *N* = no *Y* = yes blank
Display on O/E select	Alphanumeric, 1 position; required	Valid values are: *N* = no *Y* = yes blank
% net fill	Numeric, 5 positions with a 2-place decimal	User defined field.
% margin	Numeric, 5 positions with a 2-place decimal	User defined field.
Cost per order	Numeric, 13 positions with a 2-place decimal	User defined field.
Variable ad expense	Numeric, 13 positions with a 2-place decimal	User defined field.
SRC user 1	Alphanumeric, 30 positions	User defined field.
SRC user 2	Alphanumeric, 30 positions	User defined field.
SRC user 3	Alphanumeric, 30 positions	User defined field.
SRC user 4	Alphanumeric, 30 positions	User defined field.
SRC user 5	Alphanumeric, 30 positions	User defined field.
SRC user 6	Alphanumeric, 30 positions	User defined field.
Exclude from flex opt	Alphanumeric, 1 position	Valid values are: *N* = no *Y* = yes blank
Exclude promotion	Alphanumeric, 1 position	Valid values are: *N* = no *Y* = yes blank
Division	Alphanumeric, 2 positions; required	Must be a valid Order Administration division.
Promotion code	Alphanumeric, 7 positions	Must be a valid Order Administration promotion code.
OFR number	Alphanumeric, 3 positions; required	Must be a valid Order Administration offer number.
Source category	Alphanumeric, 2 positions	Must be a valid Order Administration source category.
Ship via	Numeric, 2 positions	NA
Freight table	Alphanumeric, 3 positions	Must be a valid Order Administration freight table.
Recency code	Alphanumeric, 4 positions	Not currently implemented.
LST source	Alphanumeric, 9 positions	Not currently implemented.

Field	Attributes	Field Description
FPO payment code	Alphanumeric, 5 positions	Must be a valid Order Administration FPO payment code.
Catalog request	Alphanumeric, 1 position	Valid values are: *N* = no *Y* = yes blank
Catalog request type	Alphanumeric, 3 positions	Must be a valid Order Administration catalog request type.
Customer class	Alphanumeric, 2 positions	Must be a valid Order Administration customer class.
Discount expiration	Numeric, 7 positions (CYYMMDD format)	Must be a valid date.
File status	Alphanumeric, 1 position	Valid values are: *E* = an error exists on this record. blank = an error does not exist on this record.
Price table	Alphanumeric, 5 positions	Must be a valid Order Administration price table.
Commission pct	Numeric, 5 positions with a 2-place decimal	
Warranty required	Alphanumeric, 1 position	Valid values are: *N* = no *Y* = yes blank
Credit check?	Alphanumeric, 1 position	Valid values are: *N* = no *Y* = yes blank

Setting Up Pricing Information

Topics in this part: The following topics describe how to set up and change pricing information:

- *Understanding Promotional Pricing* provides an overview of promotional pricing and the basic information you need to set up pricing information on the system.
- *Work with Promotional Pricing Groups (WPRG)* describes how to create and change a promotional pricing group.
- *Work with Promotional Pricing (WPRP)* describes how to create and change a promotional pricing record. This record establishes the eligibility requirements and the incentives available in promotional pricing.
- *Working with Price Codes (WPCD)* describes how to create price codes that you can assign to various items, so that you can offer your customers special price breaks when they order a sufficient combined quantity of these items.
- *Assigning Price Codes (APCD)* describes how to assign price codes to items based on source code or offer.

- Price Code Upload describes how to upload price code information from an external system to create, update, or delete records in the Price Code, Price Code Customer, and Price Code Details tables.
- Display Price Code Assignments (DPCA) allows you to review the items/SKUs assigned to a price code by offer or source code and the requirements that must be met for an order to be eligible for the price code.
- *Working with Price Tables (WPTB)* describes how price table pricing works and how to create and maintain price tables from items and groups of items.
- *Package Insert Processing (WPIP)* describes how to create package insert/promotional items that will be automatically added to an order in Order Entry/Maintenance.
- *Working with Coupon Promotions (WCPR)* describes how to set up coupons for percentage or dollar discounts on an order, or for selected item(s), and provides an overview of how coupon discounts work.
- *Working with Customer Price Groups (WCPG)* describes how to create and work with customer price groups used during quantity price matrix pricing, customer price group pricing, and as a qualifier for a discount promotion.
- *Customer Price Group SKU Exclusion Upload* describes how to upload customer price group SKU exclusion information from an external system to create or update records in the Customer Price Group SKU Exclusion table.
- *Customer Price Group Pricing* provides an overview of the customer price group pricing method, required setup, and processing details.
- *Working with Quantity Price Matrix (WQPM)* describes how to create and work with the quantity price matrix pricing method.
- *Pricing Upload Interface* describes how to upload source discount and quantity price matrix pricing from an external system.

Working with Quantity Price Matrix (WQPM)

Purpose: Use the Work with Quantity Price Matrix menu option to create and work with quantity price matrix price breaks.

You can use the quantity price matrix pricing method to:

- Offer a quantity price matrix discount to eligible order lines on an order.
- Apply quantity price matrix discounts to eligible order lines during repricing and end-of-order pricing.

Available order entry formats:

- Line level quantity price matrix pricing is available in interactive order entry and maintenance and through orders received through the generic order interface (Order API).
- *End of Order Quantity Price Matrix Pricing* is available in interactive order entry and through orders received through the generic order interface (Order API). End of order quantity price matrix pricing is not available in order maintenance.

The system does not apply quantity price matrix pricing to orders entered using business to business order entry.

In this topic:

- *Quantity Price Matrix Setup*

- Create Quantity Price Matrix Screen
- Copy Quantity Price Matrix Window
- Work with Quantity Price Matrix Details Screen
- Work with Quantity Price Matrix Specials Screen

Quantity Price Matrix Setup

Before you can use the quantity price matrix pricing method, you must complete the necessary setup.

- Menu Options
- System Control Values

Menu Options

Menu Option	Description
Establishing Price Override Reason Codes (WPOR)	Create the price override reason code that you want the system to assign to an order line that is priced using a *Quantity Price Matrix Customer Special*.

Menu Option	Description
Working with Customer Price Groups (WCPG)	Create customer price groups to assign to sold to customers. You can create a *Quantity Price Matrix Customer Special* that uses a customer price group as one of the criteria required to qualify for the quantity price matrix special. See *Quantity Price Matrix Price Hierarchy* for a list of the criteria you can define for a quantity price matrix special.
Working with Quantity Price Matrix (WQPM)	Create the quantity price matrix pricing structure. • Use the *Work with Quantity Price Matrix Details Screen* to create the quantity break pricing structure for a specific: – item category and quantity – item and quantity – item, SKU and quantity • Use the *Work with Quantity Price Matrix Specials Screen* to create a special quantity break pricing structure for a specific item category, item, or item and SKU and define the criteria that must be met to qualify for the special pricing structure. You can use the following criteria for a quantity price matrix special: – sold to customer and quantity – customer price group and quantity – source code and quantity – sold to customer, source code and quantity – customer price group, source code and quantity See *Quantity Price Matrix Price Hierarchy* for the hierarchy the system uses to find quantity price matrix price to use.
Working with Source Codes (WSRC)	To do *End of Order Quantity Price Matrix Pricing* during repricing, the Price method field for the source code on the order header must be set to *Reg Plus Reprice*.

System Control Values

Entity level override: You can set up pricing value overrides for any entity that should use different pricing logic from your company-wide standard. In order entry, the system checks the entity associated with the source code on the order header to determine if entity-level pricing overrides are in effect. See *Working with Entities (WENT)* for more information.

System Control Value	Description
Quantity Price Matrix Hierarchy Sequence # (K40)	Defines the sequence in the pricing hierarchy in which the system uses the quantity price matrix line level pricing method. See *Pricing Values (B31)* for a list of the available pricing methods.

System Control Value	Description
Quantity Price Matrix Pricing (K41)	*Select* this field to have the system reprice items in order entry based on the price breaks you define in the *Working with Quantity Price Matrix (WQPM)* menu option. **Note:** If you select quantity price matrix pricing as your end-of-order pricing method, you cannot select any other end-of-order pricing method. If you are reviewing this system control value using the *Pricing Values (B31)* umbrella system control value, an error message displays `No other end of order methods allowed with Qty Price Matrix`.
Price Override Reason for Price Matrix Customer Specials (K42)	Enter the price override reason code that you want the system to assign to an order line that is priced using a *Quantity Price Matrix Customer Special*. The system assigns this price override reason code to eligible order lines during repricing. Any order lines that are assigned this price override reason code cannot be further discounted. However, you can still apply a source % discount to these order lines. Also, the system prevents you from manually entering this price override reason code for an order line in order entry or order maintenance: `Price override reason reserved and cannot be manually entered`. Leave this field blank if you want to allow the system to apply further discounting, such as promotions, to order lines that are priced using a *Quantity Price Matrix Customer Special*.

Determining the Quantity Price Matrix to Use

The system uses the quantity price matrix with the most recent Effective date whose status is *Active*. If more than one active quantity price matrix exists with the same effective date, the system uses the first quantity price matrix in alphanumeric order. For example, the system would use quantity price matrix A before quantity price matrix B.

If the *Multi Currency by Offer (E03)* system control value is selected, the system uses the quantity price matrix with the most recent Effective date whose status is *Active* and whose currency matches the currency defined for the offer associated with the source code on the order header.

Example: Determining the Quantity Price Matrix to Use

The following quantity price matrixes exist in the QPM Header table.

Quantity Price Matrix	Effective Date	Active	Currency
SM09 - Summer 2009	05/01/09	Active	USD
S409 - 4th of July Specials 2009	07/01/09	Active	USD
SC09 - Back to School 2009	07/01/09	Active	USD
2009 - 2009 Prices	01/01/09	Active	USD
HL09 - Holiday Specials 2009	11/01/09	Inactive	USD

The *Multi Currency by Offer (E03)* system control value is *selected*.

- On 6/30/09, a customer places an order. The currency defined for the offer associated with the source code on the order header is USD. In this situation, the system uses quantity price matrix *SM09* to price the items on the order.
- On 7/02/09, a customer places an order. The currency defined for the offer associated with the source code on the order header is USD. In this situation, the system uses quantity price matrix *S409* to price the items on the order. Quantity price matrix SC09 has the same effective date, but the system uses S409 because it comes first alphabetically.
- On 7/02/09, a customer places an order. The currency defined for the offer associated with the source code on the order header is CAN. In this situation, the system does not find a quantity price matrix it can use and instead, refers to the pricing hierarchy defined in the *Pricing Values (B31)* system control value to find the price for each line on the order.

Determining the QPM Price to Use

The system looks at the quantity price matrix specials and quantity price matrix details to find the quantity price matrix price to apply to an order line.

- You can define quantity price matrix specials at the *Work with Quantity Price Matrix Specials Screen*.
- You can define quantity price matrix details at the *Work with Quantity Price Matrix Details Screen*.

Quantity Price Matrix Price Hierarchy

The system uses the following hierarchy to find the quantity price matrix price to apply to an item on an order line.

#	Step
1.	Use a *Quantity Price Matrix Customer Special*. Quantity price matrix customer specials are QPM discount prices that use customer or customer price group as a qualifier. You define quantity price matrix customer specials at the defined at the *Work with Quantity Price Matrix Specials Screen*. See *Quantity Price Matrix Customer Special* for a list of available QPM customer specials.

#	Step
2.	Use a *Quantity Price Matrix Source Special*. Quantity price matrix source specials are QPM discount prices that use source code, and NOT customer or customer price group, as a qualifier. You define quantity price matrix source code specials at the *Work with Quantity Price Matrix Specials Screen*. See *Quantity Price Matrix Source Special* for a list of available QPM source specials.
3.	Use a *Quantity Price Matrix Detail*: Quantity price matrix details are QPM base prices for a specific item and SKU, item, or item category. You define quantity price matrix details at the *Work with Quantity Price Matrix Details Screen*. See *Quantity Price Matrix Detail* for a list of available QPM details.

Only one quantity price matrix price can apply to an order line. For example, if an order line qualifies for a QPM customer special and a QPM source special, the system applies the QPM customer special and not the QPM source special to the order line, based on the QPM price hierarchy outlined below.

Quantity Price Matrix Customer Special
A quantity price matrix customer special is a QPM discount price defined at the *Work with Quantity Price Matrix Specials Screen* that uses customer or customer price group as a qualifier.

If an order line qualifies for a QPM special that uses customer or customer price group as a qualifier, the system applies the *Price Override Reason for Price Matrix Customer Specials (K42)* to the order line during *End of Order Quantity Price Matrix Pricing*. When this price override reason code is defined for an order line, the system cannot apply other discounts, such as promotions, to the order line; however, the system can still apply a source % discount to the order line.

The system uses the following hierarchy to find the quantity price matrix customer special to apply to an item on an order line.

#	Step
1.	**Customer, Source Code, Item, SKU, Quantity** Use the QPM special whose *sold to customer* and *source code* match the sold to customer and source code on the order header and whose *item* and *SKU* match the item and SKU on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
2.	**Customer, Source Code, Item, Quantity** Use the QPM special whose *sold to customer* and *source code* match the sold to customer and source code on the order header and whose *item* matches the item on the order line. **If the item has SKUs, all SKUs for the item qualify for the price.** If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.

#	Step
3.	**Customer, Source Code, Item Category, Quantity** Use the QPM special whose *sold to customer* and *source code* match the sold to customer and source code on the order header and whose *item category* matches the item on the order line. The system looks at the SKU ITC Category field in the SKU table to find the item category defined for the item on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
4.	**Customer Price Group, Source Code, Item, SKU, Quantity** Use the QPM special whose *customer price group* and *source code* match the sold to customer and source code on the order header and whose *item* and *SKU* match the item and SKU on the order line. The system looks at the Price Group field in the Customer Sold To table to find the customer price group defined for the sold to customer on the order header. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
5.	**Customer Price Group, Source Code, Item, Quantity** Use the QPM special whose *customer price group* and *source code* match the sold to customer and source code on the order header and whose *item* matches the item on the order line. The system looks at the Price Group field in the Customer Sold To table to find the customer price group defined for the sold to customer on the order header. If the item has SKUs, all SKUs for the item qualify for the price. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
6.	**Customer Price Group, Source Code, Item Category, Quantity** Use the QPM special whose *customer price group* and *source code* match the sold to customer and source code on the order header and whose *item category* matches the item on the order line. The system looks at the Price Group field in the Customer Sold To table to find the customer price group defined for the sold to customer on the order header. The system looks at the SKU ITC Category field in the SKU table to find the item category defined for the item on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
7.	**Customer, Item, SKU, Quantity** Use the QPM special whose *sold to customer* matches the sold to customer on the order header and whose *item* and *SKU* match the item and SKU on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.

#	Step
8.	**Customer, Item, Quantity** Use the QPM special whose *sold to customer* matches the sold to customer on the order header and whose *item* matches the item on the order line. **If the item has SKUs, all SKUs for the item qualify for the price.** If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
9.	**Customer, Item Category, Quantity** Use the QPM special whose *sold to customer* matches the sold to customer on the order header and whose *item category* matches the item on the order line. The system looks at the SKU ITC Category field in the SKU table to find the item category defined for the item on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
10.	**Customer Price Group, Item, SKU, Quantity** Use the QPM special whose *customer price group* matches the sold to customer on the order header and whose *item* and *SKU* match the item and SKU on the order line. The system looks at the Price Group field in the Customer Sold To table to find the customer price group defined for the sold to customer on the order header. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
11.	**Customer Price Group, Item, Quantity** Use the QPM special whose *customer price group* matches the sold to customer on the order header and whose *item* matches the item on the order line. The system looks at the Price Group field in the Customer Sold To table to find the customer price group defined for the sold to customer on the order header. If the item has SKUs, all SKUs for the item qualify for the price. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
12.	**Customer Price Group, Item Category, Quantity** Use the QPM special whose *customer price group* matches the sold to customer on the order header and whose *item category* matches the item on the order line. The system looks at the Price Group field in the Customer Sold To table to find the customer price group defined for the sold to customer on the order header. The system looks at the SKU ITC Category field in the SKU table to find the item category defined for the item on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.

#	Step
	Quantity Price Matrix Source Special A quantity price matrix source special is a QPM discount price defined at the *Work with Quantity Price Matrix Specials Screen* that uses source code, and NOT customer or customer price group, as a qualifier. If an order line qualifies for both a *Quantity Price Matrix Customer Special* and a *Quantity Price Matrix Source Special*, the system applies the customer special to the order line. **The system uses the following hierarchy to find the quantity price matrix source special to apply to an item on an order line.**
1.	**Source Code, Item, SKU, Quantity** Use the QPM special whose *source code* matches the source code on the order header and whose *item* and *SKU* match the item and SKU on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
2.	**Source Code, Item, Quantity** Use the QPM special whose *source code* matches the source code on the order header and whose *item* matches the item on the order line. **If the item has SKUs, all SKUs for the item qualify for the price.** If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
3.	**Source Code, Item Category, Quantity** Use the QPM special whose *source code* matches the source code on the order header and whose *item category* matches the item on the order line. The system looks at the SKU ITC Category field in the SKU table to find the item category defined for the item on the order line. If more than one quantity is defined for this QPM special, the system: • uses the QPM special whose quantity matches the order line quantity. • uses the QPM special whose quantity is less than, but closest to, the order line quantity.
	Quantity Price Matrix Detail A quantity price matrix detail is a QPM base price defined at the *Work with Quantity Price Matrix Details Screen* for a specific item and SKU, item, or item category. If an order line qualifies for a *Quantity Price Matrix Customer Special* or *Quantity Price Matrix Source Special*, the system applies the customer special or source special to the order line instead of the QPM base price. **The system uses the following hierarchy to find the quantity price matrix detail to apply to an item on an order line.**
1.	**Item, SKU, Quantity** Use the QPM detail whose *item* and *SKU* matches the item and SKU on the order line. • If more than one quantity is defined for this QPM detail, the system: • uses the QPM detail whose quantity matches the order line quantity. • uses the QPM detail whose quantity is less than, but closest to, the order line quantity.

#	Step
2.	**Item and Quantity** Use the QPM detail whose *item* matches the item on the order line. If the item has SKUs, all SKUs for the item qualify for the price. If more than one quantity is defined for this QPM detail, the system: • uses the QPM detail whose quantity matches the order line quantity. • uses the QPM detail whose quantity is less than, but closest to, the order line quantity.
3.	**Item Category and Quantity** Use the QPM detail whose *item category* matches the item on the order line. The system looks at the SKU ITC Category field in the SKU table to find the item category defined for the item on the order line. If more than one quantity is defined for this QPM detail, the system: • uses the QPM detail whose quantity matches the order line quantity. • uses the QPM detail whose quantity is less than, but closest to, the order line quantity.

Order lines for a negative order quantity: You cannot create a quantity price matrix special or quantity price matrix detail for a negative quantity. If an order line is entered for a negative quantity, the system will not apply a quantity price matrix price to the order line; the order line will use the pricing hierarchy defined in the *Pricing Values (B31)* system control value to find the price for the order line. Also, order lines for a negative quantity are not included in the total quantity used for quantity price matrix pricing calculated during repricing and end of order pricing; see *End of Order Quantity Price Matrix Pricing*.

Order lines that have a manual price override: The system does not apply a quantity price matrix price to an order line if a manual price override is defined; the order line will use the manual price override. Also, the system includes the quantity for order lines that have a manual price override in the end-of-order quantity price matrix calculation. See *End of Order Quantity Price Matrix Pricing*.

Order lines that are soldout: The system does not apply a quantity price matrix price to an order line that is soldout; the order line will use the pricing hierarchy defined in the *Pricing Values (B31)* system control value to find the price for the order line. Also, order lines that are assigned a soldout control code are not included in the total quantity used for quantity price matrix pricing calculated during repricing and end of order pricing; see *End of Order Quantity Price Matrix Pricing*.

Calculating the QPM Price

Once the system finds the quantity price matrix special or quantity price matrix detail to apply to the order line, the system calculates the price for the order line.

When a QPM price is defined: If a price is defined for the quantity price matrix detail or quantity price matrix special, the system applies this price to the order line.

Example: If the QPM price is $8.00, the unit price of the item on the order line is $8.00. If the order quantity for the item on the order line is 2, the extended price of the item on the order line is $16.00.

When a QPM discount percentage is defined: If a discount percentage is defined for the quantity price matrix special, the system applies this discount percentage to the price defined for the associated quantity price matrix detail.

The system uses the item category, item, SKU, and quantity defined for the quantity price matrix special to find the associated quantity price matrix detail.

Example: If the quantity price matrix special is:

Customer	Item	SKU	Quantity	% Discount
2	AB10	RED	1	10%

The quantity price matrix detail associated with the special is:

Item	SKU	Quantity	Price
AB10	RED	1	8.00

And the price to apply to the order line when item AB10 RED for a quantity of 1 is ordered is *7.20* (8.00 QPM detail price - 10% QPM customer special discount = 7.20).

If a quantity price matrix detail does not exist for the same quantity as defined for the quantity price matrix special, the system uses the quantity price matrix detail for the next available lower quantity.

Example: If the quantity price matrix special is:

Customer	Item	SKU	Quantity	% Discount
2	AB10	RED	3	10%

The quantity price matrix details associated with the special are:

Item	SKU	Quantity	Price
AB10	RED	1	8.00
AB10	RED	2	7.50
AB10	RED	4	7.00

The system uses the quantity price matrix detail for a quantity of 2 to apply to the order line when item AB10 RED for a quantity of 3 is ordered. The price to apply to the order line is *6.75* (7.50 QPM detail price - 10% QPM customer special discount = 6.75).

When a QPM price cannot be found: If the system cannot find a quantity price matrix price, the system uses the next pricing method in the pricing hierarchy defined in the *Pricing Values (B31)* system control value to find the price for the order line. If the system cannot find a price using any available pricing method, the system displays the standard error message: `Price (0.00) cannot be zero for item`.

Pricing method description: The pricing method description that displays on the *Work with Order Line Screen (Changing/Adding an Item)* shows the method used to calculate the price for the item.

- `Qty Price Matrix` displays if the price is a result of a *Quantity Price Matrix Detail* or *Quantity Price Matrix Source Special*.
- `Qty Price Matrix Cust Ovr` displays if the price is a result of a *Quantity Price Matrix Customer Special*. Once the system reprices the order, the system updates the pricing method description to `Qty Price Matrix`.

Discount calculation messages: If you have defined an offer price for your items and the *Display Order Line Discount Messages (F01)* system control value is *selected*, the system displays *Discount Calculation Messages* when you add an item to an order, indicating the order line number of the discounted item, the offer price, the actual price (the discounted price the customer is paying), the dollar amount of the discount, and the discount percentage. For example, if the item offer price is $10.00 and the *Quantity Price Matrix Detail* price is $5.00, the discount calculation message displays as: `Line 1: Offer = 10.00 Actual = 5.00 Discount = 5.00: 50:00%`.

Price override reason for customer specials: If an order line qualifies for a *Quantity Price Matrix Customer Special*, the system applies the *Price Override Reason for Price Matrix Customer Specials (K42)* to the order line during *End of Order Quantity Price Matrix Pricing*. When this price override reason code is defined for an order line, the system cannot apply any other discounts, such as promotions, to the order line. However, the system can still apply a source % discount to the order line.

Also, the system prevents you from manually entering this price override reason code for an order line: `Price override reason reserved and cannot be manually entered`.

Order API: If the order uses quantity price matrix pricing and no actual_price is specified for the item in the *Inbound Order XML Message (CWORDERIN)*, then the order API uses the *Quantity Price Matrix Price Hierarchy* to apply a quantity price matrix price to the order line. If the item on the order line qualifies for a *Quantity Price Matrix Customer Special*, the system applies the QPM customer discount price to the order line and assigns the *Price Override Reason for Price Matrix Customer Specials (K42)* to the order line.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> The system does not validate that the price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value is not passed as the prc_ovr_reason for an order line received through the generic order interface. However, you should not use the price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value as the override reason code for any manually entered price that you define in the actual_price.

Example: Determining the QPM Price to Use

The following quantity price matrix details exist.

Item Category	Item	SKU	Qty	Price
	STCK1		1	5.50
	STCK1	HART	1	5.00
PENC			1	8.50

The following quantity price matrix specials exist.

Cust #	Source	Item Category	Item	SKU	Qty	Price	% Disc
17		PENC			1		10
17			STCK1		1		15
17			STCK1	HART	1		25
	S7	PENC			1	6.99	

Example 1: Customer *17* places an order for source code *S7*. The following lines are added to the order.

Item	SKU	Item Category	Line Qty	Results
STCK1	ANGL	STCK	1	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 17, item = STCK1, quantity = 1, % Disc = 15. In this situation, the price = *4.68* (5.50 QPM detail price - 15% customer special discount = 4.675).
STCK1	HART	STCK	1	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 17, item = STCK1, SKU = HART, quantity = 1, % Disc = 25. In this situation, the price = *3.75* (5.00 QPM detail price - 25% customer special discount = 3.75).
PENC1		PENC	1	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 17, item category = PENC, quantity = 1, % Disc = 10. In this situation, the price = *7.65* (8.50 QPM detail price - 10% customer special discount = 7.65). The system did not apply the *Quantity Price Matrix Source Special* to the order line because the *Quantity Price Matrix Customer Special* took precedence.

Example 2: Customer *25* places an order for source code *S7*. The following lines are added to the order.

Item	SKU	Item Category	Line Qty	Results
STCK1	ANGL	STCK	1	The system applies the following *Quantity Price Matrix Detail* to the order line: item = STCK1, quantity = 5, price = *5.50*. The system did not apply the *Quantity Price Matrix Customer Special* to the order line because the customer on the order did not qualify.

Item	SKU	Item Category	Line Qty	Results
STCK1	HART	STCK	1	The system applies the following *Quantity Price Matrix Detail* to the order line: item = STCK1, SKU = HART, quantity = 5, price = *5.00*. The system did not apply the *Quantity Price Matrix Customer Special* to the order line because the customer on the order did not qualify.
PENC1		PENC	1	The system applies the following *Quantity Price Matrix Source Special* to the order line: source code = S7, item category = PENC, quantity = 1, price = *6.99*. The system did not apply the *Quantity Price Matrix Customer Special* to the order line because the customer on the order did not qualify.

End of Order Quantity Price Matrix Pricing

Quantity Price Matrix Pricing (K41)
See *When Repricing Occurs*for more information on when repricing occurs during interactive order entry.

Source code setting: To do end of order quantity price matrix pricing, the Price method field for the source code on the order header must be set to *Reg Plus Reprice*.

The system does the following steps during end of order quantity price matrix pricing.

<table>
<tr><th>#</th><th>Step</th></tr>
<tr><td>1.</td><td>The system evaluates the order lines to find the price of each order line based on the Quantity Price Matrix Price Hierarchy.

The system finds the quantity price matrix price to apply to an order line based on the total order quantity of an item across the lines on the order. For example, if item A01 is on order line 1 for a quantity of 1 and is also on order line 2 for a quantity of 2, the system uses the total order quantity of 3 to find the quantity price matrix price to apply to each order line.

Order lines priced using a quantity price matrix customer special:
The system uses the quantity price matrix customer special as the price for the order line.
The system includes the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
Order lines that have a manual price override:
The system uses the manual price override as the price for the order line.
The system includes the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
Order lines for a negative order quantity:
The system does not apply a quantity price matrix price to the order line; the order line will use the pricing hierarchy defined in the Pricing Values (B31) system control value to find the price for the order line.
The system does not include the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
Order lines that are assigned a soldout control code:
The system does not apply a quantity price matrix price to the order line; the order line will use the pricing hierarchy defined in the Pricing Values (B31) system control value to find the price for the order line.
The system does not include the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
Orders lines for a BOGO (Buy One/Get One) discount:
The system uses the BOGO discount as the price for the order line.
The system does not include the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
See BOGO (Buy One/Get One) Discount or Free Gift by Item Category or Item for more information.</td></tr>
<tr><td>2.</td><td>If the order line is priced using a Quantity Price Matrix Customer Special, the system defaults the Price Override Reason for Price Matrix Customer Specials (K42) to the order line.

Also, the system updates the pricing method description that displays on the Work with Order Line Screen (Changing/Adding an Item) from <code>Qty Price Matrix Cust Ovr</code> to <code>Qty Price Matrix</code>.</td></tr>
</table>

#	Step
3.	The system evaluates the order and order lines for any discounts, premiums, and promotions. The system decides whether an order qualifies for a discount, premium, or promotion based on the quantity price matrix price that is applied to each order line during repricing and not during initial order entry. If an order line has the *Price Override Reason for Price Matrix Customer Specials (K42)*, the system does not apply any other discounts, such as promotions, to the order line. However, the system can still apply a source % discount to the order line. *Example:* The following QPM prices are defined: • for a quantity of 1, the price = 5.00 • for a quantity of 2, the price = 4.50 • for a quantity of 3, the price = 3.50 You enter an order for source code S7. A source dollar discount is defined for S7: receive $2.00 off a $10.00 or more order. During initial order entry, you add the following order lines: • order line 1 for a quantity of 1 and a price of 5.00. • order line 2 for a quantity of 1 and a price of 5.00. During repricing, the system evaluates the total order quantity of the items on the order and reprices each order line: • order line 1 for a quantity of 1 and a price of 4.50. • order line 2 for a quantity of 1 and a price of 4.50. Because the order lines qualified for a different QPM price, the merchandise total is now 9.00 instead of 10.00 and the order no longer qualifies for the source dollar discount.

Order API: If the payment information is sent separately from the rest of the order in the generic order API, the *Detailed Order XML Response (CWORDEROUT)* might be generated twice: once when you receive the initial order message and once when you receive the payment information. In this situation, the system does end of order quantity price matrix pricing when it receives the initial order message without payment information. The system sends the final quantity price matrix price in the first pass and second pass of the *Detailed Order XML Response (CWORDEROUT)*; see *Discounted and Added Items in the CWOrderOut Response Message*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Example 1: End of Order Quantity Price Matrix Pricing

The following price matrix details exist for quantity price matrix 2009.

Item Category	Quantity	Price
STCK	1	5.00
STCK	2	4.50
STCK	3	3.50

The following price matrix special exists for quantity price matrix 2009.

Customer	Item Category	Quantity	Price
132	STCK	4	3.00

Items STK1, STK2 and STK3 are all in item category STCK.

The price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value is Q.

Customer 132 places an order for source code SPR09.

Initial order entry: The following lines are added to the order:

Item	Line Qty	Price	Price Ovr	Results
STK1	1			The system applies the following *Quantity Price Matrix Detail* to the order line: item = STK1, quantity = 1, price = *5.00*.
STK2	1	2.50	C	The system does not apply a quantity price matrix price to the order line because a price and price override reason code were manually entered. The system uses the manual price override of *2.50* for the order line.
STK2	1-			The system does not apply a quantity price matrix price to the order line because the order line quantity is a negative quantity. The system uses the item offer price of *6.00* for the order line.
STK3	1			The system applies the following *Quantity Price Matrix Detail* to the order line: item = STK1, quantity = 1, price = *5.00*.

Repricing: During repricing, the system reevaluates the order lines on the order to find the final quantity price matrix price.

Item	Line Qty	Price	Price Ovr	Results
STK1	1			Because order lines 1, 2, and 4 are eligible for end-of-order quantity price matrix pricing, the system applies the following *Quantity Price Matrix Detail* to the order line: item = STK1, quantity = 3, price = *3.50*. The order did not qualify for the *Quantity Price Matrix Customer Special* because only 3 units of the item in item category STCK were eligible for quantity price matrix pricing.
STK2	1	2.50	C	The system does not apply a quantity price matrix price to the order line because a price and price override reason code were manually entered. The price remains at *2.50*. However, the system includes this order line in the total quantity for end-of-order quantity price matrix pricing.
STK2	1-			The system does not apply a quantity price matrix price to the order line because the order line quantity is a negative quantity. The system uses the item offer price of *6.00* for the order line.

Item	Line Qty	Price	Price Ovr	Results
STK3	1			Because order lines 1, 2, and 3 are eligible for quantity price matrix pricing, the system applies the following *Quantity Price Matrix Detail* to the order line: item = STK1, quantity = 3, price = *3.50*. The order did not qualify for the *Quantity Price Matrix Customer Special* because only 3 units of the item in item category STCK were eligible for quantity price matrix pricing.

Example 2: End of Order Quantity Price Matrix Pricing

The following price matrix details exist for quantity price matrix 2009.

Item	Quantity	Price
ITM1	1	25.00
ITM2	1	15.00

The following price matrix special exists for quantity price matrix 2009.

Customer	Item	Quantity	Price
132	ITM2	2	10.00

The price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value is Q.

Customer 132 places an order. A 20% source discount exists for the source code on the order. A 5% order promotion discount exists for the order.

Initial order entry: The following lines are added to the order:

Item	Line Qty	Price	Price Ovr	Results
ITM1	1			The system applies the following *Quantity Price Matrix Detail* to the order line: item = ITM1, quantity = 1, price = 25.00. The order line qualifies for the 20% source discount, making the price *20.00* (25.00 order line price - 20% source discount = 20.00).
ITM2	2			The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 132, item = ITM2, quantity = 2, price = 10.00. The order line qualifies for the 20% source discount, making the price *8.00* (10.00 order line price - 20% source discount = 8.00).

Item	Line Qty	Price	Price Ovr	Results
ITM3	1-			The system does not apply a quantity price matrix price to the order line because the order line quantity is a negative quantity. The system uses the item offer price of 3.00 for the order line. The order line qualifies for the 20% source discount, making the price *2.40* (3.00 order line price - 20% source discount = 2.40).
ITM4	1	75.00	C	The system does not apply a quantity price matrix price to the order line because a price and price override reason code were manually entered. The order line does not qualify for the 20% source discount.

Repricing: During repricing, the system reevaluates the order lines on the order to find the final quantity price matrix price.

Item	Line Qty	Price	Price Ovr	Results
ITM1	1			The system applies the following *Quantity Price Matrix Detail* to the order line: item = ITM1, quantity = 1, price = 25.00. The order line qualifies for the 20% source discount, making the price *20.00* (25.00 order line price - 20% source discount = 20.00). During repricing, the order line qualifies for the 5% promotion discount, making the price *19.00* (20.00 order line price - 5% promotion discount = 19.00).
ITM2	2		Q	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 132, item = ITM2, quantity = 2, price = 10.00. The order line qualifies for the 20% source discount, making the price *8.00* (10.00 order line price - 20% source discount = 8.00). During repricing, the system applies the *Price Override Reason for Price Matrix Customer Specials (K42)* to the order. Because this price override reason is assigned to the order line, the order line does not qualify for the 5% promotion discount.
ITM3	1-			The system does not apply a quantity price matrix price to the order line because the order line quantity is a negative quantity. The system uses the item offer price of 3.00 for the order line. The order line qualifies for the 20% source discount, making the price *2.40* (3.00 order line price - 20% source discount = 2.40). Because the order line is for a negative quantity, the order line does not qualify for the 5% promotion discount.

Item	Line Qty	Price	Price Ovr	Results
ITM4	1	75.00	C	The system does not apply a quantity price matrix price to the order line because a price and price override reason code were manually entered. The order line does not qualify for the 20% source discount. During repricing, the order line qualifies for the 5% promotion discount, making the price *71.25* (75.00 order line price - 5% promotion discount = 71.25).

Quantity Price Matrix Pricing in Order Maintenance

During order maintenance, the system does line-level quantity price matrix pricing, but does not do end-of-order quantity price matrix pricing.

Order Maintenance Action	Results
Adding a new line to the order	When you add an order line in order maintenance, the system finds the quantity price matrix price for each individual order line as in order entry; see *Determining the QPM Price to Use* and *Calculating the QPM Price*. If you add more than one order line for the same item, the system will not reprice the order lines based on the total quantity of the item across order lines. *Example:* The following QPM prices are defined: • for a quantity of 1, the price = 5.00 • for a quantity of 2, the price = 4.50 • for a quantity of 3, the price = 3.50 You add order line 3 for a quantity of 1; the system assigns a price of 5.00. You add order line 4 for a quantity of 1; the system assigns a price of 5.00. The system does not assign a price of 4.50 to each order line, even though the total order quantity for the item across order lines is 2.
Changing an existing line on the order	If you change the quantity on an order line in order maintenance, the system will not change the price to show the new quantity price matrix price break that applies to the order line, based on the new order line quantity. *Example:* The following QPM prices are defined: • for a quantity of 1, the price = 5.00 • for a quantity of 2, the price = 4.50 • for a quantity of 3, the price = 3.50 The order quantity for an existing order line is 2 with a price of 4.50. If you change the order line quantity from 2 to 1, the system does not update the price to 5.00 and instead keeps the price of 4.50.

Order Maintenance Action	Results
Repricing an order	The Reprice option is not available in Order Maintenance. When this option is selected, the following error message displays: `Selected function is not valid for current processing mode (Maintain).` If the total quantity ordered for an item or item category across order lines results in the order lines qualifying for a different quantity price matrix price, the system does not apply the new price to the order lines. *Example:* The following QPM prices are defined: • for a quantity of 1, the price = 5.00 • for a quantity of 2, the price = 4.50 • for a quantity of 3, the price = 3.50 Order line 1 has an order quantity of 1 and a price of 5.00. If you add a new order line for an order quantity of 2, the system assigns a price of 4.50 to the order line. Even though the total order quantity across the order lines is 3, the system does not apply the price of 3.50 to the order lines.
Cancelling an existing line on the order	If you cancel an existing order line in order maintenance, the system will not reprice the other order lines on the order that are for the same item that was cancelled to find the new quantity price matrix price that applies to the order lines. *Example:* The following QPM prices are defined: • for a quantity of 1, the price = 5.00 • for a quantity of 2, the price = 4.50 • for a quantity of 3, the price = 3.50 Order line 1 has an order quantity of 1 and a price of 3.50 (based on the total order quantity of 3 across the order lines on the order). Order line 2 has an order quantity of 2 and a price of 3.50 (based on the total order quantity of 3 across the order lines on the order). If you cancel order line 2, the system cancels the order line but does not reprice order line 1 to a price of 5.00, even though the total order quantity across the order lines on the order is now 1.

Quantity Price Matrix Examples

The following quantity price matrix examples demonstrate how the system applies quantity price matrix pricing to an order.

- *Example: QPM Detail Pricing by Item Category*
- *Example: QPM Detail Pricing by Item*
- *Example: QPM Special Pricing by Customer*
- *Example: QPM Special Pricing by Customer Price Group*
- *Example: QPM Special Pricing by Source Code*

Example: QPM Detail Pricing by Item Category

The following price matrix details exist for quantity price matrix 2009.

Item Category	Quantity	Price
STCK	20	4.99
STCK	50	3.99
PENC	2	12.79
PENC	5	12.49
PENC	10	11.99

Customer 108 places an order for source code SPR09.

Initial order line entry: The following lines are added to the order:

Item	Item Category	Line Qty	Results
PENC1	PENC	2	The system applies the following quantity price matrix detail to the order line: item category = PENC, quantity = 2, price = *12.79*.
PENC2	PENC	4	The system applies the following quantity price matrix detail to the order line: item category = PENC, quantity = 2, price = *12.79*.
PENC3	PENC	6	The system applies the following quantity price matrix detail to the order line: item category = PENC, quantity = 5, price = *12.49*.
STCK1	STCK	25	the system applies the following quantity price matrix detail to the order line: item category = STCK, quantity = 20, price = *4.99*.
STCK2	STCK	50	The system applies the following quantity price matrix detail to the order lie: item category = STCK, quantity = 50, price = *3.99*.

Repricing: During repricing, the system reevaluates the order lines on the order to find the final quantity price matrix price.

Item	Item Category	Line Qty	Results
PENC1 PENC2 PENC3	PENC PENC PENC	2 4 6	The total order quantity for items in item category PENC is 12. The system applies the following *Quantity Price Matrix Detail* to each order line: item category = PENC, quantity = 10, price = *11.99*.
STCK1 STCK2	STCK STCK	25 50	The total order quantity for items in item category STCK is 75. The system applies the following *Quantity Price Matrix Detail* to each order line: item category = STCK, quantity = 50, price = *3.99*.

Example: QPM Detail Pricing by Item

The following price matrix details exist for quantity price matrix 2009.

Item Category	Item	Quantity	Price
	CS33	1	.89
	DN55	1	19.99
MAGN		25	1.99
MAGN		50	.99
	MG18	10	46.99
	MG18	25	34.99

Customer 108 places an order for source code SPR09.

Initial order line entry: The following lines are added to the order:

Item	SKU	Item Category	Line Qty	Results
CS33		MAGN	25	The system applies the following *Quantity Price Matrix Detail* to the order line: item = CS33, quantity = 1, price = *.89*.
DN55		MAGN	25	The system applies the following *Quantity Price Matrix Detail* to the order line: item = DN55, quantity = 1, price = *19.99*.
MG18	ROSE	MAGN	10	The system applies the following *Quantity Price Matrix Detail* to the order line: item = MG18, quantity = 10, price = *46.99*.
MG18	GOLD	MAGN	15	The system applies the following *Quantity Price Matrix Detail* to the order line: item = MG18, quantity = 10, price = *46.99*.

Repricing: During repricing, the system reevaluates the order lines on the order to find the final quantity price matrix price.

Item	SKU	Item Category	Line Qty	Results
CS33		MAGN	25	The system applies the following *Quantity Price Matrix Detail* to the order line: item = CS33, quantity = 1, price = *.89*.
DN55		MAGN	25	The system applies the following *Quantity Price Matrix Detail* to the order line: item = DN55, quantity = 1, price = *19.99*.
MG18 MG18	ROSE GOLD	MAGN MAGN	10 15	The total order quantity for item MG18 is 25. The system applies the following *Quantity Price Matrix Detail* to each order line: item = MG18, quantity = 25, price = *34.99*.

Example: QPM Special Pricing by Customer

The following price matrix details exist for quantity price matrix 2009.

Item Category	Quantity	Price
STCK	50	3.99
STCK	100	3.49
PENC	50	3.99
PENC	100	3.49

The following price matrix specials exist for quantity price matrix 2009.

Customer	Item Category	Quantity	Price	% Discount
132	STCK	1	3.00	
132	PENC	1		50%

The price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value is Q.

Customer 132 places an order for source code SPR09.

Initial order line entry: The following lines are added to the order:

Item	Item Category	Line Qty	Results
STCK1 STCK2	STCK STCK	50 100	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 132, item category = STCK, quantity = 1, price = *3.00*.
PENC1	PENC	50	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 132, item category = PENC, % discount = 50%. In this situation, the price = *2.00* (3.99 detail price - 50% discount = 1.995).
PENC2	PENC	100	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 132, item category = PENC, % discount = 50%. In this situation, the price = *1.75* (3.49 detail price - 50% discount = 1.745).

Repricing: During repricing, the system reevaluates the order lines on the order to find the final quantity price matrix price.

Item	Item Category	Line Qty	Override Reason	Results
STCK1	STCK	50	Q	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 132, item category = STCK, quantity = 1, price = *3.00*. Also, because the order line is priced using a quantity price matrix special that uses customer as a qualifier, the system applies the price override reason code defined in the *Price*

Item	Item Category	Line Qty	Override Reason	Results
STCK2	STCK	100	Q	*Override Reason for Price Matrix Customer Specials (K42)* system control value to each order line. Because this price override reason code is assigned to the order line, the system cannot apply any further discounts or promotions to the order line.
PENC1	PENC	50	Q	The total order quantity for item category PENC is 150. The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer = 132, item category = PENC, % discount = 50%. In this situation, the price = *1.75* (3.49 detail price - 50% discount = 1.745). Also, because the order line is priced using a quantity price matrix special that uses customer as a qualifier, the system applies the price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value to each order line. Because this price override reason code is assigned to the order line, the system cannot apply any further discounts or promotions to the order line.
PENC2	PENC	100	Q	

Example: QPM Special Pricing by Customer Price Group

The following price matrix details exist for quantity price matrix 2009.

Item Category	Quantity	Price
STCK	50	3.99
STCK	100	3.49
STCK	150	2.99
ERSR	50	3.99
ERSR	100	3.49
ERSR	150	2.99
ERSR	200	2.49

The following price matrix specials exist for quantity price matrix 2009.

Price Group	Item Category	Item	Quantity	Price	% Discount
TCHR	STCK		1	3.99	
TCHR	ERSR		1		50 %
TCHR		HRT1	1	3.39	

The price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value is Q.

Customer 133 places an order for source code SPR09. Customer 133 belongs to customer price group TCHR.

Initial order line entry: The following lines are added to the order:

Item	Item Category	Line Qty	Results
STK1 STK2	STCK STCK	50 100	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer price group= TCHR, item category = STCK, quantity = 1, price = *3.99*.
ERS1	ERSR	50	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer price group = TCHR, item category = ERSR, quantity = 1, % discount = 50%. In this situation, the price = *2.00* (3.99 detail price - 50% discount = 2.00).
ERS2	ERSR	100	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer price group = TCHR, item category = ERSR, quantity = 1, % discount = 50%. In this situation, the price = *1.75* (3.49 detail price - 50% discount = 1.745).
HRT1	ERSR	100	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer price group = TCHR, item = HRT1, quantity = 1, price = *3.39*.

Repricing: During repricing, the system reevaluates the order lines on the order to find the final quantity price matrix price.

Item	Item Category	Line Qty	Override Reason	Results
STCK1	STCK	50	Q	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer price group = TCH, item category = STCK, quantity = 1, price = *3.99*. Also, because the order line is priced using a quantity price matrix special that uses customer price group as a qualifier, the system applies the *Price Override Reason for Price Matrix Customer Specials (K42)* to each order line. Because this price override reason code is assigned to the order line, the system cannot apply any further discounts or promotions to the order line.
STCK2	STCK	100	Q	See above.

Item	Item Category	Line Qty	Override Reason	Results
ERS1	ERSR	50	Q	The total order quantity for item category ERSR (including item HRT1) is 250. The system applies the following Quantity Price Matrix Customer Special to the order line: customer price group = TCHR, item category = ERSR, % discount = 50%. In this situation, the price = *1.25* (2.49 detail price - 50% discount = 1.245). Also, because the order line is priced using a quantity price matrix special that uses customer as a qualifier, the system applies the *Price Override Reason for Price Matrix Customer Specials (K42)* to each order line. Because this price override reason code is assigned to the order line, the system cannot apply any further discounts or promotions to the order line.
ERS2	ERSR	100	Q	See above.

Item	Item Category	Line Qty	Override Reason	Results
HRT1	ERSR	100	Q	The system applies the following *Quantity Price Matrix Customer Special* to the order line: customer price group = TCHR, item = HRT1, quantity = 1, price = *3.39*. **Note:** The system includes the quantity for this order line in the total quantity for item category ERSR. Because a special price is defined for item HRT1, the system does not apply the special discount defined for the customer price group and item category. Because the order line is priced using a quantity price matrix special that uses customer price group as a qualifier, the system applies the *Price Override Reason for Price Matrix Customer Specials (K42)* to the order line. Because this price override reason code is assigned to the order line, the system cannot apply any further discounts or promotions to the order line.

Example: QPM Special Pricing by Source Code

The following price matrix details exist for quantity price matrix 2009.

Item Category	Quantity	Price
STCK	50	3.99

Item Category	Quantity	Price
STCK	100	3.49

The following price matrix special exists for quantity price matrix 2009.

Source Code	Item	Quantity	% Discount	Exp Date
SUM09	SKU1	1	75 %	08/15/09

On 07/12/09, customer 132 places an order for source code SUM09.

Initial order line entry: The following lines are added to the order:

Item	Item Category	Line Qty	Results
SKU1	STCK	150	The system applies the following *Quantity Price Matrix Source Special* to the order line: source code = SUM09, item = SKU1, quantity = 1, % discount = 75%. In this situation, the price = .87 (3.49 detail price - 75% discount = .8725).

Repricing: During repricing, the system reevaluates the order line on the order to find the final quantity price matrix price.

Item	Item Category	Line Qty	Results
SKU1	STCK	150	The system applies the following *Quantity Price Matrix Source Special* to the order line: source code = SUM09, item = SKU1, quantity = 1, % discount = 75%. In this situation, the price = .87 (3.49 detail price - 75% discount = .8725). The system does not assign the *Price Override Reason for Price Matrix Customer Specials (K42)* to the order line because the discount does not use customer or customer price discount are part of the criteria. If the customer placed this order on 08/16/09, the system would not qualify for the special source discount because the discount expired on 08/15/09.

Quantity Price Matrix Troubleshooting

If the system is not applying the correct quantity price matrix price to an order line, check the following information.

Quantity price matrix set up correctly? Verify that quantity price matrix pricing is set up correctly. See *Quantity Price Matrix Setup* for the system control values and menu options that you should verify.

Correct quantity price matrix used? Verify that the price that you expected is defined in the quantity price matrix that is currently in use. See *Determining the Quantity Price Matrix to Use* for more information on how the system decides which quantity price matrix to use.

Matching currencies? If the *Multi Currency by Offer (E03)* system control value is selected, the currency defined for the offer associated with the source code on the order header must match the currency code defined for the quantity price matrix.

Does the source code allow repricing? To do *End of Order Quantity Price Matrix Pricing* during repricing, the Price method field for the source code on the order header must be set to *Reg Plus Reprice*.

Does the order line qualify for the quantity price matrix? Verify that the order line qualifies for the quantity price matrix.

- If the order line has a manual price override, the system uses the manual price override as the price for the order line.
- If the order line is for a negative order quantity, the system does not apply a quantity price matrix price to the order line; the order line will use the pricing hierarchy defined in this *Pricing Values (B31)* system control value to find the price for the order line.
- If the order line is for a BOGO (Buy One, Get One) discount, the system uses the BOGO discount as the price for the order line.
- Look at the *Work with Order Line Screen (Changing/Adding an Item)* to review the pricing method used to price the order line. If the order line was not priced using a quantity price matrix price, take a look at the pricing hierarchy defined in the *Pricing Values (B31)* system control value to review the sequence in which the system applies line level pricing to an order line. Also, if the *Best Way Pricing (A78)* system control value is selected, the system applies the best price, and not necessarily the quantity price matrix price, to the order line.
- Review the *Quantity Price Matrix Price Hierarchy* to determine if a different quantity price matrix price from the one you expected was applied to the order. The system applies quantity price matrix pricing in the following order: QPM customer specials, QPM source specials, QPM base details.
- Check the order line quantity against the quantity price matrix quantity. To qualify, the order line quantity must match or be greater than the quantity price matrix price. For example, if the order line quantity is 2, the quantity price matrix quantity must be 2 or 1 to apply it to the order line. If the quantity price matrix quantity is greater than the order line quantity, the order line does not qualify for the price.

Does repricing change the price of the order line? If the *Quantity Price Matrix Pricing (K41)* system control value is selected, the system performs *End of Order Quantity Price Matrix Pricing*. The system checks the total order quantity for the item across the lines on the order. During repricing, the system applies the quantity price matrix price to the order line based on the total order quantity of the item across order lines. For example, if the order line quantity is 2, but the item also exists on another order line for a quantity of 1, the quantity price matrix quantity can be 3 or less to apply it to the order line.

- If the order line is priced using a quantity price matrix customer special, the system includes the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
- If the order line contain a manual price override, the system includes the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
- If the order line is for a negative order quantity, the system does not include the order line in the total quantity used for quantity price matrix pricing calculated during repricing.
- If the order line is for a BOGO (Buy One/Get One) discount, the system does not include the order line in the total quantity used for quantity price matrix pricing calculated during repricing.

Quantity price matrix customer special applied? If a *Quantity Price Matrix Customer Special* is applied to the order line, the order line does not qualify for other discounts and promotions, expect for a source % discount. Order lines that are priced using a quantity price matrix customer special are assigned the price override reason code defined in the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value. *Note:* If the *Price Override Reason for Price Matrix Customer Specials (K42)* system control value is blank, the system does not assign a price override reason code to order lines that are priced using a quantity price matrix customer special. In this situation, these order lines qualify for other discounts and promotions.

Applied discount, premium, or promotion? The system decides whether an order qualifies for a discount, premium, or promotion based on the quantity price matrix price that is applied to each order line during repricing and not during initial order entry. See *End of Order Quantity Price Matrix Pricing*.

Was the order modified in order maintenance? During order maintenance, the system does line-level quantity price matrix pricing, but does not do end-of-order quantity price matrix pricing. Because of this, the system may price an order line using a quantity price matrix price, but does not evaluate the total order quantity for an item on the order across order lines. See *Quantity Price Matrix Pricing in Order Maintenance*.

Work with Quantity Price Matrix Screen

Purpose: Use this screen to create and work with quantity price matrix price breaks.

How to display this screen: Enter *WQPM* in the Fast path field or select Work with Quantity Price Matrix from a menu.

Column Sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Quantity price matrixes first display on this screen in alphanumeric matrix code sequence. To review the quantity price matrix with the most recent effective date, click on the Effective Date field until an arrow pointing down displays next to it to display quantity price matrixes in descending effective date sequence.

For more information: See *Determining the Quantity Price Matrix to Use* for more information on how the system decides which quantity price matrix to use on an order.

Field	Description
Matrix	A unique code for a quantity price matrix. Quantity price matrix codes are defined in and validated against the QPM Header table. *Search:* Enter a full or partial matrix code to display quantity price matrixes in alphanumeric order, beginning with your entry. Alphanumeric, 4 positions; optional.

Field	Description
Active	Indicates if the quantity price matrix is active for use. • *Active* = The quantity price matrix is active and can be used for pricing. • *Inactive* = The quantity price matrix is inactive and cannot be used for pricing. *Search mode:* Select a status to display quantity price matrixes that match your entry. Optional.
Effective Date	The date when the quantity price matrix becomes effective. *Search mode:* Enter a valid date to display quantity price matrixes that match your entry. Alphanumeric, 6 positions (in user date format); optional.
Description	A description of the quantity price matrix. *Search mode:* Enter a full or partial description to display quantity price matrixes that include your entry. Alphanumeric, 30 positions; optional.
Currency	A code for the currency associated with the quantity price matrix. This field displays only if the *Multi Currency by Offer (E03)* system control value is *selected*. Currency codes are defined and validated against the Currency table. See Working with Currency (WCUR). *Search mode:* Select a currency code to display quantity price matrixes that match your entry. Optional.

Screen Option	Procedure
Create a quantity price matrix	Select *Create* to advance to the Create Quantity Price Matrix Screen.

Note:

You can also create a new quantity price matrix using the *Copy* option. This method allows you to copy the details of an existing quantity price matrix to the quantity price matrix you are creating. See Copy Quantity Price Matrix Window.

Screen Option	Procedure
Change a quantity price matrix	In the Action field, select *Change* for a quantity price matrix to advance to the Change Quantity Price Matrix screen. At this screen, you can change any field except the quantity price matrix code. See the *Create Quantity Price Matrix Screen* for field descriptions.
Delete a quantity price matrix	In the Action field, select *Delete* for a quantity price matrix to advance to the Confirm Delete window. Select *Yes* to confirm the delete; otherwise, select *No* to cancel the delete. When you delete a quantity price matrix, the system deletes all of the associated details and specials defined for the matrix.
Copy the details defined for one quantity price matrix to a new quantity price matrix	In the Action field, select *Copy* for a quantity price matrix to advance to the *Copy Quantity Price Matrix Window*.
Work with the details of a quantity price matrix	In the Action field, select *Details* for a quantity price matrix to advance to the *Work with Quantity Price Matrix Details Screen*.
Work with the specials defined for a quantity price matrix	In the Action field, select *Specials* for a quantity price matrix to advance to the *Work with Quantity Price Matrix Specials Screen*.

Create Quantity Price Matrix Screen

Purpose: Use this screen to create a quantity price matrix.

How to display this screen: Select *Create* on the *Work with Quantity Price Matrix Screen*.

Field	Description
Matrix	A unique code for a quantity price matrix. Quantity price matrix codes are defined in and validated against the QPM Header table. Alphanumeric, 4 positions. Create: required. Change: display-only.
Description	A description of the quantity price matrix. Alphanumeric, 30 positions; required.
Active	Indicates if the quantity price matrix is active for use. • *Active* = The quantity price matrix is active and can be used for pricing. • *Inactive* = The quantity price matrix is inactive and cannot be used for pricing. Required.
Effective Date	The date when the quantity price matrix becomes effective. Alphanumeric, 6 positions (in user date format); required.

Field	Description
Currency	A code for the currency associated with the quantity price matrix. This field displays only if the *Multi Currency by Offer (E03)* system control value is *selected*. Currency codes are defined and validated against the Currency table. See *Working with Currency (WCUR)*. Required.

Copy Quantity Price Matrix Window

Purpose: Use this window to copy the details and specials of one quantity price matrix to a new quantity price matrix.

To copy:

1. Enter a code in the *Matrix* field. The system validates that the quantity price matrix code you define does not already exist in the QPM Header table.
2. Enter a description of the quantity price matrix in the *Description* field.
3. Enter the date when the quantity price matrix becomes effective in the *Effective Date* field.
4. Select *OK*. The system validates your entries and displays an error message if a value you entered in invalid. Correct any errors and select *OK* again.
5. The system returns you to the *Work with Quantity Price Matrix Screen* and displays the new quantity price matrix in the bottom half of the screen. All of the details and specials defined for the quantity price matrix that you copied have been applied to the new quantity price matrix. Also, the Status and Currency defined for the quantity price matrix that you copied are applied to the new quantity price matrix.

How to display this screen: Select *Copy* for a quantity price matrix at the *Work with Quantity Price Matrix Screen*.

Field	Description
Matrix	A unique code for a quantity price matrix. The system validates that the matrix code you enter does not already exist. Quantity price matrix codes are defined in and validated against the QPM Header table. Alphanumeric, 4 positions; required.
Description	A description of the quantity price matrix. Alphanumeric, 30 positions; required.
Effective Date	The date when the quantity price matrix becomes effective. Alphanumeric, 6 positions (in user date format); required.

Work with Quantity Price Matrix Details Screen

Purpose: Use this screen to work with the base quantity price breaks defined for a quantity price matrix. You can also define special quantity price breaks for a customer, customer price group, or source code at the *Work with Quantity Price Matrix Specials Screen*.

Quantity price matrix details are QPM base prices defined for a specific item and SKU, item, or item category. See *Quantity Price Matrix Detail* for more information on the criteria you can define for an item to qualify for a quantity price matrix detail.

> **Note:**
>
> You cannot create more than one quantity price matrix detail for the same item category and quantity, item and quantity, or item and SKU and quantity.

For more information: See *Determining the QPM Price to Use* for more information on how the system uses the *Quantity Price Matrix Price Hierarchy* to find the quantity price matrix price to apply to an order line.

Uploading quantity price matrix pricing from an external system: You can also upload quantity price matrix details from an external system; see *Work with Pricing Upload (WPUP)* for an overview.

How to display this screen:

- Select *Details* for an existing quantity price matrix at the *Work with Quantity Price Matrix Screen*.
- Select *Details* at the *Work with Quantity Price Matrix Specials Screen*.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Quantity price matrix details first display on this screen in ascending alphanumeric order by item, SKU, and item category sequence, then by ascending quantity.

Field	Description
Matrix	The code of the quantity price matrix whose details you are reviewing. Alphanumeric, 4 positions; display-only.
Description	A description of the quantity price matrix whose details you are reviewing. Alphanumeric, 30 positions; display-only.
Category	A code for the item category associated with the quantity price matrix detail. Item category codes are defined in and validated against the Item Category table. *Search:* Enter a full or partial item category code and select *OK* to display quantity price matrix details that contain your entry. Alphanumeric, 4 positions; optional.
Item	A code for the item associated with the quantity price matrix detail. *Search:* Enter a full or partial item code to display quantity price matrix details that contain your entry. Alphanumeric, 12 positions; optional.

Field	Description
SKU	A code for the SKU of the item associated with the quantity price matrix detail. *Search:* Enter a full or partial SKU code to display quantity price matrix details that contain your entry. Alphanumeric, three 4-position fields; optional.
Qty	The quantity of the item that must be ordered to qualify for the quantity price matrix detail. The item qualifies for the quantity price matrix detail if the order line quantity is less than or equal to the quantity price matrix detail. See *Determining the QPM Price to Use*. *Search:* Enter a quantity to display quantity price matrix details that match your entry. Numeric, 5 positions; optional.
Price	The price of the item when the quantity specified is ordered. *Search:* Enter a price to display quantity price matrix details that match your entry. Numeric, 13 positions with a 2-place decimal; optional.
Tax Inclusive Price	The price of the item on orders subject to tax-inclusive pricing when the quantity specified is ordered. This field displays only if the *Tax Included in Price (E70)* system control value is selected. *Search:* Enter a price to display quantity price matrix details that match your entry. Numeric, 13 positions with a 2-place decimal; Optional.

Screen Option	Procedure
Create a quantity price matrix detail	Select *Create* to advance to the *Create Quantity Price Matrix Details Screen*.
Change a quantity price matrix detail	In the Action field, select *Change* for a quantity price matrix detail to advance to the Change Quantity Price Matrix Details screen. At this screen you can change the Price and Tax Inclusive Price fields. See the *Create Quantity Price Matrix Details Screen* for field descriptions.
Delete a quantity price matrix detail	In the Action field, select *Delete* for a quantity price matrix detail to advance to the Confirm Delete window. Select *Yes* to confirm the delete; otherwise, select *No* to cancel the delete.
Create and work with the specials defined for the quantity price matrix	Select *Specials* to advance to the *Work with Quantity Price Matrix Specials Screen*.

Create Quantity Price Matrix Details Screen

Purpose: Use this screen to create a quantity price matrix detail.

How to display this screen: Select *Create* at the *Work with Quantity Price Matrix Details Screen*.

Field	Description
Matrix	The code of the quantity price matrix whose details you are reviewing. Alphanumeric, 4 positions; display-only.
Description	A description of the quantity price matrix whose details you are reviewing. Alphanumeric, 30 positions; display-only.
Category	A code for the item category associated with the quantity price matrix detail. Item category codes are defined in and validated against the Item Category table. When creating a quantity price matrix detail, you must define an item category or item. You cannot define an item category and item for a quantity price matrix detail. Alphanumeric, 4 positions; required if the Item field is blank.
Item	A code for the item associated with the quantity price matrix detail. Item codes are defined in and validated against the Item table. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. When creating a quantity price matrix detail, you must define an item category or item. You cannot define an item category and item for a quantity price matrix detail. Alphanumeric, 12 positions; required if the Category field is blank.
SKU	A code for the SKU of the item associated with the quantity price matrix detail. SKU codes are defined in and validated against the SKU table. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. *Add Mode:* When creating a quantity price matrix detail: 1. If you define a SKU for the item, only the SKU specified qualifies for the quantity price matrix detail. 2. If you do not define a SKU for the item, all of the SKUs for the item qualify for the quantity price matrix detail. Alphanumeric, three 4-position fields; optional.
Qty	The quantity of the item that must be ordered to qualify for the quantity price matrix detail. The item qualifies for the quantity price matrix detail if the order line quantity is less than or equal to the quantity price matrix detail. See *Determining the QPM Price to Use*. You cannot create more than one quantity price break for the same item category and quantity, item and quantity, or item and SKU and quantity. Numeric, 5 positions; required.
Price	The price of the item when the quantity specified is ordered. You cannot enter a negative price. Numeric, 13 positions with a 2-place decimal; required.

Field	Description
Tax Inclusive Price	The price of the item on orders subject to tax-inclusive pricing when the quantity specified is ordered. You cannot enter a negative price. This field displays only if the *Tax Included in Price (E70)* system control value is selected. Numeric, 13 positions with a 2-place decimal; optional.

Work with Quantity Price Matrix Specials Screen

Purpose: Use this screen to work with the specials defined for a quantity price matrix. At this screen you can work with customer specials and source specials. You can use the *Work with Quantity Price Matrix Details Screen* to work with the base quantity price breaks defined for a quantity price matrix.

- Quantity price matrix customer specials are QPM discount prices that use customer or customer price group as a qualifier. See *Quantity Price Matrix Customer Special* for more information on the criteria you can define for an item to qualify for a quantity price matrix customer special.
- Quantity price matrix source specials are QPM discount prices that use source code, and NOT customer or customer price group, as a qualifier. See *Quantity Price Matrix Source Special* for more information on the criteria you can define for an item to qualify for a quantity price matrix source special.

For more information: See *Determining the QPM Price to Use* for more information on how the system uses the *Quantity Price Matrix Price Hierarchy* to find the quantity price matrix price to apply to an order line.

Uploading quantity price matrix specials from an external system: You can also upload quantity price matrix specials from an external system; see *Work with Pricing Upload (WPUP)* for an overview.

How to display this screen:

- Select *Specials* for a quantity price matrix at the *Work with Quantity Price Matrix Screen*.
- Select *Specials* for a quantity price matrix at the *Work with Quantity Price Matrix Details Screen*.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Initial display: Quantity price matrix specials first display on this screen in the following hierarchy:

- specials that use source code as the qualifier
- specials that use customer price group as the qualifier
- specials that use customer price group and source code as the qualifier
- specials that use customer as the qualifier
- specials that use customer and source code as the qualifer

Within this hierarchy, quantity price matrix specials display in ascending item category, item, SKU and ascending quantity sequence.

Field	Description
Matrix	The code of the quantity price matrix whose specials you are reviewing. Alphanumeric, 4 positions; display-only.
Description	The description of the quantity price matrix whose specials you are reviewing. Alphanumeric, 30 positions; display-only.
Customer	A code for the sold to customer associated with a quantity price matrix special. *Search:* Enter a customer number to display quantity price matrix specials in numeric sold to customer number order. Numeric, 9 positions; optional.
Price Group	The customer price group associated with a quantity price matrix special. *Search:* Enter a customer price group to display quantity price matrix specials in alphanumeric customer price group order. Alphanumeric, 4 positions; optional.
Source	A code for the source code associated with a quantity price matrix special. *Search:* Enter a valid source code to display quantity price matrix specials that contain your entry. Alphanumeric, 9 positions; optional.
Category	A code for the item category associated with a quantity price matrix special. *Search:* Enter a valid item category code to display quantity price matrix specials that contain your entry. Alphanumeric, 4 positions; optional.
Item	A code for the item associated with a quantity price matrix special. *Search:* Enter a valid item code to display quantity price matrix specials that contain your entry. Alphanumeric, 12 positions; optional.
SKU	A code for the SKU of the item associated with a quantity price matrix special. *Search:* Enter a valid SKU code to display quantity price matrix specials that contain your entry. Alphanumeric, three 4-position fields; optional.
Qty	The quantity of the item that must be ordered to qualify for the quantity price matrix special. See *Determining the QPM Price to Use*. *Search:* Enter a quantity to display quantity price matrix specials that match your entry. Numeric, 5 positions; optional.
Price	The price of the item when it qualifies for the quantity price matrix special. *Search:* Enter a price to display quantity price matrix specials that match your entry. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Tax Inclusive Price	The price of the item on orders subject to tax-inclusive pricing when it qualifies for the quantity price matrix special. This field displays only if the *Tax Included in Price (E70)* system control value is selected. *Search:* Enter a price to display quantity price matrix specials that match your entry. Numeric, 13 positions with a 2-place decimal; Optional.
% Discount	The percentage off the quantity price matrix detail price when the item ordered is eligible for the quantity price matrix special. For example, *10* means the item qualifies for a 10% discount. *Example:* The % discount is based on the following criteria: • customer price group = QPM1 • item category = HG • quantity = 2 • % discount = 10 The 10% discount is based on the quantity price matrix detail defined for item category HG and quantity 2: • item category = HG • quantity = 2 • price = 10.00 In this example, the 10% discount is a 1.00 discount (10.00 QPM detail - 10% QPM special = 9.00 discount price) If a quantity price matrix detail is not defined for item category HG and quantity 2, the system uses the next lowest quantity for the item category (in this example, the system uses item category HG and quantity 1). See Calculating the QPM Price for more information on how the system finds the price for a quantity price matrix detail and quantity price matrix special. *Search:* Enter a percentage to display quantity price matrix specials that match your entry. Numeric, 4 positions with a 2-place decimal; optional.
Exp Date	The date the quantity price matrix special expires. The expiration date cannot be earlier than the Effective date defined for the quantity price matrix. *Search:* Enter a date and select *Search* to display quantity price matrix specials that match your entry. Alphanumeric, 6 positions (in user date format); Optional.

Screen Option	Procedure
Create a quantity price matrix special	Select *Create* to advance to the Create Quantity Price Matrix Specials Screen.
Change a quantity price matrix special	In the Action field, select *Change* for a quantity price matrix special to advance to the Change Quantity Price Matrix Special screen. At this screen, you can change the Price, Tax Inclusive Price, % Discount, and Exp Date fields. See the Create Quantity Price Matrix Specials Screen for field descriptions.

Screen Option	Procedure
Delete a quantity price matrix special	In the Action field, select *Delete* for a quantity price matrix special to advance to the Confirm Delete window. Select *Yes* to confirm the delete or select *No* to cancel the delete.
Review quantity price matrix details	Select *Details* to advance to the *Work with Quantity Price Matrix Details Screen*.

Create Quantity Price Matrix Specials Screen

Purpose: Use this screen to create a quantity price matrix special.

How to display this screen: Select *Create* on the *Work with Quantity Price Matrix Specials Screen*.

Field	Description
Matrix	The code of the quantity price matrix whose specials you are reviewing. Alphanumeric, 4 positions; display-only.
Description	The description of the quantity price matrix whose specials you are reviewing. Alphanumeric, 30 positions; display-only.
Customer	A code for the sold to customer associated with a quantity price matrix special. Sold to customers are defined in and validated against the Customer Sold To table. You can enter a sold to customer or customer price group for a quantity price matrix special, but not both. Numeric, 9 positions; required if the Price Group and Source fields are blank.
Price Group	The customer price group associated with a quantity price matrix special. Customer price groups are defined in and validated against the Customer Price Group table. You can enter a sold to customer or customer price group for a quantity price matrix special, but not both. Alphanumeric, 4 positions; required if the Customer and Source fields are blank.
Source	A code for the source code associated with a quantity price matrix special. Source codes are defined in and validated against the Source table. Alphanumeric, 9 positions; required if the Customer and Price Group fields are blank.
Category	A code for the item category associated with a quantity price matrix special. Item category codes are defined in and validated against the Item Category table. You can enter an item category or item for a quantity price matrix special, but not both. If you enter an item category, you must also define a sold to customer, customer price group, or source code. Alphanumeric, 4 positions; required if the Item field is blank.

Field	Description
Item	A code for the item associated with a quantity price matrix special. Item codes are defined in and validated against the Item table. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. You can enter an item category or item for a quantity price matrix special, but not both. If you enter an item, you must also define a sold to customer, customer price group, or source code. Alphanumeric, 12 positions; required if the Category field is blank.
SKU	A code for the SKU of the item associated with a quantity price matrix special. SKU codes are defined in and validated against the SKU table. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. If you enter a SKU, you must also enter the item associated with the SKU in the Item field. If you do not define a SKU code for an item that has SKUs, all of the SKUs defined for the item are associated with the quantity price matrix special. Alphanumeric, three 4-position fields; optional.
Quantity	The quantity of the item that must be ordered to qualify for the quantity price matrix special. See *Determining the QPM Price to Use*. You cannot create more than one quantity price matrix special using the same criteria. Numeric, 5 positions; required.
Price	The price of the item when it qualifies for the quantity price matrix special. You can enter a price or % discount for a quantity price matrix special, but not both. Numeric, 13 positions with a 2-place decimal; required if the % Disc field is blank.
Tax Inclusive Price	The price of the item on orders subject to tax-inclusive pricing when it qualifies for the quantity price matrix special. This field displays only if the *Tax Included in Price (E70)* ysystem control value is selected. Numeric, 13 positions with a 2-place decimal; Optional.

Field	Description
% Discount	The percentage off the quantity price matrix detail price when the item ordered is eligible for the quantity price matrix special. For example, *10* means the item qualifies for a 10% discount. *Example:* The % discount is based on the following criteria: • customer price group = QPM1 • item category = HG • quantity = 2 • % discount = 10 The 10% discount is based on the quantity price matrix detail defined for item category HG and quantity 2: • item category = HG • quantity = 2 • price = 10.00 In this example, the 10% discount is a 1.00 discount (10.00 QPM detail - 10% QPM special = 9.00 discount price) If a quantity price matrix detail is not defined for item category HG and quantity 2, the system uses the next lowest quantity for the item category (in this example, the system uses item category HG and quantity 1). See *Calculating the QPM Price* for more information on how the system finds the price for a quantity price matrix detail and quantity price matrix special. You can enter a price or % discount for a quantity price matrix special, but not both. Numeric, 4 positions with a 2-place decimal; required if the Price or Tax Inclusive Price fields are blank.
Exp Date	The date the quantity price matrix special expires. The expiration date cannot be earlier than the Effective date defined for the quantity price matrix. Alphanumeric, 6 positions (in user date format); Optional.

Work with Promotional Pricing Groups (WPRG)

Purpose: Use the Work with Promotional Pricing Groups function to create and change promotional pricing groups and define the items that the groups include. You can use these groups for promotional pricing. You can promote one or more incentive items at a special price or at no charge if a customer orders a promotional item, an item from a promotional group, or a specified dollar amount.

Promotional pricing: You can use a promotional price group to identify:

- *required items:* the items that for the customer must order to be eligible for a promotional price incentive, and/or
- *incentive items:* the items that you are offering for a reduced or incentive price if the order meets the promotion price requirements.

For example, if you set up two groups, you might set up promotional pricing to offer the customer:

- a reduced or incentive price on any item from group 1 with a qualifying purchase of items from group 1

- a reduced or incentive price on any item from group 1 with a qualifying purchase of items from group 2
- a reduced or incentive price on a specific item with a qualifying purchase of items from group 2
- a reduced or incentive price on a limited quantity of items from group 2 based on a qualifying merchandise dollar value on the order

Once you define the promotional pricing group and specify the items that will be included in each group, use *Work with Promotional Pricing (WPRP)* to define the requirements the customer's order must meet to be eligible for the incentive. For example, you also need to specify a source code or offer for the promotional pricing record.

See *Upselling with Promotional Pricing* for more information on how promotional pricing incentive items are presented in order entry.

> **Note:**
>
> It is not necessary to use promotional pricing groups in order to use promotional pricing. For example, you can use promotional pricing to offer an item at a special price or at no charge when the customer uses a specific source code and meets an order dollar minimum value. See *Work with Promotional Pricing (WPRP)* for more information.

In this topic:

- *Work with Promotional Pricing Groups Screen*
- *Promo Pricing Group Screen (Add Mode)*
- *Work with Promotion Group Details Screen*

Work with Promotional Pricing Groups Screen

How to display this screen: Enter *WPRG* in the Fast Path field at the top of any menu or select the Work With Promotional Pricing Groups option from a menu.

Field	Description
Group	Allows you to enter the code for the promotional pricing group. Numeric, 3 positions; optional.
Description	Allows you to enter a full or partial description of the promotional pricing group. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a promotional pricing group	Select *Create* to advance to the *Promo Pricing Group Screen (Add Mode)*.

Screen Option	Procedure
Change a promotional pricing group	Select *Change* for a group to advance to the Promo Pricing Group screen in Change mode. See *Promo Pricing Group Screen (Add Mode)* for field descriptions. You can change only the Description field.
Delete a promotional pricing group	Select *Delete* for a group to delete it.
Display a promotional pricing group	Select *Display* for a group to advance to the Promo Pricing Group screen in Display mode. See *Promo Pricing Group Screen (Add Mode)* for field descriptions. You cannot change any information on this screen.

Promo Pricing Group Screen (Add Mode)

To create: Select *Create* on the *Work with Promotional Pricing Groups Screen*.

Field	Description
Group	A unique code that represents the pricing group. Promotional price groups categorize the items from which a customer must order to receive an incentive or free item, or an item at a special price. Numeric, 3 positions. Add mode: required. Change mode: display-only.
Description	A description of the pricing group. Alphanumeric, 30 positions; required.

Work with Promotion Group Details Screen

How to display this screen: Complete the *Promo Pricing Group Screen (Add Mode)*, or select *Details* for a group at the *Work with Promotional Pricing Groups Screen*. You can also display this screen by selecting *Add/Change* at the *Promotion Pricing Screen (Add Mode)*, (Change Mode), or (Display Mode).

Field	Description
Item	The number of the item that belongs to this promotional pricing group. The item you enter is validated against the Item table. Alphanumeric, 12 positions; required.
Clr/Size/Wdth	If the item has SKUs, enter the specific SKU of the item that belongs to this promotional pricing group. The SKU you enter is validated against the Item/SKU table. If you do not know the specific SKUs for an item, or if you would like to make all SKUs eligible, you can leave this field blank. Alphanumeric, 14 positions; optional.

To add: This screen displays in Add mode. The cursor is at the Item field, so you can begin adding item information. Once you enter an item, the information is displayed beneath the blank fields, so you can continue to add more item information.

To change or delete: If any items have been previously entered in this table, they are displayed. To change item information, select *Change* to switch to Change mode. You can type over or delete existing information.

Work with Promotional Pricing (WPRP)

Purpose: Use this function to create and change a promotional pricing record. Promotional pricing allows you to promote one or more incentive items at a special price, at a discount off the regular price, or at no charge, if the customer meets the eligibility requirements.

You define in the promotional pricing record:

- the *requirements* a customer's order must meet to be eligible to receive an incentive item. This can include ordering:
- from a specific *source code* or *offer*, and
- from a *promotional group*, or
- a *promotional item*, or
- a specified merchandise *dollar amount*
- *incentive details*, which can include ordering:
- from an incentive group or an incentive item at *no charge*, or
- from an incentive group or an incentive item at a *special price*, or
- from an incentive group or incentive item with a dollar or percentage *discount*

You specify the items that will be available as part of a promotional pricing group using *Work with Promotional Pricing Groups (WPRG)*. You then use the Work with Promotional Pricing option to define the criteria that will make a customer eligible for the incentive. However, it is not necessary to use promotional groups as part of promotional pricing; you can also base the promotion on a specific minimum order dollar value, item, offer, or source code.

> **Note:**
>
> Once you have added an incentive item to an order, the system will not reprice it or reassess tax, regardless of changes to the shipping address, customer tax status, etc.

In order entry: Promotional windows will display in Order Entry only if the order type (see *Establishing Order Types (WOTY)*) indicates to display promotional windows, and if the source code on the order allows promotional pricing. For example, you can suppress promotional windows from displaying for mail or fax orders. See *Upselling with Promotional Pricing* for more information.

> **Note:**
>
> If you have set up pop-up window messages in the Source Code table, in addition to promotional windows, the windows resulting from the Source Code table appear first, before the promotional windows. See *Working with Source Codes (WSRC)*.

In this topic:

- *Work with Promotion Pricing Screen*
- *Promotion Pricing Screen (Add Mode)*

Work with Promotion Pricing Screen

How to display this screen: Enter *WPRP in the* Fast Path field at the top of any menu or select Work with Promotional Pricing from a menu.

Field	Description
ID	The code that identifies a promotional pricing record. Alphanumeric, 5 positions; optional.
Ofr (Offer)	A code representing a catalog or advertisement that you use to present merchandise to your customers. Offers are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.
Source (Source code)	A code representing a group of customers to whom you sell. Source codes are defined in and validated against the Source table. See *Working with Source Codes (WSRC)*. Alphanumeric, 9 positions; optional.
Promotion type	The type of promotion. Valid values are: • *Group* • *Item* • *Order/Dollar* Optional.
Incentive type	The type of incentive for the promotion. Valid values are: • *Item Incentive* • *Group Incentive* Optional.
Seq #	The sequence number specified at the *Promotion Pricing Screen (Add Mode)*. Numeric, 3 positions; display-only.

Screen Option	Procedure
Create a promotional pricing record	Select *Create* to advance to the *Promotion Pricing Screen (Add Mode)*.

Screen Option	Procedure
Change a promotional pricing record	Select *Change* for a promotion to advance to the Promotion Pricing screen in Change mode. At this screen, you can change anything but the Promotion ID. See *Promotion Pricing Screen (Add Mode)* for field descriptions.
Delete a promotional pricing record	Select *Delete* for a promotion to delete it.
Display a promotional pricing record	Select *Display* for a promotion to advance to the Promotion Pricing screen in Display mode. At this screen, you cannot change any information. See *Promotion Pricing Screen (Add Mode)* for field descriptions.

Promotion Pricing Screen (Add Mode)

To create: Select *Create* on the *Work with Promotion Pricing Screen*.

> **Note:**
>
> Your entries on this screen control the window and screen flow in order entry when an order is eligible for promotional pricing. See *Upselling with Promotional Pricing* for an overview.

Field	Description
Promotion ID	A code to identify the promotion. Alphanumeric, 5 positions. Add mode: required. Change mode: display-only.
Seq #	Not currently implemented. Numeric, 3 positions; optional.
Complete either the Offer or Source code field:	
Offer	If you want this promotion to be determined by the offer, enter the code for the offer (catalog, advertisement, etc.) from which the customer must order to be eligible for this promotion. See *Working with Offers (WOFR)*. **Note:** In order to receive promotional pricing for the specified offer, make sure you create item/SKU offer prices for the items/SKUs assigned to the offer. Alphanumeric, 3 positions; required, if you do not enter a source code.

Field	Description
Source code	If you want this promotion to be determined by source code, enter the source code that the customer must use to be eligible for this promotion. See *Working with Source Codes (WSRC)*. **Note:** In order to receive promotional pricing for the specified source code, make sure you create item/SKU offer prices for the items/SKUs assigned to the offer associated with the source code. Alphanumeric, 9 positions; required, if you did not enter an offer.
Type of promotion	Defines the order requirements for a particular promotion. Valid values are: *Group* = Orders that include the required promotional grup item(s) and quantity qualify for the incentive. See *Work with Promotional Pricing Groups (WPRG)*. The Qty required and Required group fields are required with this setting. *Item* = Orders that include the required item and quantity qualify for the incentive. The Required item and Qty required fields are required with this setting. *Order/Dollar* =Orders that meet the required dollar amount qualify for the incentive. The Dollars required field is required with this setting. Required.
Dollars required	If you entered *O* for an order/dollar promotion, enter the merchandise total that the customer must order to be eligible for an incentive. Numeric, 13 positions with a 2-place decimal; required if you entered O in the Type of promotion field.
Required item	If you entered *I* for an item promotion, enter the item that the customer must order to be eligible for an incentive. Alphanumeric, 12 positions; required if you entered *I* in the Type of promotion field.
Qty required	If you entered *I* or *G* for an item or group promotion, enter the order quantity (from the required item or items within the required group) that the customer must order to be eligible for an incentive item or incentive group. Numeric, 5 positions; required if you entered *I* or *G* in the Type of promotion field.

Field	Description
Required group	Enter the code for the promotional group from which the customer must order to be eligible for an incentive item. Numeric, 3 positions; required if you entered *G* in the Type of promotion field.
Combination flag	If you entered a *G* in the Type of promotion field, enter the code that indicates if a combination of items is required for a customer to be eligible for the incentive. Valid values are: 1. *Combination required* 2. blank = combination not required If you select *Combination required*, the customer must order each item in the promotion group (up to the specified required quantity) to be eligible for an incentive. For example, if you set up a promotion group with three items (item 1, item 2, and item 3) and the required order quantity is three, then the customer must order 1 of each item. If the required order quantity is 2, then only 2 of the three items are required, but they must be different items. If you leave this field blank, the order will become eligible for incentives as soon as any item in the promotion group is ordered with the required order quantity. Optional.
Type of incentive	Defines whether a specific item or a group of items will be used as an incentive. Valid values are: *Group* = You must define an incentive group; the item(s) associated with it will appear at the *Select Incentive Group Window* in order entry. *Item* = You must define an incentive item must be defined; it will appear at the *Select Incentive Item Screen* in order entry. Required.
Incentive item	The incentive item. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; required if you entered an *I* in the Type of incentive field.
Clr/Size/Wdth	The incentive item's unique characteristics, such as its color and size. If the incentive item has SKUs but you do not specify a SKU here, the customer will be able select a SKU in order entry. Alphanumeric, three 4-position fields; optional.

Field	Description
Qty limit	The maximum order quantity allowed for an incentive item or item(s) from an incentive group. **Note:** Although the system does not allow you to exceed this quantity at the *Select Incentive Item Screen*, the *Select Incentive Group Window*, or the *SKU Scan Screen*, it is still possible to change the order line to a higher quantity afterward, for example at the *Work with Order Lines Screen (Adding Items to the Order)* or in order maintenance. Numeric, 5 positions; required.
Incentive group	Enter the code for the promotional pricing group. Promotional pricing groups are defined using *Work with Promotional Pricing Groups (WPRG)*. Numeric, 3 positions; required if you entered a G in the Type of incentive field.
You can enter either an Incentive price, Incentive Discount %, Incentive Discount $, or select the No charge flag to indicate the type of incentive you are offering with the promotional pricing.	
Incentive price	The set unit price to charge for an incentive item or item(s) from an incentive group. If you specify an incentive price, you must leave the No charge flag, the Incentive discount %, and the Incentive discount $ fields blank. Numeric, 13 positions with a 2-place decimal; optional.
No charge	Indicates whether to charge for an incentive item or item(s) from an incentive group. Valid values are: *selected* = No Charge *unselected* = priced If you want to offer this item at no charge, select *No Charge*. If you select the No charge flag, you must leave the Incentive price, the Incentive discount %, and the Incentive discount $ fields blank.

Field	Description
Incentive tax price	The unit price to charge for the incentive item if it is subject to VAT. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.
Incentive disc %	The discount percentage to subtract from the selling price of an incentive item. If you specify an Incentive discount percent, you must leave the No charge flag, Incentive price, and Incentive discount $ fields blank. Numeric, 5 positions with a 2-place decimal; optional.
Incentive disc $	The dollar discount to subtract from the unit selling price of an incentive item. If you specify an Incentive discount dollar amount, you must leave the No charge flag, Incentive price, and Incentive discount % fields blank. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Review the items within a promotional group (defined in the Required group field)	Select *Required Grp Dtl* to advance to the *Work with Promotion Group Details Screen*. You cannot change anything on this screen. You need to have set up a promotional group using Work with Promotional Groups in order for details to display.
Review the items in an incentive group (defined in the Incentive group field)	Select *Incentive Grp Dtl* to advance to the *Work with Promotion Group Details Screen*. You cannot change anything on this screen. You must have set up an incentive group using Work with Promotional Groups in order for details to display.

Working with Price Codes (WPCD)

Price codes allow you to define a price discount for items/SKUs in a specified offer or source code when you order a specified quantity. The price code can offer a dollar or percentage off the price of the item, a special price for the item, or a group price for a defined group of items. The system applies price code pricing to an order during repricing and end-of-order pricing.

Assigning items to price codes: Use *Assigning Price Codes (APCD)* to assign items to price codes.

Reviewing price code assignments: Use *Display Price Code Assignments (DPCA)* to review the items/SKUs assigned to a price code by either offer or source code and the requirements that must be met for an order to be eligible for the price code.

Promotions: You can also use price codes as qualifiers for promotions; see *Working with Promotions (WPRO)* for background.

Types of Price Code Discounting

You can offer the following types of price code discounts:

- *Price Code Special Price*
- *Price Code Dollar Discount*
- *Price Code Percent Discount*
- *Price Code Group Price*

Price Code Special Price

This discount provides a special price when you order the required quantity of the items/SKUs defined for the price code.

Example: Regular item price is $24.00, but order two or more of the qualifying items and pay $20.00 for each item. See *Example: Price Code Special Price Discount* for a detailed example.

Price Code Dollar Discount

This discount provides a dollar amount to subtract from the regular item price when you order the required quantity of the items/SKUs defined for the price code.

Example: Order two or more of the qualifying items and receive $2.00 off each item price. See *Example: Price Code Dollar Off Discount* for a detailed example.

Price Code Percent Discount

This discount provides a percentage to subtract from the regular item price when you order the required quantity of the items/SKUs defined for the price code.

Example: Order two or more of the qualifying items and receive 5% off each item price. See *Example: Price Code Percent Off Discount* for a detailed example.

Price Code Group Price

Example: Buy a shirt and tie and pay $50.00 total. See *Example: Price Code Group Price Discount* for a detailed example.

Prorating the group price: The system applies the group price discount to each order line on a pro-rata basis.

```
extended amount of the detail line before applying discounts / discountable
order merchandise total = discount percentage
```

```
pre-discount unit price of the detail line - [(total discount amounts to prorate
* discount percentage from above calculation) / line unit quantity] = unit
selling price
```

Example: An order contains the following order lines:

Line#	Quantity	Price	Extended Price
1	1	15.00	15.00
2	1	25.00	25.00

Order lines 1 and 2 qualify for price code 505: $30.00 total for 2.

The merchandise total for the lines before the group price discount is *$40.00* (15.00 + 25.00), meaning the group price discount results in *$10.00* off the merchandise total.

The system calculates the discount percentage for order line 1: *15.00* `order line extended price` / *40.00* `discountable order merchandise total` = *.375*

The system calculates the unit selling price for order line 1: *15.00* `pre-discount unit price` - *[(10.00* `total discount amount to prorate` * *.375* `discount percentage from above calculation`*)* / *1* `line unit quantity`*]* = *11.25* `unit selling price`

The system calculates the discount percentage for order line 2: *25.00* `order line extended price` / *40.00* `discountable order merchandise total` = *.625*

The system calculates the unit selling price for order line 2: *25.00* `pre-discount unit price` - *[(10.00* `total discount amount to prorate` * *.625* `discount percentage from above calculation`*)* / *1* `line unit quantity`*]* = *18.75* `unit selling price`

Line#	Quantity	Discounted Price	Extended Price
1	1	11.25	11.25
2	1	18.75	18.75

Allow Multiples?

The Allow Multiples setting defines how an order can qualify for a price code discount multiple times.

- *Unselected* = Once an order qualifies for the price code based on the price code quantity requirement, the system applies the price code discount to all qualifying items on the order that are not already assigned to a price code.
- *Selected* = Once an order qualifies for the price code based on the price code quantity requirement, the remaining items on the order that are not already assigned to a price code must meet the price code quantity requirement again in order to qualify for the price code. The Distinct By setting defines how the system determines whether the order meets the price code multiple requirement.

Distinct By:

- *Blank* = The order must meet the price code quantity requirement again in order to qualify. *Example:* If the Quantity required is 3, the order must contain 3 items/ SKUs defined for the price code in order to qualify. If the order contains 7 items that qualify, the system applies the price code to 6 of the items.
- *Item* = The quantity requirement for the price code requires separate *items* assigned to the price code in order to qualify. *Example:* If the Quantity required is 3, the order must contain 3 separate items defined for the price code in order to qualify.
- *SKU* = The quantity requirement for the price code requires separate *SKUs* assigned to the price code in order to qualify. *Example:* If the Quantity required is 3, the order must contain 3 separate SKUs defined for the price code in order to qualify.
- *Category* = The quantity requirement for the price code requires separate *item categories* for the items assigned to the price code in order to qualify. *Example:* If

the Quantity required is 3, the order must contain 3 separate item categories for the items defined for the price code in order to qualify.

In this topic:

- *Price Code Setup*
- *Regular Price Code Pricing*
- *Examples*
  - *Example: Price Code Special Price Discount*
  - *Example: Price Code Dollar Off Discount*
  - *Example: Price Code Percent Off Discount*
  - *Example: Price Code Group Price Discount*
  - *Example: Applying Multiple Price Codes to the Order*
  - *Example: Item Qualifies for More than One Price Code*
  - *Example: Price Code Multiples and Distinct By*
- *Work with Price Codes Screen*
- *Create Price Code Screen*
- *Work with Qualifying Customer/Price Groups Screen*

Price Code Setup

Before you can use the price code pricing method, you must:

1. Create a price code.
2. Define the sold to customers and customer price groups that qualify for the price code. If you do not define any sold to customers or customer price groups, then ALL sold to customers and customer price groups qualify for the price code.
3. Assign items, by either offer or source code, to the price code. See *Assigning Price Codes (APCD)* for more information.
4. Select the *Price Codes (D93)* system control value to perform price code pricing during repricing and end-of-order pricing.
5. If the *Customer Price Group Code for CPG Pricing Only (L58)* system control value is blank, the system performs .
6. If the *Customer Price Group Code for CPG Pricing Only (L58)* system control value contains a customer price group, the system performs *Customer Price Group Price Code Pricing*.

Price Code upload: The *Price Code Upload Table (PriceCdUpload)* allows you to upload price code information from an external system. Use the *Upload* option on the *Work with Price Codes Screen* to perform the *Price Code Upload Process*. This process creates, updates, and deletes records in the Price Code, Price Code Customer, and Price Code Details tables. See *Price Code Upload* for more information.

To manually set up price code information:

#	Step
1.	Use the *Create Price Code Screen* to create a price code. 1. *Special Price*: Enter the discounted price in the *Special price* field. If the *Tax Included in Price (E70)* system control value is *selected*, define the discounted price for orders subject to VAT in the *Tax inclusive price for special price* field. 2. *Dollar Off:* Enter the dollar off the item price in the *Dollar discount* field. 3. *Percentage Off:* Enter the percentage off the item price in the *Percent discount* field. 4. *Group Price:* Enter the discounted price for the group of items in the *Group price* field and select the *Allow Multiples* flag. Use the *Distinct By* field to define how the system determines whether the order meets the multiple requirement. If the *Tax Included in Price (E70)* system control value is *selected*, define the discounted price for orders subject to VAT in the *Tax inclusive price for group price* field.
2.	Use the *Work with Qualifying Customer/Price Groups Screen* to define the sold to customers and customer price groups that qualify for the price code. **Note:** If you do not define any sold to customers or customer price groups for a price code, then ALL sold to customers and customer price groups qualify for the price code.

#	Step
3.	Use the *Work with Price Codes for Offer Screen* to assign items, by either offer or source code, to the price code. You can assign more than one price code to each item/offer or item/source combination. If more than one price code applies to an order, the system: 1. If you use *Regular Price Code Pricing*, uses the price code with the lowest sequence number. If two price codes have the same sequence number, the system applies the price code with the lowest numeric price code. If order lines remain on the order that are not assigned a price code, the system applies the price code with the next lowest numeric price code, until all of the eligible lines on the order are assigned to a price code. 2. If you use *Customer Price Group Price Code Pricing*, uses the price code that provides the greatest discount to the order. If eligible lines remain on the order that are not assigned a price code, the system applies the price code that provides the next greatest discount to the order, until all of the eligible lines on the order are assigned to a price code. **Note:** Regardless of the sequence number and price code number, price code assignments by source code take precedence over price code assignments by offer. For example, if the items on an order are assigned to price code 10 with a sequence number of 20 by source code, and also assigned to price code 2 with a sequence number of 1 by offer, price code 10 overrides price code 2.

Assigning Price Codes (APCD)

Purpose: Use the Assign Price Codes function to assign price breaks (defined with *Working with Price Codes (WPCD)*) to items by source code or offer.

You can assign one or more price codes to each item/source code and item/offer combination, and you can assign the same price codes to a group of items. Typically, you might assign the same price code or sequence of price codes to items that appear together in a catalog. In Order Entry, the system reprices items eligible for price codes repricing when you select *Reprice* at the Order Detail screen.

Reviewing price code assignments: Use *Display Price Code Assignments (DPCA)* to review the items/SKUs assigned to a price code by either offer or source code and the requirements that must be met for an order to be eligible for the price code.

In this topic:

- *Assign Price Codes Screen*
- *Work with Price Codes for Offer Screen*
- *Changing Price Code Assignments*

Assign Price Codes Screen

Purpose: Use this screen to assign a price code to an item by offer or source code.

How to display this screen: Enter *APCD* in the Fast path field at the top of any menu or select Assign Price Codes from a menu.

Field	Description
Item	A code representing a unit of inventory that you sell. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; required.
SKU (Unlabeled field(s) to the right of the item field)	The item's unique characteristics, such as its color or size. Alphanumeric, three 4-position fields; optional.
Offer	A catalog, advertisement, or other means you use to present merchandise to your customers. The price code defined for an item/offer combination applies to orders whose header-level source code points to the offer. Offers are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required if you do not enter a source code.
Source	A code you use to group a segment of your customers. The price code defined for this item/source code combination applies to orders with this source code on the order header. Source codes are defined in and validated against the Source Code table. See *Working with Source Codes (WSRC)*. Alphanumeric, 9 positions; required if you do not enter an offer

> **Note:**
>
> You have the option of assigning a price code to an item by either offer or source code. If you assign price codes to an item by both methods, the price codes assigned by source code take precedence.

To enter an item and offer or source code to be assigned price codes, complete the Item field, the SKU information if desired, and either the Offer or Source code field.

You advance to the *Work with Price Codes for Offer Screen* if you entered an offer code, or the Work with Price Codes for Source if you entered a source code.

Work with Price Codes for Offer Screen

Purpose: You can work with price codes for offer or source in either Add mode or Change mode. When you advance to this screen to first assign price codes to an item, it is in Add mode; see *Changing Price Code Assignments* for a discussion of Change mode.

How to display this screen: You advance to either the Work with Price Codes for Offer or Work with Price Codes for Source screen when you select *OK* at the *Assign Price Codes Screen*. You can also switch to Add Mode from Change mode on either screen by selecting *Add Price Codes*.

Price code: Enter as many price codes as apply to this item/offer or item/source combination. The price code is a three-position, numeric field. The system validates your entries against the Price Code table.

See *Assign Price Codes Screen* for the remaining fields on this screen.

Screen Option	Procedure
Change existing price codes	Select *Change* to switch to Change mode. See *Changing Price Code Assignments*.

Changing Price Code Assignments

Purpose: Use the Work with Price Codes for Source screen or this screen in Change mode to review or delete price codes that have been assigned to an item/offer or item/source combination. The *Work with Price Codes for Offer Screen* in Change mode is identical, except that the source code displays instead of the offer. Each field on this screen is described under *Assign Price Codes Screen* or *Work with Price Codes for Offer Screen*.

How to display this screen: You advance to these screens from the *Assign Price Codes Screen* when you enter an item/offer or item/source combination that already has price codes assigned to it, or from the Work with Price Codes for Offer or *Work with Price Codes for Offer Screen* in Add mode when

- you enter one or more price codes, or
- select *Change*.

To delete: Select *Delete* for a price code to delete it.

> **Note:**
>
> No message displays when you select *Delete*; the system simply removes the price code.

Display Price Code Assignments (DPCA)

Price codes allow you to define a price discount for items/SKUs in a specified offer or source code when you order a specified quantity. The price code can offer a dollar or percentage off the price of the item, a special price for the item, or a group price for a defined group of items. The system applies price code pricing to an order during repricing and end-of-order pricing.

1. Use *Working with Price Codes (WPCD)* to create a price code and to define the requirements that must be met for an item to be eligible for the price code. In addition, the *Price Code Upload Table (PriceCdUpload)* allows you to upload price code information from an external system. Use the *Upload* option on the *Work with Price Codes Screen* to perform the *Price Code Upload Process*. This process creates, updates, and deletes records in the Price Code, Price Code Customer, and Price Code Details tables. See *Price Code Upload* for more information.
2. Use *Assigning Price Codes (APCD)* to assign items/SKUs to a price code by offer or source code.
3. Use Display Price Code Assignments (DPCA) to review the items/SKUs assigned to a price code by offer or source code and the requirements that must be met for an order to be eligible for the price code. **Note:** You must use the *Work with Qualifying Customer/ Price Groups Screen* in *Working with Price Codes (WPCD)* to review the customer price groups and sold to customers that qualify for the price code discount.

For more information: See:

- *Types of Price Code Discounting* for an overview on the types of price code discounting you can offer.
- *Price Code Setup* for more information on how to set up a price code pricing method.
- *Regular Price Code Pricing* for an overview of price code pricing when the *Price Codes (D93)* system control value is selected.
- *Customer Price Group Price Code Pricing* for an overview on price code pricing when the *Customer Price Group Code for CPG Pricing Only (L58)* system control value contains a customer price group code.

Price Code Assignments

Display Price Code Assignments Screen

Purpose: Use this screen to review the items/SKUs assigned to a price code by either offer or source code and the requirements that must be met for an order to be eligible for the price code.

How to display this screen: Enter *DPCA* in the Fast path field at the top of any menu or select Display Price Code Assignment from a menu.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Price codes first display on this screen in ascending alphanumeric price code, item/SKU sequence.

Field	Description
Price Code	The price code that defines a repricing method you offer to your customers when they order a sufficient quantity of items associated with this price code. Price codes are defined in and validated against the Price Code table. **Search:** Enter a valid price code to display price codes that starts with your entry. Numeric, 7 positions; optional.
Description	A description of the price code. Alphanumeric, 30 positions; display-only.
Item	A code representing an item assigned to the price code. Item codes are defined in and validated against the Item table. **Search:** Enter a valid item code to display price codes that match your entry. Alphanumeric, 12 positions; optional.
SKU	The SKU of an item assigned to the price code. SKU codes are defined in and validated against the SKU table. **Search:** Enter a valid SKU code to display price codes that contains your entry. Alphanumeric, 14 positions; optional.

Field	Description
Offer	An offer code assigned to the price code. The price code defined for an item/offer combination applies to orders whose header-level source code points to the offer. Offers are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. **Search:** Enter a valid offer code to display price codes that match your entry. Alphanumeric, 3 positions; optional.
Source	A source code assigned to the price code. The price code defined for an item/source code combination applies to orders with this source code on the order header. Source codes are defined in and validated against the Source Code table. See *Working with Source Codes (WSRC)*. **Search:** Enter a valid source code to display price codes that match your entry. Alphanumeric, 9 positions; optional.

Screen Option	Procedure
Review the details of a price code	In the Action field, select *Display* for a price code assignment to advance to the *Display Price Code Window*.
Review the qualifying customers and/or price groups for a price code	In the Action field, select *Qual CPG* to advance to the *Display Qualifying Customer/Price Groups Screen*.

Display Price Code Window

Purpose: Use this window to review the details of a price code.

How to display this screen: Select *Display* for a price code assignment on the *Display Price Code Assignments Screen*.

Field	Description
Price Code	The price code that defines a repricing method you offer to your customers when they order a sufficient quantity of items associated with this price code. Price codes are defined in and validated against the Price Code table. Numeric, 7 positions; display-only.
Description	The description of the price code. Alphanumeric, 30 positions; display-only.
Start Date	The beginning date when the price code discount becomes effective. Numeric, 6 positions (in user date format); display-only.
End Date	The end date when the pice code discount becomes effective. Numeric, 6 positions (in user date format); display-only.

Field	Description
Qty Required	The total quantity the customer must order of all qualifying items to get the price break. **Note:** The system evaluates minimum price code quantity by ship-to address. Numeric, 7 positions; display-only.
Distinct By	The method the system uses to determine whether the customer ordered the quantity required to receive the group price. Valid values: • *Item* = The quantity required is by item. • *SKU* = The quantity required is by SKU. • *Category* = The quantity required is by item category. Display-only.
Special Price	The special price to charge the customer for all qualifying items associated with the price code. Numeric, 13 positions with a 2-place decimal; display-only.
Tax Inclusive (Special) Price	The special price to charge the customer for all qualifying items associated with the price code on orders subject to VAT. This field displays only if the Tax Included in Price (E70) system control value is *selected*. **Note:** If an order is subject to VAT, but the item is subject to a price code with a only a special price and not a Tax-inclusive price, the system uses the special price for the price code. Numeric, 13 positions with a 2-place decimal; display-only.
Dollar Discount	The dollar amount to subtract from the regular price of each qualifying item associated with the price code. In the *Tax Included in Price (E70)* system control value is *selected*, the system applies the discount against the regular tax-inclusive price to calculate the tax-inclusive price code price. Numeric, 13 positions with a 2-place decimal; display-only.
Percent Discount	The percentage of the regular item price to subtract for each qualifying item associated with the price code. If the *Tax Included in Price (E70)* system control value is *selected*, the system applies the discount against the regular tax-inclusive price to calculate the tax-inclusive price code price. Numeric, 5 positions with a 2-place decimal; display-only.

Field	Description
Group Price	The group price to charge the customer for all qualifying items associated with the price code. Numeric, 13 positions with a 2-place decimal; display-only.
Tax Inclusive (Group) Price	The group price to charge the customer for all qualifying items associated with the price code on orders subject to VAT. This field displays only if the *Tax Included in Price (E70)* system control value is *selected*. **Note:** If an order is subject to VAT, but the item is subject to a price code with a only a special price and not a Tax-inclusive price, the system uses the special price for the price code. Numeric, 13 positions with a 2-place decimal; display-only.
Allow Multiples	Defines whether the order qualifies for a discount multiple times if the correct number of qualifying items/SKUs is added to the order. • *Selected* = Allow multiples. • *Unselected* = Do not allow multiples. Display-only.
Sequence	The order in which the system evaluates whether a price code applies to an order. *Regular Price Code Pricing*: If an order qualifies for two or more price codes, the system uses the price code with the lowest sequence number. If two price codes have the same sequence number, the system uses the price code with the lowest price code number. *Customer Price Group Price Code Pricing*: If an order qualifies for two or more price codes, the system uses the price code that provides the greatest discount to the order. If two price codes provide the same discount, the system uses the price code with the lowest sequence number. If two price codes have the same sequence number, the system uses the price code with the lowest price code number. Numeric, 7 positions; display-only.

Display Qualifying Customer/Price Groups Screen

Purpose: Use this screen to review the customers and/or price groups that qualify for the price code.

How to display this screen: Select *Qual CPG* for a price code assignment at the *Display Price Code Assignments Screen*.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Qualifying customers and customer price groups first display on this screen in ascending sold to customer number, then ascending customer price group code sequence.

Field	Description
Price Code	The price code that defines a repricing method you offer to your customers when they order a sufficient quantity of items associated with this price code. Price codes are defined in and validated against the Price Code table. Numeric, 7 positions; display-only.
Description unlabeled field to the right of Price Code	A description of the price code. Alphanumeric, 30 positions; display-only.
Group	The code for the customer price group that qualifies for the price code. Customer price groups are defined in and validated against the Customer Price Group table. *Search:* Enter a full or partial customer price group code to display customer price groups that begin with your entry. Alphanumeric, 4 positions; display-only.
Customer	The sold to customer number of a customer that qualifies for the price code. Sold to customers are defined in and validated against the Customer Sold To table. *Search:* Enter a full or partial sold to customer number to display sold to customers that begin with your entry. Numeric, 9 positions; display-only.

Working with Price Tables (WPTB)

Purpose: Use the Work with Price Tables function to define a pricing structure based on unit quantity or total dollars ordered. You can create price breaks for individual items on an order, or for the total order of a group of items. You can also select items to offer as free or reduced-price premiums on qualifying orders.

Unlike other pricing methods, price tables control pricing in both Order Entry and Order Maintenance (other methods apply in Order Entry only). No repricing takes place, however, once you have printed a pick slip for any items on the order.

You can build a table to price most or all of the items and groups of items that you normally offer. By keeping the bulk of your pricing information in the price table, you can reduce the amount of effort required to maintain pricing information.

Examples of Price Table Pricing

Purpose: Price tables provide considerable flexibility in creating pricing structures for your company. The following examples illustrate some of the ways you can use this function.

Example One: Group Quantity Pricing

You sell several similar items on the same page in your catalog. Each item is offered at the same price breaks; the customer qualifies for the price breaks by ordering any combination of these items. Additionally, you plan to offer these items at the same price breaks in several catalogs. Rather than defining price breaks individually for each item/offer combination, you can create a group within a price table to define the price breaks, then assign each item to that price table and group. The price table will always provide the same pricing information for each item within the group.

For example, your items are:

- AA100
- AB200
- AC300
- AD400
- AE500

The price breaks for this group of items are:

Quantity	Price Per Unit
1	$12.99
2-5	$11.99
6-11	$10.99
12+	$9.99

A customer places an order for:

Item	Quantity
AA100	1
AB200	4
AC300	5

The total unit quantity ordered for this group is 10, which falls within the 6-11 range. The customer pays $10.99 per item.

Example Two: Group Quantity with Separate Item Pricing

This example is similar to example one, in that the total unit quantity for the group determines the price break. In this example, however, you can define a separate pricing structure for each item within the group.

For example, page 10 of your catalog includes the following items, and their associated price breaks:

Item	Price for 1-5	Price for 6-11	Price for 12-24	Price for 25+
BA100	$55.99	$53.99	$51.99	$49.99
BB200	$53.99	$51.99	$49.99	$47.99
BC300	$27.99	$25.99	$23.99	$21.99
BD400	$42.99	$39.99	$36.99	$34.99

The customer earns the quantity price break for any combination of these items. For example, an order contains:

Item	Quantity
BA100	2
BB200	2
BC300	2

The total quantity for the group is 6. The customer pays for each item:

Item	Quantity
BA100	$53.99 each
BB200	$51.99 each
BC300	$25.99 each

You can mix and match the pricing structures presented in examples one and two. For example, you can create a group in which some of the items take their prices from the group level (as in example one), while other items have unique pricing (as in example two); yet each item earns its price breaks based on the entire group quantity.

Example Three: Discount by Group Dollars

In this example, you base a discount percentage on the total dollar amount of the group on the order rather than the unit quantity. A pricing structure like this may work best when you sell a group of items with a broad range of prices together.

Your group includes the following items:

Item	Price
CA100	$50.00
CB200	$25.00
CC300	$125.00
CD400	$5.00

You offer a discount based on group dollars as follows:

Total Group Dollars	Discount Percentage
$125-$249	20%
$250-$449	25%
$450-$649	35%
$650-$999	40%
$1000+	50%

If the customer's total order from this group comes to less than $125, you charge the full item price. If the customer's total order from the group comes to $125 or more, however, you subtract the percentage indicated from each item on the order. In the case of CD400, the item unit price would be $4.00 ($5.00 - 20%).

Premiums: You can define a premium item to offer based on item quantity or dollars, group quantity or dollars, or both. A premium can be either a free gift or an item you offer at a reduced price. The system offers the premium item in order entry only if the price of the ordered item is derived from the price table.

Maximum levels for items: You can specify a maximum price level to use for an item, yet define price breaks that exceed that maximum. A maximum price level might be useful if you want to give your Order Entry operators the discretion to exceed that maximum when they feel it is appropriate. For example, you can define a maximum price level for item DD500 as $5.00 apiece for a quantity of 500. If a customer orders 10,000, the Order Entry operator can override the maximum price break and offer the item at $3.50 apiece.

Overriding the maximum: You can use the *Price Table Level Override Code (E05)* to apply the best possible price table pricing to an order line, even if it is beyond the maximum specified in the price table; however, to apply this pricing, you need to:

1. Enter the requested quantity of the item at the *Work with Order Lines Screen (Adding Items to the Order)*using the default pricing
2. Select *Change* for the item to advance to the *Work with Order Line Screen (Changing/ Adding an Item)*
3. Complete this screen by entering the *Price Table Level Override Code (E05)*, but no price for the item

When you select *Reprice* or *Accept*, the system applies the best possible price table pricing.

You can also override the maximum through the order API by passing the *Price Table Level Override Code (E05)* but no price override amount in the *Inbound Order XML Message (CWORDERIN)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> You cannot use the *Price Table Level Override Code (E05)* as a regular price override reason code when you manually enter a price override.

Order Entry and Order Maintenance: When you add each item to an order in Order Entry or Order Maintenance, the price that appears may not indicate the final price break. This is because the system cannot know each price break that may apply to the items until you are through entering them.

Depending on your normal procedure in Order Entry, final price breaks will apply after you select *Accept Order* or *Add Recip*; or, you can display repriced lines by selecting *Reprice*. If the order is eligible for a premium item, the system advances you to the *Display Premiums Screen (Price Table Premiums)* during repricing, initial order accept, and the final order accept. At this screen, you can elect to add the premium item to the order, or delete it if desired. If you select to add the premium item to the order, the system immediately adds the premium item to the order.

To get an accurate picture of pricing and premiums for on order, you should select *Properties* when you add *or* remove items from the order. Additionally, you should reprice in Order Maintenance by selecting *Properties* before you accept the order by selecting *Accept*, to make sure that you have an opportunity to adjust premiums or review pricing with the customer if needed.

> **Note:**
>
> The system does not include items added at no charge as part of a BOGO promotion when determining price table pricing. See *Working with Promotions (WPRO)* for more information.

How the System Selects a Price Table Price for an Item

There are two places on the system where you can define a price table that may apply to an order:

- in the *Price table* field in the Source Code table
- in the *Default Price Table (E04)* system control value.

The table below indicates how the system searches for an item price in different scenarios.

In the situations of:	When you enter the item on the order, the system:	When you accept the order or select Properties, the system:
A *Default Price Table (E04)* is defined in the System Control table and a different price table is defined for the source code	Assigns a price from the source code table if it exists; otherwise, goes through the regular pricing routine for the item	Reprices based on the source code price table, or the default price table if the item record exists there and not in the source code table; otherwise, does not reprice based on price table
A *Default Price Table (E04)* is defined in the System Control table and no price table is defined for the source code	Assigns a price from the default table if you have defined pricing at the item rather than the group level; otherwise, goes through the regular pricing routine for the item	Reprices based on the default price table if the item record exists there; otherwise, does not reprice based on price table
A price table is defined for the source code but no *Default Price Table (E04)* is defined in the System Control table	Assigns a price from the source code table if it exists; otherwise, goes through the regular pricing routine for the item	Reprices based on the source code price table if the item record exists there; otherwise, does not reprice based on price table

Setting up price tables: You might follow the steps below to set up price tables on your system:

1. Create the price table (code and description).
2. Create each price table group within the price table.
3. Create each price table item, and associate each item with a group as desired (you must have first created the price table groups).
4. Create a price override reason code (see *Establishing Price Override Reason Codes (WPOR)*) for exceeding the maximum price break for an item.
5. Specify the *Price table* for each desired source code (the pricing method for the source code should be set to *Reg Plus Reprice*).
6. Specify the system control values related to price tables, described below.

Related system control values: The following system control values affect how the system uses price table information in your company:

- *Default Price Table (E04)*: the price table to use if the Price table field for the Source code is blank, or if the item is not found in the price table defined for the Source code.
- *Price Table Level Override Code (E05)*: the Price Override Reason to use when you give a customer a price break that exceeds the maximum specified for the item in the price table.
- Price Method Sequence/Price Table: the order in which to apply price table pricing relative to other pricing options.
- End of Order Pricing -- Use Price Table Pricing? indicates whether to check a price table for pricing information in Order Entry or Order Maintenance.

For more information:

- system control values: *Setting Up Order Entry Values*
- price table repricing and adding premiums: *Entering Orders*

- establishing price override reason codes: *Establishing Price Override Reason Codes (WPOR)*
- repricing and adding premiums in Order Maintenance: *Changing Item Detail Line Information in Order Maintenance*
- specifying a price table for a source code: *Working with Source Codes (WSRC)*

Work with Price Table Screen

Use this screen to review and work with existing price tables in your company, or to advance to the *Create Price Table Screen*.

How to display this screen: Enter *WPTB* in the Fast path field at the top of any menu, or select Work with Price Tables from a menu.

Field	Description
Table	A code representing a price table. A price table can include one or many item groups and many individual items; you use it to define how you will reprice items based on the customer's total order. Alphanumeric, 5 positions; optional.
Description	The description associated with the price table. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a new price table	Select *Create* to advance to the *Create Price Table Screen*.
Change a price table	Select *Change* for a table to advance to the Change Price Table screen. At this screen, you can change only the description. See *Create Price Table Screen* for field descriptions.
Copy a price table	Select *Copy* for a table to advance to the *Copy Price Table Window*.
Delete a price table	Select *Delete* for a table. If price table details exist, the Confirm Delete pop-up window indicates that dependent records exist and requires you to confirm or cancel.
Display a price table	Select *Display* for a table to advance to the Display Price Table screen. This screen displays only the price table code and description. See Create Price Table Screen for details.
Work with price table items	Select *Work w/Items* for a table to advance to the *First Work with Price Table Item Screen*.
Work with price table groups	Select *Work w/Groups* for a table to advance to the *First Work with Price Table Group Screen*.

Create Price Table Screen

Purpose: Use this screen to add a new price table to your company. You must create the price table here before you define the pricing structure for items and groups.

How to display this screen: Select *Create* at the *Work with Price Table Screen*.

Field	Description
Price table	A code representing a price table you are building to control price breaks for items and groups of items. Alphanumeric, 5 positions. Create screen: required. Change screen: display-only.
Description	The description of the price table. Alphanumeric, 30 positions; required.

Copy Price Table Window

To copy: Select *Copy* for a price table at the *Work with Price Table Screen* to copy all pricing detail to a new price table.

Enter the code and description of the new price table in the To price table and To description fields. See *Create Price Table Screen* for details.

If you enter the code of an existing price table, the system displays a message such as the following:

Price Table 123 Already Exists.

In order to copy all price table information to the destination table, you need to delete the table first and then copy.

First Work with Price Table Item Screen

Purpose: Use this screen to work with each item that takes its pricing from the price table.

How to display this screen: Select *Work w/Items* for a price table at the *Work with Price Table Screen*.

Field	Description
Item	A code representing a unit of inventory that you price with this price table. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; optional.
SKU	Codes representing the item's unique characteristics, such as its color or size. Alphanumeric, three 4-position fields; optional.
Group	This code represents the price table group that the item belongs to. Alphanumeric, 5 positions; optional.

Screen Option	Procedure
Assign a new item to the price table	Select *Create* to advance to the *Create Price Table Item Screen*.
Change price table item information	Select *Change* for an item to advance to the *Second Work with Price Table Item Screen*.
Copy price table item information	Select *Copy* for an item to advance to the *Copy Price Table Item Window*.

Screen Option	Procedure
Delete price table item information	Select *Delete* for an item to delete it from the price table.
Display price table item information	Select *Display* for an item to advance to the *Second Work with Price Table Item Screen*; each field will be display-only.

Create Price Table Item Screen

Purpose: Use this screen to specify the item/SKU to include in a price table before you specify the pricing details for the item.

> **Note:**
>
> If you are going to define a pricing structure for the item based on the total dollars or quantity ordered from a group, you need to define the group before entering all pricing details for the item. See *First Work with Price Table Group Screen*.

How to display this screen: Select *Create* at the *First Work with Price Table Item Screen*.

Field	Description
Item	A code representing a unit of inventory that you price with this price table. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; required
SKU Code	Codes representing the item's unique characteristics, such as its color or size. To set up price table pricing for: 1. All SKUs of a SKUed item: Enter the base item code only. 2. Individual overrides for selected SKUs of a SKUed item: Create price table pricing for individual SKUs in addition to the base item pricing; the individual records act as overrides for these SKUs only. 3. Selected SKUs of a SKUed item: Create price table pricing for the selected SKUs only. Alphanumeric, three 4-position fields; optional.

Completing this screen:

1. Complete the Item field and, optionally, the SKU field(s).
2. You advance to the *Second Work with Price Table Item Screen*.

> **Note:**
>
> If you exit the *Second Work with Price Table Item Screen* without entering pricing information for the item, you return to the *First Work with Price Table Item Screen*. Your cursor will be positioned at the item code you have just entered. You can select *Change* for the item to return to the *Second Work with Price Table Item Screen* and complete the pricing information, or you can delete the item from the price table by selecting *Delete* for the item.

Second Work with Price Table Item Screen

Purpose: Use this screen to define the price structure and premiums for an item.

How to display this screen: Complete the *Create Price Table Item Screen* or select *Change* for an item at the *First Work with Price Table Item Screen*.

> **Note:**
>
> The detail lines at the bottom of the screen display differently depending on whether the pricing type is based on quantity or dollars. The screen below displays the quantity pricing format; the dollars format is presented in Dollar Pricing Level Information by Group.

Field	Description
Price table	The price table containing the item. Alphanumeric, 5 positions; display-only.
Price table description (Unlabeled field to the right of the price table)	The description associated with the price table. Alphanumeric, 30 positions; display-only
Item	A code representing a unit of inventory that you price with this price table. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; display-only
SKU Code	Codes representing the item's unique characteristics, such as its color or size. The SKU displays only if the item has SKUs and if you set up the pricing information for this particular SKU only, rather than all SKUs of the item. Alphanumeric, three 4-position fields; display-only.
Group	The price table group that controls pricing for this item. In order to define a pricing structure whose type is either Group Quantity (type *2*) or Group Dollars (type *3*), you must first create the price table group. See First Work with Price Table Group Screen. If the Pricing type field is set to *1* for Item Quantity yet you enter a price table group code in this field, the system resets the pricing type to *3* for Group Dollars or *2* for Group Quantity, depending on which is the group's pricing type. Alphanumeric, 5 positions; required if the pricing type field is set to either 2 or 3.

Field	Description
Pricing type	Indicates how the system should evaluate when the item qualifies for a price break. If you associate the item with a group by entering a value in the Group field, the system will not allow you to select a pricing type that is not consistent with the group's pricing type. Valid values are: *Item Quantity* = The item qualifies for price breaks based on the total quantity the customer orders of this particular item/SKU. In Order Entry and Order Maintenance, the system will check the pricing detail information you enter at the bottom of this screen to determine how to reprice the item. The system selects the highest pricing level whose quantity is less than or equal to the quantity of the item on the order. **Note:** You cannot associate the item with a group if this field is set to 1. *Group Quantity* (default) = The item qualifies for price breaks based on the total quantity the customer orders of all items associated with the same group. In Order Entry and Order Maintenance, the system checks the pricing detail information you enter at the bottom of this screen, if any, to determine how to reprice the item; if there are no pricing levels defined for the item, the system checks the pricing levels defined for the group. The system selects the highest pricing level whose quantity is less than or equal to the quantity of all items from the group on the order. You cannot select Group Quantity as the pricing type unless the group also uses this pricing type. *Group Dollars* = The item qualifies for price breaks based on the total dollar value of all items on the order associated with the same group. In Order Entry and Order Maintenance, the system checks the pricing detail information you enter at the bottom of this screen, if any, to determine how to reprice the item; if there are no pricing levels defined for the item, the system checks the pricing levels defined for the group. The system selects the highest pricing level whose dollar value is less than or equal to the total value of all items from the group on the order. (For this purpose, the system uses the total value of items using the level 1, or highest, price.) You cannot select Group Dollars as the pricing type unless the group also uses this pricing type. If you select Group Dollars as the pricing type, the system revises the pricing level fields at the bottom of the screen so you can enter dollar level rather than quantity pricing information. See Dollar Pricing Level Information by Group. Required.

Field	Description
Maximum level	Indicates the maximum pricing level to apply to the item in Order Entry or Order Maintenance without a price override. You can define a maximum level if you want to provide your operators the discretion to offer a special price break for certain customers who place larger orders. The operator must use the price override code defined in the *Price Table Level Override Code (E05)* system control value to override the maximum defined here and still apply price table pricing. Numeric, 3 positions; optional.
Item premium	Indicates whether to offer a premium to customers who order a sufficient quantity or dollar total of the item. You can also define premiums at the group level. If you define both, the customer can earn both item premiums and group premiums on the same order. **Note:** The system offers the premium item in order entry only if the price of the ordered item is derived from the price table. When an order qualifies for one or more premiums, you advance to the *Display Premiums Screen (Price Table Premiums)* in Order Entry. (In Order Maintenance, you should select *Properties* to display this screen so that you will be able to change the premium or order information before accepting the order.) At this screen, you can indicate whether to add or remove the premium(s) from the order. The customer may not want the premium item, particularly if it is offered at an additional cost. Valid values are: *Selected* = The customer can earn a premium by ordering this item. *Unselected* (default) = The customer cannot earn a premium by ordering this item, although the total of this item may count toward a group premium.
Item	The item to offer as a premium on qualifying orders. Alphanumeric, 12 positions; required if the Item premium field is selected.
SKU	The SKU information that defines the premium item further. Alphanumeric, three 4-position fields; required if the Item premium field is selected and the premium item has SKUs.
Qty Req (Quantity required)	The total quantity of the item that the customer must order to qualify for the premium item. Numeric, 5 positions; required if the Item premium field is selected and you do not specify a dollar requirement.

Field	Description
$ Req (Dollars required)	The total dollar amount the customer must order of the price table item to qualify for the premium item. This is the net dollar amount; that is, it is calculated after applying price breaks through the price table. Numeric, 13 positions with a 2-position decimal; required if the Item premium field is set to Y and you do not specify a quantity requirement.
Qty to add (Quantity to add)	The quantity of the premium item to add to a qualifying order. Numeric, 5 positions; required if the Item premium field is selected.
Multiple	Indicates whether to multiply the quantity of premium items earned by the number of times the order meets the quantity or dollar requirement. For example, if the quantity requirement is 5 and the customer orders 10, this field indicates whether the customer earns 2 premium items or 1. Valid values are: *Selected* (default) = Multiply the premium items earned. *Unselected* = Offer just one premium item for each qualifying order.
Free gift	Indicates whether the premium item is a free gift. Valid values are: *Selected* = The premium item is free on qualifying orders. *Unselected* (default) = There is a charge for the premium item on qualifying orders. You will need to enter a premium price, below.
Price (Premium price)	The dollar amount to charge for the premium item on qualifying orders. **Premiums Offered at a Discounted Price** The system automatically adds premium items that are offered as a free item to the order. However, if the premium item is offered at a discounted price, instead of offered as a free item, the system does not automatically add the premium item to the order. Instead, you must select *Add to Order* for the premium item at the *Display Premiums Screen (Price Table Premiums)* in order to add the premium item to the order. Numeric, 13 positions with a 2-place decimal; required if the Item premium field is selected and the Free gift field is unselected.
Tax price (Tax-inclusive premium price)	The dollar amount to charge for the premium item on qualifying orders that are subject to VAT. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Quantity Pricing Level Information by Item

The system displays the pricing level fields differently on the *Second Work with Price Table Item Screen* depending on whether you define a pricing type based on quantity or dollar value. A sample of the quantity pricing level field layout is presented below.

In Change mode, you can correct or delete existing pricing information. In Add mode, the pricing information fields are blank and enterable, so you can add new pricing information for the item. Select *Change* to switch between Add and Change modes.

> **Note:**
>
> Do not complete the pricing level fields if you want the item to take pricing level information from the group.

Field	Description
Level	The number of the pricing level. Numeric, 3 positions; display-only, assigned by the system.
Qty (Quantity)	The quantity of the item that the customer must order to qualify for the pricing level. Numeric, 5 positions; required.
Price	The unit price that the customer pays for items that qualify for the pricing level, before calculating any additional discount specified in the price table. Numeric, 13 positions with a 2-place decimal; required.
Disc $ (Discount dollar amount)	The amount to subtract from the unit price of items that qualify for the pricing level. For example, if the price is $10.00, and the discount is $1.00, the actual unit price the customer pays for items that qualify for the pricing level is $9.00. Numeric, 13 positions with a 2-place decimal; optional.
Disc % (Discount percentage)	The percentage to subtract from the unit price of items that qualify for the pricing level. For example, if the price is $10.00, and the discount is 15, the actual unit price the customer pays for items that qualify for the pricing level is $8.50. Numeric, 5 positions with a 2-place decimal; optional.
N/C (No charge)	Indicates whether the item is offered at no charge at this pricing level. You cannot enter a price, discount dollar amount, or discount percentage if the item is no charge. Valid values are: *Selected* = The item is no charge at this pricing level. *Unselected* = This item has a price.
Tax price (Tax-inclusive price)	The unit price that the customer pays for items that qualify for the pricing level, before calculating any additional discount specified in the price table, on orders subject to VAT. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. If the item is subject to VAT, the system applies any discounts as it normally would if using the regular (tax-inclusive) price. Numeric, 13 positions with a 2-place decimal; required.

Quantity pricing level example:

Level	Qty	Price	Disc	$	Disc %	N/C
1	1	10.00	NA	NA	NA	NA
2	5	9.00	NA	NA	NA	NA
3	10	8.50	NA	NA	NA	NA
4	15	8.00	NA	NA	NA	NA

If the customer orders:	the price is
1-4	$10.00 apiece
5-9	$9.00 apiece
10-14	$8.50 apiece
15 or more	$8.00 apiece

Even though you have defined a pricing level for the item, it is still subject to any discounts or premiums defined at the group level if the item is part of a price table group.

Dollar Pricing Level Information by Item

> **Note:**
>
> Do not complete the pricing level fields if you want the item to take pricing level information from the group.

Field	Description
Dollars	The total dollar amount of the item the customer must order to qualify for the pricing level. The system evaluates the total dollars using the first (highest) pricing level. For example, if the first pricing level is $10.00 for total dollars of $50.00, and the next pricing level is $9.00 for total dollars of $100.00, the system multiplies the unit quantity of the item by $10.00 to determine if the item qualifies for the pricing level. Numeric, 13 positions with a 2-place decimal; required.

Dollar pricing level example:

Level	Dollars	Price	Disc	$	Disc %	N/C
1	1.00	10.00	NA	NA	NA	NA
2	25.00	9.00	NA	NA	NA	NA
3	50.00	8.50	NA	NA	NA	NA
4	100.00	8.00	NA	NA	NA	NA

If the Customer's total order from the group comes to	*the price is*
$1.00 - $24.99	$10.00 apiece
$25.00 - $49.99	$9.00 apiece
$50.00 - $99.99	$8.50 apiece
$100.00+	$8.00 apiece

> **Note:**
>
> The total order from the group is calculated using the highest (level one) price.

Even though you have defined a pricing level for the item, it is still subject to any discounts or premiums defined at the group level.

> **Note:**
>
> Complete the pricing level fields only if you want the item to use different pricing level information than the group (if any) it belongs to. If you are changing between a quantity and a dollar pricing type and pricing level information exists for the item, you can use *Clear* to clear the fields so that you can then display the desired field format; however, this will clear all but the default fields (Pricing type, Item premium, Multiple, and Free gift) as well.

Screen Option	Procedure
Switch between Add and Change mode	Select *Change*. If you are currently in Add mode (in which there are blank pricing fields for you to enter) you will switch to Change mode (in which the existing pricing information displays for you to correct or delete it). If you are currently in Change mode, you will switch to Add mode.
Clear all but the default fields	Select *Clear*. **Note:** This option is not available in Add mode.

Copy Price Table Item Window

To copy: Select *Copy* for an item at the *First Work with Price Table Item Screen* to display the Copy Price Table Item pop-up window.

You can copy the information to the same item code in a different price table, a different item code in the same price table, or a different item code in a different price table. Each field on this screen is described under *Create Price Table Screen* and *Second Work with Price Table Item Screen*.

First Work with Price Table Group Screen

Purpose: Use this screen to create, change, copy, delete, or review pricing information for a group of items within a price table.

How to display this screen: Select *Work w/Groups* for a price table at the *Work with Price Table Screen*.

Field	Description
Group	A code representing a group of items within a price table that share pricing information. Alphanumeric, 5 positions; optional.
Description	The description associated with the price table group. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a new price table group	Select *Create* to advance to the *Create Price Table Group Screen*.
Change a price table group	Select *Change* for a group to advance to the *Third Work with Price Table Group Screen*.
Copy a price table group	Select *Copy* for a group to advance to the *Copy Price Table Group Window*.
Delete a price table group	Select *Delete* for a group to delete it.
Display a price table group	Select *Display* for a group to advance to the *Third Work with Price Table Group Screen*; each field will be display-only.

Create Price Table Group Screen

Purpose: Use this screen to define a group's code and description before completing its pricing information.

How to display this screen: Select *Create* at the *First Work with Price Table Group Screen*.

Field	Description
Group	A code representing a group of items within a price table that share the same pricing type, group premium (if any), and, potentially, pricing level information. Alphanumeric, 5 positions; required.
Description	The description associated with the price table group. Alphanumeric, 30 positions; required.

Completing this screen: You advance to the *Second Work with Price Table Group Screen*.

> **Note:**
>
> If you exit the *Second Work with Price Table Group Screen* without entering pricing information for the item, you return to the *First Work with Price Table Group Screen*. Your cursor will be positioned at the group code you have just entered; however, the system will not have created the record. You must create the group again by selecting *Create*.

Second Work with Price Table Group Screen

Purpose: Use this screen to specify pricing information for a group of items within a price table.

How to display this screen: Complete the *Create Price Table Group Screen*.

> **Note:**
>
> The detail lines at the bottom of the screen display differently depending on whether the pricing type is based on quantity or dollars. See Dollar Pricing Level Information by Group.

Field	Description
Price table	The price table containing the group. Alphanumeric, 5 positions; display-only.
Price table description (Unlabeled field to the right of the price table)	The description associated with the price table. Alphanumeric, 30 positions; display-only.
Group	The group of items within the price table whose pricing information you are defining. Alphanumeric, 5 positions; display-only.
Description	The description associated with the price table group, as you defined it on the *Create Price Table Group Screen*. You have the option of changing it here. Alphanumeric, 30 positions; required.
Price type	Indicates how the system should evaluate when items belonging to this group qualify for a price break. Valid values are: *Group Quantity* (default) = Items qualify for price breaks based on the total quantity the customer orders of all items associated with this group. In Order Entry and Order Maintenance, the system checks the pricing detail information you entered for the item, if any, to determine how to reprice the item; if there are no pricing levels defined for the item, the system checks the pricing levels defined for the group. The system selects the highest pricing level whose quantity is less than or equal to the quantity of items from the group on the order. *Group Dollars* = Items qualify for price breaks based on the total dollar value of all items on the order associated with this group. In Order Entry and Order Maintenance, the system checks the pricing detail information you entered for the item, if any; if there are no pricing levels defined for the item, the system checks the pricing levels defined for the group. The system selects the highest pricing level whose dollar value is less than or equal to the total value of items from the group on the order. For this calculation, the system uses each item's level 1 (highest) price. If you select Group Dollars as the price type, the system revises the pricing level fields at the bottom of the screen so you can enter dollar level rather than quantity pricing information. See *Dollar Pricing Level Information by Group*. Required.

Field	Description
Discount % (Discount percentage)	The percentage discount to subtract from the item price of every item within the price table group, after applying any discounts you define at pricing level detail lines, either for an item within the group or at the group level. For example, if you define a discount of 15% here, and an additional discount of $1.00 for the first pricing level for an item or group, the system subtracts the discount amount from a $10.00 price as follows: `$10.00 - $1.00 = $9.00` `$9.00 - $1.35 (15% of $9.00) = $7.65` The customer pays $7.65 for the item. Numeric, 5 positions with a 2-place decimal; optional.
Group premium	Indicates whether the customer can earn a premium item for total orders within the price table group. If you have defined an item premium for an individual item within the group, the customer can earn both premiums. When an order qualifies for one or more premiums, you advance to the *Display Premiums Screen (Price Table Premiums)* in Order Entry. At this screen, you can indicate whether to add or remove the premium(s) from the order. The customer may not want the premium item, particularly if it is offered at an additional cost. (In Order Maintenance, you can display this screen by selecting *Premiums*, and then make any necessary changes before selecting *Accept* to accept.) Valid values are: *Selected* = The customer can earn a premium item. *Unselected* = The customer cannot earn a premium item from this group.
Item	The code representing the item you are offering as a group premium. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; required if the Group premium field is selected.
SKU	The premium item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; required if the Group premium field is selected and the item has SKUs.
Qty reqd (Quantity required)	The total unit quantity the customer must order of items belonging to the group in order to qualify for the premium item. Numeric, 5 positions; required if the Group premium field is selected and you do not specify a dollar requirement.
$ Reqd (Dollars required)	The total dollar amount the customer must order of items within the group to qualify for the premium item. The dollar total is the net total; that is, it is calculated based on the dollars *after* applying discounts and repricing through the price table. Numeric, 13 positions with a 2-position decimal; required if the Group premium field is selected and you do not specify a quantity requirement.
Qty to add (Quantity to add)	The unit quantity of the premium item to add to a qualifying order. Numeric, 5 positions; required if the Group premium field is selected.

Field	Description
Multiple	Indicates whether to multiply the premium item quantity by the number of times the order qualifies for the premium. For example, if the dollar requirement for 2 free premium items is $100.00, and the group total is $200.00, this field indicates whether the customer has earned 2 or 4 premiums. Valid values are: *Selected* (default) = The customer earns an additional premium item (or quantity of the premium item, if the Qty to add field is equal to more than *1*) for each multiple of the qualifying quantity or dollars. *Unselected* = The customer earns only one premium item (or quantity of the premium item, if the Qty to add field is equal to more than *1*) per order.
Free gift	Indicates whether to add the premium item to the order as a free gift, or whether there is a price attached to the premium item. Valid values are: *Selected* = Add the premium item to the order free of charge. *Unselected* (default) = There is a charge for the premium item.
Price	The price to charge for the premium item, if the Free gift? field is *unselected*. **Premiums Offered at a Discounted Price** The system automatically adds premium items that are offered as a free item to the order. However, if the premium item is offered at a discounted price, instead of offered as a free item, the system does not automatically add the premium item to the order. Instead, you must select *Add to Order* for the premium item at the *Display Premiums Screen (Price Table Premiums)* in order to add the premium item to the order. Numeric, 13 positions with a 2-place decimal; required if the Group premium field is selected and the Free gift field is unselected
Tax price (Tax-inclusive premium price)	The dollar amount to charge for the premium item on qualifying orders that are subject to VAT. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Quantity Pricing Level Information by Group

The system displays the pricing level fields differently on the Second Work with Price Table Group Screen depending on whether you define a price type based on quantity or dollar value.

Field	Description
Level	The number of the pricing level. The system assigns a sequential number to each pricing level after you enter the information. Numeric, 3 positions; display-only, assigned by the system.
Qty (Quantity)	The quantity of items within the group that the customer must order to qualify for the pricing level. Numeric, 5 positions; required.
Price	The unit price that the customer pays for items that qualify for the pricing level, before calculating any additional discount. Numeric, 13 positions with a 2-place decimal; required.

Field	Description
Disc $ (Discount dollar amount)	The amount to subtract from the unit price of items that qualify for the pricing level. For example, if the price is $10.00, and the discount is $1.00, the actual unit price the customer pays for items that qualify for the pricing level is $9.00. This discount is applied before the *Discount % (Discount percentage)*, if any, defined for the group. Numeric, 13 positions with a 2-place decimal; optional
Disc % (Discount percentage)	The percentage to subtract from the unit price of items that qualify for the pricing level. For example, if the price is $10.00, and the discount is 15, the actual unit price the customer pays for items that qualify for the pricing level is $8.50. Numeric, 5 positions with a 2-place decimal; optional.
N/C (No charge):	Indicates whether items within the group are offered at no charge at this pricing level. You cannot enter a price, discount dollar amount, or discount percentage if the item is no charge. Valid values are: *Selected* = The items are no charge at this pricing level. *Unselected* = This item has a price at this level.
Tax price (Tax-inclusive price)	The unit price that the customer pays for items in the group that qualify for the pricing level, before calculating any additional discount specified in the price table, on orders subject to VAT. Displayed only if the *Tax Included in Price (E70)* system control value is *selected*. If the item is subject to VAT, the system applies any discounts as it normally would if using the regular (tax-inclusive) price. Numeric, 13 positions with a 2-place decimal; required.

Quantity pricing level example:

Level	Qty	Price	Disc	$	Disc %	N/C
1	1	10.00	NA	NA	NA	NA
2	5	9.00	NA	NA	NA	NA
3	10	8.50	NA	NA	NA	NA
4	15	8.00	NA	NA	NA	NA

If the customer orders:	the price is:
1-4	$10.00 apiece
5-9	$9.00 apiece
10-14	$8.50 apiece
15 or more	$8.00 apiece

If you define pricing level details for any item that belongs to the group, the system uses those prices, although it still uses the total quantity for the group to determine the qualifying price level.

Dollar Pricing Level Information by Group

Field	Description
Dollars	The total dollar amount of items associated with the group that the customer must order to qualify for the pricing level. The system evaluates the total dollars using the first (highest) pricing level. For example, if the first pricing level is $10.00 for total dollars of $50.00, and the next pricing level is $9.00 for total dollars of $100.00, the system multiplies the unit quantity of the item by $10.00 to determine the qualifying price level. Numeric, 13 positions with a 2-place decimal; required.

Dollar pricing level example:

Level	Dollars	Price	Disc	$	Disc %	N/C
1	1.00	10.00	NA	NA	NA	NA
2	25.00	9.00	NA	NA	NA	NA
3	50.00	8.50	NA	NA	NA	NA
4	100.00	8.00	NA	NA	NA	NA

If the customer's total order from the group comes to:	the price is:
$1.00 - $24.99	$10.00 apiece
$25.00 - $49.99	$9.00 apiece
$50.00 - $99.99	$8.50 apiece
$100.00+	$8.00 apiece

> **Note:**
>
> The total order from the group is calculated using the highest (level one) price.

If you have defined unique pricing level information for an item, it is still subject to any discounts or premiums defined at the group level if it belongs to a group.

How to complete this screen: If you are changing between a quantity and dollar pricing type, select *OK* to change the pricing level field format. Complete the pricing level fields only if you want items within the group to inherit group-level pricing information (for each item that has no item-level pricing information defined).

> **Note:**
>
> If you are changing between a quantity and a dollar pricing type and pricing level information exists for the group, you can use *Clear* to clear the fields so that you can then display the desired field format; however, this will clear all but the default fields (Price type, Group premium, Multiple and Free gift) as well.

Third Work with Price Table Group Screen

To change: Select *Change* for a group at the *First Work with Price Table Group Screen*. You can also advance to this screen in display-only mode by selecting *Display* for a group at the First Work with Price Table Group Screen. In change mode, you can change any information on this screen except the price table and group. For field descriptions, see *Second Work with Price Table Group Screen*.

Copy Price Table Group Window

To copy: Select *Copy* for a price table group at the *First Work with Price Table Group Screen* to display this window:

You must complete each field in this window to copy the group. You can copy the group to a different group within the same price table, or to a different price table.

If you *select* the Copy price table item field, the system will copy each price table item along with the group as long as the item does not already exist for that price table. The system will not replace an existing price table item record. If you *select* the Copy price table item field, the system copies only the group information.

The system does not copy the group description. You must select *Change* for the destination group to enter a description.

Package Insert Processing (WPIP)

Package inserts are items to add to an order automatically in Order Entry based on any of the following criteria:

- customer *Class*
- *State* (state)
- *Item*
- item *Class*
- *Item category*
- *Source* code
- *List source*
- *Offer*
- *Promotion code*
- *Mail type (Current, Original)*
- all orders
- *Item category* and *State* (state)

These items are referred to as package inserts because you may want to use this function to identify flyers, catalogs, stuffers and other materials that should be put inside the package (box) with the items the customer ordered. You can also use this function to add any type of promotional item to the order free of charge.

For each criterion (customer class, state, source code etc.), you can define up to 10 items to add to the order if the order meets the specified criterion.

These package insert items must be valid items in the Item table. Once added to the order, these items process through the system as would any item on an order.

When and how are items added: The system determines if the order is eligible for a package insert item during repricing, the initial order accept, and the final order accept; if the order is eligible for a package insert item, the system applies it to the order.

These items are added to the order without any interaction with the operator unless the package insert item requires special handling (monogramming, engraving, etc.).

Retail channel orders (orders whose Internet Order field in the Order Header table is *P*) do not qualify for package insert items.

Special handling: If the package insert item requires special handling, the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen* displays. You can enter special handling information or select *Reject* to exit from the window without entering any special handling instructions.

> **Note:**
>
> If a package insert item contains special handling, the system displays the special handling window during repricing, initial order accept, and the final order accept. This is because the system reevaluates the order to see if it still qualifies for the item, and if it does, the system adds the item back to the order. You will need to reenter any special handling information you had previously defined for the item.

When you create orders through the *Generic Order Interface (Order API)*, even if the package insert item is flagged for special handling, no special handling is applied.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Free of charge: All package insert items are added to the order free of charge using the *Default Price Override Reason (B35)* system control value.

Related system control value: The system adds package insert items to the order (interactive order entry and web orders) only if the *Evaluate Promotional Items/Inserts in Order Entry/Maintenance (E48)* system control value is *selected*.

Multiple package insert items: An order may be eligible for several package insert items if the order meets more than one criterion. Package inserts are added to the order for each criterion met; however, the same package insert are not added more than once. The system evaluates the criteria in the following sequence:

- item category/state combination
- customer class
- state
- item
- item class
- item category
- source code
- list source

- offer
- promotion
- mail type
- all orders

Because all package insert items are added to the order if eligible, sequence is only important if the same item exists under more than one criterion with a different quantity. The quantity that is used is the quantity associated with the first occurrence of the package insert.

For example, if item A is a package insert item for customer class VP with a quantity of 2 and item A is also a package insert for source code B123 with a quantity of 5, and the order matches both the customer class and source code criteria, item A is added to the order with a quantity of 2 because customer class is evaluated before source code.

In this topic:

- *Work with Package Inserts Screen*
- *Work with Inserts for Customer Class Screen*
- *Create Insert for Customer Class Screen*
- *Other Package Insert Criteria*
- *Rules for Adding Package Inserts to Orders*

Work with Package Inserts Screen

Purpose: This screen shows the 12 criteria that can be used to determine whether package insert items should be added to the order.

How to display this screen: Select Work with Package Insert from a menu or enter *WPIP* in the Fast path field at the top of any menu.

Selecting criteria: Select *Work With* for a criterion to advance to the Work with Insert screen for the selected option. For example, if you select *Work With* for customer class, you advance to the *Work with Inserts for Customer Class Screen*.

Every Work with Insert screen contains the qualifying criterion and allows you to define up to 10 items and associated quantities that to add to the order if the order meets the criteria. All of the screens function similarly.

See *Other Package Insert Criteria* for definition of each criterion.

Work with Inserts for Customer Class Screen

Purpose: This screen shows all of the customer classes for which package inserts have been established.

How to display this screen: Select *Work With* for Customer Class at the *Work with Package Inserts Screen*.

Field	Description
Class	A code used to group customers for reporting, upselling, and restrictions or exclusions. Alphanumeric, 2 positions; optional.

Screen Option	Procedure
Create package inserts for the selected criteria	Select *Create* to advance to the *Create Insert for Customer Class Screen*.
Change an insert	Select *Change* for a criterion to advance to the Change Insert for Customer Class screen. For field descriptions, see Create Insert for Customer Class Screen. To remove an existing package insert item, delete the Item and SKU fields and then select *OK*.
Delete an insert	Select *Delete* for a criterion to delete it.
Display an insert	Select *Display* for a criterion to advance to the Display Insert for Customer Class screen. You cannot change any fields on this screen. For field descriptions, see Create Insert for Customer Class Screen.

Create Insert for Customer Class Screen

To create: Select *Create* at the *Work with Inserts for Customer Class Screen*.

Field	Description
Customer class	The customer class for the package insert items. The customer class is a code used to identify a group of customers. You assign a customer to a customer class in the Customer Sold-to table. Customer class codes are defined in the Customer Class table. See *Setting Up the Customer Class Table (WCCL)*. If the sold-to customer on the order is assigned this customer class, the items listed below are automatically added to the order. Alphanumeric, 2 positions; required.
Item	The code for the item to automatically add to the order if the sold-to customer is associated with this customer class. The item you enter is validated against the Item table. The item cannot be a variable set (*V* kit type). You can define up to 10 items for a particular customer class. You must enter at least one item. Alphanumeric, 12 positions; required.
Colr/Size/Othr	The style of the item, such as its color and size. Use these fields to enter the SKU code for the item to automatically add to the order. The SKU you enter is validated against the SKU table. Alphanumeric, three 4-position fields; required if the item has SKUs.
Qty (Quantity)	The number of units of the item to add automatically to the order. If the item has a sell quantity defined in the Item table, the quantity entered here should be a multiple of the sell quantity. Numeric, 7 positions; required.

Other Package Insert Criteria

Package inserts can automatically be added to an order based on 12 criteria in addition to customer class, described under *Create Insert for Customer Class Screen*.

Field	Description
Inserts for Item Category/State Combination	
Item Category	The item category for which the package inserts have been defined. The item category is validated against the Item Category table. See *Working with Item Classes (WICL)*. If the ship-to customer on the order is associated with the specified country/state and the customer orders any item belonging to this item category and the item is not soldout, the associated package inserts are automatically added to the order. Alphanumeric, 4 positions; required.
Country	The country for which the package inserts have been defined. Country codes are defined in and validated against the Country table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. If the ship-to customer on the order is associated with this country/state and the customer orders any item belonging to the specified item category and the item is not soldout, the associated package inserts are automatically added to the order. Alphanumeric, 3 positions; required.
State	The state for which the package inserts have been defined. State codes are defined in and validated against the State table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. If the ship-to customer on the order is associated with this country/state and the customer orders any item belonging to the specified item category and the item is not soldout, the associated package inserts are automatically added to the order. Alphanumeric, 2 positions; required only if the country requires state.
Inserts for State	
Country	The country for which the package inserts have been defined. Country codes are defined in and validated against the Country table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. If the ship-to customer on the order is associated with this state, the associated package inserts are automatically added to the order. Alphanumeric, 3 positions; required.
State	The state for which the package inserts have been defined. State codes are defined in and validated against the State table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. If the ship-to customer on the order is associated with this state, the associated package inserts are automatically added to the order. Alphanumeric, 2 positions; required only if the country requires state.
Inserts for Item	

Field	Description
Item	The item for which the package inserts have been defined. The item is validated against the Item table. If the customer orders this item and the item is not soldout, the associated package inserts are automatically added to the order. Alphanumeric, 12 positions; required.
Colr/Size/Othr	Optionally, the SKU for which the package inserts have been defined. The SKU is validated against the SKU table. See *Performing Initial Item Entry (MITM)*. If the customer orders this item and the item is not soldout, the associated package inserts are automatically added to the order. If no SKU is defined, the package inserts are added to the order if the customer orders any SKU of the item. Alphanumeric, three 4-position fields; optional.
Inserts for Item Class	
Item Class	The item class for which the package inserts have been defined. The item class is validated against the Item Class table. See *Working with Item Classes (WICL)*. If the customer orders any item belonging to this item class and the item is not soldout, the associated package inserts are automatically added to the order. Alphanumeric, 3 positions; required.
Inserts for Item Category	
Item Category	The item category for which the package inserts have been defined. The item category is validated against the Item Category table. See *Working with Item Classes (WICL)*. If the customer orders any item belonging to this item category and the item is not soldout, the associated package inserts are automatically added to the order. Alphanumeric, 4 positions; required.
Inserts for Source	
Source Code	The source code for which the package inserts have been defined. The source code is validated against the Source Code table. See *Working with Source Codes (WSRC)*. If the customer places an order and this is the source code on the header of the order, the associated package inserts are automatically added to the order. Alphanumeric, 9 positions; required.
Inserts for List Source	
List Source	The list source for which the package inserts have been defined. The list source is entered on the Source Code table. No validation occurs. See *Working with Source Codes (WSRC)*. If the customer places an order and the source code on the header of the order is associated with this list source, the associated package inserts are automatically added to the order. Alphanumeric, 7 positions; required.

Field	Description
Inserts for Offer	
Offer	The offer for which the package inserts have been defined. The offer is validated against the Offer table. See *Working with Offers (WOFR)*. If the customer places an order and the source code on the header of the order points to this offer, the associated package inserts are automatically added to the order. Alphanumeric, 3 positions; required
Inserts for Promotion	
Promotion	The promotion for which the package inserts have been defined. The promotion is validated against the Promotion table. See *Working with Promotions (WPRO)*. If the customer places an order and the source code on the header of the order points to this promotion, the associated package inserts are automatically added to the order. Alphanumeric, 7 positions; required
Inserts for Mail Type	
Mail Type	The mail type for which the package inserts have been defined. Valid mail types are: *B* = buyer *C* = catalog request *R* = recipient *L* = rental *S* = suspect/prospect *' '* (blank) = no mail type defined See *Work with User Fields Screen*. If sold-to customer has this current mail type, the associated package inserts are automatically added to the order. For example, if the sold-to customer has a current mail type of C (catalog request), the package inserts created for mail type C is automatically added to the order. Alphanumeric, 1 position; required or leave blank to define package inserts for customers with no current mail type.
Inserts for All Orders	
All	All Package inserts defined under this criterion are added to every order. When you select this option, no value is entered. You just enter the package insert items and quantities.

Rules for Adding Package Inserts to Orders

- If the order is a multiple-recipient order, each order is evaluated on an order ship-to by order ship-to basis when determining whether the order qualifies for a package insert.
- The package insert item is not added to the order if the qualifying item (through either item, item class, or item category) is soldout.
- The system evaluates the order to determine if it is eligible for the package insert during repricing, initial order accept, and final order accept; if the order is no longer eligible, the system deletes it.

- The package insert item is added to the order using the earliest arrival date of any one open item on the order.
- The package insert item may ship by itself if all other items on the order are backordered. To prevent this from occurring, you may want to create the package insert item as a non-inventory item in the Item table or assign the item to a coordinate group code. Items with a coordinate group code are designed not to generate a pick slip unless there are other items on the order to be shipped at the same time.
- Package insert items are not added to the order if the order type on the order matches the order type defined in *Order Type to Process as Catalog Request/Item Samples (E08)* system control value.
- Package insert items are not added to the order if the qualifying item (through item, item class, or item category) has a negative quantity.
- Package insert items are not added to the order if the order total is negative.
- Package insert items are not added to the order if the order has a ship via with a Billing Code of *Express Bill*.
- No special handling applies to package insert items added to orders you create through the *Generic Order Interface (Order API)*.
- Package insert items cannot be qualifying items to add other package insert items.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Troubleshooting: If a package insert item did not get added to the order, you should check the following:

- System control value to *Evaluate Promotional Items/Inserts in Order Entry/Maintenance (E48)* should be *selected*.
- System control value for *Default Price Override Reason (B35)*must contain a valid price override reason code.
- The system evaluates the order to see if it is eligible for the package insert during repricing, initial order accept, and final order accept. The package insert may have been removed from the order if it no longer qualified.
- Restricted field in the SKU table for the package insert item should be *unselected*.
- Sell quantity field in the Item table for the package insert item should be blank. If a sell quantity must exist, the quantity of the package insert item to be added to the order should be a multiple of the sell quantity.
- The order type on the order should not be the same as the order type defined in the *Order Type to Process as Catalog Request/Item Samples (E08)* system control value.

Working with Coupon Promotions (WCPR)

Purpose: You can use coupon promotions to offer percentage or dollar discounts on merchandise to customers. You can set up a coupon to apply to a particular order line only, or the entire order. You can also restrict a coupon to, for example, a particular offer, source code, or item, and make certain items exempt from a coupon discount.

You apply coupons to items or orders in order entry or order maintenance through the *Coupon Discount Window*. You can also apply coupons through the *Generic Order Interface (Order API)* by specifying a coupon at the order header or detail level; see *Inbound Order*

XML Message (CWORDERIN) and *Understanding Coupon Error Messages through the Order API* for more information.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

How Coupons Work

Two basic types of coupons: In addition to applying either a percentage or a dollar discount, coupons can be either:

- *order-level* (*Coupon type* = *O*): the discount applies to all eligible order detail lines.
- *detail-level* (*Coupon type* = *D*): the discount applies to the selected order detail line only.

Applying a coupon to an item or order: You can add coupons to the order at the Coupon Discount window, which you can display by:

- order-level or detail-level coupons: select *Coupon* for an item.
- order-level coupons only: select *Reprice*.

When can you enter a coupon on an order? You can use the *Coupon Discount Window* to work with coupons at any point in order entry or order maintenance as long as none of the items has printed pick slips or is in a closed (*X*) status. See *Entering Coupon Promotions on an Order*.

Applying coupons in order maintenance: In order for you to apply coupons to an order in order maintenance:

- You must have the *Price Tables (E07)* system control value at the *Pricing Values (B31)* screen *selected*, or
- You must use *Customer Price Group Pricing*; see *Customer Price Group Pricing in Order Maintenance*.

How is tax calculated? Tax is calculated based on the actual price the customer is paying after applying all coupons and other discounts.

Do coupons apply to freight charges? Coupons apply to merchandise prices only; however, discounts applied to the merchandise on an order can have the effect of also reducing freight charges, if freight charges are based on total merchandise value. To offer freight or handling discounts, you can use additional discounting options, such as *Working with Promotions (WPRO)*.

How an Order or Item Qualifies for a Coupon

Valid coupon? When you enter a coupon at the *Coupon Discount Window* in order entry or order maintenance, the system determines whether the coupon is valid based on your entries through the *Work with Coupon Promotion Screen*. Also, the system confirms that the current system date is within the *Start date* and *End date* for the coupon.

Qualifiers: Next the system determines whether the order or detail line qualifies for the coupon based on:

- *order lines are open or held:* There cannot be any detail lines on the order with printed pick slips, or in a closed (*X*) status.
- *duplicate coupon entry:* The same coupon cannot already have been applied to the item (detail-level coupon) or order (order-level coupon).
- *source code:* If the *Source requirement* field for the coupon is *selected*, then the source code on the order header must be one of the source codes specified through the *Work with Coupon Source Requirement Screen*.
- *offer:* If the *Offer requirement* field for the coupon is *selected*, then the source code on the order header must point to one of the offers specified through the *Work with Coupon Offer Requirement Screen*.
- *other coupons:* If the *Coupon restriction* field for the coupon is *selected* for any coupons on the order, then there must not be a coupon restriction set up for these coupons through the *Work with Coupon Restriction Screen*.
- *item requirement:* If the *Item requirement* field for the coupon is *selected*, and the coupon is:
- order-level: the item(s) specified through the *Work with Coupon Item Requirement Screen* must be on the order; in this case, the discount applies only to the required item(s)
- detail-level: the item on the order detail line must be the one specified through the *Work with Coupon Item Requirement Screen*; you cannot specify more than one item requirement for a detail-level coupon

- *order detail line minimum:* If the *Minimum detail $ amt* specifies a dollar value, then the regular single-unit offer price of the item or SKU must be equal to or greater than that value.
- *order total minimum:* If the *Minimum order $ amt* specifies a dollar value, then the total merchandise value on the order, excluding any non-discountable items, must be equal to or greater than this value. In this case, the total merchandise value is calculated based on the regular, single-unit offer price of each item or SKU.

> **Note:**
>
> See below for more information on how an order or detail line qualifies for a dollar minimum.

- *item restriction:* If the coupon is detail-level and carries a percentage discount, the item in the order detail line must not be restricted (as set up through the *Work with Coupon Item Restriction Screen*). However, an item is still eligible for an order-level or detail-level dollar discount, and its extended price is included in the order total for the purposes of evaluating the *Minimum order $ amt*.
- *non-discountable items:* If the coupon is detail-level, then the item must be flagged as *Discountable*; also, non-discountable items are not included in the order total for the purposes of determining the *Minimum order $ amt*. If all of the items on an order are non-discountable, then the order does not qualify for a coupon.

For more information: See *Understanding Coupon Error Messages in Order Entry* for a listing of the error messages the system displays when items or orders are not eligible for coupons.

Combining coupons with other discounts: You can offer a variety of additional discounts and pricing options in addition to coupons. When combining additional discounts and repricing:

- *Quantity break price:* If the order detail line qualifies for a quantity break price that you have set up at the *Create Item Price Screen (Quantity Price Breaks by Offer)*, then the coupon discount applies to the quantity break price. For example, if the coupon discount is $1.00, the regular price for a single unit is $20.00, and the quantity break price for five units is $19.00, the $1.00 coupon discount applies to the break price of $19.00 when the customer orders five or more units.
- *Price code price:* If the order detail line qualifies for a price code discount that you have set up through *Working with Price Codes (WPCD)*, then the coupon discount applies to the price code price. For example, if the coupon discount is $1.00, the regular price for a single unit is $20.00, and the price code price for five units is $19.00, the $1.00 coupon discount applies to the price code price of $19.00 when the customer orders five or more units.
- *Price override:* If you enter a price override reason code for an item in order entry or order maintenance, then the coupon discount applies to the overridden price. For example, if the regular price of an item is $20.00, but you override the price to $15.00 and then apply a coupon with a 10% discount, the 10% is taken from the price of $15.00.
- *Promotions:* If you use *Working with Promotions (WPRO)* to set up an order promotion (*Type* = *O*), then this promotion discount applies after any coupon discount. For example, if a coupon applies a discount of 10%, an order-level promotion carries a discount of $1.00, and the item price is $20.00, the 10%

coupon discount applies first, reducing the unit price to $18.00; then the promotion discount of $1.00 applies.

- *Customer price group price:* If you are using *Customer Price Group Pricing*, the system applies order-level coupons after all other discounts and promotions are applied to the order. The system applies the order-level coupon promotion to all lines eligible for the coupon promotion, including non-discountable items. See *Order-Level Coupon Promotions when using Customer Price Group Pricing*.

> **Note:**
>
> An order-type promotion discount can be prorated against the order lines or applied as a negative additional charge, depending on your setup. See *Working with Promotions (WPRO)* for more information.

If the coupon discount exceeds the merchandise value: If the total coupon discount amount of a detail-level coupon exceeds the extended price of the item, then the extended price of the item is set to zero. Similarly, if the total coupon discount amount of an order-level coupon exceeds the total merchandise value of the order, the total merchandise value is set to zero. The coupon does not create a negative (credit) extended item price or order total.

What price does the system use to evaluate order or detail qualifying amounts? When a coupon has a *Minimum detail $ amt* or *Minimum order $ amt* requirement, the system uses the initial price on the order line to determine whether the order or detail line meets the minimum requirement.

- *Order detail line minimum:* The system always considers the regular, single-unit price of the item or SKU when determining whether an order detail line meets the minimum requirement. For example, if the minimum is $50.00, and the customer orders two units at $30.00, the order detail line does not meet the order detail minimum requirement based on the single unit price of $30.00.
- *Order minimum:* The system always considers the total merchandise value based on the regular, single-unit prices of the entire quantity of all eligible items on the order when determining whether the order meets the minimum requirement. For example, if the order minimum is $50.00, and the customer orders two units at $30.00 as above, the order does meet the order minimum requirement based on the total merchandise value of $60.00.
- *If there is a price override:* The system still uses the regular, single-unit price of the item or SKU to evaluate the order or line for a dollar minimum if you use a price override reason code whose *Override item offer price* field is *unselected*. However, if this field is *selected*, the system uses the price override amount to evaluate the order or line for a dollar minimum. See *Overriding the Item/SKU Offer Price* for an overview.

If you apply multiple coupons to the same order or line, the system does not subtract the first coupon before determining whether the order qualifies for the second one. For example, *COUPA* carries a discount of 10%, and *COUPB* carries a discount of $1.00. The minimum dollar value for both coupons is $25.00, and that is the price for the order detail line. The order line qualifies for both coupons.

Please note the following variations in evaluating how an order or order line qualifies for a dollar minimum:

Variation	Detail Minimum = $25.00	Order Minimum = $50.00
basic qualification	1 unit at $10: does not qualify 1 unit at $100: qualifies	2 units at $10: does not qualify 1 unit at $100: qualifies
multiple units	3 units at $10 (total = $30): does not qualify 1 unit at $25: qualifies	5 units at $10: qualifies
quantity break price (as set up through *Create Item Price Screen (Quantity Price Breaks by Offer)*)	1 unit at $25: qualifies 2 units at $20 quantity break price; regular single-unit price is $25: qualifies	2 units at $20 quantity break price; single-unit price is $25; qualifies
multiple coupons	1 unit at $25; 2 coupons, each requiring a $25 minimum: qualifies for both coupons	2 units at $25; 2 coupons, each requiring a $50 minimum; qualifies for both coupons
non-discountable item (the item's *Discountable* field is *selected*)	cannot apply coupon discount to non-discountable item unless you are using *Customer Price Group Pricing*	4 units at $10, plus 1 unit of a non-discountable item at $10: does not qualify unless you are using *Customer Price Group Pricing* Non-discountable item price is not included in the order minimum unless you are using *Customer Price Group Pricing*
restricted item (as set up through the *Work with Coupon Item Restriction Screen*)	dollar discounts: normal qualification rules percentage discounts: do not apply	dollar discounts: normal qualification rules percentage discounts: 3 units at $10 plus 1 unit of a restricted item at $20: percentage discount applies to the 3 regular units

Variation	Detail Minimum = $25.00	Order Minimum = $50.00
price override (*Override item offer price* for the price override reason is *selected*)	item/SKU price = $25.00, price override = $20.00: does not qualify item/SKU price = $20.00, price override = $25.00: qualifies no item/SKU price, price override = $25.00: qualifies	item/SKU price = $25.00, price override = $20.00, 2 units: does not qualify item/SKU price = $20.00, price override = $25.00, 2 units: qualifies no item/SKU price, price override = $25.00, 2 units: qualifies

Variation	Detail Minimum = $25.00	Order Minimum = $50.00
price override (*Override item offer price* for the price override reason is *unselected*)	item/SKU price = $25.00, price override = $20.00: qualifies item/SKU price = $20.00, price override = $25.00: does not qualify no item/SKU price, price override = $25.00: does not qualify **Note:** In this situation, an item without an item/SKU price can never qualify for a coupon minimum dollar amount.	item/SKU price = $25.00, price override = $20.00, 2 units: qualifies item/SKU price = $20.00, price override = $25.00, 2 units: does not qualify no item/SKU price, price override = $25.00, 2 units: does not qualify **Note:** In this situation, an item without

Variation	Detail Minimum = $25.00	Order Minimum = $50.00

an item/SKU price can never be counted toward the coupon minimum

Variation	Detail Minimum = $25.00	Order Minimum = $50.00
		dollar amount.

Sequence of discount application: The following rules control the sequence in which multiple coupons apply to an order or single detail line:

- Detail-level coupons always apply before order-level coupons.
- Next, the system checks the *Discount calc seq #*; the coupon with the lower sequence number applies first.
- Finally, if two coupons of the same type have the same sequence number, the first coupon alphanumerically, based on coupon code, applies first.
- If you are using *Customer Price Group Pricing*, the system applies order-level coupons after all other discounts and promotions are applied to the order; see *Order-Level Coupon Promotions when using Customer Price Group Pricing*.

Order entry vs. order maintenance: The system handles coupon entry and validation the same way in order maintenance in order entry; however:

- You cannot add any coupons to an order if any of the detail lines have printed pick slips, or are in closed (*X*) status.
- In order to apply coupon discounts in order maintenance:
- You must have the *Price Tables (E07)* system control value at the *Pricing Values (B31)* screen *selected*, or
- You must use *Customer Price Group Pricing*; see *Customer Price Group Pricing in Order Maintenance*.

What items are excluded from coupon discounts?

Restriction type	Detail-level coupons apply?	Order-level coupons apply?	Extended price included in Minimum order dollar total?
non-discountable item (the item's *Discountable* field is *selected*) when using a pricing method other than *Customer Price Group Pricing*	no	no	no
non-discountable item (the item's *Discountable* field is *selected*) when using *Customer Price Group Pricing*	yes	yes	yes
restricted item (as set up through the *Work with Coupon Item Restriction Screen*)	only dollar discounts apply; restricted from percentage discounts	only dollar discounts apply; the system displays a warning message if you enter a percentage discount and there is a restricted item on the order	yes

Coupon Setup

Overview: Use the *Working with Coupon Promotions (WCPR)* menu option to set up and maintain the following to support coupon promotions:

- *Identify the coupons available in your company:* Use the *Create Coupon Promotion Screen* to specify the date range, type of discount, and any restrictions or requirements for the coupon.
- *Require an offer?* Optionally, use the *Create Coupon Offer Requirement Screen* to specify that the coupon cannot be used unless the source code on the order header is associated with a specific offer, or one of a group of offers. The *Offer requirement* field for the coupon must be *selected*.
- *Require a source code?* Optionally, use the *Create Coupon Source Requirement Screen* to specify that the coupon cannot be used unless there is a specific source code, or one of a group of source codes, on the order header. The *Source requirement* field for the coupon must be *selected*.
- *Restrict two coupons from being used on the same order or item?* Optionally, use the *Create Coupon Restriction Screen* to specify two coupons that cannot be used together. This restriction can apply to both order-level and detail-level coupons, so that you will not be able to apply two restricted coupons to any two items on the same order. This setting would be useful if the two coupons together would result in a total discount that is greater than what you want to offer. The *Coupon restriction* field for both coupons should be *selected*. When you use the *Create Coupon Restriction Screen* to restrict the first coupon from the second, the system automatically creates a restriction for the second coupon against the first.
- *Require one or more specific items?* Optionally, use the *Create Coupon Item Requirement Screen* to specify item requirements. If you require more than one item for an order-level coupon, then all specified items must be on the order. You cannot specify more than one item for a detail-level coupon. In either case, the *Item requirement* field must be *selected*.

- *Make an item exempt from a coupon percentage discount?* Optionally, use the *Create Coupon Item Restriction Screen* to identify any items that are exempt from percentage discount coupons.

Additional setup:

- *Making an item non-discountable:* Set the *Discountable*field to *unselected* if the item should never have any type of discount applied to it. You will still be able to enter order-level coupons against this item in order entry or order maintenance, but no discounts will apply to the item, and its price will not be included in the order total for the purpose of determining whether the order qualifies for a *Minimum order $ amt*. **Note:** If you use *Customer Price Group Pricing*, the system includes non-discountable items in the coupon discount.
- *Updating order detail coupon statuses:* In order to update the Coupon status field in the Order Detail Coupon table (*OECPDC*) when you print a pick slip for the item or confirm the shipment, you must have the *Pick Sort Program Name (C65)* set to *FLR0217*. This program updates the coupon status to *G* when you print the pick slip, and to *R* when you confirm shipment of the pick slip.
- *Applying coupon discounts in order maintenance:* In order to apply coupon discounts in order maintenance:
- You must have the *Price Tables (E07)* system control value at the *Pricing Values (B31)* screen *selected*, or
- You must use *Customer Price Group Pricing*; see *Customer Price Group Pricing in Order Maintenance*.

> **Important:**
>
> In order for you to apply coupons to an order, the *Price method* for the source code on the order header must be set to *D* (regular plus reprice).

Coupon Examples

An Order-level Dollar Discount plus a Detail-level Percentage Discount

Example:

Items: An order has the following items:

- *AU123*, one unit at `$10.00`
- *CH456*, one unit at `$100.00`

Original merchandise total: `$110.00`

Coupons: Enter the following coupons against *CH456*:

- *10$O*, $10.00 off (order-level)
- *15%D*, 15% off (detail-level)
- Because *10$O* is an order-level coupon, entering it against a single item has the effect of applying it to all eligible order detail lines.
- The order-level dollar discount is not prorated across each eligible order detail line; instead, the dollar discount applies to the item with the highest unit price based on the Item Offer or SKU Offer record. As a result, no discount applies to item *AU123*.

Sequence: 15%D applies first, regardless of sequence number, because detail-level coupons always apply before order-level coupons.

Result:

Coupon *15%D* applies a discount of 15% to *CH456*: `$100.00 - $15.00 (15% of $100.00) = $85.00`

Coupon *10$O* applies a discount of $10.00 to *CH456*: `$85.00 - $10.00 = $75.00`

Discounted merchandise total:

- *AU123:* one unit at `$10.00`
- *CH456:* one unit at `$75.00`
- *Total* = `$85.00`

Variation with multiple units:
Items:

- *AU123*, one unit at `$10.00`
- *CH456*, three units at `$100.00 = $300.00`

Original merchandise total: `$310.00`

> **Note:**
>
> As above, no discount applies to item *AU123*.

Result:

Coupon *15%D* applies a 15% discount to *CH456*: `$100.00 - $15.00 (15% of $100.00) = $85.00`

Coupon *10$O* applies a total dollar discount of $10.00 to *CH456*: `$255.00 - $10.00 = $245.00, or 3 units at $81.67 each`

> **Note:**
>
> The total dollar discount applied for coupon *10$O* is actually $10.01 due to rounding.

Discounted merchandise total:

- *AU123:* one unit at `$10.00`
- *CH456:* three units at `$81.67 = $245.01`
- *Total* = `$255.01`

Variation with multiple units and quantity break price:
Items: The order has three units of item *CH456*, and this item has a break price of $90.00 for quantities of three or more.

Original merchandise total:

- *CH456:* three units at `$90 = $270.00`
- *AU123:* one unit at `$10.00`
- *Total* = `$280.00`

Coupons: Same as above.

Sequence: Same as above.

Result:

Coupon *15%D* applies a discount of 15% to *CH456*: `$90.00 – $13.50 (15% of $90.00) = $76.50`

Coupon *10$O* applies a total dollar discount of $10.00 to *CH456*: `$76.50 – $3.33 ($10.00 / quantity of 3) = $73.17`

As above, no discount applies to item *AU123*.

> **Note:**
>
> The total dollar discount applied for coupon *10$O* is actually $9.99 due to rounding.

Discounted merchandise total:

- *CH456:* three units at `$73.17 = $219.51`
- *AU123:* one unit at `$10.00`
- *Total* = `$229.51`

An Order-level Percentage Discount plus a Detail-level Dollar Discount

Example:

Items: An order has the following items:

- *AU123*, two units at `$10.00 = $20.00`
- *BA456*, one unit at `$10.00`

Original merchandise total: `$30.00`

Coupons: Enter the following coupons against *AU123*:

- *03$D*, $3.00 off (detail-level)
- *05%O*, 5% off (order-level)

> **Note:**
>
> Because *05%O* is an order-level coupon, entering it against a single item has the effect of applying it to all eligible order detail lines.

Sequence: 03$D applies first, regardless of sequence number, because detail-level coupons always apply before order-level coupons.

Result:

Coupon *03$D* applies a discount of $3.00 to *AU123*, and this $3.00 is prorated across the two units: `$10.00 - $1.50 ($3.00/2) = $8.50`

Coupon *05%O* applies a discount of 5% to *AU123*: `$8.50 - $.42 (5% of $8.50) = $8.08`

> **Note:**
>
> The total discount applied is actually `$.84`, not `$.85` (`5%` of the extended price of `$17.00`) due to rounding.

Coupon *05%O* applies a discount of 5% to *BA456*: `$10.00 - $.50 (5% of $10.00) = $9.50`

Discounted merchandise total:

- *AU123:* two units at `$8.08 = $16.16`
- *BA456:* one unit at `$9.50`
- *Total* = `$25.66`

Two Order-level Discounts

Example:

Items: An order has the following items:

- *AU123*, one unit at `$10.00`
- *CH456*, one unit at `$100.00`

Original merchandise total: `$110.00`

Coupons: Enter the following order-level coupons against any order detail line (because they are both order-level, entering them against any order detail line has the effect of applying them to all eligible order detail lines):

- *10$O*, $10.00 off any order
- *10%O50*, 10% off any order over $50.00

> **Note:**
>
> Each coupon has a Discount calculation sequence number of 5.

Sequence: 10$O applies first because it is first alphanumerically; both coupons have the same sequence number.

Result:

Coupon *10$O* applies the total order discount of $10.00 to item *CH456*, because it has the highest original unit price: `$100.00 - $10.00 = $90.00`

> **Note:**
>
> As in the first example, this order-level dollar discount applies to a single item only.

Coupon *10%O50* applies a 10% discount to item *CH456*: `$90.00 - $9.0 (10% of $90.00) = $81.00`

Coupon *10%O50* applies a 10% discount to item *AU123*: `$10.00 - $1.00 (10% of $10.00) = $9.00`

Discounted merchandise total:

- *AU123:* one unit at `$9.00`
- *CH456:* one unit at `$81.00`
- *Total* = `$90.00`

Variation with different sequence numbers (the percentage discount applies first):
Original merchandise total: `$110.00`

Result: If coupon *10%O50* has a lower sequence number than coupon *10$O*, then the above example would have the following results:

Coupon *10$O50* applies a 10% discount to item *AU123* as described above: `$10.00 - $1.00 (10% of $10.00) = $9.00`

Coupon *10%O50* applies a 10% discount to item *CH456*: `$100.00 - $10.00 (10% of $100.00) = $90.00`

Coupon *10$O* applies a $10.00 discount to item *CH456*: `$90.00 - $10.00 = $80.00`

Discounted merchandise total:

- *AU123:* one unit at `$9.00`
- *CH456:* one unit at `$80.00`
- *Total* = `$89.00`

An Order-level Percentage Discount with a Minimum Order Dollar Total and a Non-discountable Item

Example:

Items: An order has the following items:

- *AU123*, two units at `$10.00 = $20.00`
- *BA456*, three units at `$10.00 = $30.00`
- *MO789*, one unit at `$10.00`

Original merchandise total: `$60.00`

> **Note:**
>
> *MO789* is flagged as non-discountable in the Item table.

Coupon: Enter coupon *10%O50* with a 10% discount for a $50.00 minimum order total against item *MO789*.

> **Note:**
>
> Even though *MO789* is flagged as non-discountable, you can still enter order-level coupons against it; however, if you attempt to enter a detail-level coupon against a non-discountable item, the system displays an error message.

Result:

Coupon *10%O50* applies a discount of 10%, or $1.00 per unit, to *AU123* and *BA456*, for a total unit price of $9.00 for each. No discount applies to *MO789*, the non-discountable item.

Discounted merchandise total:

- *AU123:* two units at `$9.00 = $18.00`
- *BA456:* three units at `$9.00 = $27.00`
- *MO789:* one unit at `$10.00`
- *Total* = `$55.00`

Variation with promotional discount:
Original merchandise total: `$60.00`

The order is also eligible for a 10% promotional discount set up through *Working with Promotions (WPRO)*.

Result: After applying the coupon discount as described above, the system applies the 10% promotional discount to *AU123* and *BA456*, for a total unit price of $8.10 for each (`$9.00 - $.90 (10% of $9.00) = $8.10`). No discount applies to *MO789*, the non-discountable item.

> **Note:**
>
> The system still considers the order to have met the $50.00 minimum for the coupon, because the promotion discount applies after the coupon discount. However, the Order Detail Coupon records do not reflect the additional promotional discounts, only the coupon discount calculations.

Discounted merchandise total:

- *AU123:* two units at `$8.10 = $16.20`
- *BA456:* three units at `$8.10 = $24.30`
- *MO789:* one unit at `$10.00`

- *Total* = `$50.50`

Variation with lower order dollar total:
Items: If the order had the following items:

- *AU123*, two units at `$10.00 = $20.00`
- *BA456*, two units at `$10.00 = $20.00`
- *MO789*, one unit at `$10.00`

Original merchandise total: `$50.00`

Result: You would not be able to enter this coupon against the order; the non-discountable item, *MO789*, does not count toward the minimum order total of $50.00. However, the promotion still applies a 10% discount to the two discountable items, for a unit price of $9.00 (`$10.00 - 10%`).

Discounted merchandise total:

- *AU123:* two units at `$9.00 = $18.00`
- *BA456:* two units at `$9.00 = $18.00`
- *MO789:* one unit at `$10.00`
- *Total* = `$46.00`

An Order-level Item Requirement with Multiple Items

Example:

Items: An order has the following items:

- *CH456*, one unit at `$100.00`
- *AR789*, one unit at `$150.00`
- *AU123*, one unit at `$10.00`

Original merchandise total: `$260.00`

Coupon: Enter coupon *10%OIT* against any item. This order-level coupon has a discount of 10%, and has two item requirements specified: *CH456* and *AR789*.

Result:

Coupon *10%OIT* applies a discount of 10% to the two required items:

- *CH456*: `$100.00 - $10.00 (10% of $100.00) = $90.00`
- *AR789:* `$150.00 - $15.00 (10% of $150.00) = $135.00`

Item *AU123* is not discounted because it doesn't meet the item requirement.

Discounted merchandise total:

- *CH456:* one unit at `$90.00`
- *AR789:* one unit at `$135.00`
- *AU123:* one unit at `$10.00`
- *Total* = `$235.00`

Coupon Discount Processing

As you enter and accept orders, generate pick slips, and confirm shipments, the system updates the Order Detail Coupon table (OECPDC) along with other order-related tables. These updates are described below.

Applying the coupon discounts to the order: The setting of the *Automatically Reprice Coupon (K02)* system control value determines when the system applies the coupon discounts to the order.

- If *selected*, the system applies the coupon discounts and validates the order dollar minimum when you select *Accept* or *Exit* at the *Coupon Discount Window*, select *Reprice*, and when you accept the order.

The system updates the following fields in the Order Detail Coupon table:

- Pre-discount price = the unit price of the item before applying this particular coupon discount. The pre-discount price already reflects discounts such as quantity break price.
- Post-discount price = the unit price of the item after applying this particular discount. The post-discount price does not reflect any additional discounts, such as subsequent applicable coupons or a promotion discount.
- Coupon status = *P* (processed)
- Status change time = the time when you selected *Reprice* to calculate end-of-order pricing or selected *Accept* to accept the order
- If *unselected*, the system applies the coupon discounts and validates the order dollar minimum when you select *Reprice* and when you accept the order.

When you select *Accept* at the *Coupon Discount Window*, the system creates a record in the Order Detail Coupon table with the following values:

- Coupon status = *N* (new)
- Status change date = current system date
- Status change time = current system time

When you select *Reprice* and when you accept the order, the system updates the following fields in the Order Detail Coupon table:

- Pre-discount price = the unit price of the item before applying this particular coupon discount. The pre-discount price already reflects discounts such as quantity break price.
- Post-discount price = the unit price of the item after applying this particular discount. The post-discount price does not reflect any additional discounts, such as subsequent applicable coupons or a promotion discount.
- Coupon status = *P* (processed)
- Status change time = the time when you selected *Reprice* to calculate end-of-order pricing or selected *Accept* to accept the order

Determining the final discounts: The system will reprice the items after you accept the order by selecting *Accept*. For example, you might delete or cancel an item on the order, reducing the merchandise total below the minimum required for the coupon. However, the changes in price after you accept the order will not be visible and you will not be able to inform the customer of the repricing unless the *Display Order Recap (A75)* system control value is *selected*; in this case, you can review the repriced order totals at the Order Recap screen.

Generating pick slips: When you print a pick slip for an order detail line, the system sets the Order Detail Coupon status to *G* (pick slip generated) only if you have the *Pick Sort Program Name (C65)* system control value set to *FLR2017*. The status change date and time are also updated.

Billing: When you confirm shipment, the system sets the Order Detail Coupon status to *R* (redeemed) if the status was previously set to *G* at pick slip generation. The status change date and time are also updated. However, if you do not have the *Pick Sort Program Name (C65)* system control value set to *FLR2017*, the coupon status will not be reset at billing.

Tracking demand: The system posts the net, discounted price to demand-tracking tables.

Example:

An order includes the item *AU123*. The regular Item Offer price is $10.00, but a coupon discount of $3.00 applies for a net price of $7.00. When you enter the order, the system posts $7.00 to demand-tracking tables such as the Order Billing History table.

Work with Coupon Promotion Screen

Purpose: Use this screen to review and work with the coupons you use to apply percentage or dollar discounts to orders, or items on orders.

How to display this screen: Enter *WCPR* in the Fast path field at the top of any menu, or select Work with Coupon Promotions from a menu.

Field	Description
Coupon code	The code associated with the coupon promotion discount. Alphanumeric, 6 positions; optional.
Coupon description	The description of the coupon, truncated from 45 positions. Alphanumeric, 35 positions; display-only.
Coupon type	Indicates whether this is an order-level or detail-level coupon: • *Order Level* = order-level coupon: applies to all applicable items on the order • *Detail Level* = detail-level coupon: applies only to a specific item on the order Alphanumeric, optional.
Calculation seq #	Indicates the sequence in which to apply this coupon compared with other coupons for the same order or order detail line. Coupons with lower sequence numbers apply first. The system uses all of the following information when determining the sequence in which to apply coupons: • Detail-level coupons always apply before order-level coupons. • Next, the system checks this sequence number. The coupon with the lower sequence number applies first. • Finally, if two coupons have the same sequence number, the first coupon alphanumerically, based on the coupon code, applies first. Numeric, 5 positions; display-only.

Field	Description
Src req (Source requirement)	Indicates whether you can apply this coupon only to orders using a required source code, or one source from a list of required source codes. You use the *Work with Coupon Source Requirement Screen* to review or work with source requirements for a coupon.
Ofr req (Offer requirement)	Indicates whether you can apply this coupon only to orders using a required offer, or one offer from a list of required offers. You use the *Work with Coupon Offer Requirement Screen* to review or work with offer requirements for a coupon.
Cpn Res (Coupon restriction)	Indicates whether this coupon is restricted from use with another coupon on the same order or order detail line. You use the *Work with Coupon Restriction Screen* to review or work with coupon restrictions for a coupon.
Itm Req (Item requirement)	Indicates whether you can apply this coupon only to: • orders that include a required item or items (order-level coupons); in this case, the coupon discount applies only to the required item(s) • order detail lines for a required item (detail-level coupons) You use the *Work with Coupon Item Requirement Screen* to review or work with item requirements for a coupon.

Option	Procedure
Create a new coupon	Select *Create* to advance to the Create Coupon Promotion Screen.
Change an existing coupon	Select *Change* for a coupon to advance to the Change Coupon Promotion screen. Use this screen to change an existing coupon promotion. See *Create Coupon Promotion Screen* for more information and field descriptions.
Delete a coupon	Select *Delete* for a coupon.
Display a coupon	Select *Display* for a coupon to advance to the Display Coupon Promotion screen. Use this screen to review an existing coupon promotion. See *Create Coupon Promotion Screen* for more information and field descriptions.
Work with offer requirements for a coupon	Select *Offer requirement* for a coupon to advance to the *Work with Coupon Offer Requirement Screen*.
Work with source code requirements for a coupon	Select *Source requirement* for a coupon to advance to the *Work with Coupon Source Requirement Screen*.
Work with coupon restrictions for a coupon	Select *Coupon restriction* for a coupon to advance to the *Work with Coupon Restriction Screen*.
Work with item requirements for a coupon	Select *Item requirement* for a coupon to advance to the *Work with Coupon Item Requirement Screen*.
Work with item restrictions	Select *Item restriction* to advance to the *Work with Coupon Item Restriction Screen*.

Create Coupon Promotion Screen

Purpose: Use this screen to create a new coupon for a dollar or percentage discount.

How to display this screen: Select *Create* at the Work with Coupon Promotion Screen.

Field	Description
Coupon code	The code associated with the coupon promotion discount. This is the code that you enter at the *Coupon Discount Window* in order entry. Alphanumeric, 6 positions; required.
Coupon description	The description of the coupon. This is the description that displays at the *Coupon Discount Window* in order entry. Alphanumeric, 45 positions; required.
Coupon type	Indicates whether this is an order-level or detail-level coupon: • *Order Level* = order-level coupon: applies to all applicable items on the order • *Detail Level* = detail-level coupon: applies only to a specific item on the order Alphanumeric, required.
Discount calc seq #	Indicates the sequence in which to apply this coupon compared with other coupons for the same order or order detail line. Coupons with lower sequence numbers apply first. The system uses all of the following information when determining the sequence in which to apply coupons: • Detail-level coupons always apply before order-level coupons. • Next, the system checks this sequence number. The coupon with the lower sequence number applies first. • Finally, if two coupons have the same sequence number, the first coupon alphanumerically, based on the coupon code, applies first. Numeric, 5 positions; required.
Campaign	For informational and reporting use only. Alphanumeric, 5 positions; optional.
Start date	The first date when the coupon can be applied to orders. The Start date cannot be later than the End date. If the current date is not within the Start date and the End date, you will not be able to apply the coupon in order entry; instead, the Coupon Discount window displays an error message: `Coupon is not currently active.` Numeric, 6 positions; required.
End date	The last date when the coupon can be applied to orders. The End date cannot be earlier than the Start date. If the current date is not within the Start date and the End date, you will not be able to apply the coupon in order entry; instead, the Coupon Discount window: displays an error message: `Coupon is not currently active.` Numeric, 6 positions; required.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Source requirement</td><td>Indicates whether you can apply this coupon to orders only if they use a required source code, or one source from a list of required source codes. Valid values are:
Selected = This coupon can be applied to an order only if the source code on the order header is specified through the Work with Coupon Source Requirement Screen
Unselected = This coupon does not have a source code requirement</td></tr>
<tr><td>Vendor #</td><td>The vendor associated with the coupon. For informational and reporting purposes only.
Numeric, 7 positions; optional.</td></tr>
<tr><td>Offer requirement</td><td>Indicates whether you can apply this coupon to orders only if they use a required offer, or one offer from a list of required offers.
Valid values are:
Selected = This coupon can be applied to an order only if the source code on the order header points to an offer specified through the Work with Coupon Offer Requirement Screen
Unselected = This coupon does not have an offer requirement</td></tr>
<tr><td>Group ID</td><td>For informational and reporting purposes only.
Alphanumeric, 3 positions; optional.</td></tr>
<tr><td>Coupon restriction</td><td>Indicates whether this coupon is restricted from use on the same order or detail line as another coupon.
Valid values are:
Selected = This coupon cannot be used on the same order (order-level coupon) or order detail line (detail-level coupon) as another coupon, specified through the Work with Coupon Restriction Screen
Unselected = This coupon does not have a coupon restriction
When you create a restriction for COUPA against COUPB, the system automatically creates a restriction for COUPA against COUPB. The system will not allow you to apply both coupons against the same order or detail line.</td></tr>
<tr><td>Coupon analysis unit</td><td>For informational and reporting purposes only.
Alphanumeric, 6 positions; optional.</td></tr>
</table>

Field	Description
Item requirement	Indicates whether you can apply this coupon to orders only if they include one or more required items. Valid values are: • *Selected* = This coupon can be applied only if: • *order-level coupons*: the order includes all the items specified through the Work with Coupon Item Requirement Screen; in this case, the coupon discount applies only to the required item(s) • *detail-level coupons*: the order detail line is for the item specified through the Work with Coupon Item Requirement Screen **Note:** You can specify only one item requirement for detail-level coupons. 1. *Unselected* = This coupon does not have an item requirement
Minimum detail $ amt	Indicates the minimum single-unit price required for an order detail line to qualify for the coupon. You can specify a minimum detail dollar amount for detail-level coupons only; if you try to specify this amount for an order-level coupon, the system displays an error message: `Minimum detail $ amt only applies to detail level coupons.` See How an Order or Item Qualifies for a Coupon for more information on how the system evaluates minimum dollar requirements. Numeric, 13 positions with a two-place decimal; optional.
Minimum order $ amt	Indicates the minimum total merchandise value required for an order to qualify for the coupon. This qualifying total does not include the price of any non-discountable items. You can specify a minimum order dollar amount for order-level coupons only; if you try to specify this amount for an detail-level coupon, the system displays an error message: `Minimum order $ amt only applies to order level coupons.` See *How an Order or Item Qualifies for a Coupon* for more information on how the system evaluates minimum dollar requirements. Numeric, 13 positions with a two-place decimal; optional.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Dollar discount</td><td>Indicates the dollar discount to apply as follows:
order-level coupons: the dollar discount applies to the item with the highest unit price, reducing the total merchandise value on the order.

Note:
If you cancel this item, the system moves the discount to the item with the next highest single-unit price if the order is still eligible for the coupon.
detail-level coupons: the total dollar discount applies to the extended price of the order detail line.
Prorating against multiple units: The dollar discount is prorated if the order detail line has a quantity of more than one unit. In this situation, there may be a slight discrepancy against the total dollar discount due to rounding. For example, if the total dollar discount is $1.00, and it is prorated against 3 units, the total discount for each unit is actually $.33, or $.99 total for the line.

See How Coupons Work and Coupon Examples for more information.

You cannot enter both a dollar discount and a percentage discount, or the system displays an error message:
<code>Either dollar or percentage discount required.</code>

Numeric, 13 positions with a two-place decimal; required if you do not specify a percentage discount.</td></tr>
<tr><td>Percentage discount</td><td>Indicates the percentage discount to apply as follows:
order-level coupons: the percentage discount applies to each order detail line that is not a restricted item (through the Work with Coupon Item Restriction Screen) or a non-discountable item
detail-level coupons: the percentage discount that applies to the unit price of the order detail line.
See How Coupons Work and Coupon Examples for more information.

You cannot enter both a dollar discount and a percentage discount or the system displays an error message:
<code>Either dollar or percentage discount required.</code>

Numeric, 7 positions with a two-place decimal; required if you do not specify a dollar discount.</td></tr>
</table>

Work with Coupon Offer Requirement Screen

Purpose: Use this screen to review and work with the offers that are required for an order to qualify for a coupon:

- *If you specify a single offer:* the source code on the order header must point to this offer
- *If you specify more than one offer:* the source code on the order header must point to one of the offers specified

Otherwise, the system displays an error message when you enter the coupon:

```
Coupon cannot be used with existing offer.
```

You cannot advance to this screen for a coupon that does not have an offer requirement, based on the *Offer requirement* field; instead, the system displays an error message:

```
No offer requirement for this coupon.
```

How to display this screen: Select *Offer requirement* for a coupon at the Work with Coupon Promotion Screen.

Field	Description
Coupon code	The coupon code with the offer requirement. Alphanumeric, 6 positions; display-only.
Coupon description	The description of the coupon. Alphanumeric, 45 positions; display-only.
Offer	The required offer. Alphanumeric, 3 positions; optional.
Offer description	The description of the required offer. Alphanumeric, 30 positions; display-only.

Option	Procedure
Create a coupon offer requirement	Select *Create* to advance to the *Create Coupon Offer Requirement Screen*.
Delete a coupon offer requirement	Select *Delete* for a coupon offer restriction to delete it.

Create Coupon Offer Requirement Screen

Purpose: Use this screen to specify an offer requirement for a coupon:

- *If you specify a single offer:* the source code on the order header must point to this offer
- *If you specify more than one offer:* the source code on the order header must point to one of the offers specified

Otherwise, the system displays an error message when you enter the coupon:

```
Coupon cannot be used with existing offer.
```

How to display this screen: Select *Create* at the Work with Coupon Offer Requirement Screen.

Completing this screen: Enter the offer that will be required to apply the coupon. Offers are defined in and validated against the Offer table; see *Working with Offers (WOFR)* for more information.

If the offer requirement already exists for the coupon, the system displays an error message:

```
Coupon Offer Requirement already exists.
```

Work with Coupon Source Requirement Screen

Purpose: Use this screen to review and work with the source code requirement(s) for a coupon:

- *If you specify a single source code:* this must be the source code on the order header
- *If you specify more than one source code:* the source code on the order header must be one of the source codes specified

Otherwise, the system displays an error message when you enter the coupon:

```
Coupon cannot be used with existing source.
```

You cannot advance to this screen for a coupon that does not have a source code requirement, based on the *Source requirement* field; instead, the system displays an error message:

```
No source requirement for this coupon.
```

How to display this screen: Select *Source requirement* for a coupon at the Work with Coupon Promotion Screen.

Field	Description
Coupon code	The coupon code with the source code requirement. Alphanumeric, 6 positions; display-only.
Coupon description	The description of the coupon. Alphanumeric, 45 positions; display-only.
Source	The required source code. Alphanumeric, 7 positions; optional.
Source description	The description of the required source code. Alphanumeric, 30 positions; display-only.

Option	Procedure
Create a coupon source requirement	Select *Create* to advance to the *Create Coupon Source Requirement Screen*.
Delete a coupon source requirement	Select *Delete* for a coupon source restriction to delete it.

Create Coupon Source Requirement Screen

Purpose: Use this screen to specify a source code requirement for a coupon:

- *If you specify a single source code:* this must be the source code on the order header
- I*f you specify more than one source code:* the source code on the order header must be one of the source codes specified

Otherwise, the system displays an error message when you enter the coupon:

```
Coupon cannot be used with existing source.
```

How to display this screen: Select *Create* at the Work with Coupon Source Requirement Screen.

Completing this screen: Enter the source code that will be required to apply the coupon. Source codes are defined in and validated against the Source Code table; see *Working with Source Codes (WSRC)* for more information.

If the source code requirement already exists for the coupon, the system displays an error message:

```
Coupon Source Requirement already exists.
```

Work with Coupon Restriction Screen

Purpose: Use this screen to review or work with the other coupons that are restricted from use with this coupon. Regardless of whether the coupons are order-level or detail-level, the system does not permit you to enter the two restricted coupons on the same order, even on separate order detail lines.

Coupon restrictions are reciprocal: The system creates coupon restrictions reciprocally. For example, when you create a coupon restriction for *COUPA* against *COUPB*, the system automatically creates a coupon restriction for *COUPB* against *COUPA*. If you try to enter *COUPA* on the same order as *COUPB*, or vice versa, the system displays an error message:

```
Coupon may not be used with a conflicting coupon.
```

You cannot advance to this screen for a coupon that does not the *Coupon restriction* field *selected*; instead, the system displays an error message:

```
No coupon restriction for this coupon.
```

How to display this screen: Select *Coupon restriction* for a coupon at the Work with Coupon Promotion Screen.

Field	Description
Coupon code	The coupon code with the coupon restriction. Alphanumeric, 6 positions; display-only.
Coupon description	The description of the coupon. Alphanumeric, 45 positions; display-only.
Restricted coupon code	The coupon that is restricted against use with this coupon. Alphanumeric, 6 positions; optional.
Restricted coupon description	The description of the restricted coupon. Alphanumeric, 45 positions; display-only.

Option	Procedure
Create a coupon restriction	Select *Create* to advance to the *Create Coupon Restriction Screen*.
Delete a coupon restriction	Select *Delete* for a coupon restriction to delete it.

Create Coupon Restriction Screen

Purpose: Use this screen to restrict this coupon from use on the same order with another coupon.

Coupon restrictions are reciprocal: The system creates coupon restrictions reciprocally, and the restriction works only as long as you do not remove the restriction for one coupon or another. For example, when you create a coupon restriction for *COUPA* against *COUPB*, the system automatically creates a coupon restriction for *COUPB* against *COUPA*. If you try to enter *COUPA* on the same order or detail line as *COUPB*, or vice versa, the system displays an error message:

```
Coupon may not be used with a conflicting coupon.
```

How to display this screen: Select *Create* at the Work with Coupon Restriction Screen.

Completing this screen: Enter the coupon code to restrict from use with the current coupon. The system creates a restriction for the current coupon against the entered coupon, and for the entered coupon against the current coupon. If the coupon restriction already exists, the system displays an error message:

```
Coupon Restriction already exists.
```

Work with Coupon Item Requirement Screen

Purpose: Use this screen to review and work with the item requirement(s) for a coupon:

- *If you specify a single item:*
- order-level coupons: the item must be included on the order; in this case, the coupon discount applies only to the required item
- detail-level coupons: the item must be on the selected order detail line
- *If you specify more than one item:*
- order-level coupons: all of the items must be on the order; in this case, the coupon discount applies only to the required items
- detail-level coupons: you cannot specify more than one item

If the order or detail line does not meet the item requirement(s), the system displays an error message when you enter the coupon:

```
Coupon item requirement(s) have not been met.
```

You cannot advance to this screen for a coupon that does not have an item requirement, based on the *Item requirement* field; instead, the system displays an error message:

```
No item requirement for this coupon.
```

How to display this screen: Select *Item requirement* for a coupon at the Work with Coupon Promotion Screen.

Field	Description
Coupon code	The coupon code with the item requirement. Alphanumeric, 6 positions; display-only.
Coupon description	The description of the coupon. Alphanumeric, 45 positions; display-only.

Field	Description
Item	The required item. Alphanumeric, 12 positions; optional.
SKU	The item's unique characteristics, such as its color or size. **Note:** If you leave the SKU field blank for a SKU'd item, the coupon applies to any SKU for the item. Alphanumeric, three 4-position fields; optional.
Description	The description of the SKU (SKU'd item) or the item (non-SKU'd item). Alphanumeric, 120 positions (item) or 40 positions (SKU); display-only.

Option	Procedure
Create an item requirement	Select *Create* to advance to the *Create Coupon Item Requirement Screen*.
Delete an item requirement	Select *Delete* for an item requirement to delete it.

Create Coupon Item Requirement Screen

Purpose: Use this screen to create an item requirement:

- *If you specify a single item:*
- order-level coupons: the item must be included on the order; in this case, the coupon discount applies only to the required item
- detail-level coupons: the item must be on the selected order detail line
- *If you specify more than one item:*
- order-level coupons: all of the items must be on the order; in this case, the coupon discount applies only to the required items
- detail-level coupons: you cannot specify more than one item

If the order or detail line does not meet the item requirement(s), the system displays an error message when you enter the coupon:

```
Coupon item requirement(s) have not been met.
```

How to display this screen: Select *Create* at the Work with Coupon Item Requirement Screen.

Completing this screen: Enter the code representing the item that should be required for the coupon. If the item is SKU'd, you can enter the SKU information to restrict the coupon to that specific SKU; or, you can leave the SKU information blank so that all SKUs are eligible for the coupon.

If you try to create more than one item requirement for a detail-level coupon, the system displays an error message:

```
Only 1 item requirement allowed for detail level coupon.
```

If you enter an item that already has an item requirement for the coupon, the system displays an error message:

```
Coupon Item already exists.
```

Work with Coupon Item Restriction Screen

Purpose: Use this screen to review or work with items that are restricted from percentage coupon discounts under the following conditions:

- *order-level coupons:* the discount does not apply to the restricted item; however, the restricted item price is included in the order total for the purposes of evaluating the *Minimum order $ amt*. When you apply an order-level percentage coupon to an order with a restricted item, the system displays an error message: `At least one item is restricted from this coupon.` If all of the items on the order are restricted, the system displays an error message: `% discount not allowed.`
- *detail-level coupons:* you cannot apply a coupon to the restricted item; instead, the system displays an error message: `% discount not allowed.` However, you can apply a detail-level dollar discount to a restricted item.

How to display this screen: Select *Item restriction* at the Work with Coupon Promotion Screen.

Field	Description
Item	The item that is restricted from percentage discount. Alphanumeric, 12 positions; optional.
SKU	The item's unique characteristics, such as its color or style. **Note:** If the item has SKUs, but the base item displays here without any SKU information, then all SKUs of the item are restricted from percentage discounts. Alphanumeric, three 4-position fields; optional.
Description	The description of the SKU (SKU'd item) or item (non-SKU'd item). Alphanumeric, 45 positions; display-only.

Option	Procedure
Create an item restriction	Select *Create* to advance to the *Create Coupon Item Restriction Screen*.
Delete an item restriction	Select *Delete* for an item restriction to delete it.

Create Coupon Item Restriction Screen

Purpose: Use this screen to specify items that are restricted from percentage coupon discounts under the following conditions:

- *order-level coupons:* the discount does not apply to the restricted item; however, the restricted item price is included in the order total for the purposes of evaluating the *Minimum order $ amt*. When you apply an order-level percentage coupon to an order with a restricted item, the system displays an error message: `At least one item is restricted from this coupon.` If all of the items on the order are restricted, the system displays an error message: `% discount not allowed.`
- *detail-level coupons:* you cannot apply a coupon to the restricted item; instead, the system displays an error message: `% discount not allowed.` However, you can apply a detail-level dollar discount to a restricted item.

How to display this screen: Select *Create* at the Work with Coupon Item Restriction Screen.

Completing this screen: Enter the item and, optionally, the SKU to restrict from percentage discounts. If the item has SKUs and you do not enter any SKU information, then all SKUs of the item will be restricted as described above.

If you enter an item that already has a restriction, the system displays an error message:

`Coupon Item Restriction already exists.`

Working with Customer Price Groups (WCPG)

Purpose: Use the Work with Customer Price Groups menu option to create and work with customer price groups. Customer price groups are used:

- during quantity price matrix pricing, defined through the *Working with Quantity Price Matrix (WQPM)* menu option.
- during *Customer Price Group Pricing*.
- as a qualifier for a discount promotion; see *Working with Promotions (WPRO)*.

Assigning the customer price group: You can assign a sold to customer to a customer price group at the *Second Create Customer Sold To Screen*. Also, you can pass the price group code in the *Inbound Order XML Message (CWORDERIN)* or the *Inbound Customer Message (CWCustomerIn)*. When you assign the customer price group through the order API, the new order is eligible for any pricing or promotions associated with the price group. If you create an order for a customer that is not assigned to a customer price group, or is assigned to an invalid customer price group code, the system assigns the customer price group code defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value to the customer.

Included in customer search response: Information on the customer's price group is included in the generic customer search response XML message. See *Generic Customer Inquiry (Search) API* for more information.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

- *Work with Customer Price Groups Screen*

- *Work with Customer Price Group Details Screen*
- *Create Customer Price Group Detail Screen*
- *Work with Customer Price Group Exclusions Screen*
- *Create Customer Price Group Exclusions Screen*

Work with Customer Price Groups Screen

Use this screen to create and work with customer price groups.

How to display this screen: Enter *WCPG* in the Fast path field or select Work with Customer Price Group from a menu.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Customer price groups first display on this screen in alphanumeric price code sequence.

Field	Description
Price Group	A code that represents a customer price group. Enter a full or partial customer price group code to display customer price groups in alphanumeric order, beginning with your entry. Alphanumeric, 4 positions; Optional.
Description	A description of the customer price group. Enter a full or partial price group description to display customer price groups that contain your entry. Alphanumeric, 30 positions; Optional.
Price Type	Defines the price the system uses as the initial price of an item during customer price group line level pricing. Valid values: • *Original* (O) = Original Price. The system uses the price defined in the *Orig retail $* (Original retail price) field in the SKU table as the initial price of the item. • *Regular* (R) = Regular Price. The system uses the price defined in the *List price* field in the SKU table as the initial price of the item. Select a valid price type to display customer price groups that match your entry. **Note:** This field displays only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value. Optional.

Field	Description
Discount	The percentage off the initial price for this customer price group. For example, *10* means the customer price group qualifies for a 10% discount. *0* indicates no discount for the customer price group. You can also define a percent discount for the customer price group at the customer price group detail level. When determining the customer price group discount, the system uses the discount defined at the customer price group detail level if its effective date qualifies; otherwise, if the effective date does not qualify or if a discount is not defined at the customer price group detail level, the system uses the discount defined at the customer price group header level. Enter a discount to display customer price groups whose discount starts with your entry. • This field displays only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value. • The system applies the customer price group discount to the lines on an order during *Line Level Customer Price Group Pricing*; however, if the order line is assigned to a price code during *Customer Price Group Price Code Pricing*, the order line no longer qualifies for the customer price group discount. Numeric, 5 positions with a 2-place decimal; optional.
Best Price Comparison	Defines whether the system performs customer price group best price comparison logic for the customer price group during end-of-order pricing and repricing. Customer price group best price comparison determines if the price available for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is a better price than the price available for the customer price group assigned to the sold to customer. Whichever customer price group provides the best price, the system applies this price to the items on the order. Valid values: • *Yes* = The system performs customer price group best price comparison logic for this customer price group. • *No* (default) = The system does not perform customer price group best price comparison logic for this customer price group. Select *Yes* or *No* to display customer price groups whose best price comparison setting matches your entry. **Note:** This field displays only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value. Optional.

Screen Option	Procedure
Create a customer price group	Select *Create* to advance to the Create Customer Price Group Screen.
Change a customer price group	In the Action field, select *Change* for a customer price group to advance to the Change Customer Price Group screen. See the *Create Customer Price Group Screen* for field descriptions.
Delete a customer price group	In the Action field, select *Delete* for a customer price group to advance to the Confirm Delete window. Select *Yes* to confirm the delete; otherwise, select *No* to cancel the delete. When you delete a customer price group, the system deletes any associated details and exclusions defined for the customer price group. • The system allows you to delete a customer price group that is assigned to a promotion. • You cannot delete a customer price group that is assigned to a customer. • You cannot delete the customer price group defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value.
Work with the details of a customer price group	In the Action field, select *Details* for a customer price group to advance to the Work with Customer Price Group Details Screen. **Note:** This option is available only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value.
Review the promotions defined in the WPRO menu option that use the customer price group as a qualifier for the promotion	In the Action field, select *Promotions* for a customer price group to advance to the Display Customer Price Group Promotions Screen.
Work with the exclusions of a customer price group	In the Action field, select *Exclusions* for a customer price group to advance to the Work with Customer Price Group Exclusions Screen. **Note:** This option is available only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value.

Create Customer Price Group Screen

Purpose: Use this screen to create a customer price group.

How to display this screen: Select *Create* at the *Work with Customer Price Groups Screen*.

Field	Description
Price Group	A code that represents a customer price group. Alphanumeric, 4 positions. Create: required. Change: display-only.
Description	The description of the customer price group. Alphanumeric, 30 positions; required.
Price Type	Used for customer price group pricing only. Defines the price the system uses as the initial price of an item during customer price group line level pricing. Valid values: • *Original* (O) = Original Price. The system uses the price defined in the *Orig retail $* (SKU original retail price) field in the SKU table as the initial price of the item. • *Regular* (R) = Regular Price. The system uses the price defined in the *List price* field in the SKU table as the initial price of the item. **Note:** This field displays only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value. Required.
Discount	The percentage off the initial price for this customer price group. For example, *10* means the customer price group qualifies for a 10% discount. *0* indicates no discount for the customer price group. You can also define a percent discount for the customer price group at the customer price group detail level. When determining the customer price group discount, the system: 1. Uses the discount defined in the Customer Price Group Detail table with an effective date that is equal to or earlier than the current date. If more than one Customer Price Group Detail record exists with a qualifying effective date, the system uses the discount with the most current effective date. 2. If a discount is not defined in the Customer Price Group Detail table with a qualifying effective date, uses the discount defined in the Customer Price Group table. • This field displays only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value. • The system applies the customer price group discount to the lines on an order during *Line Level Customer Price Group Pricing*; however, if the order line is assigned to a price code during *Customer Price Group Price Code Pricing*, the order line no longer qualifies for the customer price group discount. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
Best Price Comparison	Defines whether the system performs customer price group best price comparison logic for the customer price group during end-of-order pricing and repricing. Customer price group best price comparison determines if the price available for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is a better price than the price available for the customer price group assigned to the sold to customer. Whichever customer price group provides the best price, the system applies this price to the item on the order. Valid values: • *Yes* = The system performs customer price group best price comparison logic for this customer price group. See *Customer Price Group Best Price Comparison* for more information. • *No* (default) = The system does not perform customer price group best price comparison logic for this customer price group. **Note:** This field displays only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value. Optional.

Work with Customer Price Group Details Screen

Purpose: Use this screen to work with the additional discounts defined for a customer price group. The system applies the customer price group discount to an order during customer price group line level pricing. If a discount is not defined at the customer price group detail level, the system uses the discount defined at the customer price group header level, if any.

How to display this screen: Select *Details* for an existing customer price group at the *Work with Customer Price Groups Screen*.

> **Note:**
>
> This screen is available only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value.

Customer price group details display on this screen in ascending effective date sequence.

Field	Description
Price Group	The code and description of the customer price group. Code: Alphanumeric, 4 positions; display-only.
Description	The description of the customer price group. Description: Alphanumeric, 30 positions; display-only.

Field	Description
Effective Date	The date when the customer price group detail discount becomes effective. You cannot have more than one customer price group detail with the same effective date. Enter a valid date to display customer price group details whose effective date is equal to or later than your entry. Numeric, 6 positions (in user date format); Optional.
Discount	The percentage off the initial price for this customer price group. For example, *10* means the customer price group qualifies for a 10% discount. *0* indicates no discount for the customer price group. You can also define a percent discount for the customer price group at the customer price group detail level. When determining the customer price group discount, the system: 1. Uses the discount defined in the Customer Price Group Detail table with an effective date that is equal to or earlier than the current date. If more than one Customer Price Group Detail record exists with a qualifying effective date, the system uses the discount with the most current effective date. 2. If a discount is not defined in the Customer Price Group Detail table with a qualifying effective date, uses the discount defined in the Customer Price Group table. • **Note:** The system applies the customer price group discount to the lines on an order during *Line Level Customer Price Group Pricing*; however, if the order line is assigned to a price code during *Customer Price Group Price Code Pricing*the order line no longer qualifies for the customer price group discount. Enter a discount and select *Search* to display customer price group details that match your entry. Numeric, 5 positions with a 2-place decimal; Optional.

Screen Option	Procedure
Create a customer price group detail	Select *Create* to advance to the *Create Customer Price Group Detail Screen*.
Delete a customer price group detail	In the Action field, select *Delete* for a customer price group detail to advance to the Confirm Delete window. Select *Yes* to confirm the delete; otherwise, select *No* to cancel the delete.
Work with the exclusions of a customer price group	In the Action field, select *Exclusions* for a customer price group to advance to the *Work with Customer Price Group Exclusions Screen*.

Create Customer Price Group Detail Screen

Purpose: Use this screen to create a discount for a customer price group.

How to display this screen: Select *Create* on the *Work with Customer Price Group Details Screen*.

Field	Description
Price Group	The code and description of the customer price group. Code: Alphanumeric, 4 positions; display-only.
Description	The description of the customer price group. Description: Alphanumeric, 30 positions; display-only.
Effective Date	The date when the customer price group detail discount becomes effective. You cannot have more than one customer price group detail with the same effective date. Numeric, 6 positions (in user date format); Required.
Discount	The percentage off the initial price for this customer price group. For example, *10* means the customer price group qualifies for a 10% discount. *0* indicates no discount for the customer price group. You can also define a percent discount for the customer price group at the customer price group detail level. When determining the customer price group discount, the system: 1. Uses the discount defined in the Customer Price Group Detail table with an effective date that is equal to or earlier than the current date. If more than one Customer Price Group Detail record exists with a qualifying effective date, the system uses the discount with the most current effective date. 2. If a discount is not defined in the Customer Price Group Detail table with a qualifying effective date, uses the discount defined in the Customer Price Group table. **Note:** The system applies the customer price group discount to the lines on an order during *Line Level Customer Price Group Pricing*; however, if the order line is assigned to a price code during *Customer Price Group Price Code Pricing*, the order line no longer qualifies for the customer price group discount. Numeric, 5 positions with a 2-place decimal; Required.

Work with Customer Price Group Exclusions Screen

Purpose: Use this screen to define the items/SKUs that are not eligible for the customer price group discount applied to an order during customer price group pricing.

If an item contains SKUs, you can exclude all SKUs for the item or indicate the specific SKUs you wish to exclude from the customer price group discount.

CPG Exclusion upload: The *Customer Price Group SKU Exclusion Upload Table* allows you to upload CPG exclusion information from an external system. Use the *Customer Price Group SKU Exclusion Upload Process* to create and update records in the Customer Price Group SKU Exclusion table. See *Customer Price Group SKU Exclusion Upload* for more information.

> **Important:**
>
> Items/SKUs that are excluded from the customer price group discount, ALWAYS use the *List price* field in the SKU table as the initial price of the item, regardless of the setting of the *Price Type* field for the customer price group.

How to display this screen: Select *Exclusions* at the *Work with Customer Price Groups Screen* or *Work with Customer Price Group Details Screen*.

> **Note:**
>
> This screen is available only if a customer price group code has been defined in the *Customer Price Group Code for CPG Pricing Only (L58)* system control value.

Customer price group exclusions display on this screen in ascending item number, SKU code sequence.

Field	Description
Price Group	The code of the customer price group. Code: Alphanumeric, 4 positions; display-only.
Description	The description of the customer price group. Description: Alphanumeric, 30 positions; display-only.
Item	A code for the item you wish to exclude from the customer price group discount. Item codes are defined in and validated against the Item table. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. Enter a full or partial item code to display customer price group exclusions whose item code contains your entry. Alphanumeric, 12 positions; Optional.
SKU	The SKU of the item you wish to exclude from the customer price group discount. 1. If the item contains SKUs and you leave this field blank, all SKUs of the item are excluded from the customer price group discount. 2. If the item contains SKUs and you specify a SKU in this field, only the SKU specified is excluded from the customer price group discount. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. Enter a full or partial SKU code to display customer price group exclusions whose SKU code contains your entry. Alphanumeric, three 4-position fields; Optional.

o

Screen Option	Procedure
Create a customer price group exclusion	Select *Create* to advance to the *Create Customer Price Group Exclusions Screen*.
Delete a customer price group exclusion	In the Action field, select *Delete* for a customer price group exclusion to advance to the Confirm Delete window. Select *Yes* to confirm the delete; otherwise, select *No* to cancel the delete.

Create Customer Price Group Exclusions Screen

Purpose: Use this screen to define an item/SKU that is not eligible for the customer price group discount applied to an order during customer price group pricing.

If an item contains SKUs, you can exclude all SKUs for the item or indicate the specific SKUs you wish to exclude from the customer price group discount.

How to display this screen: Select *Create* at the *Work with Customer Price Group Exclusions Screen*.

Field	Description
Price Group	The code of the customer price group. Code: Alphanumeric, 4 positions; display-only.
Description	The description of the customer price group. Description: Alphanumeric, 30 positions; display-only.
Item	A code for the item you wish to exclude from the customer price group discount. Item codes are defined in and validated against the Item table. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. Alphanumeric, 12 positions; Required.
SKU	The SKU of the item you wish to exclude from the customer price group discount. 1. If the item contains SKUs and you leave the SKU blank, all SKUs of the item are excluded from the customer price group discount. 2. If the item contains SKUs and you specify a SKU, only the SKU specified is excluded from the customer price group discount. You can prompt on this field to advance to the Select Item/SKU window. This window displays the first 500 item/SKU records; use the search fields to refine your search results. Enter a full or partial SKU code and select *Search* to display customer price group exclusions whose SKU code contains your entry. Alphanumeric, three 4-position fields; Optional.

Work with Pricing Upload (WPUP)

Purpose: Use this menu option to review, correct, and process records in the *Pricing Upload Table*.

Records in the Pricing Upload table:

1. Create, update, or delete records in the Special Pricing by Source table. See *Uploading Special Pricing by Source Records*
2. Create, update, or delete records in the QPM Detail table. See *Uploading Quantity Price Matrix Detail Records*.

In this topic:

- *Work with Pricing Upload Screen*
- *Change Pricing Upload Screen*
- *Pricing Upload Error Records Report*
- *Pricing Upload Processed Records Report*

For more information: See *Pricing Upload Process* for an overview.

Work with Pricing Upload Screen

How to display this screen: Enter *WPUP* in the Fast path field on a menu screen or select Work with Pricing Upload from a menu.

The system displays Pricing Upload records on this screen is descending date sequence.

Field	Description
Date	The date the Pricing Upload record was created. Enter a valid date and select *OK* to display Pricing Upload records in descending date sequence, starting with the date you enter. Numeric, 6 positions (in user date format); optional.
Type	The type of Pricing Upload record. Valid values are: • *SRC* = Special Pricing by Source upload record. The system creates, updates, or deletes a record in the Special Pricing by Source table. • *QPM* = QPM Detail upload record. The system creates, updates, or deletes a record in the QPM Detail table. Select a type and select *OK* to display Pricing Upload records that match the type you selected. Alphanumeric, optional.

Field	Description
Action	Indicates whether the Pricing Upload record creates, updates, or deletes a record in the Special Pricing by Source or QPM Detail table. Valid values: • *Update* = Create or update a record. The system determines whether the Pricing Upload record creates or updates an existing record by comparing the information in the Pricing Upload record with the existing records in the Order Administration table. See Uploading Special Pricing by Source Records and Uploading Quantity Price Matrix Detail Records for more information on how the system determines if the Pricing Upload record creates a new record or updates an existing record. • *Delete* = Delete a record. The system uses the information in the Pricing Upload record to determine which record in the Special Pricing by Source or QPM Detail table to delete. Select an action and select *OK* to display Pricing Upload records that match the action you selected. Alphanumeric, optional.
Status	The status of the Pricing Upload record. Valid values: • *Unprocessed* = The Pricing Upload record has not yet been processed. • *Processed* = The Pricing Upload record has been processed, but the update to the Order Administration table has not yet occurred. • *Error* = The Pricing Upload record contains errors. See Pricing Upload Interface Errors. Select a status and select *OK* to display Pricing Upload records that match the status you selected. Alphanumeric, optional.
Error	A description of the error. Enter a full or partial error and select *OK* to display Pricing Upload records whose error description contains your entry. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Change a Pricing Upload record	Select *Change* for a Pricing Upload record to advance to the Change Pricing Upload Screen.
Review a Pricing Upload record	Select *Display* for a Pricing Upload record to advance to the Display Pricing Upload screen. You cannot change any fields on this screen. See the Change Pricing Upload Screen for field descriptions.
Delete a Pricing Upload record	Select *Delete* for a Pricing Upload record to delete it.
Submit the Pricing Upload process	Select *Process*. See *Pricing Upload Process* for processing details.
Print the Pricing Upload Error Records report	Select *Error Report*. See Pricing Upload Error Records Report for details.

Change Pricing Upload Screen

Purpose: Use this screen to review and update a Pricing Upload record.

The fields that display on this screen depend on the Record Type defined for the Pricing Upload record: *SRC* (Special Pricing by Source upload record) or *QPM* (QPM Detail upload record).

When you select *OK* on this screen, the system validates the fields on the screen and displays an error message if an error exists. See *Pricing Upload Interface Errors* for a list of errors.

How to display this screen: Select *Change* for a Pricing Upload record on the *Work with Pricing Upload Screen*.

Field	Description
Type	The type of Pricing Upload record. Valid values are: • *SRC* = Special Pricing by Source upload record. The system creates, updates, or deletes a record in the Special Pricing by Source table. • *QPM* = QPM Detail upload record. The system creates, updates, or deletes a record in the QPM Detail table. Alphanumeric, 3 positions; display-only.
Status	The status of the Pricing Upload record. Valid values: • *Unprocessed* = The Pricing Upload record has not yet been processed. • *Processed* = The Pricing Upload record has been processed, but the update to the Order Administration table has not yet occurred. • *Error* = The Pricing Upload record contains errors. See *Pricing Upload Interface Errors*. Alphanumeric, display-only.
Action	Indicates whether the Pricing Upload record creates, updates, or deletes a record in the Special Pricing by Source or QPM Detail table. Valid values: • *Update* = Create or update a record. The system determines whether the Pricing Upload record creates or updates an existing record by comparing the information in the Pricing Upload record with the existing records in the Order Administration table. See *Uploading Special Pricing by Source Records*and *Uploading Quantity Price Matrix Detail Records* for more information on how the system determines if the Pricing Upload record creates a new record or updates an existing record. • *Delete* = Delete a record. The system uses the information in the Pricing Upload record to determine which record in the Special Pricing by Source or QPM Detail table to delete. Alphanumeric, display-only.
Error	A description of the error. See *Pricing Upload Interface Errors* for a list of errors. Alphanumeric, 30 positions; display-only.

Field	Description
Seq #	A unique sequence number assigned to the Pricing Upload record. Numeric, 9 positions; display-only.
Date	The date the Pricing Upload record was created. Numeric, 6 positions (in user date format); display-only.
Item	The item defined for the Pricing Upload record. Item codes are defined in and validated against the Item table. **Special Pricing by Source** The item associated with the special source price. Corresponds to the ITM Number field in the Special Pricing by Source table. **QPM Detail** A code for the item associated with the quantity price matrix detail. You must define an item category or item for a quantity price matrix price, but not both. Corresponds to the Item field in the QPM Detail table. Alphanumeric, 12 positions; required for SRC record type.
SKU	Displays for *QPM* Pricing Upload records only. A code for the SKU of the item associated with the quantity price matrix detail. SKU codes are defined in and validated against the SKU table. • If you define a SKU for the item, only the SKU specified qualifies for the quantity price matrix detail. • If you do not define a SKU for the item, all of the SKUs for the item qualify for the quantity price matrix detail. Corresponds to the SKU field in the QPM Detail table. Alphanumeric, 14 positions; optional.
Quantity	**Special Pricing by Source** The quantity of the item that must be purchased to receive the specified price break. Corresponds to the Qty field in the Special Pricing by Source table. **QPM Detail** The quantity of the item that must be ordered to qualify for the quantity price matrix detail. The item qualifies for the quantity price matrix detail if the order line quantity is less than or equal to the quantity pice matrix detail. You cannot create more than one quantity price matrix price break for the same item category and quantity, item and quantity, or item and SKU and quantity. Corresponds to the Quantity field in the QPM Detail table. Numeric, 5 positions; required.

Field	Description
Source	The source code associated with the pricing upload record. Source codes are defined in and validated against the Source Code table. **Special Pricing by Source** The source code associated with the Special Pricing by Source record. Corresponds to the Source Code field in the Special Pricing by Source table. **QPM Detail** The source code that must exist on the order header in order to qualify for the QPM price. Corresponds to the Source field in the QPM Detail table. Alphanumeric, 9 positions; required for Record Type SRC.
Price	The price at which the item will be sold if the pricing requirements are met. **Special Pricing by Source** Corresponds to the Price field in the Special Pricing by Source table. **Note:** For Special Pricing by Source records, the price cannot be greater than 7 positions with a 2 place decimal. **QPM Detail** Corresponds to the Price field in the QPM Detail table. Numeric, 13 positions with a 2 place decimal; required for Record Type SRC.

Field	Description
Tax Inclusive Price	The price at which the item will be sold to customers if the order is subject to VAT and if the pricing requirements are met. **Note:** This field displays only if the *Tax Included in Price (E70)* system control value is selected. Special Pricing by Source Corresponds to the Tax Price field in the Special Pricing by Source table. **Note:** For Special Pricing by Source records, the tax price cannot be greater than 7 positions with a 2 place decimal. **QPM Detail** Corresponds to the Tax Price field in the QPM Detail table. Numeric, 13 positions with a 2 place decimal; optional.
Associate Price	Displays for *SRC* Pricing Upload records only. The price at which the item will be sold to associate customers if the pricing requirements are met. Corresponds to the Associate Price field in the Special Pricing by Source table. **Note:** The associate price cannot be greater than 7 positions with a 2 place decimal. Numeric, 13 positions with a 2 place decimal; optional.

Field	Description
Tax Inclusive Associate Price	Displays for *SRC* Pricing Upload records only. **Note:** This field displays only if the *Tax Included in Price (E70)* system control value is selected. The price at which the item will be sold to associate customers if the order is subject to VAT and if the pricing requirements are met. Corresponds to the Associate Tax Price field in the Special Pricing by Source table. **Note:** For Special Pricing by Source records, the associate tax price cannot be greater than 7 positions with a 2 place decimal. Numeric, 13 positions with a 2 place decimal; optional.
QPM Code	Displays for *QPM* Pricing Upload records only. The quantity price matrix code associated with the QPM Detail price. QPM codes are defined in and validated against the QPM Header table. Corresponds to the Code field in the QPM Detail table. Alphanumeric, 4 positions; required for Record Type QPM.
Item Category	Displays for *QPM* Pricing Upload records only. A code for the item category associated with the quantity price matrix detail. You must define an item category or item for a quantity price matrix price, but not both. Item category codes are defined in and validated against the Item Category table. Corresponds to the Item Category field in the QPM Detail table. Alphanumeric, 4 positions; optional.
Customer Sold To #	Displays for *QPM* Pricing Upload records only. The sold to customer that must exist on the order in order to qualify for the QPM price. Customer sold to numbers are defined in and validated against the Customer Sold To table. Corresponds to the Customer field in the QPM Detail table. Numeric, 9 positions; optional.

Field	Description
Customer Price Group	Displays for *QPM* Pricing Upload records only. The customer price group for the sold to customer on the order header in order to qualify for the QPM price. Customer price group codes are defined in and validated against the Customer Price Group table. Corresponds to the Price Group field in the QPM Detail table. Alphanumeric, 4 positions; optional.
Expire date	Displays for *QPM* Pricing Upload records only. The date the quantity price matrix price expires. The date cannot be earlier than the current date. Corresponds to the Exp Date field in the QPM Detail table. Numeric, 6 positions (in user date format); optional.
Discount %	Displays for *QPM* Pricing Upload records only. The percentage of the quantity price matrix detail price when the item ordered is eligible for the quantity price matrix special. For example, *10* means the item qualifies for a 10% discount. Corresponds to the Discount % field in the QPM Detail table. *Example:* The % discount is based on the following criteria: • customer price group = QPM1 • item category = HG • quantity = 2 • % discount = 10 • The 10% discount is based on the quantity price matrix detail defined for item category HG and quantity 2: • item category = HG • quantity = 2 • price = 10.00 In this example, the 10% discount is a 1.00 discount (10.00 QPM detail - 10% QPM special = 9.00 discount price) If a quantity price matrix detail is not defined for item category HG and quantity 2, the system uses the next lowest quantity for the item category (in this example, the system uses item category HG and quantity 1). See *Calculating the QPM Price* for more information on how the system finds the price for a quantity price matrix detail and quantity price matrix special. Numeric, 4 positions with a 2 place decimal; optional.

Reviewing Forecasting Information

Topics in this part:

- *Inventory Status Inquiry (ISIQ)* allows you to review the current inventory status and order totals for an item by offer.
- *Generating Forecasting Reports* provides descriptions and examples of several reports that help you evaluate sales response for an offer and plan and reorder merchandise.

Inventory Status Inquiry (ISIQ)

Purpose: Use Inventory Status Inquiry to view order activity for any item or SKU broken out by offer. The information includes total and net orders and sales; returns, cancellations, and exchanges; and purchase order figures. You can break out the information in three basic ways:

- summarizing all SKUs for a SKU'd item
- selecting a specific SKU for a SKU'd item
- summarizing activity for a non-SKU'd item

Other options: You can use the following additional menu options for inventory inquiry:

- *Using Inventory Inquiry (DINI)*: to review inventory information for items within warehouses and locations in warehouses
- *Inventory Inquiry by Item (IIQI)*: to review item information organized by the base item and the first SKU element

In this topic:

- *Inventory Status Inquiry Screen*
- *Inventory Status - Non SKU Screen (1 of 2)*
- *Inventory Status - Non SKU Screen (2 of 2)*
- *Inventory Status - SKU Screen (1 of 2)*
- *Inventory Status - SKU Screen (2 of 2)*
- *Inventory Status - All SKUs Screen (1 of 2)*
- *Inventory Status - All SKUs Screen (2 of 2)*

Additional inventory inquiries:

- *Using Inventory Inquiry (DINI)* for detailed information on the availability and demand for an item or SKU in a particular warehouse or locations within a warehouse.
- *Inventory Inquiry by Item (IIQI)* for detailed information on availability, demand and life-to-date history of an item and each of its individual SKUs.

Inventory Status Inquiry Screen

Purpose: Use this screen to select the item/SKU you want to view.

How to display this screen: Enter *ISIQ* in the Fast Path field at the top of any menu or select Inventory Status Inquiry from a menu.

Field	Description
Item	The code of the item you want to review. The item code is validated against the Item table. Alphanumeric, 12 positions; required.
Clr/Size/Wdth (SKUs)	The item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; optional.

Completing this screen: Enter an item code in the Item field. If you are inquiring about a SKU'd item, enter SKU information if you want to review information about that specific SKU only; leave the SKU fields blank if you want to review combined information for all SKUs. You advance to the *Inventory Status - Non SKU Screen (1 of 2)*, *Inventory Status - SKU Screen (1 of 2)*, or *Inventory Status - All SKUs Screen (1 of 2)* depending on your entries.

Inventory Status - Non SKU Screen (1 of 2)

Purpose: Use this screen to review order, return, exchange and cancellation totals for each offer where the item is sold.

How to display this screen: Enter a non-SKU'd item at the *Inventory Status Inquiry Screen*.

Fields: Each field on this screen, the *Inventory Status - SKU Screen (1 of 2)*, and the *Inventory Status - All SKUs Screen (1 of 2)* is described below.

Field	Description
Item	A code representing a unit of inventory. Alphanumeric, 12 positions.
Item description (Unlabeled field to the right of the item code)	The description associated with the item. Alphanumeric, 120 positions.
SKU (Unlabeled field below the item description)	The SKUs you entered on the selection screen, if any. Alphanumeric, three 4-position fields.
Retail	The price defined for the item in the most current offer. If this is the All SKUs screen, and you define prices at the SKU level rather than the item level, the price will display as zero. Numeric, 13 positions with a 2-place decimal.
Cost	The cost of the item. The cost is defined in the SKU table. The new purchase cost represents the actual cost at which the item was purchased plus any overhead charges and additional item charges. See *Purchase Order Receiving Overview*. Numeric, 13 positions with a 2-place decimal. **The following fields represent column headings for inventory information calculated for:** • Total: This row of figures represents the total for all offers for the item or SKU you entered at the selection screen. • Ofr (offer): This row of figures represents the total for this offer only. An offer is a catalog or advertisement you use to present items to your customers. The offer code is defined in and validated against the Offer table. See *Working with Offers (WOFR)*.
Ord (Ordered)	The total quantity ordered. If the *Update Demand for Order Maintenance Transactions (C72)* system control value is *selected*, the system also updates this field to reflect: • lines added in Order Maintenance • exchanges • changes of item quantity made in Order Maintenance Numeric, 7 positions.
Can (Canceled)	The total quantity canceled. Numeric, 7 positions.
S/O (Soldout)	The total quantity sold out. Numeric, 7 positions.

Field	Description
Ship	The total quantity shipped. Numeric, 7 positions.
Rtn (Returned)	The total quantity returned. Numeric, 7 positions.
Exch (Exchanged)	The total quantity exchanged. Numeric, 7 positions.
Net ord (Net orders)	The net order quantity, calculated as: `Total orders - (total returned + total exchanged)` If a customer exchanges an item for the exact same item and SKU, there is no effect on net orders for that particular item/SKU. Cancels and soldouts do not affect net orders. Numeric, 7 positions.
Act % (Actual return percent)	The actual return percentage for the item or SKU, calculated as: `(( units returned + units exchanged) / units shipped) x 100` Numeric, 5 positions with a 2-place decimal.

Screen Option	Procedure
Advance to the second Inventory Status Inquiry screen	Select *Right* to advance to the *Inventory Status - Non SKU Screen (2 of 2)*, *Inventory Status - SKU Screen (2 of 2)*, or *Inventory Status - All SKUs Screen (2 of 2)*.

Inventory Status - Non SKU Screen (2 of 2)

How to display this screen: Select *Right* at the Inventory Status - Non SKU Screen (1 of 2).

Field	Description
Net sales	The net amount of the item or SKU sold, calculated as `Total shipped - (Total returns + Total exchanges)` Numeric, 7 positions.
On PO (On purchase order)	The total quantity of the item or SKU on open purchase orders. Numeric, 7 positions.

Screen Option	Procedure
Return to the first Inventory Status Inquiry screen	Select *Left* to advance to the *Inventory Status - Non SKU Screen (1 of 2)*.

Inventory Status - SKU Screen (1 of 2)

How to display this screen: Enter a SKU'd item at the *Inventory Status Inquiry Screen*.

For more information: See *Inventory Status - Non SKU Screen (1 of 2)* for field descriptions.

Inventory Status - SKU Screen (2 of 2)

How to display this screen: Select *Right* at the Inventory Status - SKU Screen (2 of 2).

For more information: See *Inventory Status - Non SKU Screen (2 of 2)*.

Inventory Status - All SKUs Screen (1 of 2)

How to display this screen: Select *OK* at the *Inventory Status Inquiry Screen* without entering an item or SKU.

For more information: See *Inventory Status - Non SKU Screen (1 of 2)* for field descriptions.

Inventory Status - All SKUs Screen (2 of 2)

How to display this screen: Select *Right* at the *Inventory Status - All SKUs Screen (1 of 2)*.

For more information: See *Inventory Status - Non SKU Screen (2 of 2)*

Print Product Performance Reports (PPPR)

Purpose: Use the *Product Performance Report (Ordered Totals)* and *Product Performance Report (Shipped Totals)* to review total quantities and dollar values of items ordered or shipped for a range of dates, as well as current inventory status.

Totals not net of returns, cancels, soldouts, or after-shipment discounts: The shipped totals on the *Product Performance Report (Shipped Totals)* do not reflect any returns that have been processed against the items. For example, if there have been 100 units of an item shipped, and 15 returned, the quantity shipped on the report is 100, not 85.

Similarly, the ordered totals on the *Product Performance Report (Ordered Totals)* does not reflect any quantities sold out or canceled (unless you use a cancel reason flagged to reduce demand). If there have been 200 units of an item ordered, and 7 sold out, the ordered total is 200, not 193.

Also, the dollar totals do not reflect any discounts applied after shipment using the *Discount* option in order maintenance. For example, you shipped 10 units for an extended price of $200.00. Afterward, you applied a discount of 10% in order to preserve customer satisfaction because of an issue related to the order. The Merch dollars shipped total on the report is still $200.00 and does not reflect the 10% discount.

Component items not included: The report includes the main set item rather than its components. Items that are components of sets are included on the report only if they were ordered or shipped as stand-alone items. See *Working with Sets* for background on working with set items.

Quotes excluded: This report excludes quotes, identified by the Quote flag on the order type on the order. See *Entering Pre-Order Quotes* for an overview.

In this topic:

- *Product Performance Reports Screen*
- *Product Performance Report (Ordered Totals)*
- *Product Performance Report (Shipped Totals)*

Product Performance Reports Screen

How to display this screen: Enter *PPPR* in the Fast path field at the top of any menu, or select Print Product Performance Reports from a menu.

Field	Description
Start Date	Enter the first order or shipment date to include on the report. The report includes items that have been ordered (based on the order's Entered date) or shipped on or after this date. The start date must be on or earlier than the current date and the end date. Numeric, 6 positions (in user date format); required.
End Date	Enter the last order or shipment date to include on the report. The report includes items that have been ordered (based on the order's Entered date) or shipped on or before this date. The end date must be on or earlier than the current date and no earlier than the start date. Numeric, 6 positions (in user date format); required.
Report Option	Indicate whether the report should include total units and dollars ordered or shipped, and how to sort the report: • *Ordered Product Performance by Ascending Items* = Generate the *Product Performance Report (Ordered Totals)* in alphanumeric order by item code • *Ordered Product Performance by Descending Total Dollars* = Generate the *Product Performance Report (Ordered Totals)* listing items beginning with the item/SKU with the highest Merchandise Dollars Ordered for the selected date range and descending to the item/SKU with the lowest Merchandise Dollars Ordered • *Ordered Product Performance by Order Type* = Generates the *Product Performance Report (Ordered Totals)* listing items sorted first by the order type on which they were ordered, and then in alphanumeric order by item code • *Shipped Product Performance by Ascending Items* = Generate the *Product Performance Report (Shipped Totals)* in alphanumeric order by item code • *Shipped Product Performance by Descending Total Dollars* = Generate the Product Performance Report (Shipped Totals) listing items beginning with the item/SKU with the highest Merchandise Dollars Shipped for the selected date range and descending to the item/SKU with the lowest Merchandise Dollars Shipped • *Shipped Product Performance by Order Type* = Generates the Product Performance Report (Shipped Totals) listing items sorted first by the order type on which they were ordered and shipped, and then in descending order by shipped quantity

Completing this screen: Complete all fields as described above and select *Print Report* to submit the *PROD_PERFF* job, which generates the *Product Performance Report (Ordered Totals)* or the *Product Performance Report (Shipped Totals)*.

Print Campaign Performance Reports (PCPR)

Purpose: Use these reports to evaluate the success of marketing campaigns based on performance statistics.

Quotes: The campaign performance reports do not include quotes, identified by the Quote flag on the order type on the order. See *Entering Pre-Order Quotes* for an overview.

Campaign Performance Report Screen

How to display this screen: Enter *PCPR* in the Fast path field at the top of any menu, or select Print Campaign Performance Report from a menu.

Field	Description
Start date	Specify the first order date to include on the report. The report includes orders with order dates on or after this date, regardless of whether you are generating the *Ordered Dollars* or the *Shipped Dollars* version of the report. Numeric, 6 positions (in user date format); required.
End date	Specify the last order date to include on the report. The report includes orders with order dates before or on this date, regardless of whether you are generating the *Ordered Dollars* or the *Shipped Dollars* version of the report. The End date cannot be earlier than the Start date. Numeric, 6 positions (in user date format); required.
Source category	Optionally, enter a source category to include on the report, or leave this field blank to include all source codes regardless of category. You can use source code categories to classify your source codes, such as buyers, recipients, or rented names. Source code categories are defined in and validated against the Source Code Category table. See *Working with Source Categories (WSCT)*. Alphanumeric, 2 positions; optional.
Drop code	Optionally, enter a drop code to include on the report, or leave this field blank to include all source codes regardless of drop. Drop codes identify a catalog mailing to a list of customers. Alphanumeric, 2 positions; optional.
Ordered/Shipped	Select whether the report should indicate the total dollar value ordered or shipped during the selected date range: *Ordered* = The performance order dollar totals include merchandise ordered. *Shipped* = The performance order dollar totals include merchandise shipped. Required.

Completing this screen: Complete each field as described above and select *Print Report* to generate the Campaign Performance Report (PCPR).

Print Order Promotion Analysis Report (POPA)

Purpose: Use this report to evaluate the performance of a promotion, or all promotions with start dates within a selected time frame.

Print Promotion Analysis Report Screen

Purpose: Enter *POPA* in the Fast path field at the top of any menu, or select Order Promotion Analysis Report from a menu.

Field	Description
Start date from	The first date to include in the report, based on a promotion's start date. If you select a Start date from and an End date, the report includes promotions that have start dates on or after this date and on or before the End date. *Example:* If you enter a Start date of 6/1 and End date of 6/30, the report includes promotions whose start and end dates are: • 6/1 - 6/30 • 6/15 - 6/30 • 6/2 - 6/15 However, the report does not include promotions whose start and end dates are 5/30 - 6/30. **Note:** The date selections are based on the date range currently specified for the promotion, rather than the dates when the promotion applied to orders. If you use this report, it is important not to change the date range for a promotion, because it might not be included in the report even if it was in effect between the Start date and an End date you specify here. If you specify a Start date and an End date, you cannot specify a promotion. Numeric, 6 positions (in user date format); required if you do not specify a promotion.
End date	The last date to include on the report, based on a promotion's current start date. See the Start date, above, for a discussion. Numeric, 6 positions (in user date format); required if you do not specify a promotion.
Promotion code	The promotion to include on the report. Promotions are defined in and validated against the Promotion table; see *Working with Promotions (WPRO)* for more information. If you specify a promotion, you cannot specify a Start date and End date. **Required entry?** A promotion is included in the report when you run the report by date range regardless of whether its Required entry flag is selected; however, you cannot run the report for a single promotion unless the promotion's Required entry flag is selected. Alphanumeric, 7 positions; required if you do not specify a Start date and End date.

Completing this screen: Complete either the *Start date from* and *End date* or the *Promotion code*, as described above, and select *Submit* to generate the *Promotion Analysis Report*.

Using House List Options

Topic in this part:

- *Working with Merge/Purge Sold-to Names (MMCS)* describes how to generate a listing of duplicate records and merge customer sold-to records.
- *Merging and Purging Customer Bill To Names (MMCB)* describes how to merge customer bill-to records.

Merging and Purging Customer Bill To Names (MMCB)

Purpose: Merging and purging customer bill-to names allows you to merge the bill-to information from a source bill-to customer record with a target bill-to record. More than one source bill-to can point to a single target bill-to number. You determine which customer bill-to is the target and which is the source bill-to record. The target record remains on the system, and the source bill-to is automatically deleted when you perform the merge/purge option.

For example, you might need to consolidate branch office bill-to records that were kept separately on the system and consolidate the information with the corporate bill-to account. This option lets you merge one source and target bill-to record at a time; although, you can merge several source bill-tos with a target bill-to by performing the merge/purge option for each source/target bill-to combination.

In this topic:

- *Merge/Purge Customer Bill To Screen*
- *Merge/Purge Logic*
- *How Are the Bill-To Tables Updated?*

Merging and Purging

Merge/Purge Customer Bill To Screen

How to display this screen: Enter *MMCB* in the Fast Path field at the top of any menu or select the Merge/Purge Customer Bill To option from a menu.

Field	Description
Source bill-to cust	The bill-to *Acct #* that you want to change to a source customer. Numeric, 9 positions; required.
Target bill-to cust	The number for the bill-to customer that you wish to designate as the target customer. When you perform the merge/purge option, the information from the source customer you designated in the previous field will be consolidated with the target bill-to customer, and the source bill-to will be deleted from the system. Numeric, 9 positions; required.

Instructions:

1. Complete the Source bill-to customer and Target bill to customer fields.

2. If you wish to merge the source bill-to with the target bill-to customer record, select *Perform Merge/Purge* to have the system submit the *MERGBILLTO* job for processing.

Once this job has completed processing, the source bill-to record is purged from the system, and the information from the source bill-to is consolidated with the information for the target bill-to.

Merge/Purge Logic

When you process a bill-to merge/purge, the system attempts to keep the best, most recent and most complete information for the target and source customer consolidated into one bill-to customer record.

Affected Table	Comments
Customer Bill To Customer Bill To Extended	See *How Are the Bill-To Tables Updated?*
Customer Bill To Note	Adds the source notes to the target.
Customer Bill To Phone #	Uses most recent phone numbers based on change date.
Cust Bill To Mail Hist	Adds the source history to the target history.
Cust Bill To User Field	If any user field is blank for the target customer but not the source customer, uses the source information.

How Are the Bill-To Tables Updated?

Field	How Updated?
Address information:	NA
Prefix First name Middle initial Last Name Suffix Company name Street Address Apartment Address line 2 Address line 3 Address line 4 City State Zip Delivery code PO Box?	Uses the target information.
Additional information:	NA

Field	How Updated?
Match code Opt in/opt out Match code Fax flag EDI flag Additional documents flag Language code Currency code	Uses the target information.
Email address	If the source has information in the field and the target does not, uses the source information.

Working with Merge/Purge Sold-to Names (MMCS)

Purpose: Merging and purging customer sold-to names allows you to streamline your customer database by consolidating order and sales information from customers that have duplicate match codes (source customers) into a target customer record. Several source customer numbers can point to the same target customer number if they all share a match code. The system selects the oldest customer record as the target customer. This is the customer number that remains on the system when you run the merge/purge.

When you process the merge/purge, the system consolidates information from each source customer with the target customer. In each case, the system attempts to preserve the most current and complete information. The logic that the system uses in performing the merge/purge is discussed later in this topic.

> **Note:**
>
> It is recommended that you process the merge/purge for your bill-to customers before your sold-to customer, to avoid unnecessary duplicate bill-to errors.

Where do duplicates come from? Duplicate codes can result when two customers have demographic information close enough to produce identical match codes. For example, Gerald Smith and Geraldine Smith live at the same address, and use the same nickname, Jerry. A duplicate can also occur during Order Entry if a customer uses a variation of his first name on different orders. For example, Jonathan Jones places orders on two occasions and gives Jon as his first name on one order, Jonathan as his first name on another order.

Omitting customers from merge/purge: You can use the delete option at the *Work with Source Customers Screen* to omit a customer from the merge. Using this option flags the customer's Status as *M*, which indicates to omit the customer from future merge/purge lists. To reset all customers flagged with the *M* status and make them eligible for merge/purge selection again, use the *Clearing Customer Sold To Status (MCST)* menu option.

Adding records to the merge/purge: This function also allows you to create target and source customers in order to merge customer records that the system would not ordinarily select because the match codes are entirely different.

For example, if customer Ann Delaney resumes using her maiden name, Williams, and places an order under that name, you would want to merge Ann Delaney's customer and order history with her new customer record, Ann Williams. In order to do this, you would want to create Ann Williams as the target customer and Ann Delaney as the source customer.

If you have not generated a list of duplicate records to work with, this should be the first option that you perform. Then you can review and change customer sold-to records, if necessary, in preparation for the merge/purge.

E-Commerce: If the *Generate E-Commerce Customer Merge Staging Files (H86)* system control value is selected, the system generates an E-Commerce Customer Merge Web XML File (CustomerMergeWeb). The web storefront can use this file to review customers that have been merged in Order Administration and update the customer sold to records for the web. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

File storage API: If the Generate E-Commerce Customer Merge Staging Files (H86) system control value is selected, the merge/purge program creates a zip file in the OMS-ECOMMERCE container of the FILE_STORAGE table. The zip file contains the *E-Commerce Customer Merge Web XML File (CustomerMergeWeb)*. You can use the file storage API to download the file. See the *File Storage API* for background.

For more information: See *Clearing Customer Sold To Status (MCST)*.

Merge/Purge Customer Sold To Screen

How to display this screen: Enter *MMCS* in the Fast Path field at the top of any menu or select the Merge/Purge Customer Sold To option from a menu.

About this screen: This screen will contain no data if you have not generated a listing of customers with duplicate match codes by selecting *Generate List*. See *Submit Generation Window (Generating a List)*.

If you have already generated a listing, this screen will show the names of target customer records, along with the customer numbers that have duplicate match codes. The duplicate match code customer numbers appear in bold below the target customer name.

Field	Description
Customer #	The number assigned to the target customer; the system appends relevant information from the source customer onto the target customer record. Numeric, 9 positions; optional.
Name	The name or company name of the customer. Customer names display last name first. Company name: alphanumeric, 30 positions; display-only. Customer name: alphanumeric, 25 positions (last name) and 15 positions (first name); display-only.)
Duplicate	The customer number of the duplicate (source) customer record. If there is more than one source customer, the additional customer numbers will display. Numeric, 9 positions; display-only.
Status	The status of a customer record. Valid values are: *B* = Bill to Duplicate *O* = Open Enter a valid status code to display records of that status. Optional.

Screen Option	Procedure
Create target customer	Select *Create* to advance to the *Create Target Customer Screen*.
Delete a customer sold-to merge/purge record	Select *Delete* for a customer to delete a customer sold-to record from the merge.
Work with existing duplicates (source customers) or add duplicates	Select *Duplicates* for a customer to advance to the *Work with Source Customers Screen* in Change mode. See Creating a Source Customer for information on working with this screen in Add mode.
Change customer sold-to	Select *Change cust sold to* for a customer to advance to the *Display Customer Screen*.
Display customer sold-to	Select *Display cust sold to* for a customer to advance to the *Display Customer Screen*.
Generate a list of duplicate customer names	Select *Generate List* to submit this job for processing. See *Submit Generation Window (Generating a List)*.

Note:

This option displays only if you have authority to the *Allow Generate List in Merge/Purge (J06)* secured feature.

Screen Option	Procedure
Delete list of target and source customers	Select *Delete list* to delete the list. See *Confirm Delete Window (Deleting a List)*.
Merge and purge customers	Select *Perform Merge* to submit the merge/purge job for processing. See *Performing a Merge*.

Submit Generation Window (Generating a List)

Purpose: To generate a list of duplicate names eligible for merge/purge, select *Generate List* at the *Merge/Purge Customer Sold To Screen*.

> **Note:**
>
> The *Allow Generate List in Merge/Purge (J06)* secured feature controls access to the *Generate List* option on the *Merge/Purge Customer Sold To Screen*.

Ghost Customers

Use the Save source as ghost field on this window to indicate whether you want to delete or save source customer records with duplicate match codes once the order and customer history is merged with the target record. The *Ghost?* field defaults to *unselected*, but you can change it to *Selected*.

Records retained: If you select this field, the system will retain the source customer record in the Customer Sold To table, but the record will be flagged as a Ghost customer. All other records, such as alternate customer numbers, phone numbers, email, order history, billing history, mail history and entity history will not exist for the ghost customer, since all other records are merged into the target customer's records; see *Merge/Purge Logic*.

Ghost Customer window: When you enter a Ghost customer number in order entry, or when entering a catalog request or customer membership, a pop-up window will inform you that the customer number you entered belongs to a Ghost customer, and will indicate the target customer you can enter instead. See *Ghost Customer Number Warning Window*.

Ghost customer restrictions: Ghost customers continue to be available for review; however, if you enter a ghost customer number in any maintenance function, the system does not display any history, such as orders or catalog requests, because all history has been merged to the target customer. Additionally, you cannot include a ghost customer as a target customer or source customer in a future merge/purge.

Maximum Number of Source Customers

You can also define the maximum number of source customers you wish to process for a target customer. If you enter a maximum number, the system will complete the merge/purge process once the maximum number has been reached and the update for the target customer the system is currently working on has completed.

When you complete this screen and press *Enter*, the system submits the batch job *M_PGENERAT*, and returns you to the Merge/Purge Customer Sold To screen; exit and re-enter to review the generated list.

Confirm Delete Window (Deleting a List)

Purpose: To delete the existing list of target and source customers and clear the Customer Merge/Purge tables, select *Delete list* at the *Merge/Purge Customer Sold To Screen*.

Work with Source Customers Screen

Purpose: Once you have generated the list of target and source customers, you can work with the duplicate, or source customers; optionally, you can retain the records of the source customers by flagging them as *Ghost?*. Use this screen in Add mode to select a source customer for a target customer you added to the merge/purge list using the Create option at the *Merge/Purge Customer Sold To Screen*; see *Creating a Source Customer*.

When you delete a customer at this screen, it sets the customer's Status to *M*, which indicates not to select the customer for subsequent merge/purge lists. To clear a status of *M* from any flagged record in the Customer Sold To file, use the *Clearing Customer Sold To Status (MCST)* menu option. Once you use this menu option to clear all *M* statuses, the customers are eligible for selection the next time you generate a merge/purge list.

How to display this screen: Select *Duplicates* for a target customer at the *Merge/Purge Customer Sold To Screen*.

About this screen: This screen includes each source customer for the target customer, including both matches found by the system and source customers you selected.

Field	Description
Customer #	The number assigned to the source customer; the system appends relevant information from the source customer onto the target customer record. Numeric, 9 positions; optional.
Name	The name or company name of the customer. Customer names display last name first. Company name: alphanumeric, 30 positions; display-only. Customer name: alphanumeric, 25 positions (last name) and 15 positions (first name); display-only.)
Ghost?	A ghost customer is a source customer whose records have been merged into a target customer's records. Select this field to retain the customer records in the Customer Sold To table for the source customer after you have completed the Merge/Purge. If you retain ghost customer records, the system will flag the records as Ghost customers. When you enter a Ghost customer number in order entry, or when entering a catalog request or customer membership, a pop-up window will inform you that the customer number you entered belongs to a Ghost customer, and will indicate the target customer you can enter instead. See *Ghost Customer Number Warning Window*. Alphanumeric, 1 position; required.

Screen Option	Procedure
Add a source customer to the merge/purge	Select *Create* to advance to Add mode. See *Creating a Source Customer*.

Screen Option	Procedure
Delete a source customer from the merge/purge	Select *Delete* for a customer to delete the customer record from the record from the merge/purge and subsequent merge/purges. See *Clearing Customer Sold To Status (MCST)* for more information.
Change customer sold-to	Select *Change cust sold to* for a customer to advance to the *First Create Sold To Customer Screen*.
Display customer sold-to	Select *Display cust sold to* for a customer to advance to the *Display Customer Screen*.

Create Target Customer Screen

Purpose: You can create a target customer in order to merge customer records that the system would not normally select because the match codes are entirely different.

How to display this screen: Select *Create* on the *Merge/Purge Customer Sold To Screen*.

Field	Description
Target customer	The customer number for the sold-to customer that you wish to add to the merge/purge as a target customer. If you select any source records for this customer (see Creating a Source Customer), the system will consolidate the customer records when you perform the merge/purge. Numeric, 9 positions; required.

Instructions:

1. Complete the Target customer field.
2. You receive a system message informing you that a Customer Merge/Purge Target (Comp #/Cust #) has been created. When you return to the *Merge/Purge Customer Sold To Screen*, the target customer you just created now appears.
3. To select a source customer and link it to the target customer so the records will be consolidated when you process the merge/purge, see *Creating a Source Customer*.

Creating a Source Customer

Purpose: Use this option to select a source customer to merge with a target customer that you created manually (through the Create option at the *Merge/Purge Customer Sold To Screen*). You can also use this option to change source customers for merge/purge records created by the system; see *Work with Source Customers Screen*.

How to display this screen: Select *Duplicates* for a target customer record on the *Merge/Purge Customer Sold To Screen*, then select *Create* at the *Work with Source Customers Screen* to advance to Add mode.

About this screen: Each field on this screen is described under *Work with Source Customers Screen*.

Instructions:

1. Enter the Customer # for each customer record you would like to add as a source customer.
2. Optionally, select Ghost? field for each customer to add.
3. When you return to the *Merge/Purge Customer Sold To Screen*, the customer number you created as a source customer appears in the Duplicate field below the target customer.

Performing a Merge

Purpose: Use this option to merge the customer and order history of a target customer with a source customer(s) and purge source customer records from the system.

To perform a merge/purge: To merge the order and customer history of the source with the target customer, select *Perform Merge* at the *Merge/Purge Customer Sold To Screen*. A message displays announcing that *MERGE_PURG* job has been submitted.

See *Merge/Purge Logic* for a discussion of which tables are affected by the merge/purge, and how the system determines which information to keep from the target or source customers.

Display Customer Screen

To display: Select *Display cust sold to* for a target customer at the *Merge/Purge Customer Sold To Screen* to advance to the first Display Customer screen. You cannot change anything on this screen.

Merge/Purge Logic

When you process a merge/purge through *Working with Merge/Purge Sold-to Names (MMCS)*, the system attempts to keep the best, most recent and most complete information for the target and source customers consolidated into one customer record. See *Understanding Customer Types*.

Affected Table	Comments
Alternate Customer # Cross Reference	Adds source records to target.
Catalog Requests	Adds source requests to target.
Correspondence History	Adds source emails to target.
Customer Action	Adds the source information to the target.
Customer Address Change	Adds source address changes to target. See How are the Customer Tables Updated?
Customer Contract Pricing	Adds the source information to the target.
Customer Fraud	Adds the source information to the target.
Customer Note	Adds the source notes to the target.
Customer Ownership	Adds the source information to the target.
Customer Pay Type Exclusion	Adds the source information to the target.
Customer Profile	For any of these fields, if the source has information and the target does not, uses the source information.
Customer Ship To	Merges matching ship-to customers based on match code; adds additional source ship-to customers to target.
Customer Ship To Extended	See How are the Customer Tables Updated?
Customer Ship To Mail History	Adds the source information to the target.

Affected Table	Comments
Customer Ship To Order History	Adds the source history to the target history.
Customer Ship-To Phone Number	Uses most recent phone numbers based on change date. See How are the Customer Tables Updated?
Customer Sold To	See How are the Customer Tables Updated?
Customer Sold To Email	Adds source records to target; target's primary email address does not change.
Customer Sold To Extended	See How are the Customer Tables Updated?
Customer Sold To Item Class	Adds the source information to the target.
Customer Sold To Mail History	Adds the source information to the target.
Customer Sold To Order History	Adds the source history to the target history. See *How are the Customer Tables Updated?* for more information.
Customer Sold To Phone Number	Uses most recent phone numbers based on change date.
Customer Sold To Promotion	Adds the source information to the target.
Customer Sold To User Fields	If any user field is blank for the target customer but not the source customer, uses the source information.
Customer Subscription	Adds the source information to the target.
Customer Tax	Adds the source information to the target.
Customer Warehouse	Order Administration uses the following logic: • if the source has a customer warehouse and the target does not, use the source customer warehouse. • if the target has a customer warehouse and the source does not, use the target customer warehouse and delete the source customer warehouse.
Customer Warranty	Adds the source records to the target customer.
Order Billing History (both sold-to and ship-to customers)	Adds all target and source dollar and quantity figures together; see below for additional information.
Order Header	Adds the source records to the target.
Order Ship To	Adds the source records to the target.
Pick Control Header	Adds the source records to the target.
Pick Gen Select Customer	Adds the source records to the target.
Pick Gen Select PO	Adds the source records to the target.
PO Header	Adds the source records to the target.
Promotion Customer	Adds the source records to the target.
Store Pickup Header	Adds the source records to the target. Not currently implemented.
Tickler	Adds the source records to the target.
Tickler History	Adds the source records to the target.

How are the Customer Tables Updated?

Field	How Updated?
Address information:	NA
Prefix First name Middle initial Last Name Suffix Company name Street Address Apartment Address line 2 Address line 3 Address line 4 City State Zip Delivery code PO Box? Phone numbers Match code User fields 1-4	The system decides which information to keep based on the Change date from the most recent record in the Customer Address Change table and the Last order date in the Customer Order History table. • If the Last Change date for the source customer is more recent than the last Change date for the target customer, the system uses the source address information and creates a customer address change record for the target. • If there is no last Change date for either the target or the source, the system compares the target and source Last order date. If the Last order date for the source customer is more recent than the target customer, the system uses the source address information and creates a customer address change record for the target, as above. **Phone numbers:** If the system uses the source address information and one or more of the phone numbers for the source is blank, the system will retain the target phone number instead of removing it. *Example:* If the source has a day number, but not an evening number, the system will use the source day number, but retain the target evening number.
Primary email address	Uses the target's primary email address; however, the source's email addresses are added to the target's list.
Additional fields:	NA
Entry date	Compares target and source Entry date and uses earlier date.
Original mail type	If the target's original mail type is not *B* (buyer), uses the source's original mail type.
Current mail type	If the target has no order history (the Last order date field is blank), uses the source's current mail type.
Original source code	If the target is newer than the source based on the Entry date, uses the source information. However, if the source has the older Entry date but no original source code, then the target's original source code is retained.
Customer class	If the target is newer than the source based on the Active since date, uses the source information. (The Active since date is filled when the customer first places an order; if the customer has never placed an order, the Active since date is set to 99/99/99).
Mail Rent Seed	If any of these flags are *selected* for either the target or the source, sets the flag to *selected*.

Field	How Updated?
Hold/bypass/fraud Customer type Discount percent Price column Pop-up windows Alternate customer number Salesman number Country Mail code Call code Pop-up windows VAT number Currency code Language code Price Group Reserve warehouse	For any of these fields, if the source has information in the field and the target does not, uses the source information; otherwise, use the target information.
Tax status (tax code) Tax identification number	If the source has a tax identification number and the target does not, uses the tax identification number and tax exempt status.
Track item history Item history tracking level	If the Track item history field is set to *Sold to tracking* or *Sold to/ship to tracking* for the source but not the target, uses the Item history tracking setting from the source.
Current source code	Uses the last source code used by either the source or the target from the Customer Sold To Order History table.
External sales amount External sales update date	Uses the target customer's External sales amount and External sales update date unless the source customer's External sales update date is more recent, or the target customer has no external sales information; in either of these cases, the target customer record is updated with the source customer's external sales information.
Inactive flag Commercial flag Bypass reservation flag Auto cancel backorder flag Associate flag Bill-to customer number	Uses the target information.
Life to date warranty dollars	If the source customer has a dollar amount defined and the target customer does not, the system uses the dollar amount defined for the source customer. If a value has been defined in the Life to date warranty dollars field in the Customer Sold To Order History table for both the source customer and the target customer, the system adds the two values together.

Field	How Updated?
Relate Id	If: • the target customer has a Relate Id, do not change it, regardless of whether a source customer also has a Relate Id. • the source customer has a Relate Id and the target does not, the system uses the source customer's Relate Id. • multiple source customers have Relate Ids and the target does not, the system uses the Relate Id for the first customer who has one.
Synchronize with remote	If any of the source customers have this flag set to Y, the system sets this flag to Y for the target customer.

E-Commerce Customer Merge Web XML File (CustomerMergeWeb)

Purpose: The E-Commerce Customer Merge Web XML file (CustomerMergeWeb) contains customer sold to merge information as a result of *Performing a Merge* in *Working with Merge/Purge Sold-to Names (MMCS)*. The system generates this file if the Generate E-Commerce Customer Merge Staging Files (H86) system control value is selected, based on records in the EC Cust Sold To Merge table. Once the system generates the CustomerMergeWeb file, the system clears the records in the EC Cust Sold To Merge table.

Name of file: The name of the file is `CustomerMergeWeb_999_YYMMDDHHMMSS.xml`, where `999` is the company code where you processed the customer merge and `YYMMDD` is the date and time when the file was created.

File storage API exports: If the Generate E-Commerce Customer Merge Staging Files (H86) system control value is selected, the merge/purge program creates a zip file in the OMS-ECOMMERCE container of the FILE_STORAGE table. The zip file contains the E-Commerce Customer Merge Web XML file. You can use the file storage API to download the file. See the File Storage API for background.

Application log: The system writes any messages related to the customer merge download to the *Application Log*.

Sample message: See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for a message layout and sample message.

Clearing Customer Sold To Status (MCST)

Purpose: When you delete a customer from a merge/purge at the *Work with Source Customers Screen*, the system flags the customer with a Status of *M*. Once flagged with this status, a customer is not included the next time you generate a merge/purge list. Use the Clear Customer Sold To Status menu option to clear a Status of *M* for all records in the Customer file, so they will be eligible for subsequent merge/purge list generation.

Note:

- The Status field is not displayed on a screen.
- This menu option does not clear other values in the Status field.

For more information: See *Working with Merge/Purge Sold-to Names (MMCS)* for background.

Confirm Clear of Customer Status Window

How to display this window: Enter *MCST* in the Fast path field at the top of any menu, or select Clear Customer Sold To Status from a menu.

Completing this window: Click *OK* to clear each setting of *M* in the Status field of the Customer Sold To file for your company. The system resets the Status field from *M* to blank, and the customer is eligible to be selected the next time you generate a merge/purge list as described under *Submit Generation Window (Generating a List)*.

10 Merchandising

Setting Up the Item Supporting Tables

Supporting tables: This part describes how to set up the item supporting tables. Generally, these tables contain codes and associated descriptions which you use to define and classify items.

- Working with Hazardous Item Codes (WHAZ) describes creating, changing, deleting, and displaying these codes.
- Working with Item Category Codes (WITG) describes creating, changing, deleting, and displaying these codes.
- Working with Item Classes (WICL) describes creating, changing, deleting, and displaying these codes.
- Working with Item Status (WIST) describes creating, changing, deleting, and displaying these codes.
- Working with Long SKU Classes (WLSC) describes creating, changing, deleting, and displaying these codes.
- Working with Long SKU Departments (WLSD) describes creating, changing, deleting, and displaying these codes.
- Working with Units of Measure (WUOM) describes creating, changing, deleting, and displaying these codes.
- Working with Item Subscriptions (WISB) describes creating, changing, deleting, and displaying subscription items.
- Working with Item Keywords (WKEY) describes creating, changing, and deleting keywords you can use when scanning for an item.

- Working with Item Keyword Exclusions (WEXC) describes creating, changing, and deleting words you can exclude from automatic keyword creation.
- *Working with Tax Product Code Cross References (WTPC)* describes how to set up a cross reference table to map tax product codes to an item class, long SKU division, long SKU department, and long SKU class combination.

Working with Hazardous Item Codes (WHAZ)

Hazard codes identify hazardous items and indicate if special storage and/or handling is required. You assign a *Hazard code* to an item in Work with Item/SKUs.

In this topic:

- *Work with Hazard Codes Screen*
- *Create Hazard Code Screen*

Work with Hazard Codes Screen

How to display this screen: Enter *WHAZ* in the Fast path field at the top of any menu or select Work with Hazardous Item Codes at a menu.

Field	Description
Code	A code that identifies the hazard type. Numeric, 2 positions; optional.
Description	The description of the hazard code. Alphanumeric, 40 positions; optional

Screen Option	Procedure
Create a new code	Select *Create* to advance to the *Create Hazard Code Screen*.
Change a hazard code	Select *Change* for a hazard code to advance to the Change Hazard Code screen. At this screen, you can change any information except the hazard code. See *Create Hazard Code Screen* for field descriptions.

Screen Option	Procedure
Delete a hazard code	Select *Delete* for a hazard code to delete it. **Note:** You can delete a code even if it is assigned to an item. The next time you maintain the item, a message similar to the following indicates that the hazard code assigned to the item does not exist: Hazard not found.
Display a hazard code	Select *Display* for a hazard code to advance to the Display Hazard Code screen. You cannot change any information on this screen. See *Create Hazard Code Screen* for field descriptions.

Create Hazard Code Screen

Purpose: Use this screen to create new hazard codes.

How to display this screen: At the *Work with Hazard Codes Screen*, select *Create*.

Field	Description
Code	A code used to categorize an item as a hazardous material that requires special storage and/or handling. You can assign hazard codes to an item through Work with Item/SKUs. Numeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The hazardous materials description. Alphanumeric, 40 positions; required.
Class	A class of hazardous materials such as flammable or radioactive. These codes are assigned by the Department of Transportation (DOT). The Class field is used for information and reporting only. Alphanumeric, 15 positions; required.
Label type	The type of label that should be produced for this type of hazardous material. The label identifies the hazardous item as flammable or radioactive to warehouse personnel or shippers. The Label type field is used for information and reporting only. The system will not automatically print a label. Alphanumeric, 15 positions; required.

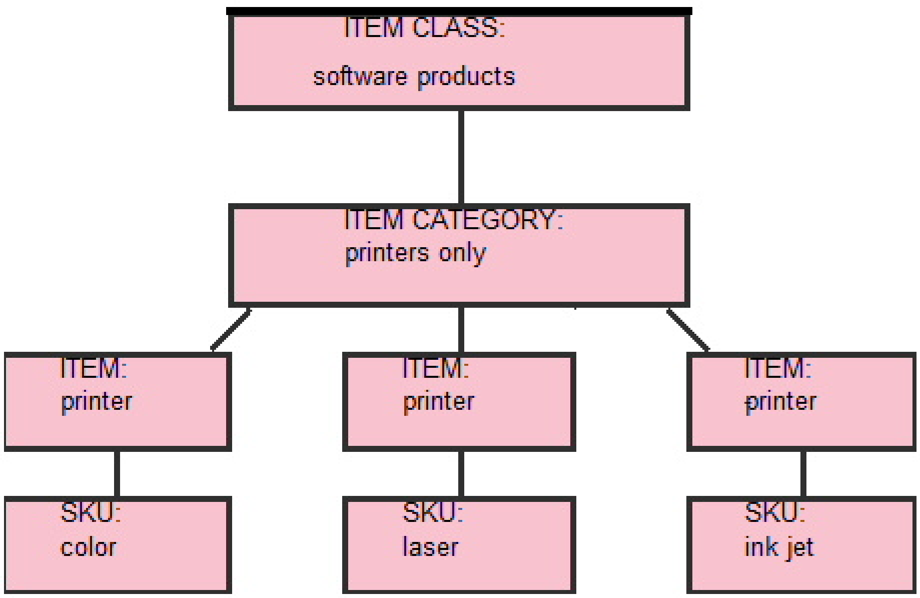
Working with Item Category Codes (WITG)

Item category codes classify and group similar items on a level below Item Class. For example, you can assign a group of items within the same item class an Item category of “printers only” to differentiate printers from the other items under that item class.

In this topic:

- *How Items are Classified and Grouped*
- *Work with Item Categories Screen*
- *Create Item Category Screen*

How Items are Classified and Grouped



Where you can use item category codes:

- Product relationship feature in Order Entry: see *Working with Items on the Order*.
- Inventory reports, such as the *Item Sales Analysis Report*, or the *Item Stock Status Report*
- Applying or excluding promotions; see *Working with Promotions (WPRO)*.

Work with Item Categories Screen

How to display this screen: Enter *WITG* in the Fast path field at the top of any menu or select Work with Item Categories at a menu.

Field	Description
Category	A code that identifies the item category. Alphanumeric, 4 positions in alphanumeric order; optional.
Description	The description of the item category. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a new code	Select *Create* to advance to the *Create Item Category Screen*.
Change an item category code	Select *Change* for an item category code to advance to the Change Item Category screen. At this screen you can change only the description. See *Create Item Category Screen* for field descriptions.
Delete an item category code	Select *Delete* for an item category code to delete it. **Note:** You can delete a code even if it is assigned to an item. The next time you maintain the item a message such as the following indicates that the code assigned to the item does not exist: `Item Category not found.`
Display an item category code	Select *Display* for an item category code to advance to the Display Item Category screen. You cannot change any information on this screen. See *Create Item Category Screen* for field descriptions.

Create Item Category Screen

Purpose: Use this screen to create new item category codes.

How to display this screen: At the *Work with Item Categories Screen*, select *Create*.

Instructions:

Field	Description
Cat (Category)	A code that classifies items that are related to, or compatible with each other. You can assign an *Item category* to an item in Work with Item/SKUs. Alphanumeric, 4 positions. Create screen: required. Change screen: display-only.
Description	The description of the item category. Alphanumeric, 30 positions; required.

Working with Item Classes (WICL)

Purpose: Use item class codes to group items for inventory and demand reporting. For example, you can use item class to:

- select which items or SKUs to copy from one offer to another: see *Copying SKU Offer Information (MCSO)*
- override item offer or SKU offer information: see *Working with Offer Overrides by Item Class (WSOI)*
- identify a tax exemption for a group of items: see *Working with Item Tax Exemptions (WITX)*
- grouping items for inventory reporting: see *Performing Inventory Analyses*)
- design the templates used to present information in specific settings, such as order entry or on a web storefront: see *Entering Additional Item Information*)
- track demand by customer: see *Reviewing Customer History*)
- identify when to automatically download availability information to the web storefront: see *E-Commerce Interface*.

Uploading: You can use the *Submit Supporting Data Upload Screen (SDUP)* to upload new item class codes. See *Importing Item-Related Supporting Data (SDUP)* for an overview.

In this topic:

- *Work with Item Class Screen*
- *Create Item Class Screen*
- *Item Class Restrictions by Customer Class Screen (Working with Restrictions)*
- *Restrict Item Class by Customer Class (Creating a Restriction)*
- *Work with Item Restrictions by City Screen (Defining City/State Restrictions)*
- *Create Item Restriction by City Screen*
- *Special Handling Restrictions by Item Class Screen*
- *Restrict Special Handling by Item Class Screen*

Work with Item Class Screen

How to display this screen: Enter *WICL* in the Fast path field at the top of any menu or select Work with Item Class from a menu.

Field	Description
Class	A code that identifies the item class. Alphanumeric, 3 positions; optional.
Description	The description of the item class. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create an item class code	Select *Create* to advance to the *Create Item Class Screen*.
Change an item class code	Select *Change* for an item class code to advance to the Change Item Class screen. On this screen, you can change any information except the item class. See *Create Item Class Screen*.

Screen Option	Procedure
Delete an item class code	Select *Delete* for an item class code to delete it. **Note:** You can delete an item class code even if it is assigned to an item. The next time you maintain the item you will receive a message indicating that the code assigned to the item is not found.
Display an item class code	Select *Display* for an item class code to advance to the Display Item Class screen. You cannot change any information on this screen. See *Create Item Class Screen* for field descriptions.
Define a customer class restriction	Select *Cust Class Restric* for an item class code to advance to the *Item Class Restrictions by Customer Class Screen (Working with Restrictions)*.
Define a city restriction	Select *City/State Restrict.* for an item class code to advance to the *Work with Item Restrictions by City Screen (Defining City/State Restrictions)*.
Work with special handling restrictions	Select *Special Handling Restrict.* for an item class code to advance to the *Special Handling Restrictions by Item Class Screen*.

Create Item Class Screen

Purpose: Use this screen to create an item class.

How to display this screen: Select *Create* at the *Work with Item Class Screen*.

Field	Description
Item Class	A code to identify a group of items, such as computer hardware or computer software. Item Class codes are used as a high-level method to sort and classify inventory. You assign an item *Class* to an item in the Item table. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	A description of the item class, such as furniture or computer hardware. The item class description prints on several inventory reports. Alphanumeric, 30 positions; required.

Field	Description
Commission %	Not currently implemented. Numeric, 5 positions with a 2 place decimal; optional.
Estimate freight	Your “best guess” on the vendor's freight charges for items defined in this item class. This unit amount is added to an item's cost to represent the estimated freight charges. Including estimated freight charges is helpful if you sell merchandise before the actual freight charges are known. The system includes estimated freight in the cost of an item when determining gross profit in order entry, maintenance, inquiry and item availability. Gross profit margin is the amount of the item's price that exceeds your cost of the item. You can use gross margin to determine the profit of an item on an order based on the item's selling price, or to determine the profit of an entire order. See *Determining Gross Profit* for more information. Numeric, 7 with a 2-place decimal; optional.
Estimated freight %	Your “best guess” on the vendor's freight charges for items defined in this item class. This percentage amount is added to an item's cost to represent the estimated freight charges. Including estimated freight charges is helpful if you sell merchandise before the actual freight charges are known. The system includes estimated freight in the cost of an item when determining gross profit in order entry, maintenance, inquiry and item availability. Gross profit margin is the amount of the item's price that exceeds your cost of the item. You can use gross margin to determine the profit of an item on an order based on the item's selling price, or to determine the profit of an entire order. See *Determining Gross Profit* for more information. Numeric, 13 positions with a 2-place decimal; optional.
Availability threshold (item class-level)	Use this field to indicate when to trigger an automatic download of item availability information through the generic inventory API. The system creates a trigger record for an item when its available quantity breeches the threshold, and an integration layer process generates the *Inventory Download XML Message (CWInventoryDownload)* message to send inventory information to an external system. See *Generic Inventory Download API* in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for an overview of message generation rules and processing. **Availability threshold hierarchy:** The system checks this setting if there is no *Avail thrshld (Item-level availability threshold)* specified for the individual item. If both the item-level or item class-level thresholds are blank, the system checks the *Quantity Available Threshold for Inventory Downloads (G36)* system control value. See this system control value for a complete description of how the availability threshold hierarchy works, and for a description of the e-commerce download. Numeric, 5 positions; optional.

Item Class Restrictions by Customer Class Screen (Working with Restrictions)

Purpose: Item class restriction by customer class is used to prevent the sale of an item to certain customers. For example, if you sell lethal weapons you will need to restrict customers who are under 21 years of age from purchasing them. By creating and using customer class restrictions, you can prevent a class of customers from ordering a class of items. When you define a customer class restriction for an item class, the system:

- displays a message in Order Entry informing you that a particular item is restricted for a certain class of customer
- does not allow you to enter the item on an order for that class of customer

Use this screen to create and delete customer class restrictions.

How to display this screen: At the *Work with Item Class Screen*, select *Customer Class Restriction* for an item class.

Field	Description
Item class	The item class for which you are creating a customer class restriction. Item class code: alphanumeric, 3 positions; display-only. Item class description: alphanumeric, 30 positions; display-only.
Customer class	A code that identifies a class of customers such as for an item restriction, list selection, or reporting purposes. Alphanumeric, 2 positions; optional.

Screen Option	Procedure
Create a new restriction by customer class	Select *Create* to advance to the *Restrict Item Class by Customer Class (Creating a Restriction)*.
Delete a restriction by customer class	Select *Delete* for a customer class restriction to delete it.

Restrict Item Class by Customer Class (Creating a Restriction)

Purpose: Use this screen to restrict a customer class from ordering a specific item class.

How to display this screen: Select *Create* at the *Item Class Restrictions by Customer Class Screen (Working with Restrictions)*.

Field	Description
Item class	The item class code and description for which you wish to create a customer class restriction. Item class code: alphanumeric, 3 positions; display-only. Item class description: alphanumeric, 30 positions; display-only.
Customer class	The customer class code you wish to restrict from a specific item class. Customer Class codes are defined in and validated against the Customer Class table. See *Setting Up the Customer Class Table (WCCL)*. Numeric, 2 positions; required.

Work with Item Restrictions by City Screen (Defining City/State Restrictions)

Purpose: Item class restrictions by city/state prevent the sale of certain items where it is illegal for them to be sold. For example, it is illegal to sell lethal sprays in Massachusetts. By creating and using City/State restrictions, you can prevent customers in a certain location from ordering a class of items. When you define a city/state restriction for an item class, the system:

- displays a message in Order Entry indicating that the item is restricted for the location
- does not allow you to enter the item on an order for that city/state

How to display this screen: At the *Work with Item Class Screen*, select *City/State Restriction* for an item class.

Field	Description
Item class	The item class code and description for which you are creating a city restriction. Item class: Alphanumeric, 3 positions; display-only. Item class description: Alphanumeric, 30 positions; display-only.
City	The city where an item class restriction applies. Alphanumeric, 25 positions; optional.
State	The two-letter code for the state or province where the city is located. Alphanumeric, 2 positions; optional.

Screen Option	Procedure
Create a new restriction by city	Select *Create* to advance to the *Create Item Restriction by City Screen*.
Delete a restriction by city	Select *Delete* for a city/state restriction to delete it.

Create Item Restriction by City Screen

Purpose: Use this screen to restrict a city from a specific item class.

How to display this screen: At the *Work with Item Restrictions by City Screen (Defining City/State Restrictions)*, select *Create*.

Field	Description
Item class	The item class code and description for which you are creating a city restriction. Item class code: alphanumeric, 3 positions; display-only. Item class description: alphanumeric, 30 positions; display-only.
City	The city where an item class restriction applies. Alphanumeric, 25 positions; required.
State	The two-letter code for the state or province. State codes are defined in and validated against the State table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 2 positions; required.

Special Handling Restrictions by Item Class Screen

Purpose: Use this screen to restrict the type of special handling that a customer can order based on item class. For example, you might want to restrict personalizing a t-shirt with an emblem if the process used to attach the emblem damages the t-shirt.

A message similar to the following indicates when you define a special handling code for an item assigned to a restricted item class:

Additional charge code (EM) cannot be used with this item class (RST).

How to display this screen: At the *Work with Item Class Screen*, select *Special Handling Restriction* for an item class.

Field	Description
Item class	The item class code and description that is restricted from special handling. Item class code: alphanumeric, 3 positions; display-only. Item class description: alphanumeric, 30 positions; display-only.
S/H code (Special handling code)	The code for the type of special handling that is restricted. Special handling codes are defined in and validated against Work with Additional Charges (fast path = *WADC*); see *Establishing Additional Charge Codes (WADC)*. Alphanumeric, 2 positions; optional.
Description (Special handling code description)	The description of the type of special handling that is restricted. Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Delete a special handling restriction	Select *Delete* for the special handling restriction to delete it.
Create a special handling restriction	Select *Create* to advance to the *Restrict Special Handling by Item Class Screen*.

Restrict Special Handling by Item Class Screen

Purpose: Use this screen to restrict special handling codes from being used by an item class.

How to display this screen: On the *Special Handling Restrictions by Item Class Screen*, select *Create*.

Field	Description
Item class	The item class code and description for which you are creating a special handling restriction. Item class code: alphanumeric, 3 positions; display-only. Item class code description: alphanumeric, 30 positions; display-only.
S/H code (Special handling code)	The special handling code you wish to restrict for this item class. Alphanumeric, 2 positions; required.

Working with Item Status (WIST)

Purpose: Use the Work with Item Status Codes function to define an item status such as obsolete, discontinued, future ship or soldout, which you can then use for:

- selecting items for inventory inquiries and reports
- displaying message lines in Order Entry and Order Maintenance
- assigning a future arrival date
- controlling the display of the item

Assigning to an item: You use the Status field on the first *Create Item Screen* or Change Item screen to assign a status code to an item. If the item has SKUs, you can also assign a status to the individual SKUs. The SKU status overrides the status of the base item.

Future arrival date: You can default a future ship arrival date to an item in order entry through the *Future Orders Item Status (E52)* system control value. The date defaults from the *Default Future Orders Arrival Date (E53)* system control value.

Grouping items: The item status code is one of several types of codes you can use to define and group items. Other codes include department, item class, item category, long SKU class, and long SKU department. See *Performing Initial Item Entry (MITM)* for information on assigning these codes to items.

Preventing display at the Item Selection screen: The Item Selection screen does not list Items that are assigned to the *Item Status for Suppressing Item During Item Selection (L21)*, provided the status is assigned at the item level rather than the SKU level.

Uploading: You can use the *Submit Supporting Data Upload Screen (SDUP)* to upload new item status codes. See *Importing Item-Related Supporting Data (SDUP)* for an overview.

In this topic:

- *Work with Item Status Screen*
- *Create Item Status Screen*

Work with Item Status Screen

How to display this screen: Enter *WIST* in the Fast Path field at the top of any menu or select Work with Item Status from a menu.

Field	Description
Sts (Status)	A code that identifies the item status. Alphanumeric, 1 positions; optional.
Description	The description of the item status. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a new code	Select *Create* to advance to the *Create Item Status Screen*.
Change an item status code	Select *Change* for a code to advance to the Change Item Status screen. At this screen, you can change any information except the code. See *Create Item Status Screen* for field descriptions.
Delete an item status code	Select *Delete* for a code to delete it. **Note:** You can delete a code even if it is assigned to items. The next time you maintain any items associated with this status code a message will display indicating that the code assigned to the item is not found.
Display an item status code	Select *Display* for a code to advance to the Display Item Status Screen. You cannot change any information on this screen. See *Create Item Status Screen* for field descriptions.

Create Item Status Screen

To create: At the *Work with Item Status Screen*, select *Create*.

Field	Description
Status	A code that represents an item's status, such as obsolete, discontinued, soldout, etc. You can use item status codes as selection criteria for inventory reporting or to create status message lines to display in Order Entry or Order Maintenance. Alphanumeric, 1 position. Create screen: required. Change screen: display-only.
Description	A description of the item status code. Alphanumeric, 30 positions; required.
O/E message 1 and 2	The two message lines to display in the *Item Status Message Window* in Order Entry and Order Maintenance for items with this status code. Alphanumeric, two lines of 50 positions each; optional.

Field	Description
Return disposition	A code that identifies how a returned item assigned to this item status code will be handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the item will be returned. **Note:** When you return an item that is assigned to an item status code that has a return disposition code defined, the system does not default the return disposition code to the return. Return disposition codes are defined in and validated against the Return Disposition table. Alphanumeric, 2 positions; optional.

Working with Long SKU Classes (WLSC)

Purpose: Long SKU classes represent class codes for a SKU. For example, you may want to assign a long SKU class code to items that differ from the mail order class codes for the same group of items. These codes are typically used in a retail environment; however, they can be used for other classifications.

Long SKU Class codes are used in conjunction with Long SKU Department codes for reporting purposes. A long SKU class is assigned to an item in the *L/S class (Long SKU class)* field of the Item table; the system will validate your entry to this field against the Long SKU Class table.

Retail integration (external system to Order Administration): If you are using Retail Integration (external system to Order Administration) by *selecting* the *Use Retail Integration (H26)* system control value, you define a retail class within the long SKU department assigned to an item rather than a using a long SKU class. For example, retail class 10 might be Ties within Department 20 (Men's Apparel), but within Department 30 (Women's Apparel) class 10 might be Slacks.

As a result, when you are using the Retail Integration (external system to Order Administration), the system validates retail classes against the Retail Class table and denies access to the Work with Long SKU Class menu option. If you attempt to use the menu option, the screen displays an error message: `Work with Long SKU Class Not Allowed with SCV H26.`

Require long SKU class: If the *Require L/S Class (I93)* system control value is selected, the system requires you to enter a long SKU class when you create or maintain an item.

Long SKU elements: The entire Long SKU consists of the following elements:

- L/S Style
- L/S Vendor
- L/S Department

- L/S Class
- L/S Color
- L/S Size
- L/S Width

If the *Use Retail Integration (H26)* system control value is selected, the system requires you to enter a L/S style, L/S subclass, L/S department, and L/S class when you create or maintain an item.

Uploading: If the *Use Retail Integration (H26)* system control value is unselected, you can use the *Submit Supporting Data Upload Screen (SDUP)* to upload new long SKU class codes. See *Importing Item-Related Supporting Data (SDUP)* for an overview.

In this topic:

- *Work with Long SKU Classes Screen*
- *Create Long SKU Class Screen*

Work with Long SKU Classes Screen

How to display this screen: Enter *WLSC* in the Fast Path field at the top of any menu or select Work with Long SKU Classes from any menu.

Field	Description
Class	A code that represents the long SKU class. Numeric, 4 positions; optional.
Description	The description of the long SKU class. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a new long SKU class	Select *Create* to advance to the *Create Long SKU Class Screen*.
Change a long SKU class	Select *Change* for a long SKU class to advance to the Change Long SKU Class Screen. At this screen you can change any information except the long SKU class code. See *Create Long SKU Class Screen* for field descriptions.
Delete a long SKU class	Select *Delete* for a long SKU class to delete it.

> **Note:**
>
> You can delete a code even if it is assigned to an item. The next time you maintain the item you will receive a message indicating that the code assigned to the item is not found.

Screen Option	Procedure
Display a long SKU class	Select *Display* for a long SKU class to advance to the Display Long SKU Class Screen. You cannot change any information on this screen. See *Create Long SKU Class Screen* for field descriptions.

Create Long SKU Class Screen

Purpose: Use this screen to create a long SKU class.

How to display this screen: At the *Work with Long SKU Classes Screen*, select *Create*.

Field	Description
Class	A user-defined code that defines the long SKU class. Long SKU Class codes are used in conjunction with Long SKU Department codes for reporting purposes. Numeric, 4 positions. Create screen: required. Change screen: display-only.
Description	The description of the long SKU class code. Alphanumeric, 30 positions; required.

Working with Long SKU Departments (WLSD)

Purpose: Use the Work with Long SKU Departments menu option to create or work with department codes for a SKU, or if you are using Retail Integration (external system to Order Administration), to assign a retail class code to a long SKU department. For example, you might want to use a long SKU department code that differs from the mail order department codes you assign to a group of items. These codes are typically used in a retail environment; however, they are sometimes used for other classifications.

Long SKU department codes are used in conjunction with long SKU class codes for reporting purposes and to create a hierarchy within a company or entity. If you have the *Require Long SKU Division with Long SKU Department (E85)* system control value *selected*, you must specify a long SKU division when creating or maintaining long SKU departments.

Retail integration (external system to Order Administration): If you are using Retail Integration (external system to Order Administration), long SKU class codes are linked to long SKU department codes to create retail classes. See the *Work with Retail Class Screen*.

A long SKU department is assigned to an item in the *L/S dept (Long SKU department)* field of the Item table; the system will validate your entry to this field against the Long SKU Department table.

Require long SKU department: If the *Require L/S Department (I92)* system control value is selected, the system requires you to enter a long SKU department when you create or maintain an item.

Long SKU elements: The entire Long SKU consists of the following elements:

- L/S Style
- L/S Vendor
- L/S Department
- L/S Class
- L/S Color
- L/S Size
- L/S Width
- L/S Subclass

If the *Use Retail Integration (H26)* system control value is selected, the system requires you to enter a L/S style, L/S subclass, L/S department, and L/S class when you create or maintain an item; also, it is possible to assign a retail class to a long SKU department.

Uploading: Options include:

- *Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS)*
- *Importing Item-Related Supporting Data (SDUP)*

In this topic:

- *Work with Long SKU Departments Screen*
- *Create Long SKU Department Screen*
- *Work with Retail Class Screen*
- *Create Retail Class Screen*

Work with Long SKU Departments Screen

How to display this screen: Enter *WLSD* in the Fast Path field at the top of any menu or select Work with Long SKU Department from a menu.

> **Note:**
>
> The *Assign Retail Class* option is not available if the *Use Retail Integration (H26)* system control value *unselected*.

Field	Description
Dept. (Department)	A code that represents the long SKU department. Numeric, 4 positions; optional.
Description	The description of the long SKU department. Alphanumeric, 30 positions; optional.

Field	Description
Division	The division associated with the long SKU department. Not validated by any Order Administration table, but can be used for sorting purposes on reports. **Note:** The *Importing Item-Related Supporting Data (SDUP)* and *Working with Retail Integration Item Upload (RIIU)* options support a maximum of 3 positions for the long SKU division code. Alphanumeric, 4 positions; display-only.

Screen Option	Procedure
Create a new long SKU department	Select *Create* to advance to the *Create Long SKU Department Screen*.
Change a long SKU department	Select *Change* for a long SKU department to advance to the Change Long SKU Department screen. At this screen, you can change any information except the long SKU department code. See *Create Long SKU Department Screen* field descriptions.
Delete a long SKU department	Select *Delete* for a long SKU department to delete it. **Note:** You can delete a code even if it is assigned to an item. The next time you maintain the item you will receive a message indicating that the code assigned to the item is not found.
Display a long SKU department	Select *Display* for a long SKU department to advance to the Display Long SKU Department Screen. You cannot change any information on this screen. See *Create Long SKU Department Screen* for field descriptions.

Screen Option	Procedure
Assign a long SKU department to a retail class	Select *Assign Retail Class* for a long SKU department to advance to the *Work with Retail Class Screen*. This option is available only if you have the *Use Retail Integration (H26)* system control value *selected*.

Create Long SKU Department Screen

Purpose: Use this screen to create a long SKU department.

How to display this screen: Select *Create* at the *Work with Long SKU Departments Screen*.

Field	Description
Department	A user-defined code that identifies a long SKU department. Long SKU department codes are used in conjunction with long SKU class codes for reporting purposes. Numeric, 5 positions. Create screen: required. Change screen: display-only.
Description	The description of the long SKU department code. Alphanumeric, 30 positions; required.
L/S division (Long SKU division)	The code identifying the long SKU division. Long SKU divisions are defined in and validated against the Long SKU Division table. You use the division code to establish a hierarchy and to sort item information when you generate reports. See *Creating and Maintaining Long SKU Divisions (WLDV)*. Required if the *Require Long SKU Division with Long SKU Department (E85)* system control value is *selected*. **Note:** The *Importing Item-Related Supporting Data (SDUP)* and *Working with Retail Integration Item Upload (RIIU)* options support a maximum of 3 positions for the long SKU division code. Alphanumeric, 4 positions; required if system control value is *selected*.

Work with Retail Class Screen

Purpose: Use this screen to create, change, delete or display a retail class within the long SKU department.

The creation and assignment of retail classes is part of integrating retail operation into Order Administration and is controlled through the *Use Retail Integration (H26)* system control value. A retail class is a long SKU class that you have assigned to a specific long SKU department. You can create retail classes either through this screen by selecting *Create* or through a Retail Class File conversion program.

How to display this screen: If the *Use Retail Integration (H26)* system control value is selected, select *Assign Retail Class* for a long SKU department at the *Work with Long SKU Departments Screen*.

Field	Description
L/S Department	The code and description of the long SKU department to which you will assign a long SKU class. Long SKU departments are linked with long SKU classes in Retail Integration (external system to Order Administration) for creating an organizational hierarchy and for reporting purposes. Department code: Numeric, 4 positions; display-only. Department description: Alphanumeric, 30 positions; display-only.
Class	A code that represents a retail class. A long SKU class that is assigned to a long SKU department is called a retail class. Retail classes are department specific whereas regular long SKU classes are unique and remain constant across departments. For example, Retail Class 10 may be Ties within Department 20 (Men's Apparel), but within Department 30 (Women's Apparel) Retail Class 10 may be Slacks. With regular long SKU classes, Class 15 may be Shoes, and will remain Shoes regardless of the department. Retail classes are defined in and validated against the Retail Class table whereas long SKU classes are defined in and validated against the Long SKU Class table. Therefore, when the *Use Retail Integration (H26)* system control value is *selected*, you can not access the Work with Long SKU Class menu option or the *WLSC* fast path. Numeric, 4 positions; optional.
Description	The description of a retail class. If you ran the Retail Class Table conversion program to populate the Retail Class table, the existing long SKU class description defaults for the retail class description. Alphanumeric, 30 positions, optional.

Option	Procedure
Create a retail class	Select *Create* to advance to the *Create Retail Class Screen*.
Change a retail class	Select *Change* for a retail class to advance to the Maintain Retail Class Screen. At this screen you can change the description for a retail class. If you want to change the retail class code (L/S Class), you must delete (*Delete*) the existing code and create (*Create*) a new retail class code. See *Create Retail Class Screen* for field descriptions.

Option	Procedure
Delete a retail class	Select *Delete* for a retail class to delete it. **Note:** You can delete a code even if it is assigned to an item. The next time you maintain the item you will receive a message indicating that the code assigned to the item is not found within the long SKU department.
Display a retail class	Select *Display* for a retail class to advance to the Display Retail Class Screen. You can not change any information on this screen. See *Create Retail Class Screen* for field descriptions.
Print a list of retail classes	Select *Print List* to print a list of the retail class(es) assigned to the long SKU department. The system submits the job *RETAIL_CLS*.

Create Retail Class Screen

Purpose: Use this screen to create a retail class within the particular long SKU department.

How to display this screen: Select *Create* at the *Work with Retail Class Screen*.

Field	Description
L/S Department	The code and description of the long SKU department to which you will assign a long SKU class. Long SKU departments are used with long SKU classes in Retail Integration (external system to Order Administration) to create an organizational hierarchy and for reporting purposes. Department code: Numeric, 4 positions; display-only. Department description: Alphanumeric, 30 positions; display-only.

Field	Description
L/S Class (Long SKU Class)	A code that represents a retail class. A long SKU class that is assigned to a long SKU department is called a retail class. Retail classes are department-specific, while regular long SKU classes are unique and remain constant across departments. For example, Retail Class 10 might be Ties within Department 20 (Men's Apparel), but within Department 30 (Women's Apparel) Retail Class 10 might be Slacks. With regular long SKU classes, Class 15 might be Shoes, and remain Shoes regardless of the department. Retail classes are defined in and validated against the Retail Class table, while long SKU classes are defined in and validated against the Long SKU Class table. As a result, when the *Use Retail Integration (H26)* system control value is *selected*, you can not access the Work with Long SKU Class menu option. Numeric, 4 positions; required.
Retail Class Description	The description of a retail class. If you ran the Retail Class Table conversion program to populate the Retail Class table, the existing long SKU class description defaults for the retail class description. Alphanumeric, 30 positions, required.

Completing this screen: Enter the L/S Class (Retail Class) code and Retail Class Description and select *OK*. The system clears the fields and indicates: `Retail Class (xxx) created.`

Working with Units of Measure (WUOM)

Purpose: Use this option to defines the standard units of measure by which items are purchased and sold. Typical units of measure include cases, pounds, dozens, and "eaches." You define a unit of measure for each item in the Item and Vendor Item tables.

After setting up units of measure, use *Working with Unit of Measure Conversions (WUMC)* to set up conversions so that units and costs calculate correctly in PO Maintenance and PO Receipts.

In this topic:

- *Work with Units of Measure Screen*
- *Create Unit of Measure Screen*

Work with Units of Measure Screen

How to display this screen: Enter *WUOM* in the Fast Path field in the top of any menu or select this option from a menu.

Field	Description
UOM (Unit of measure)	A code that represents the unit of measure. Alphanumeric, 3 positions; optional.
Description	The description of the unit of measure. Alphanumeric, 30 positions; optional.

Field	Description
Units	The number of units (single items) represented by this unit of measure, such as 12 units in a case. Numeric, 4 positions; optional.

Screen Option	Procedure
Create a new unit of measure	Select *Create* to advance to the *Create Unit of Measure Screen*.
Change a unit of measure	Select *Change* for a unit of measure to advance to the Change Unit of Measure screen. At this screen you can change any information except the unit of measure. See *Create Unit of Measure Screen* for field descriptions.
Delete a unit of measure	Select *Delete* for a unit of measure to delete it. **Note:** You can delete a unit of measure even if it is assigned to an item. The next time you maintain the item you will receive a message indicating that the unit of measure assigned to the item is not found.
Display a unit of measure	Select *Display* for a unit of measure to advance to the Display Unit of Measure Screen. You cannot change any information on this screen. See *Create Unit of Measure Screen* for field descriptions.

Create Unit of Measure Screen

To create: At the *Work with Units of Measure Screen*, select *Create*.

You must create units of measure before working with unit of measure conversions. See *Working with Unit of Measure Conversions (WUMC)*.

Field	Description
Unit of measure	A code that represents a unit of measure for an item. Typical units of measure include: *EA* - each *IN* - inches *C12* - case of 12 Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.

Field	Description
Description	A description of the vendor unit of measure such as each, 12 cases, or inches. Alphanumeric, 30 positions; required.
Units	The number of units (single items) represented by this unit of measure, such as 12 units in a case. Numeric, 4 positions; optional.

Working with Item Subscriptions (WISB)

Purpose: Use the Item Subscriptions function to define the particulars of a subscription item you sell to your customers. You must define a record in this table for each subscription item you create.

Overview: Defining and selling subscriptions through Order Management System involves the following process:

- *Define the subscription in the Item table. Select* the Subscription field and the Non/inv (non-inventory item) field. See *Performing Initial Item Entry (MITM)*.
- *Define the subscription in the Item Subscription table*.
- *Enter orders and pick slips*. You enter a subscription on an order as you do other items. When you accept the order, the system creates a separate pre-generated pick for the subscription item. When you generate pick slips for the order, the system bills the subscription item immediately and indicates on the pick slip that the subscription is shipping separately. See *Preparing Orders for Pick Slip Generation* and *Performing Pick Slip Generation* for more information on preparing and generating picks.
- *Generate the Subscription Extract file*. See *Generating the Subscription Extract Table (WGSE)* for information on creating a file of customers to receive subscription items.
- *Purge the Subscription Extract file*. Periodically, you can use the purge function to clear the file of closed or canceled subscriptions. You can also clear the file completely. See *Generating the Subscription Extract Table (WGSE)* for more information on purging subscription records or clearing the file.

You can also review, cancel, or change a specific customer's subscription information through the Work with Customers function and in standard Order Inquiry. See *Displaying More Options in OIOM*.

In this topic:

- *Work with Item Subscriptions Screen*
- *Create Item Subscription Screen*

Work with Item Subscriptions Screen

How to display this screen: Enter *WISB* in the Fast path field at the top of any menu or select this option from a menu.

Field	Description
Item	The item code that identifies the subscription. An item is designated as a subscription by a *selected* Subscription field of the Item (Base Information) record. Items are defined in and validated against the Item table. Alphanumeric, 12 positions.
Cur iss (Current issue number)	The number of the subscription that will be the first issue sent when the customer orders the subscription or the issue presently being mailed. Numeric, 3 positions.
# of int (Number of intervals)	The number of issues the customer should receive when purchasing the subscription. Numeric, 3 positions.
# of Days	The number of days between each issue. Numeric, 3 positions.
Orig item (Original item)	The original subscription item number associated with this subscription. This is used when a subscription item is offered with different intervals (such as a subscription with a multi-period offering). This is used so that the customer can extend the length of a subscription. *Example:* The customer purchased a year's subscription (item SUBSCR#1). Near the end of the subscription period, the customer calls back and orders another year's subscription (item SUBSCR#2). The system: 1. checks the Customer Subscription table to see if the original subscription (for SUBSCR#1) is still active (has not expired) 2. checks to see if there is a value in the Original item/SKU field in the Item Subscription record (SUBSCR#2, which was ordered, references original subscription item SUBSCR#1) 3. creates a Customer Subscription record for the original subscription item number (SUBSCR#1) and extends the original subscription for the period of the new subscription (in SUBSCR#2), after the initial subscription expires Items are defined in and validated against the Item table. **Note:** The system validates that the item number entered is a subscription item (Subscription = *Selected* and Non/inv = *Selected* for the item). Alphanumeric, 12 positions.

Screen Option	Procedure
Create a new item subscription	Select *Create* to display the *Create Item Subscription Screen*.

<table>
<tr><th>Screen Option</th><th>Procedure</th></tr>
<tr><td>Change an item subscription</td><td>Select Change for an item subscription to advance to the Change Item Subscription Screen. At this screen you can change any information except the subscription item code and description. See Create Item Subscription Screen for field descriptions.

Note:
Changing subscription information does not change existing subscriptions; however, new subscriptions will reflect these changes.</td></tr>
<tr><td>Delete an item subscription</td><td>Select Delete for an item subscription to delete it.

Note:
The system does not allow you to delete an item subscription if there are open subscriptions for the item. The system issues the following message if you attempt to delete an active subscription:

<code>Open subscriptions exist for this item -- cannot delete</code></td></tr>
<tr><td>Display an item subscription</td><td>Select Display for an item subscription to advance to the Display Item Subscription Screen. You cannot change any information on this screen. See Create Item Subscription Screen for field descriptions.</td></tr>
</table>

Create Item Subscription Screen

To create: At the *Work with Item Subscriptions Screen*, select *Create*.

> **Note:**
>
> You must create an Item Subscription for each subscription item you create in the Item table.

Field	Description
Item/SKU	The item code (optionally, the SKU) that identifies the subscription item. You designate an item as a subscription by *selecting* the Subscription and Non/inv fields of the Item table; see *Performing Initial Item Entry (MITM)*. The description of the item appears below the item/SKU at the Change Item Description screen, and is display-only. Item code: Alphanumeric, 12 positions. SKU: Three 4-position fields. Create screen: required. Change screen: display-only.
Current issue# (Current issue number)	The number of the subscription that will be the first issue sent when the customer orders the subscription or the number of the issue presently being mailed. Numeric, 3 positions; required.
Issue description	The description associated with the current issue of the subscription item. Alphanumeric, 25 positions; required.
# of intervals	The number of issues the customer should receive when purchasing the subscription item. Numeric, 3 positions; required.
Interval days	The number of days between each issue. Numeric, 3 positions; optional.
Original item/SKU	The original subscription item code associated with this subscription, if any. See the field description above for more information. Item code: alphanumeric, 12 positions; required. SKU: three 4-position fields; required.

Working with Item Keywords (WKEY)

Purpose: Use item keywords as a way to identify and scan for items other than by item number and item description. For example, if you sell books and the item number is a code, AN8975H, and the description is the title of the book, "The Outer Ring," you may want to use the author's name as a keyword: "Newbold." This way you can scan for items (books) that have been written by the author, instead of scanning for a specific item (by item code or the title of a specific book).

You can create as many keywords for an item as you want. For example, if you sell books and create the author's name as a keyword for each book, you could further define the item by creating a keyword for the type of book it is, for example, “Science Fiction.”

Web storefront: Keywords are included in the information you can download to the web storefront to make customers’ item searches easier. See *Downloading E-Commerce Offer Files (EOFR)*.

Retail integration (external system to Order Administration) item upload: If the *Auto-Generate Item Keywords from Description (F79)* system control value is selected, the system automatically creates keywords for items created or updated through the RI Item Upload process for record type *01* Item/SKU; see *Working with Retail Integration Item Upload (RIIU)*.

Note:

You can create item keywords only at the item level, not at the SKU level.

In this topic:

- *Generating Keywords During Item Entry*
- *First Work with Keywords for Item Screen*
- *Second Work with Keywords for Item Screen (ADD Mode)*
- *Work with Item Keywords Screen (WKEY)*
- *Create Item Keyword Screen*
- *Keyword Selection Screen (Scanning for Items Using Item Keywords)*

For more information: See *Working with Item Keyword Exclusions (WEXC)*.

Generating Keywords During Item Entry

Keyword creation/automatic advancement: There are two system control values that control automatic keyword creation and screen advancement at item entry:

SCV setting *Create Keywords at Item Entry (F78)*	*Auto-Generate Item Keywords from Description (F79)* SCV setting	Result when you create a new item
Selected	*Selected*	You advance to the *First Work with Keywords for Item Screen*. The system generates a keyword for each word in the item description.
Selected	*Unselected*	You advance to the *Second Work with Keywords for Item Screen (ADD Mode)*. The system has not created any keywords.
Unselected	*Selected*	You do not advance automatically to either of the Work with Keywords screens; however, the system generates a keyword for each word in the item description.
Unselected	*Unselected*	You do not advance automatically to either of the Work with Keywords screens, and the system does not generate keywords.

> **Note:**
>
> If system control value *Create Keywords at Item Entry (F78)* is *selected*, you first advance to the Create Vendor Item screen when you create an item; then, when you complete the Create Vendor Item screen, to the Work with Keywords for Item screen.

First Work with Keywords for Item Screen

Purpose:

- *During item entry:* Use this screen to review the keywords the system has created automatically, if any, and to delete or create keywords.
- *To work with keywords:* You can also use this screen at any time to review or delete existing keywords for an item, or create new keywords.

About item keywords: see *Working with Item Keywords (WKEY)* for an overview, and *Keyword Selection Screen (Scanning for Items Using Item Keywords)* for sample keyword selection when scanning for an item.

How to display this screen:

- depending on system control value settings, select *OK* on the Create Item (Base Information) screen in Work with Item/SKUs, or on the Create Vendor Item screen; see Generating Keywords During Item Entry
- select *Keywords* for an item at a *Work with Items Screen*
- select *Create* at the *Second Work with Keywords for Item Screen (ADD Mode)*

Field	Description
Item	The code and description for the item you are creating or working with. Item code: alphanumeric, 12 positions; display-only. Item description: alphanumeric, 120 positions; display-only.
Keyword	A word to further define an item. Item keywords are used to scan for a specific item based on information that is not found in the item code or item description. *During item entry:* Depending on your system control value settings, the system may automatically create a keyword using each word in the item description (see *Generating Keywords During Item Entry*). You can delete any unneeded keyword at this screen by selecting *Delete* for it. Alphanumeric, 20 positions; optional.

Screen Option	Procedure
Delete an item keyword	Select *Delete* for a keyword to delete it.
Add item keywords	Select *Create* to switch to the *Second Work with Keywords for Item Screen (ADD Mode)*.

Second Work with Keywords for Item Screen (ADD Mode)

Purpose: Use this screen to create item keywords.

About item keywords: see *Working with Item Keywords (WKEY)* for an overview, and *Keyword Selection Screen (Scanning for Items Using Item Keywords)* for sample keyword selection when scanning for an item.

How to display this screen:

- depending on system control value settings, select *OK* on the Create Item (Base Information) screen in Work with Item/SKUs; see Generating Keywords During Item Entry
- select *Create* at the *First Work with Keywords for Item Screen*

Field	Description
Item code	A user-defined code that represents a unit of inventory. Item codes are validated against the Item table. The item description appears to the right. Alphanumeric, 15 positions; display-only.
Keyword	A word to further define an item. Item keywords are used to scan for a specific item based on information other than the item code or item description. Alphanumeric, 20 positions; required.

Screen Option	Procedure
Create item keywords	Use each enterable line to enter a separate item keyword.
Review existing item keywords	Select *Display* to advance to the *First Work with Keywords for Item Screen*.

Work with Item Keywords Screen (WKEY)

Purpose: Use this screen to create, delete and review item keywords.

About item keywords: see *Working with Item Keywords (WKEY)* for an overview, and *Keyword Selection Screen (Scanning for Items Using Item Keywords)* for sample keyword selection when scanning for an item.

How to display this screen:

- enter *WKEY* in the Fast path field at the top of any menu or select this option from a menu, or
- select *Item Keywords* on the Item Support Maintenance pop-up window in Work with Item/SKUs

Field	Description
Keyword	A word to further define an item. Item keywords are used to scan for a specific item based on information other than the item code or item description. Alphanumeric, 20 positions; optional.

Field	Description
Item	A user-defined code that represents a unit of inventory. Item codes are validated against the Item table. Alphanumeric, 15 positions; optional.
Description	The description of the item. Alphanumeric, 120 positions; display-only.

Screen Option	Procedure
Delete an item keyword	Select *Delete* for the item keyword you wish to delete.
Create an item keyword	Select *Create* to advance to the *Create Item Keyword Screen*.

Create Item Keyword Screen

Purpose: Use this screen to create a keyword for an item.

How to display this screen: Select *Create* on the *Work with Item Keywords Screen (WKEY)*.

Field	Description
Item	A user-defined code that represents a unit of inventory. Item codes are validated against the Item table. Alphanumeric, 15 positions; required.
Keyword	A word to further define an item. Item keywords are used to scan for a specific item based on information other than the item code or item description. Alphanumeric, 20 positions; required.

Keyword Selection Screen (Scanning for Items Using Item Keywords)

Purpose: Use this screen to scan for an item by keyword and to then select the item. You would scan for an item by keyword if you did not know the item code or item description.

Example: You sell books. An item code is TB7528J, the item description is the title of the book, "Collective Thoughts." You do not know the item code or item description, only that the author of the book is Thomas Briggs and the book is a collection of his poems. You could scan for the item in order entry or order maintenance by the keyword *BRIGGS* or the keyword *POETRY*.

How to display this screen: On the Item Selection screen, selecting *Scan by Keyword*. You can advance to the Item Selection screen by *clicking* on an Item scan field. You also advance to this screen in order entry by prompting on the Item field if the *Auto-Generate Item Keywords from Description (F79)* system control value is *selected*.

Field	Description
Keyword	A word to further define an item. Item keywords are used to scan for a specific item using information other than the item code or item description. Alphanumeric, 20 positions; optional.
Item	A user-defined code that represents a unit of inventory. Item codes are validated against the Item table. Alphanumeric, 15 positions; optional.
Description	The description of the item. Alphanumeric, 120 positions; display-only.

Screen Option	Procedure
Select an item	*Select* an item keyword to select the item.
Switch to the Item Selection screen	Select *Scan by Description*.

Working with Item Keyword Exclusions (WEXC)

Purpose: Use Work with Keyword Exclusions to exclude certain words in the item description from being created as item keywords, if these words would not be useful for keyword scanning.

About item keywords: You can use item keywords as a way to identify and scan for an item other than by item number. For example, if you sell books and the item number is a code, AN8975H, and the description is the title of the book, “The Outer Ring,” you may want to use the author's name as a keyword: “Newbold.” This way you can scan for items (books) that have been written by the author, instead of scanning for a specific item (by item code or the title of a specific book).

When to use exclusions? The system automatically creates item keywords based on the words from the item's description if the *Auto-Generate Item Keywords from Description (F79)* system control value is *selected*. You might want to exclude words such as “the,” “with,” and “on” from being created as keywords; although these words might be part of an item descriptions, they would not be useful for scanning.

Related topic: See *Working with Item Keywords (WKEY)*, for more information on creating item keywords and scanning for an item using item keywords.

In this topic:

- *First Work with Keyword Exclusions Screen*
- *Second Work with Keyword Exclusions Screen*

First Work with Keyword Exclusions Screen

How to display this screen: Enter *WEXC* in the Fast path field at the top of any menu or select Work with Keyword Exclusions from a menu.

Field	Description
Exclusion	A word that has been excluded from automatically generating a keyword from the item's description when you create an item. The system automatically generates item keywords from the item's description when you create an item if the *Auto-Generate Item Keywords from Description (F79)* system control value is *selected.* Alphanumeric, 20 positions; optional.

Screen Option	Procedure
Delete a keyword exclusion	Select *Delete* for a keyword exclusion to delete it.
Create keyword exclusions	Select *Create* to advance to the *Second Work with Keyword Exclusions Screen*.

Second Work with Keyword Exclusions Screen

Purpose: Use this screen to create keyword exclusions.

How to display this screen: Select *Create* on the *First Work with Keyword Exclusions Screen*.

Field	Description
Exclusion	A word that has been excluded from automatically generating a keyword from the item's description when you create an item. The system automatically generates item keywords from the item's description when you create an item if the *Auto-Generate Item Keywords from Description (F79)* system control value is *selected.* The system displays 17 exclusion fields where you can enter words to exclude when creating keywords automatically. Alphanumeric, 20 positions; optional.

Screen Option	Procedure
Create keyword exclusions	Use each enterable line to enter a separate keyword exclusion.
Display keyword exclusions	Select *Display* to advance to the *First Work with Keyword Exclusions Screen*

Working with Tax Product Code Cross References (WTPC)

Purpose: Use this menu option to create a cross reference between a tax product code and an item class, long SKU division, long SKU department, and long SKU class combination.

Avalara Tax Integration: The Avalara AvaTax integration uses the tax product code to determine the tax for a particular product class. If a tax code is not associated with an item, AvaTax assigns a default tax code of `U0000000`, indicating an unknown tax code. See the *Avalara AvaTax Interface* and *Avalara AvaTax Setup* for more information.

Determining a match: In order to be considered a match to a tax product code, the item class, long SKU division, long SKU department, and long SKU class combination values must exactly match the values defined for an item.

Example: The following tax product code cross references are defined.

Item Class	L/S Division	L/S Department	L/S Class	Tax Product Code
NA	NA	100	100	PG068810
NA	100	100	NA	PC040111
ACC	NA	NA	NA	PA028802
ACC	100	100	NA	NA
ACC	100	100	100	98922

The system assigns the tax product code to each item using the item class, long SKU division, long SKU department, and long SKU class combination to find an exact match to a tax product code cross reference.

Item	Item Class	L/S Division	L/S Dept	L/S Class	Results
A101	ACC	100	100	200	no match found
A202	ACC	NA	100	200	no match found
A303		100	100	100	no match found
A404	ACC	NA	NA	NA	match to tax product code PA028802
A505	NA	NA	100	100	match to tax product code PG068810

In this topic:

- *Work with Tax Product Code Cross Reference Screen*
- *Create Tax Product Code Cross Reference Screen*

Work with Tax Product Code Cross Reference Screen

Purpose: Use this screen to work with tax product code cross references.

How to display this screen: Enter *WTPC* in the Fast path field at the top of any menu or select Work with Tax Product Code Cross Reference from a menu.

Field	Description
Item Class	A code to identify a group of items, such as computer hardware or computer software. Item Class codes are used as a high-level method to sort and classify inventory. You assign an item class to an item in the Item table (MITM). Enter a valid item class code and select *OK* to display tax product code cross references that match your entry. Alphanumeric, 3 positions; optional.

Field	Description
L/S Division	A code that represents a long SKU division. L/S divisions are used in conjunction with long SKU departments and long SKU classes for reporting purposes and to create a hierarchy within a company or entity. Long SKU division codes are defined in and validated against the L/S Division table (WLDV). Enter a valid long SKU division code and select *OK* to display tax product code cross references that match your entry. Alphanumeric, 4 positions; optional.
L/S Department	A code that represents a long SKU department. L/S departments are used in conjunction with long SKU divisions and long SKU classes for reporting purposes and to create a hierarchy within a company or entity. Long SKU department codes are defined in and validated against the L/S Department table (WLSD). Enter a valid long SKU department code and select *OK* to display tax product code cross references that match your entry. Alphanumeric, 5 positions; optional.
L/S Class	A code that represents a long SKU class. L/S classes are used in conjunction with long SKU departments and long SKU divisions for reporting purposes and to create a hierarchy within a company or entity. Long SKU class codes are defined in and validated against the L/S Class table (WLSC). Enter a valid long SKU class code and select *OK* to display tax product code cross references that match your entry. Alphanumeric, 4 positions; optional.
Tax Product Code	A code used to determine the tax for a particular item. Enter a valid tax product code and select *OK* to display tax product code cross references that match your entry. Alphanumeric, 24 positions; optional.

Screen Option	Procedure
Create a tax product code cross reference	Select *Create* to advance to the *Create Tax Product Code Cross Reference Screen*.
Change a tax product code cross reference	In the Action column, select *Change* for a tax product code cross reference to advance to the Change Tax Product Code Cross Reference screen. At this screen, you can change the Tax Product Code. See *Create Tax Product Code Cross Reference Screen* for field descriptions.
Delete a tax product code cross reference	In the Action column, select *Delete* for a tax product code cross reference to delete it.

Create Tax Product Code Cross Reference Screen

Purpose: Use this screen to create a cross reference between a tax product code and an item class, long SKU division, long SKU department, and long SKU class combination.

How to display this screen: Select *Create* on the *Work with Tax Product Code Cross Reference Screen*.

Field	Description
Item Class	A code to identify a group of items, such as computer hardware or computer software. Item Class codes are used as a high-level method to sort and classify inventory. You assign an item class to an item in the Item table (MITM). Item class codes are defined in and validated against the Item Class table; see *Working with Item Classes (WICL)*. Alphanumeric, 3 positions. Create screen: optional. Change screen: display-only.
L/S Division	A code that represents a long SKU division. L/S divisions are used in conjunction with long SKU departments and long SKU classes for reporting purposes and to create a hierarchy within a company or entity. Long SKU division codes are defined in and validated against the L/S Division table; see *Creating and Maintaining Long SKU Divisions (WLDV)*. Alphanumeric, 4 positions. Create screen: optional. Change screen: display-only.
L/S Department	A code that represents a long SKU department. L/S departments are used in conjunction with long SKU divisions and long SKU classes for reporting purposes and to create a hierarchy within a company or entity. Long SKU department codes are defined in and validated against the L/S Department table; see *Working with Long SKU Departments (WLSD)*. Alphanumeric, 5 positions. Create screen: optional. Change screen: display-only.
L/S Class	A code that represents a long SKU class. L/S classes are used in conjunction with long SKU departments and long SKU divisions for reporting purposes and to create a hierarchy within a company or entity. Long SKU class codes are defined in and validated against the L/S Class table; see *Working with Long SKU Classes (WLSC)*. Alphanumeric, 4 positions. Create screen: optional. Change screen: display-only.
Tax Product Code	A code used to determine the tax for a particular item. If you use the AvaTax interface, this is a tax code defined in AvaTax. Alphanumeric, 24 positions; required.

Setting Up the Purchasing Tables

Purpose:

- Working with Buyers (WBUY) explains how to create, change, delete, and display buyer information.
- Working with Purchase Order Ship Via (WPSV) explains how to create, change, delete, and display ship via codes for purchase orders.
- Working with Vendors (WVEN) includes how to create, change, delete, and display vendor information.
- Working With PO Additional Charges (WPAC) explains how to create, change, delete, and display additional charges for purchase orders.
- Working with Unit of Measure Conversions (WUMC) explains how to create, change, delete, and display unit of measure conversions between your selling unit of measure and the vendor's unit of measure.
- Working with Vendor Items (WVNI) describes how to create, change, delete, and display vendor item information. Vendor items are a reference between the vendor's item information and the item information used by your company.
- *Working with Vendor Upload (LVUP)* explains how to upload vendor information into Order Administration.
- *Working with Vendor Upload (LVUP)* explains how to upload vendor information into Order Administration.

Working with Buyers (WBUY)

Buyers are eligible to create purchase orders and may be assigned to purchase specific items. A record must be established on the system for every buyer. The Buyer table is required in order to use the Purchase Order function.

In this topic:

- *Work with Buyers Screen*
- *Create Buyer Screen*

Work with Buyers Screen

Purpose: Use this screen to create, change, delete, or display buyer information. Buyers are eligible to create purchase orders and may be assigned to purchase specific items. A record must be established on the system for every buyer.

How to display this screen: Enter *WBUY* in the Fast Path field at the top of any menu or select Work with Buyers from a menu.

Field	Description
Buyer	A code to identify a buyer. This code could be the Buyer's initials or any other coding system to identify the buyers. Alphanumeric, 3 positions; optional.
Description	The buyer's name, which is used on selected reports where the Buyer is included. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a new buyer	Select *Create* to advance to the *Create Buyer Screen*.
Change buyer information	Select *Change* for a buyer to advance to the Change Buyer Screen. At this screen you can change any information except the buyer. See *Create Buyer Screen* for field descriptions.
Delete buyer information	Select *Delete* for a buyer to delete it.
Display buyer information	Select *Display* for a buyer to advance to the Display Buyer Screen. You cannot update any information on this screen. See *Create Buyer Screen* for field descriptions.

Create Buyer Screen

To create: At the *Work with Buyers Screen*, select *Create*.

Field	Description
Buyer	The code that identifies a buyer on the system. A buyer is someone who creates the purchase order for an item. A Buyer manages inventory purchases which could be both initial and rebuy purchases or just rebuys. This code could represent the Buyer's initials or any other coding system to identify the Buyer. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	The buyer's name, which is used on selected reports where the Buyer is included. Alphanumeric, 30 positions; required.

Working with Purchase Order Ship Via (WPSV)

Purpose: Use the Purchase Order Ship Via function to add or maintain purchase order ship via codes. The system uses purchase order ship via codes during Purchase Order Maintenance to designate your preferred shipping method for the inventory. The system prints ship via information on the purchase orders.

In this topic:

- *Drop Ship Purchase Order Setup for Purchase Order Ship Vias*
- *Work with Purchase Order Ship Via Screen*
- *Create Purchase Order Ship Via Screen*

Drop Ship Purchase Order Setup for Purchase Order Ship Vias

Overview: When you generate drop ship purchase orders, the system defaults the ship via code from the order, as set up through *Working with Ship Via Codes (WVIA)*, onto the header of the drop ship purchase order, even though the Ship via field on the purchase order header is validated against the Purchase Order Ship Via table rather than the regular (order) Ship Via table.

The description of the purchase order ship via prints on the standard purchase order. As a result, if you generate drop ship purchase orders and use the standard purchase order print programs, you will need to set up purchase order ship via codes that match the regular (order) ship vias, so that the ship via is identified correctly to your drop ship vendors.

Example: A customer places an order for drop ship item DS123, and the ship via on the order is `10`: UPS two-day. When you run *Selecting Vendors for Drop Ship Processing (MDSP)*, it generates a drop ship purchase order to the vendor for the item, and sets the purchase order ship via for the generated drop ship purchase order to `10`. When you print the drop ship purchase order using the standard purchase order print programs, the description of the purchase order ship via `10`, set up through *Working with Purchase Order Ship Via (WPSV)*, prints. In order to indicate the correct ship via to your vendor, the description of regular (order) ship via `10` and purchase order ship via `10` should be the same.

Specifying purchase order print programs: You use the *PO Print Program (C64)* and *PO Print Program for PO Print in PO Sequence (C76)* system control values to specify the regular and drop ship purchase order print program(s). Standard setting for both values are *PURCHORDG* (graphical format). See the *Purchase Order* for samples and field descriptions.

Assigning a purchase order ship via to a drop ship vendor item: If you assign a purchase order ship via to a vendor item that will be included on a drop ship purchase order, this purchase order ship via is assigned to the drop ship purchase order detail line; however, the ship via for the purchase order detail line is included on the printed drop ship purchase order only if your unique print program supports it. The ship via from the originating order prints on the standard drop ship purchase order, as described above. As a result, specifying a purchase order ship via for the vendor/item of a drop ship item is not recommended unless you use your own unique print program that indicates the purchase order ship via on the purchase order detail line. See *Working with Vendor Items (WVNI)* for more information on setting up vendor items.

Supplier Direct Fulfillment integration: The ship via defined for the vendor item of the first line on a drop ship purchase order defaults to the header of a purchase order sent to Order Orchestration's Supplier Direct Fulfillment module; otherwise, if no ship via is defined for the vendor item on the first purchase order line, the ship via from the sales order header is assigned. If you use this integration to fulfill drop ship orders, you need to complete carrier setup in Order Orchestration for these ship vias, including making sure that the ship via codes map to the codes set up for an integrated shipping system that vendors use to confirm shipments of drop ship purchase orders. See *Working with Vendor Items (WVNI)* and *Interface with Order Orchestration's Supplier Direct Fulfillment Module: Overview and Setup* for more information.

Work with Purchase Order Ship Via Screen

How to display this screen: Enter *WPSV* in the Fast path field at the top of any menu or select Work with PO Ship Via from a menu.

Field	Description
Code	A code that represents a shipper used for shipping merchandise to your company. Numeric, 2 positions; optional.
Description	The description of the purchase order ship via code. Alphanumeric, 30 positions; optional.

Field	Description
Lead days	The number of days it takes the shipper to deliver merchandise to your company. Informational only. Numeric, 3 positions; optional.

Screen Option	Procedure
Create a ship via code	Select *Create* to advance to the *Create Purchase Order Ship Via Screen*.
Change a ship via code	Select *Change* for a ship via code to advance to the Change Purchase Order Ship Via Screen.At this screen you can change any information except the ship via code. See *Create Purchase Order Ship Via Screen* for field descriptions.
Delete a ship via code	Select *Delete* for a ship via code to delete it.
Display a ship via code	Select *Display* for a ship via code to advance to the Display Purchase Order Ship Via Screen. You cannot update any information on this screen. See *Create Purchase Order Ship Via Screen* for field descriptions.

Create Purchase Order Ship Via Screen

Purpose: Use this screen to create a purchase order ship via code.

How to display this screen: Select *Create* at the *Work with Purchase Order Ship Via Screen*.

Field	Description
PO shipper	A code that represents a shipper used for shipping merchandise to your company. Purchase order shipper codes are entered on the *Ship via* field for a purchase order and can be entered in the *Ship via* field for the Vendor/Item. These codes do not necessarily have to be the same codes defined for shippers of your consumer orders. Purchase Order Maintenance and Vendor/Item Maintenance validates against this table. Numeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description of the purchase order ship via code. This text prints on the purchase order. Alphanumeric, 30 positions; required.
Lead days	The number of days it takes the shipper to deliver merchandise to your company. Informational only. Numeric, 3 positions; optional.

Working with Vendors (WVEN)

Vendors are companies who supply you with merchandise or services. A record must be established on the system for every vendor from whom you purchase merchandise.

In this topic:

Upload vendors: You can upload vendor information into Order Administration using the Load Vendor Upload menu option; see *Working with Vendor Upload (LVUP)*.

Work with Vendors Screen

How to display this screen: Enter *WVEN* in the Fast path field at the top of any menu or select the Work with Vendors option from the menu.

Field	Description
Vendor #	A code that identifies a supplier who sells you goods or services. Numeric, 7 positions; optional.
Name	The name of the vendor. Alphanumeric, 30 positions; optional.
State	A code representing a state or province where a vendor's business is located. State codes are defined in and validated against the State table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 2 positions; optional.

Field	Description
Postal	The vendor's postal (zip) code. Alphanumeric, 10 positions; optional.
Telephone #	The vendor't telephone number. Alphanumeric, 14 positions; optional.
Ext	The vendor's telephone number extension. Alphanumeric, 4 positions; optional.

Screen Option	Procedure
Create a new vendor	Select *Create* to advance to the *First Create Vendor Screen*.
Change vendor information	Select *Change* for a vendor to advance to the *First Change Vendor Screen*.
Delete vendor information	Select *Delete* for a vendor to delete it. An error message displays if vendor items exist for the vendor: `WARNING - VENDOR ITEMS EXIST. Press ENTER or Click OK to confirm delete of Vendor & Vendor's Items.`
Display vendor information	Select *Display* for a vendor to advance to the *First Display Vendor Screen*.
Create a vendor discount	Select *Discounts* for a vendor to advance to the *Work with Vendor Discounts Screen*.
Display vendor history	Select *History* for a vendor to advance to the *Display Vendor History Screen*.
Work with vendor contacts	Select *Contacts* for a vendor to advance to the *Work with Vendor Contacts Screen*.
Work with vendor FOB addresses	Select *FOB* for a vendor to advance to the *Work with Vendor FOB Address Screen*.
Display vendor notes	Select *Notes* for a vendor to advance to the *Work with Vendor Notes Screen*.
Work with user defined fields	Select *User Field* for a vendor to advance to the *Work with User Fields Screen*.

First Create Vendor Screen

Purpose: Use this screen to begin to create a vendor. This is the first of two Create Vendor screens; when you complete this screen, you advance to the *Second Create Vendor Screen*.

How to display this screen: Select *Create* at the *Work with Vendors Screen*.

Field	Description
Vendor	A code that identifies a supplier. Numeric, 7 positions. Create screen: required. Change screen: display-only.

Field	Description
Name	The name of the vendor or the vendor's company. Alphanumeric, 30 positions; required.
Address	The vendor's address, as it should appear on purchase orders. Alphanumeric, 3 lines with 32 positions each line; required.
City/State/Postal/ Country	The city, state, postal zip code, and country associated with the vendor. If the Require state field for the country in the vendor address is selected, the system requires a state code for the vendor address: `State is required for this country.` **Note:** The system does not validate the vendor's address in the same way it validates a customer's address, as in order entry. For example, it does not validate that the state is associated with the SCF for the postal code. City: alphanumeric, 25 positions; required. State: alphanumeric, 2 positions; optional. Postal code: alphanumeric, 10 positions; optional. Country code: alphanumeric, 3 positions; required.
Contact name	The name of your primary contact at the vendor site. This name prints on purchase orders. You can create additional contacts for a vendor from the *Work with Vendor Contacts Screen*. Alphanumeric, 30 positions; optional.
Phone #/Ext (Telephone number and extension)	The vendor's telephone number and extension. You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and is saved as it was entered by the operator. Phone #: alphanumeric, 14 positions; optional. Extension: alphanumeric, 4 positions; optional.
Fax#	The telephone number for the vendor's fax machine. Faxing purchase orders or drop ship picks to the vendor is not currently implemented. Alphanumeric, 14 positions; optional.

Field	Description
Email	The vendor's email address. See *Email Address Validation* for information on how the system verifies that your entry is formatted correctly. **Emailing Purchase Orders** If the *Email Purchase Order (K80)* system control value and the vendor's Email P/O flag are selected, the system sends the purchase order to the vendor as an email attachment. See the *Email Purchase Order (K80)* system control value for more information. Alphanumeric, 50 positions; optional.
Email P/O	Indicates whether to send the purchase order to the vendor's email address as an attachment. Valid values are: *Selected* = Email the purchase order to the vendor. The .PDF file is attached to a plain-text email that is sent to the vendor's Email address. **Note:** If this field is selected, then you need to specify a valid Email address for the vendor. *Unselected* = Generate a .PDF file for printing. Regardless of the setting of this flag, you cannot send purchase orders by email unless the *Email Purchase Order (K80)* system control value is selected. See that system control value and *Purchase Order Emails* for more information on sending purchase orders to the vendor by email.
Remit to	The name of the person or company you send payment to for vendor invoices. The remit-to address prints on checks for the vendor. **Note:** If any portion of a name or address appears in the Remit to fields, the system will bypass the vendor name and address and print the Remit to name and address on checks. If you enter any information in the Remit to fields, be sure that it is correct and complete. Alphanumeric, 30 positions; optional.
Address	The address where you mail checks for the vendor. Alphanumeric, 30 positions; optional.

Field	Description
City/State/Postal/ Country	The city, state, postal zip code, and country where you should mail payment to the vendor. If the Require state field for the country in the vendor address is selected, the system requires a state code for the vendor address: `State is required for this country.` Alphanumeric, 25 positions; optional.
Email	The remit to vendor's email address. Informational only. See *Email Address Validation* for information on how the system verifies that your entry is formatted correctly. Alphanumeric, 50 positions; optional.

Screen Option	Procedure
Complete creation of a vendor	Select *OK* to advance to the *Second Create Vendor Screen*.
Create the Vendor Extended record	Select *Create Vend Ext* to advance to the *Change Vendor Extended Screen*.

Second Create Vendor Screen

Purpose: Use this screen to complete entry of a vendor.

How to display this screen: Select *OK* at the *First Create Vendor Screen*.

Field	Description
Print PO	Indicates whether purchase order forms print or are emailed for this vendor. If so, you order products on the purchase order, print it, then mail it to the vendor. • *Selected* = Print or email purchase orders for this vendor. • *Unselected* = Do not print or email purchase orders for this vendor. **Note:** If the *Email P/O* flag is selected, then this flag also needs to be selected.

Field	Description
Drop ship output	Indicates whether to process drop ship orders by printing purchase orders, pick slips/invoices, or transmitting information through the Order Orchestration interface for internet-based drop ship processing. Drop ship merchandise is merchandise that you sell but do not stock. Only items flagged as Drop ship are eligible for drop ship processing. • *Drop ship pick* = Print drop ship pick slips/ invoices for this vendor. • *Drop ship purchase order* = Print drop ship purchase orders for this vendor. When you print a drop ship purchase order, the system also prints a drop ship pick slip/invoice. • *OROB drop shipping* = Send drop ship purchase orders to Order Orchestration's Supplier Direct Fulfillment module for internet-based processing. See *Selecting Vendors for Drop Ship Processing (MDSP)* for information on generating drop ship pick slips or purchase orders. **Drop Ship integrations** The *Order Orchestration Drop Ship Integration* provide access to internet-based, collaborative environments for retailers and vendors to share and process information related to drop ship orders. If you use either of these integrations, your system generates drop ship purchase orders and automatically distributes them to the integrated application. *OROB drop shipping* is a valid selection only if the *Use OROB Drop Shipping (H13)* system control value is *selected*. If this system control value is *unselected* when you try to select *OROB drop shipping*, a message indicates `Collaborative shipping vendor is not allowed`. If you select *OROB drop shipping*, the *Email Address for Drop Ship Vendor Window* opens unless you have entered a vendor email address on the *Create Vendor Contact Screen*. **Generating CWPickOut messages:** The system also creates pick download triggers (File code of *PCH*) in the IL Outbound Trigger table when you generate a drop ship invoice if the *Create Generic Pick Download Triggers (I31)* system control value is *selected*. The PICK_OUT process in *Working with Integration Layer Processes (IJCT)* generates the Pick Message from Order Administration (CWPickOut) for each of these trigger records.
NA	**Scheduling:** See *Process Drop Ship Orders* to process drop ship picks or purchase orders using the periodic function *DSHPROC*. Alphanumeric, required.

Field	Description
Cutover date	The date when you switched a vendor's *Drop ship output* to *OROB drop shipping*, indicating when the system sends all new drop ship purchase orders for the vendor to Order Orchestration's Drop Ship Manager module. No cutover date is indicated if you did not switch the vendor's *Drop ship output* setting to *OROB drop shipping*: for example, if you assigned the vendor to *OROB drop shipping* at initial creation. Included on the Change and Display screen only. Numeric, 6 positions (in user date format); display only.
D/S batch size (drop ship batch size)	The number of picks to include in a drop ship batch when you are *Processing Drop Ship Orders by Batch (MDSB)* for this vendor. The drop ship batch size determines the number of pick slips that print in one batch before the system creates a new batch. *Example:* Batch size = 2 # of picks to release = 5 In this situation, the system generates 3 batches: Batch 1 contains 2 pick slips Batch 2 contains 2 pick slips Batch 3 contains 1 pick slip Numeric, 7 positions; optional.
PO ship via	A code that represents the shipper used for shipping merchandise to your company from this vendor. Purchase order ship via codes are defined in and validated against the PO Ship Via table; see *Working with Purchase Order Ship Via (WPSV)*. Numeric, 2 positions; optional.
Terms	A code for the terms and conditions for payment to the vendor, such as 30 days after invoice date or at the end of the month. Numeric, 2 positions; optional.
Discount % (Primary discount percentage)	The primary discount percentage applied towards items purchased from this vendor. This discount is applied to the dollar value of merchandise and is taken during Purchase Order Maintenance. Any other discounts from the Vendor Discount table are applied after the primary discount has been calculated. See *Work with Vendor Discounts Screen*. Numeric, 5 positions with a 2 place decimal; optional.

Field	Description
Surcharge %	A standing surcharge added to purchases from this vendor. A surcharge is typically added to purchases from a broker. The percentage is based on the item price in Purchase Order Maintenance. Numeric, 5 positions with a 2 place decimal; optional.
Quality rating	The vendor's quality rating, as calculated by the quality assurance database. Not currently implemented. Numeric, 5 positions with a 2 place decimal; system-assigned.
A/P interface vendor	The vendor code on your third party Accounts Payable system. This code is used as a bridge between Order Administration and your own Accounts Payable system. Alphanumeric, 10 positions; optional.
Parent vendor	A code for a company that is made up of one or more subsidiary vendors. If your unique interface program supports it, you can define a vendor as a parent vendor if you wish to pay the main (parent) vendor for the merchandise you received from each subsidiary (child) vendor. • If the vendor code defined in this field matches the code you are creating, this vendor represents a parent vendor. • If the vendor code defined in this field does not match the code you are creating, this vendor represents a child vendor.
NA	*Example:* Vendors 101, 102, and 103 all report to vendor 10123. Instead of paying vendors 101, 102, and 103 separately for the merchandise you received, you can pay vendor 10123 for all of the merchandise you received from each of the subsidiary vendors. If the Require Entry of Parent Vendor system control value is *selected*, you must enter a valid vendor code in this field or an error message indicates: `Parent Vendor number is required`. **Note:** Used only if your unique interface program supports it. Numeric, 7 positions; optional.

Field	Description
Currency code	A code to identify a currency type. This code is used by the Purchase Order system to identify a vendor's currency and to perform currency conversion processing if the vendor's currency is different from yours. Currency codes are defined in and validated against the Currency Code table (fast path = *WCUR*). Defaults from the *Local Currency Code (A55)* system control value, but you can override it. The currency code you enter here defaults when you enter purchase orders, but you can override it. **Note:** The Supplier Direct Fulfillment integration does not support currency conversion. Alphanumeric, 3 positions; required.
Vendor price currency	Indicates whether the prices from this vendor are in the system's currency or the vendor's own currency and controls how and when currency conversion takes place.

NA

Vendor Price Currency§	Calculation at Purchase Order Entry§	Calculation at Purchase Order Receiving§
S (system) = the price from the Vendor/Item table is in your local currency. (*default*)§	Vendor price = Price from the Vendor/Item table * currency conversion rate§	none§
V (vendor) = the price in the Vendor/Item table is in the vendor's currency.§	Cost = Price from the Vendor/Item table / currency conversion rate§	none§
N (no conversion) = the price in the Vendor/Item table is in the current currency.§	none§	Price from PO Entry / current currency conversion rate§

Field	Description
NA	**Note:** If this field is set to *N* or *V*, you must define vendor items in the Vendor Item table for the system to calculate the cost at the time of receiving. If you override the currency rate during Purchase Order Receiving, the system uses the following calculation: `Price from Purchase Order/current currency conversion rate.` **Note:** The Supplier Direct Fulfillment integration does not support currency conversion. Alphanumeric, 1 position; required.
VAT number	A number used when calculating foreign currency. Alphanumeric, 20 positions; optional.
Type of vendor	Identifies whether the vendor is an actual vendor or a manufacturer. Valid values are: • *Manufacturer* • *Vendor*
User fields	Use these fields to enter additional vendor information. The system defaults the Vendor user field 3 to the Item user field 3 field in Work with Item/SKUs (see Performing Initial Item Entry (MITM)) when you create or change an item and the program name *INR1156* has been defined in the User function field for the *CHGITEM* and *ADDITMSKU* user exit points. . Alphanumeric, three 10-position fields; optional.

Screen Option	Procedure
Create the Vendor Extended record	Select *Create Vendor Ext* to advance to the Change Vendor Extended Screen.

Email Address for Drop Ship Vendor Window

Purpose: Use this window to enter an email address for a vendor when you use the interface with Order Orchestration's Drop Ship Manager to process drop ship orders for the vendor.

Order Orchestration automatically sends email notification to vendors when you create and send drop ship purchase orders or when you request cancellation of an order line or change an order's shipping address.

How to display this screen: Select *OROB Drop Shipping* in the Drop ship output field on the *Second Create Vendor Screen* If you have not entered an email address for the vendor in the *Create Vendor Contact Screen*, this pop-up window opens.

Field	Description
Email address	The vendor contact's email address. See *Email Address Validation* for information on how the system verifies that your entry is formatted correctly. Alphanumeric, 50 positions; optional.

First Change Vendor Screen

To change: Select *Change* for a vendor at the *Work with Vendors Screen* to advance to the first Change Vendor screen. At this screen you can change any information except the vendor code. Select *OK* to advance to the *Second Change Vendor Screen*.

See *First Create Vendor Screen* and *Second Create Vendor Screen* for field descriptions.

Second Change Vendor Screen

How to display this screen: Select *OK* at the *First Change Vendor Screen*.

See *Second Create Vendor Screen* for field descriptions.

Screen Option	Procedure
Display vendor history	Select *Display Vendor Hist* to advance to the *Display Vendor History Screen*.
Display vendor extended information	Select *Change Vendor Ext* to advance to the *Display Vendor Extended Screen*.
Work with vendor contacts	Select *Vendor Contacts* to advance to the *Work with Vendor Contacts Screen*.
Display vendor notes	Select *Notes/comments* to advance to the *Work with Vendor Notes Screen*.

First Display Vendor Screen

To display: Select *Display* for a vendor at the *Work with Vendors Screen* to advance to the first Display Vendor screen. You cannot update any information on this screen. Select *OK* to advance to the *Second Display Vendor Screen*.

See *First Create Vendor Screen* for field descriptions.

Second Display Vendor Screen

How to display this screen: Select *OK* at the *First Display Vendor Screen*.

See *Second Create Vendor Screen* for field descriptions.

Screen Option	Procedure
Display vendor history	Select *Display Vendor Hist* to advance to the *Display Vendor History Screen*.
Display vendor extended information	Select *Display Vendor Ext* to advance to the *Display Vendor Extended Screen*.
Work with vendor contacts	Select *Vendor Contacts* to advance to the *Work with Vendor Contacts Screen*.
Display vendor notes	Select *Notes/comments* to advance to the *Work with Vendor Notes Screen*.

Display Vendor History Screen

Purpose: Use this screen to review performance statistics for this vendor. The OTHR_ASYNC job updates this information.

> **Note:**
>
> Purchase orders that you unlock through the *Unlock Purchase Order (MUPO)* option are not submitted (or resubmitted) to the OTHR_ASYNC job. As a result, there is no mechanism to Vendor History based on activity that occurred during the creation or maintenance session that resulted in the lock.

How to display this screen: Select *History* for a vendor at the *Work with Vendors Screen* or select *Display Vendor Hist* at the *First Display Vendor Screen* or the *Second Display Vendor Screen*.

Field	Description
Vendor	A code for the supplier of a product or service you purchase. Numeric, 7 positions; display-only.
Number POs	The number of purchase orders to date, since adding the vendor to the system. This information is also broken out into open POs (not received or partially received), held POs, and canceled POs. The fields are updated appropriately if you purge purchase orders. Numeric, 7 positions; display-only.
Value POs	The value of the purchase orders to date. This information is also broken out into open POs (unreceived or partially received), held POs, and canceled POs. These fields are updated appropriately if you purge purchase orders. Numeric, 7 positions; display-only.
Year	The current fiscal year. Numeric, 2 positions (YY format); optional.
Period	The current period. A period is user-defined, but usually refers to an accounting month. Accounting periods are defined in and validated against the Accounting Periods table. Numeric, 2 positions; optional.

Field	Description
# POs	The number of purchase orders for the year and period. These fields are not updated when you purge purchase orders, and contain true historical (life-to-date) information. Numeric, 7 positions; display-only.
Value POs	The value of the purchase orders for the year and period. These fields are not updated when you purge purchase orders and contain true historical (life-to-date) information. Numeric, 7 positions; display-only.

Change Vendor Extended Screen

Purpose: Use this screen to:

- review the dollar value of outstanding (unreceived or partially received) purchase orders for the vendor
- review or define the discount calculation method used for discounts in the Vendor Discount table

How to display this screen: Select *Change Vendor Ext* at the *First Change Vendor Screen* or the *Second Change Vendor Screen*.

Field	Description
Vendor	A code that identifies the supplier from whom you purchase goods or services. Numeric, 7 positions; display-only.
Vendor description (Unlabeled field to the right of the Vendor field)	The name of the vendor. Alphanumeric, 30 positions; display-only.
On order	The total dollar value of purchase orders which are outstanding (unreceived or partially received) for this vendor. Numeric, 13 positions with a 2-place decimal; display-only.
Priority	The Cash Disbursement priority, in a range from 9 (highest priority) to 0 (lowest priority). Numeric, 1 position; optional.

Field	Description
Discount calculation method	A code that defines the calculation method used for the three discounts from the Vendor Discounts table. Valid values are: • *Combined* = This discount method combines the total dollar amount of all 3 discounts to determine the net cost. • *Tiered* = This discount method calculates the largest discount against the purchase order's gross cost, then the second largest discount is calculated against the net result of the first discount, and the third largest discount is calculated against the net result of the second discount. • Blank = No discount is applied. • If you leave this field blank, you will not be able to apply any discounts when working with a purchase order, regardless of your entries in the discount fields. • These discounts do not apply to drop ship purchase orders. See *Combined Discount Calculation* and *Tiered Discount Calculation* for examples of each discount calculation. Required if using vendor discounts.

Display Vendor Extended Screen

Purpose: Use this screen to review:

- the dollar value of outstanding (unreceived or partially received) purchase orders for the vendor
- the discount calculation method used for discounts in the Vendor Discount table
- the dollar amount of cash that should be paid against outstanding invoices for the vendor and the weeks on which these payments should be disbursed

How to display this screen: Select *Display Vendor Ext* at the *First Display Vendor Screen* or the *Second Display Vendor Screen*.

For more information: See *Change Vendor Extended Screen* for a screen sample and field descriptions. You cannot change any information on this screen.

Work with Vendor Discounts Screen

Purpose: Use this screen to create vendor discounts to apply against the gross cost of the purchase order in Purchase Order Maintenance (see *Purchase Order Line Discount Screen*),

> **Note:**
>
> These discounts do not apply to drop ship purchase orders.

How to display this screen: Select *Discounts* for a vendor on the *Work with Vendors Screen*.

The following message indicates that you have not defined a *Discount calculation method* in the Vendor Extended table:

Discount Calculation Method not defined for Vendor.

Field	Description
Vendor #	A user-defined code to identify the supplier of an item. Vendor codes are defined in and validated against the Vendor table. See Numeric, 7 positions; display-only.
Vendor description (Unlabeled field to the right of the Vendor field)	The name of the vendor. Alphanumeric, 30 positions; display-only.
Discount (Discount fields)	The names of the three discount fields. These fields are controlled by the *Discount 1 Field (D97)*, *Discount 2 Field (D98)*, and *Discount 3 Field (D99)* values in the System Control table. The discount fields are blank if values have not been defined. **Note:** The system calculates the primary discount on a purchase order before calculating any discounts from the Vendor Discount table. Alphanumeric, 11 positions; display-only.
Percent	The percentage the system applies against the unit cost of an item on the purchase order. If you enter a discount percentage, you cannot enter a unit discount for the same discount field. The system calculates discount percentages before subtracting any dollar discounts. **Note:** The system calculates percentage discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation* for examples of each. Numeric, 11 positions with a 4-place decimal; optional.

Field	Description
Unit discount	The dollar amount the system subtracts from the unit cost of an item on the purchase order. If you enter a unit discount amount, you cannot enter a discount percentage for the same discount field. **Note:** The system calculates percentage discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation* for examples of each. Numeric, 11 positions with a 4-place decimal; optional.

Instructions: Use the following steps to create a vendor discount:

1. Complete the Percent or Unit discount field for each discount field label. If you leave both the Percent and Unit discount fields blank, no discount will apply for this label.
2. Select *OK*. The system validates your entries and highlights any fields you need to correct. Correct any fields again.
3. The discounts you have entered will apply to all purchase orders entered for this vendor. These discounts are calculated based on the method you have entered in the *Discount calculation method* field in the Vendor Extended table.

See *Combined Discount Calculation* and *Tiered Discount Calculation*.

> **Note:**
>
> The calculation of discounts in a foreign currency is not currently implemented.

Combined Discount Calculation

The combined discount calculation method combines the values of all 3 discounts to determine the net cost. Any discount percentages defined for the discounts are calculated before the unit discounts are applied.

The Combined Discount Calculation does not apply to drop ship purchase orders.

Example: An example of the combined discount calculation method is:

Cost of item = $100.00

Primary discount (defined in Vendor table) = 10%

Discount 1 = $10.00 (unit discount)

Discount 2 = 20% (percentage discount)

Discount 3 = 10% (percentage discount)

Step 1: Calculate the primary discount percentage

cost ($100.00) x primary discount (10%) = unit discount amount for primary discount ($10.00)

Step 2: Subtract the primary discount amount from the cost

cost ($100.00) - primary discount ($10.00) = cost after primary discount ($90.00)

Step 3: Calculate discount 2 percentage

cost ($90.00) x discount 2 (20%) = unit discount amount for discount 2 ($18.00)

Step 4: Calculate discount 3 percentage

cost (90.00) x discount 3 (10%) = unit discount amount for discount 3 ($9.00)

Step 5: Add discount amounts 1, 2 and 3 together

discount 2 ($18.00) + discount 3 ($9.00) + discount 1 ($10.00) = combined discount ($37.00)

Step 6: Subtract the total combined discount amount from the cost

cost ($90.00)- total combined discount (37.00) = net cost ($53.00)

Tiered Discount Calculation

The tiered discount calculation method calculates:

- the largest discount against the item's cost, then
- the second largest discount is calculated against the net result of the first discount, then
- the third largest discount is calculated against the net result of the second discount

Any discount percentages defined for the discount fields are calculated before the unit discounts are applied.

> **Note:**
>
> The Tiered Discount Calculation does not apply to drop ship purchase orders.

Example: An example of the tiered discount calculation method is:

Cost of item = $100.00

Primary discount (defined in Vendor table) = 10%

Discount 1 = $10.00 (unit discount)

Discount 2 = 20% (percentage discount)

Discount 3 = 10% (percentage discount)

Step 1: Calculate the primary discount percentage

cost ($100.00) x primary discount (10%) = unit discount amount for primary discount ($10.00)

Step 2: Subtract the primary discount amount from the cost

cost ($100.00) - primary discount ($10.00) = cost after primary discount ($90.00)

Step 3: Calculate the largest discount percentage

cost ($90.00) x discount 2 (20%) = largest discount amount ($18.00)

Step 4: Subtract the largest discount amount from cost

gross cost ($90.00) - largest discount ($18.00) = net of first calculation ($72.00)

Step 5: Calculate the 2nd largest discount percentage

net of first calculation ($72.00) x discount 3 (10%) = second largest discount amount ($7.20)

Step 6: Subtract the 2nd largest discount amount from cost

net of first calculation ($72.00) - second largest discount amount ($7.20) = net of second calculation ($64.80)

Step 7: Subtract the 3rd largest discount amount from cost

net of second calculation ($64.80) - third largest discount amount ($10.00) = net of third calculation ($54.80)

Work with Vendor Contacts Screen

Purpose: Use this screen to create, change, delete or display contacts for a specific vendor.

How to display this screen: Select *Contacts* for a vendor on the *Work with Vendors Screen*, or select *WW vend cntct* on the *First Change Vendor Screen*, *First Display Vendor Screen*, *Second Change Vendor Screen*, or *Second Display Vendor Screen*.

Field	Description
Vendor	The vendor number and description associated with the vendor contacts. Vendor number: numeric, 7 positions; display-only. Vendor description: alphanumeric, 30 positions; display-only.
Seq # (Sort sequence number)	The sort sequence number assigned to this vendor contact. This number determines how the vendor contacts display on the screen and on the Vendor Contact Listing (*Print List* to print). If you do not define a sort sequence number, the system assigns a sequence number of *0* to the vendor contact. **Note:** If you are using *Order Orchestration Drop Ship Integration* to automatically process drop ship orders for this vendor, you must enter the sequence number *999* to insure that email notifications are automatically sent to the vendor when you create drop ship purchase orders for this vendor. See *Email Address for Drop Ship Vendor Window* for more information.

Field	Description
NA	You can select *Resequence* to resequence each vendor contact that displays on the screen in increments of 2. For example contact 1 = sequence # 0 contact 2 = sequence # 0 contact 3 = sequence # 5 contact 4 = sequence # 8 When you select *Resequence*, the system resequences the vendor contacts in the following order: contact 1 = sequence # 1 contact 2 = sequence # 3 contact 3 = sequence # 5 contact 4 = sequence # 7 Numeric, 3 positions; optional.
Contact name	The name of the vendor contact. Alphanumeric, 30 positions; optional.
Title	The contact's title within the organization. Alphanumeric, 30 positions; display-only.
Type	A user-defined field to identify the address type. Informational only. Alphanumeric, 1 position; optional.

Screen Option	Procedure
Create a vendor contact	Select *Create* to advance to the *Create Vendor Contact Screen*.
Change a vendor contact	Select *Change* for a vendor contact to advance to the Change Vendor Contact screen. You can change any information on this screen except the vendor. See *Create Vendor Contact Screen*.
Delete a vendor contact	Select *Delete* for a vendor contact to delete it.
Display a vendor contact	Select *Display* for a vendor contact to advance to the Display Vendor Contact screen. You cannot change any information on this screen. See *Create Vendor Contact Screen*.
Resequence the sequence number for each vendor contact	Select *Resequence*. The system assigns sequence numbers to each vendor contact in increments of 2.

Create Vendor Contact Screen

Purpose: Use this screen to create a vendor contact.

How to display this screen: Select *Create* on the *Work with Vendor Contacts Screen*.

Field	Description
Vendor	The vendor number and description associated with the vendor contact you are creating. Vendor number: numeric, 7 positions; display-only. Vendor description: alphanumeric, 30 positions; display-only.
Contact name	The name of the vendor contact. Alphanumeric, 30 positions; required.
Contact title	The contact's title within the company. Alphanumeric, 30 positions; optional.
Address	Address lines 1, 2 and 3 for the vendor contact. The vendor's address defaults. Alphanumeric, 32 positions; address line 1 required, address lines 2 and 3 optional.
City/State/Postal/ Country	The city, state, postal zip code and country associated with the vendor contact. The vendor's city, state, postal code and country defaults. If the Require state field for the country in the vendor contact address is selected, the system requires a state code for the vendor address: `State is required for this country`. **Note:** The system does not validate the contact's address in the same way it validates a customer's address, as in order entry. For example, it does not validate that the state is associated with the SCF for the postal code. City: alphanumeric, 25 positions; required. State: alphanumeric, 2 positions; optional. Postal code: numeric, 10 positions; optional. Country: alphanumeric, 3 positions; required.
Phone #/Ext (Telephone number and extension)	The vendor contact's telephone number and extension. You can define a telephone number format to map to the phone numbers operators enter into the system. See *Setting Up the Country Table (WCTY)* for information on telephone number formats. Phone #: alphanumeric, 14 positions; optional. Extension: alphanumeric, 4 positions; optional.
Fax #/Ext	The telephone number for the vendor's fax machine. Faxing purchase orders is not currently implemented. Fax number: alphanumeric, 14 positions; optional. Extension: alphanumeric, 4 positions; optional.
Email address	The vendor contact's email address. See *Email Address Validation* for information on how the system verifies that your entry is formatted correctly. Alphanumeric, 50 positions; optional.

Field	Description
Address type	A user-defined field to identify the address type. Informational only. Alphanumeric, 1 position; optional.
Sort sequence #	The sort sequence number assigned to this vendor contact. This number determines how the vendor contacts display on the screen and on the Vendor Contact Listing (*Print List* to print). If you do not define a sort sequence number, the system assigns a sequence number of *0* to the vendor contact. **Note:** If you are using Order Orchestration Drop Ship Integration to automatically process drop ship orders for this vendor, you must enter the sequence number *999* to insure that email notifications are automatically sent to the vendor when you create drop ship purchase orders for this vendor. See Email Address for Drop Ship Vendor Window for more information.
NA	You can select *Resequence* on the Work with Vendor Contacts Screen to resequence each vendor contact that displays on the screen in increments of 2. For example contact 1 = sequence # 0 contact 2 = sequence # 0 contact 3 = sequence # 5 contact 4 = sequence # 8 When you select *Resequence*, the system resequences the vendor contacts in the following order: contact 1 = sequence # 1 contact 2 = sequence # 3 contact 3 = sequence # 5 contact 4 = sequence # 7 Numeric, 3 positions; optional.

Work with Vendor FOB Address Screen

Purpose: Use this screen to create, change, delete or display multiple FOB addresses for a specific vendor.

FOB (freight on board) address is the location where title to merchandise being shipped passes from the seller to the buyer. If the FOB address is an Origin type, ownership of the merchandise passes from seller to buyer at the origin of the shipping route, and the buyer is responsible for transportation costs and risk of loss or damage from that point. If the FOB address is a Destination type, ownership of the merchandise passes from seller to buyer at the receiving point for the merchandise, and the seller is responsible for transportation costs and risk of loss or damage until the merchandise reaches its destination.

How to display this screen: Select *FOB* for a vendor on the *Work with Vendors Screen*.

Field	Description
Vendor	The vendor number and description associated with the vendor. Vendor number: numeric, 7 positions; display-only. Vendor description: alphanumeric, 30 positions; display-only.
Type	This code identifies the address as an Origin (*O*) or Destination (*D*) type. • *Origin* = An Origin type FOB address specifies the location from which merchandise is being shipped, and indicates that ownership of merchandise being shipped transfers to the buyer when it leaves the vendor's warehouse (at the point of its shipping origin). • *Destination* = A Destination type FOB address specifies the location to which merchandise is being shipped, and indicates that ownership of the merchandise transfers to the buyer when it arrives at its destination. Alphanumeric, display-only.
City	The city of the FOB address. Alphanumeric, 25 positions; display-only.
State	The state of the FOB address. The system validates that the state you enter is assigned to the SCF in the first three positions of the postal code. Alphanumeric, 2 postions; display-only.
Postal code	The zip code of the FOB address. Alphanumeric, 10 postions; display-only.
Freight Terms	The freight terms for this vendor and this FOB address. Alphanumeric, 10 postions; display-only.

Screen Option	Procedure
Create a vendor FOB address	Select *Create* to advance to the *Create Vendor FOB Address Screen*.
Change a vendor FOB address	Select *Change* for a Vendor FOB address to advance to the Change Vendor FOB Address screen. You can change any information on this screen except vendor number and vendor name. See *Create Vendor FOB Address Screen* for field descriptions.
Delete a vendor FOB address	Select *Delete* for a vendor FOB address to delete it.
Display a vendor FOB address	Select *Display* for a vendor FOB address to advance to the Display Vendor FOB Address screen. You cannot change any information on this screen. See *Create Vendor FOB Address Screen* for field descriptions.

Create Vendor FOB Address Screen

Purpose: Use this screen to create a vendor FOB address.

How to display this screen: Select *Create* on the *Work with Vendor FOB Address Screen*.

Field	Description
Vendor	The vendor number and description of the vendor for whom you are creating an FOB address. Vendor number: numeric, 7 positions; display-only. Vendor description: alphanumeric, 30 postions; display-only.
Postal code	The zip code of the Vendor FOB address. Alphanumeric, 10 postions; required.
City	The city of the vendor FOB address. Alphanumeric, 25 positions; required.
State	The state of the vendor FOB address. If the Require state field for the country in the vendor FOB address is selected, the system requires a state code for the vendor address: `State is required for this country`. Alphanumeric, 2 postions; required.
Country	The country of the vendor FOB address **Note:** If the system control value *Use Zip/City/State Defaulting? (B13)* is *selected*, the City, State and Country fields will automatically display the correct address information when you enter a zip code in the Postal Code field. Alphanumeric, 3 postions; required.
Freight terms	A brief description of the freight terms for this vendor FOB address. Alphanumeric, 10 positions; required.
FOB type	Identifies the FOB type for this address. Valid types are Destination (*D*) and Origin (*O*). • *Destination* = the FOB address is the location to which merchandise is being shipped; this indicates that title to the merchandise passes from the seller to the buyer when the merchandise reaches its destination. • *Origin* = the FOB address is the location from which merchandise is being shipped; this indicates that title to the merchandise passes from the seller to the buyer as soon as the merchandise leaves the seller's dock (its shipping origin). Alphanumeric, required.

Work with Vendor Notes Screen

Purpose: Messages that apply to the vendor from whom the merchandise was purchased can be added, changed or viewed during Purchase Order Receipts. The Vendor table is updated with any changes made to the vendor notes during Purchase Order Receipts.

Optionally, you can choose whether to print the vendor notes on the purchase order form and the receiver's worksheet.

Vendor notes can also be entered, changed, or viewed using *Maintaining Purchase Orders (MPOE)* and *Receiving Purchase Orders (PORC)*.

How to display this screen: At the *Work with Vendors Screen*, select *Notes* for a vendor; or select *Notes* from the:

- *First Create Vendor Screen*
- *First Change Vendor Screen*
- *Second Create Vendor Screen*
- *Second Change Vendor Screen*
- *Work with Purchase Order (Header) Screen*
- *PO Maintenance - Maintain Detail Screen*
- *First Display Purchase Order Detail Screen* (PO inquiry)

Field	Description
Message	The message text for this vendor. Previously entered messages display when you access the screen. Additional lines are available to enter new messages. *Scroll* or *Page Down* to view additional messages or to access additional lines. Alphanumeric, 60 positions each line; optional.
Print	Indicates whether this message text on the line will print on the purchase order. You can choose which lines you want to print. The valid values are: • *Unselected* = Do not print the line information • *Selected* = Print the line text on the purchase order

Adding a new vendor note:

1. Enter the information you want on the first available line in the message section.
2. Use *Tab* to move to or *click* on the Print field. Enter a print code, if applicable.
3. When you finish the note, select *OK*. The system accepts the entry and updates the Vendor table.

Changing a vendor note:

1. Select *Add/Change*. The existing messages can now be changed.
2. Enter the changes as needed. The system accepts the entry and updated the Vendor table.

Working With PO Additional Charges (WPAC)

Purpose: Use Purchase Order (PO) Additional Charges to change, delete, display or create additional charges for purchase orders. Type of additional charges that can be added to a purchase order detail line include freight, brokerage, commission, duty, import, surcharge, or "other" fees.

Vendor/item assignment: You can also define additional charges that apply automatically to the vendor/item price (See *Working with Vendor Items (WVNI)*).

In this topic:

- *Work with PO Additional Charges Screen*
- *Create PO Additional Charge Screen*

Work with PO Additional Charges Screen

How to display this screen: Enter *WPAC* in the Fast Path field at the top of any menu or select Work with Purchase Order Additional Charges from a menu.

Field	Description
Code	A code that represents a type of additional charge for a purchase order detail line. Alphanumeric, 2 positions; optional.
Description	The description of the additional charge. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create additional charges	Select *Create* to advance to the *Create PO Additional Charge Screen*.
Change additional charges	Select *Change* for a code to advance to the Change PO Additional Charge screen. At this screen you can change any information except the code. See *Create PO Additional Charge Screen* for field descriptions.
Delete additional charges	Select *Delete* for a code to delete it. **Note:** When you delete additional charges, the system does not check to see whether you added this charge to an existing purchase order.
Display additional charges	Select *Display* for a code to advance to the Display PO Additional Charge Screen. You cannot change any information on this screen. See *Create PO Additional Charge Screen* for field descriptions.

Create PO Additional Charge Screen

Purpose: Use this screen to create an additional charge.

How to display this screen: Select *Create* on the *Work with PO Additional Charges Screen*.

Field	Description
Code	A code that represents a type of additional charge for a purchase order detail line, such as for brokerage, commission, duty, freight, import, or surcharge. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Description	The description of the additional charge. Alphanumeric, 30 positions; required.
Type	Identifies the type of charge being added to the purchase order. Valid system-supplied types: *B* - Brokerage *C* - Commission *D* - Duty *F* - Freight *I* - Import *O* - Other *P* - Prep *R* - Royalty *S* - Surcharge You can define estimated additional charges for a purchase order during PO maintenance. The actual charges are captured for a purchase order during PO Receipts. You can also assign additional charges to a vendor item. Alphanumeric, 1 position; required.

Working with Unit of Measure Conversions (WUMC)

Purpose: Use this option to add or maintain unit of measure conversions between your selling *Unit of measure* and the vendor's unit of measure.

This table is used in *Maintaining Purchase Orders (MPOE)* and *Purchase Order Receipts*.

Conversion requirements: In order for costs to be calculated and printed correctly on the *Purchase Order*, you need to set up conversions:

- from the vendor’s unit of measure to your unit of measure, and
- from your unit of measure to the vendor’s unit of measure

Example:

You sell an item in single units (“eaches”), but buy them from the vendor in dozens. Set up:

- Conversion from dozens to eaches:
  - factor for dozens = 1
  - factor for eaches = 12
- Conversion from eaches to dozens:
  - factor for eaches = 12
  - factor for dozens = 12

> **Note:**
>
> You must define units of measure before creating Unit of Measure Conversions. See *Working with Units of Measure (WUOM)*. In addition, your items should have units of measure in the Item table and in the Vendor/Item table; see *Working with Vendor Items (WVNI)*.

In this topic:

- *Work with Unit of Measure Conversions Screen*
- *Create Unit of Measure Conversion Screen*

Work with Unit of Measure Conversions Screen

How to display this screen: Enter *WUMC* in the Fast Path field at the top of any menu or select Work with Unit of Measure from a menu.

Field	Description
From (Unit of measure)	A code that represents the starting *Unit of measure* for conversion. Alphanumeric, 3 positions; optional.
Unit of measure	The description of the “from” unit of measure code. Alphanumeric, 30 positions; optional.
To (Unit of measure)	A code that represents the destination *Unit of measure* for conversion. Alphanumeric, 3 positions; optional.
Unit of measure	The description of the “to” unit of measure code. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create unit of measure conversion	Select *Create* to advance to the *Create Unit of Measure Conversion Screen*.
Change unit of measure conversion	Select *Change* for a unit of measure conversion to advance to the Change Unit of Measure Conversion Screen. At the Change screen you can change any information except the from and to codes and the conversion rate. See *Create Unit of Measure Conversion Screen* for field descriptions.
Delete unit of measure conversion	Select *Delete* for a unit of measure conversion to delete it.

Screen Option	Procedure
Display unit of measure conversion	Select *Display* for a unit of measure conversion to advance to the Display Unit of Measure Conversion Screen. You cannot change any information on this screen. See *Create Unit of Measure Conversion Screen* for field descriptions.

Create Unit of Measure Conversion Screen

To create: At the *Work with Unit of Measure Conversions Screen*, select *Create* to display the Create Unit of Measure Conversion screen.

> **Note:**
>
> You must define units of measure before creating Unit of Measure Conversions. See *Working with Units of Measure (WUOM)*. In addition, your items should have units of measure in the Item table and in the Vendor/Item table; see *Working with Vendor Items (WVNI)*.

Field	Description
From unit of measure	The *Unit of measure* code to convert from (e.g., EA = each). Validated against the Unit of Measure table; see *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
From factor	The number by which you multiply the From unit of measure to calculate the total quantity of the To unit of measure. `(From factor) X (From unit of measure) = (To factor) X (To unit of measure).` In other words: *2 EACHES = 1 PAIR* *12 EACHES = 1 DOZEN* *1 PAIR = 2 EACHES* *1 DOZEN = 12 EACHES* Numeric, 7 positions with a 2-place decimal; required.
To unit of measure	The *Unit of measure* to convert to (e.g., C24 = case of 24). Validated against the Unit of Measure table. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
To factor	The number of the To unit of measure that equals the total quantity of the From unit of measure. See *From factor*. Numeric, 7 positions with a 2-place decimal; required.

Field	Description
Round	Specifies whether the system should round to the nearest value or truncate (cut off additional numbers from the end of the value). *Selected* = The system round up or down to the nearest value. For example, if the conversion ends up with 1.6 units, the system rounds up to 2 units. *Unselected* = The system truncates. For example, if the conversion ends up with 1.6 units, the system truncates to 1 unit.
Conversion rate	The conversion rate for the unit of measure. The system calculates the conversion rate automatically, using the factors. The conversion rate is calculated by taking the To factor divided by the From factor. Otherwise, select *Enter Factor/Rate* to enter an actual conversion rate, instead of supplying the factor information. *Example:* If the From unit of measure was EA for each and the To unit of measure was C24 for case of 24, the From factor would be 24, the To factor would be 1, and the calculated conversion rate would be 1/24, or 0.0416667. Numeric, 12 positions with 7-place decimal; required, or system-calculated.

Working with Vendor Items (WVNI)

Purpose: You can use the Work with Vendor Items screen to create, change, delete or display vendor item information. Vendor items are a reference between the vendor's item information and the item information used by your company. This bridge between your inventory and the vendor's equivalent inventory allows you to define default information for pricing, ordering and shipping. This information defaults onto the purchase order for this item and vendor, unless you enter other information to override the default.

Additionally, this function allows you to:

- work with special quantity break or promotional pricing offers for a vendor item
- review cumulative history for this vendor item
- use the Vendor Item Notes function to review, delete or maintain notes about this item; you have the option of printing these notes on the purchase order and on reports
- update multiple SKUs of a vendor item with information such as vendor price and ship weight
- update an item's standard cost

In this topic:

- *Work with Vendor Item Screen*
- *Create Vendor Item Screen*
- *Work with Vendor Item Price Break Screen*
- *Display Vendor Item History Screen*
- *Work with Vendor Item Add'l Charges Screen*
- *Multiple Vendor Item Update Screen*

- *Multiple SKU Updates Screen (Reviewing SKUs for Update)*
- *Updating Standard Cost*

Work with Vendor Item Screen

Purpose: Use this screen to change, delete, display or create the reference between the vendor's item information and the item information used by your company.

How to display this screen: Enter *WVNI* in the Fast path field at the top of any menu or select Work with Vendor Item from a menu.

Field	Description
Vendor #	A code that identifies the supplier of an item. Numeric, 7 positions; optional.
Item	The vendor's item code. Alphanumeric, 20 positions; optional.
Description	The description of the vendor's item. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a vendor item	Select *Create* to advance to the *Create Vendor Item Screen*.
Change vendor item information	Select *Change* for a vendor item to advance to the Change Vendor Item Screen. At this screen you can change any information except the vendor item code. See *Create Vendor Item Screen* for field descriptions.
Delete vendor item information	Select *Delete* for a vendor item to delete it. **Note:** If there are dependent records associated with this vendor item, the system checks for the existence of: • vendor/item additional charges • vendor/item notes • vendor/item price breaks • vendor/item history There are no restrictions when deleting vendor item records; however, the dependent records listed above will also be deleted.

Screen Option	Procedure
Display vendor item information	Select *Display* for a vendor item to advance to the Display Vendor Item Screen. You cannot change any information on this screen. See *Create Vendor Item Screen* for field descriptions. **Note:** From this screen, you can update the item's standard cost or advance to the following screens: • *Work with Vendor Item Price Break Screen* (*Price Break*) • *Display Vendor Item History Screen* (*History*) • *Work with Vendor Item Add'l Charges Screen* (*Additional Charges*) • *Multiple Vendor Item Update Screen* (*Notes*)
Add or change vendor item price breaks	Select *Price Break* for an item to advance to the *Work with Vendor Item Price Break Screen*.
Display vendor item history	Select *History* for a vendor item to advance to the *Display Vendor Item History Screen*.
Add or change vendor item additional charges	Select *Charges* for a vendor item to advance to the *Work with Vendor Item Add'l Charges Screen*.
Update the item's standard cost	Select *Update Standard Cost* for a vendor item. See *Updating Standard Cost*.
Add or change vendor item notes	Select *Notes* for a vendor item to advance to the *Work with Vendor Item Notes Screen*.
Work with user defined fields	Select *User Field* for a vendor item to advance to the *Work with User Fields Screen*.
Update multiple SKUs	Select *Update multiple SKUs* to advance to the *Multiple Vendor Item Update Screen*.

Create Vendor Item Screen

Purpose: Use this screen to create a vendor item.

How to display this screen:

- Select *Create* on the *Work with Vendor Item Screen*.
- You advance to this screen automatically when you create a non-SKU'd item if the *Auto Advance to Vendor Item Create (E78)* system control value is *selected*; see *Creating Non-SKU'ed Items Screen Flow*.
- You advance to this screen automatically when you create a SKU'ed item if:
  - The *Auto Advance to Vendor Item Create (E78)* system control value is *selected*, and
  - The *Auto Advance to SKU Create (B34)* system control value is *selected*, and

– The *Auto Advance to SKU Generator (J06)* system control value is *unselected*. See *Creating SKU'ed Items Screen Flow*.

Field	Description
Vendor	A user-defined code that defines the supplier of an item. Validated against the Vendor table. See *Working with Vendors (WVEN)*. Numeric, 7 positions. Create screen: required. Change screen: display-only.
Vendor item	The number or code the vendor uses to identify the item. This information prints on purchase orders. Alphanumeric, 20 positions; required.
Description	The description of the item, as defined by the vendor. This information prints on purchase orders. Alphanumeric, 30 positions; required.
Item/Colr Size Othr	The item and SKU you use to identify the item. Items and SKUs are validated against the Item/SKU tables. If you advance to the Create Vendor Item screen through Work with Item/SKUs, the item/SKU you are creating displays. Item: alphanumeric, 12 position; required. SKU: alphanumeric, three 4-position fields; optional.
Price	Represents the vendor's list price for this item. When you enter a purchase order, this price defaults unless there is a price override or special pricing set up for the vendor item. See the *Work with Vendor Item Price Break Screen* for more information. **Note:** The *Display Cost in Inventory (A38)* secured feature controls whether the Change Vendor Item and Display Vendor Item screens display the price. Numeric, 13 positions with a 4-place decimal; optional.

Field	Description
Minimum qty (Minimum quantity)	The minimum unit quantity (in retailer's unit of measure) of merchandise you are required to order from the vendor. You cannot create a purchase order for fewer than this amount. A message similar to the following in purchase order maintenance indicates that you entered a quantity lower than the minimum: `Minimum order quantity is 6.` **Note:** The minimum quantity is not enforced when creating sales orders for drop ship items. Numeric, 3 positions; optional.
Lead days	The number of days it takes a vendor to deliver this item when it is ordered through a purchase order. The system adds this value to the current date to determine the due date on a drop ship purchase order detail line and to calculate the expected ship date for drop ship items (see *Assign Drop Ship Expected Ship Date (I59)* for more information). Numeric, 3 positions; optional.

Field	Description
Order multiple	The number of units (in retailer's unit of measure) by which your order quantity must be divisible when you order this item from this vendor. For example, your vendor might have an item that he sells only by whole cartons of twelve. In this situation, the system displays a message such as the following if the quantity you enter on a purchase order is not divisible by 12: `Vendor requires that Item is ordered in multiples of 12` **Note:** If your vendor's unit of measure differs from your unit of measure, you do not need to enter a multiple number in the Order multiple field as long as you have set up correct conversion ratios through the *Working with Unit of Measure Conversions (WUMC)* menu option. For example, if your vendor's unit of measure is pairs, and your unit of measure is single items, the system will automatically calculate the conversion and display a message such as the following if the quantity you enter on a purchase order does not convert to the vendor's unit of measure: `Order quantity 5 must be able to divide evenly by vendor UOM 2.` **Note:** The order multiple is not enforced for the creation of sales orders for drop ship items. Unit of measure conversion is not supported by the Order Orchestration Supplier Direct Fulfillment integration. Numeric, 5 positions; optional.
Cubic volume	The cubic volume of the item, as defined by the vendor, used for informational purposes only. The cubic volume can refer to any dimensions. The system calculates the cube of each line when you enter a purchase order and arrives at a total cube for the order. Numeric, 5 positions; optional.

Field	Description
Ship weight	The shipping weight of the item, as defined by the vendor. Prints with the item on the purchase order and is used for informational purposes only. No calculations are performed for this value. Not included on a drop ship purchase order sent to Order Orchestration's Supplier Direct Fulfillment module. Numeric, 7 positions with a 3-place decimal; optional.
Ship via	A code that represents the carrier used when shipping this item to your company. If you enter a PO ship via code here, this code defaults on the vendor item purchase order line automatically. Validated against the PO Ship Via table; see *Working with Purchase Order Ship Via (WPSV)* for more information. See *Drop Ship Purchase Order Setup for Purchase Order Ship Vias* for considerations related to specifying a vendor item ship via for items that you will include on drop ship purchase orders. Numeric, 2 positions; optional.
Unit of measure	The vendor's *Unit of measure* for an item (e.g., C12 = case of 12, GRS = gross). The system validates this unit of measure against the Unit of Measure table. In PO Maintenance and Receiving, the system will convert your unit of measure into the vendor's unit of measure using the information provided in the Unit of Measure table. *Example:* If you sell an item in eaches, but the vendor sells the item to you in cases of 12 and you place an order for 36 units, the system will convert the vendor's quantity to 3 units. You enter the retailer's quantity on the PO; however, both quantities can be seen in PO Inquiry, Maintenance, and Receiving. A message similar to the following indicates that you entered an order amount that is not divisible by the unit of measure: `Order qty 7 must be able to divide evenly by vendor UOM 12.` **Note:** For a drop ship item, the vendor item unit of measure must match the item's unit of measure if you use the *Order Orchestration Drop Ship Integration* to process drop ship orders for this vendor. Alphanumeric, 3 positions; optional.
Message	An informational message that you can use for reporting purposes. Up to 3 lines of messages are available for free-form text, such as special packing instructions. Not included on a drop ship purchase order sent to Order Orchestration's Supplier Direct Fulfillment module. Alphanumeric, 30 positions (each line); optional.

Completing this screen:

- If you are creating a vendor item in *Working with Vendor Items (WVNI)*, the system clears the data from the screen.
- If you are creating a vendor item for a non-SKUed item in Work with Item/SKUs, you advance to the Create Item Offer screen, where you can enter offer information for the item you are creating.
- If you are creating a vendor item for a SKUed item in Work with Item/SKUs, you advance to the Create SKU (With Overrides) screen, where you can create another SKU for the item you are creating.

For more information: See *Performing Initial Item Entry (MITM)*.

Work with Vendor Item Price Break Screen

Purpose: You can use this screen to display, add or change price break information. Price breaks might be a special price promotion or a series of quantity break prices for this item and this vendor.

> **Note:**
>
> The *Display Cost in Inventory (A38)* secured feature controls the display of this screen.

Quantity Break Pricing Tables

Quantity break pricing tables allow you to define:

- a start and end date,
- the purchase quantity of the item required, and
- the special price at which the item may be purchased when the quantity requirements are met.

A quantity break pricing table is defined in tiers. For example:

Tier	Purchase Quantity Required	Special Price
1	1 - 9	$10.00
2	10 - 20	$9.50
3	21 - 30	$9.00

You receive the quantity price break for the next tier only if you order an amount greater than or equal to the quantity required.

How to display this screen: Select *Price Break* for a vendor item at the *Work with Vendor Item Screen*.

Field	Description
Start Date	The date when the special price promotion or quantity break price begins. Numeric, 6 positions (in user date format); optional.

Field	Description
Stop Date	The date when the special price promotion or quantity break price ends. Numeric, 6 positions (in user date format); optional.
Quantity	The quantity, in your own unit of measure, not the vendor's, that you must purchase to receive the special promotional price or quantity break price on this item from the vendor. *Example*: `Qty=1 Price=$10.00` `Qty=10 Price=$9.50` If you purchase between 1-9, the price is $10.00. Numeric, 7 positions; optional.
Price	The vendor's special price, per vendor's unit of measure, for this item if you order the quantity required (in retailer's unit of measure). *Example:* If the vendor sells the item in pairs, but you sell the item as single units (eaches): Vendor's base price is $12.00/pair Quantity: you enter a quantity on this screen of 12. Price: you enter a price for the quantity 12 of $10.00 When you enter a purchase order, you order 12 of the item. *Result:* The system converts the quantity 12 (single units) to vendor's quantity of 6 (pairs), but prices the item at $10.00/pair, or total of $60.00, because you ordered, in retailer's unit of measure, enough units to qualify for the discount price. Numeric, 13 positions with a 4-place decimal; optional.

Using this screen: To add or change a price break, select *Add/Change*. The screen changes to *CHANGE* mode, which means the fields are enterable, so you can enter or change information.

- If the screen is in *ADD* mode, any prices that are already displayed are locked and the cursor is positioned at the next available line.
- If the screen is in *CHANGE* mode, the cursor is positioned at the top of the screen and all fields are available for entry.

Display Vendor Item History Screen

Purpose: Use this screen to review performance statistics for this item, as supplied by this vendor. All information on this screen is updated by the system, either through *Maintaining Purchase Orders (MPOE)* or *Purchase Order Receipts*. This information represents an aggregate history of this item across all purchase orders for this vendor.

How to display this screen: Select *History* for a vendor item at the *Work with Vendor Item Screen*.

Field	Description
Vendor	A numeric code that defines the supplier of an item. See *Working with Vendors (WVEN)*. Numeric, 7 positions; display-only

Field	Description
Vendor item	The number or code the vendor uses to identify the item. Alphanumeric, 20 positions; display-only.
Last purchase price	The price at which this item was last purchased from this vendor, expressed per retailer's unit of measure. For example, if the vendor sells the item in pairs, priced at $12.00/ pair, but you sell the item as single units (eaches), the price displayed here would be $6.00. See *Working with Unit of Measure Conversions (WUMC)*. **Note:** The *Display Cost in Inventory (A38)* secured feature controls the display of the Last purchase price field. Numeric, 13 positions with a 4-place decimal; display-only.
Orders	The number of purchase orders placed with the vendor for this item. This number includes every PO that has been placed, including cancelled POs. The system updates this field only once, regardless of the number of times the item is entered on a PO. Numeric, 7 positions; display-only.
Shipments	The total number of shipments of this item. Updated by PO Receiving and the number increases each time the item is received. For example, if 100 items were ordered, and 25 were received one day and 75 were received the next day, the number of shipments is 2. Numeric, 7 positions; display-only.
Overships	The number of times the vendor has shipped more of this item than was requested on purchase orders. Updated by PO Receiving and is determined when the PO is closed. Numeric, 7 positions; display-only.
Underships	The number of times the vendor has shipped fewer of this item than was requested on purchase orders. Updated by PO Receiving and is determined based on the PO line being closed and order entry does not match. Numeric, 7 positions; display-only.
Late shipments	The number of times the vendor has shipped this item late. If the receiving date is greater than the original PO due date, the system considers this a late shipment. Updated by PO Receiving. Numeric, 5 positions; display-only.
Defects	The number of items that have been identified as defective at PO Receiving. Numeric, 7 positions; display-only.
Units received	The quantity of this item received by this vendor life-to-date, in retailer's unit of measure. Updated by PO Receiving. Numeric, 7 positions; display-only.

Field	Description
Units purchased	The quantity of this item purchased from this vendor, in retailer's unit of measure. This number includes cancellations (i.e., cancellation does not decrease this number). Numeric, 7 positions; display-only.
Value purchases	The merchandise dollar value of purchases of this item from this vendor. Updated by PO Maintenance and includes cancellations. **Note:** The *Display Cost in Inventory (A38)* secured feature controls the display of the Value purchases field. Numeric, 20 positions with a 2-place decimal; display-only.
Elapsed days	An accumulation of the number of days it takes the vendor to ship this item to you. The system calculates as follows: each time the item is received, the system subtracts the PO date from the Receipt date and adds it to the field. The average elapsed days can be calculated by dividing elapsed days by the number of shipments. Numeric, 7 positions; display-only.
Late days	The accumulated number of days this item is received late from the vendor. The system calculates by subtracting the PO Receipt date from the original due date. Numeric, 7 positions; display-only.

Work with Vendor Item Add'l Charges Screen

Purpose: Use this screen to display, add or change additional charge information.

If the *Default Vendor Item Additional Charges (I21)* system control value is *selected*, the system defaults the vendor item additional charges to the purchase order. You can review the defaulted vendor item additional charges on the purchase order at the *Work with PO Detail Estimated Charges Screen*.

Receipt cost calculation: The system calculates all vendor item additional charges into the costing calculations for a purchase order if the *Default Vendor Item Additional Charges (I21)* system control value is *selected* and the *Include PO Estimated Charges in Receipt Cost Calculation (G29)* system control value is *selected*.

See *Distributing Overhead Costs* for more information on the calculations the system performs when distributing overhead costs across purchase orders.

How to display this screen: On the *Work with Vendor Item Screen*, select *Charges* for a vendor item.

Field	Description
Charge	A user-defined code that identifies a purchase order detail line for brokerage, commission, duty, freight, import, surcharge, or other user-defined fees. Additional charges are validated against the PO Additional Charge table; see *Working With PO Additional Charges (WPAC)*. Alphanumeric, 2 positions; required.
Description	A description of the additional charge. Alphanumeric, 30 positions; required.
Unit amount	The dollar amount to add to the purchase order for each unit (in retailer's unit of measure) of the vendor item. Numeric, 12 positions; required if you do not specify a percent.
Percent	The percent of the total merchandise amount to add to the purchase order for total orders of the vendor item. Numeric, 6 positions; required if you do not specify a unit amount.

Screen Option	Procedure
Add or change an additional charge	Select *Add/Change* to toggle between add and change mode. Change mode is available only if you have already created additional charges for the vendor item. When in change mode, the existing additional charge code and unit amount or percent becomes enterable.

Multiple Vendor Item Update Screen

Purpose: Use this screen to update selected fields for all the SKUs of a specific vendor item. You can also choose to update only those SKUs that share the first SKU element.

How to display this screen: Select *Update Multiple SKUs* on the *Work with Vendor Item Screen*.

Field	Description
Vendor	A numeric code that defines the supplier of an item. Numeric, 7 positions; display-only.
Item/SKU	Your item number or code (*not* the vendor item code). To update all vendor item SKUs: enter the base item code *only*. To update all SKUs with the same first SKU element: enter the first SKU only to update only matching SKUs for the vendor item; for example, enter *BLUE* to update all blue SKUs of the vendor item Item: Alphanumeric, 12 positions; required. SKU: Alphanumeric, three 4-position fields; optional.
Price	The vendor's list price for this item. This price defaults on the purchase order Numeric, 13 positions with a 4-place decimal; optional.

Field	Description
Minimum qty (Minimum quantity)	The minimum unit quantity of the vendor item that you can order. Numeric, 3 positions; optional.
Lead days	The number of days it takes a vendor to deliver this item to you. Numeric, 3 positions; optional.
Order multiple	The number by which the purchase order quantity must be divisible. Numeric, 5 positions; optional.
Cubic volume	The cubic volume of the item, as defined by the vendor, used for informational purposes only. Numeric, 5 positions; optional.
Ship weight	The shipping weight of the item, as defined by the vendor. Numeric, 7 positions with a 3-place decimal; optional.
Ship via	A code that represents the carrier used when shipping this item to your company. Numeric, 2 positions; optional.
Unit of measure	The vendor's unit of measure for an item (e.g., C12 - case of 12, GRS - gross). The system validates this unit of measure against the Unit of Measure table. Alphanumeric, 3 positions; optional.
Message	An informational message that can be used for reporting purposes. Up to 3 lines of messages are available for free-form text, such as special packing instructions. Alphanumeric, 30 positions (each line); optional.

Instructions: To update the SKUs for a specific vendor item:

1. Complete the vendor number, the item code, and (optionally) the SKU.
2. Complete any of the remaining fields to indicate which information you want to update. Only the fields you enter will be updated for the target vendor item SKUs; any fields you leave blank on the Multiple Vendor Item Update field will remain unchanged.
3. The Confirm Multi Vendor Item Update pop-up window opens.
4. Select *OK* to update the SKUs for the vendor item or select *Exit* to cancel. You can also select *Review Select SKUs* to review the SKUs that are being updated. See *Multiple SKU Updates Screen (Reviewing SKUs for Update)*.
5. If you select *OK*, the following message informs you the SKU updates have completed: Vendor Item updates have been completed.

Screen Option	Procedure
Review the SKUs being updated	Select *Review Select SKUs* to advance to the *Multiple SKU Updates Screen (Reviewing SKUs for Update)*.

Multiple SKU Updates Screen (Reviewing SKUs for Update)

Purpose: Use this screen to review the SKUs for the vendor item you wish to update.

How to display this screen: Select *Review Select SKUs* on the *Multiple Vendor Item Update Screen*.

Field	Description
Vendor	The code and name of the vendor who supplies the item you wish to update. Vendor code: numeric, 7 positions; display-only. Vendor name: alphanumeric, 30 positions; display-only.
Item	The item number and description of the item you wish to update. Item number: alphanumeric, 12 positions; display-only. Description: alphanumeric, 120 positions; display-only.
Colr, size othr	The SKU you use to identify the item you wish to update. SKUs are validated against the Item/SKU table. Alphanumeric, three 4-position fields; display-only.
Vendor item	The vendor item number of the item you wish to update. Alphanumeric, 20 positions; display-only.

Updating Standard Cost

Purpose: You can update an item's or SKU's standard cost through the *Work with Vendor Item Screen*, Change Vendor Item screen, or Display Vendor Item screen. There is also a periodic function available to update standard cost.

How to update: You can update the standard cost for a selected item by:

- selecting *Update Standard Cost* for a vendor item at the *Work with Vendor Item Screen*
- selecting *Update Standard Cost* at the Change Vendor Item screen or Display Vendor Item screen

> **Note:**
>
> Access to updating standard cost is controlled by the *Display Cost in Inventory (A38)* secured feature. If you do not have authority under that secured feature, the system displays an error message when you select *Update Standard Cost* at the *Work with Vendor Item Screen*: `Not authorized to change Standard Cost.`

If the vendor is not the item's primary vendor: The vendor item you select must be associated with the item's primary vendor (the primary vendor is the vendor you enter at the first Create or Change Item screen in Work with Items; see *Performing Initial Item Entry (MITM)*). If you attempt to update item cost but the vendor item is not associated with the item's primary vendor, a message such as the following indicates:

Can't update standard cost. Vendor# 12 is not item's primary vendor

Pop-up window: The Confirm Update of Item’s Standard Cost window opens when you choose to update the standard cost for an eligible vendor item.

Processing the update: After you select *OK* at the confirmation window, a message such as the following indicates:

SKU standard cost has been updated (WA123 10.6000)

The message includes your item code for the item you have just updated, and the new standard cost.

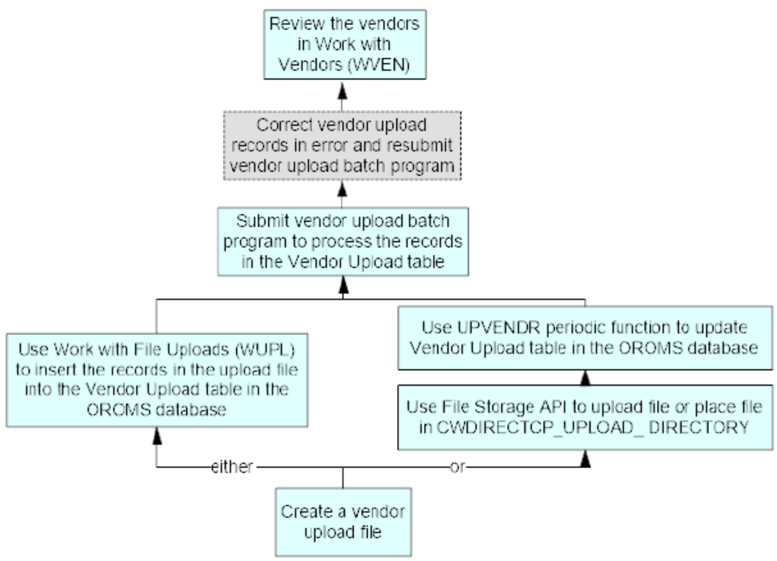
Working with Vendor Upload (LVUP)

Purpose: You use information in the Vendor Upload table to create, update, or delete a vendor record in Order Administration.

When you transfer vendor information into Order Administration, the system validates each record in the table:

- if a vendor upload record contains any errors, Order Administration prints the record on the *Vendor Upload Error Report* and places the record in an error status. You need to correct the error and resend the record through the vendor upload batch program.
- if a vendor upload record does not contain errors, Order Administration creates or updates the vendor record. See *Working with Vendors (WVEN)* for more information on vendors in Order Administration.

Vendor upload process:



> **Note:**
>
> You can also schedule this process to run periodically by setting up the VNUPLD function using the PRF0086 program. See *Scheduling Jobs* for background.

In this topic:

- *Create Vendor Upload File*
- *Transfer the Vendor Upload File to Order Administration*
- *Submit Vendor Upload Screen*
- *Vendor Upload Process*

- *Vendor Upload Errors*
- *Vendor Upload Table (VNDUPL)*
- *Vendor Upload Error Report*

Create Vendor Upload File

You can create a Vendor Upload file by:

- creating your own pipe delimited file, using a text editor or spreadsheet application, or
- copying the sample file upload data, pasting the data into a text editor, and saving it with the file extension `.txt`.
- If you wish to leave any field in the upload file blank, pass a space in an alphanumeric field and a 0 in a numeric field so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.

The file name should be VNDUPL.TXT.

Sample vendor upload data:

```
007|7|A|EXAMPLE VENDOR |1234 SAMPLE STREET |SECOND ADDRESS LINE |THIRD
ADDRESS LINE |FOURTH ADDRESS LINE |WESTBOROUGH |MA|01581 |US |JOHN SMITH |
5085550100| |0|ROBERT JONES |1234 REMIT SAMPLE ST |SECOND ADDRESS LINE |
THIRD ADDRESS LINE |FOURTH ADDRESS LINE |SPRINGFIELD |MA|01119 |US |Y|N|Y|
P|0|0|N|N|N|N|N |0|.00|.00|.00| |0| |S| |V| |VENDOR@EXAMPLE.COM |
REMIT@EXAMPLE.COM |USR1 |USR2 |USR3 | |Y
```

Transfer the Vendor Upload File to Order Administration

Use the *File Storage API*and run the *UPVENDR Upload Vendor File* (Program name *PFR0134*, Parameter *VNDUPL*) periodic function, or

Use the *Work with File Uploads (WUPL)* menu option to select and process the Vendor Upload file. The system inserts the records in the Vendor Upload file into the Order Administration Vendor Upload table. See *File Upload Process* for processing information.

Submit Vendor Upload Screen

Purpose: Use this screen to submit a batch program to transfer the records in the Vendor Upload table to the Order Administration Vendor table.

How to display this screen: Enter *LVUP* in the Fast path field at the top of a menu or select Load Vendor Upload from a menu.

Screen Option	Procedure
Submit a batch program to upload the vendor upload records to the Vendor table	Select *Submit*. See *Vendor Upload Process*. *Periodic function:* You can also schedule this process to run periodically by setting up the VNUPLD function using the PRF0086 program. See *Scheduling Jobs* for background.

Vendor Upload Process

To process: Select *Submit* at the *Submit Vendor Upload Screen* to submit the vendor upload batch program.

If you try to submit the vendor upload batch program while a vendor upload is in progress, a message indicates: `VENDOR UPLOAD in progress.`

The Vendor Upload batch program:

- determines if an active procedure indicates that a vendor upload batch program is already running for the company.
  - If an active procedure exists, an error message indicates: `Vendor Upload in progress`. You cannot submit another vendor upload batch job until the job currently running is complete.
  - If no active procedure exists, the system creates an active procedure for this vendor upload batch job.
- validates each vendor upload record in the *Vendor Upload Table (VNDUPL)*
  - if the vendor upload record contains an error, the system updates the *Vendor upload error* field with the error message and does not transfer the record to the Vendor table. You can review vendor upload records in error on the *Vendor Upload Error Report*
  - if the vendor upload record is a *D* (delete) record type, the system updates the *Vendor upload error* field with the error message `Delete` and does not delete the Vendor record. You must manually delete the vendor.
  - if the vendor upload record is an *A* (add) record type and passes validation, the system creates a record in the Vendor table and Vendor Extended table and deletes the corresponding vendor upload record from the Vendor Upload table.
  - if the vendor upload record is an *M* (modify) record type and passes validation, the system updates the existing record in the Vendor table and Vendor Extended table and deletes the corresponding vendor upload record from the Vendor Upload table. **Note:** The system updates the existing vendor record with the information in the vendor upload record, including blanks. For example, if the vendor record has a value in the remit to name and address fields but the vendor upload record does not have these fields populated, the system updates the remit to name and address fields for the vendor to blank.

  .
- produces the *Vendor Upload Error Report*, which lists each vendor upload record that contains an error. **Note:** Each vendor upload record in an error status is associated with only one error (the first error the system finds for the record). Once you correct the error and resubmit the vendor upload batch program, the system validates the record for additional errors.
  - deletes the active procedure for the vendor upload batch program.

Vendor upload validation: The vendor upload batch program validates that:

- if the upload record is a modify or delete record, the Vendor number must be a valid vendor in Order Administration.
- all required fields contain information. The fields in the Vendor Upload table that are required are:
- *Company*
- *Vendor #*
- *Record type*
- *Vendor name*

- *Vendor address line 1*
- *Vendor city*
- *Vendor state*
- *Vendor zip*
- *Vendor country*
- *Print PO?*
- *Fax?*
- *Print checks?*
- *Drop ship pick*
- *Factor?*
- *EDI?*
- *Price currency type*
- *Type*
- all fields that require a valid value contain a valid value. The fields in the Vendor Upload table that require a valid value are:
- *Company*
- *Record type*
- *Vendor state*
- *Vendor country*
- *Remit to country*
- *Remit state*
- *Print PO?*
- *Fax?*
- *Print checks?*
- *Drop ship pick*
- *Ship via code*
- *Factor?*
- *EDI?*
- *Terms code*
- *Parent vendor number*
- *Currency code*
- *Price currency type*
- *Type*
- if the vendor upload record is an add record (record type *A*), the vendor number does not already exist in the company where you are uploading. You can correct this error by changing the record type to *M* to represent a modify.
- if the vendor upload record is a modify record (record type *M*) or delete record (record type *D*), the vendor number must exist in the company where you are

uploading. You can correct this error by changing the record type to *A* to represent an add.

Vendor Upload Errors

If a vendor upload record is in error, the vendor upload batch program assigns an error status and prints the record on the *Vendor Upload Error Report*.

A field that is required is blank:

- *Company* field is blank: `Missing Company`
- *Record type* field is blank: `Missing Record Type`
- *Vendor #* field is blank: `Missing vendor number`
- *Vendor name* field is blank: `Missing vendor name`
- *Vendor address line 1* field is blank: `Missing address line 1`
- *Vendor city* field is blank: `Missing City`
- *Vendor state* field is blank: `Missing State`
- *Vendor zip* field is blank: `Missing Postal Code`
- *Vendor country* field is blank: `Missing Country`
- *Print PO?* field is blank: `Missing Print PO`
- *Fax?* field is blank: `Missing Fax PO`
- *Print checks?* field is blank: `Missing Print Checks Response`
- *Drop ship pick* field is blank: `Missing Drop Ship Output Response`
- *Factor?* field is blank: `Missing Vendor Factor`
- *EDI?* field is blank: `Missing EDI P/O Response`
- *Parent vendor number* field is blank
- *Price currency type* field is blank: `Missing Vendor Price Currency Response`
- *Type* field is blank: `Type of Vendor Invalid`
- The *Fax?* field is Y and the *Vendor fax #* field is blank: `Fax Number Missing and Fax Flag is Y`

> **Note:**
>
> Faxing is not currently implemented.

- *Vendor e-mail address* field is blank and the *Email PO* field is set to Y: `Vendor e-mail is required`

A field contains an invalid value:

- *Company* field contains a company code that does not exist: `Invalid Company`
- *Record type* field contains an invalid value: `Record Type Invalid`
- *Vendor state* field contains an invalid value: `State Does Not Exist`

- *Vendor country* field contains an invalid value: `Country Does Not Exist`
- *Remit to country* field contains an invalid value: `Remit To Country Does Not Exist`
- *Remit state* field contains an invalid value: `Remit To State Does Not Exist`
- *Print PO?* field contains an invalid value: `Print PO Invalid`
- *Fax?* field contains an invalid value: `Fax PO Invalid`
- *Print checks?* field contains an invalid value: `Print Checks Invalid`
- *Drop ship pick* field contains an invalid value: `Drop Ship Output Invalid`
- *Drop ship pick* field contains a *C* or *L*, but the *Use OROB Drop Shipping (H13)* system control value is not selected: `OROB vendor is not allowed`
- *Ship via code* field contains an invalid value: `PO Ship Via Does Not Exist`
- *Factor?* field contains an invalid value: `Vendor Factor Invalid`
- *EDI?* field contains an invalid value: `EDI P/O Invalid`
- *Terms code* field contains an invalid value: `Invalid Terms Code`
- *Type* field contains an invalid value: `Type of Vendor Invalid`
- *Currency code* field contains an invalid value: `Currency Code Invalid`
- *Price currency type* field contains an invalid value: `Vendor Price Currency Invalid`
- *Parent vendor number* contains an invalid value: `Parent Vendor does not exist`
- *Vendor e-mail address* is not formatted correctly (does not include an @ sign prior to a period, with characters between): `Vendor e-mail address Invalid`
- *Remit e-mail address* is not formatted correctly (does not include an @ sign prior to a period, with characters between): `Remit e-mail address Invalid`
- *Email PO* is not set to Y, N, or blank: `Invalid Email PO Flag`

The *Vendor #* for an *A* (add) record type vendor upload record contains a vendor number that already exists in Work with Vendors: `Vendor Already Exists`

A vendor upload record for a *D* (delete) record type exists: `Delete`. This error message does not indicate an error; rather, you use this message as a reminder to manually delete the corresponding vendor record from the Vendor table.

The *Drop ship pick* field is set to *Collaborative Shipping* and the *Use OROB Drop Shipping (H13)* system control value is *unselected*: `Collaborative Shipping vendor is not allowed`

The *Vendor #* for an *M* (modify) or *D* (delete) record type vendor upload record does not exist in the Vendor table: `Vendor Does Not Exist`

Vendor Upload Table (VNDUPL)

Field	Description
Company	The code for the Order Administration company where you wish to upload the vendor upload record. Numeric, 3 positions; required.
Vendor #	A code that identifies a supplier. Numeric, 7 positions; required.
Record type	A code that identifies whether the vendor upload record is an add, change, or delete. Valid values: *A* = Add. The vendor upload record creates a new vendor record. *M* = Modify. The vendor upload record updates an existing record. *D* = Delete. The vendor upload record deletes an existing record. Alphanumeric, 1 position; required.
Vendor name	The name of the vendor or the vendor's company. Updates the Name field in the Vendor table. Alphanumeric, 30 positions; required.
Vendor address line 1	Address line 1 defined for the vendor's address. Updates the Address line 1 field in the Vendor table. Alphanumeric, 32 positions; required.
Vendor address line 2	Address line 2 defined for the vendor's address. Updates the Address line 2 field in the Vendor table. Alphanumeric, 32 positions; optional.
Vendor address line 3	Address line 3 defined for the vendor's address. Updates the Address line 3 field in the Vendor table. Alphanumeric, 32 positions; optional.
Vendor address line 4	Address line 4 defined for the vendor's address. Updates the Address line 4 field in the Vendor table. Alphanumeric, 32 positions; optional.
Vendor city	The city defined for the vendor's address. Updates the City field in the Vendor table. Alphanumeric, 25 positions; required.
Vendor state	The state defined for the vendor's address. Updates the State field in the Vendor table. **Validation** State codes are defined in and validated against the State table. The system requires a state code if the Require state field for the country in the vendor address is selected. Alphanumeric, 2 positions; required.
Vendor zip	The postal code defined for the vendor's address. Updates the Zip field in the Vendor table. Alphanumeric, 10 positions; required.

Field	Description
Vendor country	The country defined for the vendor's address. Updates the Country field in the Vendor table. **Validation** Country codes are defined in and validated against the Country table. Alphanumeric, 3 positions; required.
Vendor contact name	The name of your primary contact at the vendor site. Updates the Contact name field in the Vendor table. Alphanumeric, 30 positions; optional.
Vendor telephone	The vendor's telephone number. Updates the Telephone # field in the Vendor table. Numeric, 11 positions; optional.
Vendor ext	The vendor's telephone number extension. Updates the Extension field in the Vendor table. Alphanumeric, 4 positions; optional.
Vendor fax #	The telephone number for the vendor's fax machine. Faxing is not currently implemented. Updates the Fax number field in the Vendor table. Numeric, 11 positions; optional.
Remit name	The name of the person or company you send payment to for vendor invoices. The remit-to address prints on checks for the vendor. Updates the Remit name field in the Vendor table. Alphanumeric, 30 positions; optional.
Remit address line 1	Address line 1 defined for the remit-to address. Updates the Remit address 1 field in the Vendor table. Alphanumeric, 32 positions; optional.
Remit address line 2	Address line 2 defined for the remit-to address. Updates the Remit address 2 field in the Vendor table. Alphanumeric, 32 positions; optional.
Remit address line 3	Address line 3 defined for the remit-to address. Updates the Remit address 3 field in the Vendor table. Alphanumeric, 32 positions; optional.
Remit address line 4	Address line 4 defined for the remit-to address. Updates the Remit address 4 field in the Vendor table. Alphanumeric, 32 positions; optional.
Remit city	The city defined for the remit-to address. Updates the Remit city field in the Vendor table. Alphanumeric, 25 positions; optional.
Remit state	The state defined for the remit-to address. Updates the Remit state field in the Vendor table. **Validation** State codes are defined in and validated against the State table. The system requires a state code if the Require state field for the country in the vendor address is selected. Alphanumeric, 2 positions; optional.

Field	Description
Remit zip	The postal code defined for the remit-to address. Updates the Remit zip field in the Vendor table. Alphanumeric, 10 positions; optional.
Remit to country	The country defined for the remit-to address. Updates the Country field in the Vendor table. **Validation** Country codes are defined in and validated against the Country table. Alphanumeric, 3 positions; optional.
Print PO?	Indicates whether purchase order forms print for the vendor. If so, you order products on the purchase order, print it, then mail it to the vendor. Updates the Print PO field in the Vendor table. Valid values: *Y* = Print purchase orders for the vendor. *N* = Do not print purchase orders for the vendor.
Fax?	Indicates whether purchase orders should be faxed to the vendor. This option is not currently implemented. Updates the Fax flag field in the Vendor table. **Validation** If you select this field, you must enter a number in the *Vendor fax #* field.
Print checks?	Indicates whether to print checks to the vendor to pay for products or services purchased. Updates the Fax flag field in the Vendor table and the Print checks field in the Vendor table. Valid values: *Y* = Print checks for the vendor. *N* = Do not print checks for the vendor.
Drop ship pick	Indicates whether to process drop ship orders by printing picks, printing purchase orders, or transmitting information through an interface for internet-based drop ship processing. Drop ship merchandise is merchandise you sell but do not stock. Updates the Fax flag field in the Vendor table the Print checks field in the Vendor table.the Drop ship pick field in the Vendor table. Valid values: *P* = Print drop ship picks for the vendor. *O* = Print drop ship purchase orders for the vendor. *L* = Use the Order Orchestration Supplier Direct Fulfillment interface for the vendor. *L* is a valid entry only if the *Use OROB Drop Shipping (H13)* system control value is selected. Alphanumeric, 1 position; required.
Drop ship batch size	The number of picks to include in a drop ship batch when you are *Processing Drop Ship Orders by Batch (MDSB)* for the vendor. The drop ship batch size determines the number of picks that print in one batch before the system creates a new batch. Updates the Drop ship batch size field in the Vendor table. Numeric, 7 positions; optional.

Field	Description
Ship via code	A code that represents the shipper used for shipping merchandise to your company from the vendor. Updates the Ship via code field in the Vendor table. **Validation** Purchase order ship via codes are defined in and validated against the PO Ship Via table; see *Working with Purchase Order Ship Via (WPSV)*. Numeric, 2 positions; optional.
Factor?	Indicates whether you are sending payment to a factor. Updates the Factor field in the Vendor table. Valid values: *Y* = Payment on invoices goes to a factor. *N* = Payment on invoices goes directly to the vendor. If you select this flag, enter the factor's address in the Remit to fields.
EDI?	Indicates whether you transmit purchase order information electronically to the vendor using EDI (Electronic Data Interchange) telecommunications. Valid values: *Y* = Transmit an EDI file with purchase orders to the vendor. *N* = Do not use EDI. If you select this flag, the *Wait for ASN?* field and *Include hold?* field default to unselected. Updates the EDI file field in the Vendor table.
Wait for ASN?	Indicates you would like to wait for Advanced Shipment Notice from the EDI service provider. Not currently implemented.
Include hold?	Indicates you would like to include held invoices in the EDI transmission. Not currently implemented.
EDI file	The EDI file used for EDI transmission. Not currently implemented. Alphanumeric, 10 positions; optional.
Terms code	A code for the terms and conditions for payment to the vendor, such as 30 days after invoice date or at the end of the month. **Validation** Term codes are defined in and validated against the Terms table. Updates the Code field in the Terms table. Numeric, 2 positions; optional.
Disc% (Primary discount percentage)	The primary discount percentage applied towards items purchased from the vendor. Updates the Discount % field in the Vendor table. Numeric, 5 positions with a 2-place decimal; optional.
Surcharge%	A standing surcharge added to purchases from the vendor. Updates the Surcharge % field in the Vendor table. Numeric, 5 positions with a 2-place decimal; optional.
Rating	The vendor's quality rating. Updates the Rating field in the Vendor table. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
Interface vendor code	The vendor code on your third party A/P system. Updates the Interface vendor code field in the Vendor table. Alphanumeric, 10 positions; optional.
Parent vendor number	A code for the company that is made up of one or more subsidiary vendors. If your unique interface program supports it, you can define a vendor as a parent vendor if you wish to pay the main (parent) vendor for the merchandise you receive from each subsidiary (child) vendor. 1. If the vendor code defined in this field matches the code from the *Vendor #* field, the vendor represents a parent vendor. 2. If the vendor code defined in this field does not match the code from the Vendor # field, the vendor represents a child vendor. Updates the Parent vendor number field in the Vendor Extended table. Numeric, 7 positions; optional.
Currency code	A code to identify the vendor's currency type. If you leave this field blank, the *Local Currency Code (A55)* system control value defaults. **Validation** Currency codes are defined in and validated against the Currency Code table; see *Working with Currency (WCUR)*. Updates the Currency code field in the Vendor table. Alphanumeric, 3 positions; optional.
Price currency type	Indicates whether the prices from the vendor are in the system's currency or the vendor's currency and controls how and when currency conversion takes place. Updates the Price currency type field in the Vendor table. Valid values: *S* = System currency. The price from the Vendor Item table is in your local currency. *V* = Vendor currency. The price in the Vendor Item table is in the vendor's currency. *N* = No conversion. The price in the Vendor Item table is in the current currency. Alphanumeric, 1 position; required.
VAT number	The tax ID number defined for the vendor; this field is informational-only. Updates the VAT number field in the Vendor table. Alphanumeric, 20 positions; optional.
Type	Identifies whether the vendor is an actual vendor or a manufacturer. Valid values are: *M* = The person is a manufacturer. *V* = The person is a vendor. Updates the Type field in the Vendor table. Alphanumeric, 1 position; required.

Field	Description
EFT account #	The electronic fund transfer account number for this vendor. Updates the EFT account # field in the Vendor table. Alphanumeric, 20 positions; optional.
Vendor e-mail address	The email address for the vendor. If the *Email Purchase Order (K80)* system control value is selected, you can send purchase orders to the vendor by email. See that system control value for more information. Required if the *Email PO* flag is set to *Y*. Updates the E-mail address field in the Vendor table. Alphanumeric, 50 positions; optional.
Remit e-mail address	The e-mail address defined for the remit-to address. Updates the Remit e-mail address field in the Vendor table. Alphanumeric, 50 positions; optional.
User field 1	Additional vendor information. Updates the User field 1 field in the Vendor table. Alphanumeric, 10 positions; optional.
User field 2	Additional vendor information. Updates the User field 2 field in the Vendor table. Alphanumeric, 10 positions; optional.
User field 3	Additional vendor information. Updates the User field 3 field in the Vendor table. Alphanumeric, 10 positions; optional.
Vendor upload error	The error message associated with the vendor upload record. The Vendor Upload batch process assigns an error message to a vendor upload record if the record contains an error; vendor upload records in error display on the *Vendor Upload Error Report*. Vendor upload records that contain an error are not uploaded to the Order Administration Vendor table. You need to correct the error and resubmit the vendor upload batch process or delete the vendor upload record. Alphanumeric, 60 positions; optional.
Email PO	Indicates whether to send purchase orders to the vendor by email. Valid values are: *Y* = Send purchase orders to the vendor through email. If this field is set to *Y*, then the *Vendor e-mail address* must contain a valid email address. *N* = Do not send purchase orders by email. Updates the Email PO field in the Vendor table. If this field is not populated, the vendor upload program sets the field in the Vendor table to *N*. Emailing purchase orders is available only if the *Email Purchase Order (K80)* system control value is selected. See that system control value for more information.

Work with Item/SKUs (MITM)

For information on:	See:
Creating **new items**	Performing Initial Item Entry (MITM)
Reviewing and working with **existing items**, with links to **additional options**	Working with Existing Items (MITM)
Working with **SKUs**	Working with SKUs
Working with **item or SKU offer** records and set up price breaks, aliases, and accompanying items	Assigning Items/SKUs to Offers
Working with **item warehouse and item location** records	Assigning Items to Warehouses
Working with **additional item options**, including comments, source prices, item coordinates, UPC codes, and item categories	Entering Additional Item Information
Set up **eligible shippers** for an item	*Working with Item Ship Via Overrides*
Copying item information from an existing item to a newly-created item	*Copying Items*

Creating and Working with Items

Purpose: The following chapters describe how to create and work with items.

- Performing Initial Item Entry (MITM) describes selecting items, creating items, creating item (base information), creating offers, and creating SKUs with overrides.
- Working with Existing Items (MITM) includes scanning, changing, deleting, and displaying items that have been created.
- Working with SKUs defines split SKU elements, SKU groups, and the SKU generator. This topic includes how to scan for, change, delete, and display SKUs.
- Assigning Items/SKUs to Offers includes how to work with item/SKU offers, price breaks, page letters, aliases, and accompanying items.
- Assigning Items to Warehouses discusses item warehouse information and item location information.
- Entering Additional Item Information describes comments and source prices.
- Working with Item Tax Exemptions (WITX) describes how to set up tax exemptions or exceptions for specific items or item classes by location.
- Working with GST Tax Exemption Status (MGTX) describes how to set up tax exemptions or exceptions for specific items by Canadian province.
- Updating Harmonize Codes (UPHC) describes how to update harmonize codes quickly for multiple items or SKUs.

- Working with Freight Exempt Items (WFEI) describes how to exclude items from freight.
- *Working with Item Ship Via Overrides* describes how to set up eligible shippers for an item.
- *Working with Item Coordinate Types (WICT)* describes how to create and work with item coordinate types.
- *Copying Items* describes how to copy item information from one item to a newly created item in the same company or copy item information from one item to another item, with the same item number, in one or more shared companies.

Working with Item Coordinates (WCIO)

Overview: Use the *Work with Item Coordinates Screen* to specify related items or SKUs for a selected item, so that when a customer orders the primary item you can cross-sell the coordinates. For example, if you sell a blazer, you might also sell a related skirt, blouse, and scarf.

In this topic:

- *About Item Coordinates*
- *Item Coordinate Creation Summary*
- *Work with Item Coordinates Screen*
- *Change Item Coordinate Screen*
- *Copy Coordinate Item Pop-Up Window*
- *Work with SKU Coordinates Screen*
- *Create SKU Coordinate Screen*
- *Select SKU Coordinates Screen*

About Item Coordinates

Setting up a primary item and coordinates: The item you select at the *Work with Items Screen*, and match related items to, is the "primary item"; the related items are "coordinate items." Item coordination does not automatically work in both directions; in other words, designating a skirt as a coordinate to a blazer does not automatically designate the blazer as a coordinate to the skirt. You must select the Work with Item Coordinates option for each item that you would like to designate as a primary item, and then select the related coordinates for cross-selling.

Order entry: When you enter an order for an item that is associated with any item coordinates:

- If the *Automatically Display Coordinate Items in Order Entry (I53)* system control value is *selected* and the *Promo* flag for the order type is set to *Promo Price,* you advance to the *Display Coordinate Items Window* when you add an item associated with coordinate items to an order.
- If the *Automatically Display Coordinate Items in Order Entry (I53)* system control value is *unselected* or blank, a coordinate message indicates when you add an item associated with coordinate items to an order: `Coordinate items exist for base item entered`. You select *Coordinates* for the primary item to advance to the *Display Coordinate Items Window*.

The system will cross-sell coordinates even if the primary item is soldout, on backorder, is a drop ship item, non-inventory item, or main set item. Additionally, the system will cross-sell coordinates that are a drop ship item, non-inventory item, or main set item.

For more information: See the *Automatically Display Coordinate Items in Order Entry (I53)* system control value for a discussion on when screens prompt you to add coordinate items in Classic View and Modern View.

Pricing: When you add an item coordinate to an order, the system selects a price the same way as if you had entered the item at an ordinary order line. If the system cannot find a price for the item coordinate, you will not be able to add it to the order from the item coordinate pop-up window.

Auto linking: The *SKU Element for Auto Linking Coordinates (F39)* system control value controls which coordinates the system creates automatically when you specify a SKUed item to coordinate with a primary item at the *Work with Item Coordinates Screen* (you can also select any SKU of an item or a non-SKUed item manually; see below for more information). For example, SKU element one is color, and you set this system control value to *1* so that auto linking will be based on color. When you enter an item to coordinate at the *Work with Item Coordinates Screen*, the system will create coordinate records only for SKUs of the coordinate that find a color match with SKUs of the primary item.

Example:

Item AB100 (blazer), primary item, sold in colors NAVY, WHIT and BLCK, sizes SMLL, MEDM, LRGE

Item BB100 (skirt), coordinate item, sold in colors NAVY, BLCK, and PURP, sizes 6, 8, 10, 12, 14

SKU element 1 (color) specified as SKU element to use for auto linking

Result: System automatically creates item coordinate records for item BB100 in the following SKUs, because SKU element 1 finds a match with AB100's SKU element 1:

- NAVY 6, 8, 10, 12, 14
- BLCK 6, 8, 10, 12, 14

Contact Center: You can also select coordinate items to add to an order in Contact Center; however, the *Automatically Display Coordinate Items in Order Entry (I53)* system control value does not apply in Contact Center. See the Select Coordinate Items page in the Modern View online help for more information.

Selected SKU values: You also have the option at the *Work with Item Coordinates Screen* to create coordinate records for a specific SKU value of the primary item only. In the example above, for instance, you could indicate that you want to create coordinates only for SKUs whose first SKU element, color, is set to NAVY.

> **Important:**
>
> The item coordinates are associated with the base primary item, and are not restricted to the individual, matching SKUs. In the above example, each coordinate SKU you create for the skirt would be associated with all SKUs of the blazer. If you enter an order for the blazer in white, size 12, you will still be able to select the skirt in navy, size 10, as a coordinate. However, you can control which SKUs display in order entry through the *SKU Element for Order Entry Filtering (F40)* system control value.

Manual linking: In addition to auto linking, you can also relate a primary item to any SKUed or non-SKUed coordinate item, even if there is no match in the selected SKU element.

Example:

Additional item coordinates for item AB100:

Item CB100 (blouse) available in WHIT and PINK, sizes 6,8, 10, 12, 14

Item DB100 (scarf), a non-SKUed item

Since the above items and SKUs do not match the selected SKU element of the primary item, you would create the item coordinate records manually, and so are not restricted to the item coordinates the system creates automatically.

Item Coordinate Creation Summary

The following table summarizes the guidelines for creating item coordinates for a SKU and a non-SKUed primary item:

Primary Item is:	Coordinate Item is:	Result:
SKUed	SKUed	*If you specify a matching SKU:* Creates coordinates only for SKUs of the coordinate item that match your entry. However, if your entry doesn't find a matching SKU for the primary item, no coordinate SKUs are created. *If you do not specify a matching SKU:* Selects only SKUs that exist for both the primary item and the coordinate item to create as coordinates SKUs
non-SKUed	SKUed	You cannot create an item coordinate at the Work with Item Coordinates screen; instead, you must *Select Items* to advance to the Select SKU Coordinates screen.
SKUed or non-SKUed	non-SKUed	Creates the item coordinate for the non-SKUed item.

Create by offer: You can also use the Work with Coordinates by Offer menu option (*WCIO*) to set up coordinates for a primary item. This menu option restricts the display and creation of coordinate items to those that are in the same offer as the primary item. Additionally, the alias for each item, if any, is displayed, and you can enter the alias rather than the actual item code.

Work with Item Coordinates Screen

How to display this screen: Select *Coordinates* for an item at the *Work with Items Screen*, or enter *WCIO* in the Fast path field at the top of any menu and complete the Item and Offer fields.

Field	Description
Primary item	The item you are relating coordinates to. This is the item you selected at the Work with Items Screen. **Note:** Item coordinates are related to the base item; you will be able to select item coordinates in order entry if you enter an order line for any SKU of the primary item. Alphanumeric, 12 positions; display-only.
Description (unlabeled field)	The description of the primary item. Alphanumeric, 120 positions; display-only.
Coordinate item	Use this field to enter the related item you are coordinating to the primary item for cross-selling purposes. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions. Work with: required. Change: display-only.
Matching SKU	The SKU element specified in the *SKU Element for Auto Linking Coordinates (F39)* system control value. Included only if the primary item is a SKUed item. *Enter a SKU value* here if you want to create item coordinates only for SKUs that match your entry. There must also be a match for the SKU value for the primary item. In other words, if this field represents color and you enter *NAVY*, the system validates that there are SKUs of both the primary item and coordinate item whose color is *NAVY*, and creates item coordinate records for the *NAVY* SKUs only. *Leave this field blank* to have the system automatically create item coordinates for each SKU of the coordinate item whose SKU value matches a SKU for the primary item. See the discussion earlier in this topic for examples. Alphanumeric, 4 positions; optional.
Coordinate type	A code representing a type of item coordinate, such as mandatory or optional. Coordinate type codes are defined in and validated against the Item Coordinate Type table; see *Working with Item Coordinate Types (WICT)*. Alphanumeric, 2 positions; optional.
Message	A persuasive or descriptive message to display on the item coordinate pop-up window in order entry. Alphanumeric, 70 positions; optional.
Coordinate	To scan, enter a full or partial item code to display existing coordinates for the primary item that match your entry. Alphanumeric, 12 positions; optional.

Field	Description
Description	The description of the coordinate, from the Item table record for the coordinate item. Alphanumeric, 120 positions; display-only.
Seq (sequence)	The sequence number assigned to the item coordinate type, indicating the sequence in which coordinate items assigned to this type display on the Display Coordinate Items window in order entry. If you change the sequence number assigned to a coordinate type in *Working with Item Coordinate Types (WICT)*, the system does not automatically update the sequence number for item coordinates that are assigned to the coordinate type. For example, if the sequence number for coordinate type *R* is *3*, any item assigned to coordinate type *R* will have a sequence number of *3*. If you change the sequence number for coordinate type *R* from *3* to *5*, any items assigned to coordinate type *R* will still have a sequence number of *3*. To update the sequence number assigned to coordinate items, select *Submit Update* at the *Work with Item Coordinate Type Screen*. See *Updating Coordinate Type Sequence* for more information. Numeric, 3 positions; display-only.
Type	A code representing the coordinate type assigned to the coordinate item, such as mandatory or optional. Coordinate type codes are defined in and validated against the Item Coordinate Type table; see *Working with Item Coordinate Types (WICT)*. Alphanumeric, 2 positions; display-only.

Creating item coordinates: Follow the steps below to create item coordinates for the primary item.

1. Enter the base item code of the item you want to coordinate with the primary item.
2. Optionally, enter the matching SKU value if you want to create only the item coordinate SKUs that match this value. This field is available only if the primary item has SKUs.
3. Optionally, enter a coordinate type code if you want to control the sequence in which coordinate items display on the Display Coordinate Items window in order entry.
4. Optionally, enter a message to display at the pop-up window in order entry.
5. Select *OK*. The system validates your entries and highlights any fields you need to correct. See below for more information.
6. When no errors exist, the system creates a record for the base item coordinate in the Item Coordinate table, and a record for each matching SKU of the item coordinate in the SKU Coordinate table. A message such as the following indicates: `Coordinate items created = 1. Coordinate SKUs created = 20.`

The number of coordinate items created will always be *1*. In the case of non-SKUed coordinates, the number of SKUs will be *1* also.

Correcting errors:

- *Coordinate item errors:* If the coordinate item you entered does not exist, a message such as the following indicates: `Item (AB1000) does not exist`.
- If the coordinate item you entered does not have any SKUs that match your entry in the Matching SKU field, a message such as the following indicates: `SKU element (WHIT) does not exist for item (AB1000)`.

Correct the coordinate item information.

- *Matching SKU errors:* If your entry in the Matching SKU field does not match any of the SKUs for the primary item, or if there are no matching SKUs for the primary and coordinate item based on the selected SKU element, a message such as the following indicates: `Coordinate item (ANGELSET) has no matching SKUs to primary item - use F7`.

Select *Select Items* to advance to the *Select SKU Coordinates Screen*, where you can select any item or SKU to create as an item coordinate.

Screen Option	Procedure
Change an item coordinate	Select *Change* for an item coordinate to advance to the *Change Item Coordinate Screen*.
Delete an item coordinate and all of its related SKUs	Select *Delete* for an item to delete it. The Confirm Delete window opens; select *OK* to delete the coordinate and its SKUs.
Work with SKUs for an item coordinate	Select *Work with SKU coordinates* for an item coordinate to advance to the *Work with SKU Coordinates Screen*.
Copy the coordinates for one primary item to another	Select *Copy* to display the *Copy Coordinate Item Pop-Up Window*.
Select additional items or SKUs to coordinate to the primary item	Select *Select Items* to advance to the *Select SKU Coordinates Screen*.

Change Item Coordinate Screen

To change: Select *Change* for a coordinate item at the *Work with Item Coordinates Screen* to advance to the Change Item Coordinate screen. You can change the Coordinate type and Message fields. See *Work with Item Coordinates Screen* for field descriptions.

Coordinate types:

- If the sequence number for the coordinate type assigned to the item coordinate has since been updated to a new sequence number, the system will automatically update the item coordinate to the new sequence number when you advance to this screen.
- If the coordinate type that is assigned to the item coordinate has since been deleted, you will receive an error message at this screen: `Item Coordinate Type not found`.

Copy Coordinate Item Pop-Up Window

Purpose: Use this window to copy the items and SKUs coordinated with the current primary item to a new primary item.

How to display this window: Select *Copy* at the *Work with Item Coordinates Screen*.

To copy: Enter the code of the item to be associated with the same coordinate items and SKUs as the “copy from” primary item. The code you enter must represent a valid item in your company.

The confirm prompt window opens. Select to confirm the copy; otherwise, select *Exit* to cancel.

Work with SKU Coordinates Screen

Purpose: Use this screen to work with the SKUs of an item that are currently coordinated with the primary item, or to coordinate additional SKUs.

When you first advance to this screen, the screen will be blank since you have not yet created any SKU coordinates.

How to display this screen: Select *Work with SKU Coordinates* for a SKUed coordinate item at the *Work with Item Coordinates Screen*.

Field	Description
Primary item	The item you are relating coordinates to. This is the item you selected at the *Work with Items Screen*. Alphanumeric, 12 positions; display-only.
Description	The description of the primary item. Alphanumeric, 120 positions; display-only.
Coordinate item	The base item for which you are defining coordinate SKUs. Alphanumeric, 12 positions; required.
Description	The description of the coordinate item. Alphanumeric, 120 positions; display-only.
SKUs	The item's unique characteristics, such as its color or size. Alphanumeric, three 4-position fields; display-only.
Description	The description of the SKU. Alphanumeric, 40 positions; optional.

Screen Option	Procedure
Create a new SKU coordinate for the primary item	Select *Create* to advance to the *Create SKU Coordinate Screen*.
Delete a SKU coordinate	Select *Delete* for a SKU to delete it.

Create SKU Coordinate Screen

Purpose: Use this screen to add a new SKU to an item coordinate.

Create a SKU coordinate: Complete the three 4-position fields to create a new SKU coordinate for the primary item. You can prompt on the SKU field to display a list of valid SKUs for the base item.

A message such as the following indicates: `Coordinate SKU created for primary item (BU001).`

How to display this screen: Select *Create* at the *Work with SKU Coordinates Screen*.

Field	Description
Primary item	The code and description of the primary item for which you are creating coordinates. Item: Alphanumeric, 12 positions; display-only. Description: Alphanumeric, 120 positions; display-only.
Coordinate item	The code and description of the base item for which you are defining SKU coordinates. Item: Alphanumeric, 12 positions; display-only. Description: Alphanumeric, 120 positions; display-only.
SKU	The item's unique characteristics, such as its color or size. Alphanumeric, three 4-position fields; display-only.

Select SKU Coordinates Screen

Purpose: Use this screen to select SKUs to coordinate with a primary item. You can also use this screen to select additional SKUs of a coordinate item that already has one or more SKUs selected to coordinate with the primary item.

You can also use the *Work with SKU Coordinates Screen* to create additional coordinated SKUs of a coordinate item.

How to display this screen: Select *Select Items* at the *Work with Item Coordinates Screen*.

Field	Description
Primary item	The code and description of the item you are relating coordinates to. This is the item you selected at the *Work with Items Screen*. Item code: Alphanumeric, 12 positions; display-only. Item description: Alphanumeric, 120 positions; display-only.
Msg (Message)	Enter the descriptive or persuasive message for the system to assign to each item or SKU you add as a coordinate. Alphanumeric, 70 positions; optional.
Coord item (Coordinate item)	The items and SKUs available to link to the primary item as coordinates. Alphanumeric, 12 positions; required.
SKU	The item’s unique characteristics, such as its color or size. Alphanumeric, three 4-position fields; display-only.
Description	The description of the SKU. Alphanumeric, 40 positions; optional.
Categ (Item category)	The category associated with the item. You can use item category to associate items that are related to or compatible with one another, both for selection in order entry and for reporting. Alphanumeric, 4 positions; optional.

To select an item or SKU: To select one or more items or SKUs to coordinate with the primary item:

1. Optionally, enter a descriptive message in the Message field for the item that you are adding as a coordinate to the primary item.

2. Optionally, use the Coordinate item, Description, and Category scan fields to position to the desired item.
3. Select the item/SKU you would like to add as an item coordinate to the primary item. The system adds the item/SKU as a coordinate and returns you to the *Work with Item Coordinates Screen*, where the newly created item coordinate displays.

> **Note:**
>
> No message indicates that your selections have been added to the Item Coordinate or SKU Coordinate tables; similarly, no error message indicates if you select an item or SKU that is already designated as a coordinate to the primary item.

Working with Item Tax Exemptions (WITX)

Purpose: Use the Item Tax Exemptions function to define tax exemptions for items based on their tax status in certain U.S. states. You can define the exemption for individual items or classes of items; exemptions can specify that items are either taxable or tax exempt, whichever is the exception to the norm. The item tax exemptions function also lets you define a dollar level at which an item's tax status changes.

For instance, you would use this function if:

- a class of apparel you sell is taxable only in three states
- a particular item is taxable only up to a certain dollar amount
- with few exceptions, your merchandise is taxable in all states

> **Note:**
>
> If you use an external tax system, the item tax exemptions you set up with this function are not used. You must set up all tax exemptions in the tax system. See *Vertex Setup* and *Avalara AvaTax Setup*.

In this topic:

- *Work with Item Tax Exemptions Screen*
- *Create Item Tax Exemption Screen*
- *Change Item Tax Exemptions Screen*
- *Display Item Tax Exemption Screen*

For more information: You can create tax exemptions and exceptions for items in Canadian provinces through *Working with GST Tax Exemption Status (MGTX)*. You can use the Work with Items/SKUs menu option to flag an item as VAT-exempt; see *Create Item (Base Information) Screen* or *Create SKU 1 of 2 (With Overrides) Screen*.

Work with Item Tax Exemptions Screen

How to display this screen: Enter *WITX* in the Fast path field at the top of any menu, or select this option from a menu.

Field	Description
St (State)	A code that represents the state where an item tax exemption applies. State codes are defined in and validated against the state table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 2 positions; optional.
Cmp (Company)	A code that represents the company carrying the item. The code of the current company appears in this field as the default. Numeric, 3 positions; optional.
Class	A code that represents a group of similar items. Alphanumeric, 3 positions; optional.
Item	A code representing a unit of inventory. Alphanumeric, 12 positions; optional.
Exempt	This code represents whether the item is tax exempt. Valid values are: *selected* = The item is tax exempt. *unselected* = The item is not tax exempt.
Tax Value	The dollar value up to which the item is taxable. If the value in the Exmpt field is *N*, the portion of the item price up to this value taxable; the portion of the item price above this value is tax exempt. Numeric, 13 positions with a 2-place decimal; optional.
No Tax Value	The dollar value that is tax exempt. If the value in the Exmpt field is *N*, and the item price is this value or less, the item is tax exempt; if the item price greater than this value, then the amount of the item price that exceeds this value is taxable. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Change an item tax exemption	Select *Change* for a tax exemption to advance to the *Change Item Tax Exemptions Screen*.
Delete an item tax exemption	Select *Delete* for a tax exemption to delete it.
Display an item tax exemption	Select *Display* for a tax exemption to advance to the *Display Item Tax Exemption Screen*.
Create an item tax exemption	Select *Create* to advance to the *Create Item Tax Exemption Screen*.

Create Item Tax Exemption Screen

Purpose: At the *Work with Item Tax Exemptions Screen*, select *Create*.

Field	Description
Country	A code that represents the country in which an item tax exemption occurs. Country codes are defined in and validated against the Country table; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; required.
State	A code that represents the state in which an item tax exemption applies. State codes are defined in and validated against the state table, which is accessible through the Work with Countries menu option; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Company	A code that represents the company you are currently working with. Numeric, 3 positions; display-only.
Item class	A code that represents a group of similar items. Item class codes are defined in and validated against the Item Class table. See *Working with Item Classes (WICL)*. Alphanumeric, 3 positions; optional.
Item	A code representing a unit of inventory. Item codes are defined in and validated against the Item table. **Note:** You can select either an item class or an item, but not both. Alphanumeric, 12 positions; optional.
Exempt	A code indicating whether the item is tax exempt. Valid values are: *Selected* = The item is tax exempt. The system does not use the Tax value or No tax value entries at this screen. *Unselected* = The item is not tax exempt. The system uses the Tax value and No tax value entries at this screen to determine the amount of tax to charge.

Field	Description
Tax value	The dollar value up to which the item is taxable. The portion of the item price above this value is tax exempt. The value in the Exempt field must be *unselected* for this field to work. *Example:* You sell an item for $250.00, and its Tax value is $200.00. If the regular tax rate is 5%, the system charges tax for the Tax value of $200.00, or $10.00. The remaining $50.00 that exceeds the Tax value of $200.00 is not taxed. **Note:** You cannot enter both a Tax value and a No tax value. Numeric, 13 positions with a 2-place decimal; optional.
No tax value	The dollar value that is tax exempt. If the item price is this value or less, the item is tax exempt; if the item price is greater than this value, then the amount of the item price that exceeds this value is taxable. The value in the Exempt field must be *unselected* for this field to work. *Example:* You sell an item for $250.00, and its No tax value is $200.00. If the regular tax rate is 5%, the system charges tax for the $50.00 that exceeds the No tax value, or $2.50. The first $200.00 is not taxed. **Note:** You cannot enter both a Tax value and a No tax value. Numeric, 13 positions with a 2-place decimal; optional.

Change Item Tax Exemptions Screen

To change: Select *Change* for an item tax exemption at the *Work with Item Tax Exemptions Screen* to advance to the Change Item Tax Exemption screen. You can change any field at this screen except the State or Company. See *Create Item Tax Exemption Screen* for field descriptions.

Display Item Tax Exemption Screen

To display: Select *Display* for an item tax exemption record at the *Work with Item Tax Exemptions Screen* to advance to the Display Item Tax Exemption screen. You cannot change any information on this screen. See *Create Item Tax Exemption Screen* for field descriptions.

Working with GST Tax Exemption Status (MGTX)

Purpose: Use the GST Tax Exemption Status to define tax exemptions for items based on their status in particular provinces.

Overview: The Canadian GST (Goods and Service Tax) is a federal tax; the PST (Provincial Services Tax) is a province-level tax. You can use Order Administration to calculate either, both, or neither of these taxes based on the shipping address on the order.

You can specify a GST rate:

- as a default in the System Control table
- for each SCF in the SCF table
- for each postal code in the Postal Code table

You can specify a PST rate:

- for each SCF in the SCF table
- for each postal code in the Postal Code table

The GST rate from the SCF table, if any, overrides the rate from the System Control table, and the GST or PST rates from the Postal Code table, if any override the rates from the SCF table.

In addition to defining rates for each of these taxes, you must define a method for computing them. You define these methods in the SCF and, optionally, the Postal Code tables. To define specific items as exceptions to the PST and GST methods for a province, you use the Work with GST Tax Exemption Status function.

You can also define an exemption or exception for a specific customer. See *Working with Customer Tax Status*.

For more information:

- *Working with SCF Codes (WSCF)*
- *Setting Up the Zip/City/State (Postal Code) Table (WZIP)*
- item exemptions in U.S. states: *Working with Item Tax Exemptions (WITX)*.

> **Note:**
>
> If you are using this function to define tax exceptions for items, you should set the *GST Item Status Default (A91)* system control value to *B* (calculate both GST and PST tax).

In this topic:

- *Calculation Methods and Exemptions*
- *If You Tax Freight and Handling*
- *Work with GST Tax Exemption Status Screen (Selecting an Item)*
- *Work with GST Tax Exempt Status Screen*
- *Create GST Tax Exempt Status Screen*

Calculation Methods and Exemptions

To understand the effect of different tax exemptions, it is useful to look at the calculation methods that may apply to GST and PST.

Method	Description	Calculation/Example (where the order total subject to tax =	Example with Exemption Type of G or P
G	Calculate the GST on the order, including freight and handling, if applicable. Add this amount to the order total, then calculate the PST on the result.	*Calculation:* `ORDER * GST rate = GST amount` `GST amount + ((GST amount + ORDER) * PST rate) = order tax` *Example*: The order total subject to tax = $10.00 `GST rate = 10%` `PST rate = 5%` `$10 * 10% = $1.00 GST amount` `$1 GST amount + (($1 + $10) * 5%) = $1 + ($11 * 5%) = $1.60`	*G* = GST only; the amount subject to PST is 0 *Example*: `$10 * 10% = $1.00 GST amount` `$1 GST amount + (($1 + 0) * 5%) = $1 + ($1 + 5%) = $1.05` *P* = PST only; the amount subject to GST is 0 *Example*: `0 * 10% = 0 GST amount` `0 GST amount + ((0 + $10) * 5%) = 0 + ($10 * 5%) = $.50`
P	Calculate the PST on the order, including freight and handling, if applicable. Add this amount to the order total, then calculate the GST on the result.	*Calculation*: `O * PST rate = PST amount` `PST amount + ((PST amount + O) * GST rate) = order tax` *Example*: (with same assumptions as above) `$10 * 5% = $.50 PST amount` `$.50 PST amount + (($.50 + $10) * 10%) = $.50 + ($10.50 * 10%) = $1.55`	*G* = GST only; the amount subject to PST is 0 *Example*: `0 * 5% = 0 PST amount` `0 PST amount + ((0 +$10) * 10%) = 0 + ($10 * 10%) = $1.00` `P = PST only; the amount subject to GST is 0` *Example*: `$10 * 5% = $.50 PST amount` `$.50 PST amount + (($.50 + 0) * 10%) = $.50 + ($.50 * 10%) = $.55`
S	Calculate GST and PST separately; neither tax is subject to the other.	Calculation: `(O * GST) + (O * PST)` *Example*: (with same assumptions as above `($10 * 10%) + ($10 * 5%) =` `$1 + $.50) = $1.50`	*G* = GST only; the amount subject to PST is 0 *Example*: `(0 * 10%) + ($10 * 5%) = $.50` *P* = PST only; the amount subject to GST is 0 Example: `($10 * 10%) + (0 * %) = $1.00`

If You Tax Freight and Handling

You can tax freight and handling on orders as well as merchandise. In order to tax freight and/or handling, you must *select* the *Tax on Freight (B14)* and/or *Tax on Handling (B15)* fields in the System Control table. You must then *select* the corresponding fields in the SCF or Postal Code tables for the location where you tax freight or handling as well.

An item tax exemption by province affects the calculation of tax on freight and handling for items shipped to that province. Assuming that GST and PST normally apply to the order, the system uses the following logic to calculate tax on freight and handling:

Order-level freight method:

- If all items on the order are exempt from PST, the system does not calculate PST on freight or handling.
- If at least one item on the order is subject to PST, the system calculates PST on freight and handling.
- If all items on the order are exempt from GST, the system does not calculate GST on freight or handling.
- If at least one item on the order is subject to GST, the system calculates GST on freight and handling.

Line-level freight method:

- If the item is exempt from PST, the system does not calculate PST on freight or handling for that line.
- If the item is exempt from GST, the system does not calculate GST on freight or handling for that line.
- If the item is subject to PST, the system calculates PST on freight and handling for that line.
- If the item is subject to GST, the system calculates GST on freight and handling for that line.

The system determines the freight method on an order from the source code. See *Working with Source Codes (WSRC)*.

You can also flag a special handling code as exempt from tax. See *Establishing Additional Charge Codes (WADC)*.

\

Work with GST Tax Exemption Status Screen (Selecting an Item)

Use this screen to select an item for creation, review, change or deletion of GST tax exemption status.

How to display this screen: Enter *MGTX* in the Fast path field at the top of any menu or select Work with GST Tax Exemption Status from a menu.

Item field: Use the item field to enter the item code that you want to work with. This is a 12-position, alphanumeric field. Item codes are defined in and validated against the Item table; see *Performing Initial Item Entry (MITM)*.

Work with GST Tax Exempt Status Screen

Purpose: Use this screen to select an item tax exemption by province to work with, or to create a new record.

How to display this screen: Enter a valid item code at the *Work with GST Tax Exemption Status Screen (Selecting an Item)*.

Field	Description
Item	The code that represents the item subject to tax exemption by province. Item codes are defined in and validated against the Item table; see *Performing Initial Item Entry (MITM)*. Alphanumeric, 14 positions; display-only.
Item description (Unlabeled field to the right of the item code)	The description associated with the item. Alphanumeric, 120 positions; display-only.
Prov (Province)	A code that represents the province where a tax exemption applies for this item. Alphanumeric, 2 positions; optional.
Sts (Status)	A code that represents the override tax status for the item in this province. Valid values are: • *Both* = Calculate both GST and PST • *GST* = Calculate GST only • *Neither* = Calculate neither GST or PST • *PST* = Calculate PST only Optional.

Screen Option	Procedure
Change GST tax exemption	Select *Change* for a province to advance to the Change GST Tax Exemption Status Screen. See the *Create GST Tax Exempt Status Screen* for field descriptions.
Delete a GST tax exemption	Select *Delete* for a province to delete it.
Display a GST tax exemption	Select *Display* for a province to advance to the Display GST Tax Exempt Status Screen. See the *Create GST Tax Exempt Status Screen* for field descriptions.
Create a tax exemption record	Select *Create* to advance to the *Create GST Tax Exempt Status Screen*.

Create GST Tax Exempt Status Screen

Purpose: At the *Work with GST Tax Exempt Status Screen*, select *Create*.

Field	Description
Item	The code that represents the item subject to tax exemption by province. Item codes are defined in and validated against the Item table. Alphanumeric, 14 positions; display-only.
Item description (Unlabeled field to the right of the item code)	The description associated with the item. Alphanumeric, 120 positions; display-only.

Field	Description
Province	A code that represents the province where a tax exemption applies for this item. Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.
Override tax status	A code that represents the override tax status for this item in this province. Valid values are: • *Both* = Calculate both GST and PST • *GST* = Calculate GST only • *Neither* = Calculate neither GST or PST • *PST* = Calculate PST only Required.

Updating Harmonize Codes (UPHC)

Purpose: Use the Update Harmonize Codes function to update harmonize codes quickly for multiple items or SKUs.

The system uses an item's harmonize code to determine whether to add a duty charge to an order. Duty is a tax that you may be required to add to orders shipping to certain countries. The system performs the following checks to determine whether to add duty for an item a customer orders:

The system checks the duty rates defined for the country on the order's shipping address. If the system finds a duty rate whose harmonize code matches the item's harmonize code, it adds the duty amount or percentage to the order. Two blank records are a match; that is, if both the item's and the duty rate's harmonize codes are blank, the system will add the duty to the order. See *Setting Up the Country Table (WCTY)* for more information on setting up duty rates for countries.

For more information: You can also update harmonize codes through the Work with Items/SKUs option; see *Performing Initial Item Entry (MITM)*.

Update Harmonize Codes Screen

Use this screen to update the harmonize codes of multiple items and SKUs quickly.

How to display this screen: Enter *UPHC* in the Fast path field at the top of any menu or select Update Harmonize Codes from a menu.

Field	Description
Item	A code representing a unit of inventory that you sell. Items are defined in and validated against the Item table; see *Performing Initial Item Entry (MITM)*. Alphanumeric, 12 positions; required.

Field	Description
Harmonize code	A code that prints on customers documents for international shipments. The system determines whether to add duty charges to an order by comparing an item's harmonize code with the harmonize codes associated with the duty rates for the customer's country. You can also create, change, delete or display an item's harmonize code on the second screen in Work with Items for a non-SKU'd item, or on the SKU screen for SKU'd items; see *Performing Initial Item Entry (MITM)*. Alphanumeric, 16 positions; required.

Instructions:

1. Complete the Item and Harmonize code fields for each item that you want to update, pressing *Tab* to move from field to field. If you reach the bottom of the screen, select *Next* to advance to another screen.
2. Press *Enter*. The system validates the item codes and highlights any fields you need to correct. Correct any fields and press *Enter* again.
3. Select *Accept* to accept your entries or *Reject* to reject. If you select *Accept*, the confirm accept pop-up window, displayed below, appears.
4. Select *OK* to accept, or select *Exit* to cancel. If you select *OK*, the system updates the harmonize code field for each item you entered. If an item has SKUs, the system updates the harmonize code field for each SKU.

To exit the screen without submitting any updates to harmonize codes, select *Reject*.

Working with Freight Exempt Items (WFEI)

Purpose: Use Work with Freight Exempt Items to exclude items from freight charges.

You may wish to exclude certain items from freight, such as memberships or subscriptions which do not have any freight costs. Also, if the price of an item already includes the cost of freight, you may wish to exclude the item from freight so that you do not charge the customer double the amount of freight.

In this topic:

- *Freight Exempt Items Setup*
- *System Control Values Related to Freight Exemption*
- *Eligible Freight Methods for Freight Exemption*
- *Flagging an Item as Freight Exempt*
- *Include Freight on Pick Slips?*
- *Freight Exempt Items Processing*
- *Use Item Freight Exemption File (E73) Selected?*
- *Eligible Freight Method on Order?*
- *Item on Order Defined in Work with Freight Exempt Items (WFEI)?*
- *Freight Exempt Hierarchy*

- *Freight Exemption and Extra Charges*
- *Work with Freight Exempt Items Screen*
- *Create Freight Exempt Item Screen*
- *Select Ship Via for Exemption Screen*

Freight Exempt Items Setup

Before you can exclude items from freight, you must perform the required setup.

- *System Control Values Related to Freight Exemption*
- *Eligible Freight Methods for Freight Exemption*
- *Flagging an Item as Freight Exempt*
- *Include Freight on Pick Slips?*

System Control Values Related to Freight Exemption

System Control Value	Description
Use Item Freight Exemption File (E73)	*Select* this system control value if you want the system to exclude items from freight based on the *Working with Freight Exempt Items (WFEI)* menu option.
Include Handling in Freight Charge Calculation (D77)	*Select* this system control value if you want to include handling charges in the total dollar amount on an order subject to freight charges. If this system control value is selected and a freight exempt item is defined with a handling charge, the handling charge will not be included in the freight calculation.

Eligible Freight Methods for Freight Exemption

You can exclude items from freight on orders using the following freight methods, as defined in *Working with Source Codes (WSRC)*. See *Introducing Offer and Source Codes* for more information about each freight method.

- Dollar chart by offer ($O) freight; see *Dollar chart by offer ($ Chart by Ofr) freight*
- Dollar chart by source ($S) freight; see *Dollar chart by source ($ Chart by Src) freight*
- Recipient (R) freight; see *Recipient freight*
- Percentage by source (PS) freight; see *Percentage by source (% Source) freight*
- Percentage by ship via (PV) freight; see *Percentage by ship via ($ Ship VIa) freight*
- By Offer Price (OP) freight; see *By Offer Price freight*
- Freight by order weight (OW) freight; see *Freight by order weight (Order Weight) freight*
- Weight (W) freight; see *Weight freight*

Flagging an Item as Freight Exempt

Use the *Working with Freight Exempt Items (WFEI)* menu option to define which items are exempt from freight charges. You can flag an item as freight exempt at the ship via level, offer level, source code level, or item level.

To flag an item as freight exempt across all ship vias, offers, and source codes: At the *Create Freight Exempt Item Screen*, enter the *Item* and leave the *Offer* and *Source* blank. Do not define records at the *Select Ship Via for Exemption Screen*. *Note:* If the item is a SKUed item, all of the SKUs for the item are exempt from freight.

To flag an item as freight exempt at the source code level: At the *Create Freight Exempt Item Screen*, enter the *Item* and *Source*. Leave the *Offer* blank. Do not define records at the *Select Ship Via for Exemption Screen*. The item will be exempt from freight only if the specified source code is defined on the order header. *Note:* The system does not look at the source code defined at the order line level to determine if the item is exempt from freight.

To flag an item as freight exempt at the offer level: At the *Create Freight Exempt Item Screen*, enter the *Item* and *Offer*. Leave the *Source* blank. Do not define records at the *Select Ship Via for Exemption Screen*. The item will be exempt from freight only if the specified offer is associated with the source code on the order header. *Note:* The system does not look at the offer code defined at the order line level to determine if the item is exempt from freight.

To flag an item as freight exempt at the ship via level:

- At the *Create Freight Exempt Item Screen*, enter the *Item* and leave the *Offer* and *Source* blank.
- At the *Select Ship Via for Exemption Screen*, *select* the ship vias for which the item is exempt from freight.

The item will be exempt from freight only if the selected ship via(s) is defined for the item on the order detail line or order header (if a ship via is not defined at the order line level).

Freight exempt items at the ship via level: When the system applies a ship via override to a pick slip, the system does not look at the Freight Exempt Item Ship Via table to determine if one or more of the items on the pick slip is excluded from freight for the ship via override. The system retains the freight that was applied to the order during order entry and prints this freight amount on the pick slip. See *Determining the Shipper for the Pick Slip*.

To flag an item as freight exempt at the ship via level for a specified source code:

- At the *Create Freight Exempt Item Screen*, enter the *Item* and *Source*. Leave the *Offer* blank.
- At the *Select Ship Via for Exemption Screen*, *select* the ship vias for which the item is exempt from freight.

The item will be exempt from freight only if the specified source code is defined on the order header *and* the selected ship via(s) is defined for the item on the order detail line or order header (if a ship via is not defined at the order line level).

To flag an item as freight exempt at the ship via level for a specified offer:

- At the *Create Freight Exempt Item Screen*, enter the *Item* and *Offer*. Leave the *Source* blank.
- At the *Select Ship Via for Exemption Screen*, *select* the ship vias for which the item is exempt from freight.

The item will be exempt from freight only if the specified offer is associated with the source code on the order header *and* the selected ship via(s) is defined for the item on the order detail line or order header (if a ship via is not defined at the order line level).

For more information: See *Freight Exempt Hierarchy* for more information on how the system determines when an item is exempt from freight.

Include Freight on Pick Slips?

There will be no freight charge on a pick slip, even if there are non-freight exempt items on the order, under the following conditions:

- the *Prorate Freight Charges (D39)* system control value is *unselected*
- the *Use Item Freight Exemption File (E73)* system control value is *selected*
- the pick slip includes only freight exempt items
- the order uses one of the *Eligible Freight Methods for Freight Exemption*

Freight Exempt Items Processing

When you add an item to an order in regular order entry/maintenance or receive an order through the *Generic Order Interface (Order API)*, the system uses the following steps to determine if the item is excluded from freight.

For more information see the Web Services Guide on My Oracle Support (ID 2953017.1).

- *Use Item Freight Exemption File (E73) Selected?*
- *Eligible Freight Method on Order?*
- *Item on Order Defined in Work with Freight Exempt Items (WFEI)?*
- *Freight Exempt Hierarchy*
- *Freight Exemption and Extra Charges*
- *Freight Exempt Item Example*

Use Item Freight Exemption File (E73) Selected?

The system checks the setting of the *Use Item Freight Exemption File (E73)* system control value.

- If *unselected*, items defined in the *Working with Freight Exempt Items (WFEI)* menu option are included in the freight calculation.
- If *selected*, items defined in the *Working with Freight Exempt Items (WFEI)* menu option are exempt from freight.

Eligible Freight Method on Order?

The system determines if the freight method on the order is eligible for freight exempt items. You can exclude items from freight on orders using the following freight methods:

- Dollar chart by offer ($O) freight; see *Dollar chart by offer ($ Chart by Ofr) freight*
- Dollar chart by source ($S) freight; see *Dollar chart by source ($ Chart by Src) freight*
- Recipient (R) freight; see *Recipient freight*
- Percentage by source (PS) freight; see *Percentage by source (% Source) freight*
- Percentage by ship via (PV) freight; see *Percentage by ship via ($ Ship VIa) freight*

- By Offer Price (OP) freight; see *By Offer Price freight*
- Freight by order weight (OW) freight; see *Freight by order weight (Order Weight) freight*
- Weight (W) freight; see *Weight freight*

If the order does not use one of these freight methods, the system includes the items on the order in the freight calculation.

If the order uses one of these freight methods, the system excludes the freight exempt items on the order from the freight calculation.

Item on Order Defined in Work with Freight Exempt Items (WFEI)?

The system determines if the item added to the order is defined in the *Working with Freight Exempt Items (WFEI)* menu option.

- If the item is not defined in Work with Freight Exempt Items (WFEI), the system includes the item in the freight calculation.
- If the item is defined in Work with Freight Exempt Items (WFEI), the system determines how the item is exempt from freight. See *Freight Exempt Hierarchy*.

Freight Exempt Hierarchy

If the item qualifies for freight exemption (see *Use Item Freight Exemption File (E73) Selected?*, *Eligible Freight Method on Order?*, and *Item on Order Defined in Work with Freight Exempt Items (WFEI)?*), the system uses the following hierarchy to determine how the item is exempt from freight.

#	Step
1.	**Ship via level:** If records exist for the item on the *Select Ship Via for Exemption Screen*, the item is exempt from freight only for those ship vias selected. The item is excluded from the freight calculation only if the specified ship via is defined on the order. The system uses the ship via defined for the order line; if a ship via is not defined on the order line, the system uses the ship via defined on the order header. In addition: • If an offer is defined for the item on the *Work with Freight Exempt Items Screen*, the item is exempt from freight only for those ship vias selected *and* if the specified offer is associated with the source code on the order header. • If a source code is defined for the item on the *Work with Freight Exempt Items Screen*, the item is exempt from freight only for those ship vias selected *and* if the specified source code is defined on the order header.
2.	**Offer level:** If records do not exist for the item on the *Select Ship Via for Exemption Screen*, but an offer is defined for the item on the *Work with Freight Exempt Items Screen*, the item is exempt from freight only if the specified offer is associated with the source code on the order header. *Note:* The system does not look at the offer code defined at the order line level to determine if the item is exempt from freight.
3.	**Source code level:** If records do not exist for the item on the *Select Ship Via for Exemption Screen*, but a source code is defined for the item on the *Work with Freight Exempt Items Screen*, the item is exempt from freight only if the specified source code is defined on the order header. *Note:* The system does not look at the source code defined at the order line level to determine if the item is exempt from freight.
4.	**Item level:** If records do not exist for the item on the *Select Ship Via for Exemption Screen*, and an offer or source code is not defined for the item on the *Work with Freight Exempt Items Screen*, then the item is always exempt from freight. If the item is a SKUed item, all of the SKUs for the item are exempt from freight.

Freight Exempt Hierarchy Example

The following items are defined in the *Working with Freight Exempt Items (WFEI)* menu option.

Item	Offer	Source	Ship Via	Results
ITM1				When you add ITM1 to an order, the item is always excluded from the freight calculation.
ITM2			1 - UPS 2 - FEDEX	When you add ITM2 to an order, the item is excluded from the freight calculation only if: • the ship via on the order detail line is *1* or *2*, or • if a ship via is not defined on the order detail line, the ship via on the order header is *1* or *2*.
ITM3	7		1- UPS 2 - FEDEX	When you add ITM3 to an order, the item is excluded from the freight calculation only if: • the ship via on the order detail line is *1* or *2* (or, if a ship via is not defined on the order detail line, the ship via on the order header is *1* or *2*), and • the source code on the order header is associated with offer *7*.
ITM4		S7	1 - UPS	When you add ITM4 to an order, the item is excluded from the freight calculation only if: • the ship via on the order detail line is *1* (or, if a ship via is not defined on the order detail line, the ship via on the order header is *1*), and • the source code on the order header is *S7*.
ITM5	7			When you add ITM5 to an order, the item is excluded from the freight calculation only if the source code on the order header is associated with offer *7*.
ITM6		S7		When you add ITM6 to an order, the item is excluded from the freight calculation only if the source code on the order header is *S7*.

Freight Exemption and Extra Charges

Ship via additional charges: Any additional charges associated with a ship via, such as service charges or charges for a federal express service, are still added to an order even when the order contains only freight exempt items.

Extra recipient charges: Extra recipient charges are not added to an order if the recipient has only ordered a freight exempt item.

Handling charges: If the *Include Handling in Freight Charge Calculation (D77)* system control value is selected and a freight exempt item is defined with a handling charge, the handling charge will not be included in the freight calculation.

Freight Exempt Item Example

The following items are defined in *Working with Freight Exempt Items (WFEI)*.

Item	Offer	Source	Ship Via
ITM1		S7	1 - UPS
ITM2		S9	1 - UPS 2 - FEDEX
ITM3		S7	

You create an order with the following information with the ship via code of 1 and a source code of S7 on the order header:

Order Detail Line	Item	Results
Line 1	ITM1 no ship via code defined	Line 1 is exempt from freight because the ship via and source code on the order header match the ship via and source code requirements in Working with Freight Exempt Items for ITM1.
Line 2	ITM2 ship via code 3	Line 2 is not exempt from freight because the ship via on the order detail line and the source code on the order header does not match the ship via and source code requirements in Working with Freight Exempt Items for ITM2.
Line 3	ITM3 ship via code 5	Line 3 is exempt from freight because the source code on the order header matches the source code requirements in Working with Freight Exempt Items for ITM3 and ship via requirements have not been defined in Work with Freight Exempt Items for ITM3.
Line 4	ITM4 no ship via code defined	Line 4 is not exempt from freight because it does not exist in the Working with Freight Exempt Items (WFEI).

Work with Freight Exempt Items Screen

Purpose: Use this screen to work with freight exempt items.

How to display this screen: Enter *WFEI* in the Fast path field at the top of any menu or select Work with Freight Exempt Items from a menu.

Field	Description
Item	An item defined as freight exempt. If the item is a SKUed item, all of the SKUs for the item are exempt from freight. Enter a full or partial item code and select *OK* to display items in alphanumeric order beginning with your entry. Alphanumeric, 12 positions; optional.
Description	The description of the item. Alphanumeric, 35 positions; display-only.

Field	Description
Offer	The offer in which the item is exempt from freight. Enter a valid offer code and select *OK* to display offers that match your entry. Alphanumeric, 3 positions; optional.
Source	The source in which the item is exempt from freight. Enter a valid source code and select *OK* to display source codes that match your entry. Alphanumeric, 9 positions; optional.
Ship via	Defines whether the item is freight exempt at the ship via level. Valid values: • *Y* = The item is exempt from freight at the ship via level. The *Select Ship Via for Exemption Screen* indicates for which ship vias that item is exempt from freight. • *N* = The item is exempt from freight across all ship vias. See *Freight Exempt Hierarchy* for more information on how the system determines when an item is exempt from freight. Alphanumeric, 1 position; display-only.

Screen Option	Procedure
Create a freight exempt item	Select *Create* to advance to the *Create Freight Exempt Item Screen*.
Change a freight exempt item	Select *Change* for a freight exempt item to advance to the Change Freight Exempt Item Screen. See the *Create Freight Exempt Item Screen* for field descriptions.
Delete a freight exempt item	Select *Delete* for a freight exempt item to delete it. Any freight exemptions defined for the item on the *Select Ship Via for Exemption Screen* are also deleted.
Display a freight exempt item	Select *Display* for a freight exempt item to advance to the Display Freight Exempt Item Screen. See the *Create Freight Exempt Item Screen* for field descriptions.
Flag an item as freight exempt at the ship via level	Select *Ship Via* for a freight exempt item to advance to the *Select Ship Via for Exemption Screen*.

Create Freight Exempt Item Screen

Purpose: Use this screen to define an item as exempt from freight.

See *Flagging an Item as Freight Exempt* for instructions on how to flag an item as freight exempt at the ship via, offer, source code, or item level.

How to display this screen: Select *Create* on the *Work with Freight Exempt Items Screen*.

Field	Description
Item	The item you wish to exempt from freight. Items are defined in and validated against the Item table. If the item contains SKUs, each SKU will be exempt from freight. Alphanumeric, 12 positions. Create screen: required. Change screen: display-only.
Offer	The offer in which the item is exempt from freight. There will be no freight for the item if this source code is associated with the source code on the order header. **Note:** The system does not look at the offer code defined at the order line level to determine if the item is exempt from freight. Offer codes are defined in and validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.
Source	The source code in which the item is exempt from freight. There will be no freight for the item if this is the source code on the order header. **Note:** The system does not look at the source code defined at the order line level to determine if the item is exempt from freight. Source codes are defined in and validated against the Source Code table. See *Working with Source Codes (WSRC)*. Alphanumeric, 9 positions; optional.

Instructions:

1. Enter a valid item in the Item field. If the item contains SKUs, each SKU will be exempt from freight.
2. Enter a valid offer in the Offer field if you want to define a specific offer in which the item is exempt from freight, or
3. Enter a valid source code in the Source field if you want to define a specific source code in which the item is exempt from freight, or
4. Leave the Offer and Source fields blank in order to define the item as exempt from freight on all orders. An error message displays if you enter both an offer and source for an item: Only Offer OR Source may be entered, not both.

5. Select *OK*. The system validates your entries and highlights any fields you need to correct. Correct and fields and select *OK* again.
6. A message similar to the following informs you the item freight exemption has been created: `Freight Exempt Item FRT8769 was created`.

Select Ship Via for Exemption Screen

Purpose: Use this screen to flag an item as exempt from freight at the ship via level. If you do not flag any ship vias on this screen, the item is exempt from freight for all ship vias.

See *Freight Exempt Hierarchy* for more information on how the system determines when to exclude an item from the freight calculation.

Which ship vias display? The first time you advance to this screen, or if you have not selected any ship vias on this screen, all ship via codes defined in *Working with Ship Via Codes (WVIA)* display on the screen. If you flag an item as exempt from freight for a particular ship via on this screen, the next time you advance to this screen only those ship vias you have selected display on the screen. You can use the *Toggle All/ Selected* option to switch between displaying all ship vias or only those ship vias that have been selected for freight exemption. The Selected field indicates whether the item is exempt from freight for a particular ship via.

Ship via overrides during pick slip generation: The system reevaluates freight exempt items at the ship via level during pick slip generation if the system applies a ship via override to the pick slip. See *Determining the Shipper for the Pick Slip*.

How to display this screen: Select *Ship Via* for a freight exempt item at the *Work with Freight Exempt Items Screen*.

Ship vias display on this screen in ascending ship via code order.

Field	Description
Item	The code and description of the item that you wish to exempt from freight at the ship via level. This is the item you selected at the *Work with Freight Exempt Items Screen*. Item code: Alphanumeric, 12 positions; display-only. Item description: Alphanumeric, 120 positions; display-only.
Via	A code for a ship via for which you can flag the item as exempt from freight. Ship via codes are defined in and validated against the Ship Via table. Enter a ship via code and select *OK* to display ship via codes in numeric order, beginning with your entry. Numeric, 2 positions; optional.
Description	A description of the ship via. Enter a full or partial description and select *OK* to display ship vias that contain your entry. Alphanumeric, 30 positions; optional.
Priority	The priority assigned to the ship via in the Ship Via table, where *0* is the lowest priority and *9* is the highest priority. Enter a valid priority and select *OK* to display ship vias that match your entry. Numeric, 1 position; optional.

Field	Description
Selected	Indicates whether the item is exempt from freight at the ship via level. • If this field is *NO* for all ship vias on this screen, the item is not exempt from freight at the ship via level. The *Work with Freight Exempt Items Screen* indicates whether the item is exempt from freight for a specific offer, source code, or across all offers and source codes. • If this field is *YES* for one or more ship vias on this screen, the item is exempt from freight only for those ship vias selected. See *Freight Exempt Hierarchy* for more information on how the system determines when the exclude an item from the freight calculation.

Screen Option	Procedure
Flag the item as exempt from freight for a ship via	*Select* a ship via code or select *Select* for a ship via code to update the Selected flag for the ship via to *YES*.
Unflag the item as exempt from freight for a ship via	Select *Deselect* for the ship via code to update the Selected flag for the ship via to *NO*.
Flag the item as exempt from freight for all ship vias	Select *Select All* to update the Selected flag for all ship vias on this screen to *YES*.
Switch between displaying all ship vias on this screen and only those ship vias that have been selected as freight exempt for the item	Select *Toggle All/Selected*. The system switches between displaying all ship vias on this screen and only those ship vias that have been selected as freight exempt for the item.

Working with Item Coordinate Types (WICT)

Purpose: Item coordinate types allow you to group item coordinates by category to help identify which coordinate items are more important to upsell. You can assign a coordinate type to a coordinate item at the *Work with Item Coordinates Screen*.

A sequence number is assigned to each coordinate type, indicating the order (from lowest to highest) in which coordinate items assigned to the coordinate type display on the *Display Coordinate Items Window* in order entry.

In this topic:

- *Item Coordinate Type Example*
- *Updating Coordinate Type Sequence*
- *Work with Item Coordinate Type Screen*
- *Create Item Coordinate Type Screen*

Item Coordinate Type Example

You offer the following coordinates for a hammock:

- hammock stand

- hanging kit
- storage bag
- pillow
- blanket
- canopy

For each of these item coordinates, you assign a type to indicate its importance:

Coordinate	Type	Seq	Results
hammock stand: • metal • wooden hanging kit: • standard • deluxe	M (mandatory)	1	The customer is required to order either a hammock stand or hanging kit. Item coordinates assigned to type M display first on the *Display Coordinate Items Window*.
storage bag	S (strongly recommended)	2	A storage bag is strongly recommended for off-season storage. Item coordinates assigned to type S display after type M item coordinates on the *Display Coordinate Items Window*.
pillow: • cotton filled • down filled	R (recommended)	3	A pillow is recommended, but not required. Item coordinates assigned to type R display after type S item coordinates on the *Display Coordinate Items Window*.
blanket: • fleece • cotton canopy: • green • striped • mosquito netting	O (optional)	4	A blanket or canopy is an optional accessory. Item coordinates assigned to type O display after type R item coordinates on the*Display Coordinate Items Window*.

Updating Coordinate Type Sequence

If you change the sequence number assigned to a coordinate type, the system does not automatically update the sequence number for item coordinates that are assigned to the coordinate type.

For example, if the sequence number for coordinate type *R* is *3*, any item assigned to coordinate type *R* will have a sequence number of *3*. If you change the sequence number for coordinate type *R* from *3* to *5*, any items assigned to coordinate type *R* will still have a sequence number of *3*.

To update the sequence number assigned to item coordinates, select *Submit Update* at the *Work with Item Coordinate Type Screen*.

When you submit the Update Coordinate Type job, the system evaluates each item in the Item Coordinate table. If the item is assigned to a coordinate type, the system updates the sequence number defined for the item coordinate to match the sequence number defined for the coordinate type in the Item Coordinate Type table. Additionally, if the coordinate type has been deleted, the system will update the coordinate type and sequence number defined for the coordinate item to blank.

> **Note:**
>
> You can also update the sequence number assigned to item coordinates by advancing to the *Change Item Coordinate Screen* for each item coordinate you wish to update; however, if you have deleted the coordinate type, you will receive an error message at the Change Item Coordinate screen: `Item Coordinate Type not found`.

Work with Item Coordinate Type Screen

Use this screen to review and work with item coordinate types.

How to display this screen: Enter *WICT* in the Fast path field at the top of a menu or select Work with Item Coordinate Types from a menu.

Field	Description
Type	A code representing a type of item coordinate, such as mandatory or optional. Alphanumeric, 2 positions; optional.
Description	A description of the item coordinate type. Alphanumeric, 30 positions; display-only.
Seq (sequence)	The sequence number assigned to the item coordinate type, indicating the sequence in which coordinate items assigned to this type display on the *Display Coordinate Items Window* in order entry. Numeric, 3 positions; display-only.

Screen Option	Procedure
Create an item coordinate type	Select *Create* to advance to the *Create Item Coordinate Type Screen*.
Change an item coordinate type	Select *Change* for an item coordinate type to advance to the Change Item Coordinate Type Screen. See the *Create Item Coordinate Type Screen* for field descriptions.
Delete an item coordinate type	Select *Delete* for an item coordinate type to delete it.
Update the sequence number assigned to each coordinate item to match the sequence number defined for the coordinate type in the Item Coordinate Type table.	Select *Submit Update*. The system displays the message `Job (UPD_ITMTYP) has been submitted to batch` at the bottom of the screen. See *Updating Coordinate Type Sequence*.

Create Item Coordinate Type Screen

Purpose: Use this screen to create an item coordinate type.

How to display this screen: Select *Create* at the *Work with Item Coordinate Type Screen*.

Field	Description
Coordinate type	A code representing a type of item coordinate, such as mandatory or optional. Alphanumeric, 2 positions. Create: required. Change: display-only.
Description	A description of the item coordinate type. Alphanumeric, 30 positions; required.
Sequence	The sequence number assigned to the item coordinate type, indicating the sequence in which coordinate items assigned to this type display on the *Display Coordinate Items Window* in order entry. Numeric, 3 positions; required.

Setting up SKUs

Purpose: The following topics describe working with SKU elements, groups, split SKUs, and using the SKU generator.

- Introducing SKU Setup discusses SKU concepts and provides an overview of split SKU elements, groups, and the SKU generator.
- Working with SKU Elements (WSK1, WSK2, WSK3) explains how to create, change, delete, and display SKU elements.
- Working with SKU Groups (WISG) includes how to create, change, delete, and display SKU groups.
- Using the SKU Generator (ESKG) describes the SKU Generator and working with input and output screens, including working with SKU base information and creating individual SKUs.
- Resequence the SKU Collating Sequence Number (RSCS) explains how to assign a SKU sort sequence number to each SKU of a selected item.

Working with SKU Elements (WSK1, WSK2, WSK3)

Purpose: The SKU Element function defines the valid values for the three SKU elements (for example, style, color and size). The values defined in this record will be validated throughout the system. For example, if the SKU element is color, you must enter all your valid colors in the SKU Element table.

The SKU Element 1, 2 and 3 tables must be completed if you use SKUs.

When defining SKU elements in the SKU table, the SKU Element 1 field defines the primary SKU element (e.g., style), the Element 2 field defines the secondary SKU element (e.g., color), and the Element 3 field defines the third SKU element (e.g., size).

The Work with SKU Element 1, 2, and 3 screens appear identical.

Uploading: You can use the *Submit Supporting Data Upload Screen (SDUP)* to upload new SKU elements. See *Importing Item-Related Supporting Data (SDUP)* for an overview.

In this topic:

- *Work with SKU Element Screen*
- *Create SKU Element Screen*

Work with SKU Element Screen

Purpose: Use this screen to create, change, delete or display a SKU element.

How to display this screen: Enter:

- *WSK1* in the Fast path field at the top of any menu or select Work with SKU Element 1 from a menu to work with the primary SKU elements
- *WSK2* in the Fast path field at the top of any menu or select Work with SKU Element 2 from a menu to work with the secondary SKU elements
- *WSK3* in the Fast path field at the top of any menu or select Work with SKU Element 3 from a menu to work with the third SKU elements

Field	Description
Element	The code that represents a valid SKU element. Alphanumeric, 4 positions; optional.
Description	The description of the SKU element. Alphanumeric, 10 positions; optional.
Sort sequence # (Sort collating sequence number)	The sequence number used to determine how SKUs sort for an item. See *Create SKU Element Screen* for a complete description. Numeric, 5 positions; display-only.

Screen Option	Procedure
Create SKU element	Select *Create* to advance to the *Create SKU Element Screen*.
Change SKU element	Select *Change* for a SKU element to advance to the Change SKU Element Screen. See the *Create SKU Element Screen* for field descriptions.
Delete SKU element	Select *Delete* for a SKU element to delete it.
Display SKU element	Select *Display* for a SKU element to advance to the Display SKU Element Screen. See the *Create SKU Element Screen* for field descriptions.

Create SKU Element Screen

Purpose: Use this screen to create a SKU element.

How to display this screen: Select *Create* on the *Work with SKU Element Screen*.

Field	Description
Element	The code that represents a valid SKU element. Values defined in this record will be validated throughout the system. For example, if the SKU element is color, enter all your valid colors in this table. Alphanumeric, 4 positions. Create screen: required. Change screen: display-only.
Description	The description associated with the SKU element code. For example, if the SKU element code is BLK, the description might be black. Alphanumeric, 10 positions; required.
Sort sequence # (Sort collating sequence number)	The sequence number used to determine how SKUs sort for an item. The system assigns a SKU sort sequence number in increments of 10 to each SKU of an item based on the sort collating sequence number defined for each SKU element: • in *Resequence the SKU Collating Sequence Number (RSCS)*. • in the SKU Generator (*Using the SKU Generator (ESKG)*) if the *Auto Assign Sort Sequence Number During SKU Generation (F24)* system control value is *selected*. See *Assigning SKU Sort Sequence Numbers Based on SKU Element* for an overview. You can also manually assign a SKU sort sequence number to a SKUI; see *SKU Sort Sequence Numbers* for an overview. Numeric, 5 positions; optional.

Work with SKU Element 2 (WSK2)

See *Working with SKU Elements (WSK1, WSK2, WSK3)*.

Work with SKU Element 3 (WSK3)

See *Working with SKU Elements (WSK1, WSK2, WSK3)*.

Working with SKU Groups (WISG)

Purpose: Use the Work with SKU Groups menu option to set up standard combinations of SKU elements for the types of items you sell. For example, you could set up a group for shoes that includes standard sizes and widths.

Use in SKU generator: You can use SKU groups to reduce data entry when you use the SKU generator. By assigning an item to a SKU group, or specifying a group when you use the SKU generator, you automatically default each element in the group onto the *SKU Generator Screen (Entering SKU Information)*. You can then edit these defaulted elements as needed before generating the SKU combinations.

SKU group structure: You can set up a SKU group to contain one or two SKU elements.

Example: A SKU group for shoes might contain two elements, size and width; or a SKU group for baby clothes might contain one element, standard baby sizes such as 3 months, 6 months, etc.

Additionally, you can designate a SKU group as a primary group, consisting of the primary element only.

Example: If your first SKU element is color, a primary SKU group is restricted to color SKU values.

You cannot set up a SKU group that contains all three SKU elements.

Assigning to an item: If you assign a SKU group to an item through the Work with Item/SKUs menu option (fast path = *MITM*), the SKU group defaults in the SKU Generator and is display-only. See *Performing Initial Item Entry (MITM)*. If you do not assign a default SKU group to an item, you can specify a group at the time you use the SKU Generator.

Exclusions: When setting up a SKU group, you can identify certain combinations that you typically want to exclude when you use the SKU generator. For example, you might not ordinarily carry narrow-width shoes in sizes larger than 10. You can flag these SKU combinations so that the SKU generator does not automatically create them unless you reset the exclusion flag.

In this topic:

- *Work with SKU Groups Screen*
- *Create SKU Group Screen*
- *Change SKU Group Exclusion Screen (Creating or Changing)*

For more information: See *Using the SKU Generator (ESKG)* for more information on how to use SKU groups within the SKU generator.

Work with SKU Groups Screen

How to display this screen: Enter *WISG* in the Fast Path field at the top of any menu, or select Work with SKU Groups from a menu.

Field	Description
Group	A code that represents a group of standard combinations of SKUs for an item. Alphanumeric, 3 positions; optional.
Description	The description of the SKU group. Alphanumeric, 30 positions; optional.

Field	Description
Clr element	Indicates whether this SKU Group contains only the first, or primary, SKU element. Valid values are: *YES* = This SKU group contains the primary SKU element only. *NO* = This SKU group is not limited to the primary SKU element. **Note:** The abbreviation from the *Split SKU Element Column 1 Heading (A34)* system control value is listed above the word "Element."

Screen Option	Procedure
Create a SKU group	Select *Create* to advance to the *Create SKU Group Screen*.
Change a SKU group	Select *Change* for a group to advance to the Change SKU Group Screen. See the *Create SKU Group Screen* for field descriptions. If the SKU group contains two elements, you advance to the *Change SKU Group Exclusion Screen (Creating or Changing)* when you complete this screen.
Delete a SKU group	Select *Delete* for a group to delete it.
Display a SKU group	Select *Display* for a group to advance to the Display SKU Group Screen. See the *Create SKU Group Screen* for field descriptions. Select *OK* to advance to the Display SKU Group Exclusion screen if there are two SKU elements in the SKU group, or select *Exit* to return to the Work with SKU Groups screen.

Create SKU Group Screen

Purpose: Use this screen to define a new SKU group.

How to display this screen: Select *Create* at the *Work with SKU Groups Screen*.

Field	Description
SKU group	A code that represents a group of standard combinations of SKUs for an item. You can use SKU groups to reduce the data entry required for the SKU generator. Numeric, 3 positions. Create screen: required. Change screen: display-only.

Field	Description
Description	The description of the SKU group. Alphanumeric, 30 positions; required.
COLOR	Defines whether this SKU group includes only the primary SKU element (SKU element 1). Valid values are: *selected* = This group contains only the primary SKU element. You must enter *1* in the Element field, below, and can enter values for only the first SKU element. *Example:* If your three SKU elements are color, size, and width, the group can contain only the first SKU element, color. *unselected* = This group is not restricted to the primary SKU element. The group can include SKU values from one or two SKU elements. *Example:* If your three SKU elements are color, size, and width, the group can contain any one or two of these elements. **Note:** The code from the *SKU Element Description 1 (G37)* system control value is listed here as the field name.
Element (First SKU group element)	The first SKU element to include in the SKU group. You must include at least one but not more than two elements. If you set the previous field to *Y*, then you must enter 1 here, and can enter values for only this SKU element. If you set the previous field to *N*, you can enter *1*, *2*, or *3*, to select any of the SKU elements. Numeric, 1 position; required.

Field	Description
SKU values (Unlabeled fields below the first SKU element)	The SKU values to include in the SKU group. You must enter at least one SKU value, and can enter up to 30. Your entries are validated against the SKU Element 1, 2, or 3 table, depending on your entry in the first SKU group element field, above. *Example:* If your SKU elements are color, size, and width, and you entered *2* in the element field, above, you use these fields to enter sizes such as *2*, *4*, *6*, and so on, or *SMLL*, *MEDM*, or *LRGE*. The system validates your entries against the SKU Element 2 table. **Note:** The system does not prevent you from entering the same SKU value more than once. For example, if a valid SKU value is *SMLL*, the system does not prevent you from entering *SMLL* more than once. However, the SKU generator will still work correctly; the system will not attempt to create multiple copies of the same SKU combination. Alphanumeric, 4 positions each; required.
Element (Second SKU group element)	The second SKU element to include in the SKU group. You can enter values for a second SKU element only if this is not a primary SKU group. You can enter *1*, *2*, or *3*, to select any of the SKU elements, excluding the element you specified for the first SKU element, above. *Example:* If your SKU elements are color, size, and width, and you entered sizes for the first SKU group element fields, above, you can enter *1* (color) or *3* (width) here. Numeric, 1 position; optional.

Field	Description
SKU values (Unlabeled fields below the second SKU element)	The SKU values to include in the SKU group. You must enter at least one SKU value if you specified a second SKU element, and can enter up to 30. Your entries are validated against the SKU Element 1, 2, or 3 table, depending on your entry in the second SKU group element field, above. *Example:* If your SKU elements are color, size, and width, and you entered *3* in the element field, above, you use these fields to enter widths such as *A*, *B*, *C*, *D*, and so on. The system validates your entries against the SKU Element 3 table. **Note:** The system does not prevent you from entering the same SKU value more than once. For example, if a valid SKU value is *AA*, the system does not prevent you from entering *AA* more than once. However, the SKU generator will still work correctly; the system will not attempt to create multiple copies of the same SKU combination. Alphanumeric, 4 positions each; required.

Instructions:

1. Complete the necessary fields for the group and the first SKU element. Enter each value to include for the first SKU element. If you designate the SKU group as a primary group, then you must enter *1* in the first SKU group element field, and only values from SKU element one.
2. Optionally, complete the second SKU element and values if this is not a primary SKU group.

When you complete this screen, you advance to the *Change SKU Group Exclusion Screen (Creating or Changing)*, unless the SKU group contains only one SKU element.

Change SKU Group Exclusion Screen (Creating or Changing)

Purpose: Use this screen to identify the SKU combinations to flag for deletion when you use the SKU generator.

Example: You have a SKU group for sportcoats that includes sizes from 38 to 50, and lengths of short, regular, and long. If you do not ordinarily offer long sportcoats in sizes under 40, you use this screen to flag any 38 long SKU combination for deletion. When you use the SKU generator, this SKU combination will have the Delete flag *selected*, although you can override it at that point if you want to create the SKU for an item.

How to display this screen: Complete the *Create SKU Group Screen* or the Change SKU Group Screen; however, you do not advance to this screen if the SKU group contains only one SKU element.

Field	Description
SKU group	A code representing the SKU group you are working with. Numeric, 2 positions; display-only.
Description	The description of the SKU group you are working with. Alphanumeric, 30 positions; display-only.
SIZE/Elem 2	The first SKU element in the SKU group. Depending on how you have set up your SKU elements, the description of this field will vary. Alphanumeric, 4 positions; optional.
WDTH/Elem 3	The second SKU element in the SKU group. Depending on how you have set up your SKU elements, the description of this field will vary. Alphanumeric, 4 positions; optional.
Exclude	Indicates whether the SKU generator should create this SKU combination with the Delete flag *selected*, indicating that the SKU combination will not be created unless you override this setting. Valid values are: *YES* = When you use the SKU generator, the Delete flag for this SKU combination will be *selected*. *No* = When you use the SKU generator, the Delete flag for this SKU combination will be blank.

Completing this screen: To identify SKU combinations that should be created in the SKU generator with the Delete flag *selected*:, *select* each SKU combination you normally exclude in the SKU generator, *Tab* through each excluded combination that you would like to include when generating SKUs.

Using the SKU Generator (ESKG)

Purpose: The SKU generator creates SKUs for an item by allowing you to specify the valid SKU elements (for example, size, color and width) and using them to create an array of valid SKU combinations.

You can use the SKU generator repeatedly for the same item. For example, if you initially create SKUs for an item in one color with various sizes, and later determine that the item is available in a second color, you can create SKUs for the new color and sizes.

SKU groups: You can use SKU groups to facilitate SKU building by reducing data entry. SKU groups allow you to define common sizes, etc. for types of items.

When generating SKUs for an item, you can accept the defaults as defined in a SKU groups, or you can add or subtract individual SKUs.

Create SKU Offers? The *Automatically Create SKU Offers (J71)* system control value indicates whether the SKU generator automatically creates SKU Offers and single-unit SKU Prices based on current or future Item Offers and Item Prices. See that system control value for more information.

In this topic:

- *SKU Generator Prompt Screen (Selecting an Item)*
- *SKU Generator Screen (Entering SKU Information)*

- *Work with SKU Generator Screen*
- *Enter SKU Base Information Pop-Up Window*
- *Create SKU Generator Screen (Creating Individual SKUs)*

SKU Generator Prompt Screen (Selecting an Item)

Purpose: Use this screen to select an item and begin the process of generating SKUs.

How to display this screen: Enter *ESKG* in the Fast path field at the top of any menu or select SKU Generator from a menu.

Entering an item: Enter a valid item code to proceed to the *SKU Generator Screen (Entering SKU Information)*. The item must be SKU'ed (have a *selected* SKU field in the Item table), or an error message indicates: `SKU Generation is not allowed for non-SKU items`.

You cannot use the SKU generator if it is already in use by another person; instead, an error message such as the following indicates: `EJOHNSON already active in the SKU Generator`.

SKU Generator Screen (Entering SKU Information)

Purpose: Use this screen to enter the information to default for the SKU combinations you are creating. The information includes SKU group, vendor item information, and individual SKU elements.

How to display this screen:

- Enter an item code at the *SKU Generator Prompt Screen (Selecting an Item)*.
- Select *SKU Generator* for an item with SKUs at the Work with Item screen.
- You advance to this screen automatically when you create a SKU'ed item if the *Auto Advance to SKU Generator (J06)* system control value is *selected*.

Field	Description
Item	The code and description of the item for which you are generating SKUs. Alphanumeric, 12 positions (item code) 30 positions (description); display-only.
SKU group	If you have assigned the item to a SKU group in the Item table, the group appears here and is display-only; the associated SKU elements appear on the screen. Otherwise, you can enter a valid SKU group to default the related SKU elements. **Note:** Enter the SKU group before entering any SKU values, or the system will clear your SKU value entries when it defaults the values from the SKU group. SKU groups are defined in and validated against the SKU Group table; see *Working with SKU Groups (WISG)*. Numeric, 3 positions; optional or display-only.

Field	Description
SKU default cost	The cost of the SKU. The default cost you entered when you created the item defaults here, but you can override it here or for individual SKUs. Overriding the cost here does not update the default cost for the item. Numeric, 13 positions with a 4-place decimal; optional.
Original retail price	Not currently implemented. Numeric, 13 positions with a 2-place decimal; optional.
List price	The price at which manufacturers recommend retailers sell a product. The system uses this price when you process item to item transfers (inventory transaction code = *G*). The list price of the source and target items must be identical, or the system will not allow you to process the transfer. If you are changing the quantity as part of the transfer, the system will confirm that the list price of the source item is the same as the list price of the target item based on the target item's quantity. For example, if the target item will constitute a set of three of the source item, the list price of the target item should be three times the list price of the source item. Numeric, 13 positions with a 2-place decimal; optional (required if you process item to item transfers).
Create vendor items	Defines whether you want to create vendor items. Valid values are: 1. *Selected* = Create vendor items for each SKU you create. The vendor item code defaults on the Work with SKU Generator Screen as described below under Item. *If the Default SKU generator vendor item system control value is selected*: The system defaults the SKU information to the vendor item code field. Typically, you would default this information if your company's SKU codes are the same as your vendor's SKU codes. Having the system create the vendor item codes can save you data entry. You can override the vendor item codes if necessary. *If the Default SKU generator vendor item system control value is unselected*: You will need to edit the vendor item codes for the SKUs so that they are each unique, or the system displays an error message. 1. *Unselected* = Do not create vendor items. The vendor item information is display-only on the Work with SKU Generator Screen. You should not complete any of the vendor-related fields described below.
Vendor	The code used to identify the vendor. Vendor codes are defined in and validated against the Vendor table. The vendor you assigned to the item, if any, defaults. Enter a vendor code only if you are creating vendor items. See Working with Vendors (WVEN). Numeric, 7 positions; optional (required if you are creating vendor items).
Vendor name	The name of the vendor. Alphanumeric, 30 positions; display-only.

Field	Description
Item	The vendor's item code. The same item code will be used for all the SKUs you create, unless you change the vendor item code on the *Work with SKU Generator Screen*. If the *Default SKU Generator Vendor Item (C61)* system control value is *selected*, and you enter an item here, the system appends the SKU information to your entry in this field to compose the vendor item code. Alphanumeric, 20 positions; optional.
Description	The vendor's description of the item. Alphanumeric, 30 positions; optional (required if creating vendor items).
Price	The vendor's price for the item. When you enter a purchase order, this price defaults. Numeric, 13 positions with a 4-place decimal; optional.
Lead days	The number of days it takes a vendor to deliver this item when you place a purchase order. The system adds the lead days to the current date to determine the due date for an item on a purchase order. Numeric, 3 positions; optional.
U/M (Unit of measure)	A standard by which a vendor's item is sold. Typical units of measure include: • *EA* - each • *IN* - inch • *C12* - case of 12 Unit of measure is defined in and validated against the Unit of Measure table. See *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; optional.
Duty (Duty percent)	The percentage of duty or tariff charges applicable to foreign orders. *Update vendor item additional charge:* The system creates an additional charge for each vendor item, using the first purchase order additional charge code whose type is *D* (duty). If there is no duty additional charge code defined in your company, the system creates a blank additional charge for the vendor item. See *Working With PO Additional Charges (WPAC)*, and *Working with Vendor Items (WVNI)*. *Calculate receiving cost*: When you enter or receive purchase orders, the system uses this percentage to calculate the amount of duty that applies to the item. This duty percentage will not be visible when you review the purchase order in purchase order inquiry; however, it will be added to the last purchase cost in the SKU table. See *Purchase Order Receiving Overview*. Numeric, 7 positions with a 2-place decimal; optional.

Field	Description
Color/style/size (SKU elements)	Use these three levels to define the elements to create the various SKU combinations. You can enter up to 30 different elements for each type. If the item is assigned to a SKU group, or if you entered a SKU group at this screen, the SKUs for the group default; however, you can override these defaults. SKU elements are validated against the SKU Element 1, 2, and 3 tables (fast paths = *WSK1*, *WSK2*, *WSK3*). If you enter a SKU element that has not been created, an error message indicates: SKU Element (xxxx) does not exist. See *Working with SKU Elements (WSK1, WSK2, WSK3)*. **Note:** No error message indicates if you enter the same SKU element value more than once; however, the system still creates the SKU combinations normally, without duplicates. Alphanumeric, thirty 4-position fields for each element; required.

Completing this screen: Select *Accept* to accept and begin the SKU generation, or select *Reject* to reject the SKU generator information. If you select *Accept*, you advance to the *Work with SKU Generator Screen*.

Work with SKU Generator Screen

Purpose: Use this screen to review the SKU combinations generated based on your entries at the SKU Generator screen, and to change this information as needed. At this screen, you can:

- delete unnecessary SKUs which were created by the SKU generator
- add SKUs which weren't created
- override information for each SKU or vendor item

How to display this screen: The system creates SKU s (and, optionally, vendor items) and then advances to this screen when you select *Accept* to accept your entries at the *SKU Generator Screen (Entering SKU Information)*.

Field	Description
Item	The code and description of the item. Alphanumeric, 12 positions (item code) 30 positions (description); display-only.
Vendor	The numeric code that identifies the supplier of an item. Numeric, 7 positions; display-only.
Default cost	The default cost of the item from the previous screen. Numeric, 13 positions with a 4-place decimal; display-only.

Field	Description
Create vendor items	Displayed regardless of your entry in the *Create vendor items* field on the previous screen. Valid values are: • *Selected* = Create vendor items. • *Unselected* = Do not create vendor items. The related fields are not enterable. blank = The vendor item-related fields are enterable on the screen. **Note:** The system does not create the vendor items when you accept your entries. Your entry on the previous screen defaults. Enter a new value to change whether the vendor item-related fields are enterable.
Vendor item	The vendor's item code. Your entry at the *SKU Generator Screen (Entering SKU Information)* defaults. *If the Default SKU generator vendor item system control value is selected:* The SKU information appears after the defaulted vendor item code. The SKU information appears by itself if you didn't enter a vendor item at the *SKU Generator Screen (Entering SKU Information)*. *If the Default SKU generator vendor item system control value is unselected:* This field is blank if you are not creating vendor items, or if you did not enter a vendor item code at the *SKU Generator Screen (Entering SKU Information)*. Alphanumeric, 20 positions; optional.
Description	The vendor's description of the item, defaulted from the *SKU Generator Screen (Entering SKU Information)*. You can override this information. Alphanumeric, 30 positions; optional.
Price	The vendor's price for the item, defaulted from the *SKU Generator Screen (Entering SKU Information)*. You can override this information. Numeric, 13 positions with a 4-place decimal; optional.
Lead days	The number of days it takes a vendor to deliver this item when it is ordered through a purchase order. Added to the current date to determine the due date on a purchase order detail line. Defaults from the *SKU Generator Screen (Entering SKU Information)*. You can override this information. Numeric, 3 positions; optional.

Field	Description
Unit of measure	A standard by which a vendor's item is sold. Typical units of measure include: 1. *EA* - each 2. *IN* - inch 3. *C12* - case of 12 Unit of measure is validated against the Unit of Measure table. Defaults from the *SKU Generator Screen (Entering SKU Information)*. You can override this information. Alphanumeric, 3 positions; optional.
Duty (Duty percent)	The percentage of duty or tariff charges applicable to foreign orders. You can override this information. Numeric, 7 positions with a 2-place decimal; optional.
SKU description	The SKU description. Alphanumeric, 40 positions; optional.
SKU	The specific SKU elements. Alphanumeric, three 4-position fields; display-only.
Sort seq. (SKU sort sequence number)	The sequence number used to determine the order in which SKUs sort. You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphanumerically by SKU code. See *SKU Sort Sequence Numbers* for an overview. Required if the *Require Sort Sequence Number in the SKU File (F23)* system control value is *selected*. The system automatically assigns a SKU sort sequence number if the *Auto Assign Sort Sequence Number During SKU Generation (F24)* system control value is *selected*. If this system control value is *selected*, this field does not display. Numeric, 5 positions; required if the Require Sort Sequence Number system control value is *selected*.
Cost	The cost of the SKU, defaulted from the Item table. You can override this value. Numeric, 13 positions with a 4-place decimal; optional.
Delete	Defines whether you wish to delete this SKU. Valid values are: • *Selected* = Delete this SKU. • *Unselected* = Do not delete this SKU; the SKU generator should create it. Defaults to *selected* if you are using a SKU group, and you flagged the SKU combination for exclusion. See *Working with SKU Groups (WISG)*.

Field	Description
L/S class (Long SKU class)	A code you can assign to SKUs for tracking and reporting purposes. The long SKU class you assigned to the base item defaults. If the *Use Retail Integration (H26)* system control value is *selected*, long SKU classes are linked to long SKU departments and are called retail classes. Retail classes are department specific whereas regular long SKU classes are unique and remain constant across departments. For this reason, when the *Use Retail Integration (H26)* system control value is *selected*, you can only enter a retail class in this field that is assigned to the long SKU department of the base item. If you enter a long SKU class that is not linked to the long SKU department, the system will not let you proceed and displays an error message: `L/S Class (xxxx) was not found in L/S Department (xx).` Retail classes are defined in and validated against the Retail Class table; see the *Work with Retail Class Screen* for more information. Long SKU classes are defined in and validated against the Long SKU Class table; see *Working with Long SKU Classes (WLSC)*. **Note:** When the *Use Retail Integration (H26)* system control value is *selected*, you can not access the Work with Long SKU Class menu option or the *WLSC* fast path. Numeric, 5 positions; optional.
L/S vendor (Long SKU vendor)	A code you can assign to SKUs for tracking and reporting purposes. The long SKU vendor you assigned to the item defaults. Long SKU vendor codes are defined in the SKU table but are not validated in Order Administration. Alphanumeric, 7 positions; optional.

Field	Description
L/S style (Long SKU style)	A code you can assign to SKUs for tracking and reporting purposes. Long SKU style is also used by external systems to identify the item. If the *Default SKU Generator L/S Style (J04)* system control value is selected, the SKU generator automatically creates a Long SKU style for each SKU. • If a long SKU style code is defined for the base item, the system creates a long SKU style code for each SKU using the base long SKU style code + SKU code. • If a long SKU style code is not defined for the base item, the system creates a long SKU style code for each SKU using the item code + SKU code. **Note:** The Long SKU style field is 20 positions. If the generated long SKU style code is greater than 20 positions, the system will truncate the value to 20 positions. If the *Default SKU Generator L/S Style (J04)* system control value is unselected and the *Require L/S Style (I94)* system control value is unselected, the system defaults the long sku style code defined for the base item to this field. Required if the *Require L/S Style (I94)* system control value is selected: `L/S Style Required`. Additionally, the system validates that the value you enter is not assigned to another item or SKU: `L/S Style is a duplicate`. Long SKU style codes are defined in the SKU table but are not validated in Order Administration. Numeric, 20 positions; optional.
Original retail price	Not currently implemented. Numeric, 13 positions with a 2-place decimal; optional.
List price	The price at which manufacturers recommend retailers sell a product. The system uses this price when you process item to item transfers (inventory transaction code = *G*). The list price of the source and target items must be identical, or the system will not allow you to process the transfer. If you are changing the quantity as part of the transfer, the system will confirm that the list price of the source item is the same as the list price of the target item based on the target item's quantity. For example, if the target item will constitute a set of three of the source item, the list price of the target item should be three times the list price of the source item. Numeric, 13 positions with a 2-place decimal; optional (required if you process item to item transfers).

Instructions: To accept the SKU information:

1. Edit or add information to the necessary fields.
2. To create additional SKUs, select *Create* and enter the SKU details at the *Create SKU Generator Screen (Creating Individual SKUs)*.
3. Select *Accept* to accept. The system displays an error message if any of the SKU combinations are duplicates of existing SKUs. Flag each duplicate for deletion by *selecting* the Delete field, or correct as desired.
4. Select *Accept* again. You advance to the *Enter SKU Base Information Pop-Up Window*.

Enter SKU Base Information Pop-Up Window

Purpose: Use this window to define the information applicable to all the SKUs you are creating. The system copies this information to each SKU. You can override this information on the Change SKU screen.

How to display this screen: Select *Accept* at the *Work with SKU Generator Screen*.

Field	Description
Item	The code and description of the base item for which you are creating SKUs. Alphanumeric, 12 positions (item code) 30 positions (description); display-only.
U/M (Unit of measure)	A standard by which a vendor's item is sold. Typical units of measure include: • *EA* - each • *IN* - inch • *C12* - case of 12 If you leave this field blank, the unit of measure defined for the base item defaults for the SKUs. Unit of measure is validated against the Unit of Measure table. See *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; optional.
Itm category (Item category)	A code assigned to the item to classify and group like items for use in the Item Relationships function. The Compatibility field should also be completed to fully use the Item Relationships function. See Working with Item Category Codes (WITG). Numeric, 4 positions; optional.
Compatibility	A code assigned to an item or SKU which you can use in the Item Relationships function to display a list of other compatible items. *Example:* Item PC1 represents an IBM PC. You can assign a compatibility code of 01 (IBM Products) to this item and to other IBM items such as printers, network cards, etc. Numeric, 3 positions; optional.
Prep code	A code used to indicate any special preparation or handling required for the SKU. Informational only. Alphanumeric, 2 positions; optional.
Return/vendor	Indicates whether the SKU can be returned; informational only. Valid values are: • *Selected* = This SKU is returnable. • *Unselected* = This SKU is not returnable.

Field	Description
Country of origin	A code representing the country where the SKU originated. Used by the World Pack interface to determine duty for shipments to certain countries. Country codes are defined in and validated against the Country table; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; optional.
S/O control (Soldout control)	This code, from the Soldout Control table, indicates when the item is considered sold out. An item can be sold out: • immediately • when the available quantity equals zero • when the available quantity plus any quantity due on purchase orders equals zero. If you have specified a *Default Soldout Control Code (D72)* it defaults here, but you can override it. If the *Disregard Soldout Controls for Non-Allocatable Warehouses (J27)* system control value is *selected*, the system disregards soldout control rules for items reserved against a non-allocatable warehouse. If the item cannot be reserved, the system backorders the item in the non-allocatable warehouse. See this system control value for more information. See *Working with Soldout Controls (WSLD)* for more information on working with soldout controls. Alphanumeric, 2 positions; optional.
Sup B/O card (Suppress backorder card)	Indicates whether to produce a backorder card for the SKUs. You might use this field to identify promotional items, free gifts, or catalogs, to prevent them from generating backorder cards or appearing on backorder lists. Valid values are: • *Selected* = Suppress normal backorder card generation for this item. • *Unselected* = Do not suppress normal backorder card generation. If the *Unconditional Suppression of Backorder Card (F19)* system control value is *selected*, suppressed SKUs will never appear on a backorder card. If this system control value is *unselected*, suppressed SKUs will appear only on the first backorder card for the order, and only if an unsuppressed item triggers the backorder card generation.
Zone reservation	A code assigned to weather-sensitive items or SKUs such as plant stock to insure that the SKUs will ship to different regions of the country within date windows suited to the regions. Zone reservation coded items/SKUs will not be reserved during order entry; instead they will be assigned a backorder status of *Z* (Zoned reservation), and will be reserved during pick generation using the batch reservation function, at an optimal time for shipping.

Field	Description
	Zone reservation logic requires: • The item/SKU must be assigned a zone reservation code. For SKU'ed items, the zone reservation code must be assigned at the SKU level. • The offer associated with the order must be assigned a season code • The shipping address for the order must be assigned to a geographic zone, using either the postal ZIP code of the ship to address, or the SCF (Sectional Center Facility) code of the ship to address. The SCF code consists of the first three digits of the ZIP code. • For each zone reservation code, you must define zone date windows for all geographic zones in the country See *Creating and Maintaining Geographic Zones (WGZN)*. Alphanumeric, 4 positions; optional.
Warehouse	A code that represents the warehouse where you will keep the SKU. The default warehouse from the System Control table defaults. Warehouse codes are validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; required.
Whs max (Warehouse maximum)	The recommended maximum quantity of the SKU to keep in the warehouse. Numeric, 7 positions; optional.
Whs min (Warehouse minimum)	The recommended minimum quantity of the SKU to keep in the warehouse. Numeric, 7 positions; optional.
Allocation freeze	Indicates whether reservations can be performed against the SKU in the specified warehouse. • *Selected* = The SKU is on hold for item reservation. All other inventory transactions are allowed. • *Unselected* = The SKU is not on hold for item reservation.
Protected Quantity	An amount of inventory that is not reserved automatically for this SKU. You can reserve the protected quantity through *Working with Interactive Reservation (MIRV)* only, as in the case of large wholesale orders or preferred mail order customers. Protected quantity is included in on-hand quantity. Numeric, 7 positions; optional.
Reorder qty (Reorder quantity)	The quantity of this SKU that should be ordered when the on-hand quantity reaches the minimum from the Min Qty field. Numeric, 7 positions; optional.
Location	The default location in the warehouse where the item is kept. This location is sometimes referred to as the “primary primary.”The “primary primary” location is stored in the field in the SKU table. Alphanumeric, 7 positions; optional.
Loc max (Location maximum)	The maximum quantity of the item to keep in this location. Numeric, 7 positions; optional.
Loc min (Location maximum)	The minimum quantity of the item to keep in this location. Numeric, 7 positions; optional.

Field	Description
Freeze flag	Indicates whether to generate pick slips for this item location. Valid values are: • *Selected* = This item location is available for pick slips. • *Unselected* = This item location is not available for pick slips.
Restrict	Indicates whether you can accept an order for this item/SKU in and whether demand is captured. • *Selected* = The operator cannot accept an order for this item/ SKU. • *Unselected* = The operator can accept an order for this item/SKU.

Create SKU Generator Screen (Creating Individual SKUs)

Purpose: Use this screen to add a SKU that was not generated based on the information from the SKU Generator screen. For example, if your SKU generator for Shoes does not generate a SKU for Size 11 shoes, you may want to add the SKUs Black, 11, B width, and Black, 11, A width to the SKUs for this item.

How to display this screen: Select *Create* on the *Work with SKU Generator Screen*.

Field descriptions: See *SKU Generator Screen (Entering SKU Information)* for field definitions.

Resequence the SKU Collating Sequence Number (RSCS)

Purpose: Use the *Resequence SKU Collating Sequence Number Screen* to assign a SKU sort sequence number to each SKU of an item.

In this topic:

- *SKU Sort Sequence Numbers*
- *Where is the Sort Sequence Number Used?*
- *How is a Sort Sequence Number Assigned?*
- *Related System Control Values*
- *Assigning SKU Sort Sequence Numbers Based on SKU Element*
- *Resequence SKU Collating Sequence Number Screen*

SKU Sort Sequence Numbers

SKU Sort Sequence Numbers are sequence numbers assigned to SKUs to determine the order in which the SKUs sort. You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphanumerically by SKU code.

Example: T-Shirts in sizes extra small, small, medium, large and extra large that are not assigned a SKU sort sequence number sort alphanumerically by SKU code:

- t-shirt LRGE
- t-shirt MEDM
- t-shirt SMLL
- t-shirt XLRG

- t-shirt XSML

You can define a SKU sort sequence number for each SKU of the t-shirt so that they sort from smallest to largest size:

- t-shirt XSML (sequence # 1)
- t-shirt SMLL (sequence # 2)
- t-shirt MEDM (sequence # 3)
- t-shirt LRGE (sequence # 4)
- t-shirt XLRG (sequence # 5)

> **Note:**
>
> If some SKUs of an item are not assigned a sort sequence number, the system sorts those SKUs first alphanumerically by SKU code, and then displays SKUs assigned to a sort sequence alphanumerically by sort sequence. For example, if sizes SMLL, MEDM, and LRGE are assigned a sort sequence number, but sizes XSML and XLRG are not assigned a sort sequence number, the system displays sizes XLRG and XSML first: XLRG, XSML, SMLL, MEDM, LRG.

Where is the Sort Sequence Number Used?

The sequence number is used to sort items:

1. when scanning for a SKU during purchase order maintenance
2. when scanning for a SKU during order entry and maintenance

How is a Sort Sequence Number Assigned?

You can assign a SKU sort sequence number to each SKU of an item in the following ways.

1. Enter a SKU sort sequence number in the Sort sequence number field on the *Create SKU 1 of 2 (With Overrides) Screen* or the Change SKU screen.
2. Select an item that contains SKUs at the *Resequence SKU Collating Sequence Number Screen* and select *OK* to have the system automatically assign a sort sequence number to each SKU, based on the SKU collating sequence number defined for each SKU element. See *Assigning SKU Sort Sequence Numbers Based on SKU Element*.
3. Enter a SKU sort sequence number in the Sort sequence number field on the *Work with SKU Generator Screen* in *Using the SKU Generator (ESKG)*.
4. *Select* the *Auto Assign Sort Sequence Number During SKU Generation (F24)* system control value to have the system automatically assign a SKU sort sequence number to each SKU in the SKU Generator (fast path = *ESKG*).

Related System Control Values

System Control Value	Description
Auto Assign Sort Sequence Number During SKU Generation (F24)	Defines whether the system automatically assigns a SKU sort sequence number to each SKU created in the SKU Generator.

System Control Value	Description
Require Sort Sequence Number in the SKU File (F23)	Defines whether the Sort sequence number field on the Create SKU and Change SKU screens in Work with Item/SKUs is a required field.

Assigning SKU Sort Sequence Numbers Based on SKU Element

The system uses the sort collating sequence number defined in *Working with SKU Elements (WSK1, WSK2, WSK3)* to determine the SKU sort sequence number to assign to each SKU. The system assigns a sort sequence number to each SKU in increments of 10.

Example:

For example, you are generating SKUs for a skirt in colors black and navy, styles petite and regular and sizes small and medium.

In Work with SKU Elements, the sort sequence numbers are defined as follows:

- *SKU Element 1*
- black: sort sequence number is blank
- navy: sort sequence number is blank
- *SKU Element 2*
- petite: sort sequence number is 1
- regular: sort sequence number is 12
- *SKU Element 3*
- small: sort sequence number is 2
- medium: sort sequence number is 5

To assign the sort sequence number, the system first retrieves the sort sequence number defined in Work with SKU Element 1. In this example, the colors black and navy are not assigned a sort sequence number. Since they are not assigned a sort number, the system sorts the elements defined in SKU Element 1 alphanumerically.

The system then retrieves the sort sequence number defined in Work with SKU Element 2. In the example, petite is assigned a sort sequence number of 1 and regular is assigned a sort sequence number of 12. The system sorts petite styles before regular styles.

The system then retrieves the sort sequence number defined in Work with SKU Element 3. In the example, small is assigned a sort sequence number of 2 and medium is assigned a sort sequence number of 5. The system sorts small sizes before medium sizes.

The system assigns SKU sort sequence numbers to each SKU based on the sort collating sequence numbers defined for each SKU element:

Item/ SKU	Element 1/ Sequence #	Element 2/ Sequence #	Element 3/ Sequence #	SKU Sort Sequence Number
skirt	black (blank)	petite (1)	small (2)	10
skirt	black (blank)	petite (1)	medium (5)	20
skirt	black (blank)	regular (12)	small (2)	30
skirt	black (blank)	regular (12)	medium (5)	40
skirt	navy (blank)	petite (1)	small (2)	50
skirt	navy (blank)	petite (1)	medium (5)	60
skirt	navy (blank)	regular (12)	small (2)	70
skirt	navy (blank)	regular (12)	medium (5)	80

Resequence SKU Collating Sequence Number Screen

Use this screen to select an item you wish to assign SKU sort sequence numbers to for each of the item's SKUs.

The following error message indicates if the *Auto Assign Sort Sequence Number During SKU Generation (F24)* system control value is *unselected*: `Auto Assign Sort Seq# is not selected`.

How to display this screen: Enter *RSCS* in the Fast path field at the top of any menu or select Resequence SKU Collating Sequence Number from a menu.

Field	Description
Item number	The item you wish to assign SKU sort sequence numbers to for each of the item's SKUs. The following error message indicates if you enter an item that does not contain SKUs: `Item entered is a Non-SKU'd Item`. Alphanumeric, 12 positions; required.

Working with Sets

In this part: The following topics describe how to create, change, delete, and display sets.

- Introducing Sets provides a brief overview of sets and how to select the set tables.
- Entering Set Information (WSET) describes a set; how to scan for, create, and delete sets; and how to work with set component items.
- Entering Variable Set Information (WVST) defines a variable set and includes how to scan for, create, and delete variable sets, and how to work with variable set groups.
- Entering Finished Goods Information (WFGD) defines a finished good and includes how to scan for, create, and delete finished goods sets, and how to work with finished good component items.

Entering Set Information (WSET)

Purpose: Use the Work with Sets function to indicate which component items make up a set. A set is a group of two or more items that you sell together as a unit, usually at a reduced price. The items that make up a set are often referred to as components. You can also offer these components individually.

The system identifies a set item by the setting of *S* in the *Kit type* field. When the Order Entry operator enters the set item, a line is added to the order for each component of the set. The set item itself is a non-inventory item. All inventory is kept at the component level.

The system tracks Unit Demand (Units Order) at both the component item level and set level, and Dollar Demand at the set level only. For example, a set is made up of 3 combs and 2 brushes. Someone orders the comb/brush set for $15.00. Units ordered for the comb/brush set increases by 1, units ordered for brushes increase by 2, and units ordered for combs increase by 3. Dollars ordered for the set item only increases by $15.00. Dollars orders for the component items increase only when you sell them as separate items.

Making sure the set ships together: You must make sure to coordinate group the components of the set; otherwise, it is possible for the main set item to print and bill even if there is not a sufficient quantity of the component items. Also, a set may split into several picks based on the warehouse, ship via, or location class assigned to the main set item and its components; see *Splitting an Order Across Multiple Picks* for a complete list of when the items on an order may split into several picks. *Example:* If the component items are assigned to location class B and the main set item is not, the main set item prints on a separate pick slip from the components.

Print set separately? If the main set item or its component items are flagged as ship alone items, a separate pick slip prints for each item included in the set with the message **Other Items Shipped Separately**. However, the system will include the main set item with one of the component items that is assigned to the same ship via in order to avoid printing the main set item on its own pick slip. If the main set item or its component items are not flagged to ship alone, the main set item and components are eligible to print on the same pick slip as the other items.

If set is on hold: If the main set item is on hold, the system does not perform pick slip preparation or produce a pick slip for the set and its components, regardless of whether the components of the set are coordinate grouped, until the main set item is released from hold. If another item on the order prints on a pick slip, the set and its components are listed as backordered on the pick slip.

If a component of the set is on hold:

- The system does not perform pick slip preparation or produce a pick slip for the set and its components if the components of the set are coordinate grouped. If another item on the order prints on a pick slip, the set and its components are listed as backordered on the pick slip.
- If the components of the set are not coordinate grouped, the system performs pick slip preparation and generates a pick slip for the main set item and the components that are not on hold. The component that is on hold is listed as backordered on the pick slip.

Secured feature: The *Set Component Maintenance (J01)* secured feature controls the ability to change, cancel, delete, or sell out a set component item in order entry and order maintenance. See that secured feature for more information.

Soldouts:

- *Component items(s):*

- If the *Sell Out Set if Component is Sold Out (I05)* system control value is *selected*: When any of the component items on a set are sold out based on the assigned soldout control code and the current inventory situation, the main set item and each of the component items are added to the order in a soldout status (*S*). For example, if the set includes five items, and one of the items is assigned a soldout control code indicating to sell the item out immediately, the main set item and all of the component items will be added to the order in a soldout status.
- If this system control value is *unselected*: In the example described above, just the sold out component item is added to the order in a soldout status.
- *Main set item:* If the main set item itself is assigned any soldout control code, the main set item and each of the component items are added to the order in a soldout status (*S*).

See *Working with Soldout Controls (WSLD)* for a discussion on how soldout controls indicate when an item is sold out.

> **Note:**
>
> When one or more of the set's components are backordered (that is, they are unavailable, but no soldout control code has been assigned to them) the system will not perform pick slip preparation or generate a pick slip for the set item if the components are coordinate grouped.

Set component upload: You can use the set component upload option to create the set header and set components. See *Importing Set Components (WCUP)* for information.

Cannot add accompanying item with set: The system does not add an accompanying item to the order if it is associated with a set item.

In this topic:

- *Work with Sets Screen*
- *Create Set Screen*
- *Work with Set Component Items Screen*

Work with Sets Screen

How to display this screen: Enter *WSET* in the Fast Path field at the top of any menu or select Work with Sets from a menu.

Field	Description
Item	The set item code. Alphanumeric, 12 positions; optional.
Clr Size Wdth	The SKU elements. Scanning on these fields is not currently implemented. Alphanumeric, three 4-position fields; optional.
Description	The description of the set item. Alphanumeric, 30 positions; optional

Screen Option	Procedure
Create a set	Select *Create* to advance to the *Create Set Screen*.
Delete a set	Select *Delete* for a set item to delete it. Deleting a set does not delete the set item or components, just the association (link) between the two.
Work with set component items	Select *Work with* for a set item to advance to the *Work with Set Component Items Screen*.

Create Set Screen

Purpose: Use this screen to create a set item.

How to display this screen: At the *Work with Sets Screen*, select *Create*.

Field	Description
Set item	A set item/SKU. The set item/SKU is made up of two separate fields. The first part is the item code, which represents a unit of inventory. The second part is the SKU code, which represents the special characteristics of an item, such as color, size, width, etc. The item code you enter must have an *S* in the *Kit type* field. Alphanumeric, 12 positions (item), three 4-position fields (SKU); required.

Completing this screen: Enter the item number to advance to the *Work with Set Component Items Screen*.

Work with Set Component Items Screen

Purpose: Use this screen to add, change, delete, or display component items that make up a set (as defined by an *S* in the Kit Type field in the Item table).

How to display this screen:

- Enter an item at the *Create Set Screen*.
- Select *Work with* for a set item at the *Work with Sets Screen*.
- Select *Sets* for a set item at the *Work with Items Screen* or *Work with SKUs Screen*.
- Select *Display Components* for a set item at the *Display Item/Warehouse Information Screen*

Field	Description
Item	A component item of the set. Item codes are defined in and validated against the Item table. You can define finished goods as component items; however, you cannot define other sets or variable sets as components. Alphanumeric, 12 positions; required.

Field	Description
SKU	The SKU elements that define the item. **Note:** If the item has SKUs, you must specify the specific SKU elements here. You do not have an opportunity in Order Entry to specify a component item's SKU. Alphanumeric, three 4-position fields; required if item has SKUs.
Qty	The number of units of this item to include in one set. Numeric, 5 positions; required.
Cost % (Cost percentage)	The percentage of the set's cost that this item comprises. The total cost of all components must equal 100%. Numeric, 5 positions with a 2-place decimal; optional.
CG (Coordinate group)	A number that you can assign to components in a set to ensure that they will ship together. You should assign the same coordinate group number to all components of a set to ensure that they ship together. This coordinate group number will display in the order detail line in Order Entry. **Note:** You must make sure to coordinate group the components of the set; otherwise, it is possible for the main set item to print and bill even if there is not a sufficient quantity of the component items. Numeric, 3 positions; optional.
Avail	The total quantity available for the component item. **Note:** If you advanced to this screen from the *Display Item/Warehouse Information Screen*, the available quantity reflects the selected warehouse only; otherwise, the quantity reflects all allocatable warehouses. Numeric, 7 positions; display-only.

To add components:

1. Complete each required field for a component item and, optionally, the Coordinate group field.
2. Select *OK* to add the new component item information and display it in the middle area of the screen.
3. Continue with the above steps until you have defined all components of the set.
4. Select *Accept* to accept the components. The system validates that the total cost percentage for all component items equals 100%. Correct any item's cost percentage, if necessary, by selecting *Change* for it to advance to the Change Set Component Item screen. Select *Accept* again when you are done.

Screen Option	Procedure
Accept a set	Select *Accept* to accept the set information.
Change a component item	Select *Change* for a component item to advance to the Change Set Component Item Screen. See above for field descriptions.
Delete a component item	Select *Delete* for an item to delete it as a component of the set.
Display a component item	Select *Display* for an item to advance to the Display Set Component Item Screen. See above for field descriptions.

Entering Variable Set Information (WVST)

Overview: A variable set consists of a list of items that customers can choose from to make up the set they want to purchase. Individual items may also be selected from this screen. Typically, the items available in a variable set all exist on the same page of the catalog.

A variable set item is designated by a *V* in the *Kit type* field in the Item table. A variable set, for example a Wardrobe Set, may be a special collection of items such as: “Choose any 2 slacks, 1 jacket, and 1 belt from this page for only $200.00.” Variable set groups, in this case, must be defined for slacks, jackets, and belts, providing the customer with several combinations of colors and sizes.

In Order Entry, when the operator enters a variable set item, a pop-up window appears for each “group” of items in the variable set. Each pop-up window contains a list of valid items in the group. The operator must select the desired items from each group. The system will ensure that the customer orders the correct quantity from each variable set group by maintaining a counter of the number of items allowed as compared to the number of items selected. The variable set item does not appear on the order. Instead, the system creates order entry detail lines for each item picked from groups.

Unit Demand (units ordered) is tracked at the component item level only. For example: the variable set is made up of 2 pair of slacks, 1 jacket, and 1 belt. A customer orders the slacks, jacket, and belt as a variable set. Units ordered for the slacks increases by 2, units ordered for the jacket increases by 1, and units ordered for the belt increases by 1. Dollars ordered is tracked at the component item level only.

> **Note:**
>
> Variable sets are priced by item components; the price of the complete set is the total price of each of its components. Although you can enter a price for a variable set item at the item offer, the system does not use this price when totaling the price of the order.

Set component upload: You can use the set component upload option to create variable set groups and group components. See *Importing Set Components (WCUP)* for information.

In this topic:

- *Work with Variable Sets Screen*
- *Create Variable Set Screen*
- *Create Variable Set Group Screen*
- *Work with Variable Set Components Screen*
- *Work with a Variable Set Groups Screen*

Work with Variable Sets Screen

How to display this screen: Enter *WVST* in the Fast Path field at the top of any menu or select this option from a menu.

Field	Description
Item	The variable set item number. Alphanumeric, 12 positions; optional.
Clr Size Wdth	The SKU elements. SKU elements can be entered in conjunction with the item number to further narrow the scan. The system cannot display scan information without the item number. You must enter the item number in conjunction with one or more SKU elements. Alphanumeric, three 4-position fields; optional.
Description	The description of the item. Alphanumeric, 120 positions; display only.

Screen Option	Procedure
Create a variable set	Select *Create* to advance to the *Create Variable Set Screen*.
Delete a variable set	Select *Delete* for a set to delete it.

> **Note:**
>
> Deleting a variable set does not delete the set item or components, just the association (link) between the two.

Screen Option	Procedure
Work with a variable set group	Select *Work with* for a set to advance to the *Work with a Variable Set Groups Screen*.

Create Variable Set Screen

To create a variable set: At the *Work with Variable Sets Screen*, select *Create*.

Field	Description
Variable set	The variable set item/SKU is made up of two separate fields. The first part is the item code which represents a unit of inventory. The second part is the SKU code which represents the special characteristics of an item, such as color, size, width, etc. The item code you enter must have the Kit Type field set to *V*. Alphanumeric, 12 positions (item), three 4-position fields (SKU); required.

Instructions: Enter the item code to advance to the *Create Variable Set Group Screen*.

Create Variable Set Group Screen

To create a variable set group: Complete the *Create Variable Set Screen*. You can also display this screen by selecting *Create* at the *Work with a Variable Set Groups Screen*.

Field	Description
Group	The numeric code that represents the group. The pop-up window in Order Entry will appear in group code sequence; therefore, if you want to be prompted for jackets before belts, you should create jackets with a lower group code number than belts. Numeric, 3 positions; required.
Description	The description of your group. The description appears in the pop-up window in Order Entry. Alphanumeric, 30 positions; required.
# of items	The number of units the customer must order from this group. **Note:** Multiple units of the same item may be ordered to achieve this number. Numeric, 3 positions; required.

Completing this screen: When you complete this screen, you advance to the Work with Variable Set Components Screen.

Work with Variable Set Components Screen

Purpose: Use this screen to define each item available in a variable set group. You can define several variable set groups for one variable set item.

How to display this screen:

- Select *Work with* for an item *Work with a Variable Set Groups Screen*.
- Complete the *Create Variable Set Group Screen*.
- Select *Variable Sets* for a variable set item at the *Work with Items Screen* or *Work with SKUs Screen*.
- Select *Display Components* for a variable set item at the *Display Item/Warehouse Information Screen*

Field	Descriptions
Variable set	The variable set item/SKU is made up of two separate fields. The first part is the item code which represents a unit of inventory. The second part is the SKU code which represents the special characteristics of an item, such as color, size, width, etc. Alphanumeric, 12 positions (item), three 4-position fields (SKU); display-only.
Group	The numeric code that represents the group. Numeric, 3 positions; display-only.
# of items	The number of units the customer must order from this group. **Note:** Multiple units of the same item may be ordered to achieve this number. Numeric, 3 positions; display-only.
Item	The item to be included as part of the variable group. Validated against the Item table. A customer can order any combination of the component items to make up the number of items in the group. Alphanumeric, 12 positions; required.
SKU	The SKU elements used to further define the item. **Note:** If the item has SKUs, the specific SKU elements must be specified. The SKU scan screen will not display in Order Entry. Alphanumeric, three 4-position fields (SKU); required (if the item has SKUs).

Field	Descriptions
Description	Description of the item. Alphanumeric, 120 positions; display-only.
Avail	The total quantity available for the component item. **Note:** If you advanced to this screen from the *Display Item/Warehouse Information Screen*, the available quantity reflects the selected warehouse only; otherwise, the quantity reflects all allocatable warehouses. Numeric, 7 positions; display-only.

Adding component items to a variable set: Enter each item code and the SKU information, if the item has SKUs. Each time you enter an item, the system validates the information and displays the item below the entry fields.

Work with a Variable Set Groups Screen

Purpose: Use this screen to change, delete, display, or create variable set groups for the variable set which are similar to option packages that specify the item quantity required from each group to make up the variable set.

This function allows you to define the variable set group codes and descriptions and provides access to the *Work with Variable Set Components Screen*, which allows you to identify each item available in the variable set group.

How to display this screen:

1. Complete the *Create Variable Set Screen*.
2. Select *Work with* for an item at the *Work with Variable Sets Screen*.
3. Select *Variable Sets* for an item at the *Work with Items Screen* or *Work with SKUs Screen*.

Field	Description
Group	The numeric code that represents your group. Numeric, 3 positions; optional
Description	The description of your group. Alphanumeric, 40 positions; optional.
# of items	The number of different items that make up your group. Numeric, 3 positions; optional.

Screen Option	Procedure
Create a variable set group	Select *Create* to advance to the *Create Variable Set Group Screen*.
Change a variable set	Select *Change* for a variable set group to advance to the Change Variable Set Group Screen. See the *Create Variable Set Group Screen* for field descriptions.
Delete a variable set	Select *Delete* for a variable set group to delete it.
Work with variable set components	Select *Work with* for a variable set group to advance to the *Work with Variable Set Components Screen*.

Entering Finished Goods Information (WFGD)

Overview: A finished good is an item that requires assembly prior to picking and packing and is comprised of one or more component items that may also be sold individually, or of raw materials that are used only as components of a finished good. An item record must exist for each component item, including raw materials (so that you can track inventory and usage).

When an Order Entry operator places an order for a finished good, the components of the finished good do not appear on the Order Entry screen, only the finished good item.

Unit demand (units ordered) is tracked at the finished goods level. Dollar demand is tracked at the finished goods level. For example: the finished good is a sketch kit and its component items are 1 drawing pad, 3 charcoal pencils and 1 erasure. A customer orders the sketch kit for $20.00. Units ordered for the finished good increase by 1, and dollars ordered increase for the finished good by $20.00.

In this topic:

- *Work with Finished Goods Screen*
- *Create Finished Good Screen*
- *Work with Finished Good Component Items Screen*

Work with Finished Goods Screen

How to display this screen: Enter *WFGD* in the Fast path field at the top of any menu or select Work with Finished Goods from a menu.

Field	Description
Item	The finished good item number. Alphanumeric, 12 positions; optional.
Clr Size Width	The SKU elements. Alphanumeric, three 4-position fields; optional.
Description	The description of the item. Alphanumeric, 120 positions; optional.

Screen Option	Procedure
Create a finished good	Select *Create* to advance to the *Create Finished Good Screen*.
Delete a finished good	Select *Delete* for a finished good to delete it. **Note:** Deleting a finished good does not delete the item or component items, just the association (link) between the two.
Work with finished good components	Select *Work with* for a finished good to advance to the *Work with Finished Good Component Items Screen*.

Create Finished Good Screen

Purpose: Use this screen to create a finished good.

How to display this screen: At the *Work with Finished Goods Screen*, select *Create*.

Field	Description
Finished good	The finished good item/SKU. Item: alphanumeric, 12 positions; required. SKU: three 4-position fields; required if the item has SKUs.

Work with Finished Good Component Items Screen

Purpose: Use this screen to add, change, delete, or display component items associated with a finished good (as defined by an *F* in the *Kit type* field for the item).

How to display this screen:

- Complete the *Create Finished Good Screen*.
- Select *Work with* for a finished good item at the *Work with Finished Goods Screen*.
- Select *Finished Goods* for a finished good item at the *Work with Items Screen* or *Work with SKUs Screen*.
- Select *Display Components* for a finished good item at the *Display Item/ Warehouse Information Screen*

Field	Description
Item	A component item that makes up the finished good. Alphanumeric, 12 positions. Work with screen: required. Change screen: display-only.
SKU	The SKU elements used to further define the item. Alphanumeric, three 4-position fields; required if the item has SKUs.
Qty	The number of items that are used to make up the finished good. Numeric, 5 positions; required.
Avail	The total quantity available for the component item. **Note:** If you advanced to this screen from the *Display Item/Warehouse Information Screen*, the available quantity reflects the selected warehouse only; otherwise, the quantity reflects all allocatable warehouses. Numeric, 7 positions; display-only.

Screen Option	Procedure
Add a finished good component item	Enter the item code (and SKU information if the item has SKUs) to add the item as a component to the finished good. The item is listed below the other component items in the center of the screen. **Note:** You cannot add a component if there is an open work order for the finished good. See *Finished Good Work Order Processing (WWOR)*.
Change a finished good component item	Select *Change* for a component item to advance to the Change Finished Good Component Item Screen. See the *Create Finished Good Screen* for field descriptions.
Delete a finished good component item	Select *Delete* for a component item to delete it from the finished good.

Screen Option	Procedure
Display a finished good component item	Select *Display* for a component item to advance to the Display Finished Good Component Items Screen. See the *Create Finished Good Screen* for field descriptions.

Updating Items and SKUs

Topics in this part:

- Creating Item/SKU Offers (MISO) describes how to create an item/SKU offer.
- Updating Item/SKU Offers (MUSO) explains the Update SKU Offer screen and its fields. This option updates information on multiple SKU offer records at one time.
- Deleting SKUs for an Item (MDLT) explains how to delete a SKU for a particular item.
- Copying SKU Offer Information (MCSO) describes how to duplicate the information in one offer to another offer.
- Copying Item Warehouse Information (MCIW) explains how to duplicate the item warehouse information in one warehouse to another warehouse.
- Working with Offer Overrides by Item Class (WSOI) explains how to override existing item/offer and SKU/offer information by item class.
- Maintaining SKU Cross Reference Codes (MSKR) describes how to create a cross reference between a Order Administration item and SKU and another system's item and SKU.
- Updating SKU Offer Prices (MUSK) allows you to create SKU/offer prices for specific SKUs of an item and specific offers.
- Maintaining Item/SKU/Offer (CPIM) describes how to recalculate the projected units or update other information in the Item/Offer table.
- Maintaining Item Offers (MIOF) describes how to update item offer information for a specific offer, or to change item information for a specific item.
- Copying SKU/Offer Records (CSKO) describes how to copy SKU offer information from one offer to another.

Creating Item/SKU Offers (MISO)

Purpose: Use Create Item/SKU Offers to indicate that an item is available in an offer and to enter the related pricing and return information.

Using this menu option may be more efficient than selecting the Work with Item/SKUs menu option (fast path = *MITM*) and advancing to the Create Item Offer or the Create SKU Offer screens if, for example, you are entering offer information for a group of existing items and SKUs.

In this topic:

- *Create Item/SKU Offers Screen*
- *Create SKU Offers Screen*

For more information: See *Performing Initial Item Entry (MITM)* for more information on the screens you use to work with items or SKUs.

Create Item/SKU Offers Screen

Purpose: Use this screen to create item and SKU offer information. This screen may be more efficient than selecting the Work with Item/SKUs menu option (fast path = *MITM*) and advancing to the *Create Item Offer Screen* if, for example, you are entering offer information for a group of existing items.

How to display this screen: Enter *MISO* in the Fast path field at the top of any menu or select Create Item/SKU Offer from a menu.

Field	Description
Update SKUs	Indicates whether to update the SKU information. • *Selected* = Update the SKUs. You advance to the *Create SKU Offers Screen* when you press *Enter* so you can enter different information at the SKU level. • *Unselected* = Do not update the SKUs.
Item	A user-defined code that represents a new unit of inventory. Validated against the Item table. Alphanumeric, 12 positions; required.
Offer	The offer you would like to include the item/SKU in. Validated against the Offer table. Alphanumeric, 3 positions; required.
Effective date	The date the price or quantity break discount becomes valid. This date should be on or after the effective date of the offer. If there are multiple effective dates for the same item/offer, the system uses the price associated with the effective date closest to, but not greater than, the order date. For example, if there are effective dates of Feb. 20, and Mar. 31 and the customer placed an order on April 1, the customer receives the price associated with the effective date of March 31. Numeric, 6 positions (in user date format); optional.
Sub page	Informational only. You can use this field to call an external program that creates an item alias outside of Order Administration. The system provides a “hook” to the program when a user defines a sub page code and completes this screen or the *Create Item Offer Screen* in Work with Item/SKUs (fast path = *MITM*). Once the program completes, Order Administration returns to normal processing. Alphanumeric, 5 positions; optional.
Price	The price at which the item will be sold in this offer, if no discounts are applied and the order date is on or after the effective date. Multiple effective dates and prices can be established for the same item/offer. Numeric, 13 positions with a 2-place decimal; required.
Associate price	The price at which the item will be sold in this offer to associate customers. Associate price is used when the Associate field on the order is selected and the order date is equal to or greater than the effective date. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Tax inclusive price	The price at which the item will be sold in this offer on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket. Included only if the *Tax Included in Price (E70)* system control value is selected. Numeric, 13 positions with a 2-place decimal; optional.
Tax incl assoc price (Tax-inclusive associate price)	The price at which the item will be sold to associate customers on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket. Included only if the *Tax Included in Price (E70)* system control value is selected. Numeric, 13 positions with a 2-place decimal; optional.
Special handling	Indicates whether this item is eligible for any type of special handling in this offer (such as monogramming, hemming, etc.). • *Selected* = This item is eligible for special handling. • *Unselected* = This item is not eligible for special handling. If this field is selected and there is a default special handling code defined (see below), *OR* if you specify special handling for an item in order entry, you advance to the *Work with Special Handling Screen* or the *Work with Custom Special Handling Screen*; however, if the special handling code's: • *Suppress S/H window* field is selected: the system adds the special handling code and charge to the item without displaying the special handling screen. • *Bypass S/H* field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the item; however, you can still advance to the special handling screen by selecting *Special Handling* for the item. See *Special Handling Overview* for more information.
S/H price (Special handling price)	The price to charge the customer for special handling. Use the *Evaluate Special Handling Charges by Order Line (D67)* system control value whether to add the price just once for each order line, or to multiply the special handling price by the unit quantity on the order. Numeric, 13 positions with a 2-place decimal; optional.
S/H code (Special handling code)	The additional charge code associated with the type of special handling you are offering for the item. The system validates that the additional charge code is defined as special handling type standard or custom; the system handles each type in a different way. See *Special Handling Overview* for more information. If you enter a special handling code here, you will advance to the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen* automatically in order entry; however, if the special handling code's: • *Suppress S/H window* field is selected: the system adds the special handling code and charge to the item without displaying the special handling screen. • *Bypass S/H* field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the item; however, you can still advance to the special handling screen by selecting *Special Handling* for the item. See *Special Handling Overview* for more information. Alphanumeric, 2 positions; optional.

Field	Description
Gift wrap	Indicates whether you offer gift wrapping for this item in this offer. Defaults to *selected* if the Gift Wrap Default (F07) system control value is selected; however, you can override this default. • *Selected* = This item can be gift wrapped. • *Unselected* = This item cannot be gift wrapped.
G/W price (Gift wrap price)	The price you are charging to gift wrap this item. The G/W field must be selected to indicate that this item is eligible for gift wrap. The gift wrap price is multiplied by the unit quantity on the order line to arrive at the total gift wrap charge for the order line. Numeric, 13 positions with a 2-place decimal; optional.
Freight	The freight amount to charge for this item. Multiplied by the unit quantity on the order line to determine the freight charge for this item. Used only if the Freight method field for the Source Code table is set to *By Item* or *Flat Rt/Item*. Numeric, 13 positions with a 2-place decimal; optional.
Hidden freight	Used only with item level freight methods, such as flat rate by item, by item quantity, and by item source. Hidden freight represents the portion of the item's catalog price that is used for freight. You might define a hidden freight value when the freight charge to ship the item is very high. The hidden freight charge is included in the price of the item so the actual freight charge is not visible to the customer. Hidden freight is also know as "theoretical" or "buried" freight. Numeric, 13 positions with a 2-place decimal; optional.
Sale item	Indicates whether the item is on sale. Valid values are: • *selected* = This is a sale item. • *unselected* (default) = This is not a sale item. If the Exclude Sale Item When Prorating Discounts (I65) system control value is selected, this flag controls whether the item is included in prorated discounts or is included when determining whether an order qualifies for a promotion. See the system control value for more information.
Volume discount	Indicates whether this item is eligible for an end-of-order discount that will be applied when you accept the order during Order Entry. • *selected* = The item/SKU is eligible for the volume discount. • *unselected* = The item/SKU is not eligible for the volume discount. See Item Volume Discounting.
Coupon discount $	Represents the amount that is subtracted from the price when the item is ordered from this offer. Numeric, 13 positions with a 2-place decimal; optional.
Coupon expiration date	The date the coupon is effective until (i.e., when it expires). Numeric, 6 positions (in user date format); optional.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Feature/option</td><td>Indicates whether the item is considered a featured or optional item in a depiction. A depiction is a photograph or drawing of several items within an offer. The featured item is the focus of the depiction, whereas the optional items are less prominently displayed. For example, if a dining room is depicted, the dining room set may be the featured item and the individual place settings, crystal, and centerpiece may be the optional items.
Valid values are:
• Feature = Item is the featured item in the depiction.
• Option = Item is an optional item in the depiction.
Optional.</td></tr>
<tr><td>Pickup/new</td><td>Indicates whether the item has been carried over from a previous offer or is new to your product offerings.
Valid values are:
• Pickup = Item is a pickup item, previously sold in another offer.
• New = Item is a new addition in this offer.
Optional.</td></tr>
<tr><td>Warranty</td><td>Defines whether the item in this offer is a warranty item.
Valid values are:
• Selected = The item in this offer is a warrant item. When an operator adds this item to an order in order entry or order maintenance, the system adds the item to the order at no charge.
• Unselected = The item in this offer is not a warranty item.
If the Default Price Override Reason for Warranty Items (G01) system control value contains a price override reason code, the system defaults this code to the Price override code field; otherwise the operator must enter a code.</td></tr>
<tr><td>Required reason code</td><td>Defines whether an Order addition reason code is required when the item in this offer is added to an order in order entry or order maintenance. When you specify an add reason code for an item, there is a record of the add reason code stored in an order line history record, available for review at the Display Order Line History Screen.
Valid values are:
• selected = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. The Enter Add Reason Window opens when an operator adds this item to an order in order entry or order maintenance.
• unselected = The item is this offer does not require an add reason code when the item is added to an order in order entry or order maintenance.

Note:
When the item is added automatically to an order through the order API, the add reason code is not required. For example, an item might be added to an order automatically if it is set up as a free gift by source code.</td></tr>
</table>

Screen Option	Procedure
Work with alias	Select *Work with Alias* to advance to the *Work with Alias Screen*.
Work with SKU offers	*Select* the Update SKUs field and select *OK* to advance to the *Create SKU Offers Screen*. Any information you have entered defaults to this screen.

Create SKU Offers Screen

Purpose: Use this screen to define offer information related to a specific SKU. This screen may be more efficient than selecting the Work with Item/SKUs menu option (fast path = *MITM*) and advancing to the *Create SKU Offer Screen* if, for example, you are entering offer information for a group of existing SKUs.

How to display this screen: *Select* the Update SKUs field at the *Create Item/SKU Offers Screen*. Any information you have entered at that screen defaults here.

Field	Description
Item	A user-defined code that represents a new unit of inventory. Defaults from the previous screen. Alphanumeric, 12 positions; display-only.
Offer	The offer in which you are presenting the SKU. Defaults from the previous screen. Alphanumeric, 3 positions; display-only.
Sel (Select)	Indicates whether the SKU is selected for update. Valid values: • *Select* (default) = The SKU is selected for update. • *Ignore* = The SKU is not selected for update. Required.
Colr Size Othr	The SKU code and description that is used to further define the item. Validated against the SKU Elements (1,2,3) tables; see *Working with SKU Elements (WSK1, WSK2, WSK3)*. Alphanumeric, three 4-position fields; display-only.
Price	The price at which you are selling the item/SKU in this offer, if no discounts are applied, and the offer date is equal to or greater than the effective date. Multiple effective dates and prices can be established for the same item/offer. To establish multiple effective dates, see *Work with Item Prices Screen (Quantity Price Breaks by Offer)*. Numeric, 13 positions with a 2-place decimal; required.
Sale (Sale item)	Indicates whether the item/SKU is on sale in this offer. Valid values are: • *Yes* = this item/SKU is on sale • *No* = this item/SKU is not on sale If the *Exclude Sale Item When Prorating Discounts (I65)* system control value is *selected*, this flag controls whether the item is included in prorated discounts or is included when determining whether an order qualifies for a promotion. See the system control value for more information.
Description	A description of the SKU. Alphanumeric, 40 positions; display-only.

Field	Description
SH? (Special handling)	Indicates whether this item/SKU is eligible for any type of special handling in this offer (such as, monogramming, hemming, etc.). • *Yes* = This item/SKU is eligible for special handling. • *No* = This item/SKU is not eligible for special handling. If this field is set to *Yes* and there is a default special handling code defined (see below), *OR IF* you specify special handling for an item in Order Entry, a pop-up window opens for you to enter special handling instructions.
SH price (Special handling price)	The price that will be charged for special handling. Use the *Evaluate Special Handling Charges by Order Line (D67)* system control value to specify whether to add the price just once for each order line, or multiply the special handling price by the item quantity for the line. Numeric, 13 positions with a 2-place decimal; optional.
S/H (Special handling code)	A code that represents the type of special handling that is required for this item/SKU. The special handling can be either standard or custom; the system handles each type in a different way. See Establishing Additional Charge Codes (WADC) and Establishing Custom Special Handling Formats (WSHF). If you enter a special handling code here, you will advance to the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen* automatically in order entry. Alphanumeric, 2 positions; optional.
GW?(Gift wrap)	Indicates whether this SKU is eligible for gift wrap. If the *Gift Wrap Default (F07)* system control value is *selected*, this field defaults to *Yes*, although you can override it; otherwise, this field defaults to *No*. • *Yes* = The item/SKU can be gift wrapped. • *No* = In this offer, the item/SKU cannot be gift wrapped.
GW price (Gift wrap price)	The price to charge in this offer to gift wrap this item/SKU. The G/W field must be *selected* to indicate that this item/SKU is eligible for gift wrap. The gift wrap price is multiplied by the total unit that is gift wrapped. Numeric, 13 positions with a 2-place decimal; optional.
Frt (Freight)	The freight amount to be charged for this item/SKU. Multiplied by the quantity ordered to determine the freight charge for this item. Used only if the *Freight method* field for the Source Code table is set to *By Item* or *Flat Rt/Item*. Numeric, 13 positions with a 2-place decimal; optional.
Hdn frt (Hidden freight)	Used only with item level freight methods, such as: Flat rate by item, flat rate by item quantity, flat rate by item source, and by item. Hidden freight represents the portion of the item's catalog price that is used for freight. You might define a hidden freight value when the freight charge to ship the item is very high. The hidden freight charge is included in the price of the item so the actual freight charge is not visible to the customer. Hidden freight is also known as "theoretical" or "buried" freight. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
F/O (feature/option)	Indicates whether the item/SKU is considered a featured or optional item in a depiction in the offer. The featured item is the focus of the depiction; optional items are displayed less prominently. For example, in a depiction of a dress, the shoes and belt depicted may be the optional items. Valid values are: • *Feature* = this is the featured item • *Option* = this is an optional item Optional.
Pickup/new	Indicates whether the item has been carried over from a previous offer or you are presenting it for the first time in this catalog. Valid values are: • *Pickup* = this is a pickup item • *New* = this is a new item Optional.
Tax Inclusive Price	The price at which the item/SKU will be sold in this offer on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket. Included only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.
Asso. price (associate price)	The price at which the item/SKU will be sold in this offer to associate customers. Associate price is used when the Associate field on the order is selected and the order date is equal to or greater than the effective date. Numeric, 13 positions with a 2-place decimal; optional.

Updating Item/SKU Offers (MUSO)

Purpose: Use Update Item/SKU Offers to update information on multiple Item/SKU Offer records at one time.

The *Update Item or SKU Offer(s) Screen* is divided into two sections.

- Use the top section to enter the item and SKU for the offers you wish to update, and the update information. You must complete at least one update field to continue.
- Use the lower portion of the screen to enter the offers that you want to update.

The system updates only those fields in which you enter data; all other fields will remain as is.

You can update both the item offer and SKU offer by making changes for the “base” item and leaving the SKU field blank. When you select *OK* to accept the changes, you advance to the *Confirm Multiple SKU Offer Update Window* where you *select* the Update ALL SKU Offers for base item field.

Defaulting active offers: If the *Default Active Offers (J07)* system control value is selected and you do not manually enter an offer in the Offer fields, the system defaults the 20 most recent active offers to the Offer fields for the entered item: `Offers have been defaulted - press Enter to update`.

The offers default to the Offer fields in descending Start date sequence.

- If you enter an item without a SKU code, the system defaults the 20 most recent active offers defined for the item.
- If you enter an item and SKU code, the system defaults the 20 most recent active offers defined for the SKU. The system will not default any item offers, even if no SKU offers exist.

Note:

- If the item is not assigned to 20 active offers, the system defaults the available active offers assigned to the item. For example, if the item is assigned to 25 offers, but only 8 offers are active, the system defaults the 8 active offers.
- If the item is assigned to more than 20 active offers, the system evaluates the offer's Start date to determine the 20 most recent active offers to default.
- If active offers do not exist for the item, the Offer fields remain blank and you must manually enter offers in the Offer fields.
- If you update the Item and/or SKU field, the system will not update the defaulted offers.
- You can manually enter an offer that is a future offer or expired offer.

Update Item or SKU Offer(s) Screen

Use this screen to update information on multiple Item/SKU Offer records at one time.

How to display this screen: Enter *MUSO* in the Fast Path field at the top of any menu or select Update Item/SKU from a menu.

Field	Description
Item	A unit of inventory. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; required.
Clr Size Wdth (SKU codes)	The item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; required if SKU/offer records exist.
Effective date	The date the price or quantity break discount becomes valid. This date should be equal to or greater than the effective date of the offer. The customer receives this price when placing an order on this date or later, if the order is for a great enough quantity. If you establish multiple effective dates for the same item/offer, the system uses the price associated with the effective date closest to, but not greater than, the order date. *Example:* If you establish effective dates of Feb. 20, and Mar. 31 and the customer places an order on April 1, the customer receives the price associated with the effective date of March 31. Numeric, 6 positions (in user date format); optional.

Field	Description
Price	The price at which you are selling the item in this offer, if no discounts are applied, and the order date is on or after the effective date. You can establish multiple effective dates and prices for the same item/offer. See *Work with Item Prices Screen (Quantity Price Breaks by Offer)*. Numeric, 13 positions with a 2-place decimal; required.
Associate price	The price at which you are selling the item in this offer to associate customers. The system uses the associate price when the Associate field on the order is selected and the customer places the order on or after the effective date. Numeric, 13 positions with a 2-place decimal; optional.
Tax inclusive price	The price at which the item will be sold in this offer on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket. Included only if the *Tax Included in Price (E70)* system control value is selected. Numeric, 13 positions with a 2-place decimal; optional.
Tax-inclusive (Tax-inclusive associate price)	The price at which the item will be sold to associate customers on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket. Included only if the *Tax Included in Price (E70)* system control value is selected. Numeric, 13 positions with a 2-place decimal; optional.
Sale item	Indicates whether the item is on sale in this offer. Valid values are: • *selected* = this item is on sale • *unselected* = this item is not on sale If the *Exclude Sale Item When Prorating Discounts (I65)* system control value is selected, this flag controls whether the item is included in prorated discounts or is included when determining whether an order qualifies for a promotion. See the system control value for more information.
Freight	The freight amount to be charged for this item. Multiplied by the quantity ordered. Used only if the *Freight method* for the source code is *By Item* or *Flat Rt/Item*. Numeric, 13 positions with a 2-place decimal; optional.
Hidden freight	The system uses this value only with item level freight methods such as flat rate by item, flat rate by item quantity, flat rate by item source, and by item. Hidden freight represents the portion of the item's catalog price that pays freight. You can define a hidden freight value when the freight charge for the item is very high. You include the hidden freight charge in the item price so that the customer is not aware of the actual cost of shipping. Hidden freight is also known as “theoretical” or “buried” freight. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
S/H (Special handling)	Indicates whether this item is eligible for any type of special handling in this offer (such as monogramming, hemming, etc.). • *selected* = This item is eligible for special handling. • *unselected* = This item is not eligible for special handling. If this field is selected and there is a default special handling code defined (see below), *OR* if you specify special handling for an item in order entry, you advance to the *Work with Special Handling Screen* or the *Work with Custom Special Handling Screen*; however, if the special handling code's: • *Suppress S/H window* field is selected: the system adds the special handling code and charge to the item without displaying the special handling screen. • *Bypass S/H* field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the item; however, you can still advance to the special handling screen by selecting *Special Handling* for the item. See *Special Handling Overview* for more information.
Volume discount	Determines whether you can apply discounts to the item for large order quantities. • *selected* = This item is eligible for volume discount. • *unselected* = This item is not eligible for volume discount. See *Item Volume Discounting*.
S/H charge code (Special handling code)	The additional charge code associated with the type of special handling you are offering for the item. The system validates that the additional charge code is defined as special handling type standard or custom; the system handles each type in a different way. See *Special Handling Overview* for more information. If you enter a special handling code here, you will advance to the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen* automatically in order entry; however, if the special handling code's: • *Suppress S/H window* field is selected: the system adds the special handling code and charge to the item without displaying the special handling screen. • *Bypass S/H* field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the item; however, you can still advance to the special handling screen by selecting *Special Handling* for the item. See *Special Handling Overview* for more information. Alphanumeric, 2 positions; optional.
Price (Special handling price)	The price to charge for special handling of the item. The system multiplies this charge by the total unit quantity if the *Evaluate Special Handling Charges by Order Line (D67)* system control value is unselected. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
G/W flag (Gift wrap flag)	Indicates whether this item is eligible for gift wrapping in this offer. If the *Gift Wrap Default (F07)* system control value is selected, this field will default to selected; however, you can override this value. • *selected* = The item can be gift wrapped. • *unselected* = The item cannot be gift wrapped.
Price (Gift wrap price)	The price to charge for gift wrapping the item. The system multiplies the gift wrap price by the total unit quantity gift wrapped. Numeric, 13 positions with a 2-place decimal; optional.
Feature/option	Indicates whether the item is considered a featured or optional item in a depiction in the offer. The featured item is the focus of the depiction; optional items are displayed less prominently. For example, in a depiction of a dress, the shoes and belt depicted might be optional items. Valid values are: • *Feature* = This is a feature item. • *Option* = This is an optional item. Optional.
Pickup/new	Indicates whether the item has been carried over from a previous offer or you are presenting it for the first time in this offer. Valid values are: • *Pickup* = This is a pickup item. • *New* = This is a new item. Optional.
Warranty	Defines whether the item in this offer is a warranty item. Valid values are: • *selected* = The item in this offer is a warranty item. When an operator adds this item to an order in order entry or order maintenance, the system adds the item to the order at no charge. • *unselected* = The item in this offer is not a warranty item. If the *Default Price Override Reason for Warranty Items (G01)* system control value contains a price override reason code, the system defaults the code to the Price override code field; otherwise the operator must enter a code.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Required reason code</td><td>Defines whether an Order addition reason code is required when the item in this offer is added to an order in order entry or order maintenance. When you specify an add reason code for an item, there is a record of the add reason code stored in an order line history record, available for review at the Display Order Line History Screen.

Valid values are:
• selected = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. The Enter Add Reason Window opens when an operator adds this item to an order in order entry or order maintenance.
• unselected = The item is this offer does not require an add reason code when the item is added to an order in order entry or order maintenance.

Note:
When the item is added automatically to an order through the order API, the add reason code is not required. For example, an item might be added to an order automatically if it is set up as a free gift by source code.</td></tr>
<tr><td>Offers</td><td>The offers where the item/SKU should be updated.

If the Default Active Offers (J07) system control value is selected and you do not manually enter an offer in the Offer fields, the system defaults the 20 most recent active offers to the Offer fields for the entered item. The offers default to the Offer fields in descending Start date sequence.

Offers are defined in and validated against the Offer table. See Working with Offers (WOFR).

Alphanumeric, twenty 3 position fields; required.</td></tr>
<tr><td>Create if record does not exist</td><td>Controls whether to create the Item/offer or SKU/offer record automatically if it doesn't already exist.
• selected = Create the record.
• unselected (default) = Do not create the record.

Note:
If this field is unselected and the Update all SKU offers for base item field is selected, the system creates SKU Price records only for those SKUs that are already associated with the offer.</td></tr>
</table>

Screen Option	Procedure
Display item/offer or SKU/offer records	Select *Display Offers* to advance to the Work with Item Offers Screen or *Work with SKU Offers Screen*. If the item is a SKU'ed item, you must specify a SKU code before displaying offers.

Confirm Multiple SKU Offer Update Window

Use this window to update the item offer and all SKU offers for the item.

Select the Update ALL SKU Offers for base item field to update both the item offer and all SKU offers for this "base" item.

> **Note:**
>
> If the Update ALL SKU Offers for base item field is *selected* and the Create if record does not exist field is *unselected*, the system creates SKU Price records only for those SKUs that are already associated with the offer.

If you select *Exit* or *select* this field, the system updates the item or SKU offer(s) entered and clears the fields so that you can update another item/SKU offer if desired.

Deleting SKUs for an Item (MDLT)

Purpose: The Delete SKUs for Item function deletes all SKU records for an item.

Example: Item BK4000 (a blanket) has three SKUs (BLUE, BONE, and GOLD). If you enter the item number (BK4000) at the Delete SKUs for an Item screen, all the SKU records (BLUE, BONE, and GOLD) will be deleted.

How to display this screen: Enter *MDLT* in the Fast Path field at the top of any menu or select this option from a menu.

Field	Description
Company	Defaults to the company in which you are working. You can override the company code to another valid company, as defined in the Company table. Alphanumeric, 3 positions; optional.
Item number	A user-defined code that represents a unit of inventory. In this case, the item must have SKUs associated with it. Validated against the Item table. Alphanumeric, 12 positions; required.

> **Important:**
>
> You cannot delete SKUs if there is on-hand quantity, open orders, or open purchase orders.

Copying SKU Offer Information (MCSO)

Purpose: Use Copy SKU Offer Information to copy item/SKUs from one offer to another offer by selecting an offer to copy "from" and the new offer to be created "to."

Copy SKU Offer Information allows you to:

- copy all item/SKUs from one offer to another offer
- copy item/SKUs from one offer to another offer by item class
- update existing item/SKU offers in the "to" offer with information in the "from" offer
- select which item/SKU information to copy

You can also copy a selected SKU offer record from one offer to another offer using the *Copying SKU/Offer Records (CSKO)* menu option.

Copy SKU/Offer Information Screen (Selecting Information to Copy)

How to display this screen: Enter *MCSO* in the Fast path field at the top of any menu or select Copy SKU Offer Information from a menu.

Field	Description
From offer	The offer from which the information will be copied. This must be a valid offer in the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
To offer	The offer to which the information will be copied. This must be a valid offer in the Offer table. Alphanumeric, 3 positions; required.
Item class(es)	The item class(es) from which the information in the “from” offer will by copied. Each must be a valid item class in the Item Class table; see *Working with Item Classes (WICL)*. You can maintain item/SKU offers by item class through *Working with Offer Overrides by Item Class (WSOI)*. Alphanumeric, ten 3-position fields; optional.
Update SKU and item offers	Indicates whether the system updates existing item/SKU information in the “to” offer with the copied information in the “from” offer. Valid values are: *unselected* (default) = Existing item/SKU information in the “to” offer will not update with the copied information in the “from” offer. *selected* = Existing item/SKU information in the “to” offer will update with copied information in the “from” offer. *Example:* Item "Sunglasses" exists in offers 1 and 2. In offer 1, the price of the sunglasses is $10.00 and in offer 2 the price of the sunglasses is $20.00. If you are copying information from offer 2 to offer 1 and this field is selected, the price in offer 1 will update to $20.00. If this field is unselected, the price will not update and only new information will copy to offer 1.

Field	Description
	Note: Each of the field descriptions below describes the information to copy from the "from" offer to the "to" offer if the field is selected.
Freight	The freight amount to be charged for this item. Multiplied by the quantity ordered. Used only if the *Freight method* for the source code is *By Item* or *Flat Rt /Item*. Valid values are: *unselected* = In the "to" offer, the freight amount will not change. *selected* (default) = Item/SKUs in the "to" offer will default the *Freight* from the "from" offer.
Sale item	Indicates whether the item is on sale. Valid values are: *selected* (default) = The items in the "to" offer will have the same Sale item setting as the items in the "from" offer. *unselected* = In the "to" offer, the *Sale item* setting for the item will not be changed. If the *Exclude Sale Item When Prorating Discounts (I65)* system control value is selected, this flag controls whether the item is included in prorated discounts or is included when determining whether an order qualifies for a promotion. See the system control value for more information.
S/H (Special handling)	This item is eligible for any type of special handling in this offer (such as, monogramming, hemming, etc.). *selected* (default) = The items in the "to" offer will have the same special handling as the in "from" offer. *unselected* = In the "to" offer, the *Special handling* field for the items will not be changed.
Coupon discount	Represents the amount that is subtracted from the price when the item/SKU is ordered from this offer. Valid values are: *selected* (default) = The items in the "to" offer will have the coupon discount amount as in the "from" offer. *unselected* = In the "to" offer, the *Coupon discount $ (Coupon discount dollars)* for the items will not change.
S/H code (Special handling code)	Represents the type of special handling that is required for this item. If you enter a special handling code, during Order Entry a pop-up window appears. When this item is ordered, you can specify the quantity ordered, a special handling charge (if different), and special handling instructions. Valid values are: *selected* (default) = The items in the "to" offer will have the same special handling codes as in the "from" offer. *unselected* = In the "to" offer, the *S/H code (Special handling code)* for the items will not change.

Field	Description
S/H price (Special handling price)	The price to charge the customer for special handling. You can specify in the *Evaluate Special Handling Charges by Order Line (D67)* system control value whether to add the price just once for each order line, or multiply the special handling price by the item quantity for the line. *selected* (default) = The items in the “to” offer will have the same special handling price as in the “from” offer. *unselected* = In the “to” offer, the *S/H price (Special handling price)* field for the items will not be changed.
G/W (Gift wrapping)	A value that indicates whether items can be gift wrapped. *selected* (default) = The items in the “to” offer will have the gift wrap flag set the same way as in the “from” offer. *unselected* = In the “to” offer, the *Gift wrap* flag for the items will not be changed.
Hidden freight	Used only with item level freight methods, such as: Flat rate by item, flat rate by item quantity, flat rate by item source, and by item. Hidden freight represents the portion of the item's catalog price that is used for freight. You might define a hidden freight value when the freight charge to ship the item is very high. The hidden freight charge is included in the price of the item so the actual freight charge is not visible to the customer. Hidden freight is also known as “theoretical” or “buried” freight. Valid values are: *selected* (default) = The items in the “to” offer will have the same hidden freight amount as in the “from” offer. *unselected* = In the “to” offer, the *Hidden freight* amount for the items will not be changed.
G/W price (Gift wrapping price)	The price in this offer that will be charged to gift wrap this item. The G/W field must be selected to indicate that this item is gift wrap-eligible. The gift wrap price will be charged for each unit of this item that is gift wrapped. The system will multiply this charge by the order quantity for the item. *selected* (default) = The items in the “to” offer will have the same gift wrapping price as in the “from” offer. *unselected* = In the “to” offer, the *G/W price (Gift wrap price)* for the items will not be changed.
Volume discount	Indicates whether this item is eligible for an end-of-order discount that will be applied when you accept the order during Order Entry. See *Item Volume Discounting*. Valid values are: *selected* (default) = The items in the “to” offer will have the same volume discount setting as in the “from” offer. *unselected* = In the “to” offer, the *Volume discount* field for the items will not be changed.

Field	Description
SKU price	The price at which the item/SKU will be sold in this offer. Valid values are: *selected* (default) = The items in the “to” offer will have the same SKU price as in the “from” offer. *unselected* = In the “to” offer, the *Price* field for the items will not be changed. If the *Tax Included in Price (E70)* system control value is selected, the message *Includes Tax price* displays next to this field. This message indicates that both the offer price and the tax-inclusive price will be copied if you set the SKU price flag to *Y*.
Associate price	The price at which the item will be sold in this offer to associate customers. A customer pays the associate price when the Associate flag on an order is selected. Valid values are: *selected* (default) = The items in the “to” offer will have the same associate price as in the “from” offer. *unselected* = In the “to” offer, the *Associate price* field for the items will not be changed. If the *Tax Included in Price (E70)* system control value is selected, the message *Includes Tax Price* displays next to this field. This message indicates that both the offer associate price and the tax-inclusive associate price will be copied if you set the Associate price flag to *Y*.
Coupon effective date	The date the coupon becomes effective. Valid values are: *selected* (default) = The items in the “to” offer will have the same coupon effective date as in the “from” offer. *unselected* = In the “to” offer, the *Coupon expiration date* for the items will not be changed.
Warranty	Defines whether the item in this offer is a warranty item. Valid values are: *selected* (default) = The items in the “to” offer will have the same warranty setting as in the “from” offer. *unselected* = In the “to” offer, the *Warranty* field for the items will not be changed.
Feature/option	Indicates whether the item is considered a featured or optional item in a depiction. A depiction is a photograph or drawing of several items within an offer. The featured item is the focus of the depiction; whereas, the optional items are less prominently displayed. For example, if a dining room is depicted, the dining room set may be the featured item and the individual place settings, crystal, and centerpiece may be the optional items. Valid values are: *selected* (default) = The items in the “to” offer will have the same feature/option setting as in the “from” offer. *unselected* = In the “to” offer, the *Feature/option* field for the items will not be changed.

Field	Description
Required reason	Defines whether an *Order addition reason code* is required when the item in this offer is added to an order in order entry or order maintenance. When you specify an add reason code for an item, there is a record of the add reason code stored in an order line history record, available for review at the *Display Order Line History Screen*. Valid values are: • *selected* = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. The *Enter Add Reason Window* opens when an operator adds this item to an order in order entry or order maintenance. • *unselected* = The item is this offer does not require an add reason code when the item is added to an order in order entry or order maintenance. **Note:** When the item is added automatically to an order through the order API, the add reason code is not required. For example, an item might be added to an order automatically if it is set up as a free gift by source code
Pickup/new	Indicates whether the item has been carried over from a previous offer or is new to your product offerings. Valid values are: *selected* (default) = The items in the “to” offer will have the same pickup/new setting as in the “from” offer. *unselected* = In the “to” offer, the *Pickup/new* field for the items will not be changed.

Copying Item Warehouse Information (MCIW)

Purpose: Use this screen to copy Item Warehouse records from one warehouse to another. This function is useful if you are setting up a new warehouse that carries the same items as another warehouse.

You must specify the “from” and “to” warehouse and indicate whether to replace existing Item Warehouse records.

How to display this screen: Enter *MCIW* in the Fast path field at the top of any menu or select Copy Item Warehouse Information from a menu.

Field	Description
From warehouse	The numeric code that represents the source warehouse that you want to copy from. Validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; required.

Field	Description
To warehouse	The numeric code that represents the target warehouse that you want to copy to. Validated against the Warehouse table. Numeric, 3 positions; required.
Replace existing records	Valid values are: *Selected* = Any existing “to” warehouse records will be replaced during the copy procedure. *Unselected* = Any existing “to” warehouse records will not be replaced during the copy procedure. Records which may exist in the “to” warehouse but not the “from” warehouse will remain as is in the “to” warehouse.
Copy min/max (Copy minimum quantity/ maximum quantity)	Indicates whether you wish to copy the minimum and maximum quantities defined for the item warehouse records in the "from" warehouse to the "to" warehouse. Valid values are: *Selected* = Copy the minimum and maximum quantities defined for the item warehouse records in the “from” warehouse to the “to” warehouse. *Unselected* (default) = Do not copy the minimum and maximum quantities defined for the item warehouse record in the “from” warehouse to the “to” warehouse.
Copy prices (Copy retail prices)	Indicates whether you wish to copy the original retail price and current retail price defined for the item warehouse records in the "from" warehouse to the "to" warehouse. Valid values are: *Selected* = Copy the original retail price and current retail price defined for the item warehouse records in the “from” warehouse to the “to” warehouse. *Unselected* (default) = Do not copy the original retail price and current retail price defined for the item warehouse records in the “from” warehouse to the “to” warehouse.

Submitting the job: If you choose to continue with the copy procedure, the system submits *CPYITW_REC* job.

Working with Offer Overrides by Item Class (WSOI)

Purpose: Use Work with Item Offer Overrides by Class to override existing item/offer and SKU/offer information by item class. You can update item offer information at different levels:

- override the entire item class: update all items in the item class and offer with the information you enter
- override a specific item: update only selected items in the item class and offer with the information you enter
- override a specific SKU: update only selected SKUs in the item class and offer with the information you enter

Why use? Overriding existing item/SKU offer information by item class is helpful if you include an entire item class in one offer. You can copy item/SKUs from one offer to another by item class through *Copying SKU Offer Information (MCSO)*.

> **Note:**
>
> You cannot use Item Offer Overrides by Class to override item/SKU pricing information that includes value added tax (VAT). On orders subject to VAT, tax does not accumulate in the Tax field; instead, the customer pays a tax-inclusive price for each item and the tax is “hidden” on the order detail line in the Hidden tax field. See the *Tax Included in Price (E70)* system control value.

In this topic:

- *Item Offer Overrides by Item Class Screen*
- *First Item/Offer Override Details Screen*
- *Second Item/Offer Override Details Screen*
- *First SKU/Offer Override Details Screen*
- *Second SKU/Offer Override Details Screen*

Item Offer Overrides by Item Class Screen

How to display this screen: Enter *WSOI* in the Fast path field at the top of any menu or select Work with Item Offer Overrides by Class from a menu.

Field	Description
Item class	The item class code for the items and SKUs you wish to update. See *Working with Item Classes (WICL)*. The item class code is used in conjunction with the offer code. This option only updates items and SKUs that are in the item class and offer you enter. Alphanumeric, 3 positions; required.
Offer	The offer you wish to update. See *Working with Offers (WOFR)*. The offer is used in conjunction with the item class code. This option only updates items and SKUs that are in the item class and offer you enter. Alphanumeric, 3 positions; required.
Effective date	The starting date for an item price break in this offer. This item quantity discount is available until the next effective date, if any. Effective date is from the Effective date field in the Item Price table. Numeric, 6 positions (in user date format); display-only.
Price	The offer price for item/SKUs in the offer and item class you selected. Numeric, 13 positions with a 2-place decimal; optional.
Associate price	The associated offer price for item/SKUs in the offer and item class you selected. Numeric, 13 positions with a 2-place decimal; optional.
Special handling	Indicates whether an item/SKU is eligible for any type of special handling (such as monogramming) in this offer. *Selected* = The item/SKU is eligible for special handling. *Unselected* = The item/SKU is not eligible for special handling.

Field	Description
S/H price (Special handling price)	The price to charge when for special handling. This is the price per unit for special handling, multiplied by the quantity ordered. The following message indicates if you enter a price without *selecting* the Special handling field: `Special handling price not allowed when not eligible`. Numeric, 13 positions with a 2-place decimal; optional.
S/H code (Special handling code)	The additional charge code for the type of special handling you are offering for the item. The special handling can be either standard or custom; the system handles each type in a different way. See *Establishing Additional Charge Codes (WADC)* and *Establishing Custom Special Handling Formats (WSHF)*. If you enter a special handling code here, you advance to the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen* automatically in order entry. The following message indicates if you enter a price without *selecting* the Special handling field: `Special handling price not allowed when not eligible`. Alphanumeric, 2 positions; optional.
Gift wrap (Gift wrap flag)	Indicates whether the item/SKU can be gift wrapped. Valid values are: *Selected* = Eligible for gift wrap. *Unselected* = Not eligible for gift wrap.
G/W price (Gift wrap price)	The price in this offer to charge for gift wrapping. The gift wrap price is multiplied by the order quantity for the item/SKU. The following message indicates if you enter a price without *selecting* the Gift wrap field: `Gift Wrap Price not allowed when gift wrap flag is No`. Numeric, 13 positions with a 2-place decimal; optional.
Freight	The freight amount to charge for this item, multiplied by the quantity ordered. Used only if the source code uses *By Item* or *Flat Rt/Item*. Numeric, 13 positions with a 2-place decimal; optional.
Hidden freight	Used only with item level freight methods, such as: Flat rate by item, flat rate by item quantity, flat rate by item source, and by item. *What is hidden freight?* Hidden freight represents the portion of the item/SKU's catalog price that is used for freight. You can define a hidden freight value when the freight charge to ship the item/SKU is very high. The hidden freight charge is included in the price of the item/SKU so the actual freight charge is not visible to the customer. Hidden freight is also known as "theoretical" or "buried" freight. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Sale item	Indicates whether the item/SKU is on sale in this offer. Valid values are: *Selected* = The item/SKU is on sale. *Unselected* = The item/SKU is not on sale. If the *Exclude Sale Item When Prorating Discounts (I65)* system control value is *selected*, this flag controls whether the item is included in prorated discounts or when determining whether an order qualifies for a promotion. See the system control value for more information.
Volume discount	Indicates whether this item is eligible for an end-of-order discount that will be applied when you accept the order during Order Entry. • *selected* = The item/SKU is eligible for the volume discount. • *unselected* = The item/SKU is not eligible for the volume discount. See *Item Volume Discounting*.
Coupon discount $ (Coupon discount dollars)	The amount to subtract from the price when the item/SKU is ordered from this offer. Numeric, 13 positions with a 2-place decimal; optional.
Coupon expiration date	The date the coupon is no longer valid. Numeric, 6 positions (in user date format); optional.
Feature/option	Indicates whether the item/SKU is considered a featured or optional item in a depiction in the offer. The featured item is the focus of the depiction; optional items are displayed less prominently. For example, in a depiction of a dress, the shoes and belt depicted may be the optional items. Valid values are: *Feature* = This is the featured item/SKU. *Option* = This is an optional item/SKU. blank (default) = The existing value in the item/offer or SKU/offer remains unchanged. Optional.
Pickup/new	Indicates whether the item/SKU has been carried over from a previous offer or you are presenting it for the first time in this catalog. Valid values are: *Pickup* = This is a pickup item/SKU. *New* = This is a new item/SKU. Optional.

Field	Description
Warranty required	Indicates whether the item is a warranty item. Valid values are: *Selected* = In this offer, the item is a warranty item. When an operator adds this item to an order in order entry or order maintenance, the system adds the item to the order at no charge. *Unselected* = In this offer, the item is not a warranty item. If there is a price override code specified in the *Default Price Override Reason for Warranty Items (G01)* system control value, the system defaults this code to the Price override code field; otherwise, the operator must enter a code.
Required reason code	Defines whether an *Order addition reason code* is required when the item in this offer is added to an order in order entry or order maintenance. When you specify an add reason code for an item, there is a record of the add reason code stored in an order line history record, available for review at the *Display Order Line History Screen*. Valid values are: • *selected* = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. The *Enter Add Reason Window* opens when an operator adds this item to an order in order entry or order maintenance. • *unselected* = The item is this offer does not require an add reason code when the item is added to an order in order entry or order maintenance. **Note:** When the item is added automatically to an order through the order API, the add reason code is not required. For example, an item might be added to an order automatically if it is set up as a free gift by source code.

Instructions:

1. Enter a valid item class in the Item class field and a valid offer in the Offer field.
2. The system defaults the descriptions of the item class and offer and each additional field on this screen becomes enterable.
3. Complete the additional fields as described above.
4. Select *OK* once you have completed all the overrides. Any overrides you enter on this screen will update all item/SKUs in the item class and offer. You can then create exceptions to the override you entered for a specific item or SKU. See Overriding Item Offer Details and Overriding SKU Offer Details later in this topic for more information.
5. Select *Item/Offer Details* to override information for a specific item, or

6. If you do not want to override existing information for a specific item or SKU, you can select *Accept* to accept the overrides on this screen or select *Exit* to cancel. If you select *Accept*, the Confirm Accept pop-up window opens. Select *OK* to accept the overrides or select *Exit* to cancel.
7. If you select *OK* to accept the changes, you return to the previous screen and the following message informs you that the overrides have been submitted: `Job (ICL_OVRDS) has been submitted to batch.`

> **Note:**
>
> Once you select *Item/Offer Details* to advance to the *First Item/Offer Override Details Screen*, you can no longer return to this screen.

Screen Option	Procedure
Override offer details for a specific item	Select *Item/Offer Details* to advance to the *First Item/Offer Override Details Screen*.
Accept the overrides you have entered	Select *Accept*.

First Item/Offer Override Details Screen

Purpose: Use this screen to override a specific item in the item class and offer you entered on the *Item Offer Overrides by Item Class Screen*. Any information you entered on the *Item Offer Overrides by Item Class Screen* defaults.

How to display this screen: Select *Item/Offer Details* on the *Item Offer Overrides by Item Class Screen*.

Field descriptions: The Offer, Item class, Effective date, Special handling and Special handling code fields are described under *Item Offer Overrides by Item Class Screen*.

Field	Description
Item	An item that belongs to the item class and offer you entered on the *Item Offer Overrides by Item Class Screen* **Note:** Item codes for items that have SKU/ offer records but not item/offer records are in a different color than items with an item/offer record. You also cannot override the Page, Effective date, Special handling and Special handling code fields for an item that does not have an item/ offer record. An item that does not have SKUs and that also does not an item/offer record is not listed on this screen. Alphanumeric, 12 positions; optional.

Field	Description
SKU'ed	A value that identifies whether this item is a SKUed item.Valid values are: *Unselected* = This item has SKU's. *Selected* = This item does not have SKU's. You can enter an override for a specific SKU by selecting *SKU/ Offer Details* for the item whose SKUs you wish to work with. See *First SKU/Offer Override Details Screen*.

Instructions:

1. Enter information as described above.
2. Select *OK*.
3. Select *SKU/Offer Details* for an item containing SKUs to change any of the override information for a specific SKU. See *First SKU/Offer Override Details Screen*, or
4. If you do not want to override offer information for a specific SKU, select *Accept* to accept all of the overrides you have entered on *Item Offer Overrides by Item Class Screen* and the *First Item/Offer Override Details Screen*. Select *OK* at the confirmation window to accept the overrides or select *Exit* to cancel.
5. You can also reject the overrides you have entered for items/SKUs in the item class and offer by selecting *Reject*.

Screen Option	Procedure
Change additional information for a specific item	Select *Copy* for an item to advance to the *Second Item/Offer Override Details Screen*.
Override offer information for a specific SKU	Select *SKU/Offer Details* for an item to advance to the *First SKU/Offer Override Details Screen*.
Accept the overrides you have entered	Select *Accept*.
Reject the overrides you have entered	Select *Reject*.

Second Item/Offer Override Details Screen

Purpose: Use this screen to override item/offer details for a specific item.

How to display this screen: On the *First Item/Offer Override Details Screen*, select *Change* for an item.

Field descriptions: See *First Item/Offer Override Details Screen* for field descriptions.

Completing this screen: Once you have completed all the overrides you wish to make, select *Exit* to return to the *First Item/Offer Override Details Screen*.

First SKU/Offer Override Details Screen

Purpose: Use this screen to override item/offer details for a specific SKU.

How to display this screen: On the *First Item/Offer Override Details Screen*, select *SKU/ Offer Details* for a SKUed item.

Field descriptions: Additional fields are described under *First Item/Offer Override Details Screen*.

> **Note:**
>
> If there is no SKU/Offer for a specific SKU, the SKU is not listed on this screen.

Field	Description
Colr size othr (Stock keeping unit)	The special characteristics for this item. Alphanumeric, three 4-position fields; optional.

Screen Option	Procedure
Change additional information for a specific SKU	Select *Change* for a SKU to advance to the *Second SKU/Offer Override Details Screen*.

Second SKU/Offer Override Details Screen

Purpose: Use this screen to change additional SKU/offer information for a specific SKU.

How to display this screen: On the *First SKU/Offer Override Details Screen*, select *Change* for a SKU.

Field descriptions: See *First Item/Offer Override Details Screen* for field descriptions.

Maintaining SKU Cross Reference Codes (MSKR)

Purpose: Use Maintain SKU Cross Reference to create and work with SKU cross reference codes for each item or SKU sold in an offer. You can use SKU cross reference codes as a way to create a cross reference between a Order Administration item and SKU code and the item and SKU in another system, such as ChannelAdvisor.

About the ChannelAdvisor integration: See *ChannelAdvisor Integration Overview* and *ChannelAdvisor Setup* for more information.

Cross reference codes in OEOM: Creating cross reference codes for each item and SKU sold in an offer allows an operator to enter the cross reference code in the Item field when entering a line in order entry or order maintenance. When the operator adds the line to the order, the system searches the SKU Cross Reference table for the item or SKU that is associated with the cross reference code. When the system finds the item that is related to the cross reference code the operator entered, the system defaults the Order Administration item and SKU to the order.

Example:

Order Administration item/SKU: KAL555 GREY WMNS SMLL

SKU cross reference code: 525KL

When the operator enters 525KL in the Item field in order entry or order maintenance, the system defaults the Order Administration item KAL555 in the Item field and the Order Administration SKU GREY WMNS SMLL in the SKU field.

If the operator enters a SKU cross reference code that is not associated with a Order Administration item or SKU or if the operator enters a valid SKU cross reference code but also enters a SKU code, an error message such as the following indicates if the operator attempts to add the line to the order:

Base item (525KL) is missing or invalid.

Restrictions on using SKU cross references to identify items/SKUs:

- *Interactive order entry:* Since the Item field is 12 positions, the SKU cross reference code cannot exceed 12 positions in order to identify the item/SKU in interactive order entry.
- *Order API:* The generic order interface does not support using SKU cross reference codes to identify items. See *Resolving the Item and SKU in the Order API* for a discussion.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

The ChannelAdvisor integration supports using a SKU cross reference of up to 40 positions. See *ChannelAdvisor Integration Overview* for background.

Which offer is used for the order detail line?

When an operator enters a SKU cross reference code in the Item field in order entry or order maintenance, the system uses the offer on the order detail line to determine the price of the item, not the offer where the SKU cross reference code was defined. If a price has not been defined for the item in the offer on the order detail line, the error message Price (.00) cannot be zero for item displays and the operator must manually enter a price.

What if more than one item and SKU is defined with the same cross reference number?

The system searches offers alphanumerically for an item and SKU that contain the cross reference number, selecting the first item and SKU it finds.

Example:

Offer	Item	SKU	Reference Number
A01	A123	BLUE	321RG
A01	A123	RED	321RG
B01	B123	BLUE	321RG
B01	B123	RED	321RG

In order entry and order maintenance, the system defaults the Order Administration item A123 and the Order Administration SKU BLUE, when an operator enters the reference number 321RG in the Item field.

In this situation, when an operator enters the cross reference number 321RG in the Item field, the system searches offers in alphanumeric order for a Order Administration item and SKU. Then, within the first offer where the system finds a match, the system selects the first Order Administration item and SKU it finds containing the cross reference number. For example, if a Order Administration item and SKU in offer A01 was not associated with the cross reference number 321RG, the system would then search offer B01 for a Order Administration item and SKU that was associated with the cross reference number.

In this topic:

- *Work with SKU Cross Reference Screen (Selecting an Offer)*

- Maintain SKU Cross Reference Screen
- Create SKU Cross Reference Codes
- Change SKU Cross Reference Codes

Work with SKU Cross Reference Screen (Selecting an Offer)

Purpose: Use this screen to identify the offer for which you wish to define a cross reference between item and SKU codes in Order Administration and another system.

How to display this screen: Enter *MSKR* in the Fast path field at the top of any menu or select Maintain SKU Cross Reference from a menu.

Field	Description
Offer	A unique code for the catalog, space, or advertisement for which you wish to define a cross reference between an Order Administration item and SKU and another system's item and SKU. Enter a valid offer code to advance to the *Maintain SKU Cross Reference Screen*. **ChannelAdvisor:** To work with cross-references for the ChannelAdvisor integration, enter the offer code specified in the *ChannelAdvisor SKU X-Ref Offer (L92)* system control value. Alphanumeric, 3 positions; required.

Maintain SKU Cross Reference Screen

Purpose: Use this screen to create, change, and delete SKU cross reference codes for Order Administration items and SKUs. SKU cross reference codes represent the code for an item and SKU as represented in another system.

How to display this screen: Enter an offer code on the *Work with SKU Cross Reference Screen (Selecting an Offer)*.

Field	Description
Offer	The code and description of the catalog, space, or advertisement for which you wish to create SKU cross reference numbers. The system displays all existing Order Administration items and SKUs, regardless of whether the item or SKU is associated with this offer. Offer code: Alphanumeric, 3 positions; display-only. Offer description: Alphanumeric, 30 positions; display-only.
Item/desc (Item number/Item description)	The item code for which you wish to create a SKU cross reference number. The description of the item is listed below the item code. Item number: Alphanumeric, 12 positions; optional. Item description: Alphanumeric, 120 positions; optional.
Colo, styl, size	The first, second, and third SKU elements defined for an item in your company.nAlphanumeric, three 4-position fields; optional.
SKU description	The SKU description. Alphanumeric, 40 positions; optional.

Field	Description
SKU cross reference	A code for an item and SKU as represented on another system. **Note:** To use a SKU cross reference in order entry, you cannot have the code exceed 12 positions. Alphanumeric, 40 positions; optional.

Create SKU Cross Reference Codes

To create: Scan for the item and SKU for which you wish to create a SKU cross reference code, using the scan fields at the top of the screen. Enter a cross reference code in the SKU cross reference field next to the item and SKU you wish to update.

The system positions the cursor to the first scan field so that you can scan for the next item and SKU you wish to update.

Change SKU Cross Reference Codes

To change: Scan for the item and SKU for which you wish to change the SKU cross reference code, using the scan fields at the top of the screen. Enter the change you wish to make to the existing cross reference code in the SKU cross reference field next to the item and SKU you wish to update.

The system positions the cursor to the first scan field so that you can scan for the next item and SKU you wish to update.

Updating SKU Offer Prices (MUSK)

Purpose: Use the Update SKU/Offer screen to create or update a SKU/offer price for specific SKUs of an item.

You might want to use this menu option instead of maintaining SKU/offer prices through Work with Item/SKUs, if your company contains items with many SKUs and you want to update multiple SKUs for multiple offers at one time.

The SKU/Offer price information you can update for a SKU'ed item is:

- effective date
- price quantity
- price of the SKU in the offer
- associate price of the SKU in the offer
- special handling flag
- special handling price
- special handling code
- tax inclusive price of the SKU in the offer
- tax inclusive associate price of the SKU in the offer

You can define SKU/offer prices for up to 10 offers at one time.

Number assignment: The SKU Quick Price Update Number number assignment allows more than one user to enter SKU/offer prices at one time. When a user creates a SKU/offer price, the system assigns the SKU/offer price the next number available for this number assignment. See *Setting Up the Number Assignment Table (WNUM)*.

If the item/offer exists: The system creates a SKU/offer using the item/offer information, except for the information you defined for the SKU/offer price.

If the item/offer does not exist: The system creates a SKU/offer using the following information:

- the *Gift Wrap Default (F07)* system control value defaults to the Gift order field.
- the system defaults the Sale item field to *unselected*.
- the system defaults the Volume discount field to *unselected*.
- the system defaults the Column pricing field to *unselected*.
- the information you defined for the SKU/offer price

The system leaves any remaining fields blank.

In this topic:

- *Update SKU/Offer Screen*
- *Exclude SKU Offer Prices Screen*

Update SKU/Offer Screen

Use this screen to create or update a SKU/offer price for specific SKUs of an item.

Defaulting active offers: If the *Default Active Offers (J07)* system control value is selected and you do not manually enter an offer in the Offer fields, the system defaults the 10 most recent active offers to the Offer field for the entered SKU'ed item: `Offers have been defaulted - click OK to update`.

The offers default to the Offer fields in descending Start date sequence.

> **Note:**
>
> The system does not default any offers until you enter a SKU'ed item, effective date, quantity, and price, and select *OK*.

You must enter a SKU'ed item on the *Update SKU/Offer Screen*; however, you cannot enter a SKU code. Because of this, the system always defaults the 10 most recent *item offers* to the Offer fields.

- If the item is not assigned to 10 active item offers, the system defaults the available active offers assigned to the item. For example, if the item is assigned to 25 item offers, but only 8 item offers are active, the system defaults the 8 active item offers.
- If the item is assigned to more than 20 active item offers, the system evaluates the offer's Start date to determine the 20 most recent active item offers to default.

- If active offers do not exist for the item, the Offer fields remain blank and you must manually enter offers in the Offer fields.
- If you update the Item and/or SKU field, the system will not update the defaulted offers.
- You can manually change a defaulted offer to another offer, even if the offer is a future offer or expired offer.

How to display this screen: Enter *MUSK* in the Fast path field at the top of any menu or select Update SKU Offer Prices from a menu.

Field	Description
Item	A user defined code that represents an item. This is the item for which you wish to create or update SKU/offer prices. An error message indicates if you enter a non-SKU'ed item in this field: `Invalid item - Item must be SKU'ed.` An error message indicates if you enter an item that is not associated with an item/offer: `Invalid item - Item/Offer must exist.` Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; required.
Description	A description of the item. Updates when you enter an item code in the Item field. Alphanumeric, 120 positions; display-only.
Effective date	The date the price or quantity break discount becomes valid. This date should be on or after the effective date of the offer. If there are multiple effective dates for the same SKU/offer, the system uses the price associated with the effective date closest to, but not greater than, the order date. *Example:* If there are effective dates of Feb. 20 and Mar. 31 and the customer placed an order on April 1, the customer receives the price associated with the effective date of March 31. Numeric, 6 positions (in user date format); optional.
Quantity	The amount of the item/SKU that the customer must order to receive the discounted (quantity break) price. Numeric, 7 positions; required.
Tax inclusive price	The price at which the item will be sold in the specified offer(s) on orders subject to tax-inclusive pricing and VAT. Included only if the *Tax Included in Price (E70)* system control value is *selected*. If so, the following message indicates if you do not define a price in this field: `Tax Inclusive Price is required entry.` Numeric, 13 positions with a 2-place decimal; optional.
Price	The price at which the item will be sold in the specified offer(s) when the quantity and effective date are met. Numeric, 13 positions with a 2-place decimal; required.
Associate price	The price at which the item will be sold in the specified offer(s) to associate customers. Included only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Tax inclusive associated price	The price at which the item will be sold in the specified offer(s) to associate customers on orders subject to tax-inclusive pricing and VAT. Numeric, 13 positions with a 2-place decimal; optional.
Spec. hand. (Special handling)	Indicates whether this item is eligible for any type of special handling in this offer, such as monogramming or hemming. Valid values are: *Selected* = This item is eligible for special handling. When you add this item to an order, you advance to another screen where you can enter special handling instructions. *Unselected* (default) = This item is not eligible for special handling.
S/H price (Special handling price)	The price to charge the customer for special handling. You can specify in the *Evaluate Special Handling Charges by Order Line (D67)* system control value whether to add the price just once for each order line, or multiply the special handling price by the item quantity for the line. An error message indicates if you define a special handling price and the Special handling field is *unselected*: `Special handling price not allowed when not eligible`. The following message indicates if you enter a special handling price and you defined a custom special handling code in the Special handling code field: `Special handling charge not allowed with custom format code`. Numeric, 13 positions with a 2-place decimal; optional.
S/H code (Special handling code)	The additional charge code associated with the type of special handling you are offering for the item. The special handling can be either standard or custom; the system handles each type in a different way. See *Establishing Additional Charge Codes (WADC)* and *Establishing Custom Special Handling Formats (WSHF)*. If you enter a special handling code here, you will advance to the *Work with Special Handling Screen* or *Work with Custom Special Handling Screen* automatically in order entry. Alphanumeric, 2 positions; optional.
SKU element 1	The name of SKU element 1, based on the *Split SKU Element Column 1 Heading (A34)* system control value. You can define up to 30 SKU element 1 codes for which you wish to create or update SKU/offer prices. You can leave the SKU element 1 fields blank if you wish to update all of the SKU element 1 codes for the item. Alphanumeric, thirty 4-position fields; optional.
SKU element 2	The name of SKU element 2, based on the Split SKU Element 2 Column Heading system control value. You can define up to 30 SKU element 2 codes for which you wish to create or update SKU/offer prices. You can leave the SKU element 2 fields blank if you wish to update all of the SKU element 2 codes for the item. Alphanumeric, thirty 4-position fields; optional.

Field	Description
SKU element 3	The name of SKU element 3, based on the Split SKU Element 3 Column Heading system control value. You can define up to 30 SKU element 3 codes for which you wish to create or update SKU/offer prices. You can leave the SKU element 3 fields blank if you wish to update all of the SKU element 3 codes for the item. Alphanumeric, thirty 4-position fields; optional.
Offers	The offers you wish to update with this SKU/offer price information. See *Working with Offers (WOFR)*. You can create or update SKU/offer prices for up to 10 different offers at one time. If the *Default Active Offers (J07)* system control value is selected and you do not manually enter an offer in the Offer fields, the system defaults the 10 most recent active offers to the Offer fields for the entered item. The offers default to the Offer fields in descending Start date sequence. An error message indicates if you enter the same offer in more than one field: `More than one offer A01 has been entered`. An error message indicates if you do not define at least one offer: `At least one (1) Offer must be entered`. Alphanumeric, 3 positions; required.

Instructions:

1. Complete each necessary field.
2. If you did not define specific SKU codes you wish to update, the system displays the following message: `Click OK to update ALL SKUs for Item`.
3. Select *OK* to update the SKU/offer price information, or select *Exit* to cancel.
4. If you selected *OK*, you advance to the *Exclude SKU Offer Prices Screen*, where you can exclude specific SKUs from being updated with this SKU/offer price.

Exclude SKU Offer Prices Screen

Purpose: Use this screen to exclude a specific SKU from being updated with the SKU/offer price you defined.

The system displays all of the valid SKU combinations for the item, based on the SKU codes you entered on the *Update SKU/Offer Screen*. For example, if you sell mittens in small, medium, and large and in many colors, but only defined the SKU small on the Update SKU/Offer screen, the system would show mittens only in size small in all of the available colors.

How to display this screen: Complete the *Update SKU/Offer Screen*.

Field	Description
Item	A user defined code that represents an item. This is the item for which you wish to create or update SKU/offer prices. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; display-only.

Field	Description
Quantity	The amount of the item/SKU that the customer must order to receive the discounted (quantity break) price. Numeric, 7 positions; display-only.
Description	A description of the item. Alphanumeric, 120 positions; display-only.
Price	The price at which the item will be sold when the quantity and effective date are met. Numeric, 13 positions with a 2-place decimal; display-only.
Associate price	The price at which the item will be sold to associate customers. Numeric, 13 positions with a 2-place decimal; display-only.
Offers	The offers you selected on the *Update SKU/Offer Screen*. These are the offers for which you wish to create or update SKU/offer prices. Alphanumeric, 3 positions; display-only.
SKU elements	The name of SKU elements 1, 2 and 3, based on the *Split SKU Element Column 1 Heading (A34)* system control value. The system displays the valid SKU combinations that are eligible for a SKU/offer price update, based on the SKU codes you defined on the Update SKU/Offer screen. Alphanumeric, thirty 4-position fields; optional.
Exclude?	Indicates whether you wish to exclude the valid SKU combination from creating a SKU/offer price. Valid values are: *Selected* = Exclude this SKU combination from creating a SKU/offer price. *Unselected* = Do not exclude this SKU combination from creating a SKU/offer price.

Instructions:

1. *Select* the SKU combinations you wish to exclude from creating a SKU/offer price; otherwise, leave the field blank if you want to create a SKU/offer price for the SKU.
2. Select *Process* to create the SKU/offer prices, or select *Exit* to cancel.
3. The system returns you to the Update SKU/Offer screen.

You can view the SKU/Offer prices you created on the Work with SKU Prices screen in Work with Item/SKUs. See *Assigning Items/SKUs to Offers*.

> **Note:**
>
> If the effective date of the SKU/offer price you created matches the effective date of an existing SKU/offer price, the system replaces the existing SKU/offer price with the new SKU/offer price.

Maintaining Item/SKU/Offer (CPIM)

Purpose: Use Maintain Item/SKU/Offer to recalculate the projected units or update other information in the Item/Offer table.

In this topic:

- *Maintain Item/SKU/Offer Screen*

For more information: See *Working with Existing Items (MITM)* for a description of the fields on the Change Item, Change SKU, and Change SKU/Offer screens.

Maintain Item/SKU/Offer Screen

Purpose: Use this screen to update item/offer information.

How to display this screen: Enter *CPIM* in the Fast path field or select Maintain Item/SKU/Offer from a menu.

Field	Description
Offer	A code for the catalog, space, or television advertisement from which you accept orders. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
Item	A code for a unit of inventory that you sell. Alphanumeric, 12 positions.
SKU	A code for the unique characteristics of the item, such as its color, size, width, etc. Alphanumeric, three 4-position fields.
Price	The price of a single unit of the item, as advertised in the offer. Numeric, 13 positions with a 2-place decimal; optional.
F/O (Feature/Option code)	This code identifies whether the item in the offer is considered a feature or option in a depiction (a photograph or drawing of the item along with other items). If, for example, a dining room is depicted, the featured item might be the dining room table, and the options might include a place setting, crystal, and a centerpiece. Valid values are: *Feature* = Item is the featured item in the depiction *Option* = Item is an option within a depiction Optional.
P/N (Pickup/New code)	This code identifies whether the item is a carryover from a previous offer or is an item that you are just beginning to sell. Valid values are: *Pickup* = Item is a pickup item from a previous offer *New* = Item is new to this offer Optional.
Tax inclusive price	The price of a single unit of the item, as advertised in the offer, on orders which are subject to VAT. Included only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Update the base item	Select *Change* for the item you want to update to advance to the Change Item Screen. See *Performing Initial Item Entry (MITM)*.

Screen Option	Procedure
Update a SKU	Select *Change SKU* for the SKU'd item you want to update to advance to the Change SKU (First Screen). See *Performing Initial Item Entry (MITM)*
Update a SKU/Offer	Select *Change SKU offer* for the SKU/Offer you want to update to advance to the Change SKU/Offer Screen. See *Performing Initial Item Entry (MITM)*

Maintaining Item Offers (MIOF)

Purpose: Use Maintain Item Offers to update item offer information for a specific offer, or to change item information for a specific item.

For more information: See *Assigning Items/SKUs to Offers* for more information on changing item or item offer information.

Maintain Item/Offer Screen

How to display this screen: Enter *MIOF* in the Fast path field at the top of any menu or select Maintain Item Offers from a menu.

Field	Descriptionh
Offer	A code for a catalog, space, or television advertisement from which you accept orders. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
Item	A code for a unit of inventory that you sell. Once you have selected an offer, you can scan on this field. Alphanumeric, 12 positions; optional.
SKUs?	Indicates whether the item contains SKUs. Valid values are: *Selected* = this item contains SKUs *Unselected* = this item does not contain SKUs
Price	The *Price* of a single unit of the item, as advertised in the offer. Numeric, 13 positions with a 2-place decimal; optional.
F/O (Feature/option code)	The *Feature/option* code identifies whether the item in the offer is considered a feature or option in a depiction (a photograph or drawing of the item with other items). If for example, a dining room is depicted, the feature item might be the dining room table and the options might include the place setting, crystal and centerpiece. Valid values are: *Feature* = this item is the featured item in the depiction *Option* = this item is an option in the depiction Optional.
P/N (Pickup/new code)	The *P/N (Pickup/new code)* code identifies whether this item is a carryover from a previous offer or is an item that you are just beginning to sell. Valid values are: *Pickup* = Item is a pickup item from a previous offer *New* = Item is new to your offer Optional.

Field	Descriptionh
Tax inclusive price	The *Tax inclusive price* of a single unit of the item, as advertised in the offer, on orders which are subject to VAT. Included only if the *Tax Included in Price (E70)* system control value is *selected*. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Change base item information	Select *Change* for an item to advance to the Change Item screen. See *Performing Initial Item Entry (MITM)*.
Change item offer information	Select *Change Item Offer* for an item to advance to the Change Item Offer screen. See *Performing Initial Item Entry (MITM)*.

Copying SKU/Offer Records (CSKO)

Purpose: Use this menu option to copy item/SKUs from one SKU offer to another SKU offer by selecting an offer to copy from and the new offer to be created to.

You can also copy all SKU offer records from one offer to another offer using the *Copying SKU Offer Information (MCSO)* menu option.

What SKU offer information is copied? When you copy a SKU offer record to a new offer, the system copies the following records for the from offer to create matching records for the to offer.

- SKU offer
- SKU price **Note:** The system copies the SKU price record for the from offer for a quantity of 1; the system does not copy any other SKU price records that exist for other quantities to the to offer.

Additionally, if you select to copy a SKU offer record for a non-SKU'd item, the system creates a SKU offer record and an item offer record for the to offer if an item offer already exists for the from offer.

Example: You select to copy items SKU202 RED SMLL and ITEM30 from offer 202 to offer 203.

Item/SKU copied	From offer	Records copied	To offer	Records created
SKU202 RED SMLL	202	SKU offer SKU price	203	SKU offer SKU price
ITEM301	202	SKU offer SKU price Item offer	203	SKU offer SKU price Item offer

Copy SKU/Offer Records Screen

This screen displays all SKU offer records that exist for the company you are currently in; you can select which SKU offer records you wish to copy to another offer.

To copy:

- Optionally, scan for the SKU offer records you wish to copy by entering an offer in the Copy from offer field and an item in the Item field.
- Next to each SKU offer record you wish to copy, enter the offer for which you wish to create a SKU offer record in the To offer field.
- Select *Accept*.

> **Note:**
>
> The system creates a SKU offer record for the to offer that matches the SKU offer record for the from offer. You can change the information for the to offer at the Change SKU Offer screen.

How to display this screen: Enter *CSKO* in the Fast path field or select Copy Individual SKU Offers from a menu.

Field	Description
Copy from offer	The offer from which you wish to copy SKU offer information. You can use this field to scan for the offer whose SKU offer records you wish to copy. **Note:** The system does not verify that the offer you enter in this scan field is a valid offer. Alphanumeric, 3 positions; optional.
From offer	The offer from which the information will be copied. Offer codes are defined in an validated against the Offer table; see *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
Item	The item code and SKU whose SKU offer information you wish to copy. You can use this field to scan for the item and SKU whose SKU offer records you with to copy. **Note:** The system does not verify that the item and SKU you enter in this scan field is a valid item/SKU. Item code: Alphanumeric, 12 positions; optional. SKU code: Alphanumeric, three 4-position fields; optional.

Field	Description
To offer	The offer to which the information will be copied. **Note:** The system does not validate that the from offer is different from the to offer. Offer codes are defined in an validated against the Offer table; see *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.

Screen Option	Procedure
Display SKU offer information for the From SKU offer record	Select *Display* for an offer to advance to the Display SKU Offer screen.
Toggle the display of the Options field	Select *Options on/off* to toggle the Options field on or off.
Copy the SKU offer records of the From offer to create SKU offer records for the To offer	Select *Accept*.

Maintaining Purchase Orders

Topics in this part:

- *Maintaining Purchase Orders (MPOE)* tells you how to select a purchase order for maintenance, enter any changes, and accept your entries.

Maintaining Purchase Orders (MPOE)

Purpose: This topic describes how to select a purchase order for maintenance, maintain header, detail, and all related information, and accept or reject your changes.

Drop ship POs: Creating a drop ship purchase order expedites the shipment of a drop ship order to the customer. The system performs the following procedures during drop ship processing:

- An item is flagged as “Drop Ship” in Order Entry (Open Drop Ship line).
- The system checks the Item/SKU table to determine the primary vendor assigned to the item/SKU that was ordered.
- The system then checks the Vendor table to determine whether this vendor creates drop ship purchase orders or drop ship pick slips. If drop ship POs are created for this vendor, PO Print automatically prints the Drop Ship PO.
- Once confirmation has been received from the vendor, PO Receipts closes the purchase order, closes the order, and generates a billing record for the customer.

Purchase Order Outbound API: You can use the Purchase Order Outbound API to pass purchase order information to download to another system, such as a warehouse management system (WMS) or EDI vendor system. See *Generic Outbound Purchase Order API* the Web Services Guide on My Oracle Support (ID 2953017.1) for overview and setup.

In this topic:

- *Work with PO Messages Screen*
- *Purchase Order Summary Screen*
- *Completing PO Maintenance*
- *Print P/O Window*

Related Secured Features

- *Override PO Cost (A17)*
- *Approve Purchase Order (A31)*
- *Maintain from within Inquiry (A16)*
- *Non-Inventory Entry (A09)*
- *Override Vendor's Discount Percentage (A10)*
- *Update Existing Vendor Notes (A14)*
- *Update Existing P/O Messages (A13)*

Selecting Purchase Orders for Maintenance

Overview: You advance to purchase order maintenance through the *MPOE* fast path, which brings you to the PO Maintenance Select Prompt Screen. From this screen, you can advance to:

- *Select Purchase Order by Due Date Screen*
- *Select P/O by Reference Number Screen*
- *Select Purchase Order by Vendor Number Screen*
- *Vendor Selection Pop-Up Window (Selecting Purchase Orders by Vendor Name)*
- *Select P/O by Vendor Reference Screen*
- *Select Purchase Order by Vendor Item Screen*
- *Select Purchase Order by Item/SKU Screen*
- *Select Purchase Order by Buyer Screen*

From any selection screen, *select* a purchase order to advance to the PO Maintenance - Maintain Detail Screen.

Maintaining multiple purchase orders: You can select multiple purchase orders for maintenance at any selection screen. When you select *Accept* or *Reject* after you finish maintaining a purchase order, you advance to the next purchase order you selected for maintenance.

PO Maintenance Select Prompt Screen

Use this screen to locate the purchase order number you wish to maintain.

How to display this screen: Enter *MPOE* in the Fast path field at the top of any menu.

Field	Description
PO #	Enter a valid purchase order number to advance to the *PO Maintenance - Maintain Detail Screen*. Numeric, 7 positions; optional.

Field	Description
Due Date	Enter a purchase order due date to advance to the *Select Purchase Order by Due Date Screen*. Numeric, 6 positions; optional.
Reference #	Enter a purchase order reference number to advance to the *Select P/O by Reference Number Screen*.
Vendor	Enter a vendor number to advance to the *Select Purchase Order by Vendor Number Screen*. Numeric, 7 positions; optional.
Vendor name	Enter a vendor name to advance to the *Vendor Selection Pop-Up Window (Selecting Purchase Orders by Vendor Name)*. Alphanumeric, 20 positions; optional.
Reference	Enter a vendor reference number to advance to the *Select P/O by Vendor Reference Screen*. Alphanumeric, 15 positions; optional.
Vendor Item	Enter a vendor item number to advance to the *Select Purchase Order by Vendor Item Screen*. Alphanumeric, 20 positions; optional.
Item/SKU	Enter a valid item/SKU to advance to the *Select Purchase Order by Item/SKU Screen*. Alphanumeric, 12 positions (for item), three 4-position fields (SKU); optional.
Buyer	Enter a buyer code to advance to the *Select Purchase Order by Buyer Screen*. Alphanumeric, 3 positions; optional.

Select Purchase Order by Due Date Screen

How to display this screen: At the *PO Maintenance Select Prompt Screen*, enter a purchase order due date.

You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*; however, the screen options will differ.

Field	Description
Due date	The date the purchase order is due to be received. Numeric, 6 positions (in user date format); optional.
Promise date	The date the purchase order is scheduled to arrive, or to ship. This date is user-defined and its usage depends on your organization's procedures. Numeric, 6 positions (in user date format); optional.
P/O #	A unique number to identify a purchase order. Numeric, 7 positions; optional.
Balance	The value of the merchandise ordered on the purchase order. Calculated by multiplying the quantity ordered by the vendor's cost. This is the total cost for all the detail lines on the purchase order. The system updates this value. Numeric, 20 positions with a 4 place decimal.

Field	Description
Vendor	A code that defines the supplier of items. Numeric, 7 positions; optional.
Buyer	A code to identify a person authorized to make purchases. Alphanumeric, 3 positions; optional.
Status	The status of the purchase order. Status options: • Cancelled • Docked • Held • Open • Suspended • Closed Optional.

> **Note:**
>
> The Select by (field name) screens are the same in both purchase order maintenance and purchase order inquiry; however, the screen options differ.

Screen Option	Procedure
Select a purchase order for maintenance	*Select* a purchase order (if you advanced through PO maintenance) or Select *Change* for a purchase order (if you advanced through PO inquiry) to advance to the *PO Maintenance - Maintain Detail Screen*. **Maintaining multiple purchase orders:** You can select multiple purchase orders for maintenance. When you select *Accept* or *Reject* after you finish maintaining a purchase order, you advance to the next purchase order you selected for maintenance.
Select a purchase order for inquiry	*Select* a purchase order to advance to the First Display Purchase Order Detail Screen. **Note:** Available through PO inquiry only. **Reviewing multiple purchase orders:** You can select multiple for purchase orders for review. When you select *Exit* after you finish reviewing a purchase order, you advance to the next purchase order you selected for review.

Screen Option	Procedure
Copy a purchase order	Select *Copy* for a purchase order to copy an existing purchase order. See the *Copying Purchase Orders*. **Note:** This option is not available in purchase order inquiry.

Select P/O by Reference Number Screen

How to display this screen: At the *PO Maintenance Select Prompt Screen*, enter a purchase order reference number. You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*; however, the screen options will differ.

> **Note:**
>
> The fields and options are similar to those described at the *Select Purchase Order by Due Date Screen*.

Select Purchase Order by Vendor Number Screen

How to display this screen: At the *PO Maintenance Select Prompt Screen*, enter a vendor number. You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*; however, the screen options will differ.

> **Note:**
>
> The fields and options are similar to those described at the *Select Purchase Order by Due Date Screen*.

Vendor Selection Pop-Up Window (Selecting Purchase Orders by Vendor Name)

How to display this screen: Enter a vendor name at the *PO Maintenance Select Prompt Screen*. You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*.

> **Note:**
>
> The fields and options are similar to those described at the *Select Purchase Order by Due Date Screen*.

Select P/O by Vendor Reference Screen

How to display this screen: At the *PO Maintenance Select Prompt Screen*, enter a vendor reference number. You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*; however, the screen options will differ.

> **Note:**
>
> The fields and options are similar to those described at the *Select Purchase Order by Due Date Screen*.

Select Purchase Order by Vendor Item Screen

How to display this screen: At the *PO Maintenance Select Prompt Screen*, enter a vendor item number. You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*; however, the screen options will differ.

> **Note:**
>
> The fields and options are similar to those described at the *Select Purchase Order by Due Date Screen*.

Select Purchase Order by Item/SKU Screen

How to display this screen: At the *PO Maintenance Select Prompt Screen*, enter an item/SKU code. You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*; however, the screen options will differ.

> **Note:**
>
> The fields and options are similar to those described at the *Select Purchase Order by Due Date Screen*.

Select Purchase Order by Buyer Screen

How to display this screen: At the *PO Maintenance Select Prompt Screen*, enter a buyer code. You can also display this screen by entering a purchase order due date at the *Select Purchase Order for Inquiry Screen*; however, the screen options will differ.

> **Note:**
>
> The fields and options are similar to those described at the *Select Purchase Order by Due Date Screen*.

Copying Purchase Orders

Purpose: Use the Copy function to create an exact duplicate of an existing purchase order. You can copy a purchase order, regardless of the original purchase order's status. The system assigns an Open status to the new purchase order.

How to copy a purchase order:

1. At a Select Purchase Order screen, select *Copy* for the PO you want to copy. See *Selecting Purchase Orders for Maintenance*.
2. The system copies the PO and displays the *PO Maintenance - Maintain Detail Screen* for the new purchase order. The system automatically assigns a number to the new purchase order.

PO Maintenance - Maintain Detail Screen

Purpose: Use this screen to change, cancel, display, or add a line to an existing purchase order. Up to three purchase order lines display at one time; select *Next* to review additional lines.

How to display this screen:

1. Select the purchase order by number at the *PO Maintenance Select Prompt Screen*.
2. If you do not know the exact number, enter information in one of the selection fields at the *PO Maintenance Select Prompt Screen* to advance to a Select Purchase Order screen (see *Selecting Purchase Orders for Maintenance*). At this screen, *select* a PO.

Field	Description
Vendor	The code and name of the supplier. Alphanumeric, 20 positions; display-only.
PO #	The number assigned to the purchase order. Numeric, 7 positions; display-only.
Status	The status of the purchase order. Status options: • *Canceled* = The purchase order was canceled through PO Maintenance; it exists on the system for historical purposes. • *Docked* = You have received inventory associated with the purchase order, but have not yet confirmed items or quantities. • *Closed* = All lines on the purchase order have been received through PO Receiving. • *Held* = The PO must be approved through PO Maintenance before receipts can occur. • *Open* = The PO exists on the system awaiting PO Receipts. • *Suspended* = Inventory has been received into suspense through the PO Receiving function. Display-only.

Field	Description
Total cost	The total value of items to be purchased, calculated by the extended price (quantity ordered multiplied by price), plus additional estimated charges and line surcharges (minus any discounts). Expressed in your currency, not the vendor's. Numeric, 20 positions with a 4-place decimal; display-only.
Ln #	The purchase order detail line number. Up to 999 lines may exist on one purchase order. Enter a number in this field and select *OK* to position to a specific purchase order line number. Numeric, 3 positions; display-only.
Sts	The status of the purchase order line. Valid values: • *C* = Canceled • *H* = Held • *O* = Open • *S* = Suspended • *X* = Closed Alphanumeric, 1 position; display-only.
Item	A code representing an item on the purchase order. The description of the item is below this field. Enter a valid item number and select *OK* to position to a specific item. If more than one purchase order line contains the item, the purchase orders lines that contain the item display in line number sequence. Item: Alphanumeric, 12 positions; display-only. Description: Alphanumeric, 120 positions; display-only.
SKU	The SKU for the item on the purchase order line. Alphanumeric, three 4-position fields; display-only.
UOM (Unit of Measure)	The retailer’s unit of measure. This may differ from the vendor’s unit of measure. Typical units of measure include: • *EA* = each • *IN* = inches • *C12* = case of 12 Validated against the Unit of Measure table; see *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; display-only.
Qty ord (Quantity ordered)	The number ordered of the item, in the retailer’s unit of measure. Numeric, 7 positions display-only.

Field	Description
Qty due (Quantity due)	The quantity remaining to be received. The system uses the following calculation to determine the quantity due: Order quantity from PO Detail table - Received quantity from PO Detail table = Quantity due. **Note:** 0 indicates the quantity received is greater than the quantity ordered.
Ext cost (Extended cost)	The extended cost of this PO detail line, which is calculated by multiplying the quantity ordered and the price from the purchase order, adding the surcharge, and subtracting the discount. Numeric, 20 positions with a 4-place decimal; display-only.

Screen Option	Procedure
Change PO detail information	Select *Change* for a detail line to advance to the PO Maintenance - Change PO Detail Screen. You cannot change a PO line that is in a cancelled or closed status: `Cannot change a closed/ cancelled PO line`.

Screen Option	Procedure
Cancel PO detail information	Select *Cancel* for a detail line to cancel it from the purchase order. The status (Sts field) for the item changes to *C* (canceled), and the On order qty reduces by the number of units canceled. **Note:** If the item is a drop ship item, and you use the Order Orchestration Drop Ship interface to process drop ship items for this vendor, you cannot cancel the PO from this screen unless: • You have authority to the Cancel OROB Drop Ship PO (J04) secured feature. • The item is a drop ship item, but was processed before the vendor was flagged as OROB Drop Shipping. If you do not have authority to the Cancel OROB Drop Ship PO (J04) secured feature, the following message displays when you select *Cancel* for an Order Orchestration drop ship line: `Use D/S Status option in PO or Order Inquiry to cancel D/S integration PO line` From PO Inquiry or standard Order Inquiry, you can cancel an Order Orchestration drop ship item if you have authority to the secured feature Order Maintenance Access (A22).
Display PO detail information	Select *Display* for a detail line to advance to the Display Purchase Order Detail Screen.

Screen Option	Procedure
Close the PO line	Select *Close* for a detail line to close it. The status (Sts field) for the item changes to *X* (closed), and the On order qty reduces by the number of units. **Note:** If the item is a drop ship item, and you use the Order Orchestration Drop Ship interface to process drop ship items for this vendor, you cannot close the PO from this screen. Instead, when you select *Close* next to an item the following message indicates: `Use D/S Status option in PO or Order Inquiry to cancel D/S integration PO line` From PO Inquiry or standard Order Inquiry, you can cancel an Order Orchestration drop ship item if you have authority to the secured feature *Order Maintenance Access (A22)*.
Work with estimated charges	Select *Estimated Charges* for a detail line to advance to the *Work with PO Detail Estimated Charges Screen*.
Display PO detail history	Select *History* for a detail line to advance to the *Display PO Detail History Screen*.
Update PO detail messages	Select *Messages* for a detail line to advance to the *Work with PO Detail Messages Screen*.
Review receiving history	Select *Receiving* for a detail line to advance to the *Purchase Receipts History Screen*.
Work with vendor item notes for the last item entered	Select *Vendor item notes* for a detail line to advance to the *Work with Vendor Item Notes Screen*.

Screen Option	Procedure
Approve PO	Select *Approve* to approve the PO. If you are not authorized to approve purchase orders, the screen displays an error message. The *Approve Purchase Order (A31)* secured feature controls this access. **Note:** If you advanced to this screen from PO inquiry, you cannot approve a purchase order. You need to select the purchase order in PO maintenance in order to approve it, regardless of your secured feature authority.
Create PO detail information	Select *Create Dtl* to advance to the *Create PO Detail Standard Screen*.
Work with PO header information	Select *Header* to advance to the *Work with Purchase Order (Header) Screen*. **Note:** If you change the buyer, ship via, offer, due date, cancel date, or promise date on the PO header, the system updates the value on each existing PO line in an open or held status. The system also updates the value for any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level.
Accept the PO	Select *Accept* to accept the PO. See *Completing PO Maintenance*.

Screen Option	Procedure
Reject the PO	Select *Reject* to reject the PO. See *Completing PO Maintenance*.
Cancel the purchase order	Select *Cancel PO* to cancel this purchase order. If the PO is a drop ship PO and an authorization exists for the order, the system creates a record in the Void Auths table for the authorization amount. If a detail line on the PO is a drop ship item, and you use the Order Orchestration Drop Ship interface to process drop ship items, you cannot cancel the purchase order using this option, and the following message indicates: `Must cancel drop ship lines individually`
Work with vendor FOB for the PO	Select *FOB* to advance to the *Work with FOB for Purchase Order Screen*.
Add vendor notes	Select *Vendor notes* to advance to the *Work with Vendor Notes Screen*.
Display summary information	Select *Summary* to advance to the *Purchase Order Summary Screen*.
Display PO messages	Select *Messages* to advance to the *Work with PO Messages Screen*.

PO Maintenance - Change PO Detail Screen

Purpose: Use this screen to make changes to an item on a purchase order. You can also use this screen to:

- Break up shipments for a purchase order detail line or hold shipment of the entire line until a future date.
- Enter, display, update or delete estimated additional charges for brokerage, commission, duty, freight, import, surcharge, or other types of fees.
- Enter, display, update or delete estimated discounts for a purchase order detail line.

How to display this screen: At the *PO Maintenance - Maintain Detail Screen*, select *Change* for an item.

Field	Description
PO #	The number assigned to the purchase order. Numeric, 7 positions; display-only.

Field	Description
Status	The status of the purchase order. Status options: • *Canceled* = The purchase order was canceled through PO Maintenance; it exists on the system for historical purposes. • *Docked* = You have received inventory associated with the purchase order, but have not yet confirmed items or quantities. • *Closed* = All lines on the purchase order have been received through PO Receiving. • *Held* = The PO must be approved through PO Maintenance before receipts can occur. • *Open* = The PO exists on the system awaiting PO Receipts. • *Suspended* = Inventory has been received into suspense through the PO Receiving function. Display-only.
Vendor #	The code and name of the supplier. Alphanumeric, 20 positions; display-only.
Line #	The purchase order detail line number. Up to 999 lines may exist on one purchase order. Enter a number in this field and select *OK* to position to a specific purchase order line number. Numeric, 3 positions; display-only.
Status	The status of the purchase order line. Valid values: • *Open* = The PO line is open awaiting PO Receipts. • *Held* = The PO line is held. • *Cancelled* = The PO line was canceled through PO Maintenance; it exists on the system for historical purposes. • *Suspended* = Inventory has been received into suspense through the PO Receiving function. • *Closed* = The PO line has been received through PO Receiving. Alphanumeric; display-only.
Item	A code representing an item on the purchase order. The description of the item is below this field. Enter a valid item number and select *OK* to position to a specific item. If more than one purchase order line contains the item, the purchase order lines that contain the item display in line number sequence. Item: Alphanumeric, 12 positions; display-only. Description: Alphanumeric, 120 positions; display-only.
SKU	The SKU for the item on the purchase order line. Alphanumeric, three 4-position fields; display-only.

Field	Description
Qty	Quantity of the item that you have ordered from the vendor, in retailer's unit of measure. The system checks: • Minimum quantity in the Vendor/Item table (in retailer's unit of measure) • Order multiple in Vendor/Item table. (in retailer's unit of measure) An error message indicates if the quantity you order is less than the minimum, if the quantity is not a multiple of the quantity specified for the vendor/item, or if the quantity you enter cannot be converted to the vendor's unit of measure. See *Working with Vendor Items (WVNI)*. Numeric, 7 positions; optional.
Cost	The unit price you pay the vendor for this item, per retailer's unit of measure. If you do not enter a cost here, it defaults after you select *OK* as follows: • Vendor/Item cost • Standard cost from the SKU table The *Override PO Cost (A17)* secured feature controls access to this field. **Note:** You cannot change the cost of an existing purchase order line to zero, even if the vendor/item price and price from the SKU table are zero. **Order Orchestration PO Changes** When you change the cost for a drop ship purchase order line which has been sent to the *Order Orchestration Drop Ship Integration* for processing, Order Administration automatically sends the changed cost information to Order Orchestration, where the cost on the purchase order line updates automatically. Numeric, 13 positions with a 4-place decimal; required.
Transit qty	The quantity that the vendor has indicated is in transit from them to you. This is merchandise that has not been received as yet; however, it has been shipped from the vendor. You can update this quantity through *Working with P/O In Transit Information (MPIT)* or enter it here. Numeric, 7 positions; optional.
Primary disc (Primary discount percentage)	The primary discount percentage defined for this vendor that is applied to all items purchased. The primary discount is established in the Vendor record. May be overridden at the line level or using PO Header Overrides; see *Purchase Order Overrides Pop-Up Window*. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
Surcharge	An additional fee to purchase this item from this vendor. A surcharge is typically added to purchases from a broker. The surcharge is defined in the Vendor record. May be overridden using PO Header Overrides; see *Purchase Order Overrides Pop-Up Window*. Numeric, 13 positions with a 4-place decimal; optional.
Ext cost (Extended cost)	The extended cost of this PO detail line, calculated by multiplying the quantity ordered and the price, adding the surcharge, and subtracting the discount. Numeric, 13 positions with a 4-place decimal; display-only.
Vendor's	The vendor's item number, as defined in the Vendor/Item table; see *Working with Vendor Items (WVNI)*. Alphanumeric, 20 positions; display-only.
U/M (Unit of measure)	The vendor's unit of measure for the vendor's item. This typically describes how the item is ordered from the vendor. See *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; optional.
Quantity	The quantity of the item you have ordered from the vendor. This quantity is expressed in the vendor's unit of measure and may be different than the Qty field, above. For example, if your unit of measure is “eaches” and the vendor's unit of measure is cases of 24, if the Qty field is set to 48 units, the Quantity field would be 2 (representing the vendor's unit of measure). Numeric, 7 positions; optional.
Vendor price	The price the vendor charges for the item, per vendor’s unit of measure. Expressed in the vendor's currency. Numeric, 13 positions with a 4-place decimal; optional.
Vnd Dscnt (Vendor discount)	The vendor's primary discount, applied to all items purchased. May be overridden at the line level or using PO Header Overrides; see *Purchase Order Overrides Pop-Up Window*. Numeric, 13 positions with a 2-place decimal; optional.
Ext price (Extended price)	The extended price of this PO detail line. Calculated by multiplying the price by the quantity ordered. Numeric, 20 positions with a 4-place decimal; display-only.
Buyer	A code that identifies a person who is authorized to make purchases for your company; see *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; optional.
Ship via	A code that represents a carrier used for shipping merchandise to your company; see *Working with Purchase Order Ship Via (WPSV)*. Numeric, 2 positions; optional.
Offer (Offer code)	The code for the offer (catalog). See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; optional.

Field	Description
Warehouse	A code that represents the warehouse where the item will be received. Validated against the Warehouse table; see *Creating and Maintaining Warehouses (WWHS)*. You can change the warehouse on a PO line only to a warehouse where the item currently exists. Numeric, 3 positions; optional.
Due date	The date the purchase order is due to be received, based on the PO date and the Lead days from the Vendor/Item record, or manually entered for the PO. This date is listed in Order Entry, Order Maintenance, and standard or streamlined Order Inquiry. **Note:** Changing the date on the PO detail line does not change the date on the PO header. You must also change the header date. Numeric, 6 positions (in user date format); optional.
Cancel date	The date the purchase order will be marked for cancellation if the order is not received. If you complete this field, you advance to the *PO Auto Cancel Date Selection Pop-Up Window*; from this window, you can generate the *Purchase Order Auto Cancel Report*. **Note:** Changing the date on the PO detail line does not change the date on the PO header. You must also change the header date. Numeric, 6 positions (in user date format); optional.
Promise date	A user-defined date that may be used to represent the expected ship date or promised arrival date. **Note:** Changing the date on the PO detail line does not change the date on the PO header. You must also change the header date. Numeric, 6 positions (in user date format); optional.

Screen Option	Procedure
Work with purchase order line discounts	Select *Discounts* to advance to the *Purchase Order Line Discount Screen*.
Work with estimated charges	Select *Estimated Charges* to advance to the *Work with PO Detail Estimated Charges Screen*.
Work with vendor item notes for the last item entered.	Select *Vendor Item Notes* to advance to the *Work with Vendor Item Notes Screen*.
Display PO messages	Select *Messages* to advance to the *Work with PO Detail Messages Screen*.
Update the SKU cost	Select *Update SKU Cost* to advance to the *Update SKU Cost Window*. An error message displays if all of the lines on the PO are cancelled or closed: `No lines available for cost update`.

Display Purchase Order Detail Screen

Purpose: Use this screen to review information about an item on a purchase order.

How to display this screen: From the *Create PO Detail Standard Screen*, select *Display* for a detail line. You can also display this screen by selecting *Display* for an item at the *PO Maintenance - Maintain Detail Screen*.

See *Second Display Purchase Order Detail Screen* for field descriptions.

Work with PO Detail Estimated Charges Screen

Purpose: Use this screen to create or change a charge for a specific purchase order detail line.

You can define the following types of estimated charges for a purchase order header or detail line:

- freight
- brokerage
- commission
- duty
- import
- prep
- royalty
- surcharge
- other fees

In purchase order maintenance, you can enter the estimated charge as a unit cost or a percentage. You enter the actual charges (for freight, brokerage, etc.) for the detail line at purchase order receiving. These charges are not reflected in the extended price of the purchase order.

Changing a purchase order estimated charge in purchase order maintenance generates a purchase order history message indicating that the charge has been changed.

Purchase order additional charge codes are defined through *Working With PO Additional Charges (WPAC)*.

Any charges that you already entered on the *Work with PO Header Estimated Charges Screen* display on the screen. If the *Default Vendor Item Additional Charges (I21)* system control value is *selected*, any charges defined for the item in Work with Vendor Items display on the screen.

> **Note:**
>
> If you enter a charge for a detail line and then enter the same charge on the header screen, the system overrides the amount you had defined for the line to the header amount.

How to display this screen:

1. At the *Create PO Detail Standard Screen*, other detail entry screen or the *PO Maintenance - Change PO Detail Screen* select *Est. Charges*. This screen displays for the last PO line entered.
2. At the *PO Maintenance - Maintain Detail Screen*, select *Estimated Charges* for a detail line.

Field descriptions: The Line #, Status, Item, SKU, and Item description fields on this screen are described below. See *Work with PO Header Estimated Charges Screen* for a description of the other fields on this screen.

Field	Description
Line #	The number for the purchase order detail line for which you are creating or changing additional estimated charges. Numeric, 3 positions; display-only.
Status	The status of the purchase order line. Alphanumeric, 1 position; display-only.
Item	The code for the item on the purchase order detail line. Alphanumeric, 12 positions; display-only.
SKU (Unlabeled field to the right of the Item)	The code that represents the special characteristics of the item, such as color or size. Alphanumeric, three 4-position fields; display-only.
Item description (Unlabeled field below the Item)	The description of the item on the purchase order detail line. Alphanumeric, 120 positions; display-only.

Screen Option	Procedure
Toggle between add mode and change mode	Select *Add/Change*. The existing charges on the screen display as display-only or they are enterable fields. Complete the necessary fields.

Display PO Detail History Screen

Purpose: Use this screen to review any activity against the purchase order line since it was created on the system. The system notes each time the line is maintained.

How to display this screen: At the *PO Maintenance - Maintain Detail Screen* or the *First Display Purchase Order Detail Screen* in PO inquiry, select *History* for an item.

Field	Description
Vendor #	The name and number of the supplier. Alphanumeric, 20 positions; display-only.
PO #	A unique number to identify the purchase order. Numeric, 7 positions; display-only.
Ln #	The number of this line on the purchase order. Numeric, 3 positions, display-only.
Item	A code that identifies a unit of inventory. Alphanumeric, 12 positions; display-only.
B/A	A code indicating whether the history represents a before or after image of the transaction. Values are: • *Before* = information representing the purchase order detail line before the transaction was processed. • *After* = information representing the purchase order detail line after the transaction was processed. Alphanumeric, 1 position; display-only.
Date	The date when the activity was performed. Numeric, 6 positions; display-only.
User	The user who performed the activity. Alphanumeric, 10 positions; display-only.
Description	A description of the activity that was performed against the purchase order detail line. Alphanumeric, 25 positions; display-only.

Work with PO Detail Messages Screen

Purpose: Use this screen to enter or update message text. These messages can print on the purchase order detail line if your print program supports it. Line messages relate to a single item on the purchase order only.

How to display this screen:

- At the *Create PO Detail Standard Screen*, other detail entry screen, or the *PO Maintenance - Change PO Detail Screen*, select *Messages*. The PO detail messages will be displayed for the last PO line entered.
- At the *PO Maintenance - Maintain Detail Screen* in PO maintenance, select *Messages* for a detail line.
- At the *First Display Purchase Order Detail Screen* in PO inquiry, select *Messages* for an item.
- At the *Second Display Purchase Order Detail Screen* in PO inquiry, select *Messages*.

Field	Description
Message	Free-form message about the item. Alphanumeric, 60 positions (each line); optional.

Field	Description
Print	Valid values are: • *Print on PO* • Blank (Do not print) Optional.

Screen Option	Procedure
Add/Change hold and release information	Select *Add/Change* to activate the add or change function, and enter the required information.

Purchase Receipts History Screen

Purpose: Use this screen to review receipt totals for an item on a purchase order.

How to display this screen: At the *PO Maintenance - Maintain Detail Screen* or the *First Display Purchase Order Detail Screen* in purchase order inquiry, select *Receiving* for an item.

Field	Description
P/O #	A unique number to identify the purchase order. Numeric, 7 positions; display-only.
Vendor	A unique number to identify the vendor. The description appears to the right. Validated against the Vendor table; see *Working with Vendors (WVEN)*. Vendor number: numeric, 7 positions; display-only. Description: alphanumeric, 20 positions; display-only.
Line #	The purchase order detail line number. Numeric, 3 positions; display-only.
Item	A code to represent the item on the purchase order. The description appears to the right. Item: alphanumeric, 12 positions; display-only. Description: alphanumeric, 120 positions; display-only.
SKU Qty Rcv (Quantity received)	The number of units received, presented in your unit of measure. Numeric, 7 positions; display-only.
SKU U/M (Unit of measure)	A standard by which an item is sold. Typical units of measure include: • *EA* = each • *IN* = inches • *C12* = case of 12 Validated against the Unit of Measure table; see *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; display-only.
Vendor Qty Rcv (Quantity received)	The number of units received, presented in the vendor's unit of measure. Numeric, 7 positions; display-only.

Field	Description
Vendor U/M (Unit of measure)	The vendor's unit of measure. Alphanumeric, 3 positions; display-only.
Date received	The date the units were received at your warehouse. Numeric, 6 positions; display-only.
Cost at recp (Cost at receipt)	The unit cost of the item. Numeric, 13 positions with a 4-place decimal; display-only.
Date A/P	Not implemented. Numeric, 6 positions; display-only
Cost A/P	Not implemented. Numeric, 20 positions with a 4-place decimal; display-only.

Work with Vendor Item Notes Screen

Purpose: Use this screen to display, add, or change free-form notes about a vendor's item. Also, you can indicate whether to print each line of message text on purchase orders. These notes are displayed at PO Inquiry/Maintenance and Receiving.

How to display this screen:

- At the *Create PO Detail Standard Screen* other detail entry screen, or the *PO Maintenance - Change PO Detail Screen*, select *Vend Itm Notes*. The vendor notes will be displayed for the last PO line entered.
- At the *PO Maintenance - Maintain Detail Screen* in PO maintenance, select *Vendor item notes* for a detail line.
- At the *First Display Purchase Order Detail Screen* in PO inquiry, select *Vendor Item Notes* for an item.
- At the *Second Display Purchase Order Detail Screen* in PO inquiry, select *Notes*.
- At the *Work with Vendor Item Screen*, select *Vendor Item Notes* for an item

Field	Description
Note	Free-form text about the item and/or vendor. The text may print on purchase orders. Select *Next* to display additional lines. These notes are displayed at Purchase Order Inquiry (MPOI), *Maintaining Purchase Orders (MPOE)*, and Purchase Order Receipts. Alphanumeric, 60 positions (each line); optional.
Print	Valid values are: • *Print on PO* • *Do not print* Optional.

Screen Option	Procedure
Add/Change vendor item notes	Select *Add/Change* to activate the add or change function and update the required information.

Create PO Detail Standard Screen

Purpose: Use this screen to add a new item to a purchase order.

How to display this screen: At the *PO Maintenance - Maintain Detail Screen*, select *Create Dtl* for an item.

Purpose: Use this screen to add an item to the purchase order (top half of the screen) and for *Reviewing the Previous Purchase Order Detail Line* (bottom half of the screen).

Certain information defaults from the *Work with Purchase Order (Header) Screen*, including the PO number, revision number, status, and vendor number. You can override this information for a detail line. The bottom half of the screen is updated by the system and cannot be changed.

Field descriptions: The entry fields are described here. See *Reviewing the Previous Purchase Order Detail Line* for the remaining fields on this screen and for screen options.

Field	Description
P/O#	The number assigned to a purchase order is brought over from the PO Header screen and cannot be changed. Numeric, 7 positions; display-only.
Revision #	The number of times a purchase order has been revised. The revision number is increased each time the PO is maintained and accepted (*Accept*). When you initially create a purchase order, the revision number is 0. Numeric, 3 positions; display-only.
Status	The status of the purchase order. When you first create a PO, the status will be Open (blank) or Suspended. Status options: • *Canceled* = The purchase order was canceled through PO Maintenance; it remains on the system for historical purposes. • *Closed* = All lines on the purchase order have been received through PO Receiving. • *Held* = The PO must be approved through PO Maintenance before receipts can occur. • *Open* (blank) = The PO is awaiting PO Receipts. • *Suspended* = Inventory has been received into suspense through the PO Receiving function. Alphanumeric, display-only.
Total cost	A running total of the detail lines on the purchase order. The system sums the Extended cost of each detail line to display as the total cost of the purchase order. Numeric, 20 positions with a 4-place decimal; updated by the system.
Vendor #	The code that identifies the vendor or supplier of an item. Numeric, 7 positions; display-only.

Field	Description
Line #	The purchase order line number. Enables you to insert a line while creating the purchase order. *Example:* If you just added line 9, but realized that you forgot line 7, you can enter 7 in the line number field and type the item and quantity associated with this line. The system inserts line 7 and renumbers the remaining lines. **Note:** Select *P/O Detail Msg* to make sure the new line has been inserted properly. There can be up to 999 lines on one purchase order; if you try to enter more than 999 lines on a purchase order, the system displays an error message: `PO cannot exceed 999 lines`. Numeric, 3 positions; optional.
Item/Colr Size Othr	The item (and if applicable, SKU) being ordered. Must be a valid item/SKU, in retailer's item code (not vendor item code). To advance to the *SKU Scan Screen (PO Maintenance)*, complete just the item code. Item: alphanumeric, 12 positions; required. SKU: alphanumeric, three 4-position fields; required if the item has SKUs.
Quantity	The quantity of the item (in retailer's unit of measure) being ordered from the vendor. The system checks the minimum quantity and order multiple for the vendor/item, and displays an error message if the quantity you enter is too low or does not match. The following message indicates if you do not enter a quantity for a SKUed item and the *Quantity Required for Purchase Order SKU Scanning (F15)* system control value is *selected*: `Order quantity must be entered`. Numeric, 7 positions; required for non-SKUed items.
Cost	The unit price you pay the vendor for this item. If you do not enter a cost here, it defaults after you select *OK* as follows: • Vendor/Item cost • Standard cost from the SKU table If you do not enter a cost and the system does not find one using the hierarchy described above, a pop-up window opens requiring you to confirm entry of the item at a zero price. Select *OK* if the price should be zero, or select *Exit* to cancel and enter a price for the item. The *Override PO Cost (A17)* secured feature controls access to this field. Numeric, 13 positions with a 4-place decimal; required.

Field	Description
Primary disc (Primary discount)	The primary dollar discount amount to apply. If you do not specify a discount here, but there is a primary discount percentage defined for the vendor in the *Discount % (Primary discount percentage)* field, the system calculates and applies this discount as the primary. For example, the Discount % specified for the vendor is 15.00%, the unit price is $10.00, and you do not specify a Primary discount at this screen. In this situation, the system calculates a unit discount of $1.50 and applies it as the primary discount. However, in the same situation, if you entered a Primary discount of $1.75, the system applies this unit discount amount as the primary discount. Any other discounts from the Vendor Discount table apply after the primary discount has been calculated. See *Working with Vendors (WVEN)*.
Primary Discount Overrides	**Primary Discount Overrides** If you enter a primary discount override at the *Purchase Order Overrides Pop-Up Window*, the system applies the override to PO lines whose primary discount defaulted from the Vendor table. However, if you manually entered a primary discount using this field, the system does not update the primary discount with the override and instead retains the primary discount you manually defined. See *Overriding Discounts*. Numeric, 5 positions with a 2-place decimal; optional.
Buyer	A code that identifies a person who is authorized to make purchases for your company. The buyer you entered on the purchase order header defaults here, but you can override it. Validated against the Buyer table; see *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; required.
Warehouse	A code that represents the warehouse where the merchandise will be received. On order quantity is increased in this warehouse. The warehouse from the purchase order header defaults, but you can override it. Validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; required.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Ship via</td><td>A code that represents a carrier used for shipping merchandise to your company. This code is validated against the PO Ship Via table. See Working with Purchase Order Ship Via (WPSV). These shippers are defined separately from, and may differ from, those who deliver merchandise to your customers.
Ship Via Hierarchy
Each detail line on the purchase order requires a ship via code.
If you have defined a PO ship via for the vendor/item, the system defaults this ship via to the detail line.
If you enter a ship via code on the PO header, the system defaults this ship via to the detail lines that do not have a PO ship via defined for the vendor/item.
If a PO ship via is not defined for the vendor/item and you do not enter a ship via code on the PO header, you will need to enter a ship via code for each detail line on the purchase order.
Note:
If you enter PO lines and then change the ship via on the PO Header, the system defaults the new ship via to all of the lines on the PO, regardless of how the ship via originally defaulted to the line.
Numeric, 2 positions; required.</td></tr>
<tr><td>Due date</td><td>The date the PO is due to be received, based on the PO date and the Lead days defined for the Vendor/Item, or manually entered here. This date is indicated in Order Entry, Order Maintenance, and standard and streamlined Order Inquiry.
Numeric, 6 positions (in user date format); required.</td></tr>
<tr><td>Cancel date</td><td>The date the purchase order will be marked for cancellation if the order is not received. See Printing the PO Auto Cancel Report (MPAC).
Numeric, 6 positions (in user date format); optional.</td></tr>
<tr><td>Promise date</td><td>You can use this date to represent the expected ship date or promised arrival date.
Numeric, 6 positions (in user date format); optional.</td></tr>
<tr><td>Offer</td><td>The code for the offer (catalog). See Working with Offers (WOFR). The system creates a SKU/Offer record for this item if one does not already exist.
Alphanumeric, 3 positions; may be required (based on the System Control table value).</td></tr>
</table>

Completing this screen: If you enter a purchase order detail line for a SKUed item, you advance to the *SKU Scan Screen (PO Maintenance)*. Otherwise, the information you entered is in the bottom half of the Create PO Detail Standard screen. See *Reviewing the Previous Purchase Order Detail Line*.

SKU Scan Screen (PO Maintenance)

Purpose: Use this screen to create a purchase order detail line for each SKU of the item you entered on the *Create PO Detail Standard Screen*.

Screen sort: SKUs sort on this screen alphanumerically by the SKU sort sequence number assigned to each SKU. SKUs that are not assigned a SKU sort sequence number display at the top of the list and are sorted alphanumerically by SKU code. See *SKU Sort Sequence Numbers* for an overview.

How to display this screen: Enter an item containing SKUs in the Item field on the *Create PO Detail Standard Screen*.

Field	Description
P/O#	The number assigned to the purchase order, brought over from the PO Header screen. Numeric, 7 positions; display-only.
Item	The item being ordered. The item defaults from the *Create PO Detail Standard Screen*. Alphanumeric, 12 positions; display-only.
Item description (Unlabeled field below the Item)	The description of the item being ordered. Alphanumeric, 120 positions; display-only.
Discount (Purchase order discount labels)	The purchase order discount labels for discounts from the Vendor Discount table. Purchase order discount labels are from the Discount Field 1, 2, 3 system control values. See *Setting Up Purchase Order Values*. Alphanumeric, 10 positions; display-only.
Pct (Percent discount)	The percentage the system applies against the unit cost of an item/SKU on the purchase order. Percentage discounts are defined in and validated against the Vendor Discount table (Discount in Work with Vendors). The system calculates percentage discounts based on the method from the Discount calculation method field in the Vendor Extended table. See *Change Vendor Extended Screen*. Numeric, 11 positions with a 4-place decimal; display-only.
Unit disc (Unit discount)	The amount the system subtracts from the unit cost of an item/SKU on the purchase order. Unit discounts are defined in and validated against the Vendor Discount table (Discount in Work with Vendors). The system calculates unit discounts based on the method from the Discount calculation method field in the Vendor Extended table. See *Change Vendor Extended Screen*. Numeric, 13 positions with a 4-place decimal; display-only.
Vend disc (Vendor discount)	The unit discount amount, displayed in the vendor's unit of measure and currency. Numeric, 13 positions with a 4-place decimal; display-only.

Field	Description
Order qty (Order quantity)	The quantity (in retailer's unit of measure) from the Quantity field on the *Create PO Detail Standard Screen*. The system sums the quantity you enter for each SKU and requires that the total equal the quantity from this field. The following error message indicates if the value in the Quantity entered field does not match this total: `Sum of order quantities entered does not equal total order quantity.` You can select *Change Order Quantity* to override the quantity in this field if you want to match the total quantity entered for the SKUs. Not displayed if you did not enter a quantity on the Create Purchase Order Detail Standard screen. Numeric, 7 positions; display-only.
Qty entered (Quantity entered)	The total quantity ordered (in retailer's unit of measure) for all of the SKUs for this item. The system updates this field each time you enter a quantity for a SKU. The following error message indicates if the value in the Order quantity field does not match this total: Sum of order quantities entered does not equal total order quantity. Numeric, 7 positions; display-only.
Colr size other	The SKUs for the item you are ordering. Enter a valid SKU to display SKUs that match your entry. Alphanumeric, three 4-position fields; optional.
Description (SKU description)	The description of the item's SKUs. Alphanumeric, 20 positions; display-only.
Qty (Order quantity)	The quantity (in retailer's unit of measure) of each SKU that you wish to order. When you enter a quantity the system updates the quantity in the Quantity entered field. The following message indicates if you enter a quantity that is fewer than the minimum quantity for the vendor item (fast path = *WVNI*): `Minimum order quantity is 12.` The following message indicates if you enter a quantity that cannot be divided by the unit of measure for the vendor item (fast path = *WVNI*): `Order qty must be able to divide evenly by vendor UOM.` The following message indicates if you enter a quantity that is not a multiple of the order multiple (in retailer's unit of measure) for the vendor item (fast path = *WVNI*): `Vendor requires that Item is ordered in multiples of 10.` See *Working with Vendor Items (WVNI)*. Numeric, 7 positions; optional.

Field	Description
Cost	The unit price you pay the vendor for this item. If you do not enter a cost here, it defaults after you press *Enter* as follows: • cost entered at the *Create PO Detail Standard Screen*, if any • Vendor/Item cost • Standard cost from the SKU table If you do not enter a cost and the system does not find one using the hierarchy described above, a pop-up window opens requiring you to confirm entry of the item at a zero price. Select *OK* if the price should be zero, or select *Exit* to cancel and enter a price for the item. Numeric, 13 positions with a 4-place decimal; required if you entered a quantity.
Vendor item	The vendor item code. Vendor item codes are defined in Work with Vendor Items (fast path = *WVNI*); see *Working with Vendor Items (WVNI)*. Alphanumeric, 20 positions; display-only.
Vendor's qty (Vendor's quantity)	The SKU order quantity represented in the vendor's unit of measure. Displayed when you complete the Quantity field. Numeric, 7 positions; display-only.
Vendor's cost	The cost of the SKU represented in the vendor's currency. Displayed when you complete the Quantity field. Numeric, 13 positions with a 4-place decimal; display-only.

Screen Option	Procedure
Accept your entries	Select *Accept*. You return to the *Create PO Detail Standard Screen*, with the information you entered for each SKU displaying in the bottom half of the screen; see *Reviewing the Previous Purchase Order Detail Line*.
Reject your entries	Select *Reject*.
Change the percent or unit discounts for the SKUs defined on this screen	Select *Discounts* to advance to the *Purchase Order Line Discount Screen*.

Reviewing the Previous Purchase Order Detail Line

Purpose: After you enter an item at the *Create PO Detail Standard Screen*, information about that item appears in the bottom half of the screen.

Field	Description
Line #	The purchase order detail line number. You can enter up to 999 lines on one purchase order. Numeric, 3 positions; display-only.
Item	The item number and description of the item being ordered. Item: Alphanumeric, 12 positions; display-only. Description: Alphanumeric, 30 positions; display-only.

Field	Description
U/M (Retailer's unit of measure)	A standard unit by which the retailer sells the item. The retailer's unit of measure may differ from the vendor's unit of measure. Typical units of measure include: • *EA* = each • *IN* = inches • *C12* = case of 12 Validated against the Unit of Measure table (see *Working with Units of Measure (WUOM)*) and will default from the *Default Item Unit of Measure (B33)* system control value, if a value is specified. Alphanumeric, 3 positions; display-only.
Quantity	Quantity of the item, in retailer's unit of measure, that has been ordered from the vendor. Numeric, 7 positions; display-only.
Ext cost (Extended cost)	The extended cost of this PO detail line, which is calculated by multiplying the quantity ordered and the cost, adding the surcharge, and subtracting the discount. Numeric, 20 positions with a 4-place decimal; display-only.
Cost	The unit cost entered or defaulted for the item. Numeric, 13 positions with a 4-place decimal; display-only.
Primary disc (Primary discount)	The primary discount percentage to apply. Numeric, 5 positions with a 2-place decimal; display-only.
Surcharge	An additional fee to purchase this item from this vendor. A surcharge is typically added to purchases from a broker. The surcharge is defined for the vendor, but you can override it using the *Purchase Order Overrides Pop-Up Window*. Numeric, 13 positions with a 2-place decimal; display-only.

Field	Description
Trade $ (Discount 1 percentage)	The percentage of the first discount in the Vendor Discount table. The system applies this discount against the unit cost of an item on the purchase order. The resulting dollar amount for this percentage is in the Discount field located below this field. Blank if you have not defined a value for the *Vendor/PO Discount Values (E18)* system control value. The system calculates discounts based on the method from the Discount calculation method field in the Vendor Extended table. See *Purchase Order Line Discount Screen* for examples of each discount calculation method. **Note:** The system calculates primary discounts against the cost of an item before applying any other discounts. See *Overriding Discounts* for more information on how the system updates the discount percentage based on any overrides you define at the *Purchase Order Overrides Pop-Up Window*. Numeric, 11 positions with a 4-place decimal; display-only.
Coop % (Discount 2 percentage)	The percentage of the second discount in the Vendor Discount table. The system applies this discount against the unit cost of an item on the purchase order. The resulting dollar amount for this percentage is in the Discount field located below this field. Blank if you have not defined a value in the *Vendor/PO Discount Values (E18)* system control value. The system calculates discounts based on the method from the Discount calculation method field in the Vendor Extended table. See *Purchase Order Line Discount Screen* for more information. **Note:** The system calculates primary discounts against the cost of an item before any other discounts are applied. See *Overriding Discounts* for more information on how the system updates the discount percentage based on any overrides you define at the *Purchase Order Overrides Pop-Up Window*. Numeric, 11 positions with a 4-place decimal; display-only.

Field	Description
Special % (Discount 3 percentage)	The percentage of the third discount in the Vendor Discount table. The system applies this discount against the unit cost of an item on the purchase order. The resulting dollar amount for this percentage is in the Discount field located below this field. Blank if you have not defined a value in the *Vendor/PO Discount Values (E18)* system control value. The system calculates discounts based on the method from the Discount calculation method field in the Vendor Extended table. See Purchase Order Line Discount Screen for examples of each discount calculation method. See *Overriding Discounts* for more information on how the system updates the discount percentage based on any overrides you define at the Purchase Order Overrides Pop-Up Window. Numeric, 11 positions with a 4-place decimal; display-only.
Discount (Unit discount)	The amount of the first discount that the system subtracts from the unit cost of an item on the purchase order. The system calculates discounts based on the method from the Discount calculation method field in the Vendor Extended table. See Purchase Order Line Discount Screen. See *Overriding Discounts* for more information on how the system updates the discount percentage based on any overrides you define at the Purchase Order Overrides Pop-Up Window. Numeric, 13 positions with a 4-place decimal; display-only.
Discount (Unit discount)	The amount of the second discount that the system subtracts from the unit cost of an item on the purchase order. The system calculates discounts based on the method from the Discount calculation method field in the Vendor Extended table. See Purchase Order Line Discount Screen. See *Overriding Discounts* for more information on how the system updates the discount percentage based on any overrides you define at the Purchase Order Overrides Pop-Up Window. Numeric, 13 positions with a 4-place decimal; display-only.
Discount (Unit discount)	The amount of the third discount that the system subtracts from the unit cost of an item on the purchase order. The system calculates discounts based on the method from the Discount calculation method field in the Vendor Extended table. See Purchase Order Line Discount Screen. See *Overriding Discounts* for more information on how the system updates the discount percentage based on any overrides you define at the Purchase Order Overrides Pop-Up Window. Numeric, 13 positions with a 4-place decimal; display-only.
Vendor # (Vendor / item number	The Vendor item number as from the Vendor/Item table. See Working with Vendor Items (WVNI). Numeric, 7 positions; display-only.
U/M (Unit of measure)	The vendor's unit of measure for the item. This is from the Vendor/Item table. See Working with Vendor Items (WVNI). Alphanumeric, 3 positions; display-only.

Field	Description
Quantity	Quantity in the vendor's unit of measure. The system automatically calculates the quantity conversion from retailer's unit of measure to vendor's if you have set up conversion factors through the *Working with Unit of Measure Conversions (WUMC)* menu option. Numeric, 7 positions; display-only.
Vendor price	The price the vendor charges for the item. The system uses the vendor's currency, if applicable. Numeric, 13 positions with a 4-place decimal; display-only.
Ext price (Extended price)	The extended price of this PO detail line. Calculated by multiplying the price by the quantity ordered. Numeric, 20 positions with a 4-place decimal; display-only.
Vnd dscnt (Vendor discount)	The primary unit discount amount represented in the vendor's currency. Calculating discounts in a foreign currency results in inaccurate discount amounts. See *Overriding Discounts* for more information on how the system updates the primary discount based on any overrides you define at the *Purchase Order Overrides Pop-Up Window*. Numeric, 13 positions with a 4-place decimal; display-only.
Warehouse	A code that represents the warehouse where the item will be received. Numeric, 3 positions; display-only.
Ship via	A code that represents a carrier used for shipping merchandise to your company. See *Working with Purchase Order Ship Via (WPSV)*. Numeric, 2 positions; display-only.
Due date	The date the PO is due to be received. Numeric, 6 positions (in user date format); display-only.
Cancel date	The date the purchase order will be marked for cancellation if the order is not received. See *Printing the PO Auto Cancel Report (MPAC)*. Numeric, 6 positions (in user date format); optional.
Promise date	You can use this date to represent the expected ship date or promised arrival date. Numeric, 6 positions (in user date format); optional.
Offer	The code for the offer (catalog). See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; display-only.
Buyer	A code that identifies a person who is authorized to make purchases for your company. See *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; display-only.

Screen Option	Procedure
Accept the purchase order	Select *Accept* to accept the purchase order. See *Completing PO Maintenance*.
Reject the purchase order	Select *Reject* to reject the purchase order. See *Completing PO Maintenance*

Screen Option	Procedure
Change item information associated with any previously entered item	Select *Change* to advance to the *PO Maintenance - Maintain Detail Screen*.
Work with PO header information	Select *P/O Header* to advance to the *Work with Purchase Order (Header) Screen*.
Work with purchase order line discounts	Select *Discounts* to advance to the *Purchase Order Line Discount Screen*.
Work with estimated charges	Select *Estimated Charges* to advance to the *Work with PO Header Estimated Charges Screen*.
Work with vendor item notes for the last item entered.	Select *Vendor Item Notes* to advance to the *Work with Vendor Item Notes Screen*.
Horizontal entry	Select *Horizontal Entry* to create PO detail lines for items that contain multiple SKUs.
Vendor item entry	Select *Vendor Item Entry* to create a PO detail line by entering the vendor item number.
Non-inventory entry	Select *Non Inventory Entry* to create a PO line for an item that does not exist in the Item table.
Display summary information	Select *Summary* to advance to the *Purchase Order Summary Screen*.
PO detail messages	Select *Line Messages* to advance to the *Work with PO Detail Messages Screen*.

Purchase Order Line Discount Screen

Purpose: Use this screen to enter or change the discount amounts of the three discount fields for a detail line.

How to display this screen: Select *Discounts* on the:

- *Create PO Detail Standard Screen*
- *PO Maintenance - Change PO Detail Screen*

Field	Description
P/O #	The number assigned to this purchase order. Numeric, 7 positions; display-only.
Line # (Detail line number)	The purchase order detail line number. Numeric, 3 positions; display-only.
Item	The item being ordered for this detail line. Alphanumeric, 12 positions; display-only.
Item description (Unlabeled field below the Item)	The description of the item on this detail line. Alphanumeric, 120 positions; display-only.
Order quantity	The quantity of the item, in retailer’s unit of measure, defaulted from the previous screen. Numeric, 5. positions, display-only.

Field	Description
Cost	The price you pay for this item, per retailer's unit of measure, as defined in the Vendor Item table for the vendor's unit of measure. For example, if the vendor sells this item in pairs, for $12.00 per pair, but you resell the item as a single unit, the Cost of the item would be $6.00. If a cost does not exist in the Vendor Item table (see *Working with Vendor Items (WVNI)*), the system pulls the cost from the Item SKU table. Numeric, 13 positions with a 4-place decimal; display-only.
Discount (Primary discount)	The primary discount percentage defined for this vendor that the system applies to this detail line. You establish the primary discount in the Vendor table. Any other discounts for this detail line are applied after the primary discount has been calculated. Numeric, 5 positions with a 2-place decimal; display-only.
Ext cost (Extended cost)	The extended cost of this purchase order detail line, which is calculated by multiplying the quantity ordered and the cost, adding the surcharge and subtracting the discount. Numeric, 20 positions with a 4-place decimal; display-only.
Vendor price	The price the vendor charges for the item. The system uses the vendor's unit of measure, and the vendor's currency, if applicable. Calculating discounts in a foreign currency results in inaccurate discount amounts. Numeric, 13 positions with a 4-place decimal; display-only.
Vendor dsct (Vendor discount)	The primary unit discount amount represented in the vendor's currency. Calculating discounts in a foreign currency results in inaccurate discount amounts. Numeric, 13 positions with a 2-place decimal; display-only.
Ext price (Extended price)	The extended price of this purchase order detail line. Extended price is calculated by multiplying the price by the quantity ordered. Numeric, 20 positions with a 4-place decimal; display-only.
Discount (Discount fields)	The names of the three discount fields from the *Vendor/PO Discount Values (E18)* system control value. **Note:** The system calculates the primary discount on a purchase order before calculating other discounts. Alphanumeric, 11 positions; display-only.

Field	Description
Percent (Discount percentage)	The percentage the system calculates against the unit cost of an item on the purchase order. If you enter a discount percentage, you cannot enter a unit discount for the same discount field. The system calculates discount percentages before subtracting any dollar discounts. **Note:** The system calculates percentage discounts based on the method from the Discount calculation method field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation* for examples of each discount calculation method. See *Overriding Discounts* for more information on how the system updates the percent and unit discounts based on any overrides you define at the *Purchase Order Overrides Pop-Up Window*. Numeric, 6 positions with a 2-place decimal; optional.
Unit discount	The amount the system subtracts from the unit cost of an item on the purchase order. If you enter a unit discount amount, you cannot enter a discount percentage for the same discount field. **Note:** The system calculates unit discounts based on the method from the Discount calculation method field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation* for examples of each discount calculation method. See *Overriding Discounts* for more information on how the system updates the percent and unit discounts based on any overrides you define at the *Purchase Order Overrides Pop-Up Window*. Numeric, 13 positions with a 4-place decimal; optional.
Vendor discount (Vendor discounts)	The unit discount amount calculated in the vendor's currency. Calculating discounts in a foreign currency results in inaccurate discount amounts. Numeric, 13 positions with a 4-place decimal; display-only.

Instructions: Use the following steps to create or change a vendor discount:

1. Complete the Percent or Unit discount field for each discount. If you leave both the Percent and Unit discount fields blank, no discount will apply.
2. Optionally, select *Change Unit Disc* to change the enterable field for a discount label to the other discount field. For example, if your cursor is placed in the Percent field for

discount 1, selecting *Change Unit Disc* will clear any amount in the Percent field and allow you the enter an amount in the Unit discount field for discount 1.

3. Select *Accept*. The Confirm Accept pop-up window opens. Select *OK* to accept the changes you have made or select *Exit* to cancel.
4. The system calculates the discounts and updates the Extended cost, Extended price, Unit discount and Vendor discount fields with the changes.

Select *Exit* to return to the purchase order detail entry screen from which you advanced to this screen.

For more information: See *Combined Discount Calculation* and *Tiered Discount Calculation* for examples of how the system calculates discounts based on the Discount calculation method field in the Vendor Extended table.

Applying Discounts to a Purchase Order Line

Purpose: The system calculates discounts based on the Discount calculation method field defined for the vendor on the purchase order line.

- *Combined* = The discount method combines the total dollar amount of all 3 discounts to determine the net cost.
- *Tiered* = The discount method calculates the largest discount against the purchase order's gross cost, then the second largest discount is calculated against the net result of the first discount, and the third largest discount is calculated against the net result of the second discount.
- Blank = No discount is applied; you will not be able to apply any discounts when working with a purchase order, regardless of the entries in the discount fields.

Combined Discount Calculation

The combined discount calculation method combines the values of all 3 discounts to determine the net cost. Any discount percentages defined for the discounts are calculated before the unit discounts are applied.

Example:

```
Cost of item = $100.00
```

```
Primary discount (defined in Vendor table) = 10%
```

```
Discount 1 = $10.00 (unit discount)
```

```
Discount 2 = 20% (percentage discount)
```

```
Discount 3 = 10% (percentage discount)
```

Step 1: Calculate the primary discount percentage

```
primary discount (10%) x cost ($100.00) = unit discount amount for primary
discount ($10.00)
```

Step 2: Subtract the primary discount amount from the cost

```
primary discount ($10.00) - cost ($100.00) = cost after primary discount
($90.00)
```

Step 3: Calculate discount 2 percentage

```
discount 2 (20%) x cost ($90.00) / 100 = unit discount amount for discount 2
($18.00)
```

Step 4: Calculate discount 3 percentage

```
discount 3 (10%) x cost ($90.00) / 100 = unit discount amount for discount 3
($9.00)
```

Step 5: Add discount amounts 1, 2 and 3 together

```
discount 2 ($18.00) + discount 3 ($9.00) + discount 1 ($10.00) = combined
discount ($37.00)
```

Step 6: Subtract the total combined discount amount from the cost

```
total combined discount ($37.00) - cost ($90.00) = net cost ($53.00)
```

Tiered Discount Calculation

The tiered discount calculation method calculates:

- the largest discount against the item's cost, then
- the second largest discount is calculated against the net result of the first discount, then
- the third largest discount is calculated against the net result of the second discount

Any discount percentages defined for the discount fields are calculated before the unit discounts are applied.

Example:

```
Cost of item = $100.00
```

```
Primary discount (defined in Vendor table) = 10%
```

```
Discount 1 = $10.00 (unit discount)
```

```
Discount 2 = 20% (percentage discount)
```

```
Discount 3 = 10% (percentage discount)
```

Step 1: Calculate the primary discount percentage

```
primary discount (10%) x cost ($100.00) = unit discount amount for primary
discount ($10.00)
```

Step 2: Subtract the primary discount amount from the cost

```
primary discount ($10.00) - cost ($100.00) = cost after primary discount
($90.00)
```

Step 3: Calculate the largest discount percentage

```
discount 2 (20%) x cost ($90.00) / 100 = largest discount amount ($18.00)
```

Step 4: Subtract the largest discount amount from cost

```
gross cost ($90.00) - largest discount ($18.00) = net of first calculation
($72.00)
```

Step 5: Calculate the 2nd largest discount percentage

```
discount 3 (10%) x net of first calculation ($72.00) / 100 = second largest
discount amount ($7.20)
```

Step 6: Subtract the 2nd largest discount amount from cost

```
net of first calculation ($72.00) - second largest discount amount ($7.20)
= net of second calculation ($64.80)
```

Step 7: Subtract the 3rd largest discount amount from cost

```
net of second calculation ($72.00) - third largest discount amount
($10.20) = net of second calculation ($54.80)
```

Update SKU Cost Window

Use this window to update the cost of all open and held lines on the PO that contain the item specified.

How to display this screen: Select *Update SKU Cost* on the *PO Maintenance - Change PO Detail Screen*.

Field	Description
PO #	The number assigned to the purchase order. Numeric, 7 positions; display-only.
Item #	The item number whose cost you wish to update. The system updates the cost for all SKUs of this item that are on the PO. Alphanumeric, 12 positions; display-only.
Cost	The unit price you pay the vendor for this item, per retailer's unit of measure. Enter the new cost for the item. The system updates the cost for all open and held lines on the PO that contain the item specified. The *Override PO Cost (A17)* secured feature controls access to this field. **Note:** You cannot change the cost of an existing purchase order line to zero, even if the vendor/item price and price from the SKU table are zero. **Order Orchestration PO Changes** When you change the cost for a drop ship purchase order line which has been sent to the *Order Orchestration Drop Ship Integration* for processing, Order Administration automatically sends the changed cost information to Order Orchestration, where the cost on the purchase order line updates automatically. Numeric, 13 positions with a 4-place decimal; required.

Instructions: Use the following steps to update the cost of all open and held lines on the PO that contain the item specified.

1. In the Cost field, enter the cost to assign to all open and held lines on the PO that contain the specified item.

2. Select *OK*. The system returns you to the *PO Maintenance - Maintain Detail Screen* and displays the message `The SKU cost on all of the lines has been changed`.

Tracking PO line changes: For each PO line whose cost was updated, the system writes a before and after record to the PO Detail Audit table to record the cost of the PO line before the SKU cost update, and the cost of the PO line after the SKU cost update. You can review PO line history on the *Display PO Detail History Screen*.

Work with Purchase Order (Header) Screen

Purpose: Use this screen to change the header information on an existing purchase order.

When you change PO Header information: If you change the buyer, ship via, offer, due date, cancel date, or promise date on the PO header, the system updates the value on each existing PO line in an open or held status. The system also updates the value for any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level.

Tracking PO changes: When you change the information on the PO header, the system writes a before and after record to the PO Header Audit table to record the value before the change and the value after the change. If the change to the PO header also updated the lines on the PO, the system writes a before and after record to the PO Detail Audit table to record the value on the PO line before the change, and the value on the PO line after the change. You can review PO line history on the *Display PO Detail History Screen*.

How to display this screen: Select *Header* on the *PO Maintenance - Maintain Detail Screen*.

Field	Description
PO #	The number assigned to the PO. Numeric, 7 positions; display-only.
Ship to	You have the option to select Warehouse, Customer number, or Order number. Each option is described below. **Warehouse** If you change the warehouse on the PO header, the system updates only the PO lines that contain an item that exists in the new warehouse; any PO lines on the PO that contain items that do not exist in the new warehouse are not updated. **Note:** The warehouse code can be overridden for any line on the order. The system will track the on order total for each item in each warehouse, based on the code entered here or on the detail line. In addition, the warehouse code will control which shipping address prints on the PO or is transmitted in the EDI table. A separate PO will be printed for each warehouse to each different ship-to address. Numeric, 3 positions; optional.

Field	Description
	Customer # or Order # Unique numbers assigned to customers or orders for identification purposes. If you are entering a drop ship PO where the merchandise will be shipped directly to the customer, you must enter either a customer or order number. The system checks one of these tables to determine the ship-to address for the purchase order. If customer number is entered, the system does not tie this number to the order, nor does it pull through the items on the order. Numeric, 9 positions; optional.
Status	The status of the purchase order. Status options: • Cancelled • Docked • Held • Open • Suspended • Closed If held, the purchase order must be approved via PO Maintenance before you can print or receive the PO. Alphanumeric, 10 positions; display-only.
Vendor	The vendor assigned to the PO. Numeric, 7 positions; display-only.
Vendor name/address	The supplier's name and address. This information defaults from the Vendor table and cannot be changed. Alphanumeric, 30 positions; display-only.
Warehouse/customer	The name and address of the warehouse or the customer, depending on which information you entered previously. This information defaults from the Warehouse or Customer table and cannot be changed. Alphanumeric, 30 positions; display-only.
Placed with	The name of the person at the vendor site with whom you placed the purchase order. This name is used for future reference. When you first enter this screen, the cursor is in this field. Alphanumeric, 30 positions; optional.
Type	Indicates whether this purchase order is an initial buy (I) or a reorder (R). Valid values are: • *Initial Buy* (default) • *Reorder* Optional.

Field	Description
Buyer	A code that identifies a person who is authorized to make purchases for your company. Buyer codes are defined in and validated against the Buyer table; see *Working with Buyers (WBUY)*. *Changing the buyer:* If you change the buyer on the PO header, the system updates the buyer on each existing PO line in an open or held status: `PO Dtl'Buyer' info has been updated for open/held rcds`. The system also updates the value on any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level. Numeric, 3 positions; required.
Ship via	A code that identifies the shipper to deliver the merchandise to you. This code is validated against the PO Ship Via table. See *Working with Purchase Order Ship Via (WPSV)*. These shippers are defined separately from, and may differ from, those who deliver merchandise to your customers. *Changing the ship via:* If you change the ship via code on the PO header, the system updates the ship via code on each existing PO line in an open or held status: `The ship via on all of the lines has been changed`. The system also updates the value on any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level. **Note:** If a purchase order ship via is defined for the vendor/item, the system defaults this ship via to any new lines added to the PO in PO Maintenance instead of defaulting the ship via on the PO header. Numeric, 2 positions; optional.
Offer	The code for the offer (catalog) you will use to sell the merchandise. See *Working with Offers (WOFR)*. The system creates a SKU/Offer record for each item on the purchase order if one does not already exist. *Changing the offer:* If you change the offer code on the PO header, the system updates the offer code on each existing PO line in an open or held status: `The Offer number has been changed on all detail lines`. The system also updates the value on any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level. Alphanumeric, 3 positions; may be required.

Field	Description
Due date	The date the purchase order is due for receipt. This is the date the operator sees in Order Entry. *Changing the due date:* If you change the due date on the PO header, the system updates the due date on each existing PO line in an open or held status: `The Due Dates on all of the lines have been changed`. The system also updates the value on any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level. Numeric, 6 positions (in user date format); optional.
Cancel date	The date the purchase order will be marked for cancellation if you do not receive it. See *Printing the PO Auto Cancel Report (MPAC)*. *Changing the cancel date:* If you change the cancel date on the PO header, the system updates the cancel date on each existing PO line in an open or held status: `The Cancel Dates on all of the lines have been changed`. The system also updates the value on any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level. Numeric, 6 positions (in user date format); optional.
Promise date	You can use this date to represent the expected ship date or promised arrival date. *Changing the promise date:* If you change the promise date on the PO header, the system updates the promise date on each existing PO line in an open or held status: `Promise date changed on all detail lines`. The system also updates the value on any new lines you add to the PO in PO Maintenance, unless you override the value at the detail level. Numeric, 6 positions (in user date format); optional.
Shipping info	One line of shipping instructions to print on the purchase order. Alphanumeric, 20 positions; optional.

Screen Option	Procedure
Place the purchase order on hold	Select *Hold* to hold the purchase order. A message informs you the purchase order is on hold.
Accept the purchase order	Select *Accept* to accept the changes you made to the purchase order in PO Maintenance. See *Completing PO Maintenance*.
Reject the purchase order	Select *Reject* to reject the changes you made to the purchase order in PO Maintenance. A window opens asking you to confirm the rejection. See *Completing PO Maintenance*.
Work with vendor	Select *FOB* to advance to the *Work with FOB for Purchase Order Screen*.
Work with purchase order header estimated charges	Select *Est Charges* to advance to the *Work with PO Header Estimated Charges Screen*.
Work with vendor notes	Select *Vendor Notes* to advance to the *Work with Vendor Notes Screen*.

Screen Option	Procedure
Work with PO overrides	Select *P/O Overrides* to advance to the *Purchase Order Overrides Pop-Up Window*.
Accept and print the purchase order	Select *Accept/Print* to accept the purchase order changes and advance to the *Print P/O Window*.
Work with PO summary	Select *P/O Summary* to advance to the *Purchase Order Summary Screen*.
Work with PO messages	Select *P/O Msg* to advance to the *Work with PO Messages Screen*.

Work with FOB for Purchase Order Screen

Purpose: Use this screen to create, change or delete vendor FOB records for a specific purchase order.

> **Note:**
>
> Any change you make from this screen updates only this purchase order and does not affect the Vendor FOB addresses defined on the *Work with Vendor FOB Address Screen*.

About FOB address: The FOB (freight on board) address is the location where title to merchandise being shipped passes from the seller to the buyer.

Types of FOB addresses: If the FOB address is an *Origin* type, ownership of the merchandise passes from seller to buyer at the origin of the shipping route, and the buyer is responsible for transportation costs and risk of loss or damage from that point. If the FOB address is a *Destination* type, ownership of the merchandise passes from seller to buyer at the receiving point for the merchandise, and the seller is responsible for transportation costs and risk of loss or damage until the merchandise reaches its destination.

How to display this screen:

- Select *FOB* at the *Work with Purchase Order (Header) Screen*.
- Select *FOB* at the *PO Maintenance - Maintain Detail Screen*.

Field	Description
Vendor	The vendor number and description for this purchase order. Vendor number: Numeric, 7 positions; display-only. Vendor description: Alphanumeric, 30 positions; display-only.

Field	Description
Type	This code identifies the FOB address as either a Destination or an Origin type. • *Destination* = the FOB address is the location to which merchandise is being shipped (its destination); title of the merchandise passes from the seller to the buyer when the merchandise reaches its destination. • *Origin* = the FOB address is the location from which the merchandise is shipped; title to the merchandise passes from the seller to the buyer when the merchandise leaves the seller's dock. Alphanumeric, optional.
City	The city of the FOB address. Alphanumeric, 25 positions; optional.
St	The state of the FOB address. Alphanumeric, 2 positions; optional.
Postal cd	The zip code of the FOB address. Alphanumeric, 10 positions; optional.
Freight terms	A brief description of the freight terms for this FOB address. Alphanumeric, 10 positions; optional.

Screen Option	Procedure
Create a vendor FOB address for this purchase order	Select *Create* to advance to the *Create FOB for Purchase Order Screen*.
Change an FOB address for this purchase order	Select *Change* for an FOB address to advance to the Change FOB for Purchase Order Screen. See the *Create FOB for Purchase Order Screen* for field descriptions and screen information.
Delete an FOB address for this purchase order	Select *Delete* for an FOB address to delete it.
Display an FOB address for this purchase order	Select *Display* for an FOB address to advance to the Display FOB for Purchase Order Screen. See the *Create FOB for Purchase Order Screen* for field descriptions.

Create FOB for Purchase Order Screen

Purpose: Use this screen to create a new FOB address for the purchase order.

> **Note:**
>
> The FOB address you create will be added to the list of FOB addresses for this purchase order only; it will not be added to the list of FOB addresses for this vendor defined through the *Work with Vendor FOB Address Screen*.

How to display this screen: Select *Create* at the *Work with FOB for Purchase Order Screen*.

Field	Description
PO #	The current purchase order number. Numeric, 7 positions; display-only.
Vendor	The vendor number and description of the vendor for this purchase order. Vendor number: Numeric, 7 positions; display-only. Vendor description: Alphanumeric, 30 positions; display-only.
Postal code	The zip code for the vendor. The first three characters of the postal code are validated against the SCF (Sectional Center Facility) table, and must be valid SCF codes associated with the city and country you enter. See *Working with SCF Codes (WSCF)*. Alphanumeric, 10 positions; required.
City/State/Country	The city, state and country of the FOB address. **Note:** If the *Use Zip/City/State Defaulting? (B13)* system control value (SCV B13) is *selected*, the City, State, and Country fields will automatically display the correct address information when you enter a zip code in the Postal Code field. City: Alphanumeric, 25 positions; required. State: Alphanumeric, 2 positions; required. Country: Alphanumeric, 3 positions; required.
Freight terms	A brief description of the freight terms for this vendor FOB address. Alphanumeric, 10 positions; required.
FOB type	This code identifies the FOB address as either a Destination type or an Origin type. • *Destination* = the FOB address is the location to which merchandise is being shipped (its destination); title of the merchandise passes from the seller to the buyer when the merchandise reaches its destination. • *Origin* = the FOB address is the location from which the merchandise is shipped; title to the merchandise passes from the seller to the buyer when the merchandise leaves the seller's dock. Alphanumeric, required.

Work with PO Header Estimated Charges Screen

Purpose: Use this screen to define estimated charges for every detail line on the purchase order.

You can define the following types of estimated charges for a purchase order header or detail line:

- freight

- brokerage
- commission
- duty
- import
- prep
- royalty
- surcharge
- other fees

In purchase order maintenance, you can enter the estimated charge as a unit cost or a percentage. You enter the actual charges (for freight, brokerage, etc.) for the detail line at purchase order receiving. These charges are not reflected in the extended price of the purchase order.

Changing a purchase order estimated charge in purchase order maintenance generates a purchase order history message indicating that the charge has been changed.

Purchase order additional charge codes are defined through *Working With PO Additional Charges (WPAC)*.

When you add, change, or delete an estimated charge at this screen, the system applies the charge to each existing detail line and each additional detail line you add to the purchase order that is in a open or held status. If an existing detail line was already associated with the same estimated charge you defined at this screen, the system overrides the charge amount defined for the detail line to the header charge amount.

How to display this screen: Select *Estimated Charges* on the *Work with Purchase Order (Header) Screen*.

Field	Description
PO #	The number of the purchase order you are currently working with, defaulted from the *Work with Purchase Order (Header) Screen*. Numeric, 7 positions; display-only.
Status	The status of the purchase order, defaulted from the *Work with Purchase Order (Header) Screen*. Alphanumeric, 10 positions; display-only.
Vendor	The vendor number and vendor name defined for this purchase order, defaulted from the *Work with Purchase Order (Header) Screen*. Vendor number: Numeric, 7 positions; display-only. Vendor name: Alphanumeric, 30 positions; display-only.

Field	Description
Code	A code that represents the charge to be added to the purchase order detail line. The following message indicates if you try to enter an estimate charge that has already been defined: PO Estimate Charge already exists. If the estimate charge you enter on the header screen already exists on a purchase order detail line, the system allows you to create the purchase order header estimate charge. The amount you define at the header screen overrides the amount defined for the purchase order detail line. If you wish to have the amount for an estimate charge different for a specific detail line, you must first enter the header charge and then overide the amount for the detail line. Purchase order additional charge codes are defined in and validated against the PO Additional Charge table; see *Working With PO Additional Charges (WPAC)*. Numeric, 2 positions; optional.
Complete the Unit Cost or Percent field:	
Unit cost	The unit charge (per unit in retailer's unit of measure) for a purchase order detail line for brokerage, commission, duty, freight, import, surcharge, or other user-defined fees. The actual charges from the vendor for these fees are entered at PO Receiving. Multiplied by the quantity ordered to determine the estimated charge. The unit cost is used in lieu of a percentage to calculate the additional estimated charge. The following message indicates if you do not define either a unit cost or percentage for a charge code: `Unit Cost or Percent must be entered`. The following message indicates if you try to enter a charge code that has already been defined: `PO Estimate Charge already exists`. The following message indicates if you try to enter a unit cost and unit percentage for a charge code: `Enter Unit Cost or Percent; but not both`. Numeric, 13 positions with a 4-place decimal; optional (required if percent is not entered).

Field	Description
Percent	The percentage used to calculate the additional charges on a purchase order detail line. Used in lieu of an additional charge based on unit cost. The percentage value is multiplied by the extended price on the purchase order detail line to determine the estimated charge. The actual charge for an additional charge is captured at PO Receiving. If you do not have authority to the *Access Estimated Charge Percent (B01)* secured feature, the percent field is display-only and you cannot enter an estimated charge percentage. The following message indicates if you do not define either a unit cost or percentage for a charge code: `Unit Cost or Percent must be entered`. The following message indicates if you try to enter a charge code that has already been defined: `PO Estimate Charge already exists`. The following message indicates if you try to enter a unit cost and unit percentage for a charge code: `Enter Unit Cost or Percent; but not both`. Numeric, 5 positions with a 2-place decimal; optional (required if unit cost is not entered).

Instructions:

- Select *Add/Change* to activate the add/change function. The system displays the same screen; however, you are able to change previously added information.
- Complete the necessary fields.
- When you return to the previous screen, the system displays the following message to indicate the charges have been applied to each purchase order detail line.

All detail estimated charges have been updated with changes

Screen Option	Procedure
Toggle between add mode and change mode	Select *Add/Change*. The existing charges on the screen change to display-only or enterable fields.

Purchase Order Overrides Pop-Up Window

Purpose: Use this window to define overrides to the vendor record for this purchase order only without updating the vendor record itself.

Overriding Discounts

If you override one or more of the vendor discount fields in PO maintenance:

- the overrides are applied to any new PO lines added during PO maintenance.
- the system applies the overrides only to existing PO lines that do not currently have any discount defined (a discount is not defined in the primary discount, percent discount, or unit discount fields).

- if a PO line without discounts has already been partially received, the system applies the overrides to the remaining quantity waiting to be received.

System control value: The *Apply Discount To Manual Cost (D96)* system control value defines whether purchase order discounts are applied against a manually entered cost; select this system control value to receive discounts against manually entered costs.

Example: You enter a PO for a vendor with no primary discount or percent or unit discounts.

Scenario	Results
You enter PO line 1 for 1 unit at 25.00.	The system creates PO line 1 with an extended cost of 25.00 (no discounts applied).
You enter PO line 2 for 1 unit at 25.00 and add a trade unit discount of *5.00*.	The system applies the *5.00* trade unit discount to PO line 2, updating the extended cost to 20.00 (25.00 - 5.00 = 20.00)
In PO Maintenance:	
At the Purchase Order Overrides window, you enter a primary discount override of *5.00%*.	The system applies the *5.00%* primary discount override to PO line 1. The system does not apply the 5.00% primary discount override to PO line 2 since the line currently has a *5.00* trade unit discount.
You add PO line 3 for 1 unit at 25.00.	The system applies the *5.00%* primary discount override to PO line 3.

How to display this screen: At the *Work with Purchase Order (Header) Screen*, select *P/O Overrides*.

Field	Description
Reference #	A reference number you can use if you have the system assign purchase order numbers and you want to track an internal purchase order number or a tracking number on the purchase order. Reference numbers can be used in P/O Inquiry to scan for a specific purchase order number. The reference number may print on the PO, depending on the print program from the *PO Print Program (C64)* system control value. Alphanumeric, 15 positions; optional.
Terms	A code that represents a type of payment terms, such as net 30 days. The terms default from the Vendor table will display here, but can be overridden for any order. Terms are validated against the Terms code table. Numeric, 2 positions; optional.
Vendor reference #	An internal reference number that may be stored with the purchase order. For example, the reference number may represent an internal purchase order number from a preprinted purchase order, or an internal control for departmental purchase orders. Information in this field will be available to print on the PO or any report. Alphanumeric, 15 positions; optional.

Field	Description
Negotiate price	Determines whether the program pulls prices for items entered. • *Selected* = You must enter a price for each item. • *Unselected* = The system will automatically pull prices for each item. Prices will be pulled from: 1. Vendor/Item quantity break table 2. Vendor/Item table 3. Item table.
Primary discount %	The primary discount percentage applied to each item ordered from this vendor. The primary discount percent defaults from the Vendor table. You may enter an override to the primary discount percentage established for this vendor towards purchases. The override to the Discount % is valid only for the current purchase order. See *Overriding Discounts* for more information on how the system updates the discount percentage based on any overrides you define at the Purchase Order Overrides Pop-Up Window. Numeric, 5 positions with a 2-place decimal; optional.
Confirming PO	Determines whether this is a confirming purchase order. If this is a confirming purchase order, you can print confirming purchase orders and the purchase order will indicate that it is a confirming document when you print it; see Printing Purchase Orders. If you are using EDI to transmit orders and follow up with the printed order, the system indicates on the printed document that it is a confirmation of an EDI transmission. • *Selected* = The order was placed over the phone with a vendor and this is a confirming PO. • *Unselected* = This is not a confirming PO.
Tax exempt #	The Ship to field's reseller or tax exempt certificate number for this drop ship purchase order. May default from the Tax identification field in the Customer record. Alphameric, 15 positions; optional.
Currency rate	The currency of the vendor or broker from whom the purchase order is being placed. If a foreign currency value is entered, the system will store the vendor's currency on the PO and will calculate your currency whenever necessary, (e.g., during inquiry and reporting). See Working with Currency (WCUR). Alphanumeric, 3 positions; optional.
Surcharge %	You may override or enter a surcharge that is added to purchases from this vendor. A surcharge is typically added to purchases from a broker. If a Surcharge % is defined in the Vendor table, it will default here. The surcharge percent is reflected in the price of each item. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
Percent discount	The percentage the system applies against the unit cost of an item on the purchase order. Percentage discounts are defined in and validated against the Vendor Discount table. If you enter a discount percentage, you cannot enter a unit discount for the same discount field. The system calculates discount percentages before subtracting any dollar discounts. The text for the 3 percent discounts is blank if a value has not been defined in the *Vendor/PO Discount Values (E18)* field in the System Control field. **Note:** The system calculates percentage discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Purchase Order Line Discount Screen* for examples of each discount calculation method. See *Overriding Discounts* for more information on how the system updates the percent and unit discounts based on any overrides you define at the *Purchase Order Overrides Pop-Up Window*. Numeric, 11 positions with a 4-place decimal; optional.
Unit discounts	The amount the system subtracts from the unit cost of an item on the purchase order. Unit discounts are defined in and validated against the Vendor Discount table. If you enter a unit discount amount, you cannot enter a discount percentage for the same discount field. The text for the 3 unit discounts is blank if you have not defined a value in the *Vendor/PO Discount Values (E18)* field in the System Control field. **Note:** The system calculates unit discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Purchase Order Line Discount Screen* for examples of each discount calculation. See *Overriding Discounts* for more information on how the system updates the percent and unit discounts based on any overrides you define at the *Purchase Order Overrides Pop-Up Window*. Numeric, 13 positions with a 4-place decimal; optional.

Work with PO Messages Screen

Purpose: Use this screen to define or update message text that may print on the purchase order. These messages can also be displayed in PO Inquiry/Maintenance and Receiving.

How to display this screen: Select *PO Msg* at the:

- *Work with Purchase Order (Header) Screen*
- *PO Maintenance - Maintain Detail Screen*

You can also display this screen by selecting *Messages* at the *Display Purchase Order Header Screen* in PO inquiry.

Field	Description
Message	Free-form message about the vendor and/or order. You can mark any portion of the message to print on the PO, or you can use the messaging capability to keep detailed notes about the order for internal use. Alphanumeric, 60 positions (each line); optional.
Print	Select *Print on PO* to print on the purchase order; otherwise, leave this option blank. Optional.

Entering messages: Select *Add/Change* to activate the add/change function. The system displays the same screen; however, you are able to change previously added information.

Purchase Order Summary Screen

Purpose: Use this screen to review the PO detail lines that have been entered on the purchase order. You can also use this screen to view the running totals for the purchase order as a whole and the individual totals for each detail line. Up to eight purchase order detail lines appear on this screen at one time. This screen also allows you to accept or reject the entire purchase order if PO detail line entry is completed.

How to display this screen: Select *Summary* at the At the *Create PO Detail Standard Screen*, another detail entry screen, the *Work with Purchase Order (Header) Screen*, or the *\PO Maintenance - Maintain Detail Screen*.

Field	Description
P/O #	The number assigned to a purchase order, defaulted from the *Work with Purchase Order (Header) Screen*. Numeric, 7 positions; display-only.
Rev # (Revision number)	The number of times a purchase order has been revised. When you initially create a purchase order, the revision number is 1. Numeric, 3 positions; display-only.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Status</td><td>The status of the purchase order. When you first create a PO, the status will be Open or Suspended.
Status options:
• Canceled = The purchase order was canceled through PO Maintenance; it exists on the system for historical purposes.
• Closed = All lines on the purchase order have been received through PO Receiving.
• Held = The PO must be approved through PO Maintenance before receipts can occur.
• Open = The PO exists on the system awaiting PO Receipts.
• Suspended = Inventory has been received into suspense through the PO Receiving function.
Alphanumeric, display-only.</td></tr>
<tr><td>Vendor #</td><td>The code that identifies the vendor or supplier of an item.
Numeric, 7 positions; display-only.</td></tr>
<tr><td>Ord qty (Order quantity)</td><td>The quantity of the item that has been ordered (in retailer’s unit of measure) from the vendor.
Numeric, 7 positions; display-only.</td></tr>
<tr><td>Opn qty (Open quantity)</td><td>The total quantity on the purchase order that has not been assigned to backorders through the PO layering function. The system updates this value.
Numeric, 7 positions; display-only.</td></tr>
<tr><td>Ext cost (Extended cost)</td><td>The extended cost or sum of all open PO detail lines.
Numeric, 20 positions with a 4-place decimal; display-only.</td></tr>
<tr><td>Act chrge (Actual charges)</td><td>The actual additional charges associated with the purchase order. Actual charges are assigned in PO Receiving.
Numeric, 13 positions with a 4-place decimal; display-only.</td></tr>
<tr><td>Est chrge (Estimated charges)</td><td>The estimated additional charges for this entire purchase order. Represents the sum of all additional charges for each line.
Numeric, 20 positions with a 4-place decimal; display-only.</td></tr>
<tr><td>Weight</td><td>The cumulative weight of all items ordered on the purchase order which is calculated by multiplying the ship weight and the quantity ordered. If no Ship weight is defined in the Vendor/ Item table, weight is taken from the Item table.
Numeric, 7 positions with a 3-place decimal; display-only.</td></tr>
<tr><td>Cube</td><td>The cumulative cubic volume of all items ordered on the purchase order which is calculated by multiplying the cubic volume and the quantity ordered. If no Cubic volume is defined in Vendor/Item table, cube is taken from the Item table.
Numeric, 7 positions; display-only.</td></tr>
<tr><td>Line</td><td>The purchase order line number. Up to 999 lines may exist on one purchase order.
Numeric, 3 positions; display-only.</td></tr>
</table>

Field	Description
Status	The status of the purchase order. Status options: • *Cancelled* • *Hold* • *Open* • *Suspended* • *Complete* Alphanumeric, display-only.
Item/Cls Size	The item number and SKU being ordered. Alphanumeric, 12 positions (item), three 4-position fields (SKU); display-only.
U/M (Unit of measure)	A standard by which an item is sold. Typical units of measure include: • *EA* = each • *IN* = inches • *C12* = case of 12 Validated against the Unit of Measure table; see *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; display-only.
Ord qty (Order quantity)	The quantity ordered, in retailer's unit of measure. Numeric, 7 positions; display-only.
Opn qty (Open quantity)	The total quantity of the line item that has not been assigned to backorders through the PO layering function. The system updates this value. Numeric, 7 positions; display-only.
Ext cost (Extended cost)	The extended cost of this PO detail line, which is calculated by multiplying the quantity ordered and the price per retailer's unit of measure, adding the surcharge, and subtracting the discount. Numeric, 20 positions with a 4-place decimal; display-only.

Screen Option	Procedure
Accept the purchase order information	Select *Accept* to accept the PO. See *Completing PO Maintenance*.
Reject the purchase order information	Select *Reject* to reject the PO. See *Completing PO Maintenance*.

Completing PO Maintenance

Purpose: To complete PO maintenance, perform one of the following:

- *Accept Purchase Order*
- *Reject Purchase Order*
- *Approve Purchase Order*
- *Cancel Purchase Order*

Accept Purchase Order

On the *Work with Purchase Order (Header) Screen*, select *Accept/Print* to accept a purchase order and advance to the *Print P/O Window*. This option is not available at any purchase order detail screen.

> **Note:**
>
> Faxing the purchase order is not currently implemented.

Accept PO without printing: To accept a purchase order without advancing to the *Print P/O Window*, you can select *Accept* at the following screens:

Screen	Result
Work with Purchase Order (Header) Screen	The system accepts changes made and returns to the *PO Maintenance Select Prompt Screen*.
Create PO Detail Standard Screen	The system accepts changes made and returns to the *PO Maintenance Select Prompt Screen*.
Purchase Order Summary Screen	The system accepts changes made and returns to the *PO Maintenance Select Prompt Screen*.

If you cancelled one or more lines on a drop ship PO: The system displays an error message when you select *Accept* if you are maintaining a drop ship PO and during PO maintenance you cancelled some, but not all, of the lines on the PO: `D/S PO cannot be accepted with partially cancelled lines. Please cancel all lines.` To complete PO maintenance, you must cancel all of the lines on a drop ship PO.

Updates: The system performs field and table updates through a background processing job (OTHR_ASYNC) when you select *Accept* or *Accept/Fax*. See *Updates During Background Processing* for more information.

Reject Purchase Order

To reject a purchase order, select *Reject* at any of the screens listed above. A pop-up window appears prompting you to confirm. Select *OK* to confirm the rejection and exit the screen; otherwise, select *Exit* to cancel the rejection and return to the previous screen.

> **Note:**
>
> No changes made during this session of PO Maintenance will be recorded/accepted if you select *Reject* to reject.

Approve Purchase Order

Select *Approve* to approve the purchase order. You must have authority to the *Approve Purchase Order (A31)* secured feature to approve a purchase order.

> **Note:**
>
> If you advanced to PO Maintenance from PO inquiry, you cannot approve a purchase order. You need to select the purchase order in PO maintenance in order to approve it, regardless of your secured feature authority.

Cancel Purchase Order

To cancel the entire PO: Select *Cancel PO* to cancel the entire purchase order.

> **Note:**
>
> If a PO line contains a drop ship item, and you use the Order Orchestration Drop Ship interface to process drop ship items for this vendor, you cannot cancel the purchase order using the *Cancel PO* option: `Must cancel drop ship lines individually`.

To cancel individual lines: Select *Cancel* for a detail line to cancel it from the purchase order. The status (Sts field) for the item changes to *C* (canceled), and the On order qty reduces by the number of units canceled.

> **Note:**
>
> If you cancel some, but not all, of the lines on a drop ship PO individually and then select *Accept* to accept the PO maintenance changes, the system displays an error message: `D/S PO cannot be accepted with partially cancelled lines. Please cancel all lines`. To complete PO maintenance, you must cancel all of the lines on a drop ship PO.

Authorizations for drop ship PO: When you cancel a drop ship PO and an authorization exists for the associated order, the system creates a record in the Void Auths table for the authorization amount.

Drop ship pick: When you cancel a drop ship PO, the system also voids the associated drop ship pick.

Order Orchestration Drop Ship interface: If a PO line contains a drop ship item, and you use the Order Orchestration Drop Ship interface to process drop ship items for this vendor, you cannot cancel the PO line unless:

- You have authority to the *Cancel OROB Drop Ship PO (J04)* secured feature.
- The item is a drop ship item, but was processed before the vendor was flagged as OROB Drop Shipping.

If you do not have authority to the Cancel OROB Drop Ship PO (J04) secured feature, the following message displays when you select *Cancel* for a drop ship line: `Use D/S Status option in PO or Order Inquiry to cancel D/S integration PO line`.

Cancellation reason code: The system assigns the *Auto Soldout Cancel Reason (C20)* to the canceled order line(s).

From PO Inquiry or standard Order Inquiry, you can cancel an Order Orchestration drop ship item if you have authority to the secured feature *Order Maintenance Access (A22)*. See *Cancelling Order Orchestration Drop Ship Order Lines* for processing details.

Print P/O Window

Use this window to print the *Purchase Order*.

Emailing the purchase order: Emailing the purchase order as well as printing it is available when:

- the *Email Purchase Order (K80)* system control value is selected, and
- the vendor's *Email P/O* flag is selected, and
- the vendor has a valid *Email* address.

You can override the email address at this window if you would like to send the purchase order to an alternate address. Your entry at this window does not update the email address in the Vendor record.

The purchase order is sent as an attachment to an email, using the *PO Print Program (C64)*. The text in the email is derived from the Purchase Order template set up through *Working with E-Mail Notification Templates (WEMT)*.

> **Note:**
>
> Faxing the purchase order is not currently implemented.

Purchase order status: The status of the purchase order determines whether it is eligible to print.

- All open, held, and suspended purchase orders are eligible to print through this window.
- If the *Print ordered quantity* field on this window is *selected*, closed purchase orders are eligible to print through this window; otherwise, the window does not display an error message, but no purchase order is printed.
- Cancelled purchase orders are not eligible to print through this window, although the window does not display an error message.

Purchase order line status: The status of the purchase order line determines whether it is eligible to print on eligible purchase orders.

- Open, held, and suspended purchase order lines are included on eligible purchase orders that you print.
- If the *Print ordered quantity* field on this window is *selected*, closed purchase order lines are included on purchase orders that you print. If the *Print ordered quantity* field is *unselected*, closed purchase order lines are not included.
- Cancelled purchase order lines are not included on purchase orders that you print.

For more information: See *Completing PO Maintenance*.

How to display this window:

- Select *Accept/Print* at the *Work with Purchase Order (Header) Screen* in purchase order maintenance. You must first select *OK* in purchase order maintenance to accept the purchase order.
- Select *Print* at the *Display Purchase Order Header Screen* in purchase order inquiry.

Field	Description
Purchase order #	The number of the purchase order. Numeric, 7 positions; display-only.
Vendor	The name of the vendor on the purchase order. Alphanumeric, 30 positions; display-only.
Print PO	Controls whether the system prints the *Purchase Order* when you select *OK* at this pop-up window. Valid values are: • *Selected* (default) = print the purchase order. • *Unselected* = do not print the purchase order.
Print ordered quantity	Controls the quantity to print on the *Purchase Order* when you select *OK* at this pop-up window. Valid values are: 1. *Selected* = Print the quantity ordered for each purchase order line. For example, if the order quantity is 10, and 7 units have been received, the purchase order lists a quantity of 10. You need to select this option to print a closed purchase order or include closed purchase order lines. **Note:** The quantity printed is the most recent order quantity on the purchase order line. For example, if the original quantity ordered was 100, but you updated the quantity to 125 in purchase order maintenance, a quantity of 125 prints on the purchase order. • *Unselected* (default) = Print the quantity due for each purchase order line. For example, if the order quantity is 10, and 7 units have been received, the purchase order lists a quantity of 3. If you select this option, the system does not print a closed purchase order.

Field	Description
Email purchase order	Indicates whether to email the purchase order to the vendor, or to simply produce a .PDF file for printing without emailing. This field is included only if: • the *Email Purchase Order (K80)* system control value is selected, and • the vendor's *Email P/O* flag is selected, and • the vendor has a valid *Email* address. Valid values are: • *Selected* (default) = Send the purchase order as a .PDF attachment to the Email address indicated, using the *PO Print Program (C64)*. The text in the email is derived from the Purchase Order template set up through *Working with E-Mail Notification Templates (WEMT)*. This template is available at the company level only, since the purchase order is not related to a specific entity. The .PDF file is also available for printing. • *Unselected* = Generate a .PDF file of the purchase order for printing, and do not send it by email. If you deselect this flag, you will need to clear the Email address field before you accept your entries at this window.
Email address	The email address where the purchase order should be sent. Included only if the Email purchase order flag is selected; see the description above for more information. Optionally, you can override the vendor's email address to send the purchase order to a different address, although overriding the email here does not update the email address stored in the Vendor record. Alphanumeric, 50 positions; required if the Email purchase order flag is selected.

Completing this window: When you complete this window, the system submits the PO_PRINT job. This job:

- Generates the *Purchase Order* using the *PO Print Program (C64)*. If you are not emailing the purchase order; the .PDF file is available at the *Forms Management (My Forms)* screen. Otherwise, it attaches the .PDF file to an email to the vendor's email address as well as making the .PDF file available for printing. The text of the email is derived from the Purchase Order template set up through *Working with E-Mail Notification Templates (WEMT)*.
- Updates the Print date for the purchase order, displayed in purchase order inquiry.
- Writes a PO Message if you are emailing the purchase order, indicating the email address where the purchase order was sent, for example:

```
PO emailed to vendor email ejohnson@example.com
```

> **Note:**
>
> The generation date is not displayed at the *Work with PO Messages Screen*, although it is written to the PO Message table. Also, if the entire message, including the email address, exceeds the maximum message length of 60 positions, it is truncated.

Using Purchase Order Inquiry

Topics in this part:

- *Purchase Order Inquiry (MPOI)* describes the screens you use to review a purchase order on the system.

Purchase Order Inquiry (MPOI)

Purpose: Use purchase order inquiry to review the status, details, and other information about a purchase order.

In this topic:

- *Select Purchase Order for Inquiry Screen*
- *First Display Purchase Order Detail Screen*
- *Second Display Purchase Order Detail Screen*
- *Display Purchase Order Detail Charges Screen*
- *Display Purchase Order Header Screen*
- *Purchase Order Header History Screen*
- *Purchase Order Line History Screen*
- *Purchase Order Overrides Pop-Up Window*
- *Display Purchase Order Actual Charges Screen*
- *Display Vendor Notes Screen*
- *First Display FOB for Purchase Order Screen*
- *Second Display FOB for Purchase Order Screen*

Select Purchase Order for Inquiry Screen

Purpose: Use this screen is used to select a purchase order directly for inquiry; or enter information into any of the selection fields to review a list of purchase orders that closely match your entry.

How to display this screen: Enter *MPOI* in the Fast Path field at the top of any menu or select this option from a menu.

When you enter information at any of these fields, you advance to a Select Purchase Order screen based on the first field that you completed. For example, if you enter a vendor number and a buyer, you advance to the *Select Purchase Order by Vendor Number Screen* because the Vendor field is before the Buyer field.

Field	Description
P/O #	The number assigned to a purchase order. Enter a PO number to advance to the *First Display Purchase Order Detail Screen*. Numeric, 7 positions; optional.

Field	Description
Due date	The date the purchase order is due to be received, based on the PO date and the Lead days from the Vendor/Item record, or a date entered for the PO. Enter a date to advance to the *Select Purchase Order by Due Date Screen*. Numeric, 6 positions (in user date format); optional.
Reference #	An internal reference number that may be stored with the purchase order. Enter a number to advance to the *Select P/O by Reference Number Screen*. Alphanumeric, 15 positions; optional
Vendor (number)	The code assigned to the vendor. Enter a vendor number to advance to the *Select Purchase Order by Vendor Number Screen*. Numeric, 7 positions; optional.
Vendor name	The name of your supplier. Enter a vendor name to advance to the *Vendor Selection Pop-Up Window (Selecting Purchase Orders by Vendor Name)*. Alphanumeric, 30 positions; optional.
Reference	The vendor's reference number. Enter a reference number to advance to the *Select P/O by Vendor Reference Screen*. Alphanumeric, 15 positions; optional.
Item	The vendor's item number. Enter an item code to advance to the *Select Purchase Order by Item/SKU Screen*. Alphanumeric, 20 positions; optional.
Item/Clr Size	The item number and SKU, if applicable. Alphanumeric, 12 positions (item) and three 4-position fields (SKU); optional.
Buyer	A code to identify a person authorized to make purchases. Enter a buyer code to advance to the *Select Purchase Order by Buyer Screen*. Alphanumeric, 3 positions; optional.

First Display Purchase Order Detail Screen

Purpose: Use this screen to review all aspects of a purchase order.

How to display this screen:

- Enter the number of the purchase order at the *Select Purchase Order for Inquiry Screen*, or
- Enter information in one of the selection fields at the *Select Purchase Order for Inquiry Screen*, then *select* a PO at a subsequent Select PO by (fieldname) screen.
- Select *Detail* at the *Display Purchase Order Header Screen*

Field	Description
P/O #	The number assigned to a purchase order. Numeric, 7 positions; display-only.

Field	Description
Vendor	The name and the number of the supplier of the item. Vendor codes are defined in and validated against the Vendor table; see *Working with Vendors (WVEN)*. Alphanumeric, 20 positions; display-only
Buyer	A code that identifies an employee who is authorized to make purchases for your company. Buyer codes are defined in and validated against the Buyer table; see *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; display-only.
Status	The status of the purchase order. Valid values are: • *C* = Cancelled. The purchase order was canceled through P.O. Maintenance; it exists on the system for historical purposes. • *D* = Docked. The purchase order has arrived at the warehouse, but the inventory has not yet been reviewed or received. • *H* = Held. If the purchase order is on hold, you cannot receive it until you approve it through purchase order maintenance. • *O* = Open. You expect to receive the items on the purchase order. • *S* = Suspended. Inventory has been received into suspense through the P.O. Receiving function. At a later point, permanent locations in the warehouse will be determined for these items. • *X* = Closed. All items on the purchase order have been received. Alphanumeric, 1 position; display-only.
Promise (Promise date)	A user-defined date for the expected ship date or promised arrival date. Numeric, 6 positions (in user date format); display-only.
Due (Due date)	The date the purchase order is due to be received, based on the PO date and the Lead days from the Vendor/Item record or manually entered for the PO. Numeric, 6 positions (in user date format); display-only.
Print (Print date)	The date the purchase order was printed. Numeric, 6 positions; display-only.
Cancel (Cancel date)	The date the purchase order will be flagged for cancellation if the items are not received. An auto-cancellation option is available that will produce a list of all items approaching or beyond the specified cancel date. Numeric, 6 positions (in user date format); display-only.
Total cost	The total value of items to be purchased, calculated by the extended price (quantity ordered multiplied by price), plus additional estimated charges and line surcharges (minus any discounts). Expressed in your currency, not the vendor's. Numeric, 20 positions with a 4-place decimal; display-only.
Ln # (Line number)	The purchase order detail line number. You can enter up to 999 lines on one purchase order. Numeric, 3 positions; display-only

Field	Description
Sts (Status)	The status of the purchase order detail line. Valid values are: • *C* = Canceled • *H* = Held • *O* = Open • *S* = Suspended • *X* = Closed Alphanumeric, 1 position; display-only.
Item	A code for an unit of inventory. Item numbers are defined in and validated against the Item table. Item: Alphanumeric, 12 positions; display-only. Description: Alphanumeric, 120 positions; display-only.
SKU	A code that further identifies a unit of inventory by its unique style, such as its color and size. Alphanumeric, three 4-position fields; display only.
UOM (Unit of measure)	A standard by which an item is sold. Typical units of measure include: • *EA* = each • *IN* = inches • *C12* = case of 12 Unit of measure codes are defined in and validated against the Unit of Measure table; see *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; display-only.
Qty due (Quantity due)	The quantity remaining to be received from the vendor. Numeric, 7 positions; display-only.
Qty rcv (Quantity received)	The quantity already received from the vendor. PO Receiving updates this field. Numeric, 7 positions; display-only.
	You can select
Qty ord (Quantity ordered)	The quantity originally ordered of the item. Numeric, 7 positions; display-only.
Ext cost (Extended cost)	The total cost for this item. The calculation is: `(Quantity ordered * (Price from the Vendor/Item or Item record + Surcharge)) - Discount` Numeric, 20 positions with a 4-place decimal; display-only.

Screen Option	Procedure
Display PO detail information	Select *Display* for an item to advance to the *Second Display Purchase Order Detail Screen*.
Review receiving history	Select *Receiving* for an item to advance to the *Purchase Receipts History Screen*.

Screen Option	Procedure
View Order Orchestration status information about a drop ship purchase order detail line	Select *DS Status* next to an item to advance to the *Display P/O Drop Ship Screen*, if the item is a drop ship item and you use the *Order Orchestration Drop Ship Integration* to process drop ship items for this vendor. If you have authority to the Order Maintenance Access (A22) secured feature, you can initiate a cancel request for the item from the Display PO Drop Ship screen. If the item is not a drop ship purchase order processed through Order Orchestration, the following message displays: `Selected line has no drop ship purchase order information.`
Work with estimated charges	Select *Estimated Charges* for an item to advance to the *Display Purchase Order Detail Charges Screen*.
Work with vendor item notes	Select *Vendor item notes* for an item to advance to the *Work with Vendor Item Notes Screen*.
Work with line messages	Select *Messages* for an item to advance to the *Work with PO Detail Messages Screen*.
Display PO detail history	Select *History* for an item to advance to the *Display PO Detail History Screen*.
Maintain PO	Select *Maintain* to display the *PO Maintenance - Maintain Detail Screen*. **Note:** If you advance to PO maintenance from PO inquiry, you cannot approve a purchase order. You need to select the purchase order in *Maintaining Purchase Orders (MPOE)*.
Display PO header information	Select *Header* to advance to the *Display Purchase Order Header Screen*.
Display the quantity due or the quantity received	Select *Toggle due/rcv* to switch between fields.
Display actual charges	Select *Charges* to advance to the *Display Purchase Order Actual Charges Screen*.
Display PO header history	Select *History* to advance to the *Purchase Order Header History Screen*.
Display vendor notes	Select *Vendor notes* to advance to the *Work with Vendor Notes Screen*.
Display PO messages	Select *Messages* to advance to the *Work with PO Messages Screen*.

Second Display Purchase Order Detail Screen

Purpose: Use this screen to review items on a purchase order.

How to display this screen: At the *First Display Purchase Order Detail Screen*, select *Display* for an item.

All fields on this screen are display-only.

Field	Description
PO #	The number assigned to this purchase order. Numeric, 7 positions.
Rev # (Revision number)	The number of times a purchase order has been revised. The revision number is increased each time the purchase order is maintained and accepted. When you initially create a purchase order, the revision number is 1. Numeric, 3 positions.
Status	The status of the purchase order. When you first create a purchase order, the status will be *Open* or *Suspended*. Status options: • *Canceled* = The purchase order was canceled through Purchase Order Maintenance; it exists on the system for historical purposes. • *Closed* = All lines on the purchase order have been received through Purchase Order Receiving. • *Held* = The purchase order must be approved through Purchase Order Maintenance before receipts can occur. • *Open* = The purchase order exists on the system awaiting Purchase Order Receipts. • *Suspended* = Inventory has been received into suspense through Purchase Order Receiving. Alphanumeric.
Line #	The purchase order detail line number. There can be up to 999 lines on one purchase order. Numeric, 3 positions; display-only.
Vendor #	The code that identifies the vendor or supplier of an item. See *Working with Vendors (WVEN)*. Numeric, 7 positions.
Status	The status of the purchase order line. Valid values: • Canceled • Held • Open • Suspended • Closed Alphanumeric, display-only.
Item	The item and SKU you are ordering. The description of the item is below. Item: alphanumeric, 12 positions; display-only. SKU: alphanumeric, three 4-position fields; display-only. Description: alphanumeric, 120 positions; display-only.

Field	Description
U/M (Unit of measure)	A standard by which an item is sold. Typical units of measure include: • *EA* = each • *IN* = inches • *C12* = case of 12 Validated against the Unit of Measure table; see *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; display-only.
Quantity	Quantity of the item that has been ordered from the vendor. Numeric, 7 positions; display-only.
Transit qty (Transit quantity)	The quantity that the vendor has indicated is in transit from the vendor to you. Numeric, 7 positions; display-only.
Cost	The unit price for this item. Numeric, 13 positions with a 4-place decimal; display-only.
Primary disc (Primary discount)	The primary discount percentage defined for this vendor that is applied to all items purchased. The standing discount for the vendor defaults, but you can override it at the line level or using PO Header Override; see *Purchase Order Overrides Pop-Up Window*. Numeric, 5 positions with a 2-place decimal; display-only.
Surcharge	An additional fee to purchase this item from this vendor. A surcharge is typically added to purchases from a broker. The surcharge for the vendor defaults, but you can override it using PO Header Overrides; see *Purchase Order Overrides Pop-Up Window*. Numeric, 13 positions with a 4-place decimal; display-only.
Ext cst (Extended cost)	The extended cost of this PO detail line, calculated by multiplying the order quantity and the price, adding the surcharge, and subtracting the discount. Numeric, 20 positions with a 4-place decimal; display-only.
Trade % (Discount 1 percentage)	The percentage of the first discount in the Vendor Discount table. The system applies this discount against the unit cost of an item on the purchase order. The resulting dollar amount for this percentage is in the Discount field located below this field. Discount 1 is blank if you have not defined a value in the *Vendor/PO Discount Values (E18)* system control value. The system calculates discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation*. Numeric, 11 positions with a 4-place decimal; display-only.

Field	Description
Coop % (Discount 2 percentage)	The percentage of the second discount in the Vendor Discount table. The system applies this discount against the unit cost of an item on the purchase order. The resulting dollar amount for this percentage is in the Discount field located below this field. Discount 2 is blank if you have not defined a value in the *Vendor/PO Discount Values (E18)* system control value. The system calculates discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation*. Numeric, 11 positions with a 4-place decimal; display-only.
Special % (Discount 3 percentage)	The percentage of the third discount in the Vendor Discount table. The system applies this discount against the unit cost of an item on the purchase order. The resulting dollar amount for this percentage is in the Discount field located below this field. Discount 3 is blank if you have not defined a value in the *Vendor/PO Discount Values (E18)* system control value. The system calculates discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation*. Numeric, 11 positions with a 4-place decimal; display-only.
Discount (Unit discount)	The amount of the first discount that the system subtracts from the unit cost of an item on the purchase order. The system calculates discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation*. Numeric, 13 positions with a 4-place decimal; display-only.
Discount (Unit discount)	The amount of the second discount that the system subtracts from the unit cost of an item on the purchase order. The system calculates discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation*. Numeric, 13 positions with a 4-place decimal; display-only.
Discount (Unit discount)	The amount of the third discount that the system subtracts from the unit cost of an item on the purchase order. The system calculates discounts based on the method from the *Discount calculation method* field in the Vendor Extended table. See *Combined Discount Calculation* and *Tiered Discount Calculation*. Numeric, 13 positions with a 4-place decimal; display-only. Vendor's information (see *Working with Vendor Items (WVNI)*
Vendor's	The vendor's item code for the item. Alphanumeric, 20 positions; display-only.
U/M (Unit of measure)	The vendor's unit of measure for the vendor's item. Alphanumeric, 3 positions; display-only.
Quantity	The quantity of the item that has been ordered from the vendor, expressed in the vendor's unit of measure. For example, if your unit of measure is eaches and the vendor's unit of measure is cases of 24, the Qty field may contain 48 units and the Quantity field would be 2 (representing the vendor's unit of measure). Numeric, 7 positions; display-only.

Field	Description
Vendor price	The price the vendor charges for the item, expressed in the vendor's currency. Numeric, 13 positions with a 4-place decimal; display-only.
Vnd disc (Vendor discount)	The primary unit discount amount represented in the vendor's currency. Numeric, 13 positions; display-only.
Vnd disc 1 (Vendor unit discount)	The amount of the first discount displayed in the vendor's currency. Calculating discounts in a foreign currency results in inaccurate discount amounts. Numeric, 13 positions with a 4-place decimal; display-only.
Vnd disc 2 (Vendor unit discount)	The amount of the second discount displayed in the vendor's currency. Calculating discounts in a foreign currency results in inaccurate discount amounts. Numeric, 13 positions with a 4-place decimal; display-only.
Vnd disc 3 (Vendor unit discount)	The amount of the third discount displayed in the vendor's currency. Calculating discounts in a foreign currency results in inaccurate discount amounts. Numeric, 13 positions with a 4-place decimal; display-only.
Ext price (Extended price)	The extended price of this PO detail line in the vendor's unit of measure. Calculated by multiplying the price by the quantity ordered. Numeric, 20 positions with a 4-place decimal; display-only.
Prc mthd (Price method description)	The description of the pricing method used for the item on this purchase order. Valid values are: • *Price overridden* = At purchase order maintenance, you specified the price for the item. • *Vendor item price* = The vendor item price defaulted. • *Item standard cost* = The standard cost from the SKU table defaulted. . Unless you override it, the system uses the vendor/item price, if it exists, for the purchase order. If there is no vendor/item price, the system uses the average, standard, or last purchase cost, based on your costing method as described above. Display-only.
Buyer	A code that identifies a person who is authorized to make purchases for your company. The buyer's name is to the right. See *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; display-only.
Ship via	A code that represents a carrier used for shipping merchandise to your company. The description is to the right. See *Working with Purchase Order Ship Via (WPSV)*. Numeric, 2 positions; display-only
Offer (Offer code)	A code for the offer (catalog) in which you will sell the item. See *Working with Offers (WOFR)*. The description is to the right. Alphanumeric, 3 positions; display-only.

Field	Description
Warehouse	A code that represents the warehouse where the item is kept. Validated against the Warehouse table. The description is to the right. Numeric, 3 positions; display-only.
Due date	The date the PO is due to be received, based on the PO date and the Lead days for the vendor item or manually entered in Purchase Order Maintenance. This date is shown in Order Entry, Order Maintenance, and standard or streamlined Order Inquiry. Numeric, 6 positions (in user date format); display-only.
Cancel date	The date the order will be marked for cancellation if the order is not received. See *Printing the PO Auto Cancel Report (MPAC)*. Numeric, 6 positions (in user date format); display-only.
Promise date	A user-defined date that may be used to represent the expected ship date or promised arrival date. Numeric, 6 positions (in user date format); display-only.

Screen Option	Procedure
Review estimated charges	Select *Estimated Charges* to advance to the *Display Purchase Order Detail Charges Screen*.
Update vendor item notes	Select *Vendor Item Notes* to advance to the *Work with Vendor Item Notes Screen*.
Update PO detail messages	Select *P/O detail messages* to advance to the *Work with PO Detail Messages Screen*.

Display Purchase Order Detail Charges Screen

Purpose: Use this screen to review additional charges, such as freight, brokerage, commission, or duty charges, for this purchase order detail line. These charges are for estimating purposes only. You can assign additional charges at purchase order receiving; see *Purchase Order Inquiry (MPOI)*.

You use the *Working With PO Additional Charges (WPAC)* menu option to define PO additional charges. You can enter the estimated charge as a unit cost or a percent to apply against each unit on this purchase order detail line.

How to display this screen:

- At the *First Display Purchase Order Detail Screen*, select *Estimated Charges* for an item.
- At the *Second Display Purchase Order Detail Screen*, select *Estimated Charges*.

Field	Description
P/O #	The number assigned to a purchase order. Numeric, 7 positions; display-only.
Line # (Line number)	The purchase order detail line number. There can be up to 999 lines on one purchase order. Numeric, 3 positions; display-only.

Field	Description
Item	A code that represents a unit of inventory. Alphanumeric, 12 positions; display-only.
Code	A code that represents the estimated charge for to the detail line. Validated against the PO Additional Charge table; see *Working With PO Additional Charges (WPAC)*. Numeric, 2 positions; optional.
Description	Text that describes the charge code. Alphanumeric, 30 positions; display-only.
Unit cost	The unit charge for this purchase order detail line for brokerage, commission, duty, freight, import, surcharge, or other user-defined fees. Actual charges from the vendor for these fees are captured at PO Receiving. The system multiplies the unit cost by the quantity ordered to determine the estimated charge. Numeric, 13 positions with a 4-place decimal; display-only.
Percent	The percentage used to calculate the additional charges on a purchase order detail line. The system multiplies the percentage by the extended price on the purchase order detail line to determine the estimated charge. Actual charges are captured at PO Receiving. Numeric, 5 positions with a 2-place decimal; display-only.

Display Purchase Order Header Screen

Purpose: Use this screen to review information about the purchase order that pertains to the entire purchase order record, such as status, ship-to address, buyer, or offer.

Purchase order download triggers: If the *Create Generic PO Download Triggers (K26)* system control value is *selected*, the system generates a purchase order header (POH) trigger whenever a purchase order is printed, based on the trigger rules defined for the Purchase Order Download (PO_OUT) integration layer job. The PO_OUT integration layer job monitors for purchase order download triggers and generates a *PO Download XML Message (CWPurchaseOrderOut)* to send purchase order information to a remote system. See *Generic Outbound Purchase Order API* in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for an overview.

How to display this screen: At the *First Display Purchase Order Detail Screen*, select *Header*.

Field	Description
P/O #	The number assigned to a purchase order. Numeric, 7 positions.

Field	Description
Ship to	The ship-to information entered for the purchase order. Each option is described below. *Warehouse:* Defaults from the primary warehouse defined in the System Control table. If you do not have a default defined in the System Control table, you must enter the warehouse code. **Note:** You can override the warehouse code for any line on the purchase order. The system tracks the total on order for each item in each warehouse, based on the code entered here or on the detail line. In addition, the warehouse code controls which shipping address prints on the PO or is transmitted in the EDI table. A separate PO prints for each warehouse to each different ship-to address. Numeric, 3 positions. *Customer number/Order number:* Unique numbers the system assigns to customers or orders. The system requires either a customer or order number for drop ship purchase orders. If you enter the customer number, the system does not tie this number to the order or pull the items from the order through to the purchase order. Numeric, 9 positions.
Status	The status of the purchase order. Valid values are: • *Canceled* = The purchase order was canceled through PO Maintenance; it exists on the system for historical purposes. • *Closed* = All lines on the purchase order have been received through PO Receiving. • *Docked* = One or more deliveries against the purchase order have been docked and the purchase order is awaiting receipt. • *Held* = The PO must be approved through PO Maintenance before receipts can occur. • *Open* = At least one line on the PO is awaiting receipt. • *Suspended* = Inventory has been received into suspense through the PO Receiving function. Alphanumeric
Vendor	A unique number to identify the supplier you are purchasing from. Validated against the Vendor table. Numeric, 7 positions.
Vendor name/address	The supplier's name and address. Alphanumeric, 30 positions.

Field	Description
Warehouse/customer	The name and address of the warehouse or the customer, depending on which information you entered. Alphanumeric, 30 positions.
Placed with	The name of the person at the vendor site who took the purchase order originally. Alphanumeric, 30 positions.
Shipping	One line of shipping instructions to print on the purchase order. Alphanumeric, 20 positions.
Buyer	A code that identifies an employee who is authorized to make purchases for your company. Validated against the Buyer table; *Working with Buyers (WBUY)*. Numeric, 3 positions.
Ship via	A code that identifies your preferred shipper, or the shipper agreed upon with the vendor. Validated against the PO Ship Via table; see *Working with Purchase Order Ship Via (WPSV)*. Numeric, 2 positions.
Offer (Offer code)	The code for the offer (catalog) you use to sell this merchandise. Alphanumeric, 3 positions.
Due date	The date the purchase order is due to be received. The due date is the date the operator always sees in Order Entry. Numeric, 6 positions (in user date format).
Cancel date	The date the purchase order will be marked for cancellation if the order is not received. An auto-cancellation option is available that will produce a list of all items approaching or beyond the specified cancel date. Numeric, 6 positions (in user date format).
Promise date	A user-defined date that may be used to represent the expected ship date or promised arrival date. Numeric, 6 positions (in user date format).
Print date	The date the purchase order was printed. Numeric, 6 positions (in user date format).
Type	Indicates whether this purchase order is an initial buy or a reorder. Valid values are: • *Initial Buy* • *Reorder*
Entry date	The date the purchase order was entered. Numeric, 6 positions (in user date format).
Receipt date	The date when the most current receiving activity was performed against this purchase order. Numeric, 6 positions (in user date format).
Approve date	The date the purchase order was approved. Numeric, 6 position (in user date format

Field	Description
Entered by	The ID that identifies the user who entered the order. Alphanumeric, 10 positions.
Received by	A code that identifies the user who received the merchandise. Alphanumeric, 10 positions.
Approved by	A code that identifies the user who approved the purchase order. Alphanumeric, 10 positions.

Screen Option	Procedure
Review purchase order details	Select *Detail* to return to the First Display Purchase Order Detail Screen.
Print the purchase order	Select *Print* to advance to the *Print P/O Window*. **Note:** Faxing the purchase order is not currently implemented.
Review FOB addresses for the purchase order	Select *FOB* to advance to the *First Display FOB for Purchase Order Screen*.
Display actual charges	Select *Act Chgs* to advance to the *Display Purchase Order Actual Charges Screen*.
Review purchase order history	Select *P/O Hist* to advance to the *Purchase Order Header History Screen*.
Review purchase order overrides	Select *P/O Overrides* to advance to the *Purchase Order Overrides Pop-Up Window*.
Update purchase order messages	Select *P/O Messages* to advance to the *Work with PO Messages Screen*.
Display vendor notes	Select *Vendor Notes* to advance to the *Display Vendor Notes Screen*.

Purchase Order Header History Screen

Purpose: Use this screen to review the activity that has taken place for a purchase order at the header level.

How to display this screen: Select *P/O Hist* at the *Display Purchase Order Header Screen*.

Field	Description
P/O #	A unique number to identify the purchase order. Numeric, 7 positions; display-only.
Vendor #	The name and number of the supplier. Alphanumeric, 20 positions; display-only.

Field	Description
B/A	A code indicating whether the history represents a before or after image of the transaction. Values are: • *Before* = information representing the purchase order before the transaction was processed. • *After* = information representing the purchase order after the transaction was processed. Alphanumeric, display-only.
Date	The date when the activity was performed. Numeric, 6 positions; display-only.
User	The user who performed the activity. Alphanumeric, 10 positions; display-only.
Description	A description of the activity that was performed against the purchase order. Alphanumeric, 25 positions; display-only.

Screen Option	Description
Review purchase order line history	Select *Line History* to advance to the Purchase Order Line History screen. See *Display PO Detail History Screen* for screen sample and field descriptions of this screen.

Purchase Order Line History Screen

Purpose: Use this screen to review any activity against the purchase order line since it was created on the system. The system notes each time anything happens to the line (such as, maintenance, receipts, etc.).

How to display this screen: At the *Purchase Order Header History Screen*, select *Line History*.

Field	Description
P/O #	The unique number which identifies the purchase order , and the description of the supplier. Alphanumeric, 20 positions; display-only.
Line #	The number of this line on the purchase order. Numeric, 3 positions, display-only.
Item	The code and description of the item. Item: Alphanumeric, 12 positions; display-only. Description: Alphanumeric, 120 positions; display-only.
B/A	A code indicating whether the history represents a before or after image of the transaction. Values are: • *Before* = information representing the purchase order detail line before the transaction was processed. • *After* = information representing the purchase order detail line after the transaction was processed. Alphanumeric, display-only.

Field	Description
Date	The date when the activity was performed. Numeric, 6 positions; display-only.
User	The user who performed the activity. Alphanumeric, 10 positions; display-only.
Description	A description of the activity that was performed against the purchase order detail line. Alphanumeric, 25 positions; display-only.

Screen Option	Description
Review history for the next detail line of the purchase order	Select *OK*.

Purchase Order Overrides Pop-Up Window

Purpose: Use this window to review overrides that have been made to the Vendor record for this purchase order only.

How to display this screen: At the *Display Purchase Order Header Screen*, select *P/O Overrides*.

Field	Description
Reference #	An internal reference number to store with the purchase order. For example, this might be an internal purchase order number from a preprinted purchase order, or an internal control for departmental purchase orders. Alphanumeric, 15 positions; display-only.
Currency/Rate	The currency of the vendor or broker, and the current currency conversion rate. See *Working with Currency (WCUR)*. Currency: alphanumeric, 3 positions; display-only. Rate: numeric, 13 positions with a 7-place decimal; display-only.
Vendor ref # (Vendor reference number)	The vendor's reference number, such as an alternate order number. Prints on the purchase order. Alphanumeric, 15 positions; display-only.
Terms	A code that represents the payment terms, such as net 30 days. Defaults from the Vendor table, but you can override it in purchase order maintenance. Numeric, 2 positions; display-only.
Discount % (Discount percent)	The discount percent to apply to each item ordered from this vendor. Defaults from the Vendor table, but you can override it in purchase order maintenance. Numeric, 5 positions with a 2-place decimal; display-only.
Surcharge % (Surcharge percent)	The surcharge percentage to add to purchases from this vendor. A surcharge is typically added to purchases from a broker. Defaults from the Vendor table, but you can override it in purchase order maintenance. The surcharge percent is reflected in the cost of each item. Numeric, 5 positions with a 2-place decimal; display-only.

Field	Description
Tax status	The resale or exempt classification, if any, entered in purchase order maintenance. Informational. Alphanumeric, 15 positions; display-only.
Negotiate price	Determines whether prices default for items. • *Selected* = You must enter a price for each item. • *Unselected* = The price automatically defaults for each item from: 1. Vendor/Item quantity break table 2. Vendor/Item table 3. Item table See *Working with Vendor Items (WVNI)*.
Confirming P/O	Indicates whether this is a confirming purchase order. When you print a confirming purchase order, it indicates if it is a confirming document. • *Selected* = The purchase order was already communicated to the vendor, and this is a confirming purchase order. • *Unselected* = This is not a confirming purchase order.

Display Purchase Order Actual Charges Screen

Purpose: Use this screen to review the actual additional charges for the purchase order in terms of brokerage, commission, duty, freight, import, surcharge, or other user-defined fees.

The actual charges are captured at PO Receiving. These may be compared against the estimated charges defined for the PO during PO Maintenance. These charges represent the cumulative charges over all lines on a PO.

How to display this screen: At the *Display Purchase Order Header Screen*, select *Act Chgs*.

Field	Description
P/O # (Purchase order number)	The number assigned to a purchase order. Numeric, 7 positions; display-only or required
Receipt date	The date on which the most current receiving activity was performed against this purchase order. Updated by PO Receiving. Numeric, 6 positions (in user date format); display-only.
Vendor #	The number and name of the supplier. Alphanumeric, 20 positions; display-only.
Charge code	A code that represents a type of additional charge for the purchase order, such as brokerage, commission, duty, freight, import, surcharge, or other user-defined fees. Valid additional charge codes are defined through the PO Additional Charge function; see *Working With PO Additional Charges (WPAC)*. Alphanumeric, 2 positions; display-only.

Field	Description
Description	Description associated with an additional charge for a purchase order detail line, for brokerage, commission, duty, freight, import, surcharge, or other user-defined fees. Alphanumeric, 30 positions; display-only.
Amount	The total dollar value of the actual additional charge for brokerage, commission, duty, freight, import, surcharge, or other user-defined fees. Represents the total for this type of fee across all lines of the purchase order. Updated at PO Receiving. This charge may be compared against the estimated additional charges entered during PO Maintenance. Numeric, 20 positions with a 4-place decimal; display only.

Display Vendor Notes Screen

Purpose: Use this screen to display free-form notes about this vendor. These notes are displayed in PO Inquiry, PO Maintenance, and PO Receiving.

How to display this screen: At the *Display Purchase Order Header Screen*, select *Vendor Notes*.

Field	Description
Note	Free-form text about the vendor. The text can print on purchase orders and reports. These notes are displayed in PO Maintenance, PO Inquiry, and PO Receiving. Select *Next* to view additional lines. Alphanumeric, 60 positions (each line); display only.
Print	Valid values are: • *Selected* = The note will print on purchase orders for the vendor. • *Unselected* = The note will not print on purchase orders for the vendor.

First Display FOB for Purchase Order Screen

Purpose: Use this screen to review vendor FOB records for a specific purchase order.

About FOB Address: The FOB (freight on board) address is the location where title to merchandise being shipped passes from the seller to the buyer. If the FOB address is an Origin type, ownership of the merchandise passes from seller to buyer at the origin of the shipping route, and the buyer is responsible for transportation costs and risk of loss or damage from that point. If the FOB address is a Destination type, ownership of the merchandise passes from seller to buyer at the receiving point for the merchandise, and the seller is responsible for transportation costs and risk of loss or damage until the merchandise reaches its destination.

How to display this screen: Select *FOB* at the *Display Purchase Order Header Screen*.

You cannot change any information on this screen. To change vendor FOB information for a purchase order, advance to the *Work with FOB for Purchase Order Screen* through *Maintaining Purchase Orders (MPOE)* (fast path = *MPOE)*.

Field	Description
Vendor	The vendor number and description for this purchase order. Vendor number: Numeric, 7 positions; display-only. Vendor description: Alphanumeric, 30 positions; display-only.
Type	Identifies the FOB address as either a Destination type or an Origin type. • *Destination* = in this field identifies the FOB address as the location to which merchandise is being shipped (its destination), and indicates that title to the merchandise passes from the seller to the buyer when the merchandise reaches its destination. • *Origin* = in this field identifies the FOB address as the location from which the merchandise is shipped, and indicates that title to the merchandise passes from the seller to the buyer when the merchandise leaves the seller's dock. Alphanumeric, display-only.
City	The city of the FOB address. Alphanumeric, 25 positions; display-only.
St	The state of the FOB address. Alphanumeric, 2 positions; display-only.
Postal cd	The zip code of the FOB address. Alphanumeric, 10 positions; display-only.
Freight terms	A brief description of the freight terms for this FOB address. Alphanumeric, 10 positions; display-only.

Screen Option	Procedure
Display detail information for an FOB address for this purchase order	Select *Display* for a vendor FOB address to advance to the *Second Display FOB for Purchase Order Screen*.

Second Display FOB for Purchase Order Screen

Purpose: Use this screen to review details of a single FOB address for a purchase order.

How to display this screen: Select *Display* for an FOB address on the *First Display FOB for Purchase Order Screen*. See that screen for field descriptions.

Printing Purchase Orders

Topic in this part:

- *Printing Purchase Orders (MPRP)* describes how to make standard print selections (sequence, date, type) and making additional print selections (vendor, buyers, and warehouses) in order to print or email the purchase order.

Printing Purchase Orders (MPRP)

Purpose: Use the Print Purchase Order menu option to print hard copies of purchase orders or to email them to the vendor.

Purchase order status: All open and held purchase orders (status = *O* or *H*) are eligible for printing or emailing through this menu option.

Purchase order download triggers: The *Create Generic PO Download Triggers (K26)* system control value determines whether a purchase order header (POH) trigger is generated whenever a purchase order is printed. See *Generic Outbound Purchase Order API* in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).for an overview.

> **Note:**
>
> This option does not send purchase order information to Order Broker.

In this topic:

- *Print PO Selection Screen*
- *PO Print Selection Window (Additional Selections)*
- *Completing the Print Process*
- *Purchase Order*

Print PO Selection Screen

How to display this screen: Enter *MPRP* in the Fast path field at the top of any menu or select Print Purchase Order from a menu.

Field	Description
Sequenced by	Indicates how to sort the purchase orders, and which print program to use. Valid values are: • *Sort by P/O #:* the system uses the *PO Print Program for PO Print in PO Sequence (C76)* • *Sort by vendor*: the system uses the *PO Print Program (C64)* Required.

Field	Description
Email PO	Indicates whether to email the purchase order to the vendor, provided the vendor's Email P/O flag is selected and you have specified an email address for the vendor through *Working with Vendors (WVEN)*; otherwise, the system produces the purchase order as a .PDF file for printing but does not email it. This field is available only if the *Email Purchase Order (K80)* system control value is selected. Valid values: • *Selected* (default) = send purchase orders as email attachments to vendors whose Email P/O flags are selected and who have an email address defined, as well as producing the .PDF file; all other emails selected at this screen should be printed only but not emailed. • *Unselected* = do not send any selected purchase orders by email; print only. When you email purchase orders, the purchase order is sent as a .PDF attachment to a plain-text email, using the print program related to your selection at the *Sequenced by* field. Even if a vendor receives multiple purchase orders, each is attached to a separate email. The text in the email is derived from the Purchase Order template set up through *Working with E-Mail Notification Templates (WEMT)*.
Unprinted	This option indicates whether to print or email purchase orders that have been not yet been printed or emailed. Valid values are: • *Selected* = Print (or email) unprinted purchase orders. • *Unselected* = Do not print (or email) unprinted purchase orders.
To restrict the range of unprinted purchase orders to print or email, complete Entry date OR Entry PO fields:	NA
Entry date	If you enter a "from" and "to" date here, the system restricts printing (or emailing) to unprinted purchase orders created on or between these dates. Numeric, 6 positions (in user date format) each field; optional.
Entry PO # (Purchase order number)	If you enter a "from" and "to" purchase order number, the system restricts printing (or emailing) to unprinted purchase orders within this range. Numeric, two 7-position fields; optional.
Revised	This option indicates whether to print or email purchase orders that have been changed since they were printed or emailed. Valid values are: • *Selected* = Print or email revised purchase orders. **Note:** The system selects a purchase order only if it has a Print date earlier than a Revised date. • *Unselected* = Do not print or email revised purchase orders.

Field	Description
To restrict the range of revised purchase orders to print or email, complete Revised date or Revised PO fields:	NA
Revised date	If you enter a “from” and “to” date here, the system restricts printing or emailing to purchase orders revised on or between these dates. Numeric, 6 positions (in user date format) each field; optional
Revised PO # (Revised purchase order number)	If you enter a “from” and “to” purchase order number, the system restricts printing or emailing to revised purchase orders within this range. Numeric, two 7-position fields; optional.
Reprint	This option indicates whether to print or email purchase orders that have been printed or emailed previously. Valid values are: • *Selected* = Print or email purchase orders that have printed or emailed previously. The system selects purchase orders that have a Print date. • *Unselected* = Do not print or email purchase orders that have been printed or emailed previously.
To restrict the range of printed purchase orders to reprint or email, complete the Reprint date or Reprint PO # fields:	NA
Print date (reprint date)	If you enter a “from” and “to” date here, the system restricts printing or emailing to purchase orders printed or emailed on or between these dates. Numeric, 6 positions (in user date format) each field; optional.
Reprint PO # (Reprinted purchase order number)	If you enter a “from” and “to” purchase order number, the system restrict printing or emailing to purchase orders printed or emailed within this range. Numeric, two 7-position fields; optional

Screen Option	Procedure
Accept the settings to print the purchase order	Select *Accept* to create a batch print job. See Completing the Print Process.
Display additional selections	Select *Additional Selections* to advance to the PO Print Selection Window (Additional Selections).

PO Print Selection Window (Additional Selections)

Purpose: Use this window to select the specific vendors, buyers, and/or warehouses for printing or emailing purchase orders.

How to display this screen: Select *Additional Selections* at the Print PO Selection Screen.

Field	Description
Selected vendors	This code identifies a supplier from whom you purchase merchandise. The system restricts printing or emailing purchase orders for the vendors you specify here. Vendor numbers are defined in and validated against the Vendor table; see *Working with Vendors (WVEN)*. You can enter up to 10 vendors. Numeric, ten 7-position fields; optional.
Selected buyers	This code identifies an individual who places purchase orders for you. The system restricts printing or emailing purchase orders for the buyers you specify here. Buyers are defined in and validated against the Buyer table; see *Working with Buyers (WBUY)*. You can enter up to 10 buyers. Alphanumeric, ten 3-position fields; optional.
Selected warehouses	This code identifies the warehouse where the merchandise is to be received. The system restricts printing or emailing purchase orders for the warehouses you specify here. Warehouses are defined in and validated against the Warehouse table; see *Creating and Maintaining Warehouses (WWHS)*. You can enter up to 10 warehouses. Numeric, ten 3-position fields; optional.

Completing the Print Process

Accepting and printing POs: To accept and print or email the Print PO selections, select *Accept* at the *Print PO Selection Screen*. The system generates a batch print job (*PO_PRINT*) and displays a message. This job:

- Generates the *Purchase Order* using the *PO Print Program for PO Print in PO Sequence (C76)* if you selected *Sort by P/O #;* otherwise, the system uses the *PO Print Program (C64)* if you selected *Sort by vendor*.
- If you are not emailing the purchase order; the .PDF file is available at the *Forms Management (My Forms)* screen. Otherwise, it attaches each purchase order as a .PDF file to a separate email to the vendor's email address. The text of the email is derived from the Purchase Order template set up through *Working with E-Mail Notification Templates (WEMT)*.
- Updates the Print date for the purchase order, displayed in purchase order inquiry.
- Writes a PO Message if you are emailing the purchase order, indicating the email address where the purchase order was sent. The generation date is not displayed at the *Work with PO Messages Screen*, although it is written to the PO Message table.

> **Note:**
>
> When the purchase order is printed, a sequence number that is assigned to each line prints rather than the actual purchase order line number. This prevents a vendor from seeing gaps in the line numbers, which can occur if a purchase order has canceled lines or has been partially received.

Printing Purchase Order Reports

Topics in this part:

- *Printing the Open PO Listing By Vendor Report (MPPO)* explains how to generate this report.
- *Printing the PO Auto Cancel Report (MPAC)* explains how to generate the PO Auto Cancel reports.
- *Printing the Purchase Order Expected Delivery Listing (PEXD)* explains how to generate the PO Expected Delivery report.

Printing the Open PO Listing By Vendor Report (MPPO)

Purpose: The Open PO Listing By Vendor report lists purchase orders that have not been received in your warehouse. The report sorts by vendor number, then by descending entry date, and then by ascending PO number.

Print Open PO's By Vendor Screen

How to display this screen: Enter *MPPO* in the Fast path field at the top of any menu, or select Print Open PO's By Vendor from a menu.

Field	Description
Starting due date	The beginning date of the time span you want the system to search for open PO's. For example, if you wanted to search for open PO's throughout the first week of July, you'd fill in 070197 (July 1) in this field. Numeric, 6 positions (in user date format); optional.
Ending due date	The ending date of the time span you want the system to search for open PO's. For example, if you wanted to search for open PO's throughout the first week of July, you'd fill in 070797 (July 7) in this field. Numeric, 6 positions (in user date format); optional.

How to print this report: Select *OK* to select all open POs, or enter in the date fields to select POs by due date. The system generates the *Open PO’s by Vendor Report* according to your selections and returns you to a menu.

Printing the PO Auto Cancel Report (MPAC)

Purpose: The Purchase Order Auto Cancel report provides a listing of purchase orders that have been flagged for cancellation.

Setting the cancel date for a PO: At the *PO Maintenance - Change PO Detail Screen*, enter the Cancel date (which must be greater than the current date).

> **Note:**
>
> There is currently no function that automatically cancels purchase orders flagged for cancellation.

PO Auto Cancel Date Selection Pop-Up Window

How to display this screen: Enter *MPAC* in the Fast Path field at the top of any menu or select this option from a menu.

Completing this window: Complete the latest cancel date to include on the report and Select *Accept*. The system automatically submits a batch job (*POAUTO_CAN*) and generates the *Purchase Order Auto Cancel Report*.

Printing the Purchase Order Expected Delivery Listing (PEXD)

Purpose: Use the Print Expected Delivery Listing menu option to generate the *PO Expected Delivery Report*. This report displays purchase order lines by warehouse and vendor that are due to be received within a specified date range.

PO Expected Delivery List Prompt Screen

Use this screen to generate the *PO Expected Delivery Report*.

How to display this screen: Enter *PEXD* in the Fast path field at the top of a menu or select Print Expected Delivery Listing from a menu.

Field	Description
PO due date range	The date range you wish to use to generate the PO Expected Delivery report. Enter a “from” date in the first field and a “to” date in the second field. The “from” date must be earlier than the “to” date. The system allows you to enter a “to” date that is greater than the current date so that you can review inventory that will be arriving in the future. Numeric, 6 positions (in user date format); required if a PO # is not defined.
PO #	The purchase order number for which you wish to generate the PO Expected Delivery report. Purchase order numbers are defined in and validated against the PO Header table. Numeric, 7 positions; required if a PO due date range is not defined.
Print SKU detail (Y/N)	Indicates if you wish to include SKU information on the PO Expected Delivery report. Valid values: *Selected* = Include SKU information on the report. The system includes the SKU code and SKU description for each item whose due date falls within the report’s date range. *Unselected* (default) = Do not include SKU information on the report. The system lists each item whose due date falls within the report’s date range. If the item is a SKU item, the system does not indicate which SKU of the item is expected to be delivered.

Completing this screen:

1. Enter a PO due date range or PO number.

2. Indicate if you wish to include SKU information on the PO Expected Delivery report.
3. Select *Submit*.
4. If the Print SKU detail field is *Selected*, the system submits the *EXPDLVSKU* job and generates the *PO Expected Delivery Report* with SKUs.
5. If the Print SKU detail field is *Unselected*, the system submits the *EXPDLV* report and generates the *PO Expected Delivery Report* without SKUs.

Performing Inventory Analyses

Topics in this part:

- *Using Inventory Inquiry (DINI)* describes how to use the Inventory Quantity Inquiry menu option to review inventory information for items and SKUs.
- *Printing Item Sales Analysis Reports (MISA)* includes how to access this function, how to set up the report, and a sample report.
- *Printing Item Stock Status Reports (MISS)* includes how to access this function, how to set up the report, and a sample report.
- *Inventory Inquiry by Item (IIQI)* describes how to review order activity on screen for a group of SKUs sharing the same first SKU element.
- *Item Availability API* describes how the system responds to requests for item availability about and item or group of items.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Using Inventory Inquiry (DINI)

Purpose: Inventory inquiry allows you to review on hand quantities in each warehouse and in each location in a warehouse. This function can be used by several departments within your organization and provides a way to display item/SKU information quickly.

Other options: You can use the following additional menu options for inventory inquiry:

- *Inventory Inquiry by Item (IIQI)*: to review item information organized by the base item and the first SKU element
- *Inventory Status Inquiry (ISIQ)*: to review order activity for any item or SKU broken out by offer

In this topic:

- *Inventory Quantity Inquiry Prompt Screen*
- *Item/SKU Selection Screen*
- *Display Item/Warehouse Information Screen*
- *Display Inventory Warehouses Screen*
- *Display Inventory Locations Screen*
- *Inventory On Hand by Location Selection Screen*
- *Inventory On Hand by Location Screen*
- *Display Open Purchase Orders Screen*

- *Display Item Warehouse History Screen*
- *Display Item Screen*
- *Display SKU (Base Information) Screen (Non-SKU'ed Item)*
- *Display SKU - 1 of 2 (With Overrides) Screen*
- *Display SKU - 2 of 2 (With Overrides) Screen*

Inventory Quantity Inquiry Prompt Screen

Purpose: Use this screen to enter information for the Item/SKU/Warehouse that you want to review.

How to display this screen: Enter *DINI* in the Fast Path field at the top of any menu.

Using this screen:

- Use the top portion of the screen to enter warehouse, item and SKU information for inquiry. You advance to the *Display Item/Warehouse Information Screen*. The *Default Warehouse (A04)* from the System Control table defaults.
- If you enter only the base item code and not a specific SKU for a SKU'ed item, the quantity information you see will be the sum of all SKUs for the item.
- Use the lower portion of the screen to scan quickly for items by class, item status, item description, buyer, department, vendor, SKU status, SKU description, compatibility, or category, or a combination of these fields. You advance to the *Item/SKU Selection Screen*.

Field	Description
Class	A code to identify a group of items. Item class codes are used as a high-level method to sort inventory, define information templates at the item class level, assign city/state restrictions, and assign customer class restrictions, and are defined in and validated against the Item Class table; see *Working with Item Classes (WICL)*. Alphanumeric, 3 positions; optional.
Item Status	A code that represents an item's status, such as obsolete, discontinued, etc. You can define this code at the item or the SKU level. Item status codes are defined in and validated against the Item Status table; see *Working with Item Status (WIST)*. Alphanumeric, 1 position; optional.
Item description	The description of the item. You can enter any portion of the description. Alphanumeric, 120 positions; optional.
Buyer	A person authorized to make purchases. Buyer codes are defined in and validated against the Buyer table; see *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; optional.
Department	The department to which the item belongs. Department codes are defined in and validated against the Long SKU Department table; see *Working with Long SKU Departments (WLSD)*. Numeric, 4 positions; optional.
Vendor	The supplier of an item. Vendor numbers are defined in and validated against the Vendor table; see *Working with Vendors (WVEN)*. Numeric, 7 positions; optional.

Field	Description
SKU Status	A code that represents a SKU's status, such as obsolete, discontinued, etc. You can search for an item through either its item or SKU status. The status might differ at the item and SKU level if, for example, you discontinue the "Green" SKU for the base item "Sweater." All other SKUs will have the status you defined at the base item level, but you assign the green sweater a discontinued SKU status in addition to the defined item status. This SKU status now overrides the base item status throughout the system. SKU status codes are defined in and validated against the Item Status table; see *Working with Item Status (WIST)*. Alphanumeric, 1 position; optional.
SKU description	The description of the SKU. You can enter any portion of the description. Alphanumeric, 40 positions; optional.
Category	A category assigned to the item to classify and group similar items. The Item Category is a level below the Item Class. Validated against the Item Category table; see *Working with Item Category Codes (WITG)*. Alphanumeric, 4 positions; optional.
Compatibility	A code assigned to items/SKUs to identify them as compatible items. You might assign a compatibility code of IBM, for example, to all IBM products such as a PC, printer, etc., to indicate that these items work together. The compatibility code is a user-defined code that is not validated by the system. Alphanumeric, 3 positions; optional.

Item/SKU Selection Screen

Purpose: Use this screen to select a specific item/SKU for inventory inquiry.

How to display this screen: Complete scanning information on the lower portion of the *Inventory Quantity Inquiry Prompt Screen*

Selecting an item: You can use the fields in the top portion of this screen to scan further for an item, or you can select an item by *selecting* it. See *Inventory Quantity Inquiry Prompt Screen* for field descriptions.

Screen Option	Procedure
Select an item	*Select* an item to advance to the *Display Item/ Warehouse Information Screen*.
Display item details	Select *Item Details* for an item to advance to the *Display Item Screen*.
Display SKU details	Select *SKU Details* for a non-SKU'd item to advance to the *Display SKU (Base Information) Screen (Non-SKU'ed Item)*; or select *SKU Details* for a SKU'd item to advance to the *Display SKU - 1 of 2 (With Overrides) Screen*.

Display Item/Warehouse Information Screen

Purpose: Use this screen to review information for an item/SKU in the warehouse.

How to display this screen:

- *Select* an item at the *Item/SKU Selection Screen*
- Enter a valid item and warehouse number at the *Inventory Quantity Inquiry Prompt Screen*
- Select *Display Info* at the Display Inventory Warehouses Screen, the Display Inventory Locations Screen, the Inventory On Hand by Location Selection Screen, or the Inventory On Hand by Location Screen

All fields are display-only.

Field	Description
Item description (unlabeled field)	The description of the item. Alphanumeric, 120 positions; display-only.
Item	A code to identify a unit of inventory. Alphanumeric, 12 positions; display-only.
SKU unlabeled field to the right of the item	The item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; display-only.
SKU description unlabeled field below the item description	The description of the SKU, if this is a SKU'ed item. Alphanumeric, 40 positions; display-only.
U/M Unit of measure	The multiples in which you buy the item from the vendor. See *Working with Units of Measure (WUOM)*. Alphanumeric, 3 positions; display-only.
Item status	The *Status* for the SKU, if any; otherwise, the *Status* for the item, if any. The description is to the right. Alphanumeric, 1 position; display-only.
Whse Warehouse	A code that represents the warehouse where the item is stored. Warehouse codes are defined in and validated against the Warehouse table; see *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; display-only.
Location	The "primary primary" location, which is stored in the *Primary location* field in the SKU table. The location code represents the area within the warehouse that contains the item/SKU. Typically, the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` See *Creating and Maintaining Locations (WLOC)*. Alphanumeric, 7 positions; display-only.

Field	Description
Buyer	This code identifies the person who purchased this item from the vendor. Validated against the Buyer table (see *Working with Buyers (WBUY)*), and used primarily for reporting purposes. It does not default on POs. Alphanumeric, 3 positions; display-only.
Short SKU	The short SKU code for the item/SKU, as defined in the SKU table. The system assigns the short SKU number when the item/SKU is created using the next number available in the Short SKU (A12) number assignment value. Numeric, 7 positions; display-only.
Offer	The code for the offer (catalog) where the item currently appears. You use the *Create Item Offer Screen* or the *Create SKU Offer Screen* to assign an item or SKU to an offer. Defaults from the most current SKU/offer with a current price, if any; otherwise, it defaults from the most current item/offer with a current price. If there is no current item/offer or SKU offer, the system displays a message: `NO CURRENT OFFER` Alphanumeric, 3 positions; display-only.
Page	The Page number for the displayed SKU/offer or item/offer, as specified at the *Create Item Offer Screen* or the *Create SKU Offer Screen* Numeric, 5 positions; display-only.
Offer price	The price at which you are selling the item or SKU in this offer before applying any discounts. The price defaults from the offer. Numeric, 13 positions with a 2-place decimal; display-only.
Vendor	The primary vendor or supplier of the item, as defined in the Item table. Vendor codes are defined in and validated against the Vendor table; see *Working with Vendors (WVEN)*. Numeric, 7 positions; display-only.
Weight	The *Ship weight* for the SKU, if any; otherwise, the *Ship wgt. (Shipping weight)* for the item, if any. Numeric, 7 positions with a 3-place decimal.
Kit type	Identifies a type of kit or set item. Defaults from the *Kit type* for the item. The description is to the right. Alphanumeric, 1 position.
S/O control	The *S/O control (Soldout control)* code, if any, assigned to the item or SKU. The description is to the right. Soldout control code: alphanumeric, 2 positions; display-only. Description: alphanumeric, 30 positions; display-only.
On hand	The number of units of this item in all locations in this warehouse. Numeric, 7 positions; display-only.

Field	Description
On order	The total quantity of this item in this warehouse that is due to be received on open purchase orders. This quantity increases when you enter a purchase order and decreases when you receive a purchase order. If you receive purchase orders into suspense, the suspended quantity remains in this total until you place the suspended stock. The *Purchase Order Layering* process updates this total if the *UPDATE_ON_ORDER_FROM_PO_LAYERING* property is set to TRUE. However, you should leave this property set to FALSE if you use the *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)*. If you use the *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)*, the on-order quantity for active purchase order items is the same as the *PO On Order* quantity minus the *PO Receipts* quantity. Numeric, 7 positions; display-only.
Next exptd delivery (Next expected delivery)	The date that you expect to receive this item from your vendor; this is the date from the PO Layering table. **Note:** If no entry exists in the PO Layering table or if the PO Layering record has a quantity of zero, then a next expected PO date does not display. This date is displayed for drop ship items only if the *Assign Drop Ship Expected Ship Date (I59)* system control value is selected. Numeric, 6 positions (in user date format); display-only.
Reserved	The quantity of this item/SKU in this warehouse that is reserved for existing orders. This total increases through immediate, batch, and interactive reservation, and decreases through confirmation or pick void/reprint. Numeric, 7 positions; display-only.
All whses (All warehouses)	The total number of units of this item across all warehouses. Numeric, 7 positions; display-only.
Last receipt date	The most recent date when you received the item into the warehouse. Does not update when you receive the item into a different warehouse. Numeric, 6 positions (in user date format); display-only.
Backorder	The quantity of the item/SKU in this warehouse that is currently on open orders but not available in your warehouse. Numeric, 7 positions; display-only.
S/H reserved	The quantity of this item/SKU in this warehouse that is reserved and flagged for some type of special handling, such as monogramming, hemming, etc. This total increases through reservation of items/SKUs assigned a special handling code in order entry or maintenance, and decreases through confirmation or pick void/reprint. Numeric, 7 positions; display-only.

Field	Description
Out of stock date	The last date the on hand level for this item went to zero. Numeric, 6 positions (in user date format); display-only.
Protected	The quantity of this item or SKU that is protected from immediate or batch reservation across all locations in this warehouse. The system reserves this inventory only through *Working with Interactive Reservation (MIRV)*, which is used for the manual disbursement of large wholesale orders or preferred mail order customers. Numeric, 7 positions; display-only.
SKU open	The total units remaining to be shipped for all open order detail lines, including any quantity reserved and quantity backordered. **Reset:** You can use the *Reset SKU Open Order Quantity (MRSO)* option to reset this quantity if the total in the SKU table is incorrect. Numeric, 7 positions; display-only.
Out of stock freq (Out of stock frequency)	Incremented whenever the on-hand level for this item or SKU reaches zero. Numeric, 7 positions; display-only.
Available	The quantity of this item or SKU currently available to sell in this warehouse. This quantity includes only reservable locations, not locations defined as defective or return to-vendor. Item availability is calculated as follows: `On hand - Protected - Reserved - Reserve Transfer - Backordered = Quantity available` Numeric, 7 positions; display-only.
SKU future	The number of units needed to fulfill future orders. Normally, you would run the Evaluate Future Orders periodic function daily to evaluate each order detail line marked as a "future order." This function calculates arrival date as described below and determines if orders should be moved to open and reserved (Immediate Reservation) or open and backordered. Arrival Date calculation: `Arrival date - Reservation Lead Days (from system control value) = Date` If the resulting date is today's date or earlier, the system attempts to reserve inventory. See the *Reservation Lead Days (B27)* system control value. Numeric, 7 positions; display-only.
Open D/S	The total quantity on open drop-ship orders. **Reset:** You can use the *Reset SKU Open Order Quantity (MRSO)* option to reset this quantity if the total in the SKU table is incorrect. Numeric, 7 positions; display-only.
Pickable	The total quantity of pickable stock in this warehouse. The pickable quantity is equal to the sum of all on hand quantity in all pickable locations in the warehouse. Numeric, 7 positions; display-only.

Field	Description
SKU - susp (SKU suspended)	The total quantity received but not yet placed into a specific location. Increases through purchase order receiving and decreases through purchase order suspense placement. Numeric, 7 positions; display-only.
Recv'd (Received)	The number of units received in this warehouse. • *MTD* = Month to date • *YTD* = Year to date • *LTD* = Life to date These totals increase through receiving (not suspense placement). Numeric, 7 positions each; display-only.
Issued	The total number of units shipped from this warehouse. • *MTD* = Month to date • *YTD* = Year to date • *LTD* = Life to date These totals increase through billing. Increases occur for drop ship, variable sets, and sets. Returns do not decrease this number. If you ship merchandise without affecting inventory (e.g., express bill), this field does not update. Numeric, 7 positions each; display-only.
Retn'd (Returned)	The total number of units that have been returned by customers into this warehouse. • *MTD* = Month to date • *YTD* = Year to date • *LTD* = Life to date. These update through order or return authorization processing. Numeric, 7 positions each; display-only.
Adjusted	The total number of inventory adjustments that have been made through A type inventory transactions only. • *MTD* = Month to date • *YTD* = Year to date • *LTD* = Life to date. The net value is indicated. For example, if you adjust one location up 10 units, and another location down 3, the total adjusted quantity is 7. Numeric, 7 positions each; display-only.
Active PO	Indicates whether this is an active purchase order item for which you can accept orders before you expect to have inventory to fulfill. The periodic functions which are part of the *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)*, set this flag and handle updates and orders for active purchase order items that are fulfilled through the integration with Order Orchestration. Possible settings: • *selected* = This is an active purchase order item, and orders will be submitted to Order Orchestration as inventory becomes available. • *unselected* = This is not an active purchase order item. This flag is unselected at item creation, and you cannot change its setting at a screen. Only the periodic functions mentioned above update this flag. Display-only.

Field	Description
PO On Order	The total quantity on purchase orders for an active purchase order item. From the RMS On-order quantity, as set by the OCDSFA periodic function. Used to determine the maximum number of active purchase order units allowed on orders before selling out the item. This quantity does not decrease based on the PO Receipts quantity; however, the PREORDER or ACTPO periodic function sets this quantity to 0 if the PO Receipts quantity is greater than or equal to the PO On Order quantity, indicating that all open units of the active purchase order item have been received on purchase orders, and the item is no longer eligible for active PO processing. See *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)* for more information. Numeric, 7 positions each; display-only.
PO Receipts	The total quantity received on purchase orders for an active purchase order item. From the RMS Receipt quantity, as set by the OCDSFA periodic function. Used to determine the number of units of an active purchase order item to release to Order Orchestration for fulfillment. See *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)* for more information. Numeric, 7 positions each; display-only.
PO Updated	The most recent date when active purchase order information was updated through *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)*. From the RMS Update Date. Date; display-only.
Released Qty	The total quantity of an active purchase order item that has been released to Order Orchestration for fulfillment. From the RMS Released quantity. See *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)* Numeric, 7 positions each; display-only.

Screen Option	Procedure
Display inventory warehouse information	Select *Whses/Item* to advance to the *Display Inventory Warehouses Screen*.
Display inventory location information	Select *Locs/Item* to advance to the *Display Inventory Locations Screen*.
Display inventory on hand by location	Select *On hand by loc* to advance to the *Inventory On Hand by Location Selection Screen*.
Display open purchase orders	Select *Open POs* to advance to the *Display Open Purchase Orders Screen*.
Display components	Select *Display Components* to advance to the Work with Set (Variable, etc.) screen. If this is a set item, you advance to the appropriate screen based on the type of set: • *Work with Set Component Items Screen* • *Work with Variable Set Components Screen*
Display item warehouse history	Select *History* to advance to the *Display Item Warehouse History Screen*.

Display Inventory Warehouses Screen

Purpose: Use this screen to review quantity information for an item/SKU across all warehouses.

How to display this screen: Select *Whses/Item* at the *Display Item/Warehouse Information Screen*, the *Display Inventory Locations Screen*, the *Inventory On Hand by Location Selection Screen*, or the *Inventory On Hand by Location Screen*. All fields are display-only.

Field	Description
Item	A user-defined code that represents a unit of inventory. Alphanumeric, 12 positions; display-only.
Warehouse	A code that represents the warehouse. Warehouse codes are defined in and validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; display-only.
On hand	The number of units of this item across all locations in this warehouse. Numeric, 7 positions; display-only.
Available	The quantity of this item currently available to sell in the designated warehouse. Takes into account only reservable locations (not locations defined as defective or return to-vendor). Item availability is calculated as follows: `On hand - Protected - Reserved - Reserve Transfer - Backordered = Quantity available` Numeric, 7 positions; display-only.
Pickable	The total quantity of pickable stock in this warehouse. The pickable quantity is equal to the quantity on hand minus the quantity printed. Numeric, 7 positions; display-only.
On order	The total quantity of this item in this warehouse that is due to be received on open purchase orders. This quantity increases when you enter a purchase order and decreases when you receive a purchase order. If you receive purchase orders into suspense, the suspended quantity remains in this total until you place the suspended stock. If you use the *Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing)*, the PREORDER periodic function sets the on-order quantity for active purchase order items to the *PO On Order* quantity minus the *PO Receipts* quantity. Numeric, 7 positions; display-only.

Screen Option	Procedure
Display buyer information	Select *Buyer Info* to return to the *Display Item/Warehouse Information Screen*, where buyer information is displayed.

Screen Option	Procedure
Display inventory location information	Select *Locs/Item* to advance to the *Display Inventory Locations Screen*.
Display inventory on hand by location	Select *On hand by Location* to advance to the *Inventory On Hand by Location Selection Screen*.
Display open purchase orders	Select *Open POs* to advance to the *Display Open Purchase Orders Screen*.
Display components	Select *Display Components* to advance to the Working with Set (Variable, Finished good, etc.) screen. See Working with Sets. **Note:** Select this option only for items identified as a set, finished good, or variable set.

Display Inventory Locations Screen

Purpose: Use this screen to review item location information for the specified item or SKU and warehouse.

How to display this screen: Select *Locs/Item* at the *Display Item/Warehouse Information Screen*, *Display Inventory Warehouses Screen*, the *Inventory On Hand by Location Selection Screen*, or the *Inventory On Hand by Location Screen*. All fields are display-only.

Field	Description
Item	A code that represents a unit of inventory. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; display-only.
Warehouse	The code and description of the warehouse. Warehouse codes are defined in and validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Code: numeric, 3 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Location	A code representing the area within the warehouse that contains the item/SKU. Typically, the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` Alphanumeric, 7 positions; display-only.

Field	Description
Location type	A code that defines the type of location. Valid values are: • *Primary* = The primary, or main location where the item is picked. The system does not delete a primary item/location record when the on-hand quantity equals zero. • *Secondary* = Typically, you would use a secondary location for storage when the primary location is full. The system allocates from a secondary location when the total order quantity cannot be filled from the primary location. The system allocates from both the primary and secondary locations when neither location contains enough stock to fulfill the entire order. You can use secondary locations to replenish primary locations. • *Bulk* = Typically, you would use a bulk location to store unbroken lots or cartons. Bulk locations serve as the replenishment source for primary locations. • *Temporary* = Typically, you would use a temporary location to place merchandise that you want recognized as received before you have assigned a permanent location. A temporary location cannot exist without at least one item/location record associated with it. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system will delete the location and the item/location record. **Note:** Order Administration will not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location. Display-only.
Maximum	The total unit quantity of the item to keep in this location. Numeric, 7 positions; display-only.
Minimum	The least amount of inventory on hand for this item/SKU. Numeric, 7 positions; display-only.
On hand	The number of units of this item in this location. Numeric, 7 positions; display-only.
Printed	The total quantity printed on an open (unconfirmed) pick slip for the item in this location. Numeric, 7 positions; display-only
Pending	The total quantity of the item in this location with a pending batch inventory transaction or work order. Numeric, 7 positions; display-only.
Pickable	A code indicating whether inventory can be picked from the location. • *Selected* = Inventory can be picked from the location. • *Unselected* = Inventory cannot be picked from the location. Bulk locations, or locations where you keep defective merchandise, might be defined as non-pickable.
Placement dt (Placement date)	The date when you first placed the item in this location through purchase order receiving, a customer return, or an adjustment. Numeric, 6 positions (in user date format); display-only.

Screen Option	Procedure
Display buyer information	Select *Buyer Info* to return to the Display Item/Warehouse Information Screen, where buyer information is displayed.
Display inventory warehouse information	Select *Whses/Item* to advance to the Display Inventory Warehouses Screen.
Display inventory on hand by location	Select *On hand by Location* to advance to the Inventory On Hand by Location Selection Screen.
Display open purchase orders	Select *Open POs* to advance to the Display Open Purchase Orders Screen.
Display components	Select *Display Components* to advance to the Working with Set (Variable, Finished good, etc.) screen. See Working with Sets.

Inventory On Hand by Location Selection Screen

Purpose: Use this screen to review the locations that are available for inquiry.

How to display this screen: Select *On hand by Location* at the Display Item/Warehouse Information Screen, the Display Inventory Warehouses Screen, or the Display Inventory Locations Screen. All fields are display-only.

Field	Description
Warehouse	A code that represents the warehouse, validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS). Numeric, 3 positions; display-only.
Location	A that represents a warehouse location where merchandise is stored. The warehouse location code can consist of a zone/aisle/shelf/bin combination, or it can be any user-defined code. The location code prints on picks slips and reports. *Example:* The location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` Alphanumeric, 7 positions; display-only.
Type	A code that defines the type of location. Valid values are: • *P* = Primary. The primary, or main location where the item is picked. The system does not delete a primary item/location record when the on-hand quantity equals zero. • *S* = Secondary. Typically, you would use a secondary location for storage when the primary location is full. The system allocates from a secondary location when the total order quantity cannot be filled from the primary location. The system allocates from both the primary and secondary locations when neither location contains enough stock to fulfill the entire order. You can use secondary locations to replenish primary locations. • *B* = Bulk. Typically, you would use a bulk location to store unbroken lots or cartons. Bulk locations serve as the replenishment source for primary locations.

Field	Description
	• *T* = Temporary. Typically, you would use a temporary location to place merchandise that you want recognized as received before you have assigned a permanent location. A temporary location cannot exist without at least one item/location record associated with it. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system will delete the location and the item/location record. **Note:** Order Administration will not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location. Alphanumeric, 1 position; display-only.
Zone/Aise/Shelf/Bin #	If your warehouse locations consist of a warehouse zone, aisle, bin number, and shelf number combination, separate fields are provided for these values. • *Zone* = the warehouse zone where the location is situated. Assigning zone codes provides for inventory analysis reporting by zone. Zone codes are also used to sort pick slips when the Cart Bin Picking method is used. • *Aisle* = the warehouse aisle of the location. • *Shelf* = the location's shelf number within the aisle. • *Bin* = the location's bin number on the shelf. *Example:* The location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` Alphanumeric, 7 positions; display-only.
Units	The total number of units that can fit in the location. Numeric, 7 positions; display-only.
Weight	The total weight the location can hold, expressed in pounds. Numeric, 7 position with a 3-place decimal; display-only.
Volume	The cubic capacity of the location. The volume calculation multiplies the height, by the length, by the width of the location. Numeric, 7 positions; display-only.

Screen Option	Procedure
Display on hand information	*Select* a location to advance to the *Inventory On Hand by Location Screen*.
Display buyer information	Select *Buyer Info* to return to the *Display Item/ Warehouse Information Screen*, where buyer information is displayed.
Display inventory warehouse information	Select *Whses/Item* to advance to the *Display Inventory Warehouses Screen*.
Display inventory location information	Select *Locs/Item* to advance to the *Display Inventory Locations Screen*.

Inventory On Hand by Location Screen

Purpose: Use this screen to review on hand inventory for items in a particular location.

How to display this screen: At the *Inventory On Hand by Location Selection Screen*, *select* a location. All fields are display-only.

Field	Description
Whse (Warehouse)	A code that represents the warehouse, validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; display-only.
Location	A code that represents a warehouse location where merchandise is stored. The warehouse location code can consist of a zone/aisle/shelf/bin combination, or it can be any user-defined code. The location code prints on picks slips and reports. *Example:* The location A010201 indicates: `Zone Aisle Shelf Bin` `A 01 02 01` Alphanumeric, 7 positions; display-only.
Type	A code that defines the type of location. Valid values are: • *P* = Primary. The primary, or main location where the item is picked. The system does not delete a primary item/location record when the on-hand quantity equals zero. • *S* = Secondary. Typically, you would use a secondary location for storage when the primary location is full. The system allocates from a secondary location when the total order quantity cannot be filled from the primary location. The system allocates from both the primary and secondary locations when neither location contains enough stock to fulfill the entire order. You can use secondary locations to replenish primary locations. • *B*= Bulk. Typically, you would use a bulk location to store unbroken lots or cartons. Bulk locations serve as the replenishment source for primary locations. • *T* = Temporary. Typically, you would use a temporary location to place merchandise that you want recognized as received before you have assigned a permanent location. A temporary location cannot exist without at least one item/location record associated with it. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system will delete the location and the item/location record. **Note:** Order Administration will not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location. Alphanumeric, 1 position; display-only.
Item	A code that represents a unit of inventory. Alphanumeric, 12 positions; display-only.
SKU	The code that represents the special characteristics of the item (e.g., color, size, width). Alphanumeric, three 4-position fields; display-only.

Field	Description
On hand	The number of units of this item in this location in the warehouse. Numeric, 7 positions; display-only.
Printed	The number of pick slips printed for this item in the specific location. Numeric, 7 positions; display-only.

Screen Option	Procedure
Display buyer information	Select *Buyer Info* to return to the *Display Item/ Warehouse Information Screen*, where buyer information is displayed.
Display inventory warehouse information	Select *Whses/Item* to advance to the *Display Inventory Warehouses Screen*.
Display inventory location information	Select *Locs/Item* to advance to the *Display Inventory Locations Screen*.

Display Open Purchase Orders Screen

Purpose: Use this screen to obtain information about the unreceived or partially received purchase orders for an item. This screen includes the purchase order numbers, vendors, quantities and expected delivery dates for the item.

How to display this screen: Select *Open POs* at the *Display Item/Warehouse Information Screen*, the *Display Inventory Warehouses Screen*, or the *Display Inventory Locations Screen*

Field descriptions: The Item, SKU and Description fields are described at the *Display Item/Warehouse Information Screen*. The remaining fields on this screen are:

Field	Description
Whs (Warehouse)	The warehouse where the item will be delivered. Numeric, 3 positions; display-only.
PO#	The number of the purchase order on which you ordered the item from the vendor. Numeric, 7 positions; display-only.
Ln#	The line number of item on the purchase order. Numeric, 3 positions; display-only.
Vendor #	A code to identify the supplier of the item. Vendor codes are defined in and validated against the Vendor table; see *Working with Vendors (WVEN)*. Numeric, 7 positions; display-only.
Name	The name of the vendor associated with the vendor number. Blank if the *Vendor Name Display (D41)* system control value is *unselected*. Alphanumeric, 30 positions; display-only.
Qty due (Quantity due)	The number of units of the item expected in the shipment. Numeric, 7 positions; display-only.

Field	Description
Date	The date when the shipment of the item is expected; this is the date from the PO Layering table. If no entry exists in the PO Layering table or if the PO Layering record has a quantity of zero, then a next expected Po date does not display. Numeric, 6 positions (in user date format); display-only.

Display Item Warehouse History Screen

Purpose: Use this screen to review sale and return information for an item in the specified warehouse.

How to display this screen: Select *History* at the *Display Item/Warehouse Information Screen*.

Field	Description
Year (Accounting period year)	The year when the activity occurred. Numeric, 2 positions (YY format); optional.
Period (Accounting period number)	The accounting period within the specified year. Accounting periods are defined in and validated against the Accounting Period table; see *Working with Accounting Periods (WACP)*. Numeric, 2 positions; optional.
Item	A code that represents a unit of inventory. Alphanumeric, 12 positions; display-only.
Whse (Warehouse)	A code that represents the warehouse; defined in and validated against the Warehouse table. Numeric, 3 positions; display-only.
Today	Total Sales, Value sales, returns, and Value returns for the current date. These totals are updated during billing and are cleared by the Daily Clear Process periodic function (program name *MSR0574*).
Sales today	The number of sales for this item/SKU in this warehouse for today. Numeric, 20 positions; display-only.
Value sales today	The actual dollars sold (shipped and billed) for this item/SKU for today. This total is updated during billing with the actual merchandise dollars billed on the shipment. Numeric, 20 positions with a 2-place decimal; display-only.
Returns today	The number of units of this item/SKU in this warehouse returned for today. This total is updated when you receive a returned item through order entry, order maintenance, or return authorizations. Numeric, 11 positions; display-only.
Value returns today	The value of all returns that have been received today for this item/SKU in this warehouse. This total is updated when you receive the return through order entry, order maintenance, or return authorizations, using the actual price from when you shipped the item/SKU. Numeric, 20 positions with a 2-place decimal; display-only.

Display Item Screen

Purpose: Use this screen to review information for an item.

How to display this screen: Select *Display* for an item at the *Item/SKU Selection Screen*.

For more information: See *Create Item Screen* for field descriptions.

Display SKU (Base Information) Screen (Non-SKU'ed Item)

Purpose: Use this screen to display SKU-level detail information for a non-SKU'ed item.

Non-SKU'ed items: Although a non-SKU'ed item does not contain SKU elements such as color and size, every non-SKU'ed item has one SKU record. This SKU record contains the type of detail information that is kept at the SKU level for SKU'ed items, such as warehouse, location, and costing information.

How to display this screen: Select *SKU Details* for a non-SKU'd item at the *Item/SKU Selection Screen*.

For more information: See *Create Item (Base Information) Screen* for information on each field and option on this screen.

Display SKU - 1 of 2 (With Overrides) Screen

Purpose: Use this screen to review information about a specific SKU.

How to display this screen: Select *SKU Details* for a SKU'd item at the *Item/SKU Selection Screen*.

For more information: See *Create SKU 1 of 2 (With Overrides) Screen* for information on each field and option on this screen.

Display SKU - 2 of 2 (With Overrides) Screen

Purpose: Use this screen to review additional information about a specific SKU.

How to display this screen: Select *OK* at the *Display SKU - 1 of 2 (With Overrides) Screen*.

For more information: See *Create SKU 2 of 2 (With Overrides) Screen* for information on each field and option on this screen.

Printing Item Sales Analysis Reports (MISA)

Purpose: Use the Item Sales Analysis Reports to review inventory, cost, sales, and returns information for each item included on the report.

This menu option differs from many other report options in that you can define report selection criteria and sort options, and save your selections to run as needed.

In this topic:

- *Work with Report Selection Screen (MISA)*
- *Create Report Selection Screen*
- *Item Report Selection Screen (Defining Selection Criteria/MISA)*
- *Item Sales Analysis Save Options Screen (Additional Report Selections)*
- *Item Sales Analysis Report*
- *Display Sales Analysis Report Options Screen*

Work with Report Selection Screen (MISA)

How to display this screen: Enter *MISA* in the Fast path field at the top of any menu or select Print Item Sales Analysis Report from a menu.

Field	Description
User	The user ID of the person who created the report option. Alphanumeric, 10 positions; optional.
Report	The name of the report. Alphanumeric, 3 positions; optional.
Description	The description of the report. Alphanumeric, 40 positions; optional.
Date	The last date the report was printed or the report selection was updated. Numeric, 6 positions (in user date format); optional.
Time	The last time the report was printed or the report selection was updated. Numeric, 6 positions (HHMMSS format); optional.

Screen Option	Procedure
Create a report selection	Select *Create* to advance to the *Create Report Selection Screen*.
Define and save or print a report selection	*Select* a report selection to advance to the *Item Report Selection Screen (Defining Selection Criteria/ MISA)*.
Display a report selection	Select *Display* for a report to advance to the *Display Sales Analysis Report Options Screen*.

Create Report Selection Screen

Purpose: Use this screen to create the header information for a new version of the *Item Sales Analysis Report*.

How to display this screen: At the *Work with Report Selection Screen (MISA)*, Select *Create*.

Field	Description
Report	The name of the report selection. Alphanumeric, 10 positions; optional.
Description	The description of the report selection. Alphanumeric, 30 positions; optional.

Completing this screen: See *Item Report Selection Screen (Defining Selection Criteria/ MISA)* for information on how to continue creating a new report selection.

Item Report Selection Screen (Defining Selection Criteria/MISA)

Purpose: Use this screen to define how to select items for inclusion on the report. For example, to produce a report for items in Warehouse 1 that were supplied by vendors 100 and 200, you complete the warehouse and vendor fields at this screen.

How to display this screen: At the *Work with Report Selection Screen (MISA)*, *select* a report.

Field descriptions:

> **Note:**
>
> When selecting items to include on the report, the system checks the item's primary assignment in the Item or SKU table. You can check an item's assignment through the Enter/Maintain Items menu option; see *Performing Initial Item Entry (MITM)*. For example, if you specify warehouse 1 as a selection criterion, the system includes only items whose primary warehouse assignment is to this warehouse.

Field	Description
Whs (Warehouse)	A code that represents the warehouse. Validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; optional.
Dept (Department)	A numeric code assigned to items to group them into departments for reporting purposes. Validated against the Department table; see *Working with Long SKU Departments (WLSD)*. Numeric, 4 positions; optional.
Class	A code assigned to a group of items to: • sort inventory • define information templates at the item class level • assign city/state restrictions • assign customer class restrictions See *Working with Item Classes (WICL)*. Alphanumeric, 3 positions; optional.
Vendor	A code that represents the supplier of an item. Validated against the Vendor table; see *Working with Vendors (WVEN)*. Numeric, 7 positions; optional.
Buyer	A code that represents a person who is authorized to make purchases for this item. Validated against the Buyer table; see *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; optional.
Cat (Category)	A code assigned to an item to classify and group like items. Item categories are used in the Item Relationship function. Validated against the Item Category table; see *Working with Item Category Codes (WITG)*. Alphanumeric, 4 positions; optional.

Field	Description
Sts (Status)	A code that represents an item's status such as obsolete, discontinued, etc. This information is used for inventory reporting purposes only. See *Working with Item Status (WIST)*. Alphanumeric, 1 position; optional.

Completing this screen: When you complete this screen, you advance to the *Item Sales Analysis Save Options Screen (Additional Report Selections)*.

Item Sales Analysis Save Options Screen (Additional Report Selections)

Purpose: Use this screen to:

- select the sort order of the *Item Sales Analysis Report*
- select the accounting periods to include on the report
- indicate whether to print, save, or print and save the report
- optionally, enter a different description

How to display this screen: At the *Item Report Selection Screen (Defining Selection Criteria/MISA)*, select *OK*.

Field	Description
Sort selection	The sort selection field specifies how the report will be sorted. Valid values: • By Warehouse $ Sold Ascending • Warehouse $ Sold Descending • By Department $ Sold Descending • By Department $ Sold Ascending • By Item Class $ Sold Ascending • By Item class $ Sold Descending • By Vendor $ Sold Ascending • By Vendor $ Sold Descending • By Buyer $ Sold Descending • By Buyer $ Sold Ascending • By Category $ Sold Ascending • By Category $ Sold Descending • By Status $ Sold Descending • By Status $ Sold Ascending • By Item $ Sold Ascending • By Item $ Sold Descending • By $ Sold Ascending • By $ Sold Descending • By Units Sold Ascending • By Units Sold Descending Required.
Starting period	The starting month and year used in report selection. Enter the starting date to include. Numeric, 2 positions; required.

Field	Description
Ending period	The ending month and year used in the report selection. Enter the ending date to include. Numeric, 2 positions; required.
Selection option	Enter the number associated with the options, as follows: • *1* = Print the *Item Sales Analysis Report*; do not save the selection information • *2* = Save the selection information; do not print the report • *3* = Print the report and save the selection information Alphanumeric, 1 position; required.
Report code	The name of the report selection. Alphanumeric, 10 positions; display-only.
Description	The description of the report selection. Alphanumeric, 30 positions; required.

Completing this screen: Based on your selection option, the system prints the *Item Sales Analysis Report* and/or saves your selections.

Display Sales Analysis Report Options Screen

To display: Select *Display* for a report at the *Work with Report Selection Screen (MISA)* to advance to the Display Report Selection screen. This screen displays the selection criteria and sort selection for the report. You cannot change any information on this screen.

Printing Item Stock Status Reports (MISS)

Purpose: The Print Item Stock Status Report function is used to create, delete, and display status reports for item stock.

In this topic:

- *Work with Report Selection Screen (MISS)*
- *Create Report Selection Screen (MISS)*
- *Item Report Selection Screen (MISS)*
- *Item Stock Status Save Options Screen*
- *Item Stock Status Report*
- *Display Stock Status Report Options Screen*

Work with Report Selection Screen (MISS)

How to display this screen: Enter *MISS* in the Fast Path field at the top of any menu.

Field	Description
Report	The name of the report. Alphanumeric, 3 positions; optional.
Description	The description of the report. Alphanumeric, 40 positions; optional.

Field	Description
Date	The last date the report was printed or the report selection was updated. Numeric, 6 position (in user date format); optional.
Time	The last time the report was printed or the report selection was updated. Numeric, 6 positions (HHMMSS format); optional.

Screen Option	Procedure
Create a report selection	Select *Create* to advance to the *Create Report Selection Screen (MISS)*.
Define and save report selections	*Select* a report selection to advance to the *Item Report Selection Screen (MISS)*.
Display report selections	Select *Display* for a report selection to advance to the *Display Stock Status Report Options Screen*.

Create Report Selection Screen (MISS)

Purpose: Use this screen to define the name and description of the report selection.

How to display this screen: At the *Work with Report Selection Screen (MISS)*, Select *Create*.

Field	Description
Report	The name of the report selection which is used for future reference. The selection criteria are saved to the Item Report Selection table with this name the first time the report is run. In the future, you can call up these selection criteria by entering this report name. Alphanumeric, 10 positions; optional.
Description	The description of the report selection which is used for future reference. If the report selection is saved, the report description is displayed on the selection screen, provided you choose to list all of the previously saved report selections. Alphanumeric, 30 positions; optional.

Item Report Selection Screen (MISS)

Purpose: Use this screen to define the information that will be included on the report. For example, to produce a report for items in Warehouse 1 that were supplied by vendor's 100 and 200 you would define the warehouse and vendor fields at this screen.

How to display this screen: At the *Work with Report Selection Screen (MISS)*, *select* a report.

Field descriptions:

Field	Description
Whs (Warehouse)	A code that represents the warehouse, validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. Numeric, 3 positions; optional.
Dept (Department)	A numeric code used to group items into departments for reporting purposes. Validated against the Department table; see *Working with Long SKU Departments (WLSD)*. Numeric, 4 positions; optional.
Class	A user-defined code that identifies a group of items. Item Class codes are used as a high level method to: • sort inventory • define information templates at the item class level • assign city/state restrictions • assign customer class restrictions See *Working with Item Classes (WICL)*. Alphanumeric, 3 positions; optional.
Vendor	A user-defined code that represents the primary vendor or supplier of the item. Validated against the Vendor table. See *Working with Vendors (WVEN)*. Numeric, 7 positions; optional.
Buyer	A user-defined code that represents a person who is authorized to make purchases for this item. Validated against the Buyer table. See *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; optional.
Cat (Category)	A user-defined code assigned to an item to classify and group like items. Item category is a level below the item class. Validated against the Item Category table. See *Working with Item Category Codes (WITG)*. Alphanumeric, 4 positions; optional.
Sts (Status)	A code that represents an item's status such as obsolete, discontinued, etc. This information is used for inventory reporting purposes only. See *Working with Item Status (WIST)*. Alphanumeric, 1 position; optional.

Item Stock Status Save Options Screen

Purpose: Once you have defined the report information, you are ready to save this information and to print the *Item Stock Status Report*.

How to display this screen: At the *Item Report Selection Screen (MISS)*, Select *OK*.

Field	Description
Sort selection	The sort selection field specifies how the report will be sorted. You can use the prompt (*click* on the arrow) to view the list of available values. Valid values: • By Item Warehouse • By Warehouse Item • By Depart. Item Warehouse • By Depart. Warehouse Item • By Item Class Item Warehouse • By Item Class Warehouse Item • By Vendor Warehouse Item • By Vendor Item Warehouse • By Buyer Item Warehouse • By Buyer Warehouse Item • By Category Warehouse Item • By Category Item Warehouse • By Status Item Warehouse • By Status Warehouse Item • By Backorder $ Ascending • By Backorder $ Descending • By Backorder Units Descending • By Backorder Units Ascending Required.
Include on order	*Selected* = The on-order (purchase order) quantity should be included in the quantity available calculation on the *Item Stock Status Report*. *Unselected* = The on-order quantity should not be included in the quantity available calculation on the Inventory Stock Status Report.
FIFO option	The FIFO option identifies whether the report should include held orders in the backorder calculation. Valid values: • *Both open and held orders* • *Open orders only* Required.
Selection option	Type the number associated with the option, as follows: 1. Print only = Prints the *Item Stock Status Report* and does not save your selections. You must select the sort option the next time you run this report. 2. Save only = Saves your selections, but does not print the report. 3. Save and print = Saves your selections and prints the report. Numeric, 1 position; required.
Report function	Represents the system-assigned function name of the report that is run. As each report is selected and run, the system will update this field with the name of the report. You cannot change this field. Alphanumeric, 1 position; display only.
Report code	The name of the report selection. The selection criteria is saved to the Item Report Selection table with this code. Alphanumeric, 10 positions; required.

Field	Description
Description	The description of the report selection. If the report selection is saved, the report description is displayed on this screen. Alphanumeric, 30 positions; required.

Completing this screen: Based on your selection option, the system prints the *Item Stock Status Report* and/or saves your selections.

Display Stock Status Report Options Screen

Display a report selection: Select *Display* for a report at the *Work with Report Selection Screen (MISS)* to advance to the Display Report Selection screen. You cannot change any information on this screen. See *Item Report Selection Screen (MISS)* for field descriptions.

Inventory Inquiry by Item (IIQI)

Purpose: Use the Inventory Inquiry by Item function to review item information organized by the base item and the first SKU element. The information presented through this function summarizes order and fulfillment activity; backorder and purchase order dates and totals; and returns and cancellations. You can also advance from the Inventory Inquiry by Item function to additional inventory inquiries.

The information presented through this function requires at least three screens to display (more if there are many SKU combinations). You advance left to right or right to left among these screens by pressing function keys.

Other options: You can use the following additional menu options for inventory inquiry:

- *Using Inventory Inquiry (DINI)*: to review inventory information for items within warehouses and locations in warehouses
- *Inventory Status Inquiry (ISIQ)*: to review order activity for any item or SKU broken out by offer

In this topic:

- *Inventory Inquiry by Item Prompt Screen (Selecting an Item)*
- *Inventory Inquiry by Item Screen (1 of 3)*
- *Inventory Inquiry by Item Screen (2 of 3)*
- *Inventory Inquiry by Item Screen (3 of 3)*
- *Enter New SKU Pop-Up Window*

Inventory Inquiry by Item Prompt Screen (Selecting an Item)

Purpose: Use this screen to select the item and first SKU element for inventory review.

How to display this screen: Enter *IIQI* in the Fast path field at the top of any menu or select Inventory Inquiry by Item from a menu.

Field	Description
Item	A code representing a unit of inventory that you sell to your customers. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; required.
Colr (First SKU element)	A SKU defines an item's unique characteristics, such as its color, size, width, etc. You can define up to three SKUs for each item. You enter the value from the *Split SKU Element Column 1 Heading (A34)* system control value here. Alphanumeric, 4 positions; required if the item has SKUs.

Completing this screen: You advance to the *Inventory Inquiry by Item Screen (1 of 3)*.

Inventory Inquiry by Item Screen (1 of 3)

Purpose: Use this screen to review information about Item/SKU order activity and availability.

> **Note:**
>
> Each field is display-only.

How to display this screen: Enter a valid item code and first SKU element value at the *Inventory Inquiry by Item Prompt Screen (Selecting an Item)*.

Field	Description
Item	A code representing a unit of inventory you sell to your customers. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions.
Item description (unlabeled field to the right of the item code)	The description associated with the item. Alphanumeric, 120 positions.
Retail (Retail price)	The retail price for the item defined for the most current offer. If you define the price for items with SKUs at the SKU level rather than the item level, the retail price indicated is .00. Numeric, 13 positions with a 2-place decimal.
Dept (Long SKU department)	A code representing the department defined for the item. See *Working with Long SKU Departments (WLSD)*. Numeric, 4 positions.
COLR (First SKU element)	A SKU defines an item's unique characteristics, such as its color, size, width, etc. You can define up to three SKUs for each item. From the *Split SKU Element Column 1 Heading (A34)* system control value. Alphanumeric, 4 positions.
Description (Unlabeled field to the right of the first SKU element)	The description associated with the first SKU element. Alphanumeric, 10 positions.

Field	Description
Vendor	The vendor from the Item table, if any. See *Working with Vendors (WVEN)*. Alphanumeric, 7 positions.
Cost	The unit cost of the item. Each of these costs is stored in the SKU table. Numeric, 13 positions with a 4-place decimal.
Class	A code to identify a group of items. You might use item classes to assign city/state or customer class selling restrictions or sort inventory. Item class codes are defined in and validated against the Item Class table. See *Working with Item Classes (WICL)*. Alphanumeric, 3 positions.
Colr (First SKU element)	From *Split SKU Element Column 1 Heading (A34)* system control value. The figures on this row of information represent total inventory calculations for all SKUs for the item that match the SKU element 1 you selected. See field descriptions below, beginning with the *Cust ord (Customer orders)* field, for more information.
Item	The figures on this row of information represent item-wide total inventory calculations. See field descriptions below, beginning with the *Cust ord (Customer orders)* field, for more information.
Size (Second SKU element)	The second special characteristic of an item. From the Split SKU Element 2 Column Heading system control value. See *Split SKU Element Column Headings (A52, A53, A54)*. Alphanumeric, 4 positions.
Wdth (Third SKU element)	The third special characteristic of an item. From the Split SKU Element 3 Column Heading system control value. See *Split SKU Element Column Headings (A52, A53, A54)*. Alphanumeric, 4 positions.
	The following fields represent column headings for inventory information calculated for: • Clr: All SKUs containing the first SKU element you entered on the selection screen. • Item: All SKUs for the item, regardless of first SKU element. • Each unique SKU that contains the first SKU element you entered on the selection screen (these are the rows that display below the column headings)
TTL ord (Total ordered)	The total quantity of units ordered for this item or SKU across all offers. Includes both open and closed orders. Numeric, 7 positions.
Avail (Available)	The total quantity on-hand, minus the quantity on order. Negative figures represent backorders. For the SKU element 1 and Item totals, this figure represents the net of available minus backorders for all SKUs included in the calculation. Numeric, 7 positions.
Rsv (Reserved)	The total quantity reserved. Numeric, 7 positions.

Field	Description
Printed	The total quantity on printed pick slips. Numeric, 7 positions.
O/H (On hand)	The total quantity present in your warehouses. Numeric, 7 positions.
B/O (Backordered)	The total quantity that is backordered. Numeric, 7 positions.
Soldout control	Indicates whether there is a soldout control code for the item or SKU. You define soldout controls with one of three values: • sellout immediately • sellout when on-hand inventory is exhausted • sellout when on-hand inventory plus all purchase order receipts are exhausted. Valid values for this field are: *Selected* = There is a soldout control specified for this item or SKU. *Unselected* = There is no soldout control specified for this item or SKU. Soldout controls are defined in and validated against the Soldout Control table. See *Working with Soldout Controls (WSLD)*.

Screen Option	Procedure
Advance to Inventory Quantity Inquiry	Select *Inv Qty* to advance to the *Inventory Quantity Inquiry Prompt Screen*.
Advance to Inventory Status Inquiry	Select *Inv Status* to advance to *Inventory Status Inquiry (ISIQ)*.
Change the first SKU element	Select *Change Colr* to advance to the *Enter New SKU Pop-Up Window*.
Advance to the second screen	Select *Right* to advance to the *Inventory Inquiry by Item Screen (2 of 3)*.

Inventory Inquiry by Item Screen (2 of 3)

Purpose: Use this screen to review additional information about the item, including backorder and purchase order dates and order fulfillment figures.

How to display this screen: Select *Right* at the *Inventory Inquiry by Item Screen (1 of 3)*.

> **Note:**
>
> If you have advanced downward on the *Inventory Inquiry by Item Screen (1 of 3)* by pressing *Next* to review additional SKUs, you will retain this relative position when you advance to this screen or the *Inventory Inquiry by Item Screen (3 of 3)*.

Field descriptions: The information at the top of this screen, and the item/SKU information on the left, is repeated from the *Inventory Inquiry by Item Screen (1 of 3)*. The additional fields on this screen are described below.

The fields on this screen and the next are historical, representing life-to-date figures for all offers associated with the item or SKU.

Field	Description
Oldest B/O (Oldest backorder)	The date of the oldest backorder for the item or SKU. Numeric 6 positions (in user date format).
Recpt (Received)	The total received quantity for the item or SKU in all allocatable warehouses. Numeric, 7 positions.
On PO	The total quantity of the item or SKU on purchase order and not yet received. Numeric, 7 positions.
Next recpt (Next receipt)	The next date that you expect to receive the item or SKU at your warehouse. Numeric, 6 positions (in user date format).
Ship	The total quantity of the item or SKU that you have shipped to customers. Numeric, 7 positions.
Rtn (Returned)	The total quantity of the item or SKU that has been returned by customers. Numeric, 7 positions.
Cancel	The total quantity of the item or SKU that has been canceled. Numeric, 7 positions.

Screen Option	Procedure
Advance to Inventory Quantity Inquiry	Select *Inv Qty* to advance to the *Inventory Quantity Inquiry Prompt Screen*.
Advance to Inventory Status Inquiry	Select *Inv Status* to advance to *Inventory Status Inquiry (ISIQ)*.
Change the first SKU element	Select *Change Colrr* to advance to the *Enter New SKU Pop-Up Window*.
Return to the first screen	Select *Left* to return to the *Inventory Inquiry by Item Screen (1 of 3)*.
Advance to the third screen	Select *Right* to advance to the *Inventory Inquiry by Item Screen (3 of 3)*.

Inventory Inquiry by Item Screen (3 of 3)

Purpose: Use this screen to review exchange, net sales, lost sales and total order figures for the item or SKUs.

How to display this screen: Select *Right* at the *Inventory Inquiry by Item Screen (2 of 3)*.

> **Note:**
>
> If you have advanced downward on the *Inventory Inquiry by Item Screen (1 of 3)* or the *Inventory Inquiry by Item Screen (2 of 3)* by selecting *Next* to review additional SKUs, you will retain this relative position when you advance to this screen.

Field descriptions: The information at the top of this screen and the item/SKU information on the left, is repeated from the *Inventory Inquiry by Item Screen (1 of 3)*. The additional fields on this screen are described below.

The fields on this screen are historical, representing life-to-date figures for all offers associated with the item or SKU.

Field	Description
Exchg (Exchanges)	The total quantity of the item or SKU that has been exchanged. Numeric, 7 positions.
Net sales	Net sales for the item or SKU, calculated as: `Total quantity shipped - (returns + exchanges)` Numeric, 7 positions.
Lost sales	The total quantity of the item or SKU that customers would have ordered if the item or SKU were available. You enter lost sales through *Display Item Availability Screen* in Order Entry. Numeric, 5 positions.
Cust ord (Customer orders)	The total quantity ordered but not yet shipped. Numeric, 7 positions.

Screen Option	Procedure
Advance to Inventory Status Inquiry	Select *Inv Status* to advance to *Inventory Status Inquiry (ISIQ)*.
Change the first SKU element	Select *Change Colrr* to advance to the *Enter New SKU Pop-Up Window*.
Return to the first screen	Select *Left* to return to the *Inventory Inquiry by Item Screen (2 of 3)*.

Enter New SKU Pop-Up Window

Purpose: Select *Change Colrr* at the *Inventory Inquiry by Item Screen (1 of 3)*, *Inventory Inquiry by Item Screen (2 of 3)*, or *Inventory Inquiry by Item Screen (3 of 3)* to select another first SKU element to review. The Enter New SKU pop-up window opens:

You can enter a new SKU at this window, or prompt for all valid SKUs by *clicking* on the arrow in this field. You then advance to the Select SKU pop-up window; when you select a SKU from this window, the system defaults the first SKU element from your selection to the Enter New SKU pop-up window.

Retail Integration (External System to Order Administration)

Topic in this part: The following topics describe the processes, setup requirements, and functions available to upload item information from your retail system into Order Administration.

- *Retail Integration (External System into Order Administration) Overview and Setup* explains how you can keep merchandise information at your retail merchandising system in sync with merchandise information in Order Administration.
- *Working with Retail Integration Item Upload (RIIU)* explains how to upload item information from your retail merchandising system into Order Administration.
- *Creating and Maintaining Long SKU Divisions (WLDV)* explains how to create and modify long SKU division codes.

Working with Retail Integration Item Upload (RIIU)

Purpose: Use the Work with Retail Integration Item Upload menu option to process, review, and correct batch item upload records passed to Order Administration from a retail master system through the *RI Item Upload Table (RIIUPP)*.

About the generic RI Item Upload: This generic integration allows you to keep merchandise information at your merchandising system consistent with merchandise information in Order Administration. You can use the *RI Item Upload Table (RIIUPP)* to upload information about items and SKUs from the external system into Order Administration. The types of information you can upload include:

- items/SKUs
- item offers and SKU offers
- item prices and SKU prices
- vendor items
- item UPC's
- item coordinates

See the *Retail Integration (External System into Order Administration) Overview and Setup* for an overview and the required setup.

RMFCS integration: The item import from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) also creates records in the RI Item Upload table; however, the RMFCS import uses a different set of files than that described in *Retail Integration (External System into Order Administration) Overview and Setup* to populate the RI Item Upload table, and a different periodic function. See *Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration* for more information.

Require long SKU information? The *Use Retail Integration (H26)* system control value determines whether Order Administration changes certain table structures so that it can read records you upload from a retail system, including RMFCS. When this system control value is *selected*, the system:

1. uses long SKU class codes from the Retail Class table instead of long SKU class codes from the Long SKU Class table. This allows you to create a hierarchy of

retail class within long SKU department. You can link retail classes to a long SKU department in *Working with Long SKU Departments (WLSD)*.

2. requires a value in the Long SKU department, Long SKU class (retail class), Long SKU style, and Long SKU subclass fields when you create or maintain a base item.

If you wish to selectively require certain long SKU values, you can select one or more of the following system control values instead of selecting the *Use Retail Integration (H26)* system control value:

- *Require L/S Department (I92)*
- *Require L/S Class (I93)*
- *Require L/S Style (I94)* (This system control value also validates that the long SKU style code is unique at both the item and SKU level.)

Create supporting tables? Order Administration creates supporting table values, such as buyer code, for items/SKUs created or updated through the item upload if they do not already exist in the Order Administration table. See *Tables Updated by the RI Item Upload*.

Scheduling the generic item upload process: You can schedule the periodic functions, including the *UPRITEM Upload Retail Item File* (Program name *PFR0134*, Parameter *RIIUPP*), the *RI Item Upload Translation Program*, and *RI Item Upload Edit Program* to run the Item Upload Process periodically. See *Scheduling Jobs* for background. However, a different periodic function processes the item information from RMFCS; see *Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration* for background.

Active procedure: The system creates the active procedure RI ITEM UPLOAD when you submit the process to prevent more than one RI Item Upload process from running at the same time.

In this topic:

- *RI Item Upload Process*
- *RI Item Upload Translation Program*
- *RI Item Upload Edit Program*
- *Tables Updated by the RI Item Upload*
- *RI Item Upload Table (RIIUPP)*
- *Work with Retail Item Upload Screen*
- *Change Item Upload Screens*
- *Change Item Upload - Item/SKU Screens*
- *Change Item Upload - Item Offer Screens*
- *Change Item Upload - SKU Offer Screens*
- *Change Item Upload - Item Price Screen*
- *Change Item Upload - SKU Price Screen*
- *Change Item Upload - Vendor Item Screen*
- *Change Item Upload - Item UPC Screen*
- *Change Item Upload - Item Coordinate Screen*
- *Display Item Upload Screens*

- *Work with Retail Item Upload Errors Screen*
- *Retail Item Upload Errors*
- *Item Upload Error Report*
- *Record Deleted from RI Item Upload Report*

RI Item Upload Process

You can create records in the *RI Item Upload Table (RIIUPP)* by using the *File Storage API*or *Work with File Uploads (WUPL)* to upload retail merchandise information into the *RI Item Upload Table (RIIUPP)*.

- If you use the *File Storage API* to upload the Retail Integration Item file named `RIIUPP` or `RIIUPP.TXT` into the FILE_STORAGE table and then use the *UPRITEM Upload Retail Item File* (Program name *PFR0134*, Parameter *RIIUPP*) periodic function to create records in the RI Item Upload Table (RIIUPP).
- If you use *Work with File Uploads (WUPL)*, the RI Item Upload Table records are created through the upload process.

You can use the sample data provided to create records in the text file you wish to upload; see *Sample Retail Integration Items Upload Data*.

> **Note:**
>
> When populating the RI Item Upload table:

- the information should be entered in all upper case values.
- If you wish to leave any field in the upload file blank, pass a space in an alphanumeric field and a 0 in a numeric so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.
- selecting *Accept* at the *Copy Item to Company Window* in *Working with Existing Items (MITM)*.

Once you have passed item upload records from your retail master system to the RI Item Upload table, you process the table by selecting *Process* at the *Work with Retail Item Upload Screen*. If you are copying items, the system submits the process automatically.

RMFCS integration: The item import from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) also creates records in the RI Item Upload table; however, the RMFCS import uses a different set of files than that described in *Retail Integration (External System into Order Administration) Overview and Setup* to populate the RI Item Upload table, and a different periodic function. See *Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration* for more information.

What type of information gets passed to the RI Item Upload table? The type of information in each RI Item Upload record is indicated by its record type:

- *01* = Item/SKU
- *03* = Item Offer

- *04* = SKU Offer
- *05* = Item Price
- *06* = SKU Price
- *07* = Vendor Item
- *08* = Item UPC
- *09* = Item Coordinate

Based on the record type, the system reads information related to that type and ignores any other information defined for the record. For example, when you are creating an item, the system does not check whether there is information in the record related to SKU price or item UPC.

Request types: These codes indicate whether the system creates or maintains the related information in Order Administration. Request types are:

- *A* = Add record; however, if the system finds a record in the Order Administration database that matches the information in the RI Item Upload record, the system changes the Request type to *C* and updates the existing record.
- *C* = Change record; however, if the system cannot find a record in the Order Administration database that matches the information in the RI Item Upload record, the system changes the Request type to *A* and creates a new record.
- *Blank* = The system compares the information in the RI Item Upload record to the existing records in the Order Administration database.
  - If the system cannot match the RI Item Upload record to an existing record in the Order Administration database, the system considers the RI Item Upload record an add request.
  - If the system can match the RI Item Upload record to an existing record in the Order Administration database, the system considers the RI Item Upload record a change request.

Key type: *IT* (item/SKU) indicates the system identifies the item and SKU associated with a record in the *RI Item Upload Table (RIIUPP)* using the *Item* and *SKU* passed in the record.

RI Item Upload Translation Program

The system calls the RI Item Upload translation program when you select *Process File* at the *Work with Retail Item Upload Screen*. The system also automatically calls this translation program when you select *Accept* at the *Copy Item to Company Window* in *Working with Existing Items (MITM)*.

The RMFCS integration also uses this program. See *Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration* for more information.

Scheduling the RI Item Upload process: You can also schedule the *RI Item Upload Process* to run periodically by setting up the *RIUPLD* function using the PFR0084 program. See *Scheduling Jobs* for background.

The RI Item Upload translation program:

#	Step
1.	Creates the active procedure RI ITEM UPLOAD. See *Ending the RI Item Upload Process Before It Completes* if you need to end the RI Item Upload program before it is finished.
2.	Processes records in the *RI Item Upload Table (RIIUPP)* in record type sequence: 1. Process 01 Item/SKU records. 2. Process 03 Item Offer records. 3. Process 04 SKU Offer records. 4. Process 05 Item Price records. 5. Process 06 SKU Price records. 6. Process 07 Vendor Item records. 7. Process 08 Item UPC records. 8. Process 09 Item Coordinate records. If there are any records in *I* (In Process) status, changes their status to *U* (Unprocesssed). Order Administration only selects records to process that are in a *U* or blank (Unprocessed) or *E* (Error) status. When Order Administration selects a record type to process, the system updates the status of all records with this record type to *B* (Batch Selected) in order to prevent other activity against this set of records.
3.	For the record type selected to process, Order Administration processes records in batches of 1000 records, based on: • Earliest date and time. • If there are both add records and change records, process the add records first. When Order Administration processes a batch of 1000 records, the system updates the status of the records in the batch to *I* (In Process).
4.	For each record in the selected batch, identifies the *Item* and *SKU* defined for the item upload record.
5.	Checks for duplicate records in the selected batch of records.
6.	The system places any RI item upload record that fails one or more of the above edits in an error (*E*) status in the RI Item Upload table and in the RI Item Upload Error table. These records in error also print on the *Item Upload Error Report*. See *Work with Retail Item Upload Errors Screen*.

RI Item Upload Edit Program

Once the *RI Item Upload Translation Program* identifies the item/SKU associated with the item upload record the system calls the RI Item Upload Edit Program. This edit program checks for invalid field values or combinations in the RI item upload record. If the record passes all validations, the edit program:

#	Step
1.	Checks the ***DFLT ITEM Item/SKU* to determine whether to default values to any blank fields in the RI item upload record. The system checks the **DFLT ITEM only for add and change item upload records for record type *01* (item/SKU information). See ***DFLT ITEM Item/SKU*.

#	Step
2.	Checks the ***DFTCHG Item/SKU* to determine whether to update an existing item/SKU with the values in the RI item upload record. The system checks the **DFT CHG item only for change item upload records for record type *01* (item/SKU information). See ***DFTCHG Item/SKU*. **Note:** If the **DFT CHG item has a value, the system does not validate that field in the RI item upload record.
3.	Creates or maintains the item/SKU, based on the *Request Type* for the item upload record. If the *Auto-Generate Item Keywords from Description (F79)* system control value is selected, the system also creates keywords for items created through the RI Item Upload process for record type *01* Item/SKU.
4.	Changes the status of the item upload records to *P* (Processed).
5.	If the *Create Generic Item Download Trigger Records (I15)* system control value is selected, the system submits the secondary job *RISECU* to create item download triggers and changes the status of the item upload records to *S* (Other Updates).
6.	Deletes the RI item upload record from the *RI Item Upload Table (RIIUPP)*.
7.	If the RI item upload record fails any validation, the edit program: • Changes the status of the RI item upload record to *E* (Error) and does not delete the record from the RI Item Upload table. • Creates a record in the RI Item Upload Error table which displays the reason(s) why the record failed.
8.	Once RI item upload records are processed, the records are listed on: • *Item Upload Error Report*: indicates that RI item upload records failed one or more edits and remain in the RI Item Upload table. • *Record Deleted from RI Item Upload Report*: indicates that you deleted the RI item upload record(s) from the RI Item Upload table by selecting *Delete* for an item upload record at the *Work with Retail Item Upload Screen*. This means that the edit program did not create or maintain any item/SKU information.

Retail Item Upload Email

If a valid email is defined in the Email address field for the user that submitted the RI Item Upload Program, the system sends a Retail Item Upload email to the user's email address when the job completes indicating whether all records were processed successfully or whether any records contain errors.

Sample successful email: A sample of the retail item upload email that is generated when all of the records processed successfully is displayed below.

Address information:

```
From: [email from]
```

`To: [email to]`

`Subject: Retail Item Upload finished successfully`

System generated text: `The Retail Item Upload has run successfully with no errors.`

Sample error email: A sample of the retail item upload email that is generated when one or more records contain errors is displayed below.

Address information:

`From: [email from]`

`To: [email to]`

`Subject: Retail Item Upload finished with errors`

System generated text: `The Retail Item Upload has run successfully but errors exist. Please review reports produced for more information.`

You can use the *Item Upload Error Report* to review the item upload records that failed one or more edits and remain in the RI Item Upload table.

Ending the RI Item Upload Process Before It Completes

If you need to end the RI Item Upload program before it is finished (if, for example, you are processing a large number of RI item upload records), you can terminate the job by deleting the RI ITEM UPLOAD active procedure in the *Purging Active Procedures (MACP)* menu option.

When you delete the RI ITEM UPLOAD active procedure, the system:

1. Finishes processing the current batch of 1000 RI Item Upload records.
2. Terminates the RI Item Upload job.
3. If the *Create Generic Item Download Trigger Records (I15)* system control value is selected, the system submits the secondary job *RISECU* for the RI Item Upload records that finished processing. The system changes the status of these item upload records to *S* (Other Updates). Once the *RISECU* job ends, the system deletes these RI item upload records from the *RI Item Upload Table (RIIUPP)*.
   Note: You can submit another RI Item Upload process while the *RISECU* job is running.
4. Updates the status of any remaining records in a *B* (Batch Selected) status to *U* (Unprocessed).
5. Leaves any remaining unprocessed records until the next time you run the RI Item Upload program.

Tables Updated by the RI Item Upload

For every RI item upload record that you pass to the *RI Item Upload Table (RIIUPP)*, you can create, change or delete primary item and SKU values in these tables:

- Item
- SKU
- Vendor Item

- Item/Offer
- SKU/Offer
- Item Price
- SKU Price
- Item UPC
- Item Coordinate

Using the RI item upload, you can create values for secondary, supporting item/SKU tables. You can only create secondary table values; the system does not allow you to change already existing values. You can create values in these secondary item/SKU-related tables:

- SKU Element 1
- SKU Element 2
- SKU Element 3
- Item Warehouse
- Item Location
- Item Class
- Item Status
- Buyer
- L/S Department
- L/S Class
- L/S Division
- Retail Class
- Item Category

RI item upload processing will not create records in the more complex or Order Administration-specific secondary tables. You must manually create these values before passing them in a retail item upload request. For example, you cannot create ship vias, warehouses, locations, drop points, seasons, entities, vendors, sold out controls, and any other table not specifically mentioned above using the item upload.

RI Item Upload Table (RIIUPP)

The values you enter in the key type fields determine the fields in the RI item upload record for which you must enter a value. See:

- *Keys to the table: fields that are required for all record types*
- *Fields for 01 Item/SKU record type*
- *Fields for 03 Item Offer record type*
- *Fields for 04 SKU Offer record type*
- *Fields for 05 Item Price record type*
- *Fields for 06 SKU Price record type*
- *Fields for 07 Vendor Item record type*
- *Fields for 08 Item UPC record type*
- *Fields for 09 Item Coordinate record type*

****DFLT ITEM and **DFTCHG:** You can create the following items for the system to consider when uploading RI item upload records for record type *01* (item/SKU information).

- ***DFLT ITEM:* create this item to define the values to *default* to add or change item upload records; see ***DFLT ITEM Item/SKU*.
- ***DFTCHG:* create this item to determine *when* the system updates an existing item/SKU with the values defined in a change item upload record; see ***DFTCHG Item/SKU*.

> **Note:**
>
> You are not required to create the ***DFLT ITEM* item or ***DFTCHG* item, however it is recommended.

This table indicates the name of the field in the RI Item Upload table and a description of the field.

Populating the RI Item Upload table: Create an RI Item Upload text file that contains the records you wish to upload. Run the *UPRITEM Upload Retail Item File* (Program name *PFR0134*, Parameter *RIIUPP*) periodic function or use the *Work with File Uploads (WUPL)* menu option to upload the records in the text file to the RI Item Upload table. You can use the sample data provided to create records in the text file you wish to upload; see *Sample Retail Integration Items Upload Data*.

When populating the RI Item Upload table, the information should be entered in all upper case.

RMFCS integration: See *RMFCS to OACS Mapping* for information on how the data from RMFCS maps to Order Administration.

Field	Description
	Keys to the table: fields that are required for all record types You must enter a value in these key fields. The values you enter for these keys determine: • What information gets passed to Order Administration. • Whether the RI item upload program creates or changes an item. • How the RI item upload program identifies the Order Administration item associated with the item upload record. See *Basic errors* and *Item errors*.
Company	A code that represents the company to which you wish to upload retail item/SKU information. Company codes are defined in and validated against the Company table. Numeric, 3 positions; required.

Field	Description
Record Created Date	The date you create the RI item upload record. **Note:** If you leave this field blank and select *Change* for the RI item upload record at the *Work with Retail Item Upload Screen*, you advance to an E2 Key Screen and will not be able to correct any errors in the record. Numeric, 7 positions (CYYMMDD format); required.
Record Created Time	The time you create the item upload record. **Note:** If you leave this field blank and select *Change* for the RI item upload record at the *Work with Retail Item Upload Screen*, you advance to an E2 Key Screen and will not be able to correct any errors in the record. Numeric, 6 positions (HHMMSS format), required.

Field	Description
Record Type	A code that defines the item/SKU information you want to add or change. Valid values are: • *01* = Item/SKU • *03* = Item Offer • *04* = SKU Offer • *05* = Item Price • *06* = SKU Price • *07* = Vendor Item • *08* = Item UPC • *09* = Item Coordinate **Note:** You must enter the leading *0* in this field. For example, you must pass *01* and not just *1*. The record type determines which fields the system considers in the RI item upload record. For example, if you want to change a SKU's price information, enter an *06* record type. Even if all the fields in the RI item upload record are populated for that SKU, the system only looks at information in the nine SKU price fields. See the following for the fields and descriptions associated with each record type: • *Fields for 01 Item/SKU record type* • *Fields for 03 Item Offer record type* • *Fields for 04 SKU Offer record type* • *Fields for 05 Item Price record type* • *Fields for 06 SKU Price record type* • *Fields for 07 Vendor Item record type* • *Fields for 08 Item UPC record type* • *Fields for 09 Item Coordinate record type* **Note:** When passing information to Order Administration, you must build upon values passed in this record type. For example, you cannot create a vendor item (*07* record type) until you have first created the item/SKU (*01* record type).

Field	Description
	****DFLT ITEM and **DFTCHG** The ***DFLT ITEM Item/SKU* allows you to default values to blank fields in an add or change RI item upload record for an item/SKU record type. The ***DFTCHG Item/SKU* determines if the system updates an existing item with the values defined in a change RI item upload record for an item/SKU record type. See *Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG*. Alphanumeric, 2 positions; required.
Request Type	A code that defines whether the upload program creates or maintains item/SKU information. Valid values are: • *A* = Add record; however, if the system finds a record in the Order Administration database that matches the information in the RI Item Upload record, the system changes the Request type to *C* and updates the existing record. • *C* = Change record; however, if the system cannot find a record in the Order Administration database that matches the information in the RI Item Upload record, the system changes the Request type to *A* and creates a new record. • *Blank* = The system compares the information in the RI Item Upload record to the existing records in the Order Administration database. • If the system cannot match the RI Item Upload record to an existing record in the Order Administration database, the system considers the RI Item Upload record an add request. • If the system can match the RI Item Upload record to an existing record in the Order Administration database, the system considers the RI Item Upload record a change request. **Add Request Type (A)** You can pass numerous add requests for the same item/SKU with these record types: • *03* (item offer) • *04* (SKU offer) • *05* (item price) • *06* (SKU price) • *07* (vendor item) • *08* (UPC record type) • *09* (item coordinate) You can pass multiple add requests for an existing item (record type *01*) as long as you are creating a new SKU; see *Record Type*. If you pass blank values for an item/SKU (*01* record type), the system defaults values based on the **DFLT ITEM and system control values; see ***DFLT ITEM Item/SKU*.

Field	Description
	Change Request Type (C) You can pass multiple change requests for all record types; however, the fields associated with the specified record type are overwritten with the most recent information you pass for that record type. If you pass blank values for an item/SKU (*01* record type), the system defaults values using the **DFLT ITEM and system control values. Also, if a value exists in **DFTCHG, the system does not update the existing item with the upload value; see *Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG*. If you pass blank values for any other record type, the system updates the value for the existing item to blank. **Note:** The system does not update any history records for transactions that occurred prior to the change date. Alphanumeric, 1 position; optional.
Sequence #	A unique sequence number assigned to the RI item upload record. Sequence numbers can be in a random order or sequentially assigned, but they must be unique for each day. Numeric, 3 positions; required.
Key Type	A code that defines how the system identifies the Order Administration item/SKU associated with a change item upload record. *IT* (Item/SKU) is the only valid key type and indicates the upload record contains the item code, and optionally SKU code, that matches a Order Administration item/SKU. If the item contains SKUs and you do not enter a SKU code, the system maintains the base item. **Note:** If you pass an invalid key type for an *01* Item/SKU record type, the system automatically corrects it. Alphanumeric, 2 positions; required.
Order Administration values	

Field	Description
Item	A user-defined code that represents a unit of inventory. For an add request for an *01* *Record Type*, you must pass an item code unless you have the *Auto Assign Item # (D46)* system control value *selected*. **Note:** The item code you enter must identically match an item in Order Administration for the system to identify the item associated with a change item upload record. Alphanumeric, 12 positions; required.
SKU	The unique attributes of an item, such as color, size, and style. Does not include distinct fields for split SKU elements; therefore, you must count positions and enter the SKU element in the respective place on the field. Spacing is as follows: 1. SKU Element 1 = spaces 1-4 2. SKU Element 2 = spaces 6-9 3. SKU Element 3 = spaces 11-14 Alphanumeric, 14 positions; required if the *Allow SKUs* field is selected.
Status	A system-generated code that represents the record's status in the RI Item Upload table. Valid values are: • *U* or blank = Unprocessed • *B* = Batch Selected • *I* = In Process • *S* = Other Updates • *P* = Processed • *E* = Error • *D* = Delete Pending When you initially upload records to the RI Item Upload table, the unprocessed records display on the *Work with Retail Item Upload Screen* with a blank *Sts (Status)* field. When you select *Process File* to process and edit the item upload records, the system updates all records with the appropriate status. Only records in *E* status remain visible at the Work with Retail Item Upload Screen so that you can correct them. Alphanumeric, 1 position; optional.
Processed Date	The date the item upload record was processed. This date is used to update the Created date and the Last change date in the Item table. This date is visible as the *Last chg date (Last change date)* field in Creating and Maintaining Items (MITM). Numeric, 7 positions (CYYMMDD format); optional.
Processed Time	The time the item upload record was processed. This time is used to update the Created time and Maintained time in the Item table. Numeric, 6 positions (HHMMSS format); optional.

Field	Description
Fields for 01 Item/SKU record type	See *Basic errors*, *Item errors*, and *SKU errors*. **Note:** This table currently does not contain the *External info* field; however, you can update this field on the Change Item screen.
Allow SKUs	Indicates whether the item is available in various styles, such as color, size, etc. Valid values are: • *Y* = This item has SKUs associated with it. • *N* = There are no SKUs associated with this item. Enter *Y* in this field when you pass an *01* (Item/SKU), *04* (SKU Offer), *06* (SKU Price) or *07* (Vendor Item) *Record Type* for upload records containing a SKU code. Does not default from the ***DFLT ITEM Item/SKU*. If you leave this field blank, the system looks at the SKU field; if the SKU field contains a value, the system updates this flag to *Y*; if the SKU field does not contain a value, the system updates this flag to *N*. Alphanumeric, 1 position; optional.
Cub val	The cubic volume of the item. Controls the number of units of the item that can fit into a carton. Numeric, 7 positions with a 1-place decimal; optional.
Drop Ship	Indicates whether you ship the item from your warehouse, or have your vendor ship it to the customer directly. Valid values are: • *Y* = When a customer orders the item, you order the item from your vendor and the vendor ships it directly to your customer. • *N* = You ship the item from your warehouse. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Height	The height measurement for an item. The Height, Length, and Width values determine the cubic volume of an item. Can be entered in feet or centimeters, or any other measurement as long as it is consistent. Numeric, 3 positions; optional.

Field	Description
Kit Type	Defines the type of kit or set functionality represented by this item. Valid values: • *S* = Set • *V* = Variable set • *Blank* = none of the above **Note:** You cannot link set component items to the main set item through the item upload; you must do this within Order Administration after you create the item/SKU records. Alphanumeric, 1 position; optional.
Length	The length measurement for an item. The Height, Length, and Width values determine the cubic volume of an item. Can be entered in feet or centimeters, or any other measurement as long as it is consistent. Numeric, 3 positions; optional.
Long SKU Style	A user-defined field representing the long SKU style defined for the item. If the *Require L/S Style (I94)* system control value is *selected*, the system requires a long SKU style when creating or updating a SKU and validates that the long SKU style code defined at the item level and SKU level are both unique values. **Note:** If the *Use Retail Integration (H26)* system control value is *selected*, the system ignores the setting of the *Require L/S Style (I94)* system control value. In this situation, the system requires a long SKU style when creating or updating an item, but it does not have to be unique. Alphanumeric, 20 positions; required if SCV H26 or SCV I94 is selected.
Retail Style #	A user-defined code used to identify the item. Alphanumeric, 20 positions; optional.
Long SKU Vendor	A user-defined field representing the long SKU vendor for the item/SKU. Alphanumeric, 7 positions; optional.
Standard Cost	The standard cost of the item. This is the cost that appears in the Default cost field in the Item table. Numeric, 13 positions with a 4-place decimal; optional.

Field	Description
Non-Inventory	Indicates whether inventory levels are maintained for the item. 1. *Y* = This is a non-inventory item. 2. *N* = This is a regular item that will be tracked. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Pieces Per Case	The system uses this value to determine the number of units that fit in a case when suggesting location placement. Numeric, 5 positions; optional.
Selling Qty	The selling quantity defines the required order quantity (or multiple of) for this item. For example, an item may be stocked in single units, but must be sold in quantities of 6 (or 12, or 18, etc.). Numeric, 5 positions; optional.
Selling Weight	Used to calculate the freight charge on an item when the *Freight method* on the order is *By Item* or *Flat Rt/Item*. Numeric, 7 positions with a 3-place decimal; optional.
Serial # Tracking	This field is not implemented; enter *N* in this field. Alphanumeric, 1 position; optional.
Ship Alone	Indicates how to ship this item. Valid value is: *S* = This item must ship by itself, and each unit prints on its own pick slip. Blank = This item can ship with other items. Alphanumeric, 1 position; optional.
Ship Weight	The actual shipping weight of the item. Numeric, 7 positions with a 3-place decimal; optional.
User Field 1	An informational field you can use according to your organization's specific requirements. Alphanumeric, 10 positions; optional.
User Field 2	An informational field you can use according to your organization’s specific requirements. Alphanumeric, 10 positions; optional.
User Field 3	An informational field you can use according to your organization’s specific requirements. Alphanumeric, 10 positions; optional.
User Field 4	An informational field you can use according to your organization’s specific requirements. Alphanumeric, 10 positions; optional.
Width	The width measurement for an item. The Height, Length, and Width values determine the cubic volume of an item. Can be entered in feet or centimeters, or any other measurement as long as it is consistent. Numeric, 3 positions; optional.

Field	Description
Allow % discount?	Determines whether certain discounts can be applied to the item. • *Y* = This item is discountable. • *N* = This item is not discountable. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Oversize	Determines whether this item is considered an oversized item. • *Y* = This is an oversized item. • *N* = This is not an oversized item. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Description (Item description)	The description of the item. Does not default from the ***DFLT ITEM Item/SKU*. **Note:** Although you can create an item with a description of up to 120 positions, you cannot save a record at the *Change Item Upload - Item/SKU Screens* if the description exceeds 40 positions. Alphanumeric, 120 positions; required.
Second Language Desc	The second language description for the item. Alphanumeric, 40 positions; optional.
Exclude From Flex Pay	Determines whether this item is excluded from deferred and installment payment plans. Valid values are: • *Y* = Exclude this item from deferred and installment payment plans. • *N* = Do not exclude this item from deferred and installment payment plans. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.

Field	Description
Royalty	Indicates whether sales of the item require royalty payments to an author or owner, and is used for query and reporting purposes only. Valid values are: 1. *Y* = This is a royalty item. 2. *N* = This is not a royalty item. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Membership	Indicates that the item represents a membership program, which you can use to generate periodic orders to a customer. Valid values are: • *Y* = This is a membership item. • *N* = This is not a membership item. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Qty Threshold	You can use this field to indicate when to trigger an automatic download of item availability information to an extract table; from there, the information is available to a web storefront if you use the *E-Commerce Interface*. This download allows you to display an item's availability status to web customers if your web storefront supports it. **Note:** Although this field has a 9.0 length in the RI Item Upload table, you can only pass a 5-position value. If you pass more than 5 numbers, the edit program displays an error message: `Quantity must be limited to 99999`. Numeric, 9 positions; optional.
SVC type	A code that indicates the item is a stored value card, and whether the stored value card is a physical or virtual card. • *blank* (default) = The item is not a stored value card. • *P* = The item is a physical stored value card. • *E* = The item is a physical stored value card and, as soon as the stored value card is processed through billing, the system sends an email notification to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and is in the process of being delivered. • *V* = The item is a virtual (non-physical) stored value card. See *Creating a Stored Value Card Item* for more information on setting up a stored value card item. Alphanumeric, 1 position; optional.

Field	Description
Buyer	The person who is authorized to make purchases for your company. Buyer codes are defined in and validated against the Buyer table; see *Working with Buyers (WBUY)*. Alphanumeric, 3 positions; optional.
CTN ID # (SKU) (Carton ID)	The type of carton in which this item must be shipped. **Note:** This field is not currently implemented. Numeric, 2 positions; optional.
Inventory Value G/L #	This field is not implemented. Numeric, 8 positions; optional.
Code (Hazard code)	A user-defined code used to categorize an item as a hazardous material that requires special storage and/or handling. Validated against the Item Hazard table; see *Working with Hazardous Item Codes (WHAZ)*. Numeric, 2 positions; optional.
Item Class	A user-defined code that identifies a group of items. This code is validated against the Item Class table; see *Working with Item Classes (WICL)*. An item class code is required if the *Require Item Class in Work with Items (F06)* system control value is *selected*. Alphanumeric, 3 positions; required if SCV F06 is selected.
SKU Group	A code that represents a group of common characteristics of a SKU item. SKU Group codes are defined in and validated against the SKU Group table; see *Working with SKU Groups (WISG)*. Numeric, 3 positions; optional.
STS (Status)	A code that represents an item's status, such as obsolete, discontinued, etc. This information is used for inventory reporting purposes, to assign a future arrival date, or to prevent the Item Selection screen from listing the item. See *Working with Item Status (WIST)* for background. Alphanumeric, 1 position; optional.
Location Class	A code that represents a location type, such as caged area, etc. Validated against the location class table; see *Creating and Maintaining Location Classes (WLCL)*. Alphanumeric, 2 positions; optional.

Field	Description
Class (Long SKU class)	A code to group items into classes for reporting purposes. Required if the *Use Retail Integration (H26)* or *Require L/S Class (I93)* system control value is selected. **Long SKU Class** If the *Use Retail Integration (H26)* system control value is *unselected*, the system validates this field against the Long SKU Class table. Long SKU classes have only one value to an organization. For example, Long SKU Class 15 may be Men's Shoes, and will remain Men's Shoes regardless of the department. For more information see *Working with Long SKU Classes (WLSC)*. **Retail Class** If the *Use Retail Integration (H26)* system control value is *selected*, the system validates this field against the Retail Class table instead of the Long SKU Class table. Long SKU classes that are linked to long SKU departments are called retail classes. Retail classes are department specific. For example, Retail Class 10 may be Ties within Department 20 (Men's Apparel), but within Department 30 (Women's Apparel) Retail Class 10 may be Slacks. See the *Work with Retail Class Screen*. If you pass a new retail class code to Order Administration, the system reads the long SKU department code (whether new or existing) with the new retail class code and creates the retail class and description. If you do not pass a long SKU department code and a long SKU department code does not default from the ***DFLT ITEM Item/SKU*, the system displays an error message: `Long SKU Department required`. If you enter an invalid combination of codes or do not enter a long SKU department code, the system displays an error message: `Invalid Long SKU Class/Department combination for item`. If you leave this field blank and a retail class code does not default from the ***DFLT ITEM Item/SKU*, the system displays an error message: `Item Long SKU Class required`. Numeric, 4 positions; required if SCV H26 or SCV I93 is selected and you are using an 01 record type.
Department (L/S department)	A code used to group items into departments for reporting purposes. Required if the *Use Retail Integration (H26)* or *Require L/S Department (I92)* system control value is selected. Long SKU departments are defined in and validated against the Long SKU Department table; see *Working with Long SKU Departments (WLSD)*. When using Retail Integration from an external system into Order Administration, long SKU classes are linked to long SKU departments and become retail classes. You can pass a new or existing long SKU department code with a new or existing retail class code and the system creates the long SKU department and the associated retail class. If you do not pass a long SKU department code and one does not default, the system displays an error message: `Long SKU Department required`.

Field	Description
	If you enter an invalid combination of codes or do not enter a long SKU department code, the system displays an error message: `Invalid Long SKU Class/Department combination for item`. If the *Require Long SKU Division with Long SKU Department (E85)* system control value is *selected*, you must enter a value in the *L/S Division* field or use a L/S department code that already has a L/S division code assigned to it. If the system creates the long SKU department, the system will also create the long SKU division if it does not already exist. However, if the long SKU department does not need to be created, the system will not create the long SKU division if it does not already exist. Numeric, 4 positions; required if SCV H26 or SCV I92 is selected and you are using an 01 record type.
L/S Division	A code that represents a long SKU division. L/S divisions are used in conjunction with L/S departments and L/S classes for reporting purposes and to create a company or entity hierarchy. Long SKU division codes are defined in and validated against the L/S Division table. If the *Require Long SKU Division with Long SKU Department (E85)* system control value is *selected*, you must specify a long SKU division when the long SKU department is either new, or does not have a L/S division associated with it. If the long L/S department already exists and is already assigned a L/S division, you do not need to enter a L/S division code. If the L/S division is new, the system creates a new code in the L/S Division table, but only if the system is also creating the long SKU department. **Note:** Although the long SKU division field is 4 positions elsewhere, the RI Item Upload table supports just 3 positions. Alphanumeric, 3 positions; required if the Require L/S Division with L/S Department (E85) system control value is selected and you are passing a new L/S department value.
UOM (Unit of Measure)	A standard by which an item is sold. Typical units of measure include: • *EA* = each • *IN* = inches • *C12* = case of 12 Validated against the Unit of Measure table (see *Working with Units of Measure (WUOM)*). If you leave this field blank, defaults from the *Default Item Unit of Measure (B33)* system control value. Alphanumeric, 3 positions; optional.

Field	Description
Vendor #	A code that defines the vendor or supplier of an item. Vendor codes are defined in and validated against the Vendor table; see *Working with Vendors (WVEN)*. Numeric, 7 positions; optional.
Ship Via Code	A code that represents the carrier that must be used when shipping this item. Numeric, 2 positions; optional.
Manufacturer Vendor	The vendor who manufactured the item. Numeric, 7 positions; optional.
Entity Number	A business unit within your company that is held accountable for sales performance; for example, mail order, retail, or e-commerce. If the system control value *Require Entity in Item File (G44)* is *selected*, you must enter an entity code for each item you set up; entity codes for items and SKUs are defined at the item level. Informational only. Numeric, 3 positions; optional.
Season	Defines the season associated with this item, such as spring. Season codes are defined in and validated against the Season table; see *Working with Season Codes (WSEA)*. Alphanumeric, 3 positions; optional.
Collating Seq #	The sequence number used to determine the order in which SKUs sort. You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphanumerically by SKU code. Required if the *Require Sort Sequence Number in the SKU File (F23)* system control value is *selected*. See *SKU Sort Sequence Numbers* for an overview. Numeric, 5 positions; required if the Require Sort Sequence Number system control value is selected.
Compatibility	A user-defined code assigned to an item/SKU. Alphanumeric, 3 positions; optional.
SKU Last purchase cost	The cost of the item from the most recent purchase order, including any discounts, surcharges, or additional charges. Numeric, 13 positions with a 4-place decimal; optional.
Cub val (Cubing value)	The cubic volume of the SKU, which overrides the cubic volume defined at the base item level. Numeric, 7 positions with a 1-place decimal; optional.
SKU Description	The description of the SKU element. If no value is passed, the SKU description will be blank. Alphanumeric, 40 positions; optional.

Field	Description
Subscription	Indicates whether the item is a subscription item. Valid values are: 1. *Y* = Item is a subscription item. 2. *N* = Item is not a subscription item. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU* If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. If you identify an item as a subscription item, you must: 1. enter *Y* in the *Non-Inventory* field to indicate that inventory levels are not maintained for the subscription item and that customer will be billed (the full price of the subscription) immediately through Express Billing. 2. create a record for the subscription in the Item Subscriptions table to define the particulars of the subscription, such as the current issue number, length of subscription (number of intervals and number of days between issues). See *Working with Item Subscriptions (WISB)*. Alphanumeric, 1 position; optional.
Height Override	The height measurement for a SKU. The Height, Length, and Width values are used to determine the cubic volume of an item/SKU. You can enter the height in feet or centimeters, or any other measurement as long as it is consistent. Numeric, 3 positions; optional.
Length Override	The length measurement for a SKU. The Height, Length, and Width values are used to determine the cubic volume of an item/SKU. You can enter this value in feet or centimeters, or any other measurement as long as it is consistent. Numeric, 3 positions; optional.
List Price	The system uses this price when you process item to item transfers (inventory transaction code = *G*). Numeric, 13 positions with a 2-place decimal; optional (required if you process item to item transfers).
Long SKU Color	A code, typically used in a retail environment, that represents the color portion of the long SKU code. Used for reporting purposes. Numeric, 5 positions; optional.
Long SKU Size	A code, typically used in a retail environment, that represents the size portion of the long SKU code. Used for reporting purposes. Numeric, 5 positions; optional.
Long SKU Width	A code, typically used in a retail environment, that represents the width portion of the Long SKU code. Used for reporting purposes. Numeric, 5 positions; optional.
Lowest Price	The lowest recommended sale price for the item/SKU; however, the item/SKU can be sold at a lower price. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Max Qty for Location	The SKU's recommended maximum number of units to be stored in the primary pick location. The primary pick location refers to the code that you pass in the *Location* field. Numeric, 7 positions; optional.
Max Qty for Warehouse	The SKU's recommended maximum number of units for the warehouse specified in the *Whs (Warehouse)* field. Numeric, 7 positions; optional.
Min Qty for Location	The SKU's recommended minimum quantity to be stored in the primary pick location. The primary pick location refers to the code that you pass in the *Location* field. Numeric, 7 positions; optional.
Min Qty for Warehouse	The SKU's recommended minimum number of units for the warehouse specified in the *Whs (Warehouse)* field. Numeric, 7 positions; optional.
SKU Gift Certificate	This field is not implemented; enter *N* for this field. Alphanumeric, 1 position; optional.
Reserve Qty Limit	If the order quantity exceeds this amount, the system will not reserve the item/SKU and will display the Backorder Reason. Numeric, 7 positions; optional.
Restrict Orders	Indicates whether you can accept an order for this item/SKU in Order Entry and whether demand is captured. • *Y* = The operator cannot accept an order for this item/SKU. • *N* = The operator can accept an order for this item/SKU. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Retail Ref #	Represents the retail reference or alternate product number. You can use this value to cross-reference an item/SKU to an external system, such as through the *Generic Inventory Transaction Upload* or the *Generic Order Interface (Order API).* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Numeric, 15 positions; optional.
Selling Weight Override	The system uses this value to calculate the freight charge on a SKU when the *Freight method* on the order is *By Item* or *Flat Rt/Item*. Overrides the selling weight, if any, defined at the base item level. Numeric, 7 positions with a 3-place decimal; optional.

Field	Description
Short SKU	A unique number that the system assigns to all items and SKUs unless you pass a value for the item/SKU in the item upload. • For add *01* (Item/SKU) records, leave this field blank to have the system assign a unique short SKU number to the item/SKU. The system does not default the short SKU defined for the ***DFLT ITEM Item/SKU* to a new item/SKU. • For change *01* (Item/SKU) records, create the ***DFTCHG Item/SKU* so that existing items/SKUs retain their assigned short SKU number; however, even if you pass a short SKU number for a change 01 record, the system retains the existing short SKU number that is assigned to the item/SKU. Numeric, 7 positions; optional.
User field 1	An informational field you can use according to your organization's specific requirements. Alphanumeric, 10 positions; optional.
User field 2	An informational field you can use according to your organization’s specific requirements. Alphanumeric, 10 positions; optional.
User field 3	An informational field you can use according to your organization’s specific requirements. Alphanumeric, 10 positions; optional.
Weight Override	The actual shipping weight of the SKU. The system may use this value to calculate carton weights and to determine your shipping charges if you perform manual confirmation and use cubing. Numeric, 7 positions with a 3-place decimal; optional.
Width Override	The width measurement for an SKU. The Height, Length, and Width values are used to determine the cubic volume of an item/SKU. You can enter this value in feet or centimeters, or any other measurement as long as it is consistent. Numeric, 3 positions; optional.
Sale Credit Flag	Not implemented. Alphanumeric, 1 position; optional.
Harmonize Code	A code that prints on customs documents for international shipments. Alphanumeric, 16 positions; optional.
Coord group (Coordinate group items?)	A code that may be assigned to item/SKUs to ensure that certain item/SKUs ship together when ordered together. Numeric, 3 positions; optional.
Average Cost	A method to determine the cost of an item. Not currently implemented. Numeric, 13 positions with a 4-place decimal; optional.
FIFO Cost	A method to determine the cost of an item. Not currently implemented. Numeric, 13 positions with a 4-place decimal; optional.
LIFO Cost	A method to determine the cost of an item. Not currently implemented. Numeric, 13 positions with a 4-place decimal; optional.
Standard Cost	The defined cost of the item. The system does not calculate a new standard cost automatically. Numeric, 13 positions with a 4-place decimal; optional.

Field	Description
Second language description	Not currently implemented. Alphanumeric, 40 positions; optional.
VAT exempt flag	Indicates if the item is exempt from VAT. • *Y* = The item is exempt from VAT. • *N* = The item is not exempt from VAT. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Second Compatibility	A user-defined code assigned to the item. Alphanumeric, 3 positions; optional.
Hidden Tax Amount	The amount to include in the Hidden tax field for an item subject to VAT. Numeric, 13 positions with a 2-place decimal; optional.
Hidden Tax Percent	The percentage to use when calculating hidden tax for an item subject to VAT. See *How Hidden Tax is Calculated by Percentage* for more information. Numeric, 5 positions with a 2-place decimal; optional.
Suppress B/O Card	Indicates whether to produce a backorder card for the SKU. Valid values are: • *Y* = Suppress normal backorder card generation for this item. • *N* = Do not suppress normal backorder card generation. If you leave this field blank, the system defaults this value from the ***DFLT ITEM Item/SKU*. If the **DFLT ITEM (or NA SKU for the **DFLT ITEM) does not exist, the system defaults this value from the *Unconditional Suppression of Backorder Card (F19)* system control value. If this system control value is blank, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Projected Returns	The number of units you expect to receive in returns for the item. Numeric, 7 positions; optional.
User Field 4	An informational field you can use according to your organization's specific requirements. Alphanumeric, 5 positions; optional.
User Field 5	An informational field you can use according to your organization's specific requirements. Alphanumeric, 5 positions; optional.
Returnable	Indicates whether the item is eligible for return; informational only. Valid values are: • *Y* = The item is eligible for return • *N* (default) = This item is not eligible for return If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *N*. Alphanumeric, 1 position; optional.

Field	Description
Retail X-Ref #	Represents the UPC (Universal Product Code) or Retail Reference number for the SKU. Used for informational purposes. If you want the system to create an item UPC code, you must enter values in the *Fields for 08 Item UPC record type*. Numeric, 10 positions; optional.
L/S Style	The long SKU style defined for the SKU. If the *Require L/S Style (I94)* system control value is *selected*, the system requires a long SKU style when creating or updating a SKU and validates that the long SKU style code defined at the item level and SKU level are both unique values. **Note:** If the *Use Retail Integration (H26)* system control value is *selected*, the system ignores the setting of the *Require L/S Style (I94)* system control value. In this situation, the system requires a long SKU style when creating or updating an item, but it does not have to be unique. Alphanumeric, 20 positions; optional.
L/S Vendor	A user-defined field that represents the long SKU vendor for the item/SKU. Alphanumeric, 7 positions; optional.
Excl Store Restock	This field is not implemented; enter *N* in this field. Alphanumeric, 1 position; optional.
Original Retail Price	The original price of the item at the retail store. Numeric, 13 positions with a 2-place decimal; optional.
GTIN	Not currently implemented. Numeric, 14 positions; optional.
Commodity Code	Not currently implemented. Numeric, 8 positions; optional.
ABC Code	This field is not implemented. Alphanumeric, 1 position; optional.
Carton ID #	The type of carton in which this item must ship. **Note:** This field is not currently implemented. Numeric, 2 positions; optional.

Field	Description
Freq Code (Frequency code)	This code classifies the performance of a SKU based on the number of picks generated for the SKU over a month's time. **Note:** This field is not currently implemented. Alphanumeric, 1 position; optional.
Whs (Warehouse)	A code that represents a warehouse where this item is stocked. Warehouse codes are defined in and validated against the Warehouse table. See *Creating and Maintaining Warehouses (WWHS)*. If the ***DFLT ITEM Item/SKU* does not exist and you do not define a valid warehouse, the system defaults the warehouse defined in the *Default Warehouse (A04)* system control value. Numeric, 3 positions; required.
Location	A code that represents an area within the warehouse that contains the item/SKU. Sometimes referred to as the “primary primary.” Validated against the Location table. Alphanumeric, 7 positions; optional.
Soldout control code	A code that represents how you determine when an item/SKU is soldout. You can define a value in the *Default Soldout Control Code (D72)* system control value to default automatically when you create items and SKUs; however, you can override this value. See *Working with Soldout Controls (WSLD)*. Alphanumeric, 2 positions; optional.
UOM Type	A standard by which an item/SKU is sold. Validated against the Unit of Measure table (see *Working with Units of Measure (WUOM)*). Defaults from the *Default Item Unit of Measure (B33)* system control value if you have not defined a default value in the ***DFLT ITEM Item/SKU* or the **DFLT ITEM does not exist. Alphanumeric, 3 positions; optional.
SEO Code	SKU element 1. Alphanumeric, 4 positions; optional.
SEW Code	SKU element 2. Alphanumeric, 4 positions; optional.
SET Code	SKU element 3. Alphanumeric, 4 positions; optional.
Status	A code that represents a SKU's status, such as obsolete, discontinued, sold out, etc. This information is used for inventory reporting purposes. The status defined at the SKU level overrides the status defined at the base item level. See *Working with Item Status (WIST)* for background. Alphanumeric, 1 position; optional.

Field	Description
Category	A code assigned to the SKU to classify and group like item/SKUs for use in the Item Relationships function. Validated against the Item Category table; see *Working with Item Category Codes (WITG)*. Alphanumeric, 4 positions; optional.
Prep Code	A code used to indicate any special preparation or handling required for the SKU. Informational only. **Note:** This field is not currently implemented. Alphanumeric, 2 positions; optional.
Country of Origin	A code representing the country where the SKU originated. Country codes are defined in and validated against the Country table; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; optional.
L/S Class	A code to group items into classes for reporting purposes. Long SKU classes are defined in and validated against the Long SKU Class table; see *Working with Long SKU Classes (WLSC)*. If the *Use Retail Integration (H26)* system control value is *selected*, long SKU classes are linked to long SKU departments and are called retail classes. Retail classes are department specific whereas regular long SKU classes are unique and remain constant across departments. For this reason, when the *Use Retail Integration (H26)* system control value is *selected*, you can only enter a retail class in this field that is assigned to the base item's long SKU department. If you enter a long SKU class that is not linked to the base item's long SKU department, the system will not let you proceed and displays an error message: `L/S Class (xxxx) was not found in L/S Department (xx).` Retail classes are defined in and validated against the Retail Class table; see the *Work with Retail Class Screen* for more information. Numeric, 4 positions; optional.
Zone Reservation	A code assigned to weather-sensitive items/SKUs such as plant stock to insure that the items will ship to different regions of the country within time windows suited to the regions. See *Shipping Zone Reservation Overview*. Alphanumeric, 4 positions; optional.

Field	Description
OROB Eligible	Indicates whether to include this item when: 1. sending item and inventory information from Order Administration to Order Orchestration through a stored procedure; however, this flag does not control whether to include the item through an API that uses an XML message, such as the *Generic Item Download API* or the *Generic Inventory Download API*. For more information see the Web Services Guide on My Oracle Support (ID 2953017.1). 2. sending backordered order lines to Order Orchestration for fulfillment. See *Order Orchestration Integration* for an overview, and see *Rules for Submitting Backorders to Order Orchestration* for more rules that govern eligibility for Order Orchestration. Valid values: • *Y* = Include this item when you use a stored procedure to send item and inventory information to Order Orchestration; also, the item is eligible to be sent to Order Orchestration for fulfillment, provided it meets the other *Rules for Submitting Backorders to Order Orchestration*. • *N* = Do not include this item when you use the stored procedure to send item and inventory information to Order Orchestration; also, the item is not eligible to be sent to Order Orchestration for fulfillment. If you leave this field blank, it defaults from the ***DFLT ITEM Item/SKU*. If the ***DFLT ITEM Item/SKU* does not exist, the system defaults this field to *Y*. Alphanumeric, 1 position; optional.
ITM Image Link	The URL to the location of the item image on the external image hosting application. No validation. See *Item Image/Info Link Screen*. Updates the ITM Image Link field in the Item table. Alphanumeric, 256 positions; optional.
ITM Info Link	The URL to the location of the item information on the external image hosting application. No validation. See *Item Image/Info Link Screen*. Updates the ITM Info Link field in the Item table. Alphanumeric, 256 positions; optional.
SKU Image Link	The URL to the location of the SKU image on the external image hosting application. No validation. See *Item Image/Info Link Screen*. Updates the SKU Image Link field in the SKU table. Alphanumeric, 256 positions; optional.
SKU Info Link	The URL to the location of the SKU information on the external image hosting application. No validation. See *Item Image/Info Link Screen*. Updates the SKU Info Link field in the SKU table. Alphanumeric, 256 positions; optional.
ITM Tag Type	This field is not implemented. Alphanumeric, 2 positions; optional.
Fields for 03 Item Offer record type	See *Item Offer errors*.

Field	Description
Offer for Item Offer	The code for the offer (catalog) in which the item/SKU appears. Validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required (if other information is entered).
Cost	Not implemented. Numeric, 7 positions with a 2-place decimal; optional.
Expected Return Pct	Not implemented. Numeric, 5 positions with a 2-place decimal; optional.
G/W Flag	Indicates whether this SKU is eligible for gift wrap. Valid values: 1. *Y* = The item/SKU can be gift wrapped. 2. *N* = In this offer, the item/SKU cannot be gift wrapped. If you leave this field blank, the system defaults *Y* to this field if the *Gift Wrap Default (F07)* system control value is *selected*; otherwise, this field defaults to *N*. Alphanumeric, 1 position; optional.
G/W Price	The price for gift wrapping the item. The G/W field must be *Y*. The gift wrap price will be charged for each unit of this SKU that is gift wrapped. Numeric, 13 positions with a 2-place decimal; optional.
Page #	Not implemented. Numeric, 5 positions; optional.
Projected Units	Not implemented. Numeric, 7 positions; optional.
S/H Price	The price that will be charged for special handling. Numeric, 13 positions with a 2-place decimal; optional.
S/H Flag	Indicates whether this item is eligible for any type of special handling in this offer (such as, monogramming, hemming, etc.). • *Y* = This item is eligible for special handling. • *N* = This item is not eligible for special handling. If you leave this field blank, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Square Inches	Not implemented. Numeric, 5 positions with a 2-place decimal; optional.
Freight	The freight amount to be charged for this item/SKU. Multiplied by the quantity ordered to determine the freight charge for this item. Used only if the *Freight method* field for the Source Code table is set to *By Item* or *Flat Rt/Item*. Numeric, 13 positions with a 2-place decimal; optional.
Hidden Freight	Used only with item/SKU level freight methods, such as: *Flat Rt/Item*, *Flat Rt/Qy*, *Flat Rt/Itm Src*, and *By Item*. Hidden freight represents the portion of the item's catalog price that is used for freight. Numeric, 13 positions with a 2-place decimal; optional.
Spread	Not implemented. Alphanumeric, 3 positions; optional.

Field	Description
Volume Discount Y/N	Indicates whether this item is eligible for an end-of-order discount that will be applied when you accept the order during Order Entry. • *Y* = The item/SKU is eligible for the volume discount. • *N* = The item/SKU is not eligible for the volume discount. If you leave this field blank, the system defaults this field to *N*. See *Item Volume Discounting*. Alphanumeric, 1 position; optional.
Coupon Disc %	Represents the amount that is subtracted from the price when the SKU is ordered from this offer. Numeric, 7 positions with a 2-place decimal; optional.
Coupon Effective Date	The date the coupon is effective until (i.e., the date expires). Numeric, 7 positions (CYYMMDD format); optional.
Feature/ option	Indicates whether the item is considered a featured or optional item in a depiction. Valid values are: • *F* = Item is the featured item in the depiction • *O* = Item is an optional item in the depiction Alphanumeric, 1 position; optional.
Pickup/new	Indicates whether the item has been carried over from a previous offer or is new to your product offerings. Valid values are: • *P* = Item is a pickup item, previously sold in an offer • *N* = Item is a new addition to your offer Alphanumeric, 1 position; optional.
Pop Up Message 1-4	For optional message lines. Alphanumeric, 30 positions each; optional.
Warranty Item?	Indicates whether the item in this offer is a warranty item. Valid values are: • *Y* = The item in this offer is a warranty item. When an operator adds this item to an order in order entry or order maintenance, the system adds the item to the order at no charge. • *N* = The item in this offer is not a warranty item. If you leave this field blank, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Require Add Reason	Indicates whether an *Order addition reason code* is required when the item in this offer is added to an order in order entry or order maintenance. Valid values are: • *Y* = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. • *N* = The item is this offer does not require an add reason code when the item is added to an order in order entry or order maintenance. If you leave this field blank, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Curve Code	Not implemented. Numeric, 3 positions; optional.

Field	Description
Add'l chg code	The additional charge code associated with the type of special handling you are offering for the item. The system validates that the additional charge code is defined as special handling, with a Type of standard or custom; the system handles each type in a different way. See *Special Handling Overview* for more information. Alphanumeric, 2 positions; optional.
Add-On Code	Not currently implemented. Alphanumeric, 3 positions; optional.
Fields for 04 SKU Offer record type	See *SKU Offer errors*.
Offer for SKU Offer	The code for the offer (catalog) in which the item/SKU appears. Validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required (if other information is entered).
Cost	Not implemented. Numeric, 7 positions with a 2-place decimal; optional.
Expected Return Pct	Not implemented. Numeric, 5 positions with a 2-place decimal; optional.
G/W Flag	Indicates whether this SKU is eligible for gift wrap. Valid values: • *Y* = The item/SKU can be gift wrapped. • *N* = In this offer, the item/SKU cannot be gift wrapped. If you leave this field blank, the system defaults *Y* to this field if the *Gift Wrap Default (F07)* system control value is *selected*; otherwise, this field defaults to *N*. Alphanumeric, 1 position; optional.
Page #	Not implemented. Numeric, 5 positions; optional.
Projected Units	Not implemented. Numeric, 7 positions; optional.
S/H Price	The price that will be charged for special handling. Numeric, 13 positions with a 2-place decimal; optional.
S/H Flag	Indicates whether this item is eligible for any type of special handling in this offer (such as, monogramming, hemming, etc.). • *Y* = This item is eligible for special handling. • *N* = This item is not eligible for special handling. If you leave this field blank, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Square Inches	Not implemented. Numeric, 5 positions with a 2-place decimal; optional.
G/W Price	The price for gift wrapping the item. The G/W field must be *Y*. The gift wrap price will be charged for each unit of this SKU that is gift wrapped. Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Freight	The freight amount to be charged for this item/SKU. Multiplied by the quantity ordered to determine the freight charge for this item. Used only if the *Freight method* field for the Source Code table is set to *By Item* or *Flat Rt/Item*. Numeric, 13 positions with a 2-place decimal; optional.
Hidden Freight	Used only with item/SKU level freight methods, such as: *Flat Rt/Item*, *Flat Rt/Qty*, *Flat Rt/Itm Src*, and *By Item*. Hidden freight represents the portion of the item's catalog price that is used for freight. Numeric, 13 positions with a 2-place decimal; optional.
Coupon discount %	Represents the amount that is subtracted from the price when the SKU is ordered from this offer. Numeric, 7 positions with a 2-place decimal; optional.
Coupon Effective	The date the coupon is effective until (i.e., the date expires). Numeric, 7 positions (CYYMMDD format); optional.
Volume disc?	Indicates whether this item is eligible for an end-of-order discount that will be applied when you accept the order during Order Entry. • *Y* = The item/SKU is eligible for the volume discount. • *N* = The item/SKU is not eligible for the volume discount. If you leave this field blank, the system defaults this field to *N*. See *Item Volume Discounting*. Alphanumeric, 1 position; optional.
Spread	Not implemented. Alphanumeric, 3 positions; optional.
Feature/ Option	Indicates whether the item is considered a featured or optional item in a depiction. Valid values are: • *F* = Item is the featured item in the depiction • *O* = Item is an optional item in the depiction Alphanumeric, 1 position; optional.
Pickup/New	Indicates whether the item has been carried over from a previous offer or is new to your product offerings. Valid values are: • *P* = Item is a pickup item, previously sold in an offer • *N* = Item is a new addition to your offer Alphanumeric, 1 position; optional.
Warranty Item?	Indicates whether the item/SKU in this offer is a warranty item. Valid values are: • *Y* = The item/SKU in this offer is a warranty item. When an operator adds this item/SKU to an order in order entry or order maintenance, the system adds the item to the order at no charge. • *N* = The item/SKU in this offer is not a warranty item. If you leave this field blank, the system defaults this field to *N*. Alphanumeric, 1 position; optional.

Field	Description
Required Add Reason?	Indicates whether an *Order addition reason code* is required when the item in this offer is added to an order in order entry or order maintenance. Valid values are: • *Y* = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. • *N* = The item is this offer does not require an add reason code when the item is added to an order in order entry or order maintenance. If you leave this field blank, the system defaults this field to *N*. Alphanumeric, 1 position; optional.
Curve Code	Not implemented. Numeric, 3 positions; optional.
Add'l chg	The additional charge code associated with the type of special handling you are offering for the item. The system validates that the additional charge code is defined as special handling, with a Type of standard or custom; the system handles each type in a different way. See *Special Handling Overview* for more information. Alphanumeric, 2 positions; optional.
Add-On Code	Not currently implemented. Alphanumeric, 3 positions; optional.
Fields for 05 Item Price record type	See *Item Price errors*.
Offer for Item Price	The code for the offer (catalog) in which the item appears. Validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
Effective Date	The date the price or quantity break discount becomes valid. Numeric, 7 positions (CYYMMDD format); required.
Qty	The amount of an item that the customer must order to receive the discounted (quantity break) price. Numeric, 7 positions; required.
Associate Price	The price at which the item will be sold in this offer to associate customers. Numeric, 13 positions with a 2-place decimal; optional.
Price	The price at which the item will be sold in this offer, if no discounts are applied, and the order date is on or after the effective date. If the *Tax Included in Price (E70)* system control value is unselected, you must define a price; if this system control value is selected, you can define a price or tax inclusive price. Numeric, 13 positions with a 2-place decimal; required if SCV E70 is unselected.
Price Column	The pricing column associated with the price entered. In the Customer table, you may assign a customer to a pricing column. This means that the customer will be charged the column price, even if the customer does not order the number of units specified for the price break. Alphanumeric, 2 positions; optional.

Field	Description
Tax Inclusive Associate Price	The price at which the item will be sold in this offer to associate customers on orders subject to VAT. Numeric, 13 positions with a 2-place decimal; optional.
Tax Incl Price	The price at which the item will be sold in this offer on orders subject to VAT. When an order is subject to VAT, tax does not accumulate in the Tax bucket on the order; instead, the customer pays a tax-inclusive price for the items and VAT is included as a “hidden tax” on the order detail line. If the *Tax Included in Price (E70)* system control value is unselected, you must define a price; if this system control value is selected, you can define a price or tax inclusive price. Numeric, 13 positions with a 2-place decimal; optional.
No Charge?	Indicates whether this item/SKU is eligible for any type of special handling in this offer (such as, monogramming, hemming, etc.). • *Y* = The item/SKU is eligible for special handling. • *N* = The item/SKU is not eligible for special handling. **Note:** This field is not currently implemented. Alphanumeric, 1 position; optional.
Fields for 06 SKU Price record type	See *SKU Price errors*.
Offer SKU Price	The code for the offer (catalog) in which the SKU appears. Validated against the Offer table. See *Working with Offers (WOFR)*. Alphanumeric, 3 positions; required.
Effective Date	The date the price or quantity break discount becomes valid. Numeric, 7 positions (CYYMMDD format); required.
SKU Price Qty	The amount of a SKU that the customer must order to receive the discounted (quantity break) price. Numeric, 7 positions; required.
Associate Price	The price at which the SKU will be sold in this offer to associate customers. Numeric, 13 positions with a 2-place decimal; optional.
Price	The price at which the SKU will be sold in this offer, if no discounts are applied, and the order date is on or after than the effective date. If the *Tax Included in Price (E70)* system control value is unselected, you must define a price; if this system control value is selected, you can define a price or tax inclusive price. Numeric, 13 positions with a 2-place decimal; required if SCV E70 is unselected.
Price Column	The pricing column associated with the price entered. In the Customer table, you may assign a customer to a pricing column. This means that the customer will be charged the column price, even if the customer does not order the number of units specified for the price break. Alphanumeric, 2 positions; optional.

Field	Description
Tax Inclusive Associate Price	The price at which the SKU will be sold in this offer to associate customers on orders subject to VAT. Numeric, 13 positions with a 2-place decimal; optional.
Tax Incl Price	The price at which the SKU will be sold in this offer on orders subject to VAT. If the *Tax Included in Price (E70)* system control value is unselected, you must define a price; if this system control value is selected, you can define a price or tax inclusive price. Numeric, 13 positions with a 2-place decimal; optional.
No Charge?	Indicates whether this item/SKU is eligible for any type of special handling in this offer (such as, monogramming, hemming, etc.). • *Y* = The item/SKU is eligible for special handling. • *N* = The item/SKU is not eligible for special handling. **Note:** This field is not currently implemented. Alphanumeric, 1 position; optional.
Fields for 07 Vendor Item record type	See *Vendor Item errors*.
Vendor Number	A code that defines the supplier of an item. Defined in and validated against the Vendor table. See *Working with Vendors (WVEN)*. Numeric, 7 positions; required.
Item (Vendor item)	The code you use to identify a vendor item. If an item has SKUs, you must define the vendor item code at the SKU level. If you are creating a vendor item for a SKU, you must specify a *Key Type* that will be able to identify the SKU in Order Administration. For example, if you enter the *RS* key type and enter the base item's retail style number, you must also enter the SKU code of the SKU. If you are entering a change request, you cannot change the vendor item; instead, you need to create a new record. Alphanumeric, 20 positions; required.
Cubic Volume	The cubic volume of the item, as defined by the vendor; used for informational purposes only. Numeric, 5 positions; optional.
Description	The description of the item, as defined by the vendor. Alphanumeric, 30 positions; required.
Lead Days	The number of days it takes a vendor to deliver this item when it is ordered through a purchase order. Numeric, 3 positions; optional.
Message Line 1-3	An informational message that you can use for reporting purposes. Up to 3 lines of messages are available for free-form text, such as special packing instructions. Alphanumeric, 30 positions (each line); optional.

Field	Description
Min Qty	The minimum unit quantity of merchandise you are required to order from the vendor. Numeric, 7 positions; optional.
Price	Represents the vendor's list price for this item. Numeric,13 positions with a 4-place decimal; optional.
Ship Weight	The shipping weight of the item, as defined by the vendor. Numeric, 7 positions with a 3-place decimal; optional.
Vendor ord qty multiple	The number of units by which your order quantity must be divisible when you order this item from this vendor. Numeric, 5 positions; optional.
Ship Via	A code that represents the carrier used when shipping this item to your company. If you pass a vendor item PO ship via code, it defaults on a vendor item purchase order line automatically, but you can override it. Validated against the PO Ship Via table. Numeric, 2 positions; optional.
UOM Type (SKU)	The vendor's *Unit of measure* for an item (e.g. C12 = case of 12, GRS = gross). The system validates this unit of measure against the Unit of Measure table. Alphanumeric, 3 positions; optional.
Country of Origin	A code representing the country where the vendor item originated. Country codes are defined in and validated against the Country table; see *Setting Up the Country Table (WCTY)*. Alphanumeric, 3 positions; optional.
Fields for 08 Item UPC record type	See *Item UPC errors*.
UPC Type	The type of UPC code. Informational only. Valid values are: • *E13* = EAN-13, indicating a 13 position UPC code; however Order Administration does not validate the UPC length. • *E8* = EAN-8, indicating an 8 position UPC code; however, Order Administration does not validate the UPC length. • *UA* = UPC-A, indicating a 12 position UPC code; however Order Administration does not validate the UPC length. • *UE* = UPC-E, indicating a 6 position UPC code; however Order Administration does not validate the UPC length. Alphanumeric, 3 positions; required.
UPC	A UPC code defined for the item/SKU, including any leading zeros. *Example:* If the UPC code is *06012011*, the UPC code passed should be `06012011` and not `6012011`. Alphanumeric, 14 positions; required.
UPC Vendor Nbr	A user-defined code that identifies the supplier of the item/SKU UPC. Defined in and validated against the Vendor table. See *Working with Vendors (WVEN)*. Numeric, 7 positions; optional.

Field	Description
Fields for 09 Item Coordinate record type	See *Item Coordinate errors*.
Coordinate Item	The related item you are coordinating to the primary item (identified in the *Item* field) for cross-selling purposes. Item codes are defined in and validated against the Item table. **Note:** If you specify a *SKU* in an item coordinate request, the system ignores it; item coordinates are assigned to the base item only, not to individual SKUs. Alphanumeric, 12 positions; required.
ICN Coordinate Item Type	A code representing a type of item coordinate, such as mandatory or optional. If you do not specify a coordinate type in a change request, the system clears the existing coordinate type assignment. Coordinate type codes are defined in and validated against the Item Coordinate Type table; see *Working with Item Coordinate Types (WICT)*. Alphanumeric, 2 positions; optional.
Message	A persuasive or descriptive message to display on the item coordinate pop-up window in order entry. If you do not specify a message in a change request, the system clears the existing message. Alphanumeric, 70 positions; optional.
ICN Coordinate SKU	The coordinate item's unique characteristics, such as its color or size. Required if the coordinate item has SKUs. 1. If you define a SKU for the coordinate item that is not already defined for the primary item, the system creates a new Item Coordinate record for the primary item. 2. If you define a SKU for the coordinate item that is already defined for the primary item, the system updates the Coordinate type and Message values for the existing Item Coordinate record. Alphanumeric, three 4-position fields; required if the item has SKUs.

Work with Retail Item Upload Screen

Purpose: Use this screen to process batch item upload records, then review and correct the records with errors.

All batch records that you pass to the *RI Item Upload Table (RIIUPP)* using the process described under *RI Item Upload Process* or *Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration* display on this screen with a blank status. You can process the batch by selecting *Process File* to submit the RI_UPLD job. Any records that are in error remain on this screen, and the system places the record(s) in error status (*E*).

How to display this screen: Enter *RIIU* in the Fast Path at the top of any menu or select Work with Retail item Upload from a menu.

Field	Description
Date	The date you created the item upload record. Numeric, 6 positions; optional.
Record type	Indicates the item/SKU information you want to add, change, or delete. Valid values are: • Item/SKU • Item Offer • SKU Offer • Item Price • SKU Price • Vendor Item • Item UPC • Item Coordinate Fields in the RI Item Upload table are categorized by record type and this code determines the group of item/SKU information fields that the item upload program evaluates to create or update an item/SKU. **Note:** Although the record type description is listed on this screen, each record type is identified by a numeric code in the table. For example, an Item/SKU is record type *01*. *Example:* If you want to change a SKUs price information, you enter a SKU Price record type. Even if all the fields in the item upload record are populated for that SKU, the system will only pass information in the nine SKU price fields. **Note:** If you maintain values (a change *Request Type*) for different record types and you leave blank fields in the item upload record, the system updates the associated tables with blanks. **Item/SKU Record Type (01)** When passing information to Order Administration, you must build upon values passed in this record type. For example, you cannot create a vendor item record type until you have first created the item/SKU record type).

Field	Description
	The system considers fields associated with this record type. Of these fields, the following are required when the *Use Retail Integration (H26)* system control value is *selected*: • L/S style • L/S vendor • Item description • L/S class • L/S department • L/S division (if the *Require Long SKU Division with Long SKU Department (E85)* system control value is *selected*, AND you are passing a new L/S Department value) • Item class (if the *Require Item Class in Work with Items (F06)* system control value is *selected*) See *Fields for 01 Item/SKU record type*. Creating an item/SKU record is the only instance where the item and SKU code fields are evaluated outside of the *Key Type*, and the only instance where the item identifier values for the key type do not have to be specified. *Example:* When creating an item/SKU (an add *Request Type* for an *01* record type), you must pass an *Item* code unless you have the *Auto Assign Item # (D46)* system control value *selected*. If you do not enter an item code, a message indicates: `Missing Item/SKU for Key Type IT`. You must also pass a *SKU* code in the above situation (an add *Request Type* for an *01* record type) when the *Allow SKUs* field is *selected*. **Note:** When you pass an add request for the *01* record type and leave various fields blank, the system tries to default values from the **DFLT ITEM or system control values. See *Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG*. **Item Offer Record Type (03)** The system considers fields associated with this record type. The Offer for item offer field is required. See *Fields for 03 Item Offer record type*. **SKU Offer Record Type (04)** The system considers fields associated with this record type. The SKU offer for SKU offer field is required. See *Fields for 04 SKU Offer record type*.

Field	Description
	Item Price Record Type (05) The system considers the fields associated with the item price record type. These fields are required: • Offer for item price • Effective date • Quantity • Price See *Fields for 05 Item Price record type*. You cannot create an item price record until you have created an item offer record. **SKU Price Record Type (06)** The system considers the fields associated with the SKU price record type. These fields are required: • Offer for SKU price • SKP effective date • SKP quantity • SKP price See *Fields for 06 SKU Price record type*. You cannot create a SKU price record without first creating a SKU offer record. **07 Vendor Item Record Type** The system considers the fields associated with the vendor item record type. These fields are required: • Vendor for vendor item record • item code • Description See *Fields for 07 Vendor Item record type*. If the item for which you are creating a vendor item has SKUs, you must enter a code in the *SKU* field for the item upload record. **08 UPC Record Type** The system considers the fields associated with the UPC record type. The UPC type and UPC code are required. See *Fields for 08 Item UPC record type*. **09 Item Coordinate Record Type** The system considers the fields associated with the item coordinate record type. The Item coordinate is always required, and the Coordinate SKU is required if the coordinate item has SKUs. See *Fields for 09 Item Coordinate record type*. **Optional.**

Field	Description
Req type (Request Type)	A code that defines whether you create or change item/SKU information. Valid values are: • *Add* = Add record; however, if the system finds a record in the Order Administration database that matches the information in the RI Item Upload record, the system updates the existing record. • *Maintain* = Change record; however, if the system cannot find a record in the Order Administration database that matches the information in the RI Item Upload record, the system creates a new record. • *Blank* = The system compares the information in the RI Item Upload record to the existing records in the Order Administration database. • If the system cannot match the RI Item Upload record to an existing record in the Order Administration database, the system considers the RI Item Upload record an add request. • If the system can match the RI Item Upload record to an existing record in the Order Administration database, the system considers the RI Item Upload record a change request. **Add Request Type** You can pass numerous add requests for the same item/SKU with these record types: • *03* (item offer) • *04* (SKU offer) • *05* (item price) • *06* (SKU price) • *07* (vendor item) • *08* (UPC record type) • *09* (item coordinate) You can also pass multiple add requests for the same item (record type *01*) as long as you are creating a new SKU for that base item. See the *Record Type* field description for more information. When adding an item/SKU (*01* record type), the system tries to default values whenever you leave a record type *01* field blank. The system looks to the **DFLT item and system control values to default values whenever possible. See *Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG*. **Change Request Type** You can pass multiple change requests for all record types; however, the fields associated with the specified record type are overwritten with the most recent information you pass for that record type. Do not pass a change request trying to update only one or two fields.

Field	Description
	Example: You want to change the effective date for a SKU price record (*C* request type, *06* record type). Assuming you enter identifier Key Type values and the system can find the SKU associated with the item upload record, if you enter the required fields for a SKU price record, updating the effective date but you leave the other fields that the system considers for the SKU price Record Type blank, the system updates the table with the values you entered in the required fields, and overwrites the rest of the data in the table with blanks. **Note:** The system overwrites data from blank fields passed in change requests for every record type except the *01* item/SKU record type. With this record type, the system defaults values whenever possible, either from the **DFLT ITEM or from system control values. See *Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG*. Optional.
Key type (IUP Key Type)	Defines the field values the system evaluates in order to identify the Order Administration item or SKU associated with an item upload record. Valid value is *Item/SKU*. The Item and SKU fields identify the item and SKU associated with the item upload record. The Item field is required and optionally the SKU field if you want to change information for a specific SKU. If the item contains SKUs and you do not enter a SKU code, the system maintains the base item for an item-level Record Type. A message indicates if you do not enter a code in the Item and SKU fields. Optional.
Key	The information that the system/translation program retrieved to identify the item or SKU associated with the item upload record. If the system maps the record to an item/SKU within Order Administration, the item/SKU's full information is shown here. Alphanumeric, 30 positions; display-only.

Field	Description
Sts (Status)	The status of the item upload record. Valid values are: • *Unprocessed* or blank = The item upload record is waiting to be processed. • *Batch Selected* = The item upload record contains the *Record Type* that is currently selected to process. • *In Process* = The item upload record is part of the batch of 1000 records that is currently being processed. • *Other Updates* = The item upload record is being processed by the secondary job *RISECU* that creates item download triggers and data warehouse triggers. • *Deleted* = The item upload record will be deleted from the table. • *Error* = The item upload record contains errors. • *Processed* = The item upload record has been processed. When you pass records to the RI Item Upload table, the Upload Translation program creates unprocessed records that display on the *Work with Retail Item Upload Screen* with a blank *Sts (Status)* field. When you select *Process File* to process and edit the item upload records, the system updates all records with the appropriate status. Only records in *Error* status remain visible at the Work with Retail Item Upload Screen so that you can correct them. Optional.

Screen Option	Procedure
Process item upload records	Select *Process File* to edit and process batch item upload records. See *RI Item Upload Process* for more information on how the system edits and populates the tables. The system submits the *RI_UPLD* job. *Periodic function:* You can also schedule this process to run periodically by setting up the RIUPLD function using the PFR0084 program. See *Scheduling Jobs* for background.
Change an item upload record	Select *Change* for an item upload record to advance to one of the *Change Item Upload Screens*.

Note:

You cannot change an item upload record if its status is *B* (Batch Selected), *I* (In Process), *S* (Other Updates) or *P* (Processed).

Screen Option	Procedure
Delete an item upload record	Select *Delete* for an item upload record to delete it. When you process the batch (select *Process File*), the system deletes the item upload record from the RI Item Upload table. **Note:** You cannot delete an item upload record if its status is *B* (Batch Selected), *I* (In Process), *S* (Other Updates) or *P* (Processed).
Display an item upload record	Select *Display* for an item upload record to advance to one of the *Display Item Upload Screens*.
Errors	Select *Errors* for an item upload record to advance to the *Work with Retail Item Upload Errors Screen*.
Delete all records that currently exist in the *RI Item Upload Table (RIIUPP)*, across all companies	Select *Delete All*. At the Are you sure you want to delete? window, select *Delete* to delete all records; otherwise, select *Exit* to cancel.
Print an item upload error report	Select *Print Error Report* to print the *Item Upload Error Report*. The system submits the *RI_ERROR* job.

Change Item Upload Screens

Purpose: Use these screens to correct batch item upload records with errors.

The system displays different information on the Change screens based on the information in the item upload record. For example, vendor item information is indicated for an item upload record containing vendor item information.

E2 Key screen: If you do not enter one of the keys to the table for the item upload record, you advance to an E2 Key Screen and are not able to advance to these screens to correct the errors.

Note:

You cannot change an item upload record if its status is *B* (Batch Selected), *I* (In Process), *S* (Other Updates) or *P* (Processed).

The following types of change screens exist:

- *Change Item Upload - Item/SKU Screens*
- *Change Item Upload - Item Offer Screens*
- *Change Item Upload - SKU Offer Screens*
- *Change Item Upload - Item Price Screen*
- *Change Item Upload - SKU Price Screen*

- *Change Item Upload - Vendor Item Screen*
- *Change Item Upload - Item UPC Screen*
- *Change Item Upload - Item Coordinate Screen*

Change Item Upload - Item/SKU Screens

Purpose: Use these screens to work with item upload records containing item/SKU information (*01* Item/SKU record type).

Default values:

- If you use the ***DFLT ITEM Item/SKU* to default values, the system does not default these values until you correct any errors.
- If you use the ***DFTCHG Item/SKU* to keep the existing values for an item/SKU and only update the fields defined in the item upload, the system defaults the retained values to the Change Item Upload - Item/SKU screens.

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 01 Item/SKU record type*.

Change Item Upload - Item Offer Screens

Purpose: Use these screens to work with item upload records containing item/offer information (*03* record type).

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 03 Item Offer record type*.

Change Item Upload - SKU Offer Screens

Purpose: Use these screens to work with item upload records containing SKU/offer information (*04* record type).

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 04 SKU Offer record type*.

Change Item Upload - Item Price Screen

Purpose: Use this screen to work with item upload records containing item/price information (*05* record type).

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 05 Item Price record type*.

Change Item Upload - SKU Price Screen

Purpose: Use this screen to work with item upload records containing SKU/price information (*06* record type).

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 06 SKU Price record type*.

Change Item Upload - Vendor Item Screen

Purpose: Use this screen to work with item upload records containing vendor/item information (*07* record type).

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 07 Vendor Item record type*.

Change Item Upload - Item UPC Screen

Purpose: Use this screen to work with item upload records containing item/UPC information (*08* record type).

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 08 Item UPC record type*.

Change Item Upload - Item Coordinate Screen

Purpose: Use this screen to work with item upload records containing item coordinate (*09* record type).

For field descriptions see *Keys to the table: fields that are required for all record types* and *Fields for 09 Item Coordinate record type*.

Display Item Upload Screens

To display: Select *Display* for an item upload record at the *Work with Retail Item Upload Screen* to advance to one of the Display Item Upload Screens. The *Record Type* of the item upload record determines the category of information that is indicated. See the *Change Item Upload Screens* for the different types of screens that display and see *RI Item Upload Table (RIIUPP)* for an explanation of the fields.

Work with Retail Item Upload Errors Screen

Purpose: Use this screen to review all errors associated with an item upload record, to review the values you passed for the keys to the table such as the created date, record type, request type, and key type, and to review the key information the translation program found for an Order Administration item associated with the item upload record.

Once you perform the *RI Item Upload Process* by selecting *Process* for the item upload batch at the *Work with Retail Item Upload Screen*, all item upload records that contain errors display in three places:

- the Retail Integration Item Upload Error table
- the *Item Upload Error Report*
- the *Work with Retail Item Upload Screen*

How to display this screen: Select *Errors* for an item upload record at the *Work with Retail Item Upload Screen*.

The top portion of the screen displays the key information you passed to the item upload table for the item upload record. See *Work with Retail Item Upload Screen* for descriptions of these fields.

> **Note:**
>
> If you do not enter values for all the *Keys to the table: fields that are required for all record types*, you will receive an error message displaying which value(s) you are missing. However, you cannot change these values here. You must delete the item upload record, and re-send it with the required corrections.

Retail Item Upload Errors

The following table lists some of the most common errors the Retail Item Translation Program and the Retail Integration Edit Program find during *RI Item Upload Process*.

Types of errors include:

- *Basic errors*
- *Item errors*
- *SKU errors*
- *Item Offer errors*
- *SKU Offer errors*
- *Item Price errors*
- *SKU Price errors*
- *Vendor Item errors*
- *Item UPC errors*
- *Item Coordinate errors*

Error Code	Error Message	Problem
Basic errors		See *Keys to the table: fields that are required for all record types* and *Fields for 01 Item/SKU record type*.
IA	Invalid Season for Item.	The *Season* field contains an invalid value.
IB	SKU Group can only be entered for items which have SKUs.	The *SKU Group* field must be blank if the item is not SKUed.
IC	Item Drop ship and Non-inventory are mutually exclusive.	The *Drop Ship*field is *selected* and the item is a non-inventory item.
ID	Item Drop ship and Kit Type 'S' are mutually exclusive.	The *Drop Ship* field is *selected* and the item is a set item.
IE	Entity required.	The *Entity Number* field is required.
IF	Item Long SKU Style required.	The *Long SKU Style* field is required for the item.
IG	Item Long SKU Vendor required.	The *Long SKU Vendor* field is required for the item.

Error Code	Error Message	Problem
IH	Quantity must be limited to 99999.	The *Qty Threshold* field must be less than or equal to 5 positions.
GA	Invalid Company	The *Company* does not exist.
GB	Company required	The *Company* is required.
GC	Item required.	The *Item* is required because the system could not identify the item based on the information passed for the RI Item Upload record.
GD	Invalid Item	You tried to add an 03-08 record type without first creating the item/SKU (01 record type).
GE	SKU is required for this record type.	The *SKU* is required.
GF	Invalid record type for an item without skus.	The *Record Type* is invalid for the item.
GG	Invalid SKU.	The *SKU* is invalid.
GH	Invalid record type.	The *Record Type* is invalid.
GI	Invalid request type.	The *Request Type* is invalid.
IN	Change of Allow SKUs is not allowed.	You cannot change the *Allow SKUs* field to *N* because SKUs exist.
IO	Invalid SVC code	You entered an invalid value in the *SVC type* field. • Valid values are: • 1. *blank* (default) = The item is not a stored value card. 2. *P* = The stored value card item is a physical card. 3. *E* = The stored value card is a physical card and, as soon as the stored value card is processed through billing, the system sends an email notification to the ship to customer on the order, notifying the customer that a stored value card has been purchased and is in the process of being delivered. 4. *V* = The stored value card is a virtual (non-physical) card.
IP	Item L/S Style is Not Unique	The *Require L/S Style (I94)* system control value is *selected* and the *Long SKU Style* defined at the item level is also assigned to another item or SKU.
K1	Missing company	The *Company* field requires a value.
K2	Missing date	The *Record Created Date* field requires a value.
K4	Missing record type	The *Record Type* field requires a value.
KI	Missing Item/SKU for Key Type IT.	You must enter an *Item* if the Key type is IT.
KT	Invalid key type for record.	The *Key Type* field is invalid. The key type must be *IT*. If you pass an invalid key type for an *01* Item/SKU record type, the system automatically corrects it.

Error Code	Error Message	Problem
SC	Multiple primary locations for this Item/SKU not allowed.	The SKU already had a primary location and the *Allow Multiple Primary Item Locations (D12)* system control value is set to *NOT ALLOW*.
SD	SKU Long SKU Style required.	The *Require L/S Style (I94)* system control value is *selected* and a *L/S Style* is not defined at the SKU level.
SE	SKU Long SKU Style is not unique.	The *Require L/S Style (I94)* system control value is *selected* and the *L/S Style* defined at the SKU level is also assigned to another item or SKU.
Q1	Error on Query	The current batch of 1000 RI Item Upload records failed to process because someone was creating or updating item/SKU information in Order Administration at the same time the RI Item Upload process was processing a record for the same item/SKU information. For example, you would get this error if someone was creating an item at the same time the RI Item Upload process was trying to create this same item. In this situation, the system updates the status of all of the records in the batch to *E* (Error) with the reason Error on Query.
Item errors		See *Fields for 01 Item/SKU record type*.
10	Invalid Long SKU Department.	The *Department (L/S department)* field contains an invalid value.
11	Long SKU Department required.	The *Department (L/S department)* field does not contain a value.
12	Long SKU Division required.	The *L/S Division* field does not contain a value. This field is required if the *Require Long SKU Division with Long SKU Department (E85)* system control value is *selected* and you are passing a new *Department (L/S department)* value.
13	Invalid Long SKU Division.	The *L/S Division* field contains an invalid value.
14	Invalid UOM Type for item.	The *UOM (Unit of Measure)* field for the item contains an invalid value.
15	UOM - Item Required.	The *UOM (Unit of Measure)* field for the item does not contain a value.
16	Invalid Vendor for Item.	The *Vendor #* field for the item contains an invalid value.
17	Invalid Ship Via for Item	The *Ship Via Code* field for the item contains an invalid value.
18	Invalid Manufacturing Vendor for Item.	The *Manufacturer Vendor* field for the item contains an invalid value.
19	Invalid Entity for Item.	The *Entity Number* field for the item contains an invalid value.
1D	Invalid Kit Type	The *Kit Type* field must be *S*, *F*, or *V*.
1G	Invalid Ship Alone flag.	The *Ship Alone* field must be *S* or blank.

Error Code	Error Message	Problem
1J	Item Description required.	The *Description (Item description)* field is blank and requires a value.
1N	Invalid buyer for item.	The *Buyer* field contains an invalid value.
1Q	Invalid Hazard Code	The *Code (Hazard code)* field contains an invalid value.
1R	Invalid Item Class for item.	The *Item Class* field contains an invalid value for the item.
1S	Item Class Required	The *Item Class* field does not contain a value.
1U	Invalid Item SKU Group code for item.	The *SKU Group* field contains an invalid value.
1V	Invalid Item Status for item.	The *STS (Status)* field for the item contains an invalid value.
1W	Invalid Location Class	The *Location Class* field contains an invalid value.
1Y	Invalid Long SKU Class for item.	The *Class (Long SKU class)* field contains an invalid value.
1Z	Item Long SKU Class required.	The *Class (Long SKU class)* field does not contain a value.
SKU errors		See *Fields for 01 Item/SKU record type*.
20	SKU Crt - SKU Exists	The SKU you are trying to create already exists.
21	Subscription must be defined as non-inventory.	The *Subscription* field must contain a *Y* or *N*.
22	Must enter hidden tax amount OR hidden tax percent.	You can enter a value in the *Hidden Tax Amount* field OR *Hidden Tax Percent* field, but not both.
24	Sort Sequence # required for SKU.	The *Collating Seq #* field must contain a value.
25	SKU not eligible for zone reservation code.	The *Zone Reservation* field must be blank for the SKU.
26	Coordinate Group (999) cannot be assigned to a Set/ Component item.	You cannot enter a value in the *Coord group (Coordinate group items?)* field for a set item.
2L	Invalid Warehouse code.	The *Whs (Warehouse)* field contains an invalid value.
2M	Warehouse is Required.	The *Whs (Warehouse)* field does not contain a value.
2N	Invalid Location code.	The *Location* field contains an invalid value.
2O	Invalid Sold Out Control code.	The *Soldout control code* field contains an invalid value.

Error Code	Error Message	Problem
2P	Invalid UOM Type for SKU	The *UOM Type* field for the SKU contains an invalid value.
2Q	Invalid Item Status for SKU	The *Status* field contains an invalid value for the SKU.
2R	Invalid category for SKU.	The *Category* field contains an invalid value for the SKU.
2T	Invalid Country of origin for SKU	The *Country of Origin* field contains an invalid value for the SKU.
2U	Invalid Long Sku Class for SKU.	The *L/S Class* field contains an invalid value for the SKU.
2V	Invalid Long SKU Class/Department combination for SKU.	The *L/S Class* and *Department (L/S department)* combination is invalid for the SKU.
2W	Invalid Zone Reservation for SKU.	The *Zone Reservation* field contains an invalid value.
2X	Invalid SKU Element 1	The *SKU* field contains an invalid value for SKU element 1.
2Y	Invalid SKU Element 2	The *SKU* field contains an invalid value for SKU element 2.
2Z	Invalid SKU Element 3	The *SKU* field contains an invalid value for SKU element 3.
Item Offer errors		See *Fields for 03 Item Offer record type*.
3A	Invalid Offer for Item	The *Offer for Item Offer* field contains an invalid value for the item.
3B	Offer is Required for item	The *Offer for Item Offer* field does not contain a value for the item.
3C	Item Offer Create - Item/Offer Exists	The *Offer for Item Offer* you are trying to create already exists.
3D	Invalid Item Offer	The *Offer for Item Offer* field contains an invalid value.
3H	Invalid Feature/ Option flag on Item Offer.	The *Feature/option* field contains an invalid value for the item offer.
3I	Invalid Pickup/New flag on Item Offer.	The *Pickup/new* field contains an invalid value for the item offer.
3M	Invalid Additional Charge code on item offer.	The *Add'l chg code* field contains an invalid value for the item offer.
3N	Invalid Add-On code on item offer.	The *Add-On Code* field contains an invalid value for the item offer.
3P	Spcl Hand price not allowed on item offer when not eligible.	The *S/H Price* field does not contain a value for the item offer.

Error Code	Error Message	Problem
3Q	Spcl Hand code not allowed on item offer when not eligible.	The *S/H Flag* field does not contain a value for the item offer.
3R	Invalid Coupon Expiration Date on Item Offer	The *Coupon Effective* field contains an invalid date. The date must be in CYYMMDD format.
SKU Offer errors		See *Fields for 04 SKU Offer record type*.
4A	Invalid Offer for SKU	The *Offer for SKU Offer* field contains an invalid value for the SKU.
4B	Offer is required for SKU.	The *Offer for SKU Offer* field does not contain a value for the SKU.
4C	SKU Offer Create - SKU/Offer Exists	You cannot create the *Offer for SKU Offer* because it already exists.
4D	Invalid SKU Offer	The *Offer for SKU Offer* you are trying to create is invalid.
4H	Invalid Feature/ Option flag on SKU Offer.	The *Feature/Option* field contains an invalid value for the SKU offer.
4I	Invalid Pickup/New flag on SKU Offer.	The *Pickup/New* field contains an invalid value for the SKU offer.
4M	Invalid Additional Charge code on SKU offer.	The additional charge code in the *Add'l chg* field is invalid for the SKU offer.
4N	Invalid Add-On code on SKU offer.	The add-on code in the *Add-On Code* field is invalid for the SKU offer.
4P	Spcl Hand price not allowed on SKU offer when not eligible.	The *S/H Price* field does not contain a value for the SKU offer.
4Q	Spcl Hand code not allowed on SKU offer when not eligible.	The *S/H Flag* field does not contain a value for the SKU offer.
4R	Invalid Coupon Expiration Date on SKU Offer	The *Coupon Effective* field contains an invalid date. The date must be in CYYMMDD format.
Item Price errors		See *Fields for 05 Item Price record type*.
5A	Invalid Offer for Item Price	The *Offer for Item Price* defined for the item price is invalid.
5B	Offer is required for item price.	The *Offer for Item Price* field does not contain a value for the item price.
5C	Effective date is required for item price.	The *Effective Date* field does not contain a value for the item price.

Error Code	Error Message	Problem
5D	Quantity is Required for Item Price	The *Qty* field does not contain a value for the item price.
5E	Itm Price Crt - Item Price Exists	You cannot create the item price because it already exists.
5F	Invalid item effective date or quantity.	The *Effective Date* or *Qty* is not valid for the item price record.
5G	Price required on item price.	The *Price* field does not contain a value for the item price.
5H	Invalid Effective Date on Item Price	The *Effective Date* field contains an invalid date. The date must be in CYYMMDD format.
5I	Price cannot be negative on item price.	The *Price* field contains a negative value for the item price.
5J	Invalid item offer for item price.	The item offer price is invalid.
SKU Price errors		See *Fields for 06 SKU Price record type*.
6A	Invalid Offer for SKU Price	The *Offer SKU Price* is invalid for the SKU price.
6B	Offer is required for SKU price.	The *Offer SKU Price* field does not contain a value for the SKU price.
6C	Effective date is required for SKU price.	The *Effective Date* field does not contain a value for the SKU price.
6D	Quantity is required for SKU price.	The *SKU Price Qty* field does not contain a value for the SKU price.
6E	SKU Price Crt - SKU Price Exists	You cannot create the SKU price because it already exists.
6F	Invalid sku effective date or quantity.	The *Effective Date* or *SKU Price Qty* is not valid for the SKU price record.
6G	Price required on Sku price.	The *Price* field does not contain a value for the SKU price.
6H	Invalid Effective Date on SKU Price	The *Effective Date* field contains an invalid date. The date must be in CYYMMDD format.
6I	Price cannot be negative on Sku price.	The *Price* field contains a negative value for the SKU price.
6J	Invalid sku offer for sku price.	The SKU offer is invalid for the SKU price.
Vendor Item errors		See *Fields for 07 Vendor Item record type*.

Error Code	Error Message	Problem
7A	Invalid Vendor for Vendor Item.	The *Vendor Number* field contains an invalid value for the vendor item.
7B	Vendor is required for vendor item.	The *Vendor Number* field does not contain a value for the vendor item.
7C	Vendor Item code is required for vendor item.	The *Item (Vendor item)* field does not contain a value for the vendor item.
7D	VIT Crt - VIT Exists	You cannot create the vendor item because it already exists.
7E	Invalid vendor item.	The *Item (Vendor item)* is invalid.
7F	Vendor Item Description required.	The *Description* field is required for vendor item.
7G	Invalid PO Ship Via code on Vendor Item.	The *Ship Via* field contains an invalid value for vendor item.
7H	Invalid UOM Type for Vendor Item.	The *UOM Type (SKU)* field contains an invalid value for vendor item.
7I	Invalid country of origin for Vendor Item.	The *Country of Origin* field contains an invalid value for vendor item.
Item UPC errors		See *Fields for 08 Item UPC record type*.
8A	UPC type is required for Item UPC.	The *UPC Type* field is required.
8B	UPC # is required for Item UPC.	The *UPC* field is required.
8C	UPC Crt - UPC exists	You cannot create the UPC because it already exists.
8D	Invalid Item UPC	The *UPC* for the item is invalid.
8E	Invalid Vendor on Item UPC.	The *UPC Vendor Nbr* defined for the *UPC* is invalid.
8F	UPC already assigned to xxxx. (where xxxx is item and sku)	The *UPC* is already assigned to another item/SKU.
8G	UPC Length is Invalid	The *UPC* length is invalid for the *UPC Type*. Not currently implemented.
8H	UPC type is invalid for Item UPC	The *UPC Type* is invalid.
Item Coordinate errors		See *Fields for 09 Item Coordinate record type*.
9A	Invalid Item Coordinate	The *Coordinate Item* specified does not exist.

Error Code	Error Message	Problem
9B	Invalid Item Coordinate Type.	The *ICN Coordinate Item Type* specified does not exist.
9C	Invalid Coordinate SKU.	A SKU is specified for a non-SKUed item, or the SKU specified for a SKUed item does not exist.
9D	Item Coordinate is required.	No *Coordinate Item* is specified.
9E	Can't add Item Coordinate because Item Coordinate already ex	The non-SKUed coordinate item specified for an Add request is already assigned to the item.
9F	Can't add Coordinate SKU. Coordinate SKU already exists.	The specified SKU of the coordinate item specified for an Add request is already assigned to the item.
9G	Coordinate SKU is required for SKU'ed item.	There is no coordinate SKU specified for the coordinate item, and it is a SKU'd item.

Creating and Maintaining Long SKU Divisions (WLDV)

Purpose: Use the Work with Long SKU Division menu option to create, change, delete or display long SKU division codes. Long SKU divisions are used in conjunction with long SKU departments and long SKU classes to establish a hierarchy within a company or entity, usually in a retail environment. For example, a company can have Men's, Women's and Children's divisions, with the same departments such as Apparel, Shoes, and Accessories, with different classes in those departments.

The *Require Long SKU Division with Long SKU Department (E85)* system control value determines whether you must specify a long SKU division with a long SKU department.

Uploading: Options to import long SKU divisions include:

- *Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS)*
- *Importing Item-Related Supporting Data (SDUP)*

In this topic:

- *Work with Long SKU Division Screen*
- *Create Long SKU Division Screen*

Work with Long SKU Division Screen

How to display this screen: Enter *WLDV* in the Fast Path at the top of any menu or select Work with Long SKU Division from a menu.

Field	Description
Div (Division)	A code that represents a long SKU division. L/S divisions are used in conjunction with long SKU departments and long SKU classes for reporting purposes and to create a hierarchy within a company or entity. Long SKU division codes are defined in and validated against the L/S Division table. If the *Require Long SKU Division with Long SKU Department (E85)* system control value is *selected*, you must specify a long SKU division when you create, or maintain an existing, long SKU department, or in specific situations when you populate the *RI Item Upload Table (RIIUPP)*. See *L/S Division* for more information. Alphanumeric, 4 positions; optional.
Description	The description of the long SKU division. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a L/S Division	Select *Create* to advance to the *Create Long SKU Division Screen*.
Change L/S Division information	Select *Change* for a long SKU division to advance to the Change Long SKU Division Screen. At this screen, you can change just the Description. See the *Create Long SKU Division Screen* for field descriptions.
Delete a L/S Division	Select *Delete* for a long SKU division to delete it. Even if long SKU departments are linked to this L/S division, you can still delete the division code. The next time you maintain the L/S department value, you receive an error message that the L/S division does not exist. You must then select or create a valid L/S division code.
Display a L/S Division	Select *Display* for a long SKU division to advance to the Display Long SKU Division Screen. You cannot change any information at this screen. See the *Create Long SKU Division Screen* for field descriptions.
Print a L/S Division list	Select *Print List* for a long SKU division to print it.

Create Long SKU Division Screen

Purpose: Use this screen to create a long SKU division.

How to display this screen: Select *Create* at the *Work with Long SKU Division Screen*.

Field	Description
L/S Division	A code that represents a long SKU division. L/S divisions are used in conjunction with long SKU departments and long SKU classes for reporting purposes and to create a hierarchy within a company or entity. Long SKU division codes are defined in and validated against the L/S Division table. If the *Require Long SKU Division with Long SKU Department (E85)* system control value is *selected*, you must specify a long SKU division when you create, or maintain an existing, long SKU department, or in specific situations when you populate the *RI Item Upload Table (RIIUPP)*. See *L/S Division* for more information. Alphanumeric, 4 positions. Create screen: required. Change screen: display-only.
Description	The description of the long SKU division. Alphanumeric, 30 positions; required.

Order Entry

- Entering Orders
- Working with Error Order Batches
- Generic Order Interface
- Order Entry Appendices (Integrations with AvaTax, Vertex, and Experian Data Quality (EDQ))

Entering Orders

Topic in this part: The following topics describe how to enter individual orders on the system as you receive them:

- Introducing Order Entry describes the process of entering orders on the system from a high-level point of view.
- Setting Defaults in Order Entry describes how to pre-define codes for several Order Entry fields.
- Selecting Customers in Order Entry describes how to select a customer for Order Entry.
- Entering Orders describes how to enter a complete order.
- Working with Items on the Order describes how to change, review or enhance information for items you have added to the order.
- Upselling the Customer in Order Entry describes several features available in the system that offer the customer discounts, incentive items, or free gifts, based on a quantity, item, source code, or offer on the order.
- Expanding the Address in Order Entry describes how to enter or verify additional address information that does not appear on the initial Order Entry screen.
- Using a Permanent Shipping Address in Order Entry describes how to specify a shipping address for the order that will be linked permanently to the customer who placed the order and may be used on future orders.
- Assigning an Order Shipping Address describes how to specify a shipping address for the order that will be linked to the current order only.
- Adding a Recipient Order in Order Entry describes how to enter the address to which the recipient or gift order will be shipped.
- Assigning a Billing Address in Order Entry describes how to specify a billing address for an order.
- Defining Order Properties describes several fields that are not available on the initial Order Entry screen that allow you to further define the order.
- Adding Order Messages describes how to add messages to the order for inquiry only or that may be printed on the invoice and/or pick slip.
- Adding Miscellaneous Charges or Credits in Order Entry describes how to add miscellaneous charges or credits to the order.

- Displaying More Options in Order Entry describes how to use options related to Order Entry that are not available on the Order Entry screens, including: Customer Action Notes, Customer Profile, Customer Messages, Void/Reprint Picks, and Order Totals (All Recipients).
- Inquiring into Item Availability (DIAV) describes how to select an item for the order prior to Order Entry, how to capture lost sales, review the current on-hand availability, review the quantity on-order with your suppliers, review the next expected delivery, review the quantities available at a given location in a warehouse, review the pending purchase order deliveries, and review important item information.
- Entering User Fields describes the Enter User Fields screen that may open automatically during Order Entry to capture any type of additional information about the customer.
- Working with Order Summary Information describes the Order Summary screen, which contains all items on the order and any recipient orders.
- Posting a Return or Exchange Through Order Entry describes the process of using Order Entry to enter a return or exchange if you do not have the original order on your system.
- Entering Customer Memberships in Order Entry describes how to create a customer membership by adding a membership item in order entry.
- Entering Coupon Promotions on an Order describes how to apply coupon discounts against an order or detail line.
- Working with an Order-Level Email Address describes how the system stores an email address specific to each order.
- Valid Ship Vias for Window describes the window you use to review all eligible ship vias for the order, including their overall shipping charges and expected delivery dates. Optionally, you can use this window to select a different ship via for the order.
- Tracking Order/Call Disposition Activity describes when the system captures order/call disposition activity.
- Entering Pre-Order Quotes describes how to create a pre-order for a customer listing the items the customer wishes to order and the order totals should the customer agree to place the order.
- Customer Engagement Loyalty Integration describes how to enroll sold to customers in the Oracle Retail Customer Engagement Loyalty program, review a customer’s loyalty points and awards balances, accrue points from completed purchases, and redeem awards as a pro-rated merchandise discount on an order.
- Customer Engagement Customer Wish List Integration describes how to review and modify a customer’s wish list from Oracle Retail Customer Engagement using the Display Wish List Screen in Order Management System.

Enter/Maintain Orders (OEOM)

> **Note:**

Work with Customer Call Log Screen (WCLL)

Purpose: Use this screen to review the call log entries that have been made for a customer or to make a new entry.

How to display this screen:

- Select Call Log at the Customer Selection Screen or the
- Enter WCLL in the *Fast path* field at the top of any menu, or select Work with CTI Customer Call Log from a menu

Field	Description
Customer	A number to identify the customer whose call log you are working with. If you advanced to this screen from the Customer Selection Screen and you were already reviewing information for a customer, this customer number and call log information defaults. To scan: You can enter the customer number in this field, or you can scan by clicking on the arrow. The Select Customer Sold To pop-up window opens. See the description of the Select Customer Sold To For Order Screen for complete field descriptions and instructions. *Numeric, 9 positions; required.*
Name	The customer's name, consisting of: **Prefix** A title (such as "Mrs." or "Dr.") that precedes the customer's name. *Alphanumeric, 3 positions; display-only.* **First Name** The Sold-to customer's first name. *Alphanumeric, 15 positions; display-only.* **Initial** The initial of the customer's middle name. *Alphanumeric, 1 position; display-only.* **Last Name** The customer's last name. *Alphanumeric, 25 positions; display-only.* **Suffix** An addition to the customer's full name (such as "M.D.," "Fr.," or "III"). *Alphanumeric, 3 positions, display-only.*
Company	The name of the company associated with the customer placing. *Alphanumeric, 30 positions; display-only.*
Street	The customer's street address. This is the primary delivery address. *Alphanumeric, 32 positions; display-only.*
Apt./suite	The apartment number or suite number associated with the customer's delivery address. *Alphanumeric, 10 positions; display-only.*
Postal code	The postal or zip code for this customer. *Alphanumeric, 10 positions; display-only.*
City	The city where the customer lives or receives mail or shipments. *Alphanumeric, 25 positions; display-only.*
St (State)	The state or province where the customer lives or receives mail or shipments. *Alphanumeric, 2 positions; display-only.*

Field	Description
Country	The code for the customer's country. Country codes are defined in and validated against the Country table. *Alphanumeric, 3 positions; display-only.*
Date	The date when the customer call log entry was made. *Numeric, 6 positions (in user date format); optional.*
Time	The time when the call log entry was made. *Numeric, 6 positions (HH:MM:SS format); display-only.*
In/out	Not currently implemented.
Operator	The operator who took or placed the call, or who created the entry. *Alphanumeric, 10 positions; display-only.*
Act (Activity)	Not currently implemented.
Comment (Unlabeled field below the other call log entry information)	The first line of up to three lines of comments or description entered. *Alphanumeric, 70 positions; display-only.*

Screen Option	Procedure
Enter a new call log entry	Select Create to advance to the Log Telephone Call Screen (Entering or Changing a Call).
Change a call log entry	Select Change for a log entry to advance to the Log Telephone Call Screen (Entering or Changing a Call).
Delete a call log entry	Select Delete for a log entry to delete it. The Delete Customer Call Log Records (A78) secured feature controls the ability to delete call log records.
Display a call log entry	Select Display for a log entry to advance to the Work with Customer Call Log Screen (WCLL). See Log Telephone Call Screen (Entering or Changing a Call) for field descriptions.
Place an outbound call	This option is not currently implemented.
Display additional customer information	Select Customer Inquiry to advance to the first Display Customer screen. See Creating and Updating Sold-to Customers (WCST).

Log Telephone Call Screen (Entering or Changing a Call)

Purpose: Use this screen to enter or change a CTI call log entry.

How to display this screen: Select Create at the Work with Customer Call Log Screen (WCLL).

> **Note:**
>
> You must first specify a customer number.

Field	Description
Customer	The number identifying the sold-to customer involved in the call. *Numeric, 9 positions; display-only.*
Company	The name of the company associated with the customer. *Alphanumeric, 30 positions; display-only.*
Name	The customer's name, consisting of: **Prefix** A title (such as "Mrs." or "Dr.") that precedes the customer's name. *Alphanumeric, 3 positions; display-only.* **First Name** The Sold-to customer's first name. *Alphanumeric, 15 positions; display-only.* **Initial** The initial of the customer's middle name. *Alphanumeric, 1 position; display-only.* **Last Name** The customer's last name. *Alphanumeric, 25 positions; display-only.* **Suffix** An addition to the customer's full name (such as "M.D.," "Fr.," or "III"). *Alphanumeric, 3 positions, display-only.*
Telephone	The telephone number involved in the call. *Numeric, 10 positions; optional.*
Call type	Not currently implemented.
Date	The date when the customer call log entry was made. *Numeric, 6 positions (in user date format); display-only.*
Time	The time when the call log entry was made. *Numeric, 6 positions (HH:MM:SS format); display-only.*
Operator	The operator who took or placed the call, or who created the entry. *Alphanumeric, 10 positions; display-only.*
Activity	A code representing the activity that triggered the call log entry. Valid values are: • **Call Connected** • **Call Busy** • **Call No Answer** • **other** *Blank = this is a system-created call log entry. The system creates call log entries automatically if the Update CTI Customer Call Log (F27) system control value is selected. This is not a valid value when you create or update a call log entry manually. *Required.*

Field	Description
Comments	Three lines for you to enter a comment on or description of the call. *Alphanumeric, 70 positions each; optional.*

Inquiring into Item Availability (DIAV)

Purpose: Use item availability to check:

- The quantity available to sell of an item
- The quantity on-order from your vendor
- The next expected delivery date for an item
- The soldout status of an item
- The quantity available for an item at a given location in the warehouse
- The pending purchase order deliveries
- pricing information for an item/SKU in a specific offer

You can also select this option if you need to:

- Capture a lost sale, if the customer decides not to order an item because it is not in stock. This enables you to track true demand for the item, and reevaluate the quantity of the item to purchase in the future.
- Select an item for an order in Order Entry using the “notepad” function. This tags the item for the next order you enter, allowing you to add the item to the order automatically.
- Inquire into availability in remote systems, such as store locations

How the system selects an offer to display and to use for posting lost sales: Any lost sales you enter in order entry (by selecting Lost Sale for the item and a lost sale quantity) post to the default Current Offer (A33) for your current company, indicated next to each item/SKU in item availability.

How the system selects an offer for pricing: See the Display Item/Offer Prices Screen for a description.

For more information:

- selecting cross-company scanning for your company: Working with Companies (WCMP)
- setting up offers: Working with Offers (WOFR)
- setting up item offers and SKU offers: Assigning Items/SKUs to Offers

In this topic:

- Display Item Availability Screen
  - Displaying Item Aliases
- Selecting Items Prior to Order Entry
  - Display Selected Items Window
- On Hand by Warehouse Screen (Reviewing Quantities On-hand by Warehouse)

- Display Item/Offer Prices Screen
- Capturing Lost Sales
- Display SKU Availability Screen

See also: Display SKUs Screen (Scanning Items by SKU Description) (DSKU)

Display Item Availability Screen

How to display this screen:

- Select Availability at the Select Customer Sold To For Order Screen or Item Availability at the Customer Selection Screen in Order Entry
- Enter DIAV in the *Fast Path* field at the top of any menu, or select Display Item Availability from a menu.

Restricted items, identified by a selected Restrict field in the SKU table, do not appear on the Item Availability screen.

This screen displays item availability only for items warehouses for which the Allocatable flag is selected.

When you first advance to this screen, items display in ascending item number, SKU code, warehouse code sequence.

Field	Description
Sts (Status)	A code displayed to the left of the item number that identifies the selling status code for your items, such as "discontinued." These codes can be used for sorting inventory reports. Item status codes are defined in and validated against the Item Status table. A status code is assigned to an item in the Status field in the Item table. See Working with Item Status (WIST) for background. *Alphanumeric, 1 position; display-only.*
Item	The code for an item that you sell. Item numbers are defined in and validated against the Item table. This is the base item number; the SKU code, if any, will be suffixed to the item number to accurately identify the item. An item alias may display instead of the actual item code. See Displaying Item Aliases. Enter a full or partial item code, *or* a valid alias code to display items in alphanumeric order beginning with your entry. See Displaying Item Aliases on scanning if you are using aliases. *Alphanumeric, 12 positions; optional.*
SKU	The specific style of the item, such as its color, size, or style. Enter a valid item code and full or partial SKU code to display items in alphanumeric order beginning with your entry. See Displaying Item Aliases on scanning if you are using aliases. *Alphanumeric, three 4-position fields; display- only.*

Field	Description
Whs (Warehouse)	The code for the warehouse where the item is stored. Warehouse codes are defined in and validated against the Warehouse table. Enter a valid warehouse code to display items in ascending numeric warehouse order beginning with your entry. See Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; optional.*
Available (Quantity available)	The quantity of the item that is available to sell in this warehouse. The system uses this calculation to determine availability for a single warehouse in the Item Warehouse table: `On hand quantity - Protected quantity - Reserved quantity - Reserve Transfer quantity - Backordered quantity = Quantity available` When this field is blank or negative, the item is unavailable or on backorder. *Numeric, 7 positions; display-only, updated by the system.*
On order (Quantity on-order)	The total item quantity you expect to receive on purchase orders. If you receive purchase orders into suspense, the amount of stock received will remain in this field until the suspended stock is placed through Suspense placement. From *On order qty* in the Item Warehouse table. *Numeric, 7 positions; display-only, updated by the system.*
Ord qty (Order quantity)	The number of units of this item that the customer wants to order. See Selecting Items Prior to Order Entry for instructions. *Numeric, 5 positions; optional.*
Next Expected P/O Date	The date that you expect to receive this item from your vendor; this is the date from the PO Layering table. **Note:** If no entry exists in the PO Layering table or if the PO Layering record has a quantity of zero, then a next expected Po date does not display. Drop ships: This date is included for drop ship items only if the Assign Drop Ship Expected Ship Date (I59) system control value is selected. See that system control value for more information. *Numeric, 6 positions (in user date format); display-only.*
Next Expected Qty	The number of units of this item ordered on a purchase order that will be available for new orders. *Numeric, 7 positions; display-only.*
Item Description unlabeled field below Item number	A description of the item. *Alphanumeric, 120 positions; display-only.*

Field	Description
Item Number unlabeled field next to item description	The item number for the item alias that displays in the *Item* field. This field displays only if the Display Item Alias (D56) system control value is selected; see Displaying Item Aliases. *Alphanumeric, 12 positions; display-only.*
SKU Description unlabeled field next to item description	A description of the SKU. This field displays only if the Display Item Alias (D56) system control value is unselected and the item contains SKUs. *Alphanumeric, 40 positions; display-only.*
S/O (Soldout control code)	This code defines which calculation the system uses for item soldout processing. For example, you can: • define a soldout control code for items which will be flagged as soldout when available quantity is less than or equal to zero, including open purchase orders and projected returns • define a soldout control code for items which will be flagged as soldout when available quantity is less than or equal to zero, excluding open purchase orders and projected returns • define a soldout control code for items that must be flagged as soldout immediately See Working with Soldout Controls (WSLD). You assign these codes in the SKU table, or, if the item does not have SKUs, at the second item entry screen. If a soldout code has not been assigned to the item or SKU, this field will not display on the Display Item Availability screen. *Alphanumeric, 2 positions; display-only.*

Screen Option	Procedure
Select an in-stock item for the order	If you are using this screen within Order Entry, enter the number of units of the item the customer wants to order in the *Ord qty* field and select OK. See Selecting Items Prior to Order Entry.
Check warehouse locations for the item to see the quantity available to sell	Select Locations for an item to display the On Hand by Warehouse Screen (Reviewing Quantities On-hand by Warehouse).
Review pricing for the item, based on special pricing set up for the item in an offer	Select Pricing for an item to advance to the Display Item/Offer Prices Screen.
Review expected deliveries for the item	Select Open POs for an item to display the Display Open Purchase Orders Screen.
Log a lost sale for an out-of-stock item	Select Lost Sale for an item. Enter the quantity that the customer would have ordered in the *Ord qty* field and select OK. See Capturing Lost Sales.

<table>
<tr><th>Screen Option</th><th>Procedure</th></tr>
<tr><td>Search for the item across warehouses and stores in external systems</td><td>Select Merchandise Locator for an item to advance to the Merchandise Locator Search Window (Searching for an Item).

You cannot perform a merchandise locator search for an item/SKU if:
• the Use Merchandise Locator (I38) system control value is unselected. Otherwise, the system displays an error message: <code>Merchandise Locator is not enabled.</code>
• you have already entered an Ord qty to add to the order.
• the item is:
– soldout, canceled or closed
– included on a printed pick slip (however, if the pick slips have been voided, you can use the merchandise locator option)
– a component of a set
– a membership item
– a subscription item
– not flagged as OROB eligible
See Merchandise Locator API.</td></tr>
<tr><td>Create a tickler for the MN (manually created) tickler event</td><td>Select Create Tickler to advance to the Create Tickler Screen.

Note:
To create a MN tickler, you must have authority to the Create Manual Tickler (B13) secured feature.</td></tr>
<tr><td>Scan for an item or SKU by SKU description</td><td>Select Display SKUs to advance to the Display SKUs Screen (Scanning Items by SKU Description) (DSKU).</td></tr>
<tr><td>Display items selected for the order</td><td>If you are using this screen within Order Entry, select Selected Items to display the Display Selected Items Window to verify, add, or delete items for the order.</td></tr>
<tr><td>Display SKU availability</td><td>Select SKU Availability to advance to the Display SKU Availability Screen.</td></tr>
</table>

Displaying Item Aliases

If the Display Item Alias (D56) system control value is selected, the Display Item Availability Screen displays each item by its alias, if an alias is defined for the item in the selected offer. An alias is an alternative name you use to present an item to your customers; you might use aliases to track how presentation within an offer affects demand. The system uses these guidelines when displaying item alias information:

Actual item code display: Whenever an alias exists for the Current Offer (A33), the alias is indicated in the *Item* column. The actual item code is beneath the *Warehouse*. If an alias does not exist for the current offer, the actual item number displays in the *Item* column and beneath the *Warehouse*.

Positioning: Whether you enter an actual item code, a partial item code, or an alias in the *Item* field, the system always displays items positioned alphanumerically *by the actual item code.* You can scan by entering:

- a full or partial item code. The system displays the alias for the selected offer if it exists, but still positions alphanumerically by the actual item code.
- a valid alias code. The system displays the alias positioned alphanumerically *by the actual item code*. For example, the actual item code is BU001, while the item alias is RAB234. The system displays items positioned alphanumerically to BU001, while the item alias of RAB234 is indicated.

Most current offer: If the alias you enter is not associated with the most current offer as selected by the system, the system will still position alphanumerically to the correct item, although the alias associated with the most current offer will actually display. For example, if item AB100 has an alias of SPRING100 in your current offer but you search for it by entering WINTER100, the alias from a previous offer, the system positions to the correct item, but displays the spring alias for the item. Lost sales will post to the most current offer selected by the system.

If you enter an invalid alias code, the system displays items and/or aliases positioned alphanumerically by actual item code. In the example, if you entered RAB345 (an invalid alias code) in the *Item* field, the system would display item and/or aliases whose actual item codes begin with “R.”

Selecting Items Prior to Order Entry

Purpose: Use this option to tag items for the new order directly from the Display Item Availability Screen and Display SKU Availability Screen. These are items that the customer wanted to verify are in-stock, and now wants to order.

You can use this option to add items to an order only if you are viewing this screen within Order Entry. The system does not save this information if you selected the Display Item Availability function from a menu.

Instructions:

1. Use the Display Item Availability Screen or Display SKU Availability Screen to locate the desired item/SKU.
2. Enter the number of units the customer wants to order in the *Ord qty* field on the right side of the screen. **Note:** The Display Item Availability screen displays an *Ord qty* field for each allocatable item warehouse defined for an item; however, when you enter the number of units the customer wishes to order, the system does not hold this quantity against any specific warehouse and determines the warehouse to reserve against when you add the item to the order.
3. Select OK.
4. Repeat Steps 1-4 for each item/SKU the customer wants to order.
5. Optionally, select Selected Items to display the items/SKUs you have selected. The Display Selected Items Window opens. Here, you can verify, add, or remove items from the notepad.
6. Select Exit when you finish ordering items. You return to the Select Customer Sold To For Order Screen.
7. Begin entering an order.
8. Complete the Order Entry screen as needed.
9. Select OK. The Display Selected Items Window opens automatically.
10. Select OK to add these items to the order, select Delete for the items the customer doesn't want, or select Remove Lines to remove all items from the order.

> **Note:**
>
> - The Work with Item/SKU Comments Window opens if there are any comments associated with the selected item or SKU, provided the comments have the *Print code* set to Window.
> - If there are multiple entries for an item/SKU with different warehouses and you select a warehouse other than the default, the item/SKU is still assigned to the default warehouse when you add it to the order. Optionally, you can use the Work with Order Line Screen (Changing/ Adding an Item) in order entry or maintenance to select a different warehouse.

Display Selected Items Window

Purpose: Use this option to verify which items have been tagged to add to the order, or to delete items from the notepad.

How to display this window: Select Selected Items at the Display Item Availability Screen or Display SKU Availability Screen. You can also display this window by exiting these screens and then re-entering without clearing the selected item notepad, or by selecting a customer for order entry.

> **Note:**
>
> This window also displays any items that you selected for purchase from the Display Wish List Screen; see Selecting a Wish List Item for Purchase.

Field	Description
Item	The code for the item the customer wants to order. *Alphanumeric, 12 positions; display-only.*
SKU	The style associated with the item, such as its color, size, and style. *Alphanumeric, three 4-position fields; display-only.*
Qty (Quantity)	The quantity of the item the customer wants to order. *Numeric, 5 positions; display-only.*
Description (Unlabeled field below the item)	The description of the item. *Alphanumeric, 120 positions; display-only.*

Screen Option	Procedure
Remove an item from the notepad, if the customer changes his or her mind	Select Delete for the item.
Add all items displayed in the window to the order	Select OK. The system adds all items to the order.

Screen Option	Procedure
Remove all items from the notepad, if the customer no longer wants any of these items	Select Delete All, then select OK at the delete- confirmation prompt.

On Hand by Warehouse Screen (Reviewing Quantities On-hand by Warehouse)

Purpose: Use this option to determine where an item is available in the warehouse and how many units of the item are stored in each location. This is useful, for example, if the item is out of stock in a location, but readily available in another. It may indicate that you have to transfer the item to a different location so it can be reserved on a new order.

How to display this screen: Select Locations for an item listed on the Display Item Availability Screen.

Field	Description
Warehouse	The code for the warehouse where the item is available. Warehouse codes are defined in and validated against the Warehouse table. *Numeric, 3 positions; display-only.*
Item	The code for a unit of inventory that you sell. Item codes are defined and validated against the Item table. *Alphanumeric, 12 positions; display-only.*
SKU	The code for the style of the item, such as its color or size. SKU codes are defined in and validated against the SKU table. *Alphanumeric, three 4-position fields; display-only.*
Location	The code for the area in the warehouse where the item is stored. Location codes are defined in and validated against the Location table. Items are assigned to a location in the Item/Warehouse/ Location table. *Alphanumeric, 7 positions; display-only.*
Typ (Type)	A code that defines the type of warehouse location where the item is stored. Valid values are: P = Primary: the main location where you pick an item. S = Secondary: An additional location used for picking or replenishment. B = Bulk: an overstock area in the warehouse to store the item in case lots or cartons that you do not break up at Purchase Order Receiving. Bulk locations are used only to replenish primary and secondary locations for an item. T = Temporary: a location created only so that you can recognize an item as "received" before you assign a permanent location. The system deletes temporary locations when the quantity reaches zero. You must define a location as "pickable" for the system to print a pick slip for the location. *Alphanumeric, 1 position; display-only.*
On hand	The quantity of the item in this location that is available to sell. *Numeric, 7 positions; display-only.*

Field	Description
Printed	The number of units of this item that have been allocated in this location (picks slips have been printed). *Numeric, 7 positions; display-only.*

Display Item/Offer Prices Screen

Purpose: Use this screen to review pricing information for a specific item or SKU in an offer such as:

- pricing information for all active offers associated with the item/SKU
- the currency code for the offer
- special quantity price breaks
- the gross profit margin percentage defined for a specific price

How the system selects an offer for pricing: The pricing information displayed for the item is based on:

1. The current offer: A current offer is one whose date range includes today's date. In order for the system to check a current offer for an item or SKU in item availability, there must be at least one item offer or SKU offer that has a price, and which is currently effective based on the *Effective date*.

   If there is more than one current offer for the item or SKU, check the current offer with the most recent start date. (If the two most current offers have the same start date, select the first offer alphanumerically.) Then select

   - the most recent SKU offer based on *Effective date*. If there is not a valid SKU offer, or if the item does not have SKUs, use:
   - the most recent item offer based on *Effective date*.
2. An inactive offer: An inactive offer is one whose date range has ended. If there is not a qualifying active offer for the item or SKU, then select
   - the most recent inactive offer based on start date (if two inactive offers have the same start date, select the first one alphanumerically). Then select
     - the most recent SKU offer based on *Effective date*. If there is not a SKU offer, or if the item does not have SKUs, use:
     - the most recent item offer based on *Effective date*.
3. A future offer: A future offer is one whose start date has not yet occurred. If there is not a qualifying active or inactive offer for the item or SKU, then select the soonest future offer based on start date. If there is more than one future offer with the same start date, select the last one alphanumerically.
4. The default current offer: If there is not a qualifying active, inactive, or future offer for the item or SKU, then use the default Current Offer (A33) from the System Control table.

How to display this screen: Select Pricing for an item or SKU, for which you wish to review pricing information, on the Display Item Availability Screen. A different screen opens, depending on whether you are reviewing pricing information for an item or SKU.

Field	Description
Item	The item and description for which you are reviewing pricing information. If you are reviewing SKU pricing information, the SKU code is presented in this field. *Item code: Alphanumeric, 12 positions; display-only.* *Item description: Alphanumeric, 120 positions; display-only.*
Curr code (Currency code)	A code that defines the currency for orders you process for this offer. **Note:** Included only if the Multi Currency by Offer (E03) field in the System Control table is selected. When you enter a source code associated with this offer in Order Entry, the system will search for a price only among offers that share this currency. Additionally, you cannot override the offer on an order detail line to one with a different currency. The currency used on an order is indicated by the bank code on various screens and reports, such as those having to do with refunds. This is because each currency must be associated with at least one unique bank. When you create a source code, you must specify a division which links to a bank code that is consistent with the currency of the offer. The currency code is defined in and validated against the Currency table. See Working with Currency (WCUR). *Alphanumeric, 3 positions; display-only.*
Offer code	A code representing the catalog whose prices you are reviewing. Offers are defined in and validated against the Offer table. Use the Item/SKU Offer table to identify which items/SKUs are carried in the offer. Also, use the Item/SKU Prices table to define price breaks for the item/SKU in the offer. *Alphanumeric, 3 positions; optional.*
Qty (Quantity)	The quantity of the item/SKU that must be purchased to receive the price break. Any SKU ordered for this item is counted towards this quantity. This number is from the *Qty* field in the Item Prices table. If the quantity is 1, you are offering your customers an automatic discount if they purchase this item. If the quantity is greater than 1, your customers must purchase several units of the item (such as in different colors) to receive the price break. Customers assigned to the pricing column defined here receive the quantity break price automatically regardless of the quantity ordered. *Numeric, 7 positions; display-only.*
Price	The selling price of the item for your regular customers who order the required quantity of the item or who belong to the appropriate pricing column. *Numeric, 13 positions with a 2-place decimal; display-only.*

Field	Description
Tax incl (Tax-inclusive price)	The price at which the item will be sold on orders subject to tax-inclusive pricing and VAT. Included only if the Tax Included in Price (E70) system control value is selected. *Numeric, 13 positions with a 2-place decimal; display-only.*
Gross margin %	The percentage of the item's price that exceeds the cost of the item. You can use gross margin to determine the profit of an item on the order based on the item's selling price. See Determining Gross Profit for a discussion. The Display Gross Margin (A65) secured feature controls whether this field is included in order entry, maintenance, inquiry and item availability. *Numeric, 5 positions with a 2-place decimal; display-only.*
Assoc price (Associate price)	The selling price of the item for your associate customers (*Associate* = Selected in the Customer table) who order the required quantity of the item or who belong to the appropriate pricing column. Items eligible for the price break are repriced automatically and the system updates the pricing method field with *Quantity Break Price. *Numeric, 13 positions with a 2-place decimal; required, calculated by the system.*
Tax incl (Tax-inclusive associate price)	The price at which the item will be sold to associate customers on orders subject to tax-inclusive pricing and VAT. Included only if the Tax Included in Price (E70) system control value is selected. *Numeric, 13 positions with a 2-place decimal; display-only.*
Column (Column number)	The pricing column eligible for this price break. Customers belonging to this pricing column receive the quantity price break automatically, regardless of the quantity ordered. *Numeric, 2 positions; display-only.*

Capturing Lost Sales

Purpose: Use this option to flag a lost sale for an item that the customer would have ordered if the item was available. This option helps you capture true demand for an item. This figure is important so you can order enough stock for the item in the future to meet demand.

Why lose sales? You may lose a sale if the customer inquires about the availability of an item before placing an order. If the item is backordered, the customer may decide not to place an order at this time. Because of this, you lost a potential sale.

Recording the lost sale: The dollar value and the number of lost sales are captured in the *Units lost CTD* field in the SKU/Offer/Page record.

When you enter lost sales, the system assigns them to the offer currently displaying on the Display Item Availability Screen. Additionally, the system posts the lost sales to page number 99999 in the default Current Offer (A33) for your current company.

Instructions: At the Display Item Availability Screen:

1. Locate the item that the customer wanted to order.
2. Select Lost Sale for the item.

3. Enter the quantity of the item that the customer would have purchased in the *Ord qty* field on the right side of the screen.
4. Select OK. The system calculates the dollar amount and number of units in lost sales for the item.
5. Repeat these steps for each item you want to identify as a lost sale.

Display SKU Availability Screen

Purpose: Use this screen to see the availability of each SKU of a specified item. From this screen you can also:

- If you are in order entry, enter the quantity of the SKU you wish to add to the next customer's order.
- review the next expected purchase order date and quantity for the SKU.
- review additional information about the item.
- review open purchase orders for the item.

Restricted SKUs, identified by a selected *Restrict* field in the SKU table, do not appear on the Display SKU Availability screen.

This screen displays SKU availability across item warehouses for which the Allocatable flag is selected.

How to display this screen: Select SKU Availability at the Display Item Availability Screen.

When you first advance to this screen, you must enter an item in the *Item* field to display SKU availability for the item. SKU availability for the specified item displays in ascending SKU code sequence.

Field	Description
Item	Enter a valid item number and select OK to see availability for each SKU of the item. You can also prompt on this field to advance to the Item Selection screen where you can search and select an item. Item numbers are defined in and validated against the Item table. The message `Item does not have SKUs` displays if the item is a non-SKUed item. *Alphanumeric, 12 positions; required to review SKU availability.*
Item description unlabeled field below Item	A description of the item specified in the *Item* field. *Alphanumeric, 120 positions; display-only.*
SKU	The specific style of the item, such as its color, size, or style. The column headings are based on the values defined in the Split SKU Element Column Headings (A52, A53, A54) system control values. Enter a full or partial SKU element 1 to display SKUs in ascending alphanumeric order beginning with your entry. Enter a valid SKU element 2 or 3 to display SKUs that match your entry. *Alphanumeric, three 4-position fields; optional.*
Description	A description of the SKU. *Alphanumeric, 25 positions; display-only.*

Field	Description
Sts (Status)	The status code assigned to the SKU. Enter a valid SKU status code and select OK to display SKUs whose status matches your entry. *Alphanumeric, 1 position; optional.*
Available (Quantity available)	The quantity of the item that is available to sell across all shippable warehouses. The system sums the calculated quantity available across all allocatable item warehouses: `On hand quantity - Protected quantity - Reserved quantity - Reserve Transfer quantity - Backordered quantity = Quantity available` A negative quantity indicates that the SKU is unavailable in your inventory and is backordered. *Numeric, 7 positions; display-only, updated by the system.*
On order (Quantity on-order)	The total item quantity you expect to receive on purchase orders. If you receive purchase orders into suspense, the amount of stock received will remain in this field until the suspended stock is placed through Suspense placement. *Numeric, 7 positions; display-only, updated by the system.*
Ord qty (Order quantity)	The number of units of this SKU that the customer wants to order. See Selecting Items Prior to Order Entry. *Numeric, 5 positions; optional.*
Next Expected P/O Date	The date that you expect to receive this item from your vendor; this is the date from the PO Layering table. If no entry exists in the PO Layering table or if the PO Layering record has a quantity of zero, then a next expected Po date does not display. *Numeric, 6 positions (in user date format); display-only.*
Next Expected Qty	The number of units of the SKU ordered on a purchase order that will be available for new orders. If more than one allocatable item warehouse exists for the SKU, this information is based on the first item warehouse record found for the SKU. *Numeric, 7 positions; display-only.*

Screen Option	Procedure
Select an in-stock SKU for the order	If you are using this screen within Order Entry, enter the number of units of the SKU the customer wants to order in the *Ord qty* field and select OK. See Selecting Items Prior to Order Entry.
Review expected deliveries for the item	Select Open POs for a SKU to display the Display Open Purchase Orders Screen.
Display items selected for the order	If you are using this screen within Order Entry, select Selected Items to display the Display Selected Items Window to verify, add, or delete items for the order.

Display SKUs Screen (Scanning Items by SKU Description) (DSKU)

Purpose: Use this screen to locate a particular item or SKU based on a SKU description. You can then select the item or SKU to be displayed on the Display Item Availability screen.

How to display this screen: Select Display SKUs at the Display Item Availability Screen. You can also advance to this screen by selecting the Display SKU Screen menu option (*Fast path*= DSKU). If you use this method you will not be able to select a SKU from the SKU list.

Field	Description
Item	The code for an item that you sell. *Alphanumeric, 12 positions; optional.*
SKU	The specific style of the item, such as its color, size, or style. *Alphanumeric, three 4-position fields; display- only.*
SKU description	The description of a SKU. *Alphanumeric, 40 positions; optional.*
Available qty (Quantity available)	The quantity of the item that is available to sell. When this field is blank or this value is followed by a negative sign, the item is unavailable or on backorder. *Numeric, 7 positions; display-only, updated by the system.*

Screen Option	Procedure
Select an item or SKU to display on the Display Item Availability screen	Select an item or SKU to return to the Display Item Availability Screen. Select OK again to position the selected item/SKU at the beginning of the Item/SKU list.

Working with Error Order Batches

Topics in this part:

- Introducing Order Batches describes the process of working with batched orders from a high-level point of view.
- Working with an Order Batch describes how to review, correct, and accept orders received from an external system that are in error.
- Performing Batch Order Entry describes how to work with the individual orders in the batch.
- Accepting or Rejecting the Order Batch describes how to release the individual orders in a batch on the system once the batch is in balance or how to reject the entire batch, if necessary.

Printing the Retail Order Cross Reference Report (POCR)

Purpose: Use this menu option to print the Retail Order Cross Reference Report. This report displays the contents of the Order Cross Reference table.

You can use an external order number to associate an order with an order database existing outside of Order Administration. For example, you might take orders at your retail outlets, authorize a third party to take orders for you, or provide order entry service for someone else. You can process these orders through a variety of channels, such as from the web storefront or in retail locations.

In this topic:

- Retail Order Cross Reference Report

System Operations

Operating Background Jobs

Topics in this part: The following topics describe the functions available to operate the background ASYNC jobs.

- Using the ASYNC Jobs (MBJC) describes the purpose of the background jobs, provides a brief overview of the each background ASYNC job, explains the steps to use to start and end the background ASYNC jobs, and shows you how to location the function.
- Working with the CNTL_ASYNC Job shows you how to start and end the background ASYNC jobs, how to reorganize the data queues associated with the background ASYNC jobs, and how to change the status of the background ASYNC jobs.
- Working with the BILL_ASYNC Job shows you how to display the Billing Header Data Queue, how to correct Billing ASYNC errors, how to change the status of the Billing ASYNC job, and describes the table updates that occur when records are processed by the BILL_ASYNC job.
- Working with the EBO_ASYNC Job shows you how to display the Evaluate B/O Data Queue, how to correct EBO_ASYNC errors, how to change the status of the EBO_ASYNC job, and describes the table updates that occur when records are processed by the EBO_ASYNC job.

- Working with the ORDR_ASYNC Job shows you how to display the Order Ship To Data Queue, how to correct ORDR_ASYNC errors, how to change the status of the ORDR_ASYNC job, and describes the table updates that occur when records are processed by the ORDR_ASYNC job.
- Working with the OTHR_ASYNC Job shows you how to display the PO Header Data Queue, how to correct OTHR_ASYNC errors, how to change the status of the OTHR_ASYNC job, and describes the table updates that occur when records are processed by the OTHR_ASYNC job.
- Purging Active Procedures (MACP)shows you how to display the Active Procedures for a user and how to delete stranded Active Procedure records for a user.
- Working with Integration Layer Processes (IJCT) shows you how to work with the integration layer processes used for transmitting data between Order Management System and an external system.

Background Job Control (MBJC)

For information on:	See:
how to use the ASYNC (asynchronous) jobs, which process updates to tables related to transaction activity	Using the ASYNC Jobs (MBJC)
working with the **CNTRL_ASYNC** job reorganizing the queues	Working with the CNTL_ASYNC Job
the **BILL_ASYNC** job, which processes updates related to shipments and returns	Working with the BILL_ASYNC Job
the **EBO_ASYNC** job, which processes updates related to changes in backordered items	Working with the EBO_ASYNC Job
the **ORDR_ASYNC** job, which processes updates related to order entry and maintenance	Working with the ORDR_ASYNC Job
the **OTHR_ASYNC** job, which processes updates related to purchase order activity	Working with the OTHR_ASYNC Job

Purging Active Procedures (MACP)

Purpose: Use the Purge Active Procedures function to delete a user procedure that remains in an active status when the user is no longer in the application.

For example, if a terminal crashes when an operator is entering orders, the Active Procedures record for the user may not be deleted from the table. If a record exists in the Active Procedures table, the system thinks that the person is still using the application because the function was not exited properly.

If there are stranded Active Procedures records for any of the following functions, they must be deleted, otherwise the background ASYNC jobs cannot be ended:

- Order Entry/Maintenance
- Purchase Order Maintenance
- Receiving
- Confirmation
- PC Manifest or the *Generic Pick In API (Shipments, Voids, and Backorders)*

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

When the ASYNC jobs are ended, the system checks the Active Procedures table to see if there are any active records for these applications. A pop-up window indicates the User ID and application that is still active. You should ask that the user exit the application. If the user is not in the application, delete the record from the Active Procedures table.

> **Note:**
>
> This function should not be used to delete Active Procedures records for users who are still using an application. If you delete Active Procedures records while a user is still in the application, the user job will not be ended; that user can still enter transactions in the application, but transaction records cannot be sent to the data queues for processing because the data queues are reorganized when the ASYNC jobs end. No back end table updates for that user's transactions will be posted, which will cause your data tables to be out of sync.

Scheduling the active procedure purge: You can schedule the active procedure purge for the functions listed above using the PFR0121 Delete Stranded Active Procedures periodic function. The system deletes all active procedures for interactive jobs that are older than the number of hours defined in the periodic function's Parameter field. If the Parameter field is blank, the default number of hours is 24.

Interrupting confirmation email generation: You can delete the active procedure related to generation of shipment and return confirmations (Type = SC) in order to interrupt the generation process. The system keeps track of the last email generated so that you can restart the generation process at a later time. See Stopping and Restarting Shipment and Return Confirmation Emails for an overview.

To see active procedures for all users in your environment: Use the Purge Active Procedures Across Users (MACX) menu option to display active procedures for all users and to purge selected procedures as needed.

In this topic:

- Purge Active Procedures Screen (Selecting the User to Purge)
- Purge User's Active Procedures (Deleting an Active Procedure)

For more information: See Purge Active Procedures Across Users (MACX).

Purge Active Procedures Screen (Selecting the User to Purge)

Purpose: Use this screen to enter the User ID of the person whose record must be deleted from the Active Procedures table.

How to display this screen: Enter the Active Procedures Purge fast path name, MACP in the Fast path field at the top of any menu.

Field	Description
User	The User ID of the person whose active procedure is being deleted. The User ID is validated against the User Profile table. Alphanumeric, 10 positions; required.

Purge User's Active Procedures (Deleting an Active Procedure)

Purpose: This screen displays the system procedures that are currently active for the selected user.

> **Note:**
>
> **Important**: Be sure that the user has exited the application before you delete an Active Procedures record. When you a delete a record, the system no longer recognizes that the user is in the application. If the user is still active in the application, the user job will not be ended when the record is deleted.

How to display this screen: Enter a valid User ID at the Purge Active Procedures Screen (Selecting the User to Purge).

Screen Option	Procedure
Delete an active procedure	Select Delete for the active procedure you want to delete.

Purge Active Procedures Across Users (MACX)

Purpose: Use this option to display active procedures for all users in your environment and to purge active procedures as necessary if, for example, the job failed to end normally.

JOBCLN: The JOBCLN periodic function deletes each active procedure record for a job that is in END status, or that is not actually active . See Using the JOBCLN Function to Resolve Job Status Across Servers for a discussion.

Deleting an active procedure: Select an active procedure and click Delete to delete it.

Note:

- You cannot delete an active procedure that is actually running on a server. Only active procedure records that are unrelated to active jobs are eligible for deletion.
- When you delete an active procedure at this screen, it creates a User Audit record; however, no User Audit record is created if you attempt to delete an active procedure and the deletion does not succeed. See Tracking User, Authority, and Password Updates for more information on the User Audit table.

Purge Active Procedures Screen

How to display this screen: Enter MACX in the Fast path field at the top of any menu, or select Purge Procedures Across Users from a menu.

Field	Description
User	The user ID of the person who started the active procedure. For the BILLUSR job, set to the ID of the default user. Alphanumeric, 10 positions; display-only.
Workstation	If the active procedure is a: • background job: indicates the data queue (for example, BILLDATAQ indicates that this is the billing async job) • an IJCT process: indicates the process ID, such as BROKER Alphanumeric, 10 positions; display-only.
Job #	A job number assigned to uniquely identify the active procedure. Numeric, 6 positions; display-only.
Cmp (company)	The number identifying the company where the active procedure was started. Set to zero for active procedures that are not restricted by company, such as the background jobs; however, set to 999 for certain jobs, including the PICK_OUT process, the BROKER process, and the BROKER_ORD process. See Working with Companies (WCMP) for more information on companies. Numeric, 3 positions; display-only.
Type	The type of active procedure. Possible types are described below under Active Procedure Types. Filtering based on the Type is supported only for Data Queue and Reorganize. Display-only.
Program	The name of the program that is active. **Note:** A program of PFR0100 is displayed for the BILLUPD periodic function runs, although that function uses a Class name rather than a Program name. Alphanumeric, 10 positions; display-only.
Date	The date when the user started the procedure. Numeric, 6 positions; display-only.
Time	The time when the user started the procedure. Numeric, 6 positions; display-only.

Active Procedure Types

Some of the active procedure types displayed at this screen are described below.

Type	Description	Started When?
Data Queue	data queue	You create orders through Enter/Maintain Orders (OEOM); maintain purchase orders through Maintaining Purchase Orders (MPOE), receive purchase orders through Receiving Purchase Orders (PORC), and confirm shipments through Manually Confirming Shipments (MCON)
BA	billing async	The BILL_ASYNC job starts. See Working with the BILL_ASYNC Job for more information.
BB	batch billing update	The SUMVIA periodic function runs.
BC	batch customer conversion	You run the batch customer import from Customer Engagement. See Customer Engagement Batch Customer and Sales Integration Process Flow for more information.
BD	batch deposits	You submit auto deposits for processing. See Processing Auto Deposits (SDEP) for more information.
BR	Order Orchestration orders	The BROKER_ORD job starts in Working with Integration Layer Processes (IJCT). See Order Orchestration Integration for background.
BT	batch tokenization update	You run a batch tokenization update. See the Data Security and Encryption Guide on My Oracle Support (2953017.1).
CD	CDC async	You run the CDC async job. See Working with Drop Ship Background Jobs (WPBJ) for more information.
CL	credits by LOB	You submit line of business credits for processing. See Processing Credits by Line of Business (MCLB) for more information.
CR	catalog request	You submit the catalog request upload for processing. See Working with the Catalog Request Interface (WCRU) for more information.
CU	set component upload	You run the set component upload. See Importing Set Components (WCUP) for more information.
DS	drop ship processing	You submit drop ship orders for processing. See Selecting Vendors for Drop Ship Processing (MDSP) for more information.
KU	PICK_OUT process	You start the PICK_OUT process in Working with Integration Layer Processes (IJCT).
IO	INVOICE_OUT process	You start the INVOICE_OUT process in Working with Integration Layer Processes (IJCT).

Type	Description	Started When?
LU	line of business update	You update statistics for your line of business order queue. See Displaying the Line of Business Order Queue Summary (DLOQ) for more information.
MO	membership order generation	You generate membership orders through the Generating Membership Orders (EGMO) menu option.
MS	mass item substitution	You select the Processing Item Substitutions (PSUB) menu option.
OA	online authorization	See Performing Online Credit Card Authorizations for more information.
OB	Order Orchestration	The BROKER job starts in Working with Integration Layer Processes (IJCT). See Order Orchestration Integration for background.
PG	pick slip generation	You generate pick slips. See Performing Pick Slip Generation for more information.
QZ	purge security risk periodic function	You submit the SECRISK Periodic Function.
RE	REAUTH_JOB	You submitted the REAUTH job. See Reauthorizing Expired Authorizations for more information.
RI	retail integration item upload	You submitted the retail integration item upload. See Working with Retail Integration Item Upload (RIIU) for more information.
RO	RETURN_OUT process	You start the RETURN_OUT process in Working with Integration Layer Processes (IJCT).
RZ	reorganize	Information will be provided at a later date.
SA	batch SVC activation	You submit stored value card activations for processing, if the Use Activation / Reversal Batch Processing (I50) system control value is selected. See Transmitting Activation and Reversal Transactions (SSVC) for more information.
SB	batch SVC balance inquiry	The system submits stored value card balance inquiries in batch. See the Perform Balance Inquiry during Batch Authorizations (J19) system control value for more information.
SC	shipment and return confirmation email generation	You use the Sending Internet Order Ship Confirmation (ESCF) option or the ECSHCNF periodic function. See Stopping and Restarting Shipment and Return Confirmation Emails for information on how to stop and restart the generation program.
SI	ship via/item summary inquiry	You use the Ship Via/Item Inquiry (SVII) menu option.
SP	SKU purge	You submit a SKU purge through the Purging SKUs (MPSK) menu option.

Type	Description	Started When?
SO	process auto soldouts	You use the Process Auto Soldouts menu option; see Processing Auto Soldout Cancellations (MASO) for more information.
SR	batch SVC reversal	You process deposits that include stored value card reversals if the Perform Authorization Reversal during Deposit Processing (J20) system control value is selected. See Processing Auto Deposits (SDEP) for more information.
SU	supporting data upload	You run the supporting data upload. See Importing Item-Related Supporting Data (SDUP) for more information.
TH	threshold monitor	You start the THRESHMON background job. See Working with Threshold Values (WTHR) for more information.

Working with Integration Layer Processes (IJCT)

Purpose: Use this menu option to work with the processes that transmit data between Order Administration and an external system, such as Order Orchestration.

> **Note:**
>
> The integration layer processes are not restricted by company; when you work with or change a process, it affects all companies.

Configuration: See Advanced Queuing for information on setting up queues.

Process Overview

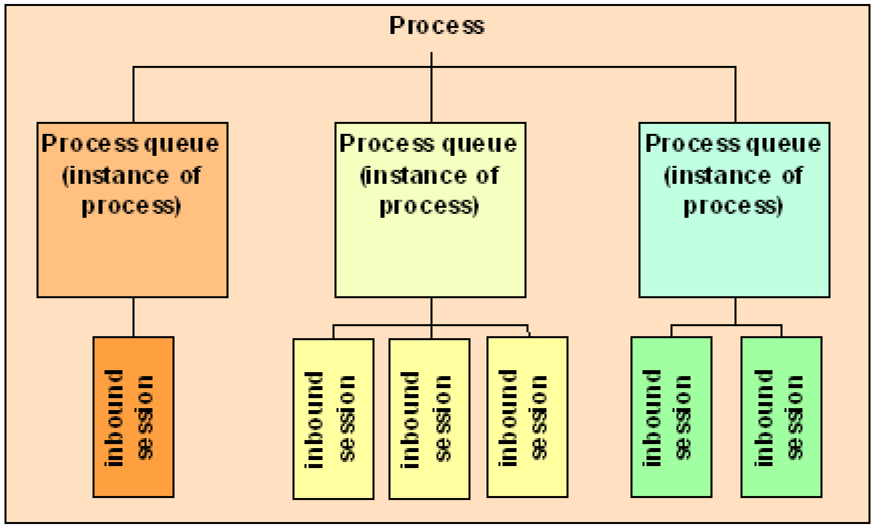
As data is processed in Order Administration, the JMS provider sends messages to the integration layer processes for processing. Processes can be one-directional or bi-directional if a response is received (for an outbound process) or generated (for an inbound process).

All messages are processed in the sequence in which they arrive at the queue.

Inbound process structure: Underneath each inbound process at the Work with Integration Layer Process Screen are one or more process queues. Multiple process queues are useful for inbound messages, so that you can receive and process messages from more than one remote system. For example, you might receive inventory transactions from both a warehouse management system and a POS system.

When there are multiple process queues, each queue is an instance of the Inbound program for the process; however, each queue should have a unique Inbound job name so that you can identify and troubleshoot each process separately.

The # inbound sessions for each process queue can be one or more. For example, you might set the number of inbound sessions higher for the process queue that processes orders from your web storefront, to prevent delays; however, you might require only one inbound session for orders you receive from a remote order entry service, because you receive these orders at a scheduled time, and an immediate response is not required.



Inbound process example:

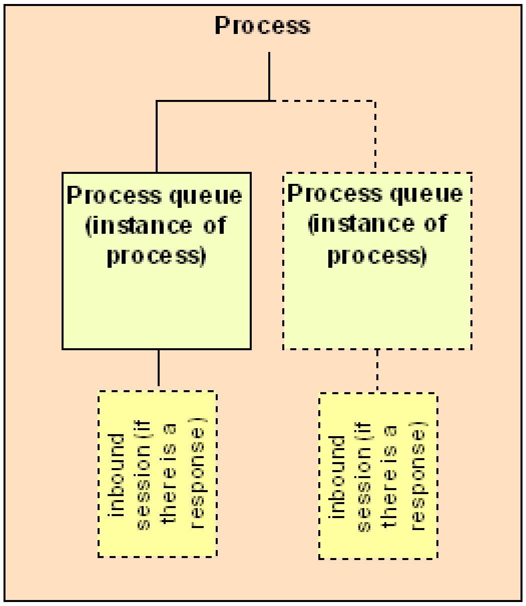
#	Step
1.	A remote system sends a message to the Inbound queue specified for an integration layer process queue in Order Administration.
2.	The process: • receives and identifies the message • parses (interprets) the XML • performs any required actions, such as building Order Administration records or submitting records to a background job for additional processing
3.	Optionally, the process sends a response using the Outbound queue specified.

Generic web service: As an alternative to sending messages directly to the inbound queue specified for each integration layer process queue, you can use the generic web service. In this situation, you send messages to the endpoint for the generic web service, which routes each message to the correct process queue and then routes the generated response. See the *Generic Web Services* for more information.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Outbound process structure: Underneath each outbound process at the Work with Integration Layer Process Screen are one or more outbound queues. Multiple outbound queues allow you to send outbound messages to more than one remote system. For example, you might send item information to your POS system and warehouse management system. If you define more than one outbound queue, the system creates a copy of the outbound message for each additional queue whose Enabled field is selected.

An outbound process requires an inbound session only when a response from the remote system is expected.



Outbound process example:

#	Step
1.	Activity in Order Administration: • generates an outbound message and sends the message to the outbound queue for the outbound process, Or • creates outbound triggers in the IL Outbound Trigger table, based on the trigger rules defined for the outbound process. See Defining Outbound Interface Trigger Rules. • When active, the outbound process looks for outbound triggers to process at defined intervals, based on the Outbound delay time field. • For each outbound trigger, the outbound process determines which elements to include in the outbound message, based on XML inclusion rules; see Outbound Interface XML Inclusion Screen. • The system then sends the generated message to the outbound queue for the outbound process. If more than one outbound queue is defined, the system creates a copy of the message to send to the additional queues that are active (the Enabled field is selected).
2.	The remote system receives the message.
3.	Optionally, the remote system sends a response using the inbound queue specified.

Message logging: See Order Administration Application Logs for information on the logs you can use to track XML messages.

XML Versions

Overview: As new elements and attributes are added to existing system-delivered XML messages processed through Integration Layer Job Control, each new version of a message is tagged with a version number. The first version of an XML message is always tagged as version 1.0, but if the next release of Order Administration adds any new attributes or elements to this XML message, this next version of the message is tagged as version 2.0.

Version compatibility: Each new attribute or element is always optional, or implied, so that the integration layer process can always process previous versions of the message.

XML version numbers vs. Order Administration release numbers: The XML version number is independent of the Order Administration release number. For example, version 2.0 of a message might be introduced in Order Administration release 23.3, while version 1.0 of another message might be introduced in Order Administration release 23.4.

About inbound XML messages: Since the integration layer processes can process any previous versions of the related inbound message, the highest version of an inbound XML message supported by an integration layer process is indicated by the Version in field at the Work with Integration Layer Process Screen. For example, if this field is set to 2.0, the integration layer process can process the message in version 1.0 and 2.0.

Not all integration layer processes receive inbound messages. The Version in field is blank for any integration layer processes that are outbound-only.

About outbound XML messages: You use the Select XML Message Version Screen to indicate which version of the outbound message the integration layer process should generate. For example, if version 1.0 and 2.0 are available for an outbound message, you could have the process generate either version. By default, the integration layer process generates version 1.0. Whichever version of the message you select will be sent to all process queues running under the integration layer process.

Outbound XML Version for EMAIL_OUT process: Version 13.0 is the current version of the CWEmailOut message. Earlier versions are not available.

Outbound XML Version for INVOIC_OUT process: Version 7.0 is the current version of the CWInvoiceOut message. Earlier versions are not available.

Outbound XML version for ITEM_OUT process: Version 1.0 of the CWItemOut message includes tags that are not currently supported. The version should be set to 2.0 for the ITEM_OUT process.

Outbound XML Version for ORDER_IN process: Version 12.0 is the current version of the CWOrderOut message. Earlier versions are not available.

Outbound XML version for PICK_OUT process: Versions 1.0 through 4.0 of the CWPickOut message include tags that are not currently supported The version should be set to 5.0 for the PICK_OUT process.

Outbound XML version for VENDOR_OUT process: Versions 1.0 of the CWVendorOut message includes tags that are not currently supported The version should be set to 2.0 for the VENDOR_OUT process.

Outbound XML version for SVC Reversal process: The SVC Reversal process (SVC_REVRSL) uses the outbound XML version defined for the SVC Activation process (SVC_OUT) to generate a stored value card authorization reversal request message. If you define an outbound XML version for the SVC Reversal process, the system ignores this version and continues to use the outbound XML version for the SVC Activation process. Typically, you would want to generate the same outbound message version for both stored value card activations and stored value card authorization reversals.

How does the system identify the current version of a message? The XML Message Version table lists the latest available version of each inbound and outbound XML message. This table is updated each time you apply a new upgrade to Order Administration.

Identifying when new attributes or elements were added to a message: Unless otherwise indicated in the XML layout, each element and attribute was included in version 1.0 of the message. See XML Messages for a listing of inbound and outbound messages processed through Working with Integration Layer Processes (IJCT), including links to the XML layouts.

Versions assigned to system-delivered messages only: Only system-delivered XML messages processed through integration layer processes support this version functionality. For example, e-commerce XML messages and unique XML messages do not support versions. See the Integration Layer Processes for a listing of system-delivered messages processed by the integration layer processes under Working with Integration Layer Processes (IJCT).

For more information see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).

> **Important:**
>
> You must select the latest available Outbound version for the EMAIL_OUT process in order for the email generation to work for any notification formats that use information added in versions greater than 1.0 (for example, backorder, soldout, and stored value card notifications). See *Outbound Email API* for more information.
>
> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Work with Integration Layer Process Screen

Purpose: Use this screen to review and work with integration layer processes.

Hidden processes? If a process is not listed at this screen, it might have had its Type changed to Hide Service. See Hiding an Integration Layer Process for more information.

How to display this screen: Enter IJCT in the Fast path field at the top of a menu or select Integration Layer Job Control from a menu.

Field	Description
Process	A code for an integration layer process. Processes include: • BROKER: See Order Orchestration Integration. • BROKER_ORD: See Order Orchestration Integration. • CUST_HIST: See *Generic Customer History API* • CUST_OUT: See *Generic Customer Download API* • CUST_SRCH: See *Generic Customer Inquiry (Search) API*. • CUSTOMR_IN: See *Generic Customer API*. • EMAIL_OUT: See *Outbound Email API*. • INV_DOWNLD: See *Generic Inventory Download API*. • INV_INQURY: See *Generic Inventory Inquiry API*. • INVOICE_OUT: See *Generic Invoice Download API*. • INVTRAN_IN: See *Generic Inventory Transaction Upload*. • ITEM_OUT: See *Generic Item Download API*. • ORDER_CLN: See Order Cleanup. • ORDER_IN: See *Generic Order Interface (Order API)*. • PICK_OUT: See *Generic Pick Out API*. • PO_OUT: See *Generic Outbound Purchase Order API*. • RETURN_IN: See *Inbound Return API*. • RETURN_OUT: See *Outbound Return API*. • TAX_INT: See Use Generic Tax XML Interface (J10) and the Vertex Interface. • VENDOR_OUT: See *Generic Vendor Download API*. • WORKFLOW: See Workflow Management Overview and Setup and WF (Remote Workflow) Event Processing. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 10 positions; optional.
Description	A description of the process. Alphanumeric, 45 positions; optional.
Version in	The latest version of the inbound XML message that the process is capable of processing. For example, if the Version in is 2.0, this indicates that the process works with version 1.0 or 2.0 of the inbound XML message. See XML Versions for an overview. This field is blank if the process does not process inbound XML messages. Numeric, 3 positions with a 1-place decimal; display-only.
Version out	The version of the outbound XML message that the process generates. You can select the outbound XML version at the Select XML Message Version Screen. See XML Versions for an overview. This field is blank if the process does not generate outbound XML messages. Numeric, 3 positions with a 1-place decimal; display-only.

Field	Description
Type	Indicates whether the process uses a JMS provider (advanced queuing) or a web service. Possible types are: MQ = the process uses a JMS provider, advanced queuing, to transmit and receive messages, or uses an Order Administration web service. See Advanced Queuing and *Generic Web Services*. WS = the process uses an external web service. If you have hidden a process, it is not listed on this screen. See Hiding an Integration Layer Process for more information.
Status	The status of the queue. Possible statuses are: • Active • Inactive • Starting • Ending • Interact: The CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW processes always have this status because they do not use a batch job, but process requests and responses interactively. See Starting or Ending a Process. Note: • The status is Active if any of the process queues is currently active. See the Work with Integration Layer Process Queues Screen for more information. • It is not necessary to start or stop the ORDER_IN job unless you want it to read from or write to queues. Alphanumeric, 9 positions; display-only.
Active session	The number of separate sessions that are active for all process queues. You might set up multiple sessions for each process queue of an inbound process to prevent delays in communication. Numeric, 5 positions; display-only.
Start	The date and time the process, or any of the process queues, was most recently started. The user ID of the person who started the process or any of its queues is also displayed. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only. User: alphanumeric, 10 positions; display-only.
End	The date and time the process, or any of the process queues, was most recently ended. The user ID of the person who ended the process or any of its queues is also displayed. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only. User: alphanumeric, 10 positions; display-only.

Screen Option	Procedure
Create an integration layer queue	Select Create to advance to the Integration Layer Process Screen (Create Mode).

Screen Option	Procedure
Change the settings for an integration layer process	Select Change for a process to advance to the Integration Layer Process Screen (Change Mode).
Delete an integration layer process	Select Delete for a process to delete it.
Review the details of an integration layer process	Select Display for a process to advance to the Display Integration Layer Process Screen. You cannot change any information at this screen. See the Integration Layer Process Screen (Create Mode) for field descriptions.
Start a process	Select Start for a process that is in an Inactive status to start all process queues for the process. See Starting or Ending a Process. **Note:** This option is not available for the CC_TOKEN, MERCH_LOC, EMAIL_OUT, and TAX_INT jobs because they are interactive rather than batch processes. (The SVC_BALANC process also has this status if no companies have the Perform Balance Inquiry during Batch Authorizations (J19) system control value selected.) Also, this option is not necessary for some jobs, such as the ORDER_IN. See Integration Layer Processes for a listing of jobs that indicates whether it is necessary to start or stop the job. To schedule: You can use the STRIJCT periodic function to schedule the start of the integration layer process whose Process ID is defined in the Parameter field for the periodic function. . Troubleshooting: See Using the JOBCLN Function to Troubleshoot IJCT Jobs for information.
End a process	Select End for a process to end all process queues. See Starting or Ending a Process. **Note:** This option is not available for the CC_TOKEN, MERCH_LOC, EMAIL_OUT, and TAX_INT jobs because they are interactive rather than batch processes. (The SVC_BALANC process also has this status if no companies have the Perform Balance Inquiry during Batch Authorizations (J19) system control value selected.) Also, this option is not necessary for some jobs, such as the ORDER_IN. See Integration Layer Processes for a listing of jobs that indicates whether it is necessary to start or stop the job. To schedule: You can use the ENDIJCT End IJCT Process Passed periodic function to schedule the end of the integration layer process whose Process ID is defined in the Parameter field for the periodic function. Troubleshooting: See Using the JOBCLN Function to Troubleshoot IJCT Jobs for information.
Work with the queues for a process	Select Work with Queues for a process to advance to the Work with Integration Layer Process Queues Screen, where you can start, end, or work with individual process queues. Only processes whose Type is MQ use queues.
Define trigger rules for an outbound process	Select Trigger Rules for a process to advance to the Outbound Interface Trigger Rules Screen or the Select Trigger Rules File Window. This option is not available for processes that do not use trigger rules.

Screen Option	Procedure
Define XML inclusion rules for an outbound process	Select XML Inclusion for a process to advance to the Outbound Interface XML Inclusion Screen. This option is available only for processes that use XML inclusion.
Select the XML version to use for outbound messages	Select Outbound XML Ver for a process to advance to the Select XML Message Version Screen. This option is not available for processes that do not generate outbound messages. Also, inclusion rules are not implemented for the MERCH_LOC process, which uses Order Orchestration's Locate Items messages. See Merchandise Locator API for an overview.
Work with background jobs	Select Background Jobs to advance to the Work with Background Jobs Screen.
Work with Drop Ship background jobs	Select Drop Ship Jobs to advance to the Work with Drop Ship Background Jobs Screen.

Integration Layer Process Screen (Create Mode)

Purpose: Use this screen to create an integration layer process. For example, you might create a new process similar to a system-delivered process in order to communicate with multiple authorization services.

How to display this screen: Select Create at the Work with Integration Layer Process Screen.

Field	Description
Process ID	A code for the job that performs integration layer updates between Order Administration and an external system. See Work with Integration Layer Process Screen for a description of each. Alphanumeric, 10 positions; required.
Description (unlabeled field next to Process ID**)**	A description of the subsystem job that is used when the integration layer process is active. Alphanumeric, 45 positions; required.

Field	Description
Status	The current status of the integration layer job. Possible statuses are: • Active • Inactive • Starting • Ending • Interact: The CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW processes always have this status because they do not use a batch job, but processes requests and responses interactively. The SVC_BALANC process also has this status if no companies have the Perform Balance Inquiry during Batch Authorizations (J19) system control value selected. Note: • The status is Active if any of the process queues are currently active. See the Work with Integration Layer Process Queues Screen for more information. • The status field is not implemented on the Create screen. Alphanumeric, 9 positions; display-only.
Communication type	Indicates whether the process uses a JMS provider (advanced queuing) or a web service. Possible types are: Message Queue (default) = the process uses a JMS provider, advanced queuing, to transmit and receive messages, or the job uses an Order Administration web service. See Advanced Queuing and *Generic Web Services*. Web Service = the process uses a web service that is external to Order Administration. Hide Service = this process is not used and will be hidden from the Work with Integration Layer Process Screen once you accept your entries on this screen. See Hiding an Integration Layer Process for more information. Required.
Inbound Processing:	
Inbound program	For an inbound process, the name of the job that receives and interprets the XML message from an external system to Order Administration, and performs any additional processing in Order Administration. Alphanumeric, 10 positions; optional.
Active session(s)	The total number of active sessions from the Work with Integration Layer Process Queues Screen. Set to zero on the Create screen. Numeric, 3 positions; display-only.

Field	Description
Inbound XML Msg/WSDL Doc Name	• If the Communication type field is set to Message Queue, this is the inbound message for the integration layer process to read and process. • If the Communication type field is set to Web Service, this is the name of the WSDL file for the integration layer process to read and process. **Note:** The only integration layer process that requires you to specify the name of a WSDL file in this field is the TAX_INT process. Other processes that use web services do not require you to specify a WSDL. Alphanumeric, 50 positions; optional.
Outbound Processing:	
Outbound job name	For an outbound process, the name of the job that generates the outbound XML message. Alphanumeric, 10 positions; optional.
Outbound program	For an outbound process, the name of the program that the job uses to build the XML message and send it to an external system. Alphanumeric, 10 positions; optional.
Outbound delay time	For an outbound process, this is the number of seconds to wait before checking the IL Outbound Trigger table for triggers in a ready (R) status. For outbound processes requiring additional configuration options, the system also uses the outbound delay time to determine the length of time to wait before performing a delete transaction, giving the system time to generate a delete download message. **Note:** For outbound processes that require additional configuration options, you must enter an outbound delay time. Numeric, 5 positions; optional.
Outbound XML message	The outbound message for the integration layer process to generate. Alphanumeric, 50 positions; optional.

Integration Layer Process Screen (Change Mode)

To change: Select Change for an integration layer process at the Work with Integration Layer Process Screen to advance to the Integration Layer Process screen in Change mode. See the Integration Layer Process Screen (Create Mode) for field descriptions.

Starting or Ending a Process

Overview: You can start or stop the Integration Layer processes at the Work with Integration Layer Process Screen by selecting Start or End, if the process is not currently active.

When you select to start a process, the system first confirms that the process is not currently running on any server. If not, the system changes its status from Inactive to Starting to Active.

When you select to end a process, the system first confirms that the process is currently running on any server. If is currently running, the system changes its status from Active to Ending to Inactive. There may be a delay while the process completes processing all records that existed when the process began.

> **Note:**
>
> If you end a process while it is in the "resting period" defined in the Outbound Delay Time, the process does not check to see if it should be ending until the Outbound Delay Time is over. So if, for example, the Outbound Delay Time is 15 minutes and the resting period just started, then the process does not end for almost 15 minutes.

Ending an individual process queue: If you end an individual process queue for a process and another process queue is still active, the system updates the status of the integration layer process to Ending. The process will remain in an Ending status until you end the other active process queue(s) for the integration layer process.

For information on how to start or end individual process queues for a process, see the Work with Integration Layer Process Queues Screen.

> **Note:**
>
> If you have more than one enabled integration layer process queue, the system may update the Active session field for the integration layer process to 1, even though more than one session actually went active on the Job Management Screen and Work with Integration Layer Process Queues Screen. In this situation, stop the integration layer process again and restart it so that the number of Active sessions matches the number of sessions that have actually started.

Interactive processes: This option is not available for the CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW jobs because they are interactive rather than batch processes. The SVC_BALANC process also has this status if no companies have the Perform Balance Inquiry during Batch Authorizations (J19) system control value selected. Also, this option is not necessary for some jobs, such as the ORDER_IN. See Integration Layer Processes for a listing of jobs that indicates whether it is necessary to start or stop the job.

Scheduling when an integration layer process starts and stops: You can schedule a periodic function to start or stop an integration layer process at a particular time. See Scheduling Jobs and Additional Interface (INT) Periodic Functions for more information on how to schedule a periodic function and for a list of the periodic functions used to start and stop the integration layer jobs.

Hiding an Integration Layer Process

Purpose: You can hide an unused integration layer process in order to simplify the information displayed at the Work with Integration Layer Process Screen.

Which processes are eligible to be hidden? You can hide a process only if:

- its current status is Inactive or Interactive

- it does not have any process queues set up through the Work with Integration Layer Process Queues Screen, or all existing process queues have the Enabled flag unselected

Before you hide a process: You should confirm that it is not a process that you are currently using or will need to use in the near future. For example, if you hide:

- TAX_INT: You will not be able to use the integration with Vertex or AvaTax.
- Outbound processes (such as ITEM_OUT, PO_OUT): Messages will not generated.
- Inbound processes (such as INVTRAN_IN): Messages will not be received and processed. In the case of an interactive process, no response message will be generated.
- EMAIL_OUT: You will not be able to send the CWEmailOut message for any template whose XML only? flag is selected; however, the system will continue to generate email notifications for email templates whose XML only? flag is not selected. See Working with E-Mail Notification Templates (WEMT) for more information.

> **Note:**
>
> If you have already configured the merchandise locator integration with Order Orchestration, this integration will continue to work after you hide the MERCH_LOC process.

Also, you should confirm that you do not have one of the Interface (INT) Periodic Functions to Start and Stop IJCT Jobs set up for a process that you are going to hide. If you do, the periodic function might start the process, even though it is hidden.

How to hide a process: At the Integration Layer Process Screen (Change Mode), change the Communication type to Hide Service.

How to show a hidden process: Once a process is hidden, you cannot show it again through an option at a screen in Order Administration. Instead, Oracle staff will need to query the Integration Layer Process table (MSILPR) and reset the ILP Communication type field from H to MQ (if the type was previously Message Queue) or WS (if the type was previously Web Service).

> **Note:**
>
> The JOBCLN periodic function does not update a job in H (hidden) status.

The BROKER, BROKER_ORD, MERCH_LOC, and TAX_INT processes use the Web Service type; the other processes use the Message Queue type.

Work with Integration Layer Process Queues Screen

Purpose: Use this screen to work with the process queues that run for each process displayed at the Work with Integration Layer Process Screen. Inbound processes might have multiple process queues if you receive messages from multiple remote systems; similarly, outbound processes might have multiple process queues if you broadcast messages to multiple remote systems. See Process Overview for more information on how processes relate to process queues.

It is not necessary to set up queues for a process that uses an external web service (Type at the Work with Integration Layer Process Queues Screen = WS).

> **Note:**
>
> You cannot create multiple process queues for the CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW processes. If you create multiple process queues for any of these processes, the system will only process messages for the queue with a sequence number of 1.

How to display this screen: Select Work with Queues for a process at the Work with Integration Layer Process Screen.

Field	Description
Process ID	The process you selected at the Work with Integration Layer Process Screen. The description is to the right. Alphanumeric, 10 positions; display-only.
Sequence	A unique sequence number to identify a queue for a process. You cannot create multiple process queues for the CC_TOKEN, SVC_OUT, SVC_BALANC, SVC_REVRSL, MERCH_LOC, or EMAIL_OUT processes. If you create multiple process queues for any of these processes, the system only processes messages for the queue with a sequence number of 1. Numeric, 3 positions; optional.
Description	The description of the process queue. Alphanumeric, 30 positions; optional.
Active sessions	The number of inbound sessions that are currently active for each process queue. You might have more than one active session for a process queue to prevent delays in responses; for example, you might have multiple active sessions for the process queue that receives new orders from your web storefront. **Note:** Active sessions do not apply to outbound processing. Numeric, 5 positions; display-only.
Start	The date and time the process queue was most recently started. The user ID of the person who started the process queue is also displayed. **Note:** This field is not displayed for outbound queues. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only. User: alphanumeric, 10 positions; display-only.

Field	Description
End	The date and time the process queue was most recently ended. The user ID of the person who ended the process queue is also displayed. **Note:** This field is not displayed for outbound queues. Date: numeric, 6 positions (in user date format); display-only. Time: numeric, 6 positions (HH:MM:SS format); display-only. User: alphanumeric, 10 positions; display-only.

Option	Procedure
Create a new process queue	Select Create to create a new queue for the selected process. You advance to the Integration Layer Process Queue Screen in Create mode. **Note:** You cannot create multiple process queues for the CC Token Process, SVC Activation, SVC Balance Inquiry, SVC Reversal, MERCH_LOC, or EMAIL_OUT processes.
Change a process queue	Select Change for a process queue to work with it. You advance to the Integration Layer Process Queue Screen in Change mode.
Delete a process queue	Select Delete for a process queue to delete it.
Display a process queue	Select Display for a process queue to advance to the Integration Layer Process Queue Screen in Display mode; all fields will be display-only.
Start a process queue	Select Start for a process queue to start it. If none of the other process queues were currently active, the status of the process at the Work with Integration Layer Process Screen changes to Active. The Start date, time, and user indicated for the process are also updated. Note: • The Enabled flag for the process queue must be selected for you to be able to start it. • Starting and stopping a process queue is not available for the CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW jobs because they are interactive rather than batch processes. Also, this option is not necessary for some jobs, such as the ORDER_IN. See Integration Layer Processes for a listing of jobs that indicates whether it is necessary to start or stop the job.
End a process queue	Select End for a process queue to end it. If none of the other process queues were currently active, the status of the process at the Work with Integration Layer Process Screen changes to Inactive. The End date, time, and user indicated for the process are also updated.
View status of a batch of messages in a queue	Select View batch status for a process queue to advance to the Work with Integration Process Control Screen.

Option	Procedure
Start all process queues for the process	Select Start all to start all process queues for the selected process. The status of the process at the Work with Integration Layer Process Screen changes to Active. The Start date, time, and user indicated for the process are also updated. Note: • Only process queues whose Enabled flag is selected will start. • Starting and stopping a process queue is not available for the CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW jobs because they are interactive rather than batch processes. Also, this option is not necessary for some jobs, such as the ORDER_IN. See Integration Layer Processes for a listing of jobs that indicates whether it is necessary to start or stop the job.
End all process queues for the process	Select End all to end all process queues for the selected process. The status of the process at the Work with Integration Layer Process Screen changes to Inactive. The End date, time, and user indicated for the process are also updated.

Starting or Stopping Process Queues

You can start or stop processes in two ways:

- All existing process queues for a process:
  - At the Work with Integration Layer Process Screen: see Starting or Ending a Process.
  - At the Work with Integration Layer Process Queues Screen: see below.
- **Individual process queues for a process:** At the Work with Integration Layer Process Queues Screen:
  - Starting a process queue: Select Start for a process queue to start it. If none of the other process queues were currently active, the status of the process at the Work with Integration Layer Process Screen changes to Active. The Start date, time, and user indicated for the process are also updated. **Note:** The Enabled flag for the process queue must be selected for you to be able to start it.
  - Ending a process queue: Select End for a process queue to end it. If none of the other process queues were currently active, the status of the process at the Work with Integration Layer Process Screen changes to Inactive. If one of the other process queues is currently active, the status of the process at the Work with Integration Layer Process Screen changes to Ending; the process will remain in an Ending status until you end the other active process queue(s) for the integration layer process.The End date, time, and user indicated for the process are also updated.

> **Note:**
>
> The BROKER_ORD job checks on whether it needs to end or to continue processing each time it has processed requests for all eligible companies and the Outbound Delay Time has passed.

Interactive processes: Starting and stopping a process queue is not available for the CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW jobs because they are interactive rather than batch processes. Also, this option is not necessary for some jobs, such as the ORDER_IN. See Integration Layer Processes for a listing of jobs that indicates whether it is necessary to start or stop the job.

System started: The system automatically starts a process queue for the SVC Activation, and SVC Reversal processes if a message is requested or received and the process is not currently running.

Starting or stopping all process queues for a process at the Work with Integration Layer Process Queues Screen:

- Starting all process queues for a process: Select Start all to start all process queues for the selected process. The status of the process at the Work with Integration Layer Process Screen changes to Active. The Start date, time, and user indicated for the process are also updated. **Note:** Only process queues whose Enabled flag is selected will start.
- Ending all process queues for a process: Select End all to end all process queues for the selected process. The status of the process at the Work with Integration Layer Process Screen changes to Inactive. The End date, time, and user indicated for the process are also updated.

Interactive processes: Starting and stopping a process queue is not available for the CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW jobs because they are interactive rather than batch processes. The SVC_BALANC process is also interactive if no companies have the Perform Balance Inquiry during Batch Authorizations (J19) system control value selected. Also, this option is not necessary for some jobs, such as the ORDER_IN. See Integration Layer Processes for a listing of jobs that indicates whether it is necessary to start or stop the job.

Which job queue? The integration layer jobs run automatically in the QSYSNOMAX job queue in order to avoid slowing down any other jobs that might be running in other job queues on the system.

Integration Layer Process Queue Screen

Purpose: Use this screen to create, change, or display a process queue for an integration layer process.

How to display this screen: At the Work with Integration Layer Process Queues Screen:

- Select Create to advance to this screen in Create mode.

Note:

You cannot create multiple process queues for the SVC_OUT, SVC_BALANC, SVC_REVRSL, MERCH_LOC, or EMAIL_OUT processes.

- Select Change for a process queue to advance to this screen in Change mode.
- Select Display for a process queue to advance to this screen in Display mode. All fields will be display-only.

Field	Description
Process ID	The Process ID for the selected process. The description of the process is to the right. Process ID: alphanumeric, 10 positions; display-only. Process description: alphanumeric, 45 positions; display-only.
Description	The description of the process queue to run for the integration layer process. For example, for an inbound process, you might use this field to indicate the source of the messages. Alphanumeric, 30 positions; required.
Enabled	Indicates whether the process queue can process messages. Valid values are: • Selected = You can start the process queue. • Unselected = You cannot start the process queue. **Note:** If this field is unselected for all process queues, you will not be able to start the process. For outbound processing, the system sends the outbound message to queues only if their Enabled field is selected.
# inbound sessions	The number of sessions to run under this process queue. You might run multiple sessions for process queues that require an immediate response, such as the process queue that receives new order messages from the web storefront. Multiple sessions are used only for inbound process queues; outbound processes should have this field set to 1 for their process queues. **Note:** If you leave this field blank, you will not be able to start the process queue. If this field is blank for all process queues for a process, you will not be able to start the process. Numeric, 5 positions; required.
Wait time	The number of seconds Order Administration waits for a response from an external system. Used only for two-way interfaces (outbound/inbound). If the message waits on the target queue longer than this number of seconds the message is automatically deleted. Numeric, 6 positions; optional.
Inbound Processing:	
Active session (s)	Indicates the number of sessions that are currently active for this process queue. Included in Change or Display mode only. Numeric, 5 positions; display-only.
Inbound queue manager	This field is currently implemented. Alphanumeric, 48 positions; optional.

Field	Description
Inbound queue	The queue in the queuing database where this process queue reads messages originating from the remote server or system. Required for inbound process queues. Alphanumeric, 48 positions; optional.
Inbound XML message	The name of the inbound XML message; informational only. Alphanumeric, 50 positions; optional.
Inbound job name	The name of the job that interprets the XML message from the external system to Order Administration. This is the Job Name listed on the Job Management screen, available through the My Jobs option. If there are multiple process queues for a process, each instance of the job should have a unique name. Required for inbound process queues. Alphanumeric, 10 positions; optional.
Outbound Processing:	
Outbound queue manager	This field is not currently implemented. Alphanumeric, 48 positions; optional.
Outbound queue	The queue to which this process queue sends messages for transmission to the remote server. Required for outbound process queues. Alphanumeric, 48 positions; optional.
Outbound XML message	The name of the outbound XML message; informational only. Alphanumeric, 50 positions; optional.

Creating a Process Queue

> **Note:**
>
> You cannot create multiple process queues for the SVC_OUT, SVC_BALANC, SVC_REVRSL, MERCH_LOC, or EMAIL_OUT processes.

1. At the Work with Integration Layer Process Queues Screen, select Create to advance to this screen in Create mode.
2. Complete the Description and set the Enabled flag, and then any additional fields required for the process queue. Select OK to accept your entries.

Work with Integration Process Control Screen

Purpose: Use this screen to review the status of a batch of messages. This screen is useful if you need to troubleshoot the location of a batch message.

Each batch status represents a record in the Integration Process Control table. The system creates a record in the Integration Process Control table when the system sends or receives a batch of messages via an integration layer process.

Purging integration process control records: When one of the integration layer jobs listed above becomes active (from a user manually starting the job, through a periodic function, or through the job starting automatically), the system submits the ILPURGE job to determine if any of the records in the Integration Process Control table should be purged. If the integration process control record has an ILC date stamp that is over 7 days old, the system removes the record from the Integration Process Control table.

Purpose: Select View batch status for a process queue at the Work with Integration Layer Process Queues Screen.

Batch status records on this screen sort in descending date and time sequence.

Field	Description
Process	The name and description of the batch integration layer process whose integration process control records you are reviewing. Code: alphanumeric, 10 positions; display-only. Description: alphanumeric, 45 positions; display-only.
Queue Name	A unique sequence number to identify a queue for a process, and the description of the process queue. Queue: numeric, 3 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Job	The job name for the process associated with the integration process control record. For example, PICK_GEN indicates a integration process control record created for the Batch CC Authorization integration layer process; these records represent a batch of credit card authorizations sent to the authorization service. Alphanumeric, 10 positions; optional.

Field	Description
Status	The status of the integration process control record. Normal transmissions process through the following statuses: TRF, SNT, RCV, RIN, CMP. TRF Unknown status indicates the batch message is unknown and has not been transmitted. SNT Sent indicates the batch message transmission has been sent to the external system. RCV Received (IDC Server) indicates the batch message transmission has been received from the external system and all background processing for the batch is complete. A batch may remain in a received status if the associated job, such as pick slip generation, has timed out or moved on before the batch could be updated to Complete. No further action is required for a batch that remains in a Received status. RIN Receiving indicates the batch message transmission is in the process of being received. CMP Complete indicates the batch message has been completed. FLD Error (Sending) indicates the batch message transmission has failed. Note: • If the Immediate response field for the service bureau is selected, completed records remain in a RCV status and never update to CMP. • If the integration process control record is in a sent or error status, the system will continue to wait for a response for that record. You must resolve any errors before receiving the next transaction. Status code: Alphanumeric, 3 positions; optional. Status description: Alphanumeric, 24 positions; display-only.
Date	The date the batch message transmission was sent to or received from an external system. Numeric, 6 positions (in user date format); display-only.
Time	The time the batch message transmission was sent to or received from an external system. Numeric, 6 positions (HH/MM/SS format); display-only.
Reference ID	The next available number from the Batch Auth File Trace Number number assignment value. Numeric, 16 positions; display-only.

Screen Option	Procedure
Delete an integration process control record	Select Delete for an integration process control record to delete it.
Review an integration process control record	Select Display for an integration process control record to advance to the Display Integration Process Control Screen.

Screen Option	Procedure
Change the status of an integration process control record that is not yet complete	Select Change status for an integration process control record to advance to the Change Status window. You cannot change the status of an integration process control record that is in CMP complete status.

Display Integration Process Control Screen

Purpose: Use this screen to review the details of an integration process control record. This screen is useful if you need to troubleshoot the location of a batch message.

How to display this screen: Select Display for an integration process control record at the Work with Integration Process Control Screen.

Field	Description
Process	The name and description of the batch integration layer process whose integration process control records you are reviewing. Code: alphanumeric, 10 positions; display-only. Description: alphanumeric, 45 positions; display-only.
Queue	A unique sequence number to identify a queue for a process, and the description of the process queue. Queue: numeric, 3 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Job #	The job number for the process associated with the integration process control record; this is the process that sent the batch message. Alphanumeric, 6 positions; display-only.
Job name	The job name for the process associated with the integration process control record. For example, PICK_GEN indicates an integration process control record created for the Batch CC Authorization integration layer process; these records represent a batch of credit card authorizations sent to the authorization service. Alphanumeric, 10 positions; display-only.
User	The user ID of the person who submitted the process associated with the batch messages. Alphanumeric, 10 positions; display-only.

Field	Description
Status	The status of the integration process control record. Normal transmissions process through the following statuses: TRF, SNT, RCV, RIN, CMP. TRF Unknown status indicates the batch message is unknown and has not been transmitted. SNT Sent indicates the batch message transmission has been sent to the external system. RCV Received (IDC Server) indicates the batch message transmission has been received from the external system and all background processing for the batch is complete. A batch may remain in a received status if the associated job, such as pick slip generation, has timed out or moved on before the batch could be updated to Complete. No further action is required for a batch that remains in a Received status. RIN Receiving indicates the batch message transmission is in the process of being received. CMP Complete indicates the batch message has been completed. FLD Error (Sending) indicates the batch message transmission has failed. **Note:** If the integration process control record is in a sent or error status, the system will continue to wait for a response for that record. You must resolve any errors before receiving the next transaction. Status code: Alphanumeric, 3 positions; optional. Status description: Alphanumeric, 24 positions; display-only.
Date	The date the batch message transmission was sent to or received from the external system. Numeric, 6 positions (in user date format); display-only.
Time	The time the batch message transmission was sent to or received from the external system. Numeric, 6 positions (HH/MM/SS format); display-only.
Reference ID	The next available number from the Batch Auth File Trace Number number assignment value. Numeric, 16 positions; display-only.
Comment	Informational error message regarding the batch message transmission, indicating a transmission error has occurred. Alphanumeric, 60 positions; display-only.

Change Status Window (Integration Process Control)

Purpose: Use this window to change the status of an integration process control record. You might change the status of a record if you experienced communication problems and need to re-send or receive transactions.

You cannot change an integration process control record that is already in a CMP Complete status: Status Already Complete.

How to display this window: Select Change status for an integration layer process control record at the Work with Integration Layer Process Queues Screen.

To change: Select a status and click OK to update the integration process control record to that status.

- Complete indicates the batch message has been completed.
- Failed indicates the batch message transmission has failed.
- Ready indicates the batch message is ready for transmission.
- Received indicates the batch message transmission has been received from the external system.
- Sent indicates the batch message transmission has been sent to the external system.
- Transferred indicates the batch message has been transmitted.

Defining Outbound Interface Trigger Rules

Outbound interface trigger rules are the criteria a transaction must meet in order for the system to create an IL outbound trigger. For each outbound process, you can create trigger rules for certain tables. For example, you can create trigger rules for the Item table and SKU table to control the Item Outbound job. If you enter more than one criterion, the record must meet all of the criteria in order to generate a trigger.

Example: For the ITEM_OUT process, you can specify to create item download triggers for SKUed items in company 555 that are located in warehouse 20. To do this, for the Item table trigger rules, select a Test of Equal and enter 555 as the Value for the Company trigger field, and select a Test of Equal and enter 'Y' as the Value for the Allow SKU's trigger field. For the SKU table trigger rules, select a Test of Equal and enter 20 as the Value for the Warehouse trigger field.

Item table criteria	SKU table criteria	Results
The Company field must equal 27 or 555. The Allow SKUs field must equal 'Y'.	The Warehouse field must equal 20.	The system generates a SKU trigger only if the item/SKU being created, updated, or deleted is in company 27 or company 555 and the item is SKU'd and the SKU is located in warehouse 20. If the item/SKU does not meet all of the criteria, no trigger is created.

You can create trigger rules for the following outbound processes.

For IL Process job:	you can create trigger rules for:	Example:
CUST_OUT	Company, Customer class, Inactive?, and Country fields	You can specify to create Customer Download messages only for active customers in the US and Canada. To do this: • Select a Test of Not Equal for the Inactive? flag and enter Y as the Value • Select a Test of Equal for the Country field and enter 'USA CAN' as the Value (assuming those are the country codes you are using)

For IL Process job:	you can create trigger rules for:	Example:
ITEM_OUT	Item (INITEM) SKU (INSKU)	You can specify to only create item download triggers for company 555, items that are SKU'ed and whose SKUs are located in warehouse 20. To do this: • in the Item table trigger rules, select a Test of Equal and enter 555 as the Value for the Company trigger field, and select a Test of Equal and enter Y as the Value for the Allow SKU's trigger field. • In the SKU table trigger rules, select a Test of Equal and enter 20 as the Value for the Warehouse trigger field. See *Item Outbound Trigger Rules*.
INVOIC_ OUT	Invoice Header (OEINHD) Order Header (OEORDR)	You can specify to only create invoice download triggers for debit invoices and not credit invoices. To do this, select a Test of Equal and enter I as the Value for the Invoice type trigger field.
INV_ DOWNLD	Item (INITEM) Item Warehouse (INIWRE) SKU (INSKU) Warehouse (INWRHS Item UPC (ITMUPC)	You can specify to exclude drop ship items, non-inventory items, and membership items. To do this, select a Test of Equal and enter Y as the Value for the Drop ship item, Non-inventory, and Membership trigger fields.
PICK_OUT	Pick Control Header (FLPCTH)	You can specify by company only.
PO_OUT	Purchase Order Header (POH)	You can specify to only create purchase order download triggers for purchase orders that are created, closed, cancelled in company 12 and vendor 10001. To do this, select a Test of In and enter 12 as the Value for the Company trigger field and select a Test of Equal and enter 10001 as the Value for the Vendor trigger field.

For IL Process job:	you can create trigger rules for:	Example:
RETURN_OUT	Order Header (OEORDR)	You can specify to only create return authorization download triggers for return authorizations that are created, changed or deleted in company 7 or 555 and are associated with orders whose order type is W. To do this, select a Test of In and enter 7 555 as the Value for the Company trigger field, and select a Test of Equal and enter W as the Value for the Order Type trigger field.
VENDOR_ OUT	Vendor (POVEND)	You can specify to create vendor download triggers only for companies 27 and 555 and vendor 202. To do this, select a Test of In and enter 27 555 as the Value for the Company trigger field, and select a Test of Equal and enter 202 as the Value for the Vendor # trigger field.

> **Note:**
>
> Applying trigger rules for the BROKER job is not currently implemented.

Defining Trigger Rule Values

To create a trigger rule, select the fields in the table that should control trigger creation. For each trigger field, define:

- a Test value: indicates how the system compares the record against the trigger rule criteria.
- a Value: defines the trigger rule criterion.

Example: For the Company trigger field, select a Test of Equal and enter 555 as the Value field. This indicates the system creates IL outbound triggers only for company 555.

Field type: The T (type) field indicates if the value you enter must be numeric or alphanumeric.

- N = the Value must be numeric.
- A = The Value is alphanumeric.

Note:

- Enter alphanumeric values between single quotes: for example, ’Y’.
- When entering a list or range of alphanumeric values, separate each value with a space: for example, ’S F V’.
- When entering a list or range of numeric values, separate each value with a comma: for example, 2,5,7.
- If you select a Test value for a field you must also enter a Value, and vice versa.
- The system does not validate that the value you enter for a trigger field is valid (if the field requires valid values) or is within the maximum field positions (for example, the Company field is 3 positions). Refer to your Database Listing to review field attributes for a table.
- Fields that are in the table but are not included in the XML message are not included as a trigger field.

Test value	Description
blank	A trigger rule is not specified for the field.
Between (falls within a defined range)	The field must fall within the trigger rule value range. For example, the Ship via must fall within 1 and 5.
Equal	The field must equal the trigger rule value. For example, the Company field must equal 555.
Greater than	The field must be greater than the trigger rule value. For example, the Cost field must be greater than 5.00.
Greater than or equal	The field must be greater than or equal to the trigger rule value. For example, the Cost field must be greater than or equal to 5.00.
In (equal to a listed value)	The field must match a trigger rule value. For example, the Company field must match 27, 409, or 555.
Less than	The field must be less than the trigger rule value. For example, the Cost field must be less than 500.00.
Less than or equal	The field must be less than or equal to the trigger rule value. For example, the Cost field must be less than or equal to 500.00.
Not Between	The field must not fall within the trigger rule value range. For example, the Postal code must not be between 96700 and 96899.
Not Equal	The field must not be equal to the trigger rule value. For example, the Company field must not be 25.
Not In (not equal to a listed value)	The field must not match a trigger rule value. For example, the Company field must not be 25 or 444.

Select Trigger Rules File Window

Purpose: This window opens if you can define trigger rules for more than one table. If a process has only one table available for trigger rules, you advance directly to the Outbound Interface Trigger Rules Screen for this process.

How to display this window: Select Trigger Rules for an outbound process for which you can create trigger rules for more than one table.

Field	Description
Process	The code and name of the process for which you are creating trigger rules. Alphanumeric, 10 positions; display-only.
File name	The table for which you are creating trigger rules. Select a table to advance to the Outbound Interface Trigger Rules Screen. Alphanumeric, 10 positions; optional.

Outbound Interface Trigger Rules Screen

Purpose: Use this screen to define trigger rules for an outbound job.

The appearance of this screen varies based on the outbound process for which you are defining outbound trigger rules.

Using this screen: See Defining Outbound Interface Trigger Rules for a discussion.

How to display this screen:

- Select Trigger Rules for an outbound process at the Work with Integration Layer Process Screen.
- Select a table at the Select Trigger Rules File Window.

Field	Description
Process ID	The code and name of the outbound process for which you are creating trigger rules. Alphanumeric, 10 positions; display-only.
File name	The table for which you are creating trigger rules. Alphanumeric, 10 positions; display-only.
Field	The field in the table for which you can create a trigger rule. When evaluating a record to determine whether to create an IL outbound trigger, the system compares the record’s field value against the trigger rule for the field. Alphanumeric, 15 positions; display-only.

Field	Description
Test	Indicates how the system compares the record against the trigger rule criteria. blank = A trigger rule is not specified for the field. Between (falls within a defined range) = The field must fall within the trigger rule value range. For example, the Ship via must fall within 1 and 5. Equal = The field must equal the trigger rule value. For example, the Company field must equal 555. Greater than = The field must be greater than the trigger rule value. For example, the Cost field must be greater than 5.00. Greater than or equal = The field must be greater than or equal to the trigger rule value. For example, the Cost field must be greater than or equal to 5.00. In (equal to a listed value) = The field must match a trigger rule value. For example, the Company field must match 27, 409, or 555. Less than = The field must be less than the trigger rule value. For example, the Cost field must be less than 500.00. Less than or equal = The field must be less than or equal to the trigger rule value. For example, the Cost field must be less than or equal to 500.00. Not Between = The field must not fall within the trigger rule value range. For example, the Postal code must not be between 96700 and 96899. Not Equal = The field must not be equal to the trigger rule value. For example, the Company field must not be 25. Not In (not equal to a listed value) = The field must not match a trigger rule value. For example, the Company field must not be 25 or 444. Alphanumeric, 5 positions; optional.
Value	Defines the trigger rule criterion. The system compares the trigger field value against the value of this field in each record. • If the record meets the trigger rule criteria, the system creates an IL outbound trigger. • If the record does not meet the trigger rule criteria, the system does not create an IL outbound trigger. When entering alphanumeric values, you must enter the value between single quotes; for example 'Y'. When entering a list or range of values, separate each value with a space; for example, 27 555 or 'S F V'. If you define a Value here, you must also select a Test value. Alphanumeric, 50 positions; optional.
Type	Indicates if the value you enter is numeric or alphanumeric. N = numeric A = alphanumeric **Note:** Enter alphanumeric values between single quotes; for example 'Y'. Alphanumeric, 1 position; display-only.

Outbound Interface XML Inclusion Screen

XML inclusion defines which elements to include in a download message.

- If the element is included, that element and its parents are included in the generated download XML message.
- If the element is excluded, that element and its children are excluded from the generated download message.

Remember: Parent elements are those elements that nest other elements; any elements nested underneath the parent element are its children.

Example: Some of the elements in the generic item download message are displayed below. In this example: Item is the parent of ItemInformation and ItemInformationDetail. ItemInformation is the parent of ItemInformationDetail and the child of Item. ItemInformationDetail is the child of ItemInformation and Item.

```
Item

SKU

UPC

Warehouse

ItemWarehouse
```

- If you include the Item element, you can still exclude the SKU element. If you exclude the Item element, the SKU element and its children (UPC, Warehouse, and ItemWarehouse) are also excluded.
- If you include the UPC element, the system automatically includes the SKU element. You can still exclude the Warehouse element.
- If you exclude the Item element, the process still generates an “empty” message with just the top element information. For example, if you exclude the entire message for the INV_DOWNLD process, the resulting “empty” message would resemble:

```
<Message source="OROACS" target="cwi"
type="CWInventoryDownload" date="02112006" time="10:38:10">

</Message>
```

This screen appears different based on the outbound process for which you are defining XML inclusion rules.

> **Important:**
>
> After you change XML inclusion rules, they do not take effect until after you restart the application.

You can define XML inclusion rules for the following outbound processes:

For IL Process job:	You can create XML inclusion rules for:
CUST_OUT	parent and child elements included in the *Customer Download XML Message (CWCustomerDownload)*. See *Customer Outbound XML Inclusion* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
ITEM_OUT	parent and child elements included in the *Item Download XML Message (CWItemOut)*. See *Item Outbound XML Inclusion*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
VENDOR_OUT	parent and child elements included in the *Vendor Download XML Message (CWVendorOut)* See *Vendor Outbound XML Inclusion*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
INVOIC_OUT	parent and child elements included in the *Invoice Download XML Message (CWInvoiceOut)*. See *Invoice Outbound XML Inclusion*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
INV_DOWNLD	parent and child elements included in the *Inventory Download XML Message (CWInventoryDownload)*. See *Inventory Download XML Inclusion.*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
PICK_OUT	parent and child elements included in the Pick Message from Order Administration (CWPickOut). See *Pick Out Processing*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> Although you can display XML inclusion options for the MERCH_LOC process, these options are not currently implemented.

When you first advance to the screen in your environment, all elements are included.

How to display this screen: Select XML inclusion for an outbound process at the Work with Integration Layer Process Screen.

Field	Description
Process ID	The code and name of the outbound process for which you are creating XML inclusion rules. Alphanumeric, 10 positions; display-only.

Field	Description
Include	Indicates whether the element is included in the download XML message. selected = the element and its parent(s) are included in the XML message. unselected = the element and its children are not included in the XML message. Select Include for an element to include it and its parents in the generated XML messages. The system updates this field for the element and its parents to selected. Select Exclude for an element to exclude it and its children in the generated XML messages. The system updates this field for the element and its children to unselected.
Element	The name of an element tag to include or exclude in the download XML message. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Include the element tag and its parents	Select Include for an element. The Include field for the element and its parents updates to Y.
Exclude the element tag and its children	Select Exclude for an element. The Include field for the element and its children updates to N.

Select XML Message Version Screen

Purpose: Use this screen to select the version of an outbound XML message to be generated by a system-delivered integration layer job. By default, each process generates version 1.0, but you can select a higher version if it is available. See XML Versions for an overview.

How to display this screen: Select Outbound XML Ver for a process at the Work with Integration Process Control Screen. This option is not available for processes that do not generate outbound XML messages.

Completing this screen: Select the XML version you would like to generate. Afterward, stop and restart the process at the Work with Integration Process Control Screen to have your change take effect.

Using the JOBCLN Function to Troubleshoot IJCT Jobs

Use the JOBCLN periodic function to resolve issues with the status of IJCT jobs. This periodic function updates IJCT job status as follows:

Note:

The JOBCLN function does not resolve issues with hidden jobs or with Interact jobs (CUSTOMER_IN, CUST_HIST, CUST_SRCH, CUSTOMER_IN, EMAIL_OUT, INV_INQUIRY, MERCH_LOC, ORDER_IN, RETURN_IN, TAX_INT, and WORKFLOW). Also, it does not resolve issues with the SVC_BALANC job unless there is at least one company that has Perform Balance Inquiry during Batch Authorizations (J19) selected.

For other IJCT jobs, the JOBCLN function does the following:

- If job has neither an Inbound or Outbound program specified, set to INACTIVE if in any other status.
- If the job is currently running (at least one process queue active):
  - If the status is INACTIVE, update to ACTIVE; otherwise, do not change status.
  - Reset the active session count if it is not correct.
  - If the job uses an active procedure (see Purge Active Procedures Across Users (MACX)) and there is currently no active procedure for the job, create it.
  - If the job is in END, FINISHED, or MSG at the Job Management (My Jobs) screen, update status to RUN and update Job History (Display Job History (DJHY)).
- If the job does not have any process queues currently running:
  - If the status is ACTIVE, STARTING, or ENDING, update to INACTIVE.
  - Set the active session count to 0 if it is greater than 0.
  - If there is an active procedure, delete it.
  - If the job is in any status but END at the Job Management screen, update it to END and update Job History.
- Deletes any existing END records for the job so that the job will remaining running when it is restarted.

Running Period End Processing

Topics in this part:

- Working with Periodic Functions (WPER) describes working with the functions you can include in your periodic processing.
- Working with Periodic Processes (WPPR) describes how to create, change, delete or display a periodic process.
- Executing Periodic Processes (EPRO) describes how to set up and execute a periodic process.
- Working with Periodic Process History (WPHS) presents the screens you use to review periodic process history.
- Purge Periodic Process History (MPPR) describes how to purge periodic process history in a completed status for all Order Administration companies prior to a specified date.

- Printing the Tax Jurisdiction Report (PTXJ) describes how to run this report and presents a sample.
- Releasing Orders from Time Hold describes the RLSTIME periodic function.
- Working with the Marketing Download Extract describes how to download order, customer, source code, and vendor information from Order Administration to the DMT system.
- Using the Financial Data Interface describes how to extract information to the Financial Sales Download table.

Working with Periodic Functions (WPER)

Periodic functions are jobs that you need to run periodically, usually on a daily, monthly, or yearly basis. Periodic functions include reports listing or summarizing activity in a particular area of your business, reports providing current status information on your business, periodic resets, and aging operations.

Assign certain functions to your daily, monthly and yearly processing; a list of these functions appears in this topic. You can define your own programs and queues as periodic functions as well.

You use Working with Periodic Processes (WPPR) to define a group of periodic functions to run together within a periodic process and to schedule when the system executes the process. You cannot run a periodic function by itself.

> **Note:**
>
> Periodic functions and processes are not restricted by company; when you create a periodic function or process, it is defined across all companies.

For more information: See Periodic Functions Available to Schedule for a listing of functions.

In this topic:

- Work with Periodic Functions Screen
- Create Periodic Function Screen

Work with Periodic Functions Screen

How to display this screen: Enter WPER in the Fast path field at the top of any menu, or select Work with Periodic Functions from a menu.

Field	Description
Function	The name of the periodic function. Alphanumeric, 7 positions; display-only.
Description	The description of the periodic function. Alphanumeric, 70 positions; optional.

Field	Description
Applic (Application area code)	The area of Order Administration (for example, Customer Service) where this function belongs. Use application areas to categorize similar system control values, secured features, and menu options as well as periodic functions. Alphanumeric, 3 positions; optional.
System	Indicates whether the periodic function is a system-level function, which was delivered with the software and cannot be changed or deleted. Valid values are: • Yes = This is a system-level function. • No = This is not a system-level function. Optional.

Screen Option	Procedure
Change a periodic function	Select Change for the function to advance to the Change Periodic Function Screen. You can change any information on this screen except for the function name. See the Create Periodic Function Screen for field descriptions.
Delete a periodic function	Select Delete for a function to delete it. **Note:** You cannot delete a function that is assigned to a periodic process. You must first remove the periodic function from the process before you can delete it.
Display a periodic function	Select Display for a function to advance to the Display Periodic Function Screen. You cannot change any information. See the Create Periodic Function Screen for field descriptions.
Create a new periodic function	Select Create to advance to the Create Periodic Function Screen.

Create Periodic Function Screen

Purpose: Use this screen to create a function to include in periodic processing.

How to display this screen: Select Create at the Work with Periodic Functions Screen.

Field	Description
Function	The name of the periodic function. You must define a function at this screen before you can assign it to a periodic process. Alphanumeric, 7 positions. Create screen: required. Change screen: display-only.
Description	The description of the periodic function. Alphanumeric, 70 positions; optional.

Field	Description
Company parameter	Select this field to indicate that a company parameter is required to execute the periodic process containing this periodic function. If you assign a function with this field selected to a periodic process, it updates the Company parameter field for the periodic process to selected, and you need to enter a company code at the First Execute Periodic Process Screen (Setting Parameters). Company codes are defined in and validated against the Company table.
Appl area (Application area code)	The area of Order Administration (for example, Customer Service) where this function belongs. Use application areas to categorize similar system control values, secured features, and menu options as well as periodic functions. Alphanumeric, 3 positions; required.
Program name	The name of the program to be called by the periodic function. Used only if no Class name is defined. You cannot define both a Program name and a Class name. Alphanumeric, 10 positions; required.
Class name	The name of the class to be called by the periodic function. Used only if no Program name is defined. You cannot defined both a Program name and a Class name. Currently, the Class name is used only for the following periodic functions: • BILLUPD periodic function (batch billing update): oracle.retail.oms.services.job.functions.BillingUpdateBatchJob • SCHDDEP periodic function (schedule deposits): oracle.retail.oms.services.job.functions.DepositBatchSingleRunJob Alphanumeric, 63 positions; required if no Program name is defined."
Parameter	A parameter required to execute the periodic function. See Periodic Functions Available to Schedule to review which periodic functions allow you to define an additional parameter. Alphanumeric, 256 positions; optional.

Working with Periodic Processes (WPPR)

Periodic processes are jobs consisting of one or more periodic functions that run on a daily, weekly, monthly, or yearly basis.

See Periodic Functions Available to Schedule for examples of functions to assign to your daily, weekly, monthly and yearly processing.

Note:

Periodic functions and processes are not restricted by company; when you create a periodic function or process, it is defined across all companies.

Scheduling jobs: See Scheduling Jobs for information on how to schedule periodic processes.

Execute process through web service: You can also use the CWProcessIn message or the ProcessIn message to start a periodic process. See *Using the*

CWProcessIn Message to Start a Periodic Process or *Using the ProcessIn REST Message to Start a Periodic Process* for more information.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Options: You can execute a periodic process or display its history from the Work with Periodic Process screen or through separate menu options. See Executing Periodic Processes (EPRO), for information on running a periodic process and Working with Periodic Process History (WPHS), for information on displaying the past records of a periodic process.

Generating a job notification: You can generate an outbound web service message to notify an external system when a periodic process is complete. See *Using the Job Notification Outbound REST Message* for more information.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Purging history: When a process completes, it automatically deletes any Process History Header records, and their associated Process History Detail records, for that process that are in completed or canceled status, and if the date for the detail records is older than the Periodic Process History Purge Days (L77). See that system control value for more information.

In this topic:

- Work with Periodic Processes Screen
- Create Periodic Process Screen
- Work with Process Assignments Screen (Assigning Functions to a Periodic Process)

Work with Periodic Processes Screen

How to display this screen: Enter WPPR in the Fast path field at the top of any menu, or select Work with Periodic Process from a menu.

Field	Description
Process	The name of the periodic process. Alphanumeric, 10 positions; optional.
Description	The description of the periodic process. Alphanumeric, 70 positions; optional.
Appl Area (Application area)	The area of Order Administration (for example, Order Entry) where this process belongs. Alphanumeric, 3 positions; optional.
Type (Periodic process type list)	Indicates the time period of the periodic process. Processes run on a daily, weekly, monthly or yearly basis. Informational-only. Valid values are: • Annually • Daily • Monthly • Weekly Optional.

Field	Description
Sys opt (System operation)	Indicates whether the periodic process is a system-level process that cannot be changed or deleted. Valid values are: • Yes = this is a system-level process • No = this is not a system-level process

Screen Option	Procedure
Change a periodic process	Select Change for the process to advance to the Change Periodic Process Screen. You can change any information on this screen except the process name and company parameter. See the Create Periodic Process Screen for field descriptions.
Delete a periodic process	Select Delete for a process to delete it. **Note:** You cannot delete a periodic process if process history exists. You must first delete the history before you can delete the periodic process.
Display a periodic process	Select Display for a process to advance to the Display Periodic Process Screen. You cannot change any information. See Create Periodic Process Screen for field descriptions.
Display the periodic functions within the periodic process	Select Functions for a process to advance to the Work with Process Assignments Screen (Assigning Functions to a Periodic Process).
Run a periodic process	Select Execute for a process to advance to the First Execute Periodic Process Screen (Setting Parameters).
Display the history of a periodic process	Select History for a process to advance to the Work with Process History Screen.
Create a new periodic process	Select Create to advance to the Create Periodic Process Screen.

Create Periodic Process Screen

Purpose: Use this screen to create a periodic process.

To assign functions to the periodic process, return to the Work with Periodic Process screen and select Functions for the process. See Work with Process Assignments Screen (Assigning Functions to a Periodic Process).

How to display this screen: Select Create at the Work with Periodic Processes Screen.

Field	Description
Process	The name of the periodic process. Alphanumeric, 10 positions. Create screen: required. Change screen: display-only.
Description	The description of the periodic process. Alphanumeric, 70 positions; required.
Type (Periodic process type list)	Indicates the time period of the periodic process. Processes can be run on a daily, weekly, monthly or yearly basis. Informational-only. Valid values are: • Annually • Daily • Monthly • Weekly Optional.
Company parameter?	This flag is included on the Change Periodic Process Screen and the Display Periodic Process Screen, and indicates whether any of the periodic functions added through the Work with Process Assignments Screen (Assigning Functions to a Periodic Process) require a company parameter. Possible settings are: • Selected = One or more of the periodic functions has the Company parameter selected • Unselected = None of the periodic functions has the Company parameter selected If this value is selected, the Company field at the First Execute Periodic Process Screen (Setting Parameters) is enterable and required; otherwise, the field is display-only.
Appl area	The area of Order Administration (for example, Order Entry) where this process belongs. Alphanumeric, 3 positions; required.
Job queue	The job queue where the system submits the periodic process. The job queue defaults to QBATCH. Alphanumeric, 10 positions; required.

Work with Process Assignments Screen (Assigning Functions to a Periodic Process)

Purpose: Use this screen to assign periodic functions to a periodic process.

How to display this screen: Select Functions for a process at the Work with Periodic Processes Screen

Field	Description
Process	The name of the periodic process. Alphanumeric, 10 positions; display-only.
Description	The description of the periodic process. Alphanumeric, 70 positions; display-only.

Field	Description
Type	Indicates the time period of the periodic process. Processes can be run on a daily, weekly, monthly or yearly basis. Informational-only. • Annually • Daily • Monthly • Weekly Alphanumeric, display-only.
Appl area	The area of Order Administration (for example, Order Entry) where this application belongs. Alphanumeric, 3 positions; display-only.
Seq # (Sequence Number)	The position of the function within the periodic process. This number indicates the order in which the system executes the functions within the process. Numeric, 3 positions; required.
Function	The name of the periodic function. Periodic functions are validated against the Periodic Function table. Alphanumeric, 7 positions; required.
Description	The description of the periodic function. Alphanumeric, 70 positions; displays when correct information is entered in the required fields.
Select	Indicates whether to include the periodic function in the next execution. Valid values are: • Yes = Include this function. • No = Do not include this function. Required.

Screen Option	Procedure
Remove a periodic function from a periodic process	Select Delete for a periodic function to advance to the Confirm Delete window. Select Delete to remove the periodic function from the periodic process; otherwise, select Exit to cancel.

Executing Periodic Processes (EPRO)

Purpose: Use the Executing Periodic Processes function to select and set up the parameters of a process for its execution.

The parameters of the process contain:

- the company where the execution takes place
- the schedule parameters of when the system executes the periodic process

> **Note:**
>
> Periodic functions and processes are not restricted by company; when you create a periodic function or process, it is accessible to run across all companies.

In this topic:

- Select Periodic Process to Execute Screen
- First Execute Periodic Process Screen (Setting Parameters)
  - Periodic Process Scheduling Examples
- Second Execute Periodic Process Screen (Selecting Functions)

Other ways to submit periodic processes: You can also execute a periodic process through:

- Working with Periodic Processes (WPPR)
- *Using the CWProcessIn Message to Start a Periodic Process*
- *Using the ProcessIn REST Message to Start a Periodic Process*

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Select Periodic Process to Execute Screen

How to display this screen: Enter EPRO in the Fast path field at the top of any menu, or select Execute Periodic Process from a menu.

Field	Description
Process	The name of the periodic process you wish to run. Alphanumeric, 10 positions; required.

Completing this screen:

1. Enter the name of a periodic process in the Process field and select OK.
2. You advance to the First Execute Periodic Process Screen (Setting Parameters). At this screen, you can define the schedule of when the system executes the periodic process.

First Execute Periodic Process Screen (Setting Parameters)

Purpose: Use this screen to set up the parameters of the process for execution.

How to display this screen:

- Enter the process name in the Process field on the Select Periodic Process to Execute Screen.
- Select Execute for a periodic process on the Work with Periodic Processes Screen.

Field	Description
Process	The name of the periodic process. Alphanumeric, 10 positions; display-only.

Field	Description
Description (unlabeled field to the right of the Process field)	The description of the periodic process. Alphanumeric, 30 positions; display-only.
Application area	The area of Order Administration, for example Order Entry, where this process belongs. Alphanumeric, 3 positions; display-only.
Type description (unlabeled field below the process description)	Unlabeled field underneath the *Description* field. Indicates the time period of the periodic process. Processes run on a daily, weekly, monthly or yearly basis. Informational-only. Valid values are: • Annually • Daily • Monthly • Weekly Display-only.
Company	The company where the process runs. You need to enter a company code even for periodic processes that run for all companies, for example, starting or stopping asyncs. The system ignores the company parameter for periodic functions in the process that do not require company. Alphanumeric, 3 positions; required.
Job queue	The job queue where the system submits the periodic process. The job queue defaults to *JOBD, indicating the system submits the periodic process to QBATCH. **Note:** If you wish to run the job in a designated queue, define that queue. Use the PICKGEN job queue when scheduling pick slip generation or deposits. Alphanumeric, 10 positions; required.
Scheduling	See Scheduling Jobs for more information on how to schedule a job.

Field	Description
Frequency	Indicates how often the system executes the periodic process. Valid values are: • Now (default) = Execute the periodic process immediately. **Note:** If you select Now, the system does not add the periodic process to the Job Scheduler. • Once = Schedule the periodic process to run once, and only once, at a specified date and time in the future. You must specify the Date and Time to execute the process. The system validates that the Date is greater than or equal to today. If you enter today's date, the system validates that the Time is greater than or equal to the current time. • Daily = Schedule the periodic process to run once a day at a specified time. You must specify the Time to execute the process. • Weekly = Schedule the periodic process to run once a week, at a specified time, on a specified day of the week. You must specify the Time and Day of week to execute the process. • Monthly = Schedule the periodic process to run once a month on a specified day and time. You must specify the Time and Day of month to execute the process. • Month Start = Schedule the periodic process to run once a month on the first day of the month at a specified time. You must specify the Time to execute the process. • Month End = Schedule the periodic process to run once a month on the last day of the month at a specified time. You must specify the Time to execute the process. Alphanumeric, required.
Date	The date when the system executes the periodic process. This field is required if you select Once for the Frequency. You can enter a date that is greater than or equal to today's date. If you enter today's date, the Time must be greater than the current time. Numeric, 6 positions (in user date format); required if Frequency is Once.

Field	Description
Time	The time, in military format, when the system executes the periodic process. If you enter today's Date, the time must be greater than the current time. This field is required if you select Once, Daily, Weekly, Monthly, Month Start, or Month End for the Frequency. A time of 000000 indicates to run the process at midnight. Numeric, 6 position (HHMMSS, military format); required unless Frequency is Now.
Day of week	The day of the week when the system executes the periodic process. This field is required if you select Weekly for the Frequency. Valid values are: • Blank = No day specified. • Sunday • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday Alphanumeric, 10 positions; required if Frequency is Weekly.
Day of month	The day of the month when the system executes the periodic process. This field is required if you select Monthly for the Frequency. Valid values are 0 - 31. **Note:** If you enter 31 as the day of the month, the system will only execute the periodic process on those months that contain 31 as a valid date. If you wish to execute the periodic process at the end of each month, select the MONTH END option for the Frequency. Numeric, required if Frequency is Monthly.

Completing this screen:

#	Step
1.	Enter a valid company code in the Company field.
2.	Enter a valid job queue in the Job queue field. If you leave this field set to *JOBQ, the system submits the periodic process to QBATCH.

#	Step
3.	Select when to execute the periodic process using the Frequency field. See Periodic Process Scheduling Examples for examples of how to schedule a periodic process. • Now = Execute the periodic process immediately. • Once = Schedule the periodic process to run once, and only once, at a specified date and time in the future. • Daily = Schedule the periodic process to run once a day at a specified time. • Weekly = Schedule the periodic process to run once a week at a specified time. • Monthly = Schedule the periodic process to run once a month on a specified day and time. • Month Start = Schedule the periodic process to run once a month on the first day of the month at a specified time. • Month End = Schedule the periodic process to run once a month on the last day of the month at a specified time.
4.	The Frequency field indicates which Scheduling fields are required, based on the frequency option you select: • Now = You do not need to define additional parameters. • Once = You must specify the Date and Time to execute the process. The system validates that the Date is greater than or equal to today. If you enter today's date, the system validates that the Time is greater than or equal to the current time. • Daily = You must specify the Time to execute the process. • Weekly = You must specify the Time and Day of week to execute the process. • Monthly = You must specify the Time and Day of month to execute the process. • Month Start = You must specify the Time to execute the process. • Month End = You must specify the Time to execute the process.
5.	If you enter a value in any of the Scheduling fields that is not required for the frequency you selected, the system ignores those entries when executing the periodic process. For example, if you select Now for the Frequency and also enter a value in the Weekly field, the system executes the periodic process immediately and ignores the value in the Weekly field.
6.	Select OK to advance to the Second Execute Periodic Process Screen (Selecting Functions). At this screen, you can select the functions within the process to execute. • If the periodic process is scheduled to execute immediately (you selected Now in the Frequency field), select Execute or Execute & Save Overrides to execute the periodic process and optionally, save the job parameters. • If the periodic process is scheduled to execute at a specified time in the future (you selected a value other than Now in the Frequency field), select Schedule. The system adds the periodic process to the job scheduler and does not execute the periodic process until the specified time is reached. See Scheduling Jobs.

Periodic Process Scheduling Examples

The table below provides examples of how to define a schedule for a periodic process.

Schedule	Procedure
Execute the periodic process immediately.	Select Now for the Frequency. The system submits the job to the specified job queue for the user that executed the periodic process. **Note:** Because the process is executed immediately, the system does not add the periodic process to the job scheduler.
Execute the periodic process tonight at 7 PM. Do not run the process any other night. Example: End asyncs tonight at 7 PM.	• Select Once for the Frequency. • Enter the current date in the Date field. • Enter 190000 (7 PM in military time) in the Time field.
Execute the periodic process today at 3 PM and tomorrow at 8 AM. Do not run the process at any other time. Example: Run a status report today at 3 PM and again tomorrow at 8 AM.	**Note:** You need to create more than one schedule for the periodic process. First Schedule: • Select Once for the Frequency. • Enter the current date in the Date field. • Enter 150000 in the Time field. Second Schedule: • Select Once for the Frequency. • Enter tomorrow's date in the Date field. • Enter 080000 in the Time field.
Execute the periodic process every morning at 6 AM. Example: Start asyncs every morning at 6 AM.	• Select Daily for the Frequency. • Enter 060000 in the Time field.

<table>
<tr><th>Schedule</th><th>Procedure</th></tr>
<tr><td>Execute the periodic process every morning, except Saturdays and Sundays, at 6 AM.
Example: Start the asyncs every morning during the work week at 6 AM.</td><td>Note: You need to create more than one schedule for the periodic process.
First Schedule:
• Select Weekly for the Frequency.
• Select Monday for the Day of week.
• Enter 060000 in the Time field.
Second Schedule:
• Select Weekly for the Frequency.
• Select Tuesday for the Day of week.
• Enter 060000 in the Time field.
Third Schedule:
• Select Weekly for the Frequency.
• Select Wednesday for the Day of week.
• Enter 060000 in the Time field.
Fourth Schedule:
• Select Weekly for the Frequency.
• Select Thursday for the Day of week.
• Enter 060000 in the Time field.
Fifth Schedule:
• Select Weekly for the Frequency.
• Select Friday for the Day of week.
• Enter 060000 in the Time field.</td></tr>
<tr><td>Run the periodic process every week on Mondays at 10 AM.
Example: Run the weekly status reports every Monday at 10 AM.</td><td>• Select Weekly for the Frequency.
• Select Monday for the Day of week.
• Enter 100000 in the Time field.</td></tr>
<tr><td>Run the periodic process every month on the 25th day of every month at 7 PM.
Example: Run the monthly status reports on the 25th day of every month at 7 PM.</td><td>• Select Monthly for the Frequency.
• Enter 25 in the Day of month field.
• Enter 190000 in the Time field.</td></tr>
<tr><td>Run the periodic process on the first day of every month at 8 AM.
Example: Run the monthly status report on the first day of every month at 8 AM.</td><td>• Select Month Start for the Frequency.
• Enter 080000 in the Time field.</td></tr>
</table>

Schedule	Procedure
Run the periodic process on the last day of every month at 9 PM. Example: Run the monthly status report on the last day of every month at 9 PM.	• Select Month End for the Frequency. • Enter 210000 in the Time field.

Second Execute Periodic Process Screen (Selecting Functions)

Purpose: Use this screen to select the functions within the process you wish to run.

How to display this screen: Complete all the necessary fields on the first First Execute Periodic Process Screen (Setting Parameters).

Field	Description
Process	The name of the periodic process. Alphanumeric, 10 positions; display-only.
Description (Unlabeled field to the right of the Process field)	The description of the periodic process. Alphanumeric, 30 positions; display-only.
Application area	The area of Order Administration, (for example, Order Entry) where this process belongs. Alphanumeric, 3 positions; display-only.
Type description (unlabeled field below the process description)	Indicates the time period of a periodic process. Processes run on a daily, weekly, monthly or yearly basis. Informational-only. Valid values are: • Annually • Daily • Monthly • Weekly Display-only.
Seq#	The position of the function within the periodic process. This number indicates the order in which the system executes the functions within the process. Alphanumeric, 1 position; display-only.
Function	The name of the periodic function. Alphanumeric, 7 positions; display only.
Description	The description of the periodic function. Alphanumeric, 70 positions; display only.
Select	Indicates whether to include the periodic function in the execution. Valid values are: • Yes = Include this function. • No = Do not include this function. Required.

Screen Option	Procedure
Schedule the periodic process and save the job options	Select Schedule. This option only displays if the periodic process is scheduled to run in the future (you selected any value other than Now in the Frequency field). The system adds the periodic process to the job scheduler and does not execute the periodic process until the specified time is reached. See Scheduling Jobs.
Execute the periodic process and do not save the job options	Select Execute. This option only displays if the periodic process is scheduled to run immediately (you selected Now in the Frequency field). Because the process runs immediately, the system does not add the process to the job scheduler.
Execute the periodic process and save the job options	Select Execute & Save Overrides. This option only displays if the periodic process is scheduled to run immediately (you selected Now in the Frequency field). Because the process runs immediately, the system does not add the process to the job scheduler.

Working with Periodic Process History (WPHS)

Purpose: Use this function to review the processing information of a periodic process.

The records of a process contain:

- the initiation date and time
- the activation date and time
- the process date and time
- the list of functions that make up the process
- the status of each function

Example: If a function within the process does not run as planned, the status function error is displayed next to the function.

> **Note:**
>
> Periodic functions and processes are not restricted by company; when you create a periodic function or process, it is defined across all companies.

In this topic:

- Work with Process History Screen
- Display Process History Details Screen

For more information:

- creating periodic functions: Working with Periodic Functions (WPER)

- creating a periodic process and assigning functions to a process: Working with Periodic Processes (WPPR)
- running a process: Executing Periodic Processes (EPRO)
- a list of functions to include in your periodic processing and reviewing the periodic process job schedule: Scheduling Jobs
- purging periodic process history in a completed status for all Order Administration companies prior to a specified date: Purge Periodic Process History (MPPR)
- specifying the default number of days old a history record should be before it is eligible for purge: Periodic Process History Purge Days (L77)

Work with Process History Screen

How to display this screen:

- Enter WPHS in the Fast path field at the top of any menu
- Select Work with Process History from a menu
- Select History for a periodic process on the Work with Process History Screen

The screen displays process history in alphanumeric order by process name, and in LIFO (last in, first out, or most recent to oldest) sequence for each process.

Field	Description
Process	The name of the periodic process. When you advance to the screen from the Work with Process History Screen, only the process you select will display. Alphanumeric, 10 positions; optional (display-only from Work with Periodic Process screen).
Description	The description of the periodic process. Alphanumeric, 30 positions; display-only.
Status	The stage of the periodic process. Valid values are: • Active • Canceled • Completed • Submitted Optional (display-only from Work with Periodic Process screen).
Init date (Initiation date)	The date the periodic process was queued for processing. Numeric, 6 positions (in user date format); optional (display-only from Work with Periodic Process screen).
Init time (Initiation time)	The time the periodic process was queued for processing. Numeric, 6 positions (HHMMSS format); optional (display-only from Work with Periodic Process screen).

Screen Option	Procedure
Display process history details	Select Details for the process to advance to the Display Process History Details Screen.

Screen Option	Procedure
Update the status of a periodic process history record to completed	Select Mark completed for the process to update the status to Completed.

Display Process History Details Screen

Purpose: Use this screen to display the details of periodic process history.

How to display this screen: Select Details for a periodic process at the Work with Process History Screen.

Field	Description
Process	The name of the periodic process displayed. Alphanumeric, 10 positions; display-only.
Description	The description of the periodic process. Alphanumeric, 30 positions; display-only.
Status	The stage of the periodic process. Valid values are: • Active • Canceled • Completed • Submitted Display-only.
Initiation date	The date when the periodic process was queued for processing. Numeric, 6 positions (in user date format); display-only.
Activation date	The date the periodic process began running, or was scheduled to begin running on the system. Valid values are: *CURRENT = the current day *MONTHSTR = the beginning of the month *MONTHEND = the end of the month *MON-*SUN = specific day of the week Alphanumeric, 10 positions (in user date format); display-only.
Initiation time	The time the periodic process was queued for processing. Numeric, 6 positions (HHMMSS format); display-only.
Activation time	The time the periodic process was actively running on the system. Valid values are: *CURRENT = the present time Alphanumeric, 10 positions (HHMMSS format); display-only.
For each periodic function included in the process:	
Date	The date the periodic function began processing on the system. Numeric, 6 positions (in user date format); optional.
Time	The time the periodic function began processing on the system. Numeric, 6 positions (HHMMSS format); optional.

Field	Description
Function	The name of the periodic function. Alphanumeric, 7 positions; display-only.
Message	Indicates the status of the job. Alphanumeric, 7 positions; display-only.

Purge Periodic Process History (MPPR)

Purpose: Use this menu option to delete all Completed (P) or Canceled (C) Process History Header records, and their associated Process History Detail records, for all processes in all companies if the date for the detail record is older than the Purge history prior to initiate date specified.

If there are any Process History Detail records that are not associated with a Process History Header record, these detail records are also deleted.

Additional way to purge history: After a periodic process runs, it automatically purges history records that are older than the Periodic Process History Purge Days (L77). This automatic purge applies only to records for that periodic process. See the Periodic Process History Purge Days (L77) system control value for more information.

Determining the purge days across companies: The setting of the Purge history prior to initiate date defaults from the Periodic Process History Purge Days (L77) system control value. Because the Purge Periodic Process History option runs across all companies, it searches for a Periodic Process History Purge Days (L77) setting across companies numerically and uses the first system control value setting that is not zero. This search occurs regardless of the current company you are working in at the time you select the Purge Periodic Process History option.

Example: You are working in company 1, where the Periodic Process History Purge Days (L77) system control value is set to zero. In company 2, the system control value is set to 45. The purge function defaults a purge date that is 45 days earlier than the current date.

Reviewing history: You can review periodic process history using the Working with Periodic Process History (WPHS) menu option.

Purge Process History Screen

Use this screen to delete periodic process history in a completed or canceled status for all Order Administration companies prior to a specified date.

How to display this screen: Enter MPPR in the Fast path field or select Purge Periodic Process History from a menu.

Field	Description
Purge history detail prior to date	The system defaults this date by subtracting the Periodic Process History Purge Days (L77) from the current date, but you can override this default. See above for a discussion. Numeric, 6 positions (in user date format); required.

Completing this screen:

1. Optionally, override the Purge history prior to initiate date. The system calculates the default date by subtracting the Periodic Process History Purge Days (L77) from the current date, but you can override the default. See above for a discussion.
2. Select OK to validate your entry.
3. Select Accept to advance to the Confirm Accept window. Select OK to submit the PHST_PURGE job; otherwise, select Exit to cancel.

The PHST_PURGE job:

- deletes records in the Process History Detail table whose PHH status is P (Completed) or C (Canceled), and whose PHH initiation date is earlier than the Purge history prior to initiate date.
- deletes records in the Process History Header table which, after the action detailed above, no longer associate with any Process History Detail records.
- deletes any additional Process History Detail records, for all companies, that are not associated with a Process History Header record.

Printing the Tax Jurisdiction Report (PTXJ)

Purpose: Run the Tax Jurisdiction Report to identify the dollars collected and credited for each tax jurisdiction for a specified invoice date range.

You can use the Working with Tax Jurisdiction (WTXJ) menu option to define tax jurisdictions. Tax Jurisdictions define postal code ranges for an area where a special tax structure exists. For example, tax jurisdictions exist for some counties in New York and New Jersey. Different tax rates apply for these areas, rather than the usual tax rate for the postal code or SCF. In addition, you can define tax jurisdictions within the United States only.

To generate the report:

#	Step
1.	At the Print Tax Jurisdiction Report Screen, enter the invoice date range you wish to use to generate the Tax Jurisdiction Report.
2.	Select OK to validate your entries and then select Print Report.
3.	The system submits the TAX_JUR job to generate the Tax Jurisdiction Report.

Determining the invoices to include on the report: The system uses the invoice date range you define on the Print Tax Jurisdiction Report Screen and the Invoice date in the Invoice Ship To table to determine which invoices to include on the report.

Determining the tax jurisdiction: The system uses the Invoice Address table to determine the ship to customer for the invoice. The system then compares the postal code defined for the ship to customer to the tax jurisdictions defined in Working with Tax Jurisdiction (WTXJ) to determine which tax jurisdiction is associated with the invoice.

UNKNOWN tax jurisdiction: Any tax amounts that are not associated with a tax jurisdiction print on the report under an UNKNOWN category.

Determining the tax: The system uses the Tax in the Invoice Ship To table to determine the tax to include on the report. Positive tax amounts accumulate in the Amount charged field on the report; negative tax amounts accumulate in the Amount credited field on the report. **Note:** The Tax field includes regular tax, GST, and PST amounts. The Tax field does not include VAT amounts.

Capture invoice address: In order to print the Tax Jurisdiction report, the Capture Addresses for Invoice (J24) system control value must be selected, indicating the system creates a record of the billing and shipping address in the Invoice Address table each time you bill a shipment.

Print Tax Jurisdiction Report Screen

Use this screen to specify the invoice date range to use to generate the Tax Jurisdiction Report and to submit the report.

How to display this screen: Enter PTXJ in the Fast path field at the top of any menu or select the Print Tax Jurisdiction report option from a menu.

Field	Description
Start date	The start date for which you want to run the Tax Jurisdiction Report. The system uses the Invoice Ship To table to determine which invoices to include in the Tax Jurisdiction report. An error message displays if the Start date is a future date: Date must be on or before today's date. Numeric, 6 positions (in user date format); required.
End date	The end date for which you want to run the Tax Jurisdiction Report. The system uses the Invoice Ship To table to determine which invoices to include in the Tax Jurisdiction report. An error message displays if the end date is a future date: Date must be on or before today's date. An error message displays if the End date is earlier than the Start date: Starting date cannot be greater than Ending Date. Numeric, 6 positions (in user date format); required.

Using the System Utilities

Topics in this part: The following topics describe the utilities available in the system that are typically used only by the System Administrator.

- Working with Default Options (WDFT) describes how to work with predefined field or program defaults.
- Consolidating Order Billing History (MOBH) describes how to consolidate order billing history.
- Working with Inventory Resets describes the options available to reset inventory levels when they become out of synch.
- Reset Allocation Quantities (MRPC) describes how to reset the printed quantities for orders.
- Reset Reserve Quantity (MRQR) describes how to reset the reserved quantity of items in inventory.
- Reset Back Order Quantity (MRBO) describes how to reset the backorder quantity of items in inventory.
- Reset Item Warehouse Quantity On Hand (MRIW) describes how to reset the quantity on-hand for each Item Warehouse record based on the total quantities on-hand.

- Reset SKU Open Order Quantity (MRSO) describes how to reset the fields in the SKU table based on the current open orders for the SKU.
- Unlocking a Stranded Order or Batch (MULO) describes how to unlock an order or batch that became locked during processing or maintenance.
- Resetting the Order Billing History Table (ROBH) describes how to reset the Order Billing History table based on the records in the Order Detail table.
- Resetting Customer Sold To Amount On Order (RONO) describes how to reset the On order amount field in the Customer Sold To Order History file so that it matches the amount of any existing open orders for the customer.
- Unlock Purchase Order (MUPO) describes how to reset locked purchase orders and reset the on-order quantities for Item Warehouse records.
- Work with File Uploads (WUPL) describes how to upload a file to a specified table in the Order Administration database.

Working with Default Options (WDFT)

Purpose: The Work with Default Options menu option lets you set up values for the system to retrieve automatically. For example, you might define default settings for the system to use when running a report or creating records in a table through a batch process. You can also define default values to pre-fill fields each time you advance to a particular screen.

> **Note:**
>
> The system will use the settings in the Default Options table only if the program is set up to do so.

In this topic:

- Work with Program/Field Default Screen
- Create Program/Field Default Screen

Work with Program/Field Default Screen

Purpose: Use this screen to review the settings of default fields.

How to display this screen: Enter WDFT in the Fast path field at the top of any menu, or select Work with Default Options from a menu.

Field	Description
Program	The program that uses the default setting. Alphanumeric, 10 positions; optional.
Field name	The name of the field to receive the default setting. Alphanumeric, 25 positions; optional.
Default	The default setting for the field to take. The attributes of the default vary, depending on the type of field. See Create Program/Field Default Screen.

Screen Option	Procedure
Create a new default	Select Create to advance to the Create Program/Field Default Screen.
Change a default	Select Change for a default option to advance to the Change Program/Field Default Screen. You can change only the field default. See the Create Program/Field Default Screen for field descriptions.
Delete a default	Select Delete for a default option to delete it.
Display a default	Select Display for a default option to advance to the Display Program/Field Default Screen. You cannot change any information at this screen. See the Create Program/Field Default Screen for field descriptions.

Create Program/Field Default Screen

Purpose: Use this screen to create a new default option.

> **Important:**
>
> The system does not validate that your entries on this screen are correct or appropriate. Also, your entries must be exact in order for the system to use the default value settings you create. For these reasons, you must take extreme care in setting up default options on this screen.

How to display this screen: Select Create at the Work with Program/Field Default Screen.

Field	Description
Program	The program that will use the default option setting. Alphanumeric, 10 positions. Create screen: required Change screen: display-only.
Field	The name of the field that will take the default value you enter below. Alphanumeric, 25 positions; required.
Change screen: the following fields are display-only. Create screen: only one of the following fields is also required:	
Status	Valid values are: Selected Unselected
Code	Alphanumeric, 10 positions.
Dollar	Numeric, 13 positions with a 2-place decimal.

Field	Description
Percentage	Numeric, 5 positions with a 2-place decimal.
Weight	Numeric, 7 positions with a 3-place decimal.
Sequence number	Numeric, 6 positions.
Number	Numeric, 7 positions.

Completing this screen: Complete the Program and Field fields and one of the remaining fields.

Consolidating Order Billing History (MOBH)

Purpose: Use the Consolidate Order Billing History menu option to consolidate records in the Order Billing History table up to a given date, to save space and eliminate unneeded information. You can “roll up” or consolidate records into summary records by indicating which key fields you would like to retain, and which you would like to blank out.

Example: You want to retain separate records by sold-to customer, but not ship-to customer. The total units and quantities of the ship-to customer records for each sold-to customer will be added or netted together, and then the individual ship-to customer records will be deleted. The resulting consolidated sold-to records will have the ship-to number fields set to zero.

The system flags each consolidated record in the table. You can consolidate any records only once.

When to run consolidation: You should run the consolidation at night, when there will not be any other activity that might update the Order Billing History table.

Reviewing consolidated records: When you review customer history through Work with Customers (fast path = WCST), any consolidated records are indicated as follows:

- Consolidated items are flagged at the Customer Sold To Item History Screen (available by selecting Item History at a Create/Change/Display Customer screen, or selecting Item History for a customer at a selection screen)
- The range of dates included in a consolidated record is indicated at the Display Customer Order History Screen (available by selecting Order History at a Create/Change/Display Customer screen, or selecting Order History for a customer at a selection screen)
- The range of dates included in a consolidated record is indicated at the Order Billing History Detail Screen (available by selecting Display for an item at the Customer Sold To Item History screen or the Customer Sold To Order History screen)

Additional information: Working with Merge/Purge Sold-to Names (MMCS) ignores consolidated records that do not include the sold-to customer number.

In this topic:

- Consolidate Order Billing History Screen
- Order Billing History Consolidation Report

Consolidate Order Billing History Screen

Each flagged option on this screen represents a key field in the Order Billing History table. In order to save separate order billing history records by a field, you must select it. For example, select the Customer flag to save separate order billing history for each sold-to customers; otherwise, the history will be consolidated across all sold-to customers in your company.

You must select at least one field.

How to display this screen: Enter MOBH in the Fast path field at the top of any menu or select Consolidate Order Billing History from a menu.

> **Note:**
>
> The system stores your entries on this screen in the Default Options table, to save data entry if you run the consolidation program periodically. The first time you use this screen, each yes/no flag will default to unselected, and the date field will be blank.

Field	Description
Consolidate transactions up to date	Enter the last date for which order billing history should be consolidated. All order billing history records from this date or earlier that meet the selection criteria will be consolidated. Numeric, 6 positions (in user date format); required.
Consolidate by:	
Customer	This field indicates whether to consolidate order billing history by number of the sold-to customer on the order. Valid values are: • Selected = Retain separate order billing history for each sold-to customer. • Unselected = Consolidate customer sold-to order billing history. See Creating and Updating Sold-to Customers (WCST).
Ship to	This field indicates whether to consolidate order billing history by customer ship-to number. Valid values are: • Selected = Retain separate order billing history for each ship-to customer. You must also select the *Customer* field, above. • Unselected = Consolidate customer ship-to order billing history. See Creating and Updating Sold-to Customers (WCST).
Item	This field indicates whether to consolidate order billing history by item. Valid values are: • Selected = Retain separate order billing history for each item. • Unselected = Consolidate customer order billing history for all items. See Performing Initial Item Entry (MITM).

Field	Description
SKU	This field indicates whether to consolidate order billing history by SKU. Valid values are: • Selected = Retain separate order billing history for each SKU. You must also select the Item field. • Unselected = Consolidate customer order billing history for SKUs. See Performing Initial Item Entry (MITM).
Ship via	This field indicates whether to consolidate order billing history by ship via. Valid values are: • Selected = Retain separate order billing history for each ship via. • Unselected = Consolidate customer order billing history for all ship vias. See Working with Ship Via Codes (WVIA).
Source	This field indicates whether to consolidate order billing history by source code. Valid values are: • Selected = Retain separate order billing history for each source code. • Unselected = Consolidate customer order billing history for all items. See Working with Source Codes (WSRC).
Offer	This field indicates whether to consolidate order billing history by item. Valid values are: • Selected = Retain separate order billing history for each offer. • Unselected = Consolidate customer order billing history for all offers. See Working with Offers (WOFR).
Salesman	This field indicates whether to consolidate order billing history by salesman. Valid values are: • Selected = Retain separate order billing history for each salesman. • Unselected = Consolidate customer order billing history for all salesmen. See Working with Sales Representatives (WSLS).
Item class	This field indicates whether to consolidate order billing history by item class. Valid values are: • Selected = Retain separate order billing history for each item class. • Unselected = Consolidate customer order billing history for all item classes. See Working with Item Classes (WICL).

Field	Description
Long SKU department	This field indicates whether to consolidate order billing history by long SKU department. Valid values are: • Selected = Retain separate order billing history for each long SKU department. • Unselected = Consolidate customer order billing history for all long SKU departments. See Working with Long SKU Departments (WLSD).
Order#	This field indicates whether to consolidate order billing history by order number. Valid values are: • Selected = Retain separate order billing history for each order. • Unselected = Consolidate customer order billing history for all orders.
Transaction code	This field indicates whether to consolidate order billing history by transaction code. Valid values are: • Selected = Retain separate order billing history for each transaction code. • Unselected = Consolidate customer order billing history for all transaction codes. Transaction codes for order billing history are: • E = entry • M = maintenance • B = billing See Reviewing Customer History.
Entity	This field indicates whether to consolidate order billing history by entity. Valid values are: • Selected = Retain separate order billing history for each entity. • Unselected = Consolidate customer order billing history for all entities. See Working with Entities (WENT).

Instructions:

1. Complete the Consolidate transactions up to date field and reset the flag for each selection option you would like to override.
2. Select Submit. The system submits the job CONSOL_OBH in held status. You must release this job to consolidate order billing history. Once released, the batch job consolidates order billing history based on your selection criteria, and produces the Order Billing History Consolidation Report.

Reset Allocation Quantities (MRPC)

Purpose: Use this option to reset the printed quantities for orders, as stored in the Order Detail, Reserved Order Line and the Item Location tables. The system uses the information in the Pick Control Detail and the Pick Location tables to determine the correct quantities.

> **Note:**
>
> To reduce the amount of time it takes to run this process, you should use Streamlined Pick Slip Generation (WSPS) to generate pick slips for as many orders as possible.

If there are inventory transaction errors: The system will not complete this reset if there are any inventory transaction errors. You must reprocess these transactions or delete the error records first. See Working with Inventory Transaction Errors (WITE).

Excluded from reset: The reset excludes any order lines that are:

- printed on drop ship pick slips or purchase orders
- brokered backordered lines being fulfilled through the Order Orchestration integration
- store pickup lines being fulfilled through Order Orchestration

See Order Orchestration Integration for information on fulfilling brokered backorders or store pickup orders through Order Orchestration.

Scheduling: You can schedule when you want this reset to run using the RSTPICK periodic function.

Reset Pick Control Screen

How to display this screen: Enter MRPC in the Fast path field at the top of any menu, or select Reset Allocation Quantities from a menu.

Completing this screen:

#	Step
1.	Select OK on the Reset Pick Control Screen. Select Confirm and then OK again to submit the Allocation Quantity Reset.
2.	**The system submits the** ALLOC_XCHK **job and looks at the setting of the** Inventory Sharing (A69) **system control value.** • If the Inventory Sharing (A69) system control value is selected, the system runs the Allocation Quantity Reset program as a batch job. **Note:** If you are using inventory sharing, run the Allocation Quantity Reset in the company where you actually maintain the inventory and then run the Allocation Quantity Reset in the company(ies) that share the inventory. • If the Inventory Sharing (A69) system control value is blank, the system calls the sp_reset_qty_printed_full SQL stored procedure to perform the Allocation Quantity Reset.
3.	If there are any inventory transaction errors, the job generates an error report indicating that the reset cannot take place until these errors are corrected; see Working with Inventory Transaction Errors (WITE).

#	Step
4.	If there are no inventory transaction errors, the Allocation Quantity Reset: • Clears the Quantity printed for all Item Location, Order Detail, and Reserved Order Line records. • Resets the Quantity printed for all open Order Detail records by summing the Quantity printed on related Pick Control Detail records. • Resets the Quantity printed for all open Reserved Order Line records by summing the Quantity allocated on related Pick Location records. • Resets the Quantity printed for all Item Location records by summing the Quantity allocated on related Pick Location records. • Removes pick slip preparation from the order and then reevaluates the order for pick slip preparation; see Preparing Orders for Pick Slip Generation. Note: • If you ran the Allocation Quantity Reset as a stored procedure (the Inventory Sharing (A69) system control value is unselected), the system also generates the Reset Audit Log for Quantity Printed. • If you ran the Allocation Quantity Reset as a batch job (the Inventory Sharing (A69) system control value is selected), the system also generates the Print Reset Audit Log. • The reset excludes any order lines: – printed on drop ship pick slips or purchase orders – brokered backordered lines being fulfilled through the Order Orchestration integration – store pickup lines being fulfilled through Order Orchestration See Order Orchestration Integration for information on fulfilling brokered backorders or store pickup orders through Order Orchestration.

Reset Reserve Quantity (MRQR)

Purpose: Use this option to reset the reserved quantity of items in inventory, as stored in the Item Warehouse table. The system uses the information in the Reserved Order Line table to determine the correct quantities of items currently reserved on open or held orders.

Scheduling the reset: You can also run this reset using the Daily Inventory Reset periodic function (program name MSR0698); see How to Schedule a Job.

If there are inventory transaction errors: The system will not complete this reset if there are any inventory transaction errors. You must reprocess these transactions or delete the error records first. See Working with Inventory Transaction Errors (WITE).

Reset Reserve Quantity Screen

Purpose: Enter MRQR in the Fast path field at the top of any menu, or select Reset Reserve Quantity from a menu.

Completing this screen:

#	Step
1.	Select OK on the Reset Reserve Quantity Screen. Select Confirm and then OK again to submit the Reserve Quantity Reset.

#	Step
2.	**The system submits the** RESET_RSRV **job and looks at the setting of the** Inventory Sharing (A69) • If the Inventory Sharing (A69) system control value is selected, the system runs the Reserve Quantity Reset program as a batch job. **Note:** If you are using inventory sharing, run the reset in the company where you actually maintain the inventory and then run the reset in the company(ies) that share the inventory. • If the Inventory Sharing (A69) system control value is blank, the system calls the sp_reset_qty_eserved SQL stored procedure to perform the reset.
3.	If there are any inventory transaction errors, the job generates an error report indicating that the reset cannot take place until these errors are corrected; see Working with Inventory Transaction Errors (WITE).
4.	If there are no inventory transaction errors, the Reserve Quantity Reset: • Clears the Quantity reserved for all open or held Order Detail records that do not have any Reserved order lines. • Resets the Quantity reserved for all open and held Order Detail records by summing the Quantity reserved on related open Reserved Order Line records. • Clears the Reserve quantity, S/H reserve quantity, and Reserve transfer quantity for all Item Warehouse records. • Resets the Reserve quantity and S/H reserve quantity for all Item Warehouse records by summing the Quantity reserved on related Order Detail records. • Resets the Reserve transfer quantity for all Item Warehouse records by summing the Actual quantity on related Autostock Replenish Detail records with a status of A. • Generates the Reset Audit Log for Quantity Reserved if the Inventory Sharing (A69) system control value is unselected. **Note:** If the Inventory Sharing (A69) system control value is selected, the reset does not generate a report.

Reset Backorder Quantity (MRBO)

Purpose: Use this option to reset the backorder quantity of items in inventory, as stored in the Item Warehouse table.

Generation options: You can run the reset for all items in all warehouses, or for a specific item/SKU in a specific warehouse. You cannot specify a warehouse unless you also specify an item/SKU:

- Update all Item Warehouse records:
  - If you leave the Warehouse, Item, and SKU fields blank, the job resets all Item Warehouse records and generates a report.
  - If you enter just the Warehouse, the screen displays an error; but if you submit the job anyway, it resets all Item Warehouse records and generates a report.
- Update a single Item Warehouse record: Otherwise, if you specify a warehouse and item/SKU, the job immediately resets just that Item Warehouse and does not generate a report. Since the screen displays the current B/O qty if you enter the warehouse and item/SKU, you can compare this number with the Backorder quantity after you exit the screen.

> **Note:**
>
> If you specify a warehouse and the item code for a SKU'd item, you must also specify a SKU.

Inventory sharing? The setting of the Inventory Sharing (A69) system control value determines which program performs the backorder reset. If this system control value is:

- selected: the system runs a batch job; also, it generates the Reset Audit Log for Item Warehouse unless you specify a warehouse and item/SKU. **Note:** If you are using inventory sharing, run the Item Warehouse Backorder Quantity Reset in the company where you actually maintain the inventory and then run the Item Warehouse Backorder Quantity Reset in the company(ies) that share the inventory.
- unselected: the system runs the sp_reset_qty_backordered SQL stored procedure; also, it generates the Reset Audit Log for Quantity on Backorder unless you specify a warehouse and item/SKU.

Scheduling the reset: You can also run this reset using the Daily Inventory Reset periodic function (program name MSR0698); see Daily Inventory Reset.

Reset Item/Warehouse B/O Quantity Screen

How to display this screen: Enter MRBO in the Fast path field at the top of any menu, or select Reset Backorder Quantity from a menu.

Field	Description
Warehouse	The warehouse whose backorder quantities you want to reset. Leave this field and the Item and SKU fields blank to reset all warehouses. See the discussion on generation options above for more information. Warehouse codes are defined in and validated against the Warehouse table. Numeric, 3 positions; optional.
Item	The item whose backorder quantity you want to reset. Leave this field and the Warehouse and SKU fields blank to reset all items. See the discussion on generation options above for more information. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions; optional.
SKU	The particular SKU of the item you want to reset. Required if you select a Warehouse and a SKU'd Item; otherwise, leave this field blank. See the discussion on generation options above for more information. **Note:** The SKU field appears as a single, 14-position field. Leave a space between each SKU element, or leave one or more additional spaces if a SKU element is shorter than the full 4 positions. Alphanumeric, 14 positions; required if you selected a SKU'd item.

Field	Description
B/O qty Backorder quantity	The backorder quantity of the selected item/SKU within the selected warehouse. If you specify a warehouse and item/SKU and select OK, this field displays the current backorder quantity for that Item Warehouse. See the discussion on generation options above for more information. Numeric, 7 positions; display-only.

Completing this screen:

#	Step
1.	Optionally, specify the warehouse and item/SKU whose backorder quantity you wish to reset. Select OK to validate your entries.Correct any errors and select OK again. Note: • If you specify a warehouse and item/SKU, the current backorder quantity for the Item Warehouse record is displayed. • If you specify a warehouse but not an item/SKU, the screen displays an error; however, if you submit the reset anyway, the program updates all items in all warehouses.
2.	**Select** Submit Reset **to submit the** RESETBOQTY **job:** Update to Item Warehouse Backorder quantity: • Clears the Backorder quantity for the Item Warehouse records included in the reset. • Resets the Backorder quantity for the Item Warehouse records included in the reset to equal the sum of the related Open and Held non-drop ship order detail lines in the Order Detail table. The system does not include any order detail lines flagged as a future order. Update to Order Detail Open quantity: Open Quantity = (Quantity Ordered - Quantity Cancelled - Quantity Soldout - Quantity Shipped - Quantity Reserved) Report: The system uses the Inventory Sharing (A69) system control value to determine the reset program to use and the report to generate. If you are updating all Item Warehouse and the Inventory Sharing (A69) system control value is: • selected: the reset generates the Reset Audit Log for Item Warehouse. **Note:**If you are using inventory sharing, run the Item Warehouse Backorder Quantity Reset in the company where you actually maintain the inventory and then run the Item Warehouse Backorder Quantity Reset in the company(ies) that share the inventory. • unselected: the reset generates the Reset Audit Log for Quantity on Backorder. **Note:** When you specify a warehouse and item/SKU, the update to the specified Item Warehouse takes place interactively and no report is generated.

Reset Item Warehouse Quantity on Hand (MRIW)

Purpose: Use this option to reset the quantity on-hand for each Item Warehouse record based on the total quantities on-hand for related Item Locations within the warehouse.

Example: The Item Warehouse record indicates that the current on-hand quantity for item AB100 in warehouse 10 is 100. There are two item location records for AB100 in warehouse 10: A010101, with a current on-hand quantity of 15; and BULK, with a current on-hand quantity of 100. This reset adds the on-hand quantities for the two item locations and resets the on-hand quantity for the Item Warehouse to 115 (100 + 15).

Scheduling the reset: You can also run this reset using the Reset On Hand Quantity periodic function (program name PFR0093); see How to Schedule a Job.

Reset On Hand Quantity Screen

How to display this screen: Enter MRIW in the Fast path field at the top of any menu, or select Reset Item Warehouse Quantity On Hand from a menu.

Completing this screen:

#	Step
1.	Select OK on the Reset On Hand Quantity Screen. Select Confirm and then OK again to submit the Item Warehouse Quantity On Hand Reset.
2.	The system submits the RESET_ONHD job and calls the sp_reset_qty_on_hand SQL stored procedure to perform the Item Warehouse Quantity On Hand Reset.
3.	The reset: • Clears the On hand quantity for all Item Warehouse records. • Resets the On hand quantity for all Item Warehouse records by summing the On hand quantity for the associated Item Location records. • Generates the Reset Audit Log for Quantity On Hand. **Note:** The reset takes place regardless of whether there are any Inventory Transaction Errors.

Reset SKU Open Order Quantity (MRSO)

Purpose: Use this menu option to reset the following fields in the SKU table based on the current open orders for the SKU:

- SKU open quantity: the total number of units remaining to be shipped for all open order detail lines, including any quantity reserved and backordered, on open, held, or suspended orders, but excluding drop-ship items and future orders. The Display Item/Warehouse Information Screen displays this field as SKU: Open.
- On hold quantity: the total number of units on held orders, excluding drop-ship items and future orders.
- Quantity order drop ship: the total number of units on open, held, or suspended orders waiting to be drop-shipped, including future orders for drop-ship items. The Display Item/Warehouse Information Screen displays this field as Open D/S.
- Future quantity: the total number of units on open, held, or suspended orders that have the Future order flag set to Y

Scheduling the reset: You can also run this reset using the Daily Inventory Reset periodic function (program name MSR0698); see How to Schedule a Job.

Quotes: Because the system does not reserve inventory for items on quotes, the Reset SKU Open Order Quantity process does not include quotes; see Entering Pre-Order Quotes for an overview.

Reset SKU Open Order Quantity Screen

How to display this screen: Enter MRSO in the Fast path field at the top of any menu, or select Reset SKU Open Order Quantity from a menu.

Completing this screen:

#	Step
1.	Select OK on the Reset SKU Open Order Quantity Screen. Select Confirm and then OK again to submit the reset.
2.	**The system submits the** RSET_SKUOO **job and calls the sp_reset_qty_quantities SQL stored procedure to perform the SKU Open Order Quantity Reset.**
3.	Regardless of whether there are any inventory transaction errors, the SKU Open Order Quantity Reset: • Clears the Open quantity, On hold quantity, and Quantity order direct ship for all SKU records. **Note:** The On hold quantity is based on the Order Header status and not the Order Detail status. • Resets the Open quantity, On hold quantity, and Quantity order direct ship for all SKU records by accumulating the quantities in open, held, and suspended Order Detail records. • Resets the Future quantity for all SKU records by accumulating the quantities in open, held, and suspended Order Detail records with the Future order flag set to Y. • Generates the Reset Audit Log for SKU Quantities. The Order Detail open quantity is calculated as: Quantity Open = (Quantity Ordered - Quantity Cancelled - Quantity Soldout - Quantity Shipped) Note: • The Open quantity in the SKU table includes held orders, which are also included in the Held quantity field in the SKU table. • The Future quantity in the SKU table includes held orders, which are also included in the Held quantity field in the SKU table.

Unlocking a Stranded Order or Batch (MULO)

Purpose: Use this menu option to clear the locked status of a stranded order or order batch so that you can work with it.

Why are orders and batches locked? Order Administration locks an order or batch when a user or process is working with the order, so that another user or process cannot update the order or batch at the same time.

What does the lock consist of? When a user is entering an order or selects an order for maintenance, or when a function is updating an order, Order Administration locks the order by entering the user’s login ID or the function name in the User field in the Order Header table. Similarly, Order Administration locks an order batch by entering the user’s login ID in the Entry user field in the Order Batch table.

How does an order or batch become stranded? Typically, an order or batch becomes stranded when a user is working with it and the session ends unexpectedly, such as when the workstation shuts down. In this situation, the system does not have an opportunity to clear the user ID from the order or order batch record. Similarly, an order or batch can become stranded if a process that is currently updating the record ends abnormally.

How can you tell when an order or batch is locked?

- Order: You can tell that an order is locked if the system displays the Warning: Order Locked window when you attempt to maintain it. This window indicates the name of the user or process using the order, based on the current entry in the User field in the Order Header table.
- Batch: You can tell that a batch is locked if a user ID is displayed in the In use by field at the Work with Error Orders Batches Screen. An error message displays if you try to access the batch: Order Batch is locked by user JJONES.

If a locked order is part of a locked batch: You must first unlock the batch, and then unlock the order.

> **Note:**
>
> The option to unlock an order is also available in Modern View.

Unlock Order or Batch Screen

How to display this screen: You can display this screen by entering MULO in the Fast path field at the top of any menu, or by selecting Unlock Order or Batch from a menu.

Field	Description
Order #	To unlock a stranded order, enter the order number here. You can enter either an order number or a batch number. Numeric, 8 positions; optional.
Batch #	To unlock a stranded batch, enter the batch number here. If your entry in the Order # field was created as part of a batch, the batch number defaults here. You cannot enter both an order number and a batch number. If a batch number has defaulted from the entry of a previous order number, you must clear this field before entering another order number. Numeric, 5 positions; optional.
Order status	The current status of the order. Displayed for orders only. Possible statuses are: • Blank = Open • A = Archived to optical disk • C = Canceled • E = In error • H = Held • Q = Quote • S = Suspended • X = Closed Alphanumeric, 1 position; display-only.

Field	Description
Batch date	The date when the batch was created. Displayed only if you enter a batch number, not if a batch number defaults because it is associated with the entered order number. Displayed for batches only. Numeric, 6 positions (in user date format); display-only.
Order date	The effective date of the order for the purposes of aging and backorder analysis. When you enter an order, the current date defaults, but you can override it. Displayed for orders only. Numeric, 6 positions (in user date format); display-only.
Locked by (order)	The user ID or process name that was updating the order at the time it became stranded. Displayed for orders only. Alphanumeric, 10 positions; display-only.
Entered date	The date when the order was created. Displayed for orders only. Numeric, 6 positions (in user date format); display-only.
Entered time	The time when the order was created. Displayed for orders only. Numeric, 6 positions (HH:MM:SS format); display-only.
Workstation	The ID of the workstation where the user was working when creating the order, or the name of the process that created the order; for example, the workstation is E-COMMERCE for orders created through the *Generic Order Interface (Order API)*. Displayed for orders only. Alphanumeric, 10 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Entered by	The user ID of the person who entered the order, or the name of the process that created the order. For orders created through the generic order API, this is either the entered_by_user specified in the *Inbound Order XML Message (CWORDERIN)*, or your default user if the entered_by_user is not specified. Displayed for orders only. Alphanumeric, 10 positions; display-only. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Locked by (batch)	The user ID or process name that was working with the batch at the time that it became stranded. Displayed for batches only. Alphanumeric, 10 positions; display-only.
Customer #	A unique number to identify the customer who placed the order (sold-to customer). Displayed for orders only. Numeric, 9 positions; display-only.
Customer name (unlabeled field below the customer number)	The name of the sold-to customer. Displayed for orders only. Alphanumeric, 41 positions; display-only.

Unlocking a batch: Enter the batch number and click OK to display information about the batch and confirm that your entry is correct; if so, select Proceed with Unlock to unlock the batch. The system clears the Entry user field from the Order Batch table, and the batch is now available to be maintained by another user.

Unlocking an order: Enter the order number and click OK to display information about the order and confirm that your entry was correct; if so, select Proceed with Unlock to unlock the order. The system:

- Clears the User field from the Order Header table.
- Removes any pick slip preparation from the order and then reevaluates the order for pick slip preparation; see Preparing Orders for Pick Slip Generation.
- Makes the order available for maintenance by another user. If the order is in an error or suspended status, you must maintain the order in its associated order batch.

> **Note:**
>
> If your initial entry is not correct, exit the screen and then re-enter to clear the information from your previous entries from displaying.

Resetting the Order Billing History Table (ROBH)

Purpose: Use the Reset Order Billing History file menu option to rebuild Order Billing History records for an order using the records in the Order Detail table.

When to run the reset: You should reset Order Billing History at night, when there will not be any activity that might update the Order Billing History table.

Instructions:

1. On the Recover Order Billing History File Screen, use the Starting order # and Ending order # fields to enter an order number or range of orders whose Order Billing History you wish to recreate.
2. Select OK.
3. Select Confirm to submit the OBH_RESET job in a held status.
4. On the Work with Submitted Jobs screen, release the OBH_RESET job from hold to begin the process of rebuilding Order Billing History for the orders you specified.

The OBH_RESET job:

- Deletes all of the Order Billing History records for the specified orders.
- Rebuilds the Order Billing History records for the specified orders, using the associated records in the following tables:
- Order Detail
- Order Ship To
- Source
- Division
- Order Header Extended

- Item
- SKU
- Recovers maintenance transactions from the Order Line History table.
- Recovers billing transactions from the Invoice Detail table.

You can review Order Billing History for a customer on the Order Billing History Detail Screen.

Quotes: The Reset Order Billing History process does not include records in the order tables that are associated with a quote; see Entering Pre-Order Quotes for an overview.

Recover Order Billing History File Screen

Use this screen to define the order number or range of orders whose Order Billing History you wish to recreate, based on the records in the Order Detail table.

How to display this screen: Enter ROBH in the Fast path field at the top of a menu or select Reset Order Billing History File from a menu.

Field	Description
Starting order #	The starting order number in the range whose Order Billing History you wish to recreate, based on the records in the Order Detail table. Numeric, 8 positions; required.
Ending order #	The ending order number in the range whose Order Billing History you wish to recreate, based on the records in the Order Detail table. Numeric, 8 positions; required.

Resetting Customer Sold to Amount on Order (RONO)

Purpose: Use this menu option to reset the On order amount field in the Customer Sold To Order History table so that it matches the amount of any existing open orders for the customer.

You can review the On order amount on the Display Customer Order History Screen. The on order amount is the total value of all open, unshipped orders for a customer, including charges for merchandise, freight, tax, special handling, and shipping. The system subtracts the amount of a cancelled item or order from this field. The on order amount does not include the amount of soldout items on the order.

When should I run a reset? You should only perform a Customer Sold To $ On Order reset if you suspect the On order amount for a sold to customer is incorrect. For example:

- an On order amount exists for a sold to customer that does not have any open orders.
- a negative On order amount exists for a sold to customer.
- an On order amount of 1.00 or less exists for a sold to customer.

> **Note:**
>
> Before you run this reset, you should end all background async jobs so that the On order amount is not changed while the reset job recalculates the On order amount.

Scheduling the reset: You can also run this reset using the Reset Customer Sold To Amount On Order periodic function (program name CSRSTONORD); see How to Schedule a Job.

Quotes: Because the system does not update the Customer Sold To $ On Order for quotes, the Reset Customer Sold To $ On Order process does not include quotes; see Entering Pre-Order Quotes for an overview.

To reset the sold to on order amount: Enter RONO in the Fast path field or select Reset Customer Sold To $ On Order from a menu. The system submits the RESET_CST job. This job:

#	Step
1.	Calls the sp_reset_customer_on_order SQL stored procedure to perform the Customer Sold To $ On Order Reset.
2.	Retrieves all customers from the Customer Sold To Order History table by company code.
3.	For each customer sold to, accumulates the total open balances for Order Ship To records, excluding any Order Ship To records associated with an Order Header status of A, C, X, E, P, or S: • unshipped merchandise balance • freight balance • tax balance • handling balance • additional charges balance • additional freight charges balance
4.	Calculates a grand total by accumulating the total balances.
5.	Compares the grand total to the COH On Order $ field in the Customer Sold To Order History table. • If the amount in the COH On order $ field matches the grand total, the job retains the value in the COH On order $ field. • If the amount in the COH On Order $ field does not match the grand total, the job updates the COH On order $ field with the grand total. If no open balances are found, the job updates the COH On order $ field to 0.

Note:

- Because the Reset Customer Sold To $ On Order process retrieves all customers from the Customer Sold To Order History table, this job may take awhile to complete.
- The Reset Customer Sold To $ On Order process does not reset the Order Header status to closed.

Unlock Purchase Order (MUPO)

Purpose: Use this option to unlock purchase orders so that you can work with or receive it.

About locked purchase orders: A purchase order is locked if the In use USR user field in the Purchase Order Header table is not blank. This situation might occur if, for example, a user's browser window closed during purchase order maintenance. Until you unlock the purchase order, you cannot work with it.

If the purchase order has no detail lines: When you unlock a purchase order that does not have any detail lines, the system deletes the purchase order.

On-order reset: You can also use this menu option to reset the on-order quantity for all Item Warehouse records based on the:

- unreceived quantities on open or held purchase orders
- quantities received into suspense or to a pending putaway warehouse

The on-order reset is also available as a periodic function. See the Reset On-Order PO Quantity Periodic Function for more information.

Unlock Purchase Order Screen

How to display this screen: Enter MUPO in the Fast path field at the top of any menu, or select Unlock Purchase Order from a menu.

Field	Description
PO#	Enter a valid number identifying a purchase order that is currently locked. You cannot prompt on this field. Numeric, 7 positions; required.
When you enter the number of a locked purchase order, the screen displays the following information:	
Status	The purchase order's current status. Possible statuses are: • C = Cancelled. The purchase order was canceled through P.O. Maintenance; it remains on the system for historical purposes. • D = Docked. The purchase order has arrived at the warehouse, but the inventory has not yet been reviewed or formally received. • H = Held. If the purchase order is on hold, you cannot receive it until you approve it through purchase order maintenance. • O = Open. You expect to receive the items on the purchase order. • S = Suspended. Inventory has been received into suspense through purchase order receiving. At a later point, permanent locations in the warehouse will be determined for these items. • X = Closed. All items on the purchase order have been received or closed without full receipt. Alphanumeric, 1 position; display-only.
Entered by	The ID that identifies the user who entered the order. Alphanumeric, 10 positions; display-only.
In use by	The ID that identifies the user who was working with the purchase order when it was locked. Alphanumeric, 10 positions; display-only.

Field	Description
Vendor	The name or description of the vendor with whom you placed the purchase order. From the Vendor record; see Working with Vendors (WVEN) for more information. Alphanumeric, 30 positions; display-only.

Completing this screen:

- Enter a number identifying a purchase order that is currently locked. If your entry is valid, the remaining fields on the screen display information about the purchase order, and a message indicates if the purchase order will be unlocked or deleted:
- Click OK to unlock PO = there is at least one purchase order detail line; the purchase order will be unlocked
- Click OK to delete PO with no details = there are no detail lines for the purchase order; the purchase order will be deleted
- Click OK.

Updates: The system:

- Clears the In use USR user field in the Purchase Order Header table
- If the purchase order does not have any complete detail lines, the system deletes the purchase order header and other related records, such as messages, overrides, estimated charges, and FOB addresses.

Additional updates not processed automatically: Unlocking a purchase order does not submit (or resubmit) the purchase order to the OTHR_ASYNC job. As a result, there is no automatic mechanism to update tables such as Vendor History based on activity that occurred during the creation or maintenance session that resulted in the lock.

Triggering updates:

- You can process additional updates through related jobs such as the on-order reset available at this screen.
- A reset is not available for certain tables, such as Vendor History. For example, if you added a new detail line in maintenance and then the browser window closed unexpectedly, locking the purchase order before you accepted your changes, the information about the new detail line is not reflected in Vendor History when you unlock the purchase order. To trigger these updates, you can select the purchase order for maintenance and then accept the maintenance session without making any changes. The purchase order is then submitted to the OTHR_ASYNC job and the related updates take place, as described in Updates During Background Processing.

Option	Procedure
Submit the on-order reset	Select Reset On Order to run the on-order reset program. This program runs interactively and resets the on-order quantity for all Item Warehouse records in your company based on the current unreceived quantities on all open or held purchase orders, and any purchase orders received into suspense or to a pending putaway warehouse location.

Working with File Uploads (WUPL)

Purpose: Use this menu option to upload a file to a specified table in the Order Administration database.

For more information: See Working with File Imports.

Work with File Upload Screen

Purpose: Use this screen to process a file upload.

RMFCS integration: You cannot use this screen to upload a file for the Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration. See Data Flow from RMFCS and RPCS to Order Administration for a process overview. However, you can review uploads from RMFCS on this screen.

How to display this screen: Enter WUPL in the Fast path field at the top of any menu or select Work with File Uploads from a menu.

When you first advance to this screen, processed file uploads display on the screen in descending date sequence.

Column sort: You can sort on any column except Date on this screen by clicking the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
File Name	The file to upload to the Order Administration database. Select Browse to locate and select the file to upload. Required.
File Type	The type of upload to perform. Valid values are: • ACS Tape • Catalog Requests • Cust Price Group Exclusions • MBS Tape • PO Layering • Price Codes • Promotions • Retail Integration Items • Sales Associates • Set Components • Source Codes • Stores • USPS Zip Codes • Vendors See Available File Uploads for more information about each upload. **Note:** You cannot use this screen to upload item or offer information from RMFCS; however, completed RMFCS imports are listed at this screen. See Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration for background. Required.

Field	Description
An upload history record displays for each file upload that you have begun processing by populating the staging table, or completed processing:	
Date	The date and time when the file upload occurred. A record is written regardless of whether the upload was submitted from the screen or through a periodic function that submitted the file data for processing. Enter a full or partial date and time to review upload history records whose date contains your entry. Optional.
Status	The status of the file upload. • Submitted = The file upload has been submitted for processing. • Uploading = The file is being moved from the client to the server. • Processing = The file upload is currently being processed. • Completed = The file upload was processed successfully. • Error = A record in the upload file failed to upload successfully. See Troubleshooting the File Upload. Enter a full or partial status to review upload history records whose status contains your entry. Alphanumeric, 10 positions; optional.
File Type	The type of file processed. Valid values are: • CSACST = ACS Tape file upload. • IXCRIN = Catalog Requests file upload. • CUSTPGEUP = Cust Price Group Exclusions file upload. • CSMBST = MBS Tape file upload. • POLAYR = PO Layering file upload. • PRICECDUPLOAD = Price Codes file upload. • PRMUPLD = Promotions file upload. • RIIUPP = Retail Integration Items file upload. • SALESREP = Sales Associates file upload. • INSCUP = Set Components file upload. • IXSRCE = Source Codes file upload. • STOREUPL = Stores file upload. • MSUSPS = USPS Zip Codes file upload. • VNDUPL = Vendors file upload. Enter a full or partial file type to review upload history records whose file type contains your entry. See Available File Uploads for more information about each upload. **Note:** You cannot use this screen to upload item or offer information from RMFCS; however, you can use this screen to review RMFCS imports. These uploads are listed with a file type of RIIUPP. See Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration for background. Alphanumeric, 15 positions; optional.

Field	Description
File Name	The name of the file that was uploaded. A file path is displayed if the file was uploaded through the screen, rather than through the File Storage API. Enter a full or partial file name to review upload history records whose file name contains your entry. Alphanumeric, 256 positions; optional.
User	The user ID of the user that performed the file upload. A user ID of ADMIN is listed if the upload was processed through the File Storage API. Enter a full or partial user ID to review upload history records whose file name contains your entry. Alphanumeric, 10 positions; optional.

Screen Option	Procedure
Process a file upload	Use the Browse button to select a file for upload, and then select the File Type. See File Upload Process for more information.
Delete an upload history record	Select Delete for an upload history record. At the Are you sure you want to delete the upload history? window, select Yes to delete it; otherwise, select No to cancel. You can also use the PURGEUH Purge Upload History Table periodic function (program name PFR0126) to purge all upload history records that are older than the number of days defined in the Parameter field.
Review the error message associated with an upload history record that is in an Error status	Select View Error to display a window that contains a description of the error that occurred during processing. The window is blank if no error occurred.
Refresh the information on the screen	Select Refresh Page.

Work with Authorization Services (WASV)

For information on:	See:
how the credit card authorization service works, including an **overview** of the available processing options	Using the Credit Card Authorization Interface
setting up the authorization services that your company uses	Defining Authorization Services (WASV)
setting up authorization service countries to cross-reference your country codes to the country codes used by the service bureau. You can also indicate whether the service bureau performs address verification for the country.	Defining Authorization Service Countries

For information on:	See:
setting up the **vendor paytype codes** you use to cross-reference your payment codes to the codes used by the authorization service	Defining Vendor Paytype Codes
setting up the **vendor response codes** that your authorization service uses to indicate whether a credit card is approved or declined, including how to automatically place orders on hold based on the response code	Defining Vendor Response Codes
setting up **merchant ID overrides** for different entities within your company	Defining Merchant ID Overrides
setting up the cross references between your company's **currency** codes and those used by the authorization service	Defining Authorization Service Currencies

Setting Up Authorization Services

Topics in this part: The following topics describe the functions available to define the credit card authorization services that your company uses.

- Reprocess Authorizations Screen (RPAA)

  Reprocess Drop Ship Authorizations Screen (RPDS)
- Working with Required Responses (WREQ)
- Reset Authorizations (RSAA) describes how to reset records in the Credit Card Authorization Transaction table from a *SENT status to a *RDY status so that they can be resent to the authorization service.
- Defining Authorization Services (WASV) shows you how to define the authorization services that your company uses.
- Defining Authorization Service Countries shows you how to cross-reference your country codes to the country codes used by the service bureau. You can also indicate whether the service bureau performs address verification for the country.
- Defining Vendor Paytype Codes shows you how to cross-reference your payment codes to the payment codes used by the service bureau.
- Defining Vendor Response Codes shows you how to define the codes your service bureau uses to identify whether a credit card is approved or declined, and how to have the system place orders on hold based upon the vendor response code.
- Defining Merchant ID Overrides describes how to set up merchant ID overrides for different entities within your company.
- Defining Authorization Service Countries describes how to set up cross references for your company's currency codes and the codes used by a service bureau.
- Performing Online Credit Card Authorizations provides an overview on online credit card authorization and required setup.

- Performing Batch Authorization (SATH) describes how to send credit cards up for batch authorization by the associated ship via.
- Printing the Online Credit Card Authorization List (PATL) describes how to print the Online Authorization Listing.
- External Payment Service for information on a RESTful web service that provides an interface from Order Administration for sending stored value card transactions and receiving responses. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Reprocess Authorizations Screen (RPAA)

Purpose: Run this recovery program if an error occurs when transmitting an Authorization (either sending or receiving) or if you responded to an error with a C (to cancel the transmission) and there are stranded records in the Credit Card Authorization Transaction table (CCAT00).

This procedure enables you to resend all records that have not been sent or received and process the authorizations.

> **Note:**
>
> When you reprocess authorizations, the system sends all authorization transactions that exist in the CC Authorization Transaction file to the authorization service, regardless if the order is a drop ship order or regular order.

Selecting this option: Enter RPAA in the Fast path field at the top of any menu screen or select the Reprocess Authorizations option from a menu.

Retransmitting Authorizations

Select the Transmit/Receive/Process Authorizations option at the Reprocess Authorizations Screen (RPAA) if you need to retransmit Authorizations.

This option resends all records in the CC Authorization Transaction table (CCAT00) that have not been sent, regardless if the order is a regular order or drop ship order. These records have a status of ***RDY** in this table.

Records successfully sent have a status of ***SENT**.

> **Note:**
>
> You can use the Reset Transmission Status Screen to reset records in the Credit Card Authorization Transaction table (CCAT00) from a *SENT status to a *RDY status.

The Enter Pick Options window opens when you select this option. This window gives you the same options you can select at Pick Slip Generation run-time.

Field	Description
Combine customer picks	Indicates whether the system will combine multiple orders for a single customer. For example, if the customer has two 1-item orders that can fit into one box, under normal cubing rules, the system would split them into two pick slips because they belong to different orders. Using this feature, however, the system combines them into a single pick slip. Valid values are: • Selected = Combine pick slips. • Unselected = Do not combine pick slips.
Complete orders only?	Indicates whether the system will ship orders that have been completely filled. Valid values are: • Selected = Ship orders that have been completely filled; do not ship orders with backordered items • Unselected = (Default;: Ship full and partially filled (backordered) orders.
Perform best way	This field is not currently implemented; leave this field unselected.
Override ship via	Allows you to replace the ship via code on the pick slip and ship all orders with this shipper. Enter a valid shipper code here, if you want all shippable orders being authorized by this service bureau to ship by this carrier. Ship via codes are defined in and validated against the Ship Via table. Numeric, 2 positions; optional.

Receiving Authorizations

Select the Receive/Process Authorizations option at the Reprocess Authorizations Screen (RPAA) if you need to receive the Authorizations from the service bureau and process the authorizations.

Records successfully received have a status of ***RCVD and have pick slips if authorized or no AVS hold or card identification hold. Also, an Authorization History record is created when creating the Pick Control Header and Detail records and is updated when the authorization or decline is received. When an authorization is received, the Authorization History record is updated with the authorization code, authorization date, and authorization amount.

If an authorization is declined, no pick slips print and the Authorization History record is updated with the decline code.

The Enter Pick Options window displays when you select this option.

Complete this window as needed.

The Select Authorization Service window opens. Select Select Request for the service bureau that you are receiving authorizations from. The REPROCESS job is submitted and the following reports are produced:

- Credit Card Authorization Listing
- Address Verification Response List (if the service bureau provides AVS)

- Declined Drop Ships
- Pick/Authorization Listing

By default, the REPROCESS job is submitted to the PICKGEN job queue at the Job Management Screen rather than the QBATCH job queue.

Address verification: If the service bureau provides AVS (address verification service), it evaluates the billing address on the credit card to ensure that it is valid. If not, the credit card charge may be authorized, but the order may be placed on hold, based on the response code for the authorization service. This gives you the opportunity to contact the customer and obtain the correct address. For example, the order is placed on hold if the customer's address is correct, but the zip code is incorrect. Once you contact the customer and update the zip code, you may take the order off of hold through the Release Held Orders function.

Credit card identification: If the service bureaus also provides credit card identification (CID, CVV2, or CVC2), it evaluates the card identification number on the credit card to ensure that the credit card data from the transaction matches the data stored by the service bureau for that card. If not, the credit card charge may be authorized, but the order may be placed on hold, based on the response code for the service bureau. Once you verify credit card ownership, you can take the order off of hold through the Release Held Orders (ERHO) menu option. See Credit Card Security Service (CID, CVV2, CVC2).

The credit card authorization is captured in the Authorization History table. The order will not be resent for authorization as long as the authorization is valid (based on the number of days in the Reauthorization days field in the Pay Type table).

Reprocess Drop Ship Authorizations Screen (RPDS)

Purpose: Run this recovery program if an error occurs when transmitting Authorizations (either sending or receiving) for a drop ship order or if you responded to an error with a C (to cancel the transmission) and there are stranded records in the Credit Card Authorization Transaction table (CCAT00) for drop ship orders.

This procedure enables you to resend all records that have not been sent or received and process the authorizations.

> **Note:**
>
> When you reprocess drop ship authorizations, the system sends all authorization transactions that exist in the CC Authorization Transaction table to the service bureau, regardless if the order is a drop ship order or regular order.

Selecting this option: Enter RPDS in the Fast path field at the top of any menu screen or select the Reprocess Drop Ship Authorizations option from a menu.

Retransmitting Authorizations

Select Transmit/Receive/Process Authorizations if you need to retransmit Authorizations.

This option resends all records in the CC Authorization Transaction table (CCAT00) that have not been sent, regardless if the order is a drop ship order or regular order. These records have a status of *RDY in this table.

Records successfully sent have a status of *SENT.

The Enter Drop Ship Options Window opens when you select this opti

Enter Drop Ship Options Window

This window gives you the same options you can select during Drop Ship Processing.

Field	Description
Print drop ship purchase orders	Indicates whether to print drop ship purchase orders. Valid values: • NONE (no print) = The system will not print drop ship purchase orders. • PURCHASE ORDER (Purchase order print) = The system prints drop ship purchase orders in purchase order number sequence. The system uses the PO Print Program for PO Print in PO Sequence (C76) system control value to print drop ship purchase orders in purchase order number sequence. • VENDOR (Vendor print) = The system prints drop ship purchase orders in vendor number sequence. The system uses the PO Print Program (C64) system control value to print drop ship purchase orders in vendor number sequence. **Note:** Drop ship purchase orders print only if: • the vendor's Drop ship output field = Drop ship purchase order, and • the vendor's Print PO field = selected, and • the Print drop ship purchase orders field on the Enter Drop Ship Options window = Purchase order The system also prints a Drop Ship Pick Slip/Invoice for the drop ship purchase order. The system also creates pick download triggers (File code of PCH) in the IL Outbound Trigger table when you generate a drop ship pick (invoice) if the Create Generic Pick Download Triggers (I31) system control value is selected. The PICK_OUT process in Working with Integration Layer Processes (IJCT) generatesthe Pick Message from Order Administration (CWPickOut) for each of these trigger records. Required.
Fax picks to vendors	Indicates whether the drop ship pick slips or invoices should be faxed to the vendor instead of printed. This option is not currently implemented.

Receiving Authorizations

Select Receive/Process Authorizations at the Reprocess Drop Ship Authorizations Screen (RPDS) if you need to receive the Authorizations from the service bureau and process the authorizations.

Overview: When you receive authorizations, records successfully received have a status of *RCVD and have drop ship output (pick slip or purchase order) if authorized or no AVS hold or card identification hold. When an authorization is approved, the Authorization History record is updated with the authorization code, authorization date, and authorization amount.

If an authorization is declined, no drop ship output (pick slip or purchase order) prints and the Authorization History record is updated with the decline code.

When you select the Receive/Reprocess Authorizations option:

1. The Enter Drop Ship Options window opens; see above for more information.
2. After you complete this window, you advance to the Select Auth Service window. Select the service bureau that you are receiving an authorization file from to submit the REPROC_DS job and produce the following reports:

- Credit Card Authorization Listing
- Address Verification Response List (if the service bureau provides AVS)
- Declined Drop Ships
- Vendor Drop Ship Worksheet
- Drop Ship Purchase Order List (if the drop ship output is purchase orders)
- Drop Ship Pick Slip/Invoice (the system generates a drop ship pick slip/invoice when the drop ship output is pick slips or purchase order)
- Purchase Order (if the drop ship output is purchase orders)

Address verification: If the service bureau provides AVS (address verification service), it evaluates the billing address on the credit card to ensure that it is valid. If not, the credit card charge may be authorized, but the order may be placed on hold, based on the response code for the authorization service. This gives you the opportunity to contact the customer and obtain the correct address. For example, the order is placed on hold if the customer's address is correct, but the zip code is incorrect. Once you contact the customer and update the zip code, you may take the order off of hold through the Release Held Orders (ERHO) menu option. See Address Verification Service (AVS).

Credit card identification: If the service bureaus also provides credit card identification (CID, CVV2, or CVC2), it evaluates the card identification number on the credit card to ensure that the credit card data from the transaction matches the data stored by the authorization service for that card. If not, the credit card charge may be authorized, but the order may be placed on hold, based on the response code for the authorization service. Once you verify credit card ownership, you can take the order off of hold through Release Held Orders. See Credit Card Security Service (CID, CVV2, CVC2).

The credit card authorization is captured in the Authorization History table. The order will not be resent for authorization as long as the authorization is valid (based on the number of days in the Reauthorization days field in the Pay Type table).

Working with Required Responses (WREQ)

> **Note:**
>
> This menu option is no longer used.

Purpose: Use this menu option to respond to Order Administration jobs that require user intervention in order to proceed.

Why would a job require user intervention?

- An error occurred during processing

- The job is used to send transactions to another system and communication failures occur before the transmission completes

Which types of job require user intervention?

- Stored Value Card (activation, balance inquiry and authorization reversal)
- Batch Authorization
- Batch Deposit

Required Response Processing

When a job requires user intervention, Order Administration:

1. Generates a Response Required Email, indicating a job requires user intervention.
2. Creates a record in the Response Required (MSRREQ) table. You can review the records in the Response Required table at the Work with Required Responses Screen.
3. Creates a message in the RESP.log indicating a job requires user intervention.
4. Order Administration waits 60 seconds for a user response.
5. After 60 seconds, Order Administration reviews the Response Required table to determine if a user responded to the response required message.

If a user responds: A user can respond to a job that requires user intervention at the Reply To Message Screen. If a user responds to a response required message, Order Administration:

- uses the response to proceed with the job.
- deletes the record from the Response Required table.
- creates a message in the RESP.log, indicating a user responded to the response required message.

If a user does not respond: If a user does not respond to a response required message, Order Administration looks at the RESPONSE_RETRIES property in Working with Admin Properties (CPRP) to determine the number of times it should look for a response for the job. Order Administration compares the Sent date and time to the Last polled date and time to determine if the number of times has been reached.

If the number of times to look for a user response has not been reached, Order Administration:

- updates the Last polled date and time in the Response Required table with the last polled date and time.
- After every fifth attempt, writes a message to the RESP.log, indicating a user response had not yet been received.
- goes back to sleep for another 60 seconds.

If the number of times to look for a user response has been reached, Order Administration:

- deletes the record in the Response Required table.
- uses a default response in order to proceed with the job. For example:
- the default response for a transmission job in a receive status is R (Resend).
- the default response for a transmission job in a sent status is C (Cancel).

> **Note:**
>
> - For the batch authorization job, the status of each record in the CC Authorization Transaction table remains in its current status so that you can use the Reprocess Authorizations Screen (RPAA) to recover the response.
> - For the batch deposit job, the status of each record in the CC Deposit Transaction table remains in its current status so that you can use the Receive option in Processing Auto Deposits (SDEP) to recover the response.
> - sends a Response Required Email, indicating the default response was used for the job.
> - writes a message to the RESP.log, indicating the default response was used.

If a user deletes the response required message: If a user deletes a response required message at the Work with Required Responses Screen, the system:

- uses a default response in order to proceed with the job. For example:
- the default response for a transmission job in a sent status is C (Cancel).
- the default response for a transmission job in a receive status is R (Resend).
- sends a Response Required Email, indicating the default response was used for the job.
- writes a message to the RESP.log, indicating the default response was used.

Response Required Email

This email is generated when a Order Administration job requires a user response in order to proceed.

The RESPONSE_EMAILS setting in the Notify Properties defines the email address(es) that receive this email.

Order Administration generates an email when:

- A job initially requires user intervention.
- A user does not respond to the response required message and the default response was used.

Sample first email:

From: cwjava@example.com

Subject: Process Authorizations

Response required for job. Please go to WREQ to view the error and enter a response.

Sample second email:

From: cwjava@example.com

To: Eleanor Johnson

Subject: Process Authorizations

No response received after 5 attempts, default used.

Contents:

- From: The mail.from setting in the Email Properties file.
- To: The user name for the RESPONSE_EMAILS property in Working with Admin Properties (CPRP).
- Subject: Process, followed by the job name. For example, Process Authorizations.
- Body:
- First email: Response required for job. Please go to WREQ to view the error and enter a response.
- Second email: No response received after 5 attempts, default used.

RESP.log

Order Administration writes messages to the RESP.log file when a job requires user intervention.

Location: /domain/conf/OMSFiles/Logs/RESP/, where domain is the WebLogic domain directory for Order Administration on the application server.

Message	Written When
Deposits - Response required for job. E-Mail sent to:email1@cware.com; email2@cware.com	Order Administration generates a Response Required email, indicating a job requires user intervention. In this example, Deposits is the job name and email@cware.com is the email address to receive the Response Required email.
Deposits - Received R response from BMIRANDA	A user responded to a response required message at the Reply To Message Screen. In this example, Deposits is the job name and BMIRANDA is the user that responded to the job.
Deposits - No response after 5 attempts, will retry	Order Administration reviewed the Response Required table five times to determine if a user responded to the response required message. In this example, Deposits is the job name.
Deposits - No response after 10 attempts, will retry	Order Administration reviewed the Response Required table ten times to determine if a user responded to the response required message. In this example, Deposits is the job name.
Deposits - No response received, default response used	The number of times to look for a response in the Response Required table has been reached without a response from a user. Order Administration uses the default response for the job. In this example, Deposits is the job name.
Deposits - Response Required entry not found, default response used	A user deleted a response required message at the Work with Required Responses Screen. Order Administration uses the default response for the job. In this example, Deposits is the job name.

Work with Required Responses Screen

Use this screen to review the jobs that require user intervention in order to proceed.

> **Note:**
>
> This screen is not company or user specific; all jobs that require user intervention display on the screen, regardless of the company where the job was submitted or the user that submitted the job.

How to display this screen: Enter WREQ in the Fast path field or select Work with Required Responses from a menu.

Field	Description
Message	Indicates the reason a job requires user intervention. For example, if transmission errors occur for a batch authorization: Error occurred during authorization transmission Alphanumeric, 75 positions; display-only.
Job	The name of the job that requires user intervention. Valid values are: • Stored Value Card • Authorizations • Deposit Display-only.
Sent	The date and time a Response Required Email was sent to the user, indicating a job requires a user response. Alphanumeric, 50 positions (YYYY.MM.DD HH:MM:SS format); display-only.
Last polled	The date and time Order Administration last reviewed the response required message to determine if a response was received from a user. Alphanumeric, 50 positions (YYYY.MM.DD HH:MM:SS format); display-only.

Screen Option	Procedure
Reply to a response required message	Select Change for a response required message to advance to the Reply To Message Screen.
Delete a response required message	Select Delete for a response required message to advance to the Confirm Delete window. At this window, select Delete to delete it. When you delete a response required message, Order Administration: • uses a default response in order to proceed with the job. • sends a Response Required Email, indicating the default response was used for the job. • writes a message to the RESP.log.

Reply To Message Screen

Purpose: Use this screen to reply to a job that requires user intervention.

An error message indicates if a job used the default reply while you were on this screen: Update not accepted - record has been changed by another user since it was displayed.

How to display this screen: Select Change for a job on the Work with Required Responses Screen.

Field	Description
Message text	Indicates the reason a job requires user intervention. For example, if transmission errors occur for a batch authorization: Error occurred during authorization transmission Alphanumeric, 75 positions; display-only.
Enter reply	Enter your response to the job. The Choices field provides a list of valid responses. Alphanumeric, 1 position; required.
Choices	The valid responses you can enter for a job that requires user intervention. Valid values are: • C = Cancel the job. • R = Resubmit the job. Alphanumeric, 1 position; display-only.
Job name	The name of the job that requires user intervention. Valid values are: • Stored Value Card • Authorization • Deposit Alphanumeric, 50 positions; display-only.
Message sent	The date and time a Response Required Email was sent to the user, indicating a job requires user intervention. Alphanumeric, 50 positions (YYYY.MM.DD HH:MM:SS format); display-only.

Notify Properties

In order to respond to Order Administration jobs that may require user intervention to proceed, you must set up the Notify Properties in Working with Admin Properties (CPRP).

Why would a job require user intervention?

- An error occurred during processing
- The job is used to send transactions to another system and communication failures occur before the transmission completes

Which types of jobs require user intervention?

- Stored Value Card (activation, balance inquiry or authorization reversal)
- Authorization (batch only, for all card types)
- Deposit

Property Name	Description
RESPONSE_RETRIES	The number of times Order Administration looks for a response to a job that requires user intervention before using the default response in order to proceed with the job. For example, if this setting is 5, Order Administration will look for a user response five times, waiting 60 seconds between each time.
RESPONSE_EMAILS	The list of email addresses that receive the Response Required email when a job requires user intervention. Each email address entered must be separated by a semi-colon (;). For example: email1@add.com;email2@add.co

Reset Authorizations (RSAA)

Purpose: Use this menu option to reset records in the Credit Card Authorization Transaction table (CCAT00) from a *SENT status to a *RDY status so that they can be resent to the authorization service.

This menu option is useful as a recovery program if an error occurs when transmitting an Authorization to the service bureau or if you responded to an error with a C (to cancel the transmission) and there are stranded records in the Credit Card Authorization Transaction table.

Once the records are reset to a *RDY status, you can use the Reprocess Authorizations Screen (RPAA) to resend all records in the Credit Card Authorization Transaction table that have not been sent and process the authorizations.

Reset Transmission Status Screen

Use this screen to select the authorization service whose records in a *SENT status in the Credit Card Authorization Transaction table you wish to reset to a *RDY status.

To reset the transmission status:

#	Step
1.	Confirm with the service bureau whether the authorization transmission was received. • If the service bureau received the authorization transmission, do not reset the transmission status to *RDY; instead, use the Receive/Process Authorizations option in Reprocess Authorizations Screen (RPAA) to receive the authorization response. • If the service bureau did not receive the authorization transmission, continue to the next step.
2.	At the Reset Transmission Status screen, enter a valid authorization service in the Select authorization service field.
3.	Select OK. The system: • updates the records in a *SENT status in the Credit Card Authorization Transaction table to a *RDY status. • returns you to the main menu and displays a message similar to the following: Records for PMT. Transmission may now be resent.

#	Step
4.	Use the Transmit/Receive/Process Authorizations option in Reprocess Authorizations Screen (RPAA) to resend all records in the Credit Card Authorization Transaction table that have not been sent or received and process the authorizations.

Field	Description
Select authorization service	Select the authorization service whose records in a *SENT status in the Credit Card Authorization Transaction table you wish to reset to a *RDY status. Required.

Performing Batch Authorization (SATH)

Purpose: Use this menu option to receive authorizations for credit cards that did not receive an authorization during order entry. This menu option sends credit cards up for authorization in a batch by the associated ship via. The system looks at the ship via defined on the order header to determine which credit cards are sent to the service bureau for authorization.

You may wish to use this menu option if:

- communication failures occurred when you tried to authorize the credit card during order entry or order maintenance.
- the credit card received an authorization during order entry, but not for the entire dollar amount associated with the card.
- the credit card received a declined authorization during order entry.
- the credit card was approved in order entry or order maintenance, but the authorization has expired.
- the credit card was approved in order entry or order maintenance, but the card failed AVS verification or card security identification (CID, CVV2, CVC2); see Address Verification Service (AVS) and Credit Card Security Service (CID, CVV2, CVC2)

> **Note:**
>
> You must authorize credit cards prior to generating pick slips if the Batch/online field for the service bureau is set to I (online only). You can perform online credit card authorization during order entry when you select Accept to accept the order, during order maintenance at the Enter Payment Methods Screen in Order Maintenance, or using this menu option.

Periodic function: The AUTHALL Authorize All Open Orders periodic function (program name PFR0131) allows you to use the job scheduler to schedule when you wish to process the Batch Authorization Program (SATH).

In this topic:

- Batch Authorization Process
- Batch Authorization Selection Screen

Batch Authorization Process

When you select Accept at the Batch Authorization Selection screen, the system submits the Get Online Authorization program.

#	Step
1.	The system determines the orders eligible for authorization, checking for Void Authorizations, the available authorized amount from Authorization History, and any existing picks with valid authorizations. • If a ship via has not been defined at the Batch Authorization Selection Screen, the system reviews by order number all open order ship to records. • If a ship via has been defined at the Batch authorization Selection Screen, the system only reviews by order number open order ship to records associated with the specified ship via. If the ship via matches, the system selects the entire order, across all ship to customers.
2.	The system performs the same steps as in order entry to determine if an order is eligible for online authorization and the information that is updated; see Receiving a Credit Card Authorization During Order Entry. **Note:** The system does not display the Select Authorization Response Option Window when you authorize credit cards using batch authorization.
3.	The system prints the Online Credit Card Authorization Listing for credit cards that received a declined authorization.

For more information: See Processing Authorizations and Deposits using an Integration Layer Process for more information on communicating with a service bureau via an integration layer job.

Batch Authorization Selection Screen

Purpose: Use this screen to select the ship vias associated with the credit cards you wish to send for authorization.

How to display this screen: Enter SATH in the Fast path field at the top of a menu or select Batch Authorization Program from a menu.

Field	Description
Ship via	A code for the ship via associated with the orders that contain credit cards you wish to send for authorization. Ship via codes are defined in and validated against the Ship Via table. Numeric, eight 3-position fields; optional.

Screen Option	Procedure
Submit the batch authorization program	Select Accept. See Batch Authorization Process. A message indicates that the job has been submitted: BATCH_AUTH submitted

Printing the Online Credit Card Authorization List (PATL)

Purpose: Use the screen to select the criteria you wish to use to print the Online Authorization Listing. This report lists credit cards that have been authorized using the online credit card authorization process. See Performing Online Credit Card Authorizations for an overview and required setup.

You can use this report to review credit cards that have been authorized, declined, authorized but not used, or sent for authorization for a specific date range.

The system looks at records in the Authorization History table and the Online Authorization table to determine what information prints on this report.

> **Note:**
>
> You can print a similar report for credits cards that are authorized during pick slip generation; see Credit Card Authorization Listing.

In this topic:

- Authorization Listing Screen
- Online Credit Card Authorization Listing

Authorization Listing Screen

How to display this screen: Enter PATL in the Fast path field at the top of a menu or select Print Credit Card Authorization List from a menu.

Field	Description
Authorization date range	The authorization date range you wish to use to generate the Authorization Listing. The system only prints authorizations that have been received for this specific date range. Enter a beginning date in the first field and enter an ending date in the second field. If you do not enter an ending date in the second field, the system defaults the beginning date, indicating the report will print for this date only. A message displays if you enter a beginning date that is greater than the ending date: From Date must be less than To Date A message displays if you enter a future date in the starting date or ending date: Date entered must not be greater than today's date Numeric, two 6 position fields (in user date format); beginning date required, ending date optional.

Field	Description
Status (Authorization status)	A code that indicates the status of the credit card authorization. Valid values are: blank = the credit card has not yet been sent for authorization Authorized = the credit card has been authorized Declined = the credit card has been declined Authd but not used = the credit card has been authorized, but the authorization has not been used Sent for authorization = the credit card has been sent to the authorization service for authorization If you enter a status, the system prints the Authorization Listing only for authorizations that contain this status. If you do not enter a status, the system prints the Authorization Listing for all eligible authorizations, regardless of status. Authorization status codes are defined in and validated against the Authorization Status table. Optional.
Held orders	Indicates whether authorizations on held orders print on the Authorization Listing. The system uses the Status field on the order header to determine if an order is held. Selected = Authorizations for held orders print on the Authorization Listing. Unselected = Authorizations for held orders do not print on the Authorization Listing. This report only displays authorizations for open orders.
Report sorts	Determines the sort on the Authorization Listing. Pay Type/Auth Date/Status = The Authorization Listing sorts in pay type/authorization date/status order. Status/Pay Type/Credit Card # = The Authorization Listing sorts in status/pay type/credit card number order. Numeric, 1 positions; required.
Response code	The authorization response you wish to use to generate the Authorization Listing. If you enter a response code, the system only prints authorizations that received this response. **Note:** If you enter a response that does not match the Status (Authorization status), nothing prints on this report. For example, if you enter D (declined) in the Status field and enter a response code of 100 (approve), nothing prints on the report because approved responses would never be put in a declined status. Vendor response codes are defined in and validated against the CC Vendor Response table; see Defining Vendor Response Codes. Alphanumeric, six 10 position fields; optional.

Screen Option	Procedure
Accept the criteria you defined and generate the Authorization Listing	Select Accept. The system displays a submit job message at the bottom of the screen indicating the Online Credit Card Authorization Listing has been submitted.

Purging Tables

Topics in this part:

- Purging Prestige Credit Card Deposits (MPSP) describes how to purge processed records from the Credit Card Deposit Prestige table.
- Purging Orders (MPOR) described how to purge closed and canceled orders based on the date of last activity.
- Purging Sold To Customers describes how to purge eligible sold to customers based on the customer's last change date.
- Purging Suspended Orders (PSOR) describes how to remove orders in a suspended status from the system.
- Purging SKUs (MPSK) described how to remove item/SKUs based on item status from the system.
- Additional Purges summarizes the additional purges available.

Purging Prestige Credit Card Deposits (MPSP)

Purpose: When you use Processing Auto Deposits (SDEP), the system processes deposits and credit card credits in your local currency interactively with your deposit service. You have the option, however, of processing deposits and credits in foreign currencies separately to capture the currency conversion rate at the time of billing. To do so, you must use a deposit service defined as Prestige (authorization service code = PRE) in the Authorization Service table.

The system writes the invoice information on foreign currencies using the separate process to the Credit Card Deposit Prestige table (CCCDPP). You then extract invoice records from this table to send to the deposit service.

Credit card encryption: Credit card encryption allows you to encrypt the credit card number in the Order Administration database to provide additional security of credit card data. If you use credit card encryption, the credit card number in the Credit Card Deposit Prestige table will not be encrypted because the information in this table is extracted to an external system. See the Data Security and Encryption Guide on My Oracle Support (2953017.1) for an overview.

You must use the Purge Prestige Credit Card Deposits function to purge the processed records from the Credit Card Deposit Prestige table.

For more information: See Defining Authorization Services (WASV).

In this topic:

- Purge Credit Card Deposits Prestige Screen

Purge Credit Card Deposits Prestige Screen

How to display this screen: Enter MPSP in the Fast path field at the top of any menu or select Purge Prestige Credit Card Deposits from a menu.

Field	Description
Start date	The beginning date of the records to purge from the Credit Card Deposit Prestige table. This is the date you used the Process Auto Deposits to create the deposit or credit card credit record in the table. The purge will include transactions processed on that date and later. Numeric, 6 positions (in user date format); required.
End date	The ending date of the records to purge from the Credit Card Deposit Prestige table. This is the date you used the Process Auto Deposits function to create the deposit or credit card credit record in the table. The purge will include transactions processed on that date and earlier. Numeric, 6 positions (in user date format); required.

Screen Option	Procedure
Purge records	Select Accept.

Purging Orders (MPOR)

Purpose: Use the Purge Orders screen to purge closed and canceled orders that have been inactive for a given period.

Which orders are purged? In addition to being closed or cancelled, the order must:

- not have had any activity for the Order Purge Days (C62) defined in the System Control table. For example, if the order purge days is 365, a closed or canceled order will be eligible for purging if the order has not been entered, shipped, or maintained for one year. The system checks the Order date from the Order Header table and the dates from the Order Transaction History table for the most recent activity.
- not have any pending returns or refunds.

Additional purge option: You can also use the PURGEOR periodic function. This function also uses the rules described above to determine whether an order is eligible for purge.

Purged Order List? If you use the PURGEOR periodic function and set the function's Parameter to Y, the submitted job also produces the Purged Order List when you use the Purge Orders Screen (MPOR).

Purging an individual order: To purge an individual order, use the Purge Orders by Order Number (MORP) option. With this option, you can delete an order even if there has been activity more recently than the Order Purge Days (C62).

Updated tables: See the Order-Related Tables for a listing of the tables purged through the Purge Orders Screen (MPOR), the Purge Orders by Order Number (MORP) option, or the PURGEOR periodic function.

The system does not delete the customer's order, item, or correspondence history; you can review this information through the Work with Customers function.

> **Note:**
>
> When you purge orders through the Purge Orders screen or the PURGEOR periodic function, the system does not create records in the Deleted Order Table.

In this topic:

- Purge Orders Screen (MPOR)
- Order-Related Tables

For more information: See:

- How to Schedule a Job for information on scheduling a periodic process that includes the PURGEOR periodic function
- Working with Periodic Functions (WPER) for information on setting up periodic functions
- Purge Orders by Order Number (MORP) for information on the screen you can use to purge individual orders

Purge Orders Screen (MPOR)

How to display this screen: Enter MPOR in the Fast path field at the top of any menu or select Purge Orders from a menu.

Field	Description
Purge date	The system subtracts the Order purge days from this date to calculate a cutoff date for purging orders. For example, if the purge date is 9/30, and the order purge days are 30, the system subtracts 30 days from 9/30 to arrive at a cutoff date of 8/31. Closed and canceled orders that have not been entered, shipped, or updated in any way since the cutoff date will be purged. See the discussion above under Purging Orders (MPOR) for more information. The system defaults the current date into this field; however, you can override it with an earlier date. Numeric, 6 positions (in user date format); required.
Order purge days (Highlighted number in the narrative on the center of the screen)	The number of days an order must have been inactive since the purge date to be eligible for purging. From the Order Purge Days (C62) system control value. Numeric, 7 positions; display-only.

Completing this screen: Optionally, enter an earlier date in the Purge date field and click OK, then select Accept. The system submits the ORDER_PURG job and returns you to the previous screen. This job purges all orders inactive since the calculated cutoff date (Purge date - Order purge days).

> **Note:**
>
> This job does not update the Deleted Order Table.

Possible errors: The screen might display an error message if, for example, there is a communication failure with EFTConnect. In this case, because payment-related records for orders cannot be purged, the order purge fails. See the Payment Configurations screen in Modern View for background.

Order-Related Tables

Purpose: The system purges records in the following order-related tables when you use the PURGEOR periodic function, the Purging Orders (MPOR) option, or the Purge Orders by Order Number (MORP) option.

Table Name	System Name
AA Void	AAVOID
Authorization History	AUTHHS
Auto Soldout	CSAUSO
Backorder Cancellation Pending	BOCANP
Carton Contents	CartonContents
CC Deposit History	CCDPHI
Correspondence History **Note:** The associated record in this table and in the Correspondence History Detail table are not deleted; however, the system deletes the order number. The correspondence history is still available for review by inquiring on the customer(s) on the order.	MSCOHS
Customer Sold To Promotion	OECSPR
Drop Ship Pending	FLDSPN
Drop Ship Work	DRPSHW
Expected Ship Date	CSEXSD
Invoice Address	OEINAD
Invoice Cross Reference	FLINXR
Invoice Currency	MSINCU
Invoice Detail	OEINDT
Invoice Detail Charge	INIDCP
Invoice Detail Cost	INIVCP
Invoice Detail Pay Method	CSINDP
Invoice Header	OEINHD
Invoice Payment Method	CSINVP

Table Name	System Name
Invoice Ship To	OEINSH
Manifest	FLMANF
Narvar Export Errors	INT_NARVAR_EXPORT_ERROR
On Line Authorization	CCOLAT
Order Additional Charge	OEOADC
Order Orchestration	oeorbk
Order Orchestration History	oeorbh
Order Coupon Discount	OEOCDP
Order Cross Reference	OEORXR
Order Detail	OEORDT
Order Detail Coupon	OECPDC
Order Detail Deal Audit	OEDDAU
Order Discount Audit	OEODIS
Order Free Gift	FREGFT

Purging Suspended Orders (PSOR)

Purpose: Use the Purge Suspended Orders menu option to remove orders in a suspended or error status from the system.

You might have orders in suspended or error status due to error or malfunction; for example, if you were entering an order when your terminal froze or a program halted, the order would remain in suspended status. You would never be able to process such an order normally (as distinguished from a suspended order batch, which you can process normally by accepting the batch).

By purging the orders in suspended or error status from the system, you reduce the reserved or backordered items from the orders.

The Purge Suspended Orders menu option purges orders only if they are not part of a batch, and if they were entered before the current date. You can purge orders by date range or select a specific order to purge.

> **Note:**
>
> You cannot use this option to purge a quote.

Purge Suspended Orders Screen

How to display this screen: Enter PSOR in the Fast path field at the top of any menu or select Purge Suspended Orders from a menu.

Field	Description
Enter order#	Enter an order number in this field to purge an order individually, rather than by date range. The order whose number you enter must be in a suspended or error status, not part of an order batch, and not a quote; otherwise, the screen displays an error message. Numeric, 8 positions; optional.

Field	Description
Starting/ending dates	Enter the beginning and ending order entry dates that indicate the period for which you would like to purge orders. in suspended or error status. The starting date you enter must be earlier than or the same as the ending date; also, you cannot enter an ending date that is later than or the same as the current date. Numeric, 6 positions (in user date format); required if you do not enter an order number.

If you are purging by order number: The system purges the order interactively and produces the Rejected Batch Listing.

If you are purging by date range: The system submits the job PURG_SUSP. This job purges all eligible orders within the date range you entered.

As a result of purging the orders, the related inventory information (SKU open, reserved, and Backorder quantities for any items on the orders) are reduced at this time.

Deleted Order table: The job writes a record in the Deleted Order Table for each purged order.

Purging SKUs (MPSK)

Purpose: Use Purge SKUs to remove items or SKUs based on item status from the system, and to print the Purged SKU List.

The system uses the SKU Purge Days (F11) system control value to determine how long an item/SKU must have been inactive (an order has not been entered for the item/SKU) to be eligible for purging. For example, if you define 365 as the SKU purge days, a SKU will be eligible for purging if the last order date on the SKU record is older than one year.

The system will not delete an item/SKU if the following records exist:

- the on hand quantity, On order quantity or Backorder quantity is greater than 0 in the Item Warehouse table (fast path = WWHS)
- an order detail line exists for the item/SKU
- an open or closed purchase order detail line exists for the item/SKU

SKU Purge Screen

How to display this screen: Enter MPSK in the Fast path field at the top of any menu or select Purge SKUs from a menu.

Field	Description
Purge SKUs with no orders for xxx days	The number of days to retain SKUs that are not on any existing order. This number defaults from the SKU Purge Days (F11) system control value. Numeric, 7 positions; display-only.

Field	Description
Select status codes for SKUs to be purged	The item status of the items and SKUs you wish to purge. Item status codes are defined in and validated against Work with Item Status (fast path = WIST). Alphanumeric, five 1 position fields; one field required.
Print only do not update	Indicates whether you wish to purge the items and SKUs that meet the selection criteria or print the SKU Purged List report only. Valid values are: Selected (default) = Print the SKU Purged List only. Unselected = Print the SKU Purged List and purge the items and SKUs that display on the report.

When you select Submit to process the SKU Purge, the system also prints the Purged SKU List, which lists each item/SKU that is available to purge.

The system purges an item that contains SKUs if all of the SKUs are available to purge.

Purge Inventory Transaction History (MITH)

Purpose: Use this option to purge records in the Item Transaction History table that are older than the number of days specified in the Inventory Transaction History Retention Days (A24) system control value.

Purge Inventory Transactions Screen

How to display this screen: Enter MITH in the Fast path field at the top of any menu, or select Purge Inventory Transaction History at a menu.

Completing this screen: This screen indicates the numeric code and description of the company where the records will be purged. Click OK to submit the PURGE_ITH job, which purges the records.

System control value required: If the Inventory Transaction History Retention Days (A24) system control value is blank, the system displays an error message. You need to use this system control value to specify a number of days in order to run the purge.

For more information: For background on inventory transactions, see Display Inventory Transaction History (DITH).

Purge Purchase Order (MPOP)

Purpose: Use this option to purge canceled and/or completed records in the following tables:

- PO Detail
- PO Detail Audit
- PO Detail Estimated Charges
- PO Detail Hold
- PO Detail Messages
- PO Detail Noninventory
- PO Header

- PO Header Audit
- PO Message
- PO Receipt Header
- PO Suspense

Purge dates: Records are eligible for purging if the date they were canceled or received is older than number of days specified in the # of Days Before PO Purge (A58) system control value.

Report: This option also generates the Purchase Order Purge Listing listing the purchase orders deleted through the purge.

Purchase Order Purge Selection Screen

How to display this screen: Enter MPOP in the Fast path field at the top of any menu, or select Purge Purchase Order from a menu.

Completing this screen:

- Select the Purge completed orders flag to delete purchase orders that are completed; otherwise, leave this flag unselected.
- Select the Purge cancelled orders flag to delete purchase orders that are canceled; otherwise, leave this flag unselected.

> **Note:**
>
> You must select either completed or canceled purchase orders for purge at this screen.

- Leave the Purge report field set to Detail (default) to print the Purchase Order Purge Listing with information on purchase order detail lines, or change the setting to Summary to print the summary version.
- Select Accept to submit the PO_PURGE job. This job purges the records based on your screen selections and the setting of the # of Days Before PO Purge (A58) system control value, and generates the Purchase Order Purge Listing.

For more information: For background on purchase orders, see Maintaining Purchase Orders (MPOE) and Purchase Order Inquiry (MPOI).

Purge Empty Item Locations (PITL)

Purpose: Use this option to purge Item Location records that have zero:

- on-hand quantity
- pending transaction quantity
- printed quantity

You need to specify the warehouse where empty item locations should be deleted. In addition, the prompt screen allows you to specify the number of days since placement date. For example, if you specify 45 days, only item locations whose placement dates were more than 45 days ago and which match all the other criteria will be deleted.

Even if the purge deletes the item location record, it is possible that the item/SKU has this warehouse and location identified in the SKU table as the “primary primary” location. The record in the SKU table is not cleared by this purge.

> **Note:**
>
> Ordinarily, the system automatically deletes all item locations when the above quantities are zero, except in the case of primary locations.

Purge Empty Item Locations Screen

How to display this screen: Enter PITL in the Fast path field at the top of any menu, or select Purge Empty Item Locations from a menu.

Completing this screen:

- Enter the 3-position warehouse number where the item locations should be deleted. This entry is required.
- Enter the number of days required since placement date for an item location to be eligible for deletion. For example, if you enter 45, and an empty item location has a placement date of 50 days ago, it is eligible for deletion.
- Select Accept to submit the PURGITL job.

Purge Order Billing History (POBH)

Purpose: Use this option to purge Order Billing History records on or earlier than a specified date.

Purge Order Billing History Screen

How to display this screen: Enter POBH in the Fast path field at the top of any menu, or select Purge Order Billing History from a menu.

Completing this screen:

- Use the Purge transactions up to field to indicate the latest date to purge in the Order Billing History table.
- Select Submit and then click OK at the confirmation window to submit the PURGE_OBH job and generate the Order Billing History Purge report.

> **Note:**
>
> The job is submitted in held status; you will need to release it in order to perform the purge and generate the report.

For more information: For background on Order Billing History, see Order Billing History Detail Screen.

Purge Orders by Order Number (MORP)

Purpose: Use this option to purge individual orders.

Purge an Order Screen

How to display this screen: Enter MORP in the Fast path field at the top of any menu, or select Purge Orders by Order Number from a menu.

Purging an order: Enter the order number to purge and select the Confirm flag to purge the order.

Eligible to purge? The system displays an error message after you select the Confirm flag if the order is ineligible for purge. An order is eligible for purge if it is suspended, canceled, or closed and there are no pending transactions or activity, such as refunds. For example, an order might be ineligible for purge for any of the following reasons:

- Order Header not found (Indicates that the order number you entered does not exist.)
- Open R/A for order
- Order Status is Open
- Open refund for order
- Order status is Held
- Order status is Quote
- Order status is Error

The purge request might also fail if there is a communication issue with EFTConnect, preventing the order purge because payment-related data for the order cannot be purged.

Updates: If the order is eligible to purge, the system deletes the Order Header and records in all related tables, and displays a message indicating that the order has been purged. See Order-Related Tables for a list. It also writes a record in the Deleted Order Table. The Process indicated is Individual Order Purge.

Purging suspended orders: You can also use the Purging Suspended Orders (PSOR) option to purge suspended orders.

Purging all eligible orders: See Purging Orders (MPOR) for information on submitting a job to purge all eligible orders.

Flexible Payment Options

Topics in this part:

- Deferred/Installment Billing Overview provides an overview of how flexible payment options work.
- Deferred/Installment Billing Setup describes the steps necessary to set up deferred or installment billing pay plans.

- Working with Flexible Payment Options (WFPO) describes the screens you use in the Work with Flexible Payment Options menu option.
- Credit Card Net Exchange Billing describes the process the system uses to net credit invoices with debit invoices before a deposit is sent to the service bureau for an invoice associated with an exchange.

> **Important:**
>
> There is a known issue with deferred/installment billing functionality when processing a return. If you plan to use deferred/installment billing, contact customer support to determine if your planned use of this functionality will be impacted by this issue.

Working with Flexible Payment Options (WFPO)

Purpose: Use the Work with Flexible Payment Options menu option to set up and work with deferred or installment pay plans. This menu option also allows you to review a pay plan's order and shipment history.

> **Note:**
>
> Only credit cards (as opposed to different types such as stored value card or debit card) are eligible for deferred or installment billing. If you accept any other credit card type besides a regular credit card, you should make the Pay type one of the Qualification Values for each payment plan you create to prevent these other credit card types from being accepted. You can use the Copy option at the Work with Flexible Payment Option Screen to make a copy of the payment plan for each eligible credit card pay type.

EXC flexible payment option: The system creates the EXC Net Billing for Exchanges flexible payment option for use during Credit Card Net Exchange Billing if the Use CC Net Exchange Billing (M23) system control value is selected. You cannot change or delete this flexible payment option, and you cannot use this flexible payment option for deferred/installment billing. See Credit Card Net Exchange Billing for processing details.

For more information:

- An overview of how pay plans work: Deferred/Installment Billing Overview
- Setting up your company if you will be using pay plans: Deferred/Installment Billing Setup

In this topic:

- Work with Flexible Payment Option Screen
- Create Flexible Payment Option Screen
- Display Payment Option History Screen

Work with Flexible Payment Option Screen

How to display this screen: Enter WFPO in the *Fast path* field at the top of any menu, or select Work with Flexible Payment Option from a menu.

Field	Description
Code	The code representing a deferred or installment pay plan. **EXC flexible payment option:** The system delivers the EXC Net Billing for Exchanges flexible payment option to use during Credit Card Net Exchange Billing if the Use CC Net Exchange Billing (M23) system control value is selected. You cannot change or delete the EXC flexible payment option; however, if this flexible payment option exists and then you deselect the system control value, this flexible payment option is automatically deleted. Credit Card Net Exchange Billing for processing details. Alphanumeric, 5 positions; optional.
Type	The type of pay plan. Valid values are: D = deferred billing I = installment Alphanumeric, 1 position; optional.
Description	The description of the pay plan. Alphanumeric, 40 positions; optional.
Start date	The date when the pay plan first becomes available to apply to orders. Does not apply to the EXC flexible payment option. Numeric, 6 positions (in user date format); display-only.
End date	The date when the pay plan is no longer available to apply to orders. Does not apply to the EXC flexible payment option. Numeric, 6 positions (in user date format); display-only).

Select Option	Procedure
Create a new pay plan	Select Create to advance to the Create Flexible Payment Option Screen.
Change a pay plan	Select Change for a pay plan to advance to the Change Flexible Payment Option Screen. At this screen, you can change any fields but the Payment code. See the Create Flexible Payment Option Screen for field descriptions. **Note:** You cannot change the EXC Net Billing for Exchanges flexible payment option; see Credit Card Net Exchange Billing for processing details and more information.
Delete a pay plan	Select Delete for a pay plan to display the Delete Confirmation prompt. You can delete a pay plan only if it is not used on any orders currently in your company. **Note:** You cannot delete the EXC Net Billing for Exchanges flexible payment option; see Credit Card Net Exchange Billing for processing details and more information.
Display a pay plan	Select Display for a pay plan to advance to the Display Flexible Payment Option Screen. You cannot change any information at this screen. See the Create Flexible Payment Option Screen for field descriptions.

Select Option	Procedure
Display history for a pay plan	Select History for a pay plan to advance to the Display Payment Option History Screen.

Create Flexible Payment Option Screen

Purpose: Use this screen to create a new pay plan.

How to display this screen: Select Create at the Work with Flexible Payment Option Screen.

Field	Description
FPO payment code	The code to identify the deferred or installment pay plan. Alphanumeric, 5 positions. Create screen: required. Change screen: display-only.
Description	The description of the deferred or installment pay plan. Alphanumeric, 40 positions; required.
Type	The type of pay plan. Valid values are: Deferred = Defer depositing the amount the customer owes for an order shipment for a specified period of time or until a specific date. Installment = Deposit the amount the customer owes for an order shipment in a specified number of equal installments. Required.
Start (Start date)	The first date when new orders will be eligible for the pay plan. When evaluating whether an order is eligible for a pay plan, the system checks the original order date, even if you are attempting to add a pay plan in order maintenance on a later date. Example: 7/25: You enter an order for an item that is currently backordered. 8/20: The customer calls to request a pay plan. The pay plan start date is 8/15. Result: The order is ineligible for the pay plan based on the pay plan start date (8/15) and order date (7/25). This date must be earlier than or the same as the end date. Numeric, 6 positions (in user date format); required.
End (End date)	The date when new orders will no longer be eligible for the pay plan. Eligibility is based on the original order date, not the current date, when you add a pay plan in order maintenance. Example: 7/25: You enter an order for an item that is currently backordered. 8/20: The customer calls to request a pay plan. The pay plan end date is 7/31. Result: The order is eligible for the pay plan based on the pay plan end date (7/31) and order date (7/25). This date must be later than or the same as the start date. Numeric, 6 positions (in user date format); required.

Field	Description
Expiration date	The date when you will no longer defer processing deposits for the pay plan. Example: 7/25: You enter an order for deferral of payment for 60 days based on invoice date. The item is currently backordered. The pay plan has an ending date of 7/31, and an expiration date of9/30. 8/15: You ship and bill the order. Result: Since the deferred date (60 days past the invoice date of 8/15, or 10/14) would be past the expiration date of 9/30, the deposit will not be deferred, but will be available for processing immediately. The system determines when the pay plan has expired as follows: Deferral: You can enter an expiration date only if you use the # of days for deferral field rather than the *Fixed deferral date.* To determine whether to apply the deferral, the system adds the number of days for deferral to the order's invoice date (if the Based on field is set to I) or the order date (if the Based on field is set to O). If the result is later than the Expiration date, the deposit is not deferred and is eligible for processing immediately after billing. You cannot enter an expiration date that is sooner than the pay plan End date; otherwise, the following error message indicates: Invalid Expiration Date Installment: To determine whether to apply the installment, the system compares the order's invoice date with the expiration date. If the Invoice date is later than or the same as the Expiration date, the deposit is not broken out into installments, but the entire amount is eligible for processing immediately after billing. Numeric, 6 positions (in user date format); required unless you enter a Fixed deferral date for a deferral pay plan.
View in OE/OM	This field indicates whether this pay play displays in order entry or order maintenance when you prompt (click on the arrow) in the pay plan field. You can still apply the pay plan by typing in the code, even if it does not display; also, the plan can be auto-applied regardless of whether it is viewable. Valid values are: Selected = pay plan is viewable in order entry/maintenance Unselected = pay plan is not viewable in order entry/ maintenance
Restrict to entity	Enter an entity code in this field to restrict the pay plan to orders whose source code points to this entity. The source code is associated with an entity through its division. The source code on the order header determines the entity. Leave this field blank to make orders eligible for the pay plan regardless of entity. Entity codes are defined in and validated against the Entity table. See Working with Entities (WENT) and Working with Flexible Payment Options (WFPO). Numeric, 3 positions; optional.

Field	Description
Auth full amount (Authorize full amount)	This field indicates whether to authorize the full pickable amount of the order when generating the initial authorization at pick slip generation. Valid values are: Selected = authorize full pickable amount Unselected = do not authorize full pickable amount. If you deselect this field, the amount authorized at pick slip generation is: Deferred**:** $1.00 is authorized at pick slip generation. Installment**:** The amount of the first installment is authorized at pick slip generation. See Processing Auto Deposits (SDEP) for an overview of the authorization process for pay plan orders.
Merchant ID message	A short message to pass to the deposit service. This message appears on the customer's credit card statement. The message is concatenated with additional information into a 14- or 18-position message, formatted as follows: DBA industry code (3 positions): taken from the first 3 positions of the *Industry format code* for the authorization service Merchant ID message (11 positions) Installment description (4 positions): for installment pay plans, this consists of a description of which installment was deposited, for example, 1of 4. With this description, the entire message for an installment plan is 18 positions. For deferred pay plans, the entire message ends after the merchant ID message, producing a 14-position message. Alphanumeric, 11 positions; optional.
Ship complete	This field indicates whether to override the Ship complete flag setting on an order that uses this pay plan to selected. You might use this field to prevent pay plan orders from having multiple invoice dates, thus multiplying the number of deposits. Example: If an order uses a pay plan of four installments, and you fulfill the order in three separate shipments because of backorders, you would need to process 12 deposits to complete the pay plan. Valid values are: Selected = force orders with this pay plan to ship complete Unselected = do not force orders with this pay plan to ship complete You might also select the Consolidated Invoice (B49) system control value to simplify pay plan processing; see Deferred/ Installment Billing Setup. **Note:** In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

Field	Description
Display summary	This field controls whether the Display Payment Plan Summary Screen displays automatically when you add this payment plan to an order. This screen includes projected deposit dates and amounts for the order. Valid values are: Selected = display the summary screen Unselected = do not display the summary screen You can also display the summary screen in order entry by selecting Pay Plan Summary for the pay type at the Enter Payment Method Screen.
Auto apply	This field indicates the method the system should use when determining which pay plan(s) apply to an order in order entry. Valid values are: Auto apply = apply this pay plan to an order if the order qualifies, without prompting the operator. If a pay plan is set to apply automatically, it overrides the regular hierarchy of pay plan selection. No auto apply = apply this pay plan to a qualifying order only when the operator selects it. Prompt = force a window to pop up in order entry displaying all available pay plans if the order qualifies for the pay plan. You should select the *View in OE/OM* field if you set this field to 3. **Note:** To simplify pay plan selection in order entry, you should use the same setting in this field for all of your pay plans. See Assigning a Payment Plan to the Order for a discussion of how the system determines which pay plan(s) an order qualifies for. Numeric, 1 position; required.
Validate CC expiration date	This field is not currently implemented.
Pick message	Three lines of message text to appear on the pick slip. Messages appear only if your pick slip printing program supports them. Alphanumeric, 60 positions each; optional.
Use the following fields to set up a deferral pay plan:	
# of days for deferral	This field indicates the number of days to defer processing the deposit for a shipment. If you enter a number in this field, you must also specify whether to base the calculation on order date or invoice date; see the field description below. Example: No payments for 60 days from shipment. You can also base a deferral on a fixed date; see *Fixed deferral date*, below. You cannot use this field for an installment pay plan. Numeric, 3 positions; required for a deferral pay plan if you do not enter a fixed date.

Field	Description
Based on	This field indicates whether to base the deferral interval on the date you enter the order, or the date you ship and bill it. Valid values are: Order Dt = base deferral on original order date. If you base the deferral on original order date, it is possible for the deposit to be eligible for processing immediately after billing. For example, if you defer payment for 30 days from order date, and you do not ship for 30 days or more after the order date, the deposit will be eligible for processing immediately. Invoice Dt = base deferral on invoice (billing) date. The system uses this field to calculate the deposit date only for deferred pay plans that use the # of days for deferral to calculate deposit date. You cannot use this field for an installment pay plan. Required for a deferral pay plan if you enter a # of days for deferral.
Fixed deferral date	This field indicates the fixed date to use for a deferral pay plan. If you select a fixed deferral date for a pay plan, all orders using this pay plan will be eligible for deposit on this date regardless of when they are entered or billed. Example: No payment till February 1 when you order from our holiday book. If you complete this field, you cannot complete the # of days for deferral or Based on fields. Also, you cannot use this field for an installment pay plan. Numeric, 6 positions (in user date format); required for a deferral pay plan if you do not enter a # of days for deferral.
Use the following fields to set up an installment pay plan:	
# of installments (Number of installments)	The number of installments required to pay off the invoice balance. Example: Four easy payments. The system divides the invoice total into this number of equal installments. If the total does not divide equally, the last installment(s) will include the additional balance. You must complete either the Interval or the Fixed installment day field to indicate when the installments will be due. You cannot use this field for a deferral pay plan. Numeric, 2 positions; required for an installment pay plan.
Interval	The number of days between installments. The shortest interval you can set is 30 days. The installment date is based on the date you bill the shipment. Example: Set this field to 30 and the *# of installments* to 3 to have deposits eligible for processing 30, 60, and 90 days after billing. You can also base the installment dates on a fixed day of the month; see *Fixed installment day* below. You cannot use this field for a deferral pay plan. Numeric, 3 positions; required for an installment pay plan if you do not complete the Fixed installment day.

Field	Description
Fixed installment day	The day of the month to process the deposits for an installment pay plan. The first deposit is eligible for processing on the first occurrence of this date after shipment. Example: If you set this field to 15, and you confirm shipment of the order on any date from August 16 to September 15, the deposit will be eligible for processing on September 15. You can also base the installment dates on a number of days between installments; see *Interval* above. You cannot use this field for a deferral pay plan. Numeric, 2 positions; required for an installment pay plan if you do not complete the Interval field.
Use the following fields to restrict orders which can use the pay plan. An order must meet ***all* of the specified criteria for the pay plan to qualify:**	
Offer	Enter an offer code to restrict the pay plan to orders for this offer. The offer is based on the source code on the order header. If you leave this field blank, the pay plan will not be restricted by offer. Offer codes are defined in and validated against the Offer table; see Working with Offers (WOFR). Alphanumeric, 3 positions; optional.
Minimum amt (Minimum amount)	Enter a minimum order merchandise total to restrict the pay plan to orders who meet or exceed this total. For a multi-recipient order, the merchandise total against all recipients is compared with this minimum to determine eligibility. If you leave this field blank, the pay plan will not be restricted by merchandise total. Numeric, 13 positions with a 2-place decimal; optional.
Pay type	Enter a pay type code to restrict the pay plan to orders that use this pay type. If you leave this field blank, the pay plan will not be restricted by pay type. Pay type codes are defined in and validated against the Pay Type table; see Working with Pay Types (WPAY). Numeric, 2 positions; optional.
Item	Enter an item code to restrict the pay plan to orders that include this item. The order can also include additional items. You can enter the base item code only. If the item has SKUs, you cannot restrict the pay plan to specific SKUs. If you leave this field blank, the pay plan will not be restricted by item. Item codes are defined in and validated against the Item table; see Performing Initial Item Entry (MITM). Alphanumeric, 12 positions; optional.

Display Payment Option History Screen

Purpose: Use this screen to review order activity history for a pay plan.

How to display this screen: Select History for a pay plan at the Work with Flexible Payment Option Screen.

> **Note:**
>
> The Update Demand for Order Maintenance Transactions (C72) system control value controls when several of these fields update.

Field	Description
Code	The code representing a deferred or installment pay plan. Alphanumeric, 5 positions; display-only.
Type	The type of pay plan. Valid values are: D = deferred billing I = installment Alphanumeric, 1 position; display-only.
Description	The description of the pay plan. Alphanumeric, 40 positions; optional.
Start date	The date when the pay plan first becomes available to apply to orders. Numeric, 6 positions (in user date format); display-only.
End date	The date when the pay plan is no longer available to apply to orders. Numeric, 6 positions (in user date format); display-only).
# of orders	The total number of orders for the pay plan. This total increases when you: • enter an order for the pay plan • change an order to this pay plan in order maintenance, if the Update Demand for Order Maintenance Transactions (C72) system control value is selected This total decreases when you cancel an item and use a cancel reason whose Reduce demand? field is unselected. See Establishing Cancel Reason Codes (WCNR). Numeric, 7 positions; display-only.
# of shipments	The total number of shipments made for this pay plan. This total increases when you confirm shipments for any orders using the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance. Numeric, 7 positions; display-only.

Field	Description
$ ordered (Dollars ordered)	The dollar merchandise total, excluding any order charges such as freight, tax, and handling, of all orders entered for the pay plan. This total increases when you: • enter an order for the pay plan • change an order to use this pay plan in order maintenance, if the Update Demand for Order Maintenance Transactions (C72) system control value is selected • add an item in order maintenance if the Update Demand for Order Maintenance Transactions (C72) system control value is selected This total decreases when you cancel an item and use a cancel reason whose Reduce demand*?* field is unselected. See Establishing Cancel Reason Codes (WCNR). Numeric, 13 positions with a 2-place decimal; display-only.
$ shipped (Dollars shipped)	The dollar merchandise total, excluding additional order charges such as freight, tax, and handling, of shipments made for the pay plan. This total increases when you confirm shipments for any orders using the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance. Numeric, 13 positions with a 2-place decimal; display-only.
# of cancels	The total number of items or orders canceled for the pay plan. This total increases when you process a cancellation for any orders using the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance, through: • order maintenance • Working with Backorders Pending Cancellation (WBPC) Orders you cancel due to credit card decline through Working with Credit Card Cancellations (WCCC) do not update this total. Numeric, 7 positions; display-only.
# of returns	The total number of items or orders returned or exchanged for the pay plan. This total increases when you process a return or exchange for an order with the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance. Numeric, 7 positions; display-only.
$ cancelled (Dollars canceled)	The dollar merchandise total, excluding additional order charges such as freight, tax, and handling, of cancellations made for the pay plan. This total increases when you process any sort of cancellation for an order using the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance, through: • order maintenance • Working with Backorders Pending Cancellation (WBPC) Orders you cancel due to credit card decline through Working with Credit Card Cancellations (WCCC) do not update this total. Numeric, 13 positions with a 2-place decimal; display-only.
$ returned (Dollars returned)	The dollar merchandise total, excluding additional order charges such as freight, tax, and handling, of returns or exchanges made for the pay plan. This total increases when you process any sort of return or exchange for an order using the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance. Numeric, 13 positions with a 2-place decimal; display-only.

Field	Description
# of sold outs	The total number of items or orders sold out for the pay plan. This total increases when sell out an item on an order with the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance, through selecting Sell Out for the item in order entry or order maintenance or Processing Auto Soldout Cancellations (MASO). Numeric, 7 positions; display-only.
$ sold out (Dollars sold out)	The dollar merchandise total, excluding additional order charges such as freight, tax, and handling, of sellouts made for the pay plan. This total increases when you process any sort of sellout for an order using the pay plan, including orders that were not originally entered for the pay plan and were changed in order maintenance, through • selecting Sell Out for the item in order entry or order maintenance • Processing Auto Soldout Cancellations (MASO) Numeric, 13 positions with a 2-place decimal; display-only.

Processing Deposits

Topics in this part:

- Processing Auto Deposits (SDEP) describes the Submit Auto Deposits menu option.
- Manage Rejected Deposits in Modern View describes how to review and work with rejected or unconfirmed deposits.
- Printing the Deposit History Summary (PDHS) describes how to print a report summarizing credit card deposits by date.
- Printing the Credit Card Deposit Schedule (PCCD) describes how to print a report listing the your projected deposits for deferred or installment billing pay plans.
- Printing the Pending Payment Plan Deposits Report (PPPD) describes how to print a report listing future deferred or installment deposits by order and invoice number.
- Printing the Deposit History Detail Report (PDHD) describes how to print a report listing deposits processed during a specific date range. Within this date range, you can select to include only deposits for a specific authorization service, pay type, and status.

Processing Auto Deposits (SDEP)

Purpose: Use the Submit Auto Deposits function to:

- transmit credit card invoice information to a deposit service once you have shipped and billed the orders.
- transmit credit card credit information once you have processed returns or credits.

When you process deposits for deferred or installment pay plan orders, there is typically an interval between the time you bill the orders and the time you process the deposit(s), based on the pay plan agreement; see Deferred or Installment Pay Plans vs. Regular (Non-Pay Plan) Orders.

Suppressing deposits: You can suppress deposit processing for orders you receive through the *Generic Order Interface (Order API)*. In this situation, the order is not included when you process deposits. See *Suppressing Deposits and Refunds* for an overview.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Tracking records evaluated and processed: The DEP_UPDATE (deposits) job tracks the total number of records and evaluated in the Job History table. See Display Job History (DJHY) for background.

Deposit Setup

In order to send information to a deposit service with the Submit Auto Deposits function, you must first:

- Define the deposit service using the Defining Authorization Services (WASV) menu option.

- Select the deposit service for each credit card payment type in the Working with Pay Types (WPAY) menu option.
- Pick, ship, confirm and bill the orders; see Performing Pick Slip Generation and Confirming and Billing Shipments.
- For refunds, you must first process the credit card credits with the Processing Refunds (MREF) menu option.

Increasing maximum threads: To enhance the performance of deposit processing, if needed, set the DEPOSIT_MAX_THREADS property in Working with Admin Properties (CPRP) to a higher number. You can enter any positive integer. This property defaults to 1.

For more information:

- Processing Deposits for the steps the system performs to process deposits.
- defining a deposit service: Defining Authorization Services (WASV)
- setting up deferred or installment pay plans: Deferred/Installment Billing Overview
- purging the Credit Card Deposit Prestige table: Purging Prestige Credit Card Deposits (MPSP)
- defining payment types: Working with Pay Types (WPAY)
- defining currency codes: Working with Currency (WCUR)
- defining country codes: Setting Up the Country Table (WCTY)
- processing refunds: Processing Refunds (MREF)
- working with Order Entry or General Usage system control values: Setting Up Order Entry Values and Setting Up General Usage Values

Scheduling Deposits

You can use the SCHDDEP periodic function (program name PFR0090) to send deposits. See Scheduling Jobs for an overview and setup information.

The Parameter field allows you to generate deposit transactions for a specific authorization service and/or define the maximum number of deposits to process for purchases. Note that this setting does not apply to refund transactions.

> **Note:**
>
> You can define a Purchases transactions to generate number in the Parameter field only if the Preload Deposits (L78) system control value is unselected.

If you do not define any parameters, the system uses the same settings as if you used the Auto Deposit Screen with all the default settings selected.

You need to specify a company when you set up the periodic process.

When you run the periodic process or submit deposits through the Submit Auto Deposits (SDEP) option, it starts a job named **AUTO_DEP123**, where 123 is the company number. The job selects records from the Invoice Payment Method table that have not yet been processed for deposit or credit, and whose deposit release date is the current date or earlier. The periodic process continues to run into the AUTO_DEP job finishes.

You can review the submitted AUTO_DEP job at the Job Management Screen. See Processing Deposits for more information

Additional things to note about the SCHDDEP function:

- To run the function for multiple companies at the same time, you can select a different job queue for each periodic process that includes the SCHDDEP periodic function.
- Each instance of the job creates its own active procedure, displayed in Purge Active Procedures Across Users (MACX) with a Type of **BD**.
- If the AUTO_DEP job is inactive for 15 minutes but the active procedure still exists, you can use the JOBCLN periodic function to delete the active procedure, and then you can restart the job.
- You cannot currently delete the AUTO_DEP job after it goes into Finished or Error status at the Job Management Screen screen. Also, job history records for this job are not purged based on the oms.job.history.purge.retain.days specified in Working with Admin Properties (CPRP).
- The Display Active Batch Jobs (DABJ) option does not display the Last Program for the SCHDDEP job.

Multi-Currency, Alternate Currency, and Prestige Process

The following system control values govern the way your company handles foreign currencies when you process deposits.

System Control Value	Description
Multi-Currency	Select the Multi Currency by Offer (E03) system control value to segregate orders based on the currency associated with the offer. If you use multi currency by offer, you will be required to specify currency at many points throughout the system, such as when you process refunds or print various reports. If you have this system control value selected, you do not need to have the Track Invoice Currency (D68) field selected, unless you also want to use the Invoice Currency table to record the exchange rate when an order bills; however, this is necessary only if you use Prestige as a deposit service.

System Control Value	Description
Prestige Process	Select the Track Invoice Currency (D68) system control value to use the separate deposit process for foreign currency (the "Prestige" process) described below. The customer's currency is determined by the country where he or she resides. If you are processing deposits in foreign currencies separately, and you want to track the currency exchange rates at the time of (Prestige) billing, you may also need to: • Select the Track Invoice Currency (D68) system control value to track the currency conversion rate at the time of billing. • Define a deposit service with a code of PRE in the Defining Authorization Services (WASV) menu option. • In the Working with Pay Types (WPAY) menu option, select the PRE deposit service for any foreign credit card payment type to be processed separately. • Define a country code in the Setting Up the Country Table (WCTY) menu option that is identical to the currency code in the Currency table; for example, both the Country and Currency codes for Japan might be defined as JPN. • When you enter orders in the foreign currency, use the foreign credit card payment type, make sure you are using the foreign Country code, and use ** for the state in the customer's address. Foreign currency transactions that use the separate process are not confirmed interactively through Process Auto Deposits. Instead, the system writes these records to the Credit Card Deposit Prestige table (CCCDPP). You must extract the contents of this table for transmission to the deposit service. Periodically, you must also purge the contents of this table through Purging Prestige Credit Card Deposits (MPSP).

Auto Deposit Screen

Purpose: Use this screen to send and receive deposit and credit card credit information to and from a deposit service.

Selecting service bureaus for deposit: Select the Select Auth Service option to advance to the Select Auth Service for Deposit Screen, where you can select the service bureau(s) for which you wish to run deposits. By default, all service bureaus are selected for deposit.

Types of transactions selected: All eligible transactions, regardless of whether they are for orders with deferred or installment pay plans or for regular (non-pay plan) orders, will be processed. See Deferred or Installment Pay Plans vs. Regular (Non-Pay Plan) Orders for more information on pay plans.

How to display this screen: Enter SDEP in the Fast path field at the top of any menu or select Submit Auto Deposit from a menu.

> **Note:**
>
> **Important:** You will receive an error message when you try to advance to the Auto Deposit screen if the Use Auto Authorization Interface (C14) system control value is not selected: Info: Auto Authorization is not currently enabled. This system control value must be selected in order to send deposits to the service bureau for confirmation.

Field	Description
Send or receive	Send Deposits is selected by default, specifying that you are sending information to the deposit service for settlement. You cannot change this option. Required.
Purchases	Use these fields to indicate the number or dollar amount of purchases to process. **Note:** The Purchases fields are display only if the Preload Deposits (L78) system control value is selected.
Transactions to generate (for purchases)	Enter the maximum number of deposits to process for purchases. Each transaction represents an invoice for a shipment or an installment payment using a credit card. Selecting transactions: If you enter a number, the system selects transactions for the service bureau(s) selected for deposit in ascending numeric order (lowest to highest) by order number, then invoice number, until it reaches the number of transactions you specify. See the description of the Amount to generate field, below, for more information on how the system selects transactions. Deposit release date: The transaction must have a deposit release date earlier than or the same as today's date to be eligible for processing. See Deposit Release Date. Leave this field blank to process all eligible deposits for purchases. Numeric, 7 positions; display-only if Preload Deposits (L78) is selected, otherwise, optional.

Field	Description
Amount to generate (for purchases)	Enter the maximum total dollar amount of all deposits to process for purchases. Selecting transactions: If you enter an amount, the system continues selecting transactions for the service bureau(s) selected for deposit in ascending order number sequence as described above, and stops before it would exceed this amount. However, if it would exceed the maximum amount by selecting the orders in exact sequence, it will skip one or more orders as necessary. Example: You enter a maximum amount to generate of $100 The following orders are currently eligible for deposit: order # / amount 100 / $50 101 / $30 102 / $30 103 / $15 104 / $10 Result: The system selects orders 100,101, and 103 for deposit. It skips order 102 because its order total of $30 would cause the total amount to exceed the maximum of $100 ($50 + $30 +$30 = $110). Also, it stops after including order 103, because it cannot add another order without exceeding the maximum. If you complete both this field and the Transactions to generate field, the system will restrict the deposits processed to within both limits. Leave this field blank to process deposits regardless of the total dollar amount. Numeric, 13 positions with a 2-place decimal; display-only if Preload Deposits (L78) is selected, otherwise, optional.
Returns	Use these fields to indicate the number or dollar amount of return credits to process:
Transactions to generate (for returns)	Enter the maximum number of deposits to process for returns. Each transaction represents a credit invoice to process against the customer's credit card. Selecting transactions: If you enter a number, the system selects transactions for the service bureau(s) selected for deposit in ascending numeric order (lowest to highest) by order number, then invoice number, until it reaches the number of transactions you specify. See the description of the Amount to generate field, below, for more information on how the system selects transactions. Deposit release date: The transaction must have a deposit release date earlier than or the same as today's date to be eligible for processing. See Deposit Release Date. Leave this field blank to process all eligible deposits for returns. See Netting Credits for Pay Plan Orders. Numeric, 7 positions; optional.

Field	Description
Amount to generate	Enter the maximum total dollar amount of all credit transactions to process. Selecting transactions: If you enter an amount, the system continues selecting transactions for the service bureau(s) selected for deposit in ascending order number sequence as described above, and stops before it exceeds this amount. Example: You enter a maximum amount to generate of $100 The following returns are currently eligible for credit deposit processing: order # / amount 100 / $50- 101 / $30- 102 / $30- Result: The system selects orders 100 and 101 for credit deposit. Then it stops after including order 103, because it cannot add another order without exceeding the maximum. If you complete both this field and the Transactions to generate field, the system will restrict the credit deposits processed to within both limits. Leave this field blank to process credit deposits regardless of the total dollar amount. Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Select which service bureau(s) you wish to select for the deposit run	Select Select Auth Service to advance to the Select Auth Service for Deposit Screen, where you can select the service bureau(s) for which you wish to run deposits. By default, all service bureaus are selected for deposit.
Send deposits to a deposit service	Select OK at the Auto Deposit Screen to start a job named **AUTO_DEP123**, where 123 is the company number. This job selects records from the Invoice Payment Method table for the service bureau(s) selected for deposit that have not yet been processed for deposit or credit, and whose deposit release date is the current date or earlier.. You can review the submitted AUTO_DEP job at the Job Management Screen. See Processing Deposits for more information. Once you submit the deposit run, the system updates the Selected field for each service bureau on the Select Auth Service for Deposit Screen to YES, indicating all service bureaus are selected for the next deposit run, unless you deselect them.

Select Auth Service for Deposit Screen

Use this screen to select the service bureau(s) for which you wish to run deposits. By default, all service bureaus are selected for deposit.

Once you run deposits, the system updates the Selected field on this screen to YES, indicating all service bureaus are selected for the next deposit run, unless you deselect them.

How to display this screen: Select Select Auth Service on the Auto Deposit Screen.

Field	Description
Description	The name of a service bureau in Defining Authorization Services (WASV). Authorization services are defined in and validated against the Authorization Services table. Enter a valid description and select OK to display the service bureau that matches your entry. Selecting and Unselecting a Service Bureau When you first advance to this screen, all service bureaus are selected for the next deposit run. • Select a service bureau whose Sel field is YES to remove the service bureau from the deposit run; the Sel field updates to NO. • Select a service bureau whose Sel field is NO to add the service bureau to the deposit run; the Sel field updates to YES. Alphanumeric, 30 positions; optional.
Sel Selected?	Indicates whether the service bureau is selected for the deposit run. • YES = The system includes the service bureau in the next deposit run. • NO = The system does not include the service bureau in the next deposit run.

Processing Deposits

The system creates records in the Invoice Payment Method table when you bill the orders and uses the Invoice Payment Method table to create records in the CC Deposit Transaction table to be used by the deposit process.

> **Note:**
>
> The system creates a record in the CC Deposit Transaction table only for pay types that have a deposit service defined.

Preload Deposits?

The setting of the Preload Deposits (L78) system control value determines whether billing or deposits creates records in the CC Deposit Transaction table and CC Deposit History table, based on the records in the Invoice Payment Method table.

Preload Deposit Process

If the Preload Deposits (L78) system control value is selected, billing creates records in the CC Deposit Transaction table and CC Deposit History table immediately after creating records in the Invoice Payment Method table.

In addition:

- If you use Customer Engagement Stored Value Card Integration, PayPal Direct Connection Integration, EFTConnect, or the External Payment Service, the system sends the deposit transaction to the service bureau during billing. You still need to use Processing Auto Deposits (SDEP) to process credit deposits and perform the Batch Deposit Updates. Also, you will need to use the Manage Rejected Deposits Modern View menu option to resubmit any deposits that were not completely processed during billing and deposits.
- For all other service bureaus, the system sends the deposit transaction to the service bureau when you submit deposits using the Processing Auto Deposits (SDEP) menu option.

> **Note:**
>
> - The system does not perform preload deposit processing for the deposit service defined in the Deposit Service for Conditional Deposits (L13) system control value. In this situation, the system uses the regular deposit process.
> - If you select the Preload Deposits (L78) system control value, you cannot use Consolidated Invoice (B49).

> **Important:**
>
> In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

Regular Deposit Process

If the Preload Deposits (L78) system control value is unselected, the deposit process creates records in the CC Deposit Transaction table and CC Deposit History table, prior to sending out the deposit transactions.

CC Deposit Transaction Table

<table>
<tr><th>Preload Deposits (L78) selected</th><th>Preload Deposits (L78) unselected</th></tr>
<tr><td>Oracle Retail Customer Engagement Service Bureau, PayPal Direct Connection, EFTConnect or External Payment Service
During billing:
the system sends the debit deposit transaction to the service bureau.
When an approved response is received, the system updates the Status of the CC Deposit Transaction record to *RCVD, and the Vendor response 1, Vendor response 2, and Authorization code based on the response received from the service bureau.
During deposits:
The system processes any credit deposit transactions.
The system processes Batch Deposit Updates for any credit deposit transactions and any debit deposit transactions that were sent to the service bureau during billing.
Once all updates are complete, the system deletes the CC Deposit Transaction record.
Any Other Service Bureau
During billing:
The Status is *RDY, indicating the deposit transaction is ready to be submitted for processing.
During deposits:
The system sends the deposit transaction to the service bureau and processes Batch Deposit Updates when a response is received.
Once all updates are complete, the system deletes the CC Deposit Transaction record.</td><td>All Service Bureaus
During billing:
The system does not create a record in the CC Deposit Transaction table.
During deposits:
The system sends the deposit transaction to the service bureau.
When an approved response is received, the system updates the Status of the CC Deposit Transaction record to *RCVD, and the Vendor response 1, Vendor response 2, and Authorization code based on the response received from the service bureau.
The system processes Batch Deposit Updates.
Once all updates are complete, the system deletes the CC Deposit Transaction record.</td></tr>
</table>

CC Deposit History Table

Preload Deposits (L78) selected	Preload Deposits (L78) unselected
All Service Bureaus During billing: • Updates Deposit date with the deposit transaction date. • Updates Deposit status to Net yet sent. During deposits: Updates Deposit status to C Confirmed.	All Service Bureaus The system does not create a record in the CC Deposit History table. During deposits: The system creates a record in the CC Deposit History table, based on the information in the Invoice Payment Method and CC Deposit Transaction tables.

Sending Deposits

The system transmits each record to the deposit service specified in the Pay Type table and confirms each deposit when the confirmation is received interactively from the deposit service.

Once the system receives the deposit response from the deposit service and updates the CC Deposit Transaction table, in order to free up the PICKGEN job queue, the system submits the DEP_UPDATE job to the QSYSNOMAX job queue to process the remaining updates; see Batch Deposit Updates.

Credit card encryption: Credit card encryption allows you to encrypt the credit card number in the Order Administration database to provide additional security of credit card data. If you use credit card encryption, the system decrypts the credit card number before sending it to the deposit service. See the Data Security Guide on My Oracle Support (2953017.1) for an overview.

Tokenization: Credit card tokenization allows you to replace the credit card number in the Order Administration database with a token provided by the authorization service. In this situation, the system sends the token rather than the actual credit card number to the deposit service. See Credit Card Tokenization in the Data Security and Encryption Guide on My Oracle Support (2953017.1).

Depositing against multiple authorizations: When you process deposits for an order containing multiple authorizations, the system looks to process the deposit against an unexpired authorization whose amount equals the deposit amount. If an unexpired authorization amount does not equal the deposit amount, the system processes the deposit against the unexpired authorization with the highest dollar amount.

If one of the authorizations for a shipment on the order has expired: If the order includes an authorized shipment and another shipment whose authorization has expired, the expired amount is authorized, and the full amount is deposited.

Example: Item 1 on an order was authorized for 10.00 and the pick slip generated, but the authorization has since expired. A pick slip is generated for item 2 for 15.00, and the amount authorized at this time is 15.00. During deposit processing, the 10.00 is authorized, and 25.00 is deposited.

Credit card net exchange billing: If a credit invoice and debit invoice are flagged for net billing, the system nets the credit invoice amount against the debit invoice amount to determine the remaining amount to deposit; see Credit Card Net Exchange Billing for processing details.

Authorization number: The original authorization number authorizing the shipment at pick slip generation is retained by the system. This is the number that displays in order inquiry for a pay plan order, even after you receive a full authorization for the amount of the deposit.

Maximum threads: To enhance performance, set the DEPOSIT_MAX_THREADS property in Working with Admin Properties (CPRP) to a higher number. If the property is empty, missing, or not set to an integer, a setting of 1 defaults, and a warning message is written to the APP.log and the CWDIRECT.log indicating that a setting of 1 was used.

Troubleshooting: When the logging level is set to debug, detailed messages are written to the app.log during deposit processing. You can use these entries to help troubleshoot any issues with deposit processing. See Logs for background.

Batch Deposit Updates

The DEP_UPDATE job performs updates in the following order.

Table	Update
Invoice Payment Method	The system updates the Invoice Payment Method record with the amount deposited. **Deposit date:** The system updates the deposit created date to the date when the DEP_UPDATE job is processed if the deposit created date was for an earlier date. This may occur if the billing date was earlier than the deposit date.
Card Security Data	If not already cleared, the system removes card security data from the Order Payment Method table and On Line Authorization table. Also, the system creates an order transaction history message indicating the security information has been cleared.
CC Deposit History	The system updates the CC Deposit History record with the response code received from the Deposit service. You can review deposit history in Order Inquiry; see Display Deposit History Screen and Display Deposit History Detail Screen. **Deposit date:** The system updates the deposit date to the date when the DEP_UPDATE job is processed if the deposit date was for an earlier date. This may occur if the billing date was earlier than the deposit date. If the deposit date in this table does not match the date when the DEP_UPDATE job is processed, the system updates the deposit date to the current date.
Order Payment History	The system creates an Order Payment History record. You can review order payment history in Order Inquiry; see Display Order Payment History Screen.
Deposit Reports	The system produces the following reports for each deposit service: • An Unconfirmed Deposits Listing Report for each deposit service lists each deposit included in the transmission but not confirmed or authorized by the service. You can use Manage Rejected Deposits to resubmit. • An Auto Deposit Confirmation Report for each deposit service lists each payment method and total amounts confirmed and unconfirmed.
CC Deposit Transaction	The system deletes the associated records in the CC Deposit Transaction table.

Foreign Currency Deposit Process (Prestige)

If the payment types for the invoice records are set up for foreign currency processing, the system does not communicate with a deposit service at this time. Instead, the system writes the records to the Credit Card Deposit Prestige table (CCCDPP). You can extract the records from this table for transmission to a deposit service at a later time.

The system produces the Unconfirmed Deposits Listing Report for the foreign transactions. However, since it considers each transaction written to the Credit Card Deposit Prestige table as “confirmed,” it does not produce an Unconfirmed Deposits Listing Report for these transactions.

You will need to purge the Credit Card Deposit Prestige table through Purging Prestige Credit Card Deposits (MPSP).

Void Unused Authorization After Initial Deposit

If the deposit amount for a credit card deposit is less than the original amount authorized, the system looks at the setting of the Void auth at deposit field for the service bureau to determine how to process the deposit.

If the Void auth at deposit field for the service bureau is selected, the system automatically voids the remaining balance against a credit card authorization that has been partially deposited. If there are multiple authorizations for the order, the system will not void the other authorizations. The system uses both the authorization transaction ID and, if necessary, the authorization number to determine the authorization history record to be voided.

> **Note:**
>
> If a deposit run contains two deposits against the same authorization transaction and the Void auth at deposit field for the service bureau is selected, the system voids the remaining authorization amount after the first deposit in the run is processed. This allows the second deposit transaction to go out to the service bureau as a conditional deposit.

Example 1: In this example, the Void auth at deposit field for the service bureau is selected.

During order entry, you process an online authorization for an order for $50.00. When you review Authorization History for the order:

- Status = A Authorized
- Amount submitted = $50.00
- Amount available = $50.00

During order maintenance, you cancel an item on the order. The order total reduces to $40.00. You ship and confirm the order. When you review Authorization History for the order:

- Status = A Authorized
- Amount submitted = $50.00

- Amount available = $10.00
- Amount deposited = $40.00

When you submit deposits, the deposit amount is $40.00. Because the Void auth at deposit field for the service bureau is selected and the deposit amount ($40.00) is less than the authorization amount ($50.00), the system voids the remaining authorization amount ($10.00). When you review Authorization History for the order:

- Status = V Voided
- Amount submitted = $50.00
- Amount available =.00
- Amount deposited = $40.00

Example 2: In this example, the Void auth at deposit field for the service bureau is unselected.

During order entry, you process an online authorization for an order for $50.00. When you review Authorization History for the order:

- Status = A Authorized
- Amount submitted = $50.00
- Amount available = $50.00

During order maintenance, you cancel an item on the order. The order total reduces to $40.00. You ship and confirm the order. When you review Authorization History for the order:

- Status = A Authorized
- Amount submitted = $50.00
- Amount available = $10.00
- Amount deposited = $40.00

When you submit deposits, the deposit amount is $40.00. Because the Void auth at deposit field for the service bureau is unselected and the deposit amount ($40.00) is less than the authorization amount ($50.00), the system retains the remaining authorization amount ($10.00). When you review Authorization History for the order:

- Status = A Authorized
- Amount submitted = $50.00
- Amount available = $10.00
- Amount deposited = $40.00

Capture Sequence and Count Sent to CyberSource

The CyberSource Debit Deposit Request (ccCaptureService) XML Message indicates the capture sequence and total capture count if:

- The Void auth at deposit flag for the authorization service is unselected, and
- The entire order does not ship and bill at once, based on the fact that it’s a debit invoice for less than the authorization amount.

Capture count and sequence examples: Examples of how the ccCapture_sequence and ccCapture_totalCount would be populated in the deposit request message:

Scenario	ccCapture_sequence	ccCapture_totalCount
First deposit for the order. The number of deposits is not known, indicated by a total count of 99.	1	99
Second deposit for the order. The number of deposits is not known, indicated by a total count of 99.	2	99
Final deposit for the order. The capture sequence and total count were previously set to 2 and 99. The sequence increments by 1, and the total count is set to match the sequence.	3	3
Final deposit for the order, and the capture sequence and total count were not previously sent. **Note:** In this case, the tags are not passed in the message.	1	1

Larger number of deposits? If the number of deposits for the order is 98 or higher, the sequence number sent in the deposit request remains at 98, and the total count remains at 99 until the final deposit is submitted. At that point, the sequence number is set to 99.

Note that the Authorization History table tracks the actual sequence number and count.

Scenarios in which the ccCapture_sequence and ccCapture_totalCount are not sent in the deposit request message: In the following scenarios, the sequence and total count are still tracked in the Authorization History record, but not included in the deposit request message:

- The tax rate increases, causing the invoice total to exceed the authorization amount. In this scenario, the original Authorization History record is voided, triggering a reversal. A new Authorization History record is created during deposit processing for the full invoice amount.
- There were multiple authorizations, but the products shipped together and generated a single invoice. In this scenario, the original Authorization History records are voided, triggering a Reversal. A new Authorization History record is created during deposit processing for the full amount. The authorization amount and deposit amount will be equal on the new Authorization History record, so it is considered the final deposit.
- The order is closed and the deposit request was already sent, but then an additional charge was added to the order and express-billed. A new Authorization History record is created for the additional charge amount.

- The order is closed but the deposit request was not yet sent, and then an additional charge is added to the order and express-billed. A new Authorization History record is created for the additional charge amount. Both are submitted for deposit and considered final deposits.

The capture sequence and total capture count are not included for the CyberSource Authorization and Deposit Request (ccAuthService and ccCaptureService) XML Message, only for the deposit request.

Multiple Capture Sequence and Final Capture Sent to External Payment Service

The deposit request for credit cards and stored value cards sent through the External Payment Service indicates the capture sequence whether this is the final capture for account situations when:

- The Void auth at deposit flag for the authorization service is unselected, and
- The entire order does not ship and bill at once, based on the fact that it's a debit invoice for less than the authorization amount.

Otherwise, if the Void auth at deposit flag is selected, the deposit request indicates a multiple capture sequence of 0, and the finalCapture tag is empty.

Capture count and sequence examples: Examples of how the multipleCaptureSequence and finalCapture would be populated in the deposit request message:

Scenario	multipleCaptureSequence	finalCapture
Void auth at deposit **is selected**	0	empty
Void auth at deposit is not selected and: • First deposit • Entire order ships and bills	1	Y
Void auth at deposit is not selected and: • First deposit • Additional item remains to be shipped	1	N
Void auth at deposit is not selected and: • Second deposit • No additional items remain to be shipped	2	Y

> **Important:**
>
> Your end payment processor, such as Paymentech or VisaNet, must support split shipments for you to set the Void auth at deposit flag to N.

Error if deposit is greater than authorization (additional scenario for a stored value card): The External Payment Service returns the error DEPOSIT_GREATER_THAN_AUTH in a situation such as the following for a stored value card:

- The Void auth at deposit flag is unselected.
- An additional item with a higher price is added to the order after the initial authorization, and an additional authorization is obtained for this second item during pick slip

generation; however, the additional authorization is based on the authorization required for the second item minus the current authorization amount, but not the full authorization amount that will be required for both items. For example:

  - ITEM01 is 25.00 and shipping is 10.00: 35.00 authorized.
  - ITEM02 is 50.00 and the 10.00 shipping billed when ITEM02 ships first: 60.00 authorization required.
  - When pick slip generation runs for ITEM02, additional 25.00 authorized (60.00 required - 35.00 already authorized).

- The second item ships before the first item on the order, and the deposit amount exceeds the amount of the first authorization because of the second item's higher price. Order Administration submits the largest existing authorization amount, which is 35.00. As a result, during deposit processing through the External Payment Service, Order Administration receives the DEPOSIT_GREATER_THAN_AUTH error based on the specified deposit amount of 60.00.
- n this case, when Order Administration receives the error response, it submits two deposit requests:
  - One for the 35.00 authorization amount.
  - One for the 25.00 authorization amount.

    Each request specifies the related authorization number, and a `multipleCaptureSequence of 1 and a finalCapture of Y`, because each request is for a separate authorization amount.
- When the original 25.00 item is in stock, Order Administration obtains a new authorization for 25.00. Then when that item ships, Order Administration submits another deposit request for 25.00, which also specifies a `multipleCaptureSequence of 1 and a finalCapture of Y` for the additional authorization.

Deferred or Installment Pay Plans vs. Regular (Non-Pay Plan) Orders

Overview: You can use flexible payment options to set up deferred or installment pay plans for your customers. Unlike regular deposits, deferred or installment deposits are not eligible for processing immediately after confirmation of shipment and creation of the invoice; instead, the system assigns a pay plan deposit with a deposit release date based on the deferral or installment agreement.

Example: Deferral pay plan: "no payment for 60 days" or "no payment till February 1" Installment pay plan: "4 easy payments"

You can use deferred or installment pay plans only if the Deferred and Installment Billing (F51) system control value is selected. See Deferred/Installment Billing Overview for an overview of deferred and installment billing and information on setting up pay plans in your company.

Deposit Release Date

The deposit release date indicates when the deposit is eligible for processing.

Type of Order	Deposit Release Date
regular (non-pay plan)	same as invoice date: deposit is eligible for processing immediately after billing

Type of Order	Deposit Release Date
deferral pay plan	can be either a fixed date ("no payment till February 1") or based on a specific interval ("no payment for 60 days") if based on a specific interval, can be calculated based on either order date or invoice date
installment pay plan	first deposit release date can be either the next time a fixed date occurs ("installments due the first of the month") or after a fixed interval from time of shipment

To review the deposit release date: The deposit release date is stored in the Invoice Pay Method table. You can review this information in order inquiry by selecting Invoices to advance to the Display Invoices screen, then selecting Invoice Pay Sum to advance to the Invoice Pay Summary Screen.

Authorizing Deposits

Unlike regular deposits, a deferred or installment deposit may not already have a current, valid authorization from the time of pick slip generation, so you need to obtain an authorization when you process deposits.

Overview: When you generate pick slips for a regular (non-pay plan) order, you authorize the pickable amount of the order, because you expect to confirm shipment and process the deposit shortly after. However, after you obtain an initial authorization for an order using a pay plan, there may be a considerable delay before you process the deposit or deposits. For this reason, it may be necessary to authorize the deposit amount as part of deposit processing.

Authorization at pick slip generation:

When you print a pick slip for...	The amount authorized is...
a regular (non-pay plan) order	the full pickable amount of the order (including any tax, shipping, and charges)
a deferred billing pay plan order	one dollar, unless the Authorize full amount field for the pay plan is selected
an installment billing pay plan order	the first payment of the installment plan, unless the Authorize full amount field for the pay plan is selected

Note:

Even if the Authorize full amount field for the pay plan is selected, the system still re-authorizes the installment amount when you process the subsequent deposit(s) for the pay plan order.

Action codes: The system uses action codes to indicate to the deposit service whether the deposit requires an authorization. When processing deposits, the system sends the deposit service an action code of:

- B (Conditional Deposit) if you need both an authorization and a deposit. The system sends a code of B for:
  - all pay plan deposits (regardless of how the Authorize full amount field for the pay plan is set) except for the first deposit of an installment plan, when a D code is sent instead.
  - any regular (non-pay plan) deposit sent to the deposit service whose authorization has expired. You can review the authorization expiration date at the Authorization History Details Window. Additionally, the system creates a new authorization history record for the new authorization number. The system assigns a Status of M (Mismatch Auth/Deposit) to authorization history records created during deposit processing.

    > **Note:**
    >
    > Conditional deposit is not supported for stored value cards.

- D (Regular Deposit) if you need to process the deposit only and do not require an authorization. The system sends a code of D for all regular (non-pay plan) deposits as long as there is an authorization code for the invoice pay method and the authorization has not expired.

Type of deposit	Action code
regular (non-pay plan)	D **Note:** The system sends an action code of B for any regular deposit sent to the deposit service whose authorization has expired.
first payment of an installment pay plan	D
subsequent payments of an installment pay plan	B
deferred billing pay plan	B
credit (refund)	R

It is possible to have a pay plan order where the deposit release date is the same as the invoice date. For example, if you set up a deferred pay plan based on order date, and shipment of the order is delayed due to a backorder, the order could be eligible for deposit as soon as you confirm shipment. In this situation, the deposit will still be sent with an action code of B, because typically you have not yet received an authorization for the amount of the deposit.

Force Deposit

You can choose to “force the deposit” when an authorization for a deferred or installment pay plan is rejected. Forcing the deposit means that the system performs all the same updates in your company as if the deposit was authorized and processed.

To force pay plan deposits, you must select the Force deposit for FPO field for the vendor response code. The system checks the setting of this field only when a deposit for a pay plan is rejected. See below for more information.

You are responsible for making any necessary arrangements with the deposit service if you plan to force deposits.

When is a pay plan deposit forced? The system forces a deposit when:

- the deposit is for a deferred or installment pay plan, and
- the deposit is sent out with an action code of B, and
- the response code sent from the service is not an approval (100 = approval), and
- the Force deposit for FPO field for the vendor response code is selected.

When is a regular (non-pay plan) deposit forced? Additionally, regular (non-pay plan) deposits are always forced because you received an authorization when you generated the pick slip, except under the following circumstances:

- The action code on the deposit is D or R and
- You are using an authorization service that allows forced deposits and
- The Vendor Response code is not an approval (100 = approval) and
- The regular deposit is returned from the authorization service with an authorization number of NOTDEP.

Netting Credits for Pay Plan Orders

The Net Credit Card Credits for Deferred and Installment Billing (F55) control value controls how refund credits are deposited for deferred or installment pay plans.

Overview: The system does not process a credit card credit against an installment or deferred billing order before the deposit itself has been processed. This rule is important to ensure that you do not credit the customer's credit card before it had actually been charged. The logic governing how to comply with this rule varies depending on whether the order uses a deferred or installment pay plan and on whether you net credit card credits.

The table describes how and when credits are eligible for deposit processing in different scenarios. In each scenario, it is assumed that the following has already occurred:

- the order has a deferred or installment pay plan
- shipment has taken place
- the refund has been processed through the Process Refunds menu option (fast path = MREF)

Type of Pay Plan	Net Credits?	Result
deferred	Unselected	The credit has a deposit release date that is the same date as the debit. The credit deposit is eligible for processing after the purchase deposit is processed. Example: • Ship an order on 8/1 for $100 with a deposit release date of 9/1 • Process return on 8/15 for $60: credit is for $60 and has a deposit release date of 9/1 • Process Deposits processes the credit of $60 after the debit of $100 is deposited.

Type of Pay Plan	Net Credits?	Result
deferred	Selected	The credit has a deposit release date that is the same date as the debit. When you process deposits, the net amount of the deposit only is processed. Example: • Ship an order on 8/1 for $100 with a deposit release date of 9/1 • Process return on 8/15 for $60: credit is for $60 and has a deposit release date of 9/1 • Process Deposits processes a deposit of $40 ($100 - $60)
installment	Unselected	The credit has a deposit release date that is the same as the date you created it; however, the credit deposit is eligible for processing after the total debit deposits meet or exceed the credit invoice amount. Example: • Ship an order on 8/1 for $100 with 4 installments of $25, deposit release dates of 9/1, 10/1, 11/1, and 12/1 • Process first installment deposit on 9/1 for $25 • Process return on 9/15 for $60: credit is for $60 and has a deposit release date of 9/15, but is not released for deposit • Process second installment deposit on 10/1 (total amount deposited now $50) • Process third installment deposit on 11/1 (total amount deposited now $75) • Process Deposits processes the credit of $60
installment	Selected	The credit has a deposit release date that is the same as the date you created it. When you process deposits, the remaining installment amounts are reduced by the total credit amount. Example: • Ship an order on 8/1 for $100 with 4 installments of $25, deposit release dates of 9/1, 10/1, 11/1, and 12/1 • Process first installment deposit on 9/1 for $25 • Process return on 9/15 for $60: credit is for $60 and has a deposit release date of 9/15 • When you next process deposits, the amount of each remaining installment is reduced to $5 ($75 remaining installments - $60 credit = $15; $15 / 3 installments = $5)

Merchant ID Messages

You can specify a message to appear on the customer's credit card statement when you process a deposit for a pay plan. The message is concatenated with additional information into a 14- or 18-position message, formatted as follows:

- DBA industry code (3 positions): taken from the first 3 positions of the Industry format code for the authorization service
- Merchant ID message (11 positions): taken from the Merchant ID message field for the pay plan

- Installment description (4 positions): for installment pay plans, this consists of a description of which installment was deposited, for example, 1of 4. With this description, the entire message for an installment plan is 18 positions. For deferred pay plans, the entire message ends after the merchant ID message, producing a 14-position message.

See Defining Authorization Services (WASV).

Updates for Installment Pay Plans

When you process a deposit for an installment pay plan, the system updates the following fields for the invoice pay method:

- Intervals remaining: reduced by one.
- Total amount deposited: increased by the deposit amount.
- Deposit release date:
  - if the installment plan uses an interval, the deposit release date is calculated by adding the interval number of days to the current date.
  - If the installment plan uses a fixed billing date, the deposit release date is changed to the next occurrence of the billing date.
- Deposit created date: This field is updated with the current date only when you deposit the last installment payment.

You can review the invoice pay method information in order inquiry. See Reviewing Deposits in Order Inquiry.

Rejected Deposits for Pay Plan Orders

Unauthorized or unconfirmed deposits display on the Unconfirmed Deposits Listing Report. Additionally, you can use Resubmit Rejected Deposits in Modern View to review, work with, or resubmit any deposits that were not fully processed through the Submit Auto Deposit menu option.

Holding orders: When a deposit is rejected for a deferred or installment pay plan, orders for the same customer and/or using the same credit card number are put on hold. See Holding Pay Plan Orders.

Installments: Additionally, when a deposit is rejected for an installment pay plan, the next installment date is changed to 999999.

Non-pay plan orders: Unconfirmed regular (non-pay plan) orders still appear on the Unconfirmed Deposit Listing and are available through the Resubmit Rejected Deposits screen in Modern View.

Holding Pay Plan Orders

When a deposit for a deferred or installment pay plan is rejected, the system puts any open orders for the same customer or the same credit card number on hold, as follows:

- same sold to customer: order goes on SB hold
- same credit card number: order goes on CB hold

If an order matches both the customer and the credit card number, it goes on CB hold.

> **Note:**
>
> You must set up these hold reason codes in your company. See Establishing Order Hold Reason Codes (WOHR).

Order history message: The system also writes a message to order history when it puts the related order an hold, for example:

```
8/10/06   H   CB Hold.  Rejected deposit on 4778/3282
       114.84   SAMPLENAME
```

In the above example, the 4778/3282 refers to the order number and invoice number of the deposit that was rejected, and the 114.84 refers to the rejected deposit amount.

See Reviewing Financial Information on an Order for more information on reviewing information in order inquiry.

For more information:

- See Rejected Deposits for Pay Plan Orders for more information on how the system handles deposits that are not forced.
- See Deferred/Installment Billing Overview for more information on the necessary setup to use deferred or installment pay plans.
- See Defining Vendor Response Codes for more information on setting up a response code to force deposit.

Stored Value Card Deposits

When processing a deposit for a stored value card, the system uses the action code D to process the deposit. Conditional deposit (B) is not supported for stored value cards.

Multiple authorizations: If there are multiple authorizations for the order and the deposit amount is greater than the remaining amount for each authorization on the order, the system will send the first authorization number for the deposit record. However, once the deposit response is received, the system will deposit both authorizations. For example, if you have 2 authorizations for 20.00 and the deposit amount is 40.00, the system will send the first authorization number for the deposit record, but will deposit both authorizations once a response is received.

If the stored value card cannot cover the entire deposit amount: If the balance on the stored value card cannot cover the entire deposit amount, the system will reject the entire deposit amount.

Stored value card credits: When you deposit a refund credit against a stored value card, the service bureau sends back a new authorization number with the deposit response; because of this, the system creates a new authorization for the credit amount that is already updated to a deposit status. At this point, the credit amount is reimbursed to the stored value card.

If the deposit amount is less than the original authorization amount: If the deposit amount is less than the original amount authorized:

- External Payment Service: The Void auth at deposit flag, set up through Defining Authorization Services (WASV), indicates how to process the deposit. See Multiple

Capture Sequence and Final Capture Sent to External Payment Service for a discussion.

- Other authorization services: The Retain Unused Stored Value Card Authorization After Deposit (J21) system control value indicates how to process the deposit.
  - If the Retain Unused Stored Value Card Authorization After Deposit (J21) system control value is selected, the system will retain a stored value card authorization after it has been partially deposited. For example, if the authorization amount is 50.00 and the deposit amount is 40.00, the system will retain the remaining 10.00 on the authorization.
  - If the Retain Unused Stored Value Card Authorization After Deposit (J21) system control value is unselected, the system will void the remaining balance against the authorization. For example, if the authorization amount is 50.00 and the deposit amount is 40.00, the system will void the remaining 10.00 on the authorization. If there are multiple authorizations for the order, the system will not void the other authorizations.

Stored value card authorization reversals during deposits: If the Perform Authorization Reversal during Deposit Processing (J20) system control value is selected, when you process deposits and the deposit amount is less than the original authorization amount, the system reimburses the stored value card the difference. For example, if the original authorization amount is 50.00, but the deposit amount is 30.00, the system will deposit 30.00 and reimburse 20.00 to the stored value card. See Authorization Reversal Process During Deposits for more information.

Sending deposits for the same order and authorization number as Conditional: For the deposit service defined in the Deposit Service for Conditional Deposits (L13) system control value, the system sends subsequent debit deposits (transaction type Purchase action code D) for the same order number and authorization code as a Conditional Deposit (transaction type Conditional, action code B) rather than a Regular Deposit (transaction type Purchase action code D). See this system control value for examples. **Note:** to use this system control value, the Retain Unused Stored Value Card Authorization After Deposit (J21) system control value must be selected and the Perform Authorization Reversal during Deposit Processing (J20) system control value must be unselected.

Reviewing Deposits in Order Inquiry

You can use order inquiry to review the deposit status of credit card payment methods for both pay plan and regular (non-pay plan) orders.

Screen	Use for:	To advance to in order inquiry:
Invoice Pay Summary	• review the total amount deposited for each invoice • review deposit release date	select Invoices, then Invoice Pay Sum
Display Invoice Pay Method	• review credit card, authorization, or installment schedule information	select Display for an invoice at the Invoice Pay Summary screen

Screen	Use for:	To advance to in order inquiry:
Change Invoice Pay Method	• review or change the deposit release date, installment information, or credit card • apply a direct cash or check payment • indicate the disposition of a rejected deposit amount	select Change for an invoice at the Invoice Pay Summary screen **Note:** This screen is also available through Manage Rejected Deposits in Modern View.
Display Deposit History	• review deposit attempts and responses	select Deposit History for an invoice at the Invoice Pay Summary screen **Note:** This screen is also available through Manage Rejected Deposits in Modern View.
Display Order Payment History	• review messages written by the system describing invoice activity, including changes to the deposit release date and credit netting calculations	select Payment History for an invoice at the Invoice Pay Summary screen **Note:** This screen is also available from the Display Order Payment Methods screen in order inquiry (select Payments)

See Reviewing Financial Information on an Order for more information on reviewing invoice and deposit activity in order inquiry.

Printing the Deposit History Summary (PDHS)

Purpose: Use the Deposit History Summary report to review the total deposits processed by date. This report breaks out the totals by pay type, and includes debit and credit subtotals for regular deposits, deferred billing, and installments.

The Deposit History Summary report includes only deposits that were actually processed, not rejected or unconfirmed deposits.

Deposit History Summary Screen

Purpose: Use this screen to select the dates to include on the Deposit History Summary Report and to print the report.

How to display this screen: Enter PDHS in the Fast path field at the top of any menu or select Print Deposit History Summary from a menu.

Field	Description
Start date	The first date to include on the report. The current date defaults. Numeric, 6 positions (in user date format); required.
End date	The last date to include on the report. The current date defaults. Numeric, 6 positions (in user date format); required.

Screen Option	Procedure
Generate the Deposit History Summary Report	Select Submit.

Printing the Credit Card Deposit Schedule (PCCD)

Purpose: Use the Credit Card Deposit Schedule to review the credit card deposits you can expect to process through deferred or installment payment plans for a given period. This report:

- lists each order or order shipment with pending deposits
- provides totals by type of payment plan, pay type, and date
- breaks out credits and debits

Summary report: This menu option also produces the Credit Card Deposit Schedule Summary. This report summarizes the projected deposits by omitting the order-level information.

Credit Card Deposit Schedule Screen

How to display this screen: Enter PCCD in the Fast path field at the top of any menu or select Print Credit Card Deposit Schedule from a menu.

Field	Description
Start date	The first expected deposit date to include on the report. The current date defaults. Numeric, 6 positions (in user date format); required.
End date	The last expected deposit date to include on the report. The current date defaults. Numeric, 6 positions (in user date format); required.
Print detail	Indicates whether to print the Credit Card Deposit Schedule. Valid values are: Selected (default) = print the Credit Card Deposit Schedule Unselected = do not print the Credit Card Deposit Schedule
Print summary	Indicates whether to print the Credit Card Deposit Schedule Summary. Valid values are: Selected (default) = print the Credit Card Deposit Schedule Summary Unselected = do not print the Credit Card Deposit Schedule Summary

Screen Option	Procedure
Generate the Credit Card Deposit Schedule and the Credit Card Deposit Schedule Summary reports	Select Submit.

Printing the Pending Payment Plan Deposits (PPPD)

Purpose: Use the Pending Payment Plan Deposits Report to review the payment plan orders with pending deposits for a range of invoice dates. This report includes detail information, such as the pay plan on the order. This report does not include regular (non-pay plan) deposits, which are eligible for processing immediately after billing.

See Deferred/Installment Billing Overview for more information on installment or deferred pay plans.

Pending Payment Plan Deposit Report Screen

How to display this screen: Enter PPPD in the Fast path field at the top of any menu, or select Print Pending Pay Plan Report from a menu.

Field	Description
Start date	The first invoice date to include on the report. This is the date when you confirmed shipment of the order. The current date defaults. Numeric, 6 positions (in user date format); required.
End date	The last invoice date to include on the report. The current date defaults. Numeric, 6 positions (in user date format); required.

Screen Option	Procedure
Generate the Pending Payment Plan Deposits Report	Select Submit.

Printing the Deposit History Detail Report (PDHD)

Purpose: Use the Deposit History Detail report to review deposits processed during a specific date range. Within this date range, you can select to include only deposits for a specific authorization service, pay type, and status.

Print Deposit History Detail Screen

Purpose: Use this screen to select the dates to include on the Deposit History Detail Report and to print the report. You can also specify to include only those deposit transactions for a specific:

- Auth Service
- Pay Type
- Status

How to display this screen: Enter PDHD in the Fast path field at the top of any menu or select Print Deposit History Detail Report from a menu.

Field	Description
Start Date	The first date for the deposits to include on the report. The system uses the Deposit date in the Deposit History table to determine which deposit transactions to include on the report. Numeric, 6 positions (in user date format); required.
End Date	The last date for the deposits to include on the report. The system uses the Deposit date in the Deposit History table to determine which deposit transactions to include on the report. Numeric, 6 positions (in user date format); required.
Auth Service	The authorization service that was used for the deposits to include on the report. The system uses the Authorization code in the Deposit History table to determine the deposit transactions to include on the report. Authorization service codes are defined in and validated against the Authorization Service table; see Defining Authorization Services (WASV). Alphanumeric, 3 positions; optional.
Pay Type	The pay type that was deposited against. The system uses the Pay type in the Deposit History table to determine which deposit transactions to include on the report. Pay type codes are defined in and validated against the Pay Type table; see Working with Pay Types (WPAY). Numeric, 2 positions; optional.
Status	The status of the deposits to include on the report. The system uses the Status in the Deposit History table to determine which deposit transactions to include on the report. Valid statuses are: • Confirmed • Deleted • Forced • Manual Confirm • Prepaid • Resubmitted • Sent • Unconfirmed Written Off Optional.

Screen Option	Procedure
Generate the Deposit History Detail Report	Enter information in the fields on the Print Deposit History Detail Screen and select Print Report. The system submits the CC_DEP_DTL job and returns you to the menu screen.

E-Commerce Interface

Topics in this part:

- E-Commerce Catalog Requests describes how the system processes a catalog request received from the web storefront.
- E-Commerce Item Availability Processing describes how the system extracts item availability information for download to the web storefront.

  For more information see the Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).
- Working with Batch Order Maintenance Transactions (WBOM) describes how the system processes a cancellation request from the web storefront and how to work with order cancel request errors.
- E-Commerce Setup describes the setup required in Order Administration for the e-commerce interface, and specifies additional documentation detailing setup requirements for communicating and for the web storefront.
- Downloading E-Commerce Offer Files (EOFR) describes the process you use to extract information related to items, source codes and offers to staging files for subsequent download to the web storefront.
- Working with E-Mail Notification Templates (WEMT) describes how to set up templates for the various email notifications you can send to customers.
- Sending Internet Order Ship Confirmation (ESCF) describes the menu option you use to send email confirmations for shipment of orders received through the web storefront.

Working with Batch Order Maintenance Transactions (WBOM)

Purpose: Use this menu option to work with errors resulting from order cancel requests from the web storefront.

About order cancel requests from the web: You can enable your customers to submit cancel requests from the web storefront if you use the e-commerce interface. Each cancel request on the web storefront generates a message to Order Administration indicating whether to cancel the order or a specific order line. Occasionally, the system cannot process the request. For example, the customer might attempt to cancel an order line that has recently shipped.

Typically, you would first check the status of the order using the *Generic Customer History API* to determine the details of the order you wish to cancel.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Cancel request: The request specifies the order ship-to or order lines you wish to cancel.

Cancel response: The response message merely indicates that the request was received; a subsequent email confirmation indicates whether the cancellation request was successful.

Fixing errors: When there is an error, you might choose to complete the requested transaction yourself; or you might need to contact the customer for further information if the desired transaction is not clear. However, you cannot edit and resubmit the maintenance requests through the Batch Order Maintenance menu option. Once you have resolved the request through research, order maintenance, or customer contact, you should delete the related error record.

What if the order includes a membership item? If the cancel request attempts to cancel a membership item, the order cancellation process does not automatically cancel the customer membership created by the membership item. You need to use Working with Customer Memberships (WWCM) in order to cancel the customer membership.See Membership Overview for background on customer memberships.

What if the order includes an order line assigned to Order Orchestration? If the cancel request attempts to cancel a brokered backorder, the request goes into error status with an error of Order Has Picks Open. You need to use order maintenance or cancel option in Work with Order Broker to cancel the order line. See Brokered Backorders for an overview.

What if the order is a retail pickup or delivery order received from Order Orchestration? If the cancel request is for a retail pickup or delivery order, the process sends a status update to Order Orchestration indicating that the order is canceled. Order Orchestration does not attempt to find another location to fulfill the order. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for an overview.

What if the order is a store pickup order? You cannot cancel a store pickup order through the CWCancel message. See Store Pickup Orders for background or store pickup orders.

In this topic:

- E-Commerce Cancel Setup
- E-Commerce Cancel Process
  - When is an Order Eligible for Cancellation through the E-Commerce Interface?
  - Order Inquiry/Maintenance Message Flow
  - Processing the Request
  - E-Commerce Cancellation Transactions

- E-Commerce Cancel Request Message (CWCancel): See the Order Admiistration Web Services Guide on My Oracle Support (ID 2953017.1

E-Commerce Cancel Setup

The CWServiceIn web service allows an external system to post the E-Commerce Cancel Request Message (CWCancel) directly to Order Administration and receive responses without the need of any queues.

See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1

Web service authentication? Use the Working with Web Service Authentication (WWSA) menu option to define a valid user for basic web service authentication, or client ID if using OAuth. You must also create a corresponding user profile in Oracle Identity Cloud Service and assign the user to the corresponding web service role defined for the Order Management application.

You can use the CWServiceIn web service as a RESTful web service.

Setup for the CWServiceIn RESTful Web Service

You POST the E-Commerce Cancel Request Message (CWCancel) to the web service's URL, or endpoint, of the RESTful service. The web service routes the messages sent to the endpoint and dispatches them to the E-Commerce Cancel process. When the E-Commerce Cancel process generates a response, the CWServiceIn web service routes the response. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1

Message type: The type attribute in the inbound message identifies the Order Administration process, so the CWServiceIn web service can route the message appropriately. The correct type for the E-Commerce Cancel Request Message (CWCancel) is CWCancel.

Determine the endpoint: The individual URL for the CWServiceIn RESTful service uses the following format: `http://server:port/oms/sxrs/application/CWServiceIn`, where `server:port` identifies the application server where the RESTful service is located and CWServiceIn is the name of the web service to call.

E-Commerce Cancel Process: When is an Order Eligible for Cancellation through the E-Commerce Interface?

In order to be fully or partially canceled through the e-commerce interface, the order must:

- have originated on the web storefront. If an order originated on the web, the Internet order field on the Order Header table is set to I.
- be in an open (O) or held (H) status
- have no pick slips printed
- not be assigned to Order Orchestration for fulfillment

Also, you will not be able to complete cancellation of the order or order line if the order is in use. The system determines that an order is “in use” if the User field on the Order Header table is not blank; for example, the system populates this field when you are maintaining an order, and clears it when you are done with maintenance.

What if the order includes a membership item? If the cancel request includes a membership item, the order cancellation process does not automatically cancel the customer membership created by the membership item. You need to use Working with Customer Memberships (WWCM) in order to cancel the customer membership.See Membership Overview for background on customer memberships.

What if the order includes an order line assigned to Order Orchestration? If the cancel request attempts to cancel an order line that is assigned to Order Orchestration for fulfillment, the request goes into error status with an error of Order Has Picks Open. You need to use order maintenance or the Working with Order Broker

(WOBR) option to cancel the order line. See Order Orchestration Integration for an overview.

Order Inquiry/Maintenance Message Flow

Order inquiry and maintenance through the e-commerce interface use the following messages:

Message	Direction	Purpose
To check status:		
Customer History Request XML Message (CWCustHistIn) For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	web storefront to Order Administration	Inquires on the status of the order.
Detailed Order Inquiry Response XML Message (CWORDEROUT) For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Order Administration to web storefront	Provides information on the order header and detail.
To cancel:		
E-Commerce Cancel Request Message (CWCancel) See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	web storefront to Order Administration	Attempts to cancel: • individual items, or reduce the quantities of selected items; or, • the entire order ship-to (a separate cancel request is required to cancel each separate shipping address for the order) This message also indicates the reason for the cancellation. See E-Commerce Cancellation Transactions.

Processing the Request

In response to a cancellation request from the web storefront, the system:

- Locks the order: The system sets the User field on the Order Header table to E-COMMERCE to prevent another user or process from attempting to update the order at the same time.
- Creates batch order maintenance error records: The system uses these records, if necessary, to track any errors in the cancellation request. See Work with Batch OM Transactions Screen.
- Edit: Next, the system checks whether there are any errors for the request.
- If there are no errors, the system:
  - processes the requested update(s) to the order.
  - deletes the batch order maintenance error records.
  - unlocks the order.

- If there are errors, the system:
  - updates the batch order maintenance error record with one or more error codes. See Display Batch OM Errors Screen.
  - depending on customer preference, sends the customer an email indicating that the cancellation attempt was not successful. See Emails for E-Commerce Cancels.
  - writes an order history message indicating that the attempt to update the order was not successful and that an email was generated. See Order History Messages.
  - places the order on hold if there is a hold reason specified in the Hold Reason for Failed E-Commerce Maintenance Transactions (H11) system control value.
  - produces the E-Commerce Order Maintenance Errors Report.
  - unlocks the order.

You can use the Work with Batch OM Transactions Screen to review any cancel requests that are in error.

> **Note:**
>
> If there are any errors in the request, none of the requested changes will be processed until the errors are corrected and the edit resubmitted.

E-Commerce Cancellation Transactions

Required for each cancel request:

- Company_code: three positions, alphanumeric; for example, company 7 is indicated by 007
- Order_id: order number
- Ship_to: the number identifying the shipping address on the order; for example, an order with a single shipping address has a ship-to number of 001
- Cancel_type:
  - O (default) = order
  - L = line

Whole order, single ship-to: The Cancel_type must be O and the Order_reason must specify a valid cancel reason code for the order.

> **Note:**
>
> If there are multiple shipping addresses, the cancel request for each ship-to must be sent separately.

Single item, reducing quantity or canceling the entire order line: the Cancel_type must be L and the following information is also required:

- Line_number: the order line number to be cancelled or have its quantity reduced
- Qty: the total quantity to cancel
- Reason: the valid cancel reason code

Emails for E-Commerce Cancels

Cancellation email: The ORDR_ASYNC job generates an order or order line cancellation email to the customer if:

- the cancellation attempt is successful, and
- you have specified an:
  - Order Line Cancellation Email Program (K79), if no shipments have occurred, or
  - Order Cancellation Email Program (K78), and
- the cancel reason code you use does not match the Cancel Reason Code to Suppress Email (L08), and
- the customer is eligible to receive email notifications; see When Does the System Generate an Email Notification?

See the Order Cancellation Confirmation Email Sample and Contents and the Order Line Cancellation Confirmation Email Sample and Contents for more information.

If the cancellation attempt is unsuccessful, the system generates the maintenance failure email if:

- you have specified a Order Maintenance Confirmation E-Mail Program (H12), and
- the customer is eligible to receive email notifications; see When Does the System Generate an Email Notification?

See the Order Cancellation Confirmation Email Sample and Contents for more information.

The system selects the order cancellation, order line cancellation, or maintenance failure email template as appropriate. See Work with E-Mail Template Screen. If the system sends an email, this information is noted in the order history message.

Order History Messages

The system writes the following message to order history if the cancellation request fails: `Web cancel request failed.`

If the cancel request is successful:

```
Web maintenance request processed.
```

If the system generates an email notification (see Emails for E-Commerce Cancels), it writes a message such as one of the the following:

```
Ord Can Conf to user@example.com.
```

or

```
Ord Can Fail to user@example.com
```

You can review order history messages at the Display Order History Screen. The system assigns the default user ID, DEFAULTUSR, to the order history messages.

Work with Batch OM Transactions Screen

Purpose: Use this screen to review any errors that have resulted when customers attempt to cancel orders from the web storefront. Also, you can use this screen to delete error records once you have resolved the errors, as the system does not delete them automatically.

Fixing errors: You might choose to complete the requested transaction yourself; or you might need to contact the customer for further information if the desired transaction is not clear. However, you cannot edit and resubmit the cancellation requests through this menu option.

For more information: See E-Commerce Cancel Process.

How to display this screen: Enter WBOM in the Fast path field at the top of any menu, or select Work with Batch OM Transactions from a menu.

Field	Description
Order number	An order that a customer has attempted to cancel from the web storefront. Numeric, 8 positions; optional.
St# (Ship-to number)	This number indicates the order ship-to address that the customer attempted to cancel. Numeric, 3 positions; optional.
Activity	The type of transaction that the customer attempted to perform. Valid values are: • Cancel Order • Line Cancel This field is blank if the cancel request message from the web storefront did not specify a valid cancel type code. Display-only.

Screen Option	Procedure
Delete a batch order maintenance error record	Select Delete for an error record to delete it. The system does not delete errors automatically, so typically you will delete errors as you resolve them.
Display a cancel request in error	Select Display for an error record to display the header-level information for the cancel request. You advance to the Display Batch OM Transactions Screen (Header). If the request includes serious errors, you will not be able to review the error record; instead, the system displays a message such as the following: Order 5493-7 is invalid -- cannot display. Print list to see errors. See E-Commerce Order Maintenance Errors Report.
Display the error message(s) for a cancel request	Select Errors for an error record to review the error message(s) for the cancel request. You advance to the Display Batch OM Errors Screen.

Screen Option	Procedure
Advance to standard order inquiry	Select Order Inquiry for an error record to advance to Order Inquiry Header Screen or the Order Inquiry Detail Screen for the related order, depending on the setting of the Default Version for Order Inquiry (C34) system control value.
Print a listing of all batch order maintenance errors in your company	Select Error List to print the E-Commerce Order Maintenance Errors Report, including all errors in your company.

Display Batch OM Transactions Screen (Header)

Purpose: Use this screen to review the header-level information that was included in the cancel request from the web storefront that was in error, so that you can determine the transaction that the customer was attempting to process.

Note: If the request includes serious errors, you will not be able to review the error record; instead, the system displays a message such as the following: Order 5493-7 is invalid -- cannot display. Print list to see errors.

You can use the Display Batch OM Errors Screen to review the errors.

How to display this screen: Select Display for a cancellation error at the Work with Batch OM Transactions Screen.

Field	Description
Order number	An order that a customer has attempted to cancel from the web storefront. The order ship-to address is separated from the order number by a hyphen. Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only.
Activity	The type of transaction that the customer attempted to perform. Valid values are: • Cancel Order • Line Cancel This field is blank if the cancel request message from the web storefront did not specify a valid cancel type. Display-only.
Cancel reason	The cancel reason code to use when cancelling the order. This information is included only for an order-level cancel request. Numeric, 2 positions; display-only.

Screen Option	Procedure
Select a detail line transaction from the cancel request for review	Select Details to advance to the Display Batch OM Transactions Screen (Detail) if the cancel request was a line cancel.
Display the error message(s) for this cancel request	Select Errors to advance to the Display Batch OM Errors Screen.

Screen Option	Procedure
Advance to standard order inquiry	Select Order Inquiry for an error record to advance to Order Inquiry Header Screen or the Order Inquiry Detail Screen for the related order, depending on the setting of the Default Version for Order Inquiry (C34) system control value.
Print a listing of the errors for this cancel request	Select Error List to print the E-Commerce Order Maintenance Errors Report, including all errors for this cancel request only.

Display Batch OM Transactions Screen (Detail)

Purpose: Use this screen to select a detail line for review if a cancel request in error included order line-level information. Line-level information could include either canceling a particular line or reducing the quantity.

If the request was to cancel the order, there will not be any detail information on this screen.

How to display this screen: Select Details at the Display Batch OM Transactions Screen (Header).

Field	Description
Order number	An order that a customer has attempted to cancel from the web storefront. The order ship-to address is separated from the order number by a hyphen. Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only.
Action	The action that the customer has attempted to perform against the order detail line. The only valid value is: Line cancellation = Reduce the quantity of the order detail line or cancel it entirely Display-only.
Line number	The order detail line number to be cancelled. Numeric, 3 positions; display-only.
Cnr (Cancel reason code)	The cancel reason code specified in the cancel request to describe why the customer wants to cancel or reduce the quantity of the order detail line. This information is included only for a detail-level cancel request. Numeric, 2 positions; display-only.
Qty	The quantity of the item that the customer has attempted to cancel. Numeric, 3 positions; display-only.

Field	Description
Item	The item that the customer has attempted to cancel. The system determines which item the customer has selected by the order detail line (when working with an existing order detail line) or the short SKU number (when adding a new item to the order). The short SKU number is stored in the SKU table. If the request does not specify a valid short SKU, the item and SKU information listed on this screen may be inconsistent; for example, even if the item code is valid, the SKU information may not represent a valid SKU for the item. Alphanumeric, 12 positions; display-only.
SKU	The item's unique characteristics, such as its color and size. Alphanumeric, three 4-position fields; display-only.

Screen Option	Procedure
Select a detail transaction in error to review	Select Display Display Batch OM Detail Screen.
Review header information for the maintenance or cancel request	Select Header to advance to the Display Batch OM Transactions Screen (Header).
Display the error message(s) for the maintenance or cancel request	Select Errors to advance to the Display Batch OM Errors Screen.
Advance to standard order inquiry	Select Order Inquiry for an error record to advance to Order Inquiry Header Screen or the Order Inquiry Detail Screen for the related order, depending on the setting of the Default Version for Order Inquiry (C34) system control value.
Print a listing of the errors for this maintenance or cancel request	Select Error List to print the E-Commerce Order Maintenance Errors Report, including all errors for this cancel request only.

Display Batch OM Detail Screen

Purpose: Use this screen to review detail information on a cancel line request from the web storefront that is in error.

How to display this screen: Select Display for a detail line at the Display Batch OM Transactions Screen (Detail).

Field	Description
Order number	The order and line number that a customer has attempted to cancel from the web storefront. The order ship-to address is separated from the order number by a hyphen, and the order line number follows: order number - ship-to number - order line number Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only. Order line number: numeric, 3 positions; display-only.

Field	Description
Activity	The action that the customer has attempted to perform against the order detail line. The only valid value is: Line cancellation = Reduce the quantity of the order detail line or cancel it entirely Display-only.
Item/SKU	The item that the customer has attempted to cancel. The system determines which item the customer has selected by the order detail line (when working with an existing order detail line) or the short SKU number (when adding a new item to the order). The short SKU number is stored in the SKU table. Alphanumeric, 12 positions; display-only.
Quantity	The quantity of the item that the customer has attempted to cancel. Numeric, 3 positions; display-only.
Cancel reason	The cancel reason code specified in the cancel request to describe why the customer wants to cancel or reduce the quantity of the order detail line. This information is included only for a detail-level cancel request. Numeric, 2 positions; display-only.

Display Batch OM Errors Screen

Purpose: Use this screen to review the errors that have prevented a cancel request from being processed.

How to display this screen: Select Errors for an error record at the Work with Batch OM Transactions Screen, or select Errors at the Display Batch OM Transactions Screen (Header) or the Display Batch OM Transactions Screen (Detail).

Field	Description
Order number	An order that a customer has attempted to cancel from the web storefront. The order ship-to number is separated from the order number by a hyphen. Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only.
Line number	The order detail number associated with the error. This field is blank if the error is associated with header-level information, or if the system could not determine which line number was involved. Numeric, 3 positions; display-only.
Error description	The description of the error that prevented the cancel request from being processed. See Batch Order Cancel Errors. Alphanumeric, 25 positions; display-only.
Notes	For certain errors, this field displays the description of the error that prevented the maintenance or cancel request from being processed. If the error is the result of an item on the order that already existed and was not part of the maintenance or cancel request, the message is: Error from a line that was not maintained.

Screen Option	Procedure
Print a listing of the errors for this cancel request	Select Error List to print the E-Commerce Order Maintenance Errors Report, including all errors for this cancel request only.

Batch Order Cancel Errors

Error Message	Occurs When:
Detail Errors	
Invalid Order Detail	The order line number specified in the cancel request does not exist on the order.
Line is not Open	The order line has a status of X (closed).
Pick Exists for Line	There is currently a printed pick slip for the order line.
Cpn Item Required	The order line specified for cancellation is required for an order-level coupon. See Working with Coupon Promotions (WCPR) for more information on coupons. **Note:** Although the error is retained for review, the system does cancel the order line and does not automatically remove the coupon from the order.
Order Tot < Cpn Requires	The cancel request has reduced the order total below the minimum required for a coupon on the order. See Working with Coupon Promotions (WCPR) for more information on coupons. Note: • Although the error is retained for review, the system does not automatically remove the coupon from the order. • This error is listed on the Display Batch OM Errors Screen for each order detail line on the order.
Invalid Transactions	The cancel type is missing or invalid.
Header Errors	
Order Has Picks Open	Any order detail lines on the order have pick slips printed or are assigned to Order Orchestration for fulfillment.
Order In Use	The order is locked from update because a user is maintaining it, or another process on the system is updating it. Use Unlocking a Stranded Order or Batch (MULO) to unlock the order.
Order Not Open or Held	The order status is not open (blank) or held (H).
Invalid Cancel Quantity	The quantity specified in the cancel request exceeds the quantity eligible for cancellation for the order detail line.
Invalid Cancel Reason	The cancel reason is not valid, as defined through Establishing Cancel Reason Codes (WCNR).
Invalid Order Ship To	• The order ID in the cancellation request is missing or invalid. • The order ship to in the cancellation request is missing or invalid for the order.

Downloading E-Commerce Offer Files (EOFR)

Purpose: Use the Download E-Commerce Offer Files menu option to select offer, source, and item-related information for download to the web storefront. Typically, this type of information changes periodically.

You can download all three types of information at once, or selected types as needed.

Type of download: The setting of the Generate E-Commerce Offer Tables (M29) system control value defines the output of the e-commerce offer download.

- If this system control value is selected, the e-commerce offer download (EOFR) populates the E-Commerce Offer Staging tables; see Offer-Related Table Extract Summary.
- If this system control value is unselected, the e-commerce offer download (EOFR) generates the E-Commerce Product Web XML File (ProductWeb).

Additional downloads: Other downloads available for the e-commerce interface are:

- static tables
- item availability and item changes

For more information: See:

- the E-Commerce Integration Manual for information on the storefront database schema.

In this topic:

- Process E-Commerce Downloads Screen
- Offer-Related Table Extract Summary
- E-Commerce Product Web XML File (ProductWeb)

Process E-Commerce Downloads Screen

How to display this screen: Enter EOFR in the Fast path field at the top of any menu, or select Download E-Commerce Offer Tables from a menu.

> **Note:**
>
> All records in each related table for your company will be selected for download, unless noted otherwise in the field descriptions.

Field	Description
Offers	Indicates whether to include the selected offer information in the e-commerce offer download for subsequent transfer to the web storefront. Only the offer(s) you enter at this screen will be included. Valid values are: Selected (default) = download the selected offer(s). Unselected = do not download the offer(s).
Sources	Indicates whether to include source codes associated with the selected offer in the e-commerce offer download for subsequent transfer to the web storefront. Only source codes associated with the offer you enter at the From offer field will be included. Valid values are: Selected (default) = include source codes associated with the selected offer. Unselected = do not include source codes.

Field	Description
All items	Indicates whether to include all items, SKUs, and all other related offer information in the e-commerce offer download for subsequent transfer to the web storefront. All items related to the offer(s) you enter at this screen will be included. Valid values are: Selected (default) = include item-related information for all items associated with the selected offer(s). Unselected = do not include item-related information for all items. Select either this field or the New items field, but not both. If you select both fields, the following message displays: Either All Items or New Items can be processed but not both.
New items	Indicates whether to include only new items in the e-commerce offer download for subsequent transfer to the web storefront. Only items related to the offer(s) you enter at this screen and which have not previously been extracted will be selected. Valid values are: Selected = The e-commerce offer download includes item-related information for only new items associated with the selected offer(s); only items which have not been previously extracted are included in the download. When you submit the download, the system updates the Ecommerce Extract Date field in the Item Offer table with the date of the extract; the system uses this field to determine whether the item has previously been included in an e-commerce offer download. Unselected (default) = do restrict extract of item-related information to only new items. Select either this field or the All items field, but not both. If you select both fields, the following message displays: Either All Items or New Items can be processed but not both.
Future prices	Indicates whether to include the latest future price for an item or SKU in the selected offer(s), or the most current price that is not in the future. Valid values are: Selected = include the latest future prices for items and SKUs in the selected offer(s). Future prices are those whose Effective dates are later than the current date. If there are no future prices for an item or SKU, the job includes the latest current price (the most current price whose Effective date is not in the future). Unselected (default) = include the most current price for items and SKUs in the selected offer(s), as long as the prices' Effective dates are not later than the current date. If there are no prices for an item or SKU except for future prices, the job does not include the item or SKU in the extract.

Field	Description
All SKU offers	Indicates whether to include all SKU Offers and SKU Prices, regardless of whether they are different from the Item offer and Item Price. Valid values are: Selected = include all existing SKU Offer and SKU Price information, even if it is identical to the corresponding Item Offer and Item Price information. Unselected (default) = include SKU Offer and SKU Price information only if it differs from the Item Offer and Item Price information: • SKU Price information is updated only if the SKU Price differs from the Item Price. **Note:** The SKU Price is included only if the regular price differs from the Item Price. If the Associate price alone differs, then the SKU Price record is not selected for extract. • SKU Offer information is updated only if the special handling or gift wrap information for the SKU Offer is different from the Item Offer. • This field displays only if the Generate E-Commerce Offer Tables (M29) system control value is selected.
Offer	Enter one or more offers to download to the web storefront. As you enter each offer, its description, start date, and end date are displayed below. You must specify at least one offer. Only the offer(s) you enter and tables associated with the selected offer(s) will be included in the extract. Offer codes are defined in and validated against the Offer table. See Working with Offers (WOFR). Alphanumeric, 3 positions; required.
Description	The description of an offer you have specified for download to the web storefront. Alphanumeric, 30 positions; display-only.
Start date	The first date when the selected offer is effective for processing orders. From the Offer date range specified for the offer. Numeric, 6 positions (in user date format); display-only.
End date	The last date when the selected offer is effective for processing orders. From the Offer date range specified for the offer. Numeric, 6 positions (in user date format); display-only.

Instructions:

#	Step
1.	Optionally reset any of the fields to exclude related information from selection. **Note:** Select either the All items field or the New items field. You cannot select both fields.
2.	Use the Offer field to specify at least one offer to include in the extract. The system validates each entry, and displays the offer’s description and effective dates below after each.
3.	Select OK. The system validates your entries and highlights any fields you need to correct. Correct any fields and select OK again.

#	Step
4.	Select Submit to submit the extract. The system displays the following message: E-Commerce download submitted to batch. Also, the system submits the job ECOMM_OFR, which extracts the selected information for download.
5.	The setting of the Generate E-Commerce Offer Tables (M29) system control value defines the output of the e-commerce offer download. • If this system control value is selected, the e-commerce offer download (EOFR) populates the E-Commerce Offer Staging tables; see Offer-Related Table Extract Summary for a listing of the information included in the extract. • If this system control value is unselected, the e-commerce offer download (EOFR) generates the E-Commerce Product Web XML File (ProductWeb). Note: If an active procedure exists, the system does not generate the ProductWeb file and instead writes an error message to the Application Log.

Offer-Related Table Extract Summary

Purpose: This table provides a summary of the tables and fields included in the offer table extract, and how they map to the e-commerce staging tables. The system populates these tables when you submit the e-commerce offer download and the Generate E-Commerce Offer Tables (M29) system control value is selected.

Information included: The e-commerce offer download adds new information to the staging tables if the tables have not been cleared since the last download; it does not update records once they are extracted to the staging tables. However, once the records are downloaded to the web storefront and cleared from the staging tables, changes to existing records are eligible to be extracted to the staging tables and passed to the storefront.

Removing items and offers:

All SKUs included? SKU-level information is included in the extract only if there is a SKU Offer and SKU Price record. For example, you can use the Creating Item/SKU Offers (MISO) menu option to create SKU Offers and SKU Prices for an item when you add it to a new offer. SKU-level offer and price information is included in the extract if you select the All SKU offers option when generating the extract; otherwise, SKU Offers are included only when they differ from the item-level information, such as a special handling or price that differs from the Item Offer or Item Price setting.

Future prices? The Future prices field on the Process E-Commerce Downloads screen controls whether to download the most current prices whose Effective dates are not in the future, or the latest prices whose Effective dates are later than the current date. If you would like to download both current and future prices, you can run the download job twice, resetting this field as needed.

Example: AB100 BLUE LRGE has the following prices set up for the selected offer(s):

Date	Quantity	Price
1/1	1	10.00
1/1	5	9.00
1/10	1	10.50
2/1	1	8.50

Date	Quantity	Price
2/1	5	7.50
3/1	1	7.00
3/1	5	6.99
	1. The current date is 1/15. If you run the extract job with the Future prices field unselected, the job selects the following prices:	
1/1	5	9.00 (most recent price for this quantity not greater than current date)
1/10	1	10.50 (most recent price for this quantity not greater than the current date)
	2. The current date is 1/15. If you run the extract job with the Future prices field selected, the job selects the following prices:	
3/1	1	7.00 (latest future price for this quantity)
3/1	5	6.99 (latest future price for this quantity)

Note:

- Item or SKU prices are included in the following extract tables (see Offer-Related Table Extract Summary for more information):
  - EC Item Breakpoint (EXIPRC): includes single-unit and multi-unit prices at the item level
  - EC Offer Item Link (EXIOFL): includes single-unit prices at the item level
  - EC Offer SKU Link (EXSOFL): includes single-unit prices at the SKU level
  - EC SKU Breakpoint (EXSPRC): includes single-unit and multi-unit prices at the SKU level
- If you run the extract job with the Future prices field selected, but there is no future price for the item or SKU, the job extracts the most recent price instead.
- If you run the extract job with the Future prices field unselected, but there is no current price for an item or SKU and just a future price, the extract omits the item or SKU prices from the extract, with the exception of the EC Offer Item Link table; this table includes a record for the item with a price of 0.

> **Note:**
>
> Clear the records from each target table before running the extract to make sure that you capture the most up-to-date information from Order Administration, as the extract process does not always write updated information in the extract table if there is already an existing record.

Selection for download: All item-related information (such as hazard codes and e-commerce categories) are selected for download only if they are assigned to items that are selected for download.

OROACS Table	Staging Table	Fields	Additional Information
If you select the Offer field at the Process E-Commerce Downloads screen:			
Offer (MSOFFR)	EC Offer (EXOFFR)	Company code Offer code Description Start date End date	Only the offer(s) you indicate at the screen is/are selected. See Working with Offers (WOFR).
If you select the Sources field at the Process E-Commerce Downloads screen:			
Source (MSSRC)	EC Source (EXSRCE)	Company code Source code Source code description Discount percentage Offer	See Working with Source Codes (WSRC).
If you select the Items or New Items field at the Process E-Commerce Downloads screen:			
Long SKU Class (INLSKC) OR Retail Class (INRTCP)	EC Class (EXCLAS)	Company code Long SKU department code Long SKU class code Long SKU class description	A long SKU class is selected for download only if it is assigned to an item selected for download, and the item is also assigned a long SKU department. The same long SKU class can be downloaded multiple times, if it is paired with different long SKU departments. See Working with Long SKU Classes (WLSC). **Note:** If you select the Use Retail Integration (H26) system control value, the interface uses the Retail Class table to populate the EC Class table.

OROACS Table	Staging Table	Fields	Additional Information
Item Coordinate (INITCO)	EC Cross-Sell (EXCSEL)	Company code Item code Cross-sell item code Cross-sell description Coordinate sequence Coordinate type	An item coordinate is selected for download only if the primary item (Note: not necessarily the coordinate item) is selected for download. Also, only the first 50 positions of the item coordinate description (a 70-position field) is included in the Cross-sell description. See \Working with Item Coordinates (WCIO).
Long SKU Department (INLSKD)	EC Department (EXDEPT)	Company code Long SKU department code Long SKU department description	See Working with Long SKU Departments (WLSD).
Shipper/Item (OESHIM)	EC Extra Shipping (EXSCIT)	Company code Ship via code Item code Extra shipping charge	See Working with Ship Via Codes (WVIA).
Hazard (INHZRD)	EC Hazard (EXHAZA)	Company code Hazard code Hazard description	See Working with Hazardous Item Codes (WHAZ).

OROACS Table	Staging Table	Fields	Additional Information
Item (INITEM)	EC Item (EXITEM)	Company code Item code Item description Height Length Width Selling quantity Shipping weight Unit of measure code Vendor number Second language description SKU? (**0**=N, **1**=Y) Active on web? (**0**=N, **1**=Y) Long SKU department Long SKU class Long SKU category Hazard code User fields 1 through 4 Status	Each non-SKU'd item associated with a selected offer(s) (that is, there is an item/offer assignment) is selected for download. SKU'd items are also included in the selection if they have item/offer assignments. See the Create Item Screen for field descriptions. **Note:** The *Active on web?* flag is not currently used.
Item Offer (INIOFR)	EC Item (EXITEM)	Allow gift wrap? (**0**=N, **1**=Y)	See the Create Item Offer Screen.
SKU (INSKU)	EC Item (EXITEM)	List price	The Original price in the EC Item table is from the highest List price for all SKUs.
Item Price (INIPRC)	EC Item Breakpoint (EXIPRC)	Company code Offer code Item code Breakpoint quantity Price	You set up a price breakpoint for a quantity of 1 when you create an item/offer assignment and specify a price. You can also specify additional price breakpoints for larger quantities. The extract includes the latest current or future price (based on the Future prices field), for each item-level quantity breakpoint. See: • above under Downloading E-Commerce Offer Files (EOFR) for a discussion of current or future prices • the Create Item Offer Screen for information on assigning items to offers at item creation Assigning Items/SKUs to Offers for information on working with item/offer assignment, including working with quantity price breaks

OROACS Table	Staging Table	Fields	Additional Information
Item Offer (INIOFR)	EC Offer Item Link (EXIOFL)	Company code Offer code Item code Price (single unit) Special handling price Item alias Gift wrap price Custom special handling format code	The extract includes the latest current or future price (based on the Future prices field), for each single-unit item-level price. See: • above under Downloading E-Commerce Offer Files (EOFR) for a discussion of current or future prices • the Create Item Offer Screen for information on assigning items to offers at item creation
SKU Offer (INSKOF)	EC Offer SKU Link (EXSOFL)	Company code Offer code Item code Short SKU Price (single-unit) Special handling price Gift wrap price Custom special handling format code	A SKU/offer is selected for download only if the special handling or gift wrap information differs from the item/offer, or if you select the All SKU offers option when generating the extract. The extract includes the latest current or future price (based on the Future prices field), for each single-unit SKU-level price. See: • above under Downloading E-Commerce Offer Files (EOFR) for a discussion of current or future prices • the Create SKU Offer Screen for information on assigning SKUs to offers **Note:** The Short SKU is stored in the SKU table and is a 7-position number used to identify SKUs and items. You can view the short SKU on display screens in Work with Items (MITM) and Inventory Inquiry (DINI). See Create Item (Base Information) Screen.

OROACS Table	Staging Table	Fields	Additional Information
SKU (INSKU)	EC SKU (EXSKU)	Company code Item code Short SKU (assigned by the system at SKU creation) SKU code SKU description SKU element 1 through 3 SKU element 1 through 3 description Restrict orders? Item Ship Via Override (INISVO)	EC Item Ship Via Override (EXISVO)	Company code Item number Shipping code	Order Administration only populates this table if records exist in the Item Ship Via Override table for an item. See Working with Item Ship Via Overrides.

E-Commerce Product Web XML File (ProductWeb)

Purpose: The E-Commerce Product Web XML file (ProductWeb) contains item offer information for the offers selected to download on the Process E-Commerce Downloads Screen. The system generates this file when Downloading E-Commerce Offer Files (EOFR) if the Generate E-Commerce Offer Tables (M29) system control value is unselected.
The e-commerce offer download creates a zip file in the OMS-ECOMMERCE container of the FILE_STORAGE table. The zip file contains the E-Commerce Product Web XML File (ProductWeb). Use the file storage API to download the file. See the File Storage API for background.

Name of file: The name of the file is ProductWeb_999_YYMMDDHHMMSS.xml, where 999 is the company code where you submitted the e-commerce offer download and YYMMDDHHMMSS is the date and time when the download occurred. When the file storage API is enabled, the file is saved in a zip file with the same name except for the .zip extension.

XML version: The ECOMMERCE_PRODUCT_XML_VERSION in Working with Customer Properties (PROP) defines the XML version of the ProductWeb XML file.

ECommerce extract date: For each item offer included in the ProductWeb XML file, the system updates the ECommerce Extract Date field in the Item Offer table with the date when the e-commerce offer download was submitted. The system uses this date if you select to include only new items in the e-commerce offer download to determine which items are new and which items have previously been downloaded.

Application log: The system writes any messages related to the e-commerce offer download to the Application Log.

Active procedure: The system creates an active procedure while the ProductWeb file is generated; once the e-commerce offer download process completes, the system clears the active procedure.

More information: See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for more information on the E-Commerce Product Web XML File.

Working with E-Mail Notification Templates (WEMT)

Purpose: Use this menu option to work with the default text to include when you send email notifications:

- first, second, and continue backorder notices

- credit card credit acknowledgments
- Contact us” requests
- credit card decline notifications
- loyalty membership activations and deactivations
- Oracle Retail Customer Engagement loyalty registration notices
- membership cancellation notifications
- order confirmations
- purchase orders
- return confirmations
- shipment confirmations
- soldout notifications
- store pickup notifications
- stored value card notifications
- quote confirmations
- order cancellation confirmations
- order line cancellation confirmations
- cancellation attempt failure notices

The system automatically creates templates for each of the above at the company level, but the templates are blank until you specify the text for each email.

General email setup: See *Email Generation Setup* for more information on how to configure Order Administration for email generation.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Email formats: Most of the system-generated emails are in HTML format; however, the purchase order and loyalty activation/deactivate notices are in simple text. See HTML Format Notification Samples and Contents and Simple Format Notification Sample for examples.

Outbound email API: You can specify generation of a generic outbound XML message, rather than an actual email, for all notifications except the loyalty activation/deactivation and purchase orders. The customer service emails use the simple text format, and the purchase order form is attached to a plain-text email.

The XML message includes additional information that is not included in the standard email notice. You might choose to generate the XML message so that you can use the information to produce a reformatted HTML email that includes promotional content. See *Outbound Email API* for an overview.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

- Summary of Customer Correspondence
- When Does the System Generate an Email Notification?
  - Order Confirmation Emails

For more information: See:

- Setup overview: *Email Generation Setup* provides an overview on setup, a listing of related system control values, and troubleshooting information.
- Which text template? Email Text Templates describes the hierarchy that controls which text template to use for notifications.
- Which "from" email address? "From" Email Address" describes the hierarchy that controls how to determine the "from" email address to use for emails.

- Actual email or CWEmailOut? HTML Email or Outbound Email XML Message? describes the hierarchy that controls whether to generate an actual email or the *Outbound Email XML Message (CWEmailOut)*.
- Controlling individual notification types by order type: Generate Notifications? describes how to control the generation of different types of notifications for an order type.
- Settings and overrides by order type: Establishing Order Types (WOTY) describes setup options by order type.
- Settings and overrides by entity or entity/order type: Working with Entities (WENT) describes setup options by entity and entity/order type.
- *Outbound Email API* describes the CWEmailOut message generation and contents, and includes a sample of each notification type.
- Testing email generation: Testing Email Generation (UEML)

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Summary of Customer Correspondence

The table below provides a summary of the customer correspondence generated by the system. See Work with E-Mail Template Screen for a listing of the information included in each type of generated email notice.

Generated Output	Generated Through:	Subject Line	Contents
Backorder 1st, 2nd, or Continue Notice			
email (HTML format), XML, or printed	Generate Backorder Notices (GBOC)	Backorder - order#:99999999	See Backorder Notification Email Sample and Contents.
“Contact us” notice			

Generated Output	Generated Through:	Subject Line	Contents
email (HTML format) or XML	Selecting the Send Contact Us Email option at the Display More Options Screen in order entry, inquiry, or maintenance. This option is available only if: • there is an email address for the customer, and • the customer's opt-in/ opt-out setting is O1 (email is preferred communication) or O2 (send order-related email only), and • the Contact Us Email Program (K54) system control value specifies an email program. **Note:** You can generate this email regardless of the setting of the Email notification flag for the order type.	Contact Us - Order#:99999999	See "Contact Us" Notification Sample and Contents.
Credit Card Credit Acknowledgement			
email (HTML format) XML, or printed	Processing Refunds (MREF) **and** Processing Refunds by Order Number (MRFO)	Credit Ack. - Order #99999999	See Credit Card Credit Acknowledgement Email Sample and Contents.
Credit Card Decline Notice			
email (HTML format) or XML	Streamlined Pick Slip Generation (WSPS) **and the REAUTH periodic function (see** REAUTH Processing**)**	Credit Card Decline - Order #99999999	See Credit Card Decline Notification Sample and Contents.
Loyalty Activate Notice and Loyalty Deactivate Notice			

Generated Output	Generated Through:	Subject Line	Contents
email only	BILL_ASYNC and ORDR_ASYNC processes in Using the ASYNC Jobs (MBJC)	Loyalty Activation or Loyalty Deactivation **Note:** The word "Loyalty" is replaced with the value in the Alternate Customer Number Label Description (H95) system control value, if any.	• sold-to customer name • sold-to customer number • loyalty program description • loyalty program membership ID
Oracle Retail Customer Engagement Loyalty Registration Notification			
email (HTML format) or XML	Registering a Customer in the Customer Engagement Loyalty Program	Loyalty Registration Notification	See Oracle Retail Customer Engagement Loyalty Registration Notification Sample and Contents.
Maintenance Failure			
email (HTML format) or XML	E-Commerce Cancel Process	Cancellation Request Failure - Order #999999	See Cancellation Request Failure Email Sample and Contents.
Membership Cancellation			
email (HTML format) or XML	cancelling a customer membership through the Working with Customer Memberships (WWCM)	Membership Cancellation	See Membership Cancellation Notification Sample and Contents.
Quote Confirmation			
email (HTML format) or XML	Select the Email Quote option on the Print/ Email Quote Window	Quote Confirmation - Quote # 99999999	See Quote Confirmation Email Sample and Contents.
Order Cancellation Confirmation			
email (HTML format) or XML	ORDR_ASYNC process in Using the ASYNC Jobs (MBJC)	Order Cancellation - Order# 99999999	See Order Cancellation Confirmation Email Sample and Contents.
Order Confirmation			

Generated Output	Generated Through:	Subject Line	Contents
email (HTML format) or XML	• accepting an order in interactive Order Entry. • processing an order through the order API, including orders in error if the Suppress Order Confirmations for Orders in Error (K09) system control value is unselected. • accepting and processing a corrected order batch, if an order confirmation has not previously been generated for the order ship to. • the ORDR_ASYNC job if an order confirmation has not previously been generated for the order ship to.	Order Confirmation - Order# 99999999	See Order Confirmation Email Sample and Contents.
Order Line Cancellation Confirmation			
email (HTML format) or XML	ORDR_ASYNC process in Using the ASYNC Jobs (MBJC)	Order Line Cancellation - Order# 99999999	See Order Line Cancellation Confirmation Email Sample and Contents.
Return Confirmation			
email (HTML format) or XML	• billing if the Send Shipment Confirmation from Billing (L98) system control value is selected • Sending Internet Order Ship Confirmation (ESCF)ECSHCNF peri odic function	Return Conf. - Order #99999999	See Return Confirmation Email Sample and Contents.
Shipment Confirmation			

Generated Output	Generated Through:	Subject Line	Contents
email (HTML format) or XML	• billing if the Send Shipment Confirmation from Billing (L98) system control value is selected • Sending Internet Order Ship Confirmation (ESCF)ECSHCNF periodic function	Ship Conf. - Order #99999999	See Shipment Confirmation Email Sample and Contents.
Soldout Notification			
email (HTML format) XML, or printed	Generating Soldout Notifications (MSON)	Soldout - Order #99999999	See Soldout Notification Email Sample and Contents.
Store Pickup Notification **Note:** Order Orchestration's Store Connect module does not use this notification email; instead, you can use Order Orchestration to generate a notification to the customer.			
email (HTML format) or XML	Email Request Message (CWEmailRequest)	Order Ready for Pickup - Order# 99999999	See Store Pickup Notification Sample and Contents.
Stored Value Card Notification			
email (HTML format) or XML	SVC_OUT process in Working with Integration Layer Processes (IJCT)	Stored Value Card Notification	See Stored Value Card Notification Sample and Contents.
Gift Acknowledgement			
printed only	Pick slip generation or billing, depending on the setting of the Automatic Generation of Gift Acknowledgement (B92) system control value	N/A	See Gift Acknowledgement.
Pick Slips			
printed only	Streamlined Pick Slip Generation (WSPS)	N/A	See Pick Slip.

Generated Output	Generated Through:	Subject Line	Contents
Drop Ship Pick Slips			
printed only	Selecting Vendors for Drop Ship Processing (MDSP)	N/A	See Drop Ship Pick Slip/Invoice.
Refund Checks			
printed only	Processing Refunds (MREF)	N/A	See Refund Check.

When Does the System Generate an Email Notification?

- Order Confirmation Emails
- Shipment and Return Confirmation Emails
- Stored Value Card Notification Emails
- Quote Confirmation Emails
- Purchase Order Emails
- Oracle Retail Customer Engagement Loyalty Registration Notifications
- Other Email Notifications

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

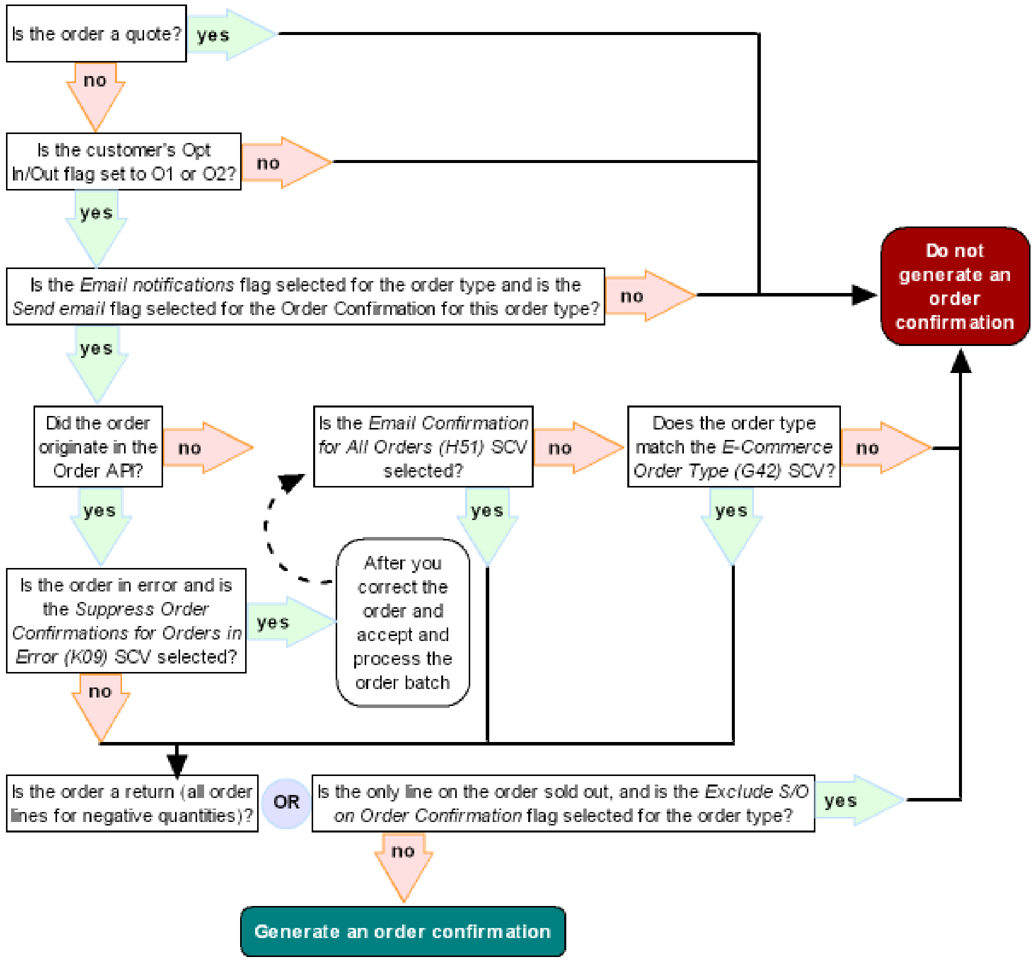
Order Confirmation Emails

An order is eligible for an order confirmation email or *Outbound Email XML Message (CWEmailOut)* if:

- the order is not a quote, and
- the Email notification flag for the order type is selected, and,
- the Send email flag for the Order Confirmation is selected for the order type at the Order Type Email Selection Screen, and
- the customer's Opt-in/out setting (see Determining the Opt-in/out Setting) is O1 or O2, and
- the customer has an Email address; and,
- the order includes one or more lines with a positive quantity, and
- the order includes lines other than a soldout item, or the Exclude S/O on order confirmation is unselected, and
  - the E-Mail Order Confirmations for All Orders (H51) is selected, or
  - the order type matches the E-Commerce Order Type (G42).

> **Note:**
>
> - If you delete the email address and the Suppress Email Address Search (J09) system control value is selected, the system does not generate order-related emails for the order. See that system control value for more information.
> - The system does not confirm that the customer's email address is a valid, existing address.
> - The XML only? flag for the Order Confirmation template used (at either the entity or company level) controls whether you generate an actual email notification or the *Outbound Email XML Message (CWEmailOut)*.
> - To generate an actual email (rather than the *Outbound Email XML Message (CWEmailOut)*), you need to have the Order Acknowledgement Program (G50) system control value set to OrdConf or to the name of your unique HTML-based email program. To generate the *Outbound Email XML Message (CWEmailOut)*, you have to set the system control value to any value, but it cannot be blank.
> - If the Suppress Order Confirmations for Orders in Error (K09) system control value is unselected and there are any errors on the order, the generated email might not be formatted correctly. For example, if there is not sufficient valid information for the shipping address on the order, this name and address are omitted from the generated email.
> - If the order includes multiple shipping addresses, the system generates a separate confirmation for each ship-to.
>
> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

For more information: See Email Setup within Order Administration for more information on the hierarchies that control the email text template and "from" email address for the order confirmation email, and that determine whether to generate the *Outbound Email XML Message (CWEmailOut)* or an actual email.



Generated when? The order confirmation email or *Outbound Email XML Message (CWEmailOut)* is generated automatically when the order is created, either through interactive order entry or the order API (order API orders); however, if an order created through the order API is in error and the Suppress Order Confirmations for Orders in Error (K09) system control value is selected, the order confirmation is not generated until you correct any errors and accept and process the corrected order batch.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

If you enter the order through interactive order entry, the confirmation is not generated while the order is still suspended in a batch. Once you accept the order, the system generates the confirmation.

For more information: See the Order Confirmation Email Sample and Contents.

Shipment and Return Confirmation Emails

The system generates a shipment or return confirmation email or *Outbound Email XML Message (CWEmailOut)* only if:

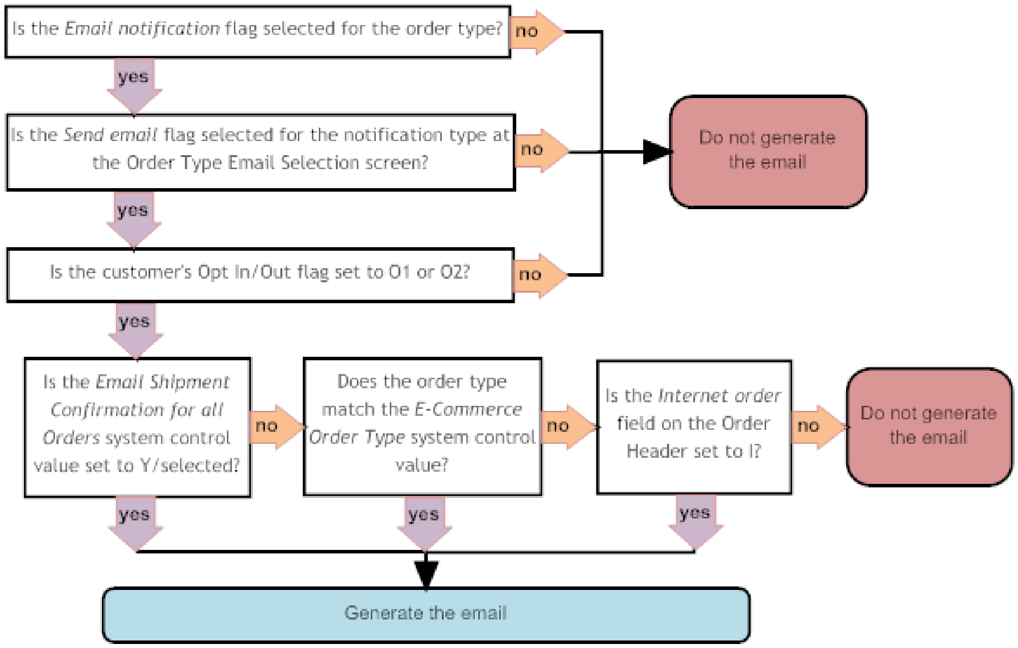
- the Email notification flag for the order type is selected, and,
- the Send email flag for the notification type is selected at the Order Type Email Selection Screen, and
- the customer's Opt-in/out setting (see Determining the Opt-in/out Setting) is O1 or O2, and,

- the customer has an *Email address*, and,
  - the E-Mail Shipment Confirmations for All Orders (H52) system control value is selected, or,
  - the order type matches the Return Disposition Code to Exclude in ORCE Sales Feed (M22), or
  - the Internet order field in the Order Header table is set to I
- for return confirmations, the return disposition code for the return does not match the return disposition code defined in the Return Disposition Code to Exclude in ORCE Sales Feed (M22) system control value and the Suppress refund field in the Order Payment Method table is N or blank.

Note:

- If you delete the email address and the Suppress Email Address Search (J09) system control value is selected, the system does not generate order-related emails for the order. See that system control value for more information.
- The system does not confirm that the customer's email address is a valid, existing address.
- The XML only? flag for the Shipment or Return Confirmation template used (at either the entity or company level) controls whether you generate an actual email notification or the *Outbound Email XML Message (CWEmailOut)*.
- To generate an actual shipment confirmation email (rather than the *Outbound Email XML Message (CWEmailOut)*), you need to have the Shipment Confirmation Program (G51) system control value set to ShpConf or to the name of your unique HTML-based email program.
- Similarly, to generate an actual return confirmation email, you need to set the Return Confirmation E-Mail Program (H53) system control value to RtnConf or to the name of your unique HTML-based email program.
- To generate the *Outbound Email XML Message (CWEmailOut)*, you have to set the system control value to any value, but it cannot be blank.

  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
- There is a separate shipment confirmation email for each invoice for the order billed on a given date.



You can generate shipment and return confirmation emails or the *Outbound Email XML Message (CWEmailOut)* through:

- billing if the Send Shipment Confirmation from Billing (L98) system control value is selected
- Sending Internet Order Ship Confirmation (ESCF)
- the ECSHCNF periodic function; see Working with Periodic Functions (WPER)
- If you do not consolidate invoices, the system keeps track of the shipment and return confirmation emails that it has generated by invoice number and date so that you can stop and restart email generation for a single date without risk of generating a duplicate email to a customer. See Stopping and Restarting Shipment and Return Confirmation Emails for an overview and more background.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

For more information: See the Shipment Confirmation Email Sample and Contents and Return Confirmation Email Sample and Contents.

Stored Value Card Notification Emails

The system generates a stored value card notification or outbound XML message when the SVC_OUT job processes an approved stored value card activation request if:

- The SVC type field for the stored value card item is E or V.
- An email address is defined for the stored value card recipient. The system uses the Stored Value Card Email Hierarchy to determine the email address to send a Stored Value Card Notification email to the stored value card recipient.
- The Stored Value Card Email Notification Program (I30) system control value specifies a program name. The base program is SVCNOTF.

The system does not look at the Email notification setting for the order type to determine whether to generate an email.

The system does not look at the Email notification setting for the order type to determine whether to generate an email.

Note:

- The system generates this email notification regardless of the setting of the Suppress Email Address Search (J09) system control value.
- The XML only flag for the Stored Value Card notification template used (at either the entity or company level) controls whether you generate an actual email notification or the *Outbound Email XML Message (CWEmailOut)*.
- To generate an actual stored value card confirmation email (rather than the *Outbound Email XML Message (CWEmailOut)Outbound Email XML Message (CWEmailOut)*), you need to have the Stored Value Card Email Notification Program (I30) system control value set to SVCNOTF or to the name of your unique HTML-based email program. To generate the *Outbound Email XML Message (CWEmailOut)*, you have to set the system control value to any value, but it cannot be blank.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Important:

The outbound XML version specified for the EMAIL_OUT process in Working with Integration Layer Processes (IJCT) must be set to at least 4.0 in order to generate email or XML stored value card notifications.

For more information: See Stored Value Card Notification Email for more detail

Quote Confirmation Emails

A pre-order quote is eligible for a quote confirmation email or *Outbound Email XML Message (CWEmailOut)* if:

- the Status of the order is Quote.
- the customer or order has an Email address; and,
- the Quote Confirmation Email Program (K74) system control value contains a valid email program. The base email program for quote confirmations is QUOCONF.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In addition, for quotes entered through the order API:

- the quote passes web order validation, and
- the Quote field and Email notification field for the order type are selected, and,
- the customer’s Opt-in/out setting (see Determining the Opt-in/out Setting) is O1 or O2

For quotes entered through interactive order entry, the system does not look at the Email notification setting for the order type or at the customer's Opt in/out setting to determine whether to generate the Quote confirmation.

Note:

- The system does not confirm that the customer's email address is a valid, existing address.
- The XML only? flag for the Quote Confirmation template used (at either the entity or company level) controls whether you generate an actual email notification or the *Outbound Email XML Message (CWEmailOut)*.
- To generate an actual email (rather than the *Outbound Email XML Message (CWEmailOut)*), you need to have the Quote Confirmation Email Program (K74) system control value set to QUOCONF or to the name of your unique HTML-based email program. To generate the *Outbound Email XML Message (CWEmailOut)*, you have to set the system control value to any value, but it cannot be blank.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Generated when? The quote confirmation email or *Outbound Email XML Message (CWEmailOut)* is generated when you select the Email Quote option on the Print/Email Quote Window.

The system does not look at the Email notification setting for the order type to determine whether to generate a quote confirmation.

For more information: See the Quote Confirmation Email Sample and Contents.

Membership Cancellations

Generated when? If the Membership Cancellation Email Program (K77) system control value specifies a valid program name, the system generates membership cancellation emails when you cancel a customer membership through Working with Customer Memberships (WWCM). These emails are not generated when you cancel the membership item through order maintenance.

Which entity? The membership's Default source indicates the entity associated with the customer membership for the purposes of determining the email template text.

Loyalty memberships: Email confirmations are also generated for loyalty memberships if you cancel them rather than deactivating them or having the system deactivate them automatically due to order cancellations or returns. Since loyalty memberships are not associated with a specific order or source code, they cannot use an entity-level template, and instead they always use the template set up through the Work with E-Mail Template Screen. Also, since loyalty memberships do not actually generate orders, both the sold-to and ship-to customer indicated in the email identify the customer possessing the loyalty membership.

Customer note: The system writes a customer note, such as Memship Cancel Conf to ejohnson@example.com, when it generates the membership cancellation email or XML message. The user ID associated with the customer note indicates the person who canceled the membership. The note is written even if the email might not actually be deliverable to the customer (for example, if there is a problem with the customer's email address). Also, the note is written for the sold-to customer, even if the notification email was sent to a recipient.

Determining the email address: The email is sent to the email address of the customer ultimately receiving the membership orders, such as the recipient customer or a permanent ship-to address, provided there is a valid email address for that address and the opt-in/out setting is O1 or O2. If there is no alternate shipping address, the email is sent to the customer purchasing the membership. If the customer's opt-in/out setting is O1 or O2 but there is no email address specified, the system writes a message to the APP.log, indicating that the email address is unresolved. See Logs for more information.

The system does look at the Email notification setting for the order type originating the membership, or assigned to generated orders, to determine whether to generate an email.

For more information: See the Membership Cancellation Notification Sample and Contents.

Purchase Order Emails

Generated when? Emailing the purchase order instead of printing it is available when:

- the Email Purchase Order (K80) system control value is selected, and
- the vendor's Email P/O flag is selected, and
- the vendor has a valid Email address.
- **Which menu options support emailing the purchase order?** If the above conditions are true, you can email purchase orders through the Print PO Selection Screen screen in Printing Purchase Orders (MPRP), and through the Print P/O Window in purchase order maintenance and inquiry.

> **Note:**
>
> You cannot email purchase orders through Selecting Vendors for Drop Ship Processing (MDSP).

Separate emails: The system always generates a separate email for each purchase order, even if you select a range of date or purchase orders through Printing Purchase Orders (MPRP).

Which print program is used? In most cases, the .PDF attached to the email is generated with the PO Print Program (C64);; however, if you are using Printing Purchase Orders (MPRP) and print by purchase order number sequence, the PO Print Program for PO Print in PO Sequence (C76) is used.

Email template: The text in the email is derived from the Purchase Order template set up through the Change E-Mail Template Screen in Working with E-Mail Notification Templates (WEMT). Things to note about the Purchase Order template:

- Unlike other email templates, this template is not available at the entity level, since the purchase order is not related to a specific entity.
- The generated email is plain text, with the purchase included as a .PDF attachment. The XML only flag is not available for this template, and you cannot generate the *Outbound Email XML Message (CWEmailOut)*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

- Because the Purchase Order email does not include any details, you would not normally enter the Text to print below items. If you do so, this text appears several lines below the Text to print above items in the generated email.
- The “from” email address is derived from the company (see Working with Companies (WCMP). If no email address specified for the company, the “from” email address is from the from.email specified through Email Properties.
- The subject of the email is Purchase Order - PO # 1234567, where 1234567 is the purchase order number.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Store Pickup Notifications

The store pickup notification email indicates that a customer’s order is ready for pickup at the selected store. The system generates the store pickup notification when it receives the CWEmailRequest message for an external system, where the order has been assigned, provided that:

- the Email notification field for the order type is selected, and
- the Opt-in/out setting (see Determining the Opt-in/out Setting) for the email address on the order is O1 or O2, and
- there is a valid email generation program specified for the Store Pickup Confirmation Email Program (L48) system control value.

For more information: See:

- Store Pickup Orders for an overview on store pickup orders
- the Store Pickup Confirmation Email Program (L48) and the Email Request Message (CWEmailRequest) for information on when the system generates the notification
- Store Pickup Notification Sample and Contents for a sample email

> **Note:**
>
> Order Orchestration’s Store Connect module does not use this notification email; instead, you can use Order Orchestration to generate a notification to the customer.

Oracle Retail Customer Engagement Loyalty Registration Notifications

The Oracle Retail Customer Engagement loyalty registration notification email indicates that a customer has successfully registered in the Oracle Retail Customer Engagement Loyalty program. The system generates the Oracle Retail Customer Engagement loyalty registration notification when a loyalty card is assigned to a customer while Registering a Customer in the Customer Engagement Loyalty Program, provided that:

- the Opt-in/out setting (see Determining the Opt-in/out Setting) for the email address is O1 or O2, and

- the Oracle Retail Customer Engagement Card Inquiry Response returned from Oracle Retail Customer Engagement contains a loyalty card number, and
- there is a valid email generation program specified for the ORCE Loyalty Registration Notification Email Program (M10) system control value.

For more information: See:

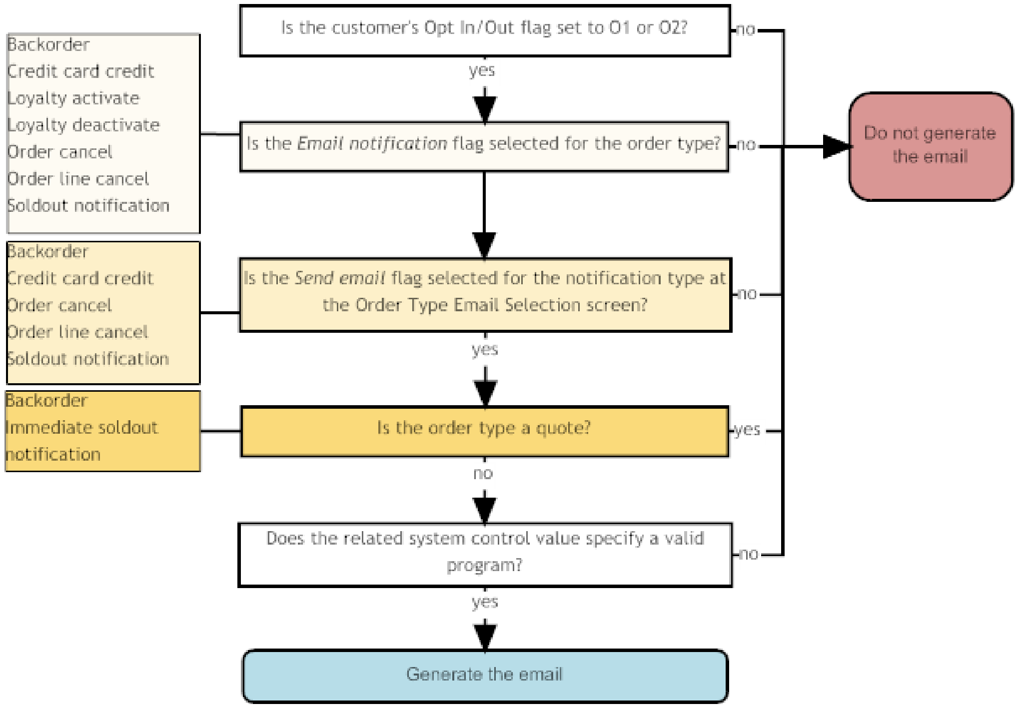
- Customer Engagement Loyalty Integration for an overview on Loyalty processing, including setup.
- the ORCE Loyalty Registration Notification Email Program (M10) for information on when the system generates the notification.
- Oracle Retail Customer Engagement Loyalty Registration Notification Sample and Contents for a sample email.

Other Email Notifications

Backorder, soldout, cancellations, loyalty membership activation or deactivation, credit card credit notifications, “contact us” emails, credit card decline emails, maintenance failure, and order or order line cancellation confirmation emails: The system generates an email, rather than including the notice in a document (if applicable), only when:

- the Email notification field for the order type is selected, and
- if the notification type is listed at the Order Type Email Selection Screen, the Send email flag is selected, and
- the Opt-in/out setting (see Determining the Opt-in/out Setting) for the email address on the order is O1 or O2, and
- there is a valid email generation program specified for the related system control value.

Generation of other notification emails: The rules on generating other emails besides the types called out separately above are illustrated below.



Affected by settings at the order type? The settings at the order type include the Email notification flag and the Send email flag available for selected notifications for that order type. Order type settings control the generation of backorder notices, credit card credit acknowledgements, order or order line cancellation confirmations, and loyalty activation and deactivation notices. Also, the settings control the generation of quote confirmations for orders received through the order API as well as order confirmations and shipment and return confirmations, as described above.

Not affected by settings at the order type: The settings at the order type do not control the generation of membership cancellations, stored value card notifications, “contact us” emails, maintenance failure notifications, or credit card decline notifications.

Note:

- If you delete the email address and the Suppress Email Address Search (J09) system control value is selected, the system does not generate order-related emails for the order. See that system control value for more information.
- The system does not confirm that the customer’s email address is valid.
- The customer API does not generate notification emails when it activates or deactivates a loyalty membership; these emails are generated only as a result of order activity. See *Generic Customer API* and v for more information.
- The XML only? flag for the template used controls whether you generate an actual email notification or the For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).. See Email Setup within Order Administration for more information on how the system determines the setting of the XML only? flag.

- This Email notification flag for the order type does not control email generation for "contact us" emails, loyalty activation or deactivation notices, maintenance failure notices, or credit card decline notices.
- Quotes are not subject to most of the notification types described above; however, the system does generate the soldout notification for a quote if you use Process Auto Soldouts to sell out the item and the quote is otherwise eligible for emails based on the criteria that apply to other order types.

Backorder, soldout, "contact us," credit card credit, and credit card decline notifications:

- To generate an actual notification email (rather than the Outbound Email XML Message (CWEmailOut)), you need to have set the related system control values correctly:

  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
- the Backorder Notification E-Mail Program (G95) system control value set to BONOTF or to the name of your unique HTML-based email program.
- the Soldout Notification E-Mail Program (G96) must be set to SONOTF or to the name of your unique HTML-based email program.
- the Credit Card Credit Acknowledgement E-Mail Program (H08) must be set to CCCNOTF or to the name of your unique HTML-based email program.
- the Credit Card Decline Email Program (K53) must be set to CDECLNOTF or to the name of your unique HTML-based email program.
- the Contact Us Email Program (K54) must be set to CTUSNOTF or to the name of your unique HTML-based email program. This email is generated on demand, and not produced automatically by the system. See Summary of Customer Correspondence for more information on when the option to generate the "Contact Us" email is available.
- the Order Cancellation Email Program (K78) must be set to ORDCANNOTF or to the name of your unique HTML-based email program.
- the Order Line Cancellation Email Program (K79) must be set to ORDLCANOTF or to the name of your unique HTML-based email program.
- for both the order and order line cancellation emails, the cancel reason code used must not match the Cancel Reason Code to Suppress Email (L08).
- To generate the Outbound Email XML Message (CWEmailOut), you have to set the related system control value to any value, but it cannot be blank.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Determining the Opt-in/out Setting

The system uses the following hierarchy to determine the opt-in/out setting to use when generating emails:

1. Check the Customer Sold To Email Address table for an email address that matches the email address on the order. If there is a match, use that Opt in/Opt out setting; otherwise,
2. Use the customer's Opt in/Opt out setting

Additional Information about Email Notifications

Related system control values: See System Control Values Related to Email Generation for a listing.

Template text hierarchy: See Email Text Templates for information on how the system determines which text template to use. The XML only? setting applied is usually the one from the text template used; see HTML Email or Outbound Email XML Message? for information.

Order history message: The system writes an Order Transaction History message when it generates an email or the *Outbound Email XML Message (CWEmailOut)*. You can review these messages at the Display Order History Screen.

Save in email repository? The Write Outbound Email to Email Repository (H99) system control value controls whether header information on email notifications or the *Outbound Email XML Message (CWEmailOut)* are stored in correspondence history. If the system control value is selected, the system records the correspondence history regardless of whether you generate an actual email or the *Outbound Email XML Message (CWEmailOut)*. See this system control value for more information on identifying and reviewing outbound emails for a customer.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> The system does not retain the body of outbound emails in correspondence history, only the header information, such as the date, subject, and "to" email address.

Selection hierarchy for the "From" email address: See "From" Email Address for information.

HTML Format Notification Samples and Contents

The system generates HTML format emails for the notification types described below if the XML only? flag for the template is unselected. If the flag is selected, the system generates the *Outbound Email XML Message (CWEmailOut)* instead.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

The contents of each of the HTML emails are derived from the *Outbound Email XML Message (CWEmailOut)*. The EMAIL_OUT process must be set to generate the most recent version of the outbound message in order to generate all of these email notifications correctly.

All other email notification types besides these notification types use the simple format described below under Simple Format Notification Sample.

Sample HTML messages:

- Order Confirmation Email Sample and Contents
- Shipment Confirmation Email Sample and Contents
- Return Confirmation Email Sample and Contents
- Backorder Notification Email Sample and Contents
- Credit Card Credit Acknowledgement Email Sample and Contents

- Soldout Notification Email Sample and Contents

Contents: The contents of the order confirmation email are derived from the *Outbound Email XML Message (CWEmailOut)* as follows:

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Preliminary Information:

- greeting: The word Dear followed by the:
- *sold_to_fname*, if any; otherwise,
- *sold_to_fname*, if any; otherwise,
- **Valued customer**

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> Each of the above is in lower case, with just the first letter of the first word capitalized.

- text: *before_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

Order Summary:

- Order #: *order_nbr* and *order_ship_to*, separated by a hyphen
- Order Date: *order_date*
- for each item/SKU ordered:
  - Item/SKU: *odt_item* and *odt_SKU*, if any, separated by a slash; however, this is the *odt_alias_item* if the customer ordered by alias, regardless of the setting of the Display Item Alias (D56) system control value
  - Quantity: *odt_qty*
  - Price: *odt_price*
  - Extended Price: *odt_extended_price*
  - Status: *odt_availability_msg*; indicates whether the item is: In stock Backordered (including order lines that are not reserved because they have future arrival dates); a brokered backorder being fulfilled through the Order Orchestration Integration (Store Ship); a drop ship (includes an Exp Date); flagged for pickup at a designated store location through the Order Orchestration Integration (Store Pickup); or sold out (No longer available). The Status Message for E-Commerce Partial Reserved Lines (G52) system control value controls whether to list partially reserved lines as Backordered or Reserved, or to include details (for example, 7 reserved, 3 B/O).

    For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> If the background jobs are not running and the order ships before the order confirmation email is generated, the status of the shipped order lines is indicated as In stock.

- Expected Date: *odt_expected_ship_date*; included only if the item is backordered or drop ship
- item description: *odt_item_desc*
- SKU description: *odt_SKU_desc*, if any (included only if the item has SKU's)
- custom special handling: *osf_label* and *osf_input*, if any (included only if item is assigned custom special handling) All custom special handling is included, even handling whose Suppress S/H window flag is set to Suppress. The system includes the osf_label even when the osf_input is blank. **Note:** The order confirmation does not include line level special handling charges since these charges are included at the order level.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

- totals:
  - Merchandise: *ost_merch*
  - Shipping and Handling: *ost_freight*, *ost_addl_freight*, *ost_hand*, and *ost_addl_charge*
  - Tax: *ost_tax*
  - Total: *ost_total_amt*

Contents: The contents of the shipment confirmation email are derived from the *Outbound Email XML Message (CWEmailOut)* as follows:

Preliminary Information:

- greeting: The word Dear followed by the:
- *sold_to_fname*, if any; otherwise,
- *sold_to_company*, if any; otherwise,

  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

- Valued customer

> **Note:**
>
> Each of the above is in lower case, with just the first letter of the first word capitalized.

- text: *before_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

Shipment Summary:

- Order #: *order_nbr* and *order_ship_to*, separated by a hyphen
- Order Date: *order_date*
- Date Shipped: *ist_ship_date*
- Amount Charged: *ist_ship_total_amt*
- Items included in this shipment:
  - Item/SKU: *idt_item* and *idt_SKU*, if any, separated by a slash; however, this is the *idt_alias_item* if the customer ordered by alias, regardless of the setting of the Display Item Alias (D56) system control value
  - Quantity: *idt_ship_qty*
  - item description: *idt_item_desc*
  - SKU description: *idt_SKU_desc*, if any (included only if the item has SKU's)
- Here are your tracking numbers for the items that shipped:
  - Carrier: *tracking_ship_via_desc*.
  - Tracking Number: *tracking_nbr*, made into a live link to the shipper's web site using the *tracking_URL*.

    Brokered backorder? If the item was a brokered backorder shipped through integration with Order Orchestration, then the ship via description is listed only if Order Orchestration passed a valid ship via code set up in Order Administration; otherwise, the message lists the shipping agent passed from Order Orchestration. In this case, the tracking number is not a live link. Also, if a brokered backorder ships on the same day as a warehouse shipment, the shipment confirmation email includes both the tracking numbers. This occurs regardless of whether you consolidate invoices. See Brokered Backorders for more information.

  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> If the order includes two invoices on the same date, one for a brokered backorder with a tracking number, and another shipment without a tracking number, the tracking number from the brokered backorder is indicated for both shipments. A shipment might not have a tracking number if, for example, you confirm a drop shipment or use manual confirmation.

- Ship
  To: *ship_to_company*, *ship_to_fname*, *ship_to_minitial*, *ship_to_lname*, *ship_to_addr1*, *ship_to_addr2*, *ship_to_addr3*, *ship_to_addr4*, *ship_to_apt*, *ship_to_city*, *ship_to_state*, *ship_to_postal*, *ship_to_country*
- Sold
  To: *sold_to_company*, *sold_to_fname*, *sold_to_minitial*, *sold_to_lname*, *sold_to_addr1*, *sold_to_addr2*, *sold_to_addr3*, *sold_to_addr4*, *sold_to_apt*, *sold_to_city*, *sold_to_state*, *sold_to_postal*, *sold_to_country* Customer #: *sold_to_nbr*

Closing: *after_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Return Confirmation Email Sample and Contents

See Shipment and Return Confirmation Emails for more information on how to generate this email.

Dear Thomas,

Your return has successfully been processed. You will receive a credit for the amount of the return shortly. If you have any questions, you can call our toll free number 1-888-555-1085.

Return Summary

Order #:	5152 - 1
Order Date:	03/25/2015
Date Returned:	03/25/2015
Amount Credited:	124.95

Items included in this return:

Item/SKU	Quantity
RF123SKU4567/ROSE XSML WMNS	1
WOMEN'S ALL WEATHER PACKABLE RAIN JACKET	
WOMEN'S X-SMALL ROSE POCKET RAIN JACKET	

Regards,
Your friends at Example Retail.

  > **Note:**
  >
  > If the order includes two invoices on the same date, one for a brokered backorder with a tracking number, and another shipment without a tracking number, the tracking number from the brokered backorder is indicated for both shipments. A shipment might not have a tracking number if, for example, you confirm a drop shipment or use manual confirmation.

> **Note:**
>
> If no items were returned: If the order was credited through the application of a negative additional charge rather than processing a return, no item/SKUs are listed. Instead, a message indicates: There were no items associated with this return. A miscellaneous credit was processed on your order. However, the Item/SKU and Quantity headings are still included in the email.

Closing: *after_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

Backorder Notification Email Sample and Contents

You can generate first, second, and continue backorder notifications through the Generate Backorder Notices (GBOC) and Working with Backorders Pending Cancellation (WBPC) menu options. See Other Email Notifications for more information on how to generate these emails.

Dear Thomas,

We regret to inform you that one or more of the items that
you have ordered is on backorder.
You can review your order at example.com to see the next
date we expect to be able to fulfill the backordered item.
If you would like to change your order, please call our toll
free number 1-888-555-1085 and have your order number handy.

Credit Card Decline Notification Sample and Contents

The pick slip generation program generates these emails to customers when their orders have been placed on hold due to a declined authorization. Also, the REAUTH periodic function generates them; see REAUTH Processing for background. See Summary of Customer Correspondence for more information.

Dear Thomas,

Please contact us to resolve an issue with your order
so that we can fulfill it as soon as possible. You can call
us at 1-800-555-0185 or email us at billing@example.com.
We look forward to hearing from you.

Regards,
Your friends at Example Retail.
Visit us at example.com!

Contents: The contents of the order line cancellation confirmation email are derived from the *Outbound Email XML Message (CWEmailOut)* as follows:

Preliminary Information:

- greeting: The word Dear followed by the:
  - *sold_to_fname*,, if there is a sold-to name; otherwise,
  - Valued customer

  For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

  > **Note:**
  >
  > Each of the above is in lower case, with just the first letter of the first word capitalized.

- text: *before_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

Order Line Cancellation Summary:

- Order #: *order_nbr* and *order_ship_to*, separated by a hyphen

- Order Date: *order_date*
- For each order line canceled during the order maintenance session or other activity, such as Working with Backorders Pending Cancellation (WBPC):
  - Item/SKU: *odt_item* and *odt_SKU*, if any, separated by a slash; however, this is the *odt_alias_item* if the customer ordered by alias, regardless of the setting of the Display Item Alias (D56) system control value
  - Quantity: *odt_qty_cancelled*, the total quantity canceled at this time, even if multiple cancel reason codes were used in order maintenance. Does not include any previous quantity canceled.
  - item description: *odt_item_desc*
  - SKU description: *odt_SKU_desc*, if any (included only if the item has SKU's)

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> Order lines that were previously canceled or sold out are not listed; also, any order lines canceled using the Cancel Reason Code to Suppress Email (L08) are omitted.

- Remaining Unshipped or Open Items:
- For each remaining open or held order line:
  - Item/SKU: *odt_item* and *odt_SKU*, if any, separated by a slash; however, this is the *odt_alias_item* if the customer ordered by alias, regardless of the setting of the Display Item Alias (D56) system control value
  - Quantity: *odt_qty*, the open or held quantity remaining on the order line
  - Status: *odt_availability_msg*; indicates whether the item is In stock Backordered (including order lines that are not reserved because they have future arrival dates); being fulfilled through the Order Orchestration Integration (Store Ship); drop ship (includes an Exp Date); or sold out (No longer available). The Status Message for E-Commerce Partial Reserved Lines (G52) system control value controls whether to list partially reserved lines as Backordered or Reserved, or to include details (for example, 7 reserved, 3 B/O).
  - Expected Date: *odt_expected_ship_date*; included only if the item is backordered or drop ship
  - item description: *odt_item_desc*
  - SKU description: *odt_SKU_desc*, if any (included only if the item has SKU's)

Purchasing Information:

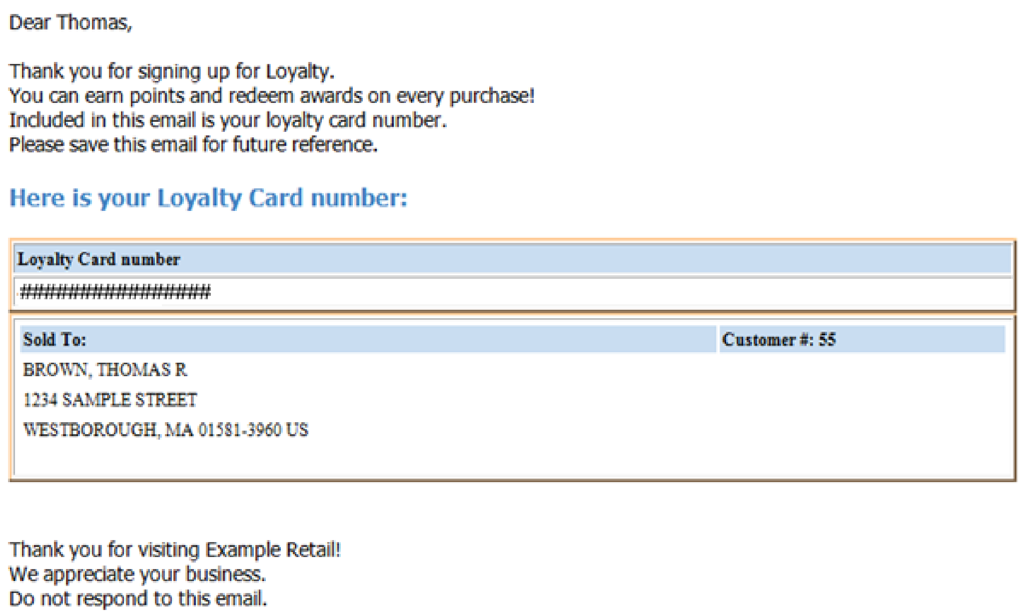
- Ship To: *ship_to_company*, *ship_to_fname*, *ship_to_minitial*, *ship_to_lname*, *ship_to_addr1*, *ship_to_addr2*, *ship_to_addr3*, *ship_to_addr4*, *ship_to_apt*, *ship_to_city*, *ship_to_state*, *ship_to_postal*, *ship_to_country*
- Sold To: *sold_to_company*, *sold_to_fname*, *sold_to_minitial*, *sold_to_lname*, *sold_to_addr1*, *so*

ld_to_addr2, *sold_to_addr3*, *sold_to_addr4*, *sold_to_apt*, *sold_to_city*, *sold_to_state*, *sold_to_postal*, *sold_to_country* Customer #: *sold_to_nbr*

Closing: *after_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Oracle Retail Customer Engagement Loyalty Registration Notification Sample and Contents



Dear Thomas,

Thank you for signing up for Loyalty.
You can earn points and redeem awards on every purchase!
Included in this email is your loyalty card number.
Please save this email for future reference.

Here is your Loyalty Card number:

Loyalty Card number
##################

Sold To:	Customer #: 55
BROWN, THOMAS R	
1234 SAMPLE STREET	
WESTBOROUGH, MA 01581-3960 US	

Thank you for visiting Example Retail!
We appreciate your business.
Do not respond to this email.

See the ORCE Loyalty Registration Notification Email Program (M10) for information on how to generate this email.

Contents: The contents of the Oracle Retail Customer Engagement loyalty registration notification email are derived from the *Outbound Email XML Message (CWEmailOut)* as follows:

Preliminary Information:

- greeting: The word Dear followed by the:
  - *sold_to_fname*, if there is a sold-to name; otherwise,
  - *sold_to_company* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

    > **Note:**
    >
    > Each of the above is in lower case, with just the first letter of the first word capitalized.

- text: *before_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

- Here is your Loyalty Card number: the loyalty card number generated and signed to the customer from Oracle Retail Customer Engagement.
- Sold
  To: *sold_to_company*, *sold_to_fname*, *sold_to_minitial*, *sold_to_lname*, *sold_to_addr1*, *sold_to_addr2*, *sold_to_addr3*, *sold_to_addr4*, *sold_to_apt*, *sold_to_city*, *sold_to_state*, *sold_to_postal*, *sold_to_country* Customer #: *sold_to_nbr*

Closing: *after_line_msg*. The email includes a line break (
) between each line entered at the Change E-Mail Template Screen.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Simple Format Notification Sample

The loyalty activation/deactivation and purchase order use a simple email format such as the following.

From: customer_servoce@example.com

Sent: Friday, February 2, 2009 4:22 p.m.

To: ebrown@example.com

Subject: PREFERRED Activation

We are pleased to tell you that your recent order qualifies you for membership in our Preferred Members Club. Club members receive a 5% discount on all orders and free ground shipping.

GUESTVIP12 000000038

Sold To: JONES, MICHAEL Customer #: 13082

PREFERRED MEMBERS CLUB   PREFERRED

Welcome to the club! We appreciate your business.

Work with E-Mail Template Screen

Purpose: Use this screen to enter boilerplate company-wide text to include in email notifications.

Overrides? You can also enter override text templates at the entity level, or overrides for certain notification types at the order type level and the entity/order type level. See Email Text Templates for more information.

How to display this screen: Enter WEMT in the Fast path field at the top of any menu, or select Work with E-Mail Templates from a menu.

Field	Description
Notice type	Indicates the type of email notification. Available templates are: • Backorder 1st notice (template type B1) • Backorder 2nd notice (template type B2) • Backorder continue notice (template type B3) • C/C credit acknowledgment (template type C1) • Contact us (template type CU) • Credit Card Decline (template type (CX) • Loyalty Activate Notice (template LA) • Loyalty Deactivate Notice (template LD) • Oracle Retail Customer Engagement Loyalty Registration Notice (template LR) • Maintenance Failure (template type ME) **Note:** The system generates maintenance failure notices in response to unsuccessful cancellation requests from the web storefront. • Membership Cancel Confirmation (template type MF) • Order Cancellation (template type OB) • Order Confirmation (template type OC) • Order Line Cancellation Confirmation (template type OL) • Purchase Order (template type PO) • Quote Confirmation (template type QC) • Return Confirmation (template type RC) • Soldout notification (template type S1) • Shipment Confirmation (template type SC) • Store Pickup Confirmation (template type SP) • Stored Value Card notification (template type SV) Alphanumeric, 25 positions; display-only.

Screen Option	Procedure
Enter or change the contents of an email notification template	Select Change for a template to advance to the Change E-Mail Template Screen.
Display the contents of an email notification template	Select Display for a template to advance to the Display E-Mail Template Screen. You cannot change any information at this screen. See the Change E-Mail Template Screen for field descriptions.

Change E-Mail Template Screen

Purpose: Use this screen to specify the standard text to include in one of the types of email notifications available in Order Administration at the company level.

Overrides? You can also enter override text templates at the entity level, and override certain notification types at the order type level and the entity/order type level. See Email Text Templates for more information.

How to display this screen: Select Change for a notice type at the Work with E-Mail Template Screen.

Field	Description
XML only	Indicates whether to generate the *Outbound Email XML Message (CWEmailOut)*) rather than an actual email notification. This XML message includes additional information that is not included in the standard email notice. You might choose to generate the XML message so that you can use the information to produce a reformatted HTML email that includes promotional material. See *Outbound Email XML Message (CWEmailOut)*) for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values are: Selected = Generate the *Outbound Email XML Message (CWEmailOut)*) rather than an actual email Unselected = Generate the email notification. See HTML Format Notification Samples and Contents for more information. **Note:** • This option is not available for the loyalty activation/deactivation or purchase order templates. • This setting applies if the system uses the associated text template. See HTML Email or Outbound Email XML Message? for more information.
Text to print above items	The standard text to include in each email above the information specific to the order, if the email is order-related. See the HTML Format Notification Samples and Contents and the Simple Format Notification Sample. Alphanumeric, ten 60-position lines; at least one line required.
Text to print below items	The standard text to include in each email below the information specific to the order, if the email is order-related. See the HTML Format Notification Samples and Contents and the Simple Format Notification Sample. **Note:** Not typically included for the purchase order email, since the email does not include any details. Alphanumeric, three 60-position lines; optional.

Completing this screen: Enter the text to appear in the email notification or to include in the *Outbound Email XML Message (CWEmailOut)*). You can type over existing text to change it, or delete it to clear a line. The text you enter will be included the next time you generate this type of email notification. Any lines that you leave blank will be omitted from the email.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Testing Email Generation (UEML)

Purpose: Use this option to generate a test email in order to confirm that Order Administration is correctly configured to generate emails.

This option does not support testing individual message notification types.

Send Email Message Screen

How to display this screen: Enter UEML in the Fast path field at the top of any menu or select Test Email from a menu.

Field	Description
To	The email address to receive the test email. **Note:** The system does not confirm that you enter a valid email address. Alphanumeric, 50 positions; required.
Subject	The text to use as the subject line for the test email. Alphanumeric, 44 positions; required.
Message	Up to four lines of text to include in the body of the email. Alphanumeric, 64 positions each; at least one line required.

Completing this screen: Complete the three fields and click OK to generate a test email.

Troubleshooting: See Emails Troubleshooting for some steps you can take to identify whether the Order Administration application is configured correctly to generate emails.

Sending Internet Order Ship Confirmation (ESCF)

Purpose: Use the Send Internet Order Ship Confirmation menu option to generate email notifications or the *Outbound Email XML Message (CWEmailOut)*) to customers when an order shipment or return takes place. The confirmation is sent to the order-level email address on the order; see Working with an Order-Level Email Address.

Confirmations for all orders? See Shipment and Return Confirmation Emails for a discussion of which orders are eligible to generate these email confirmations based on the settings in your company and the customer’s email information.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Generate shipment confirmation during billing? If the Send Shipment Confirmation from Billing (L98) system control value is selected, the system generates shipment and return confirmations during billing. You can still use this menu option to generate an additional shipment or return confirmation. See this system control value for more information.

> **Note:**
>
> If you use the Narvar Integration, Narvar generates shipment confirmation emails to the customer based on an order request message sent through billing, and the shipment confirmation is not generated through the process described here.

Periodic function: You can also use the periodic function ECSHCNF (program name = ECR0154) to generate shipment and return confirmation emails or messages. See E-Commerce Setup.

About the outbound email XML message: See *Outbound Email API* for an overview.

For sample emails and more information: See Shipment Confirmation Email Sample and Contents and Return Confirmation Email Sample and Contents.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Interrupting or completing email generation: If you generate emails for a single day, the system keeps track of the last email generated so that you do not send the same email more than once; however, this option is not supported if you consolidate invoices. See Stopping and Restarting Shipment and Return Confirmation Emails for more information.

Save in email repository? The Write Outbound Email to Email Repository (H99) system control value controls whether the email notification or the *Outbound Email XML Message (CWEmailOut)* is stored in correspondence history. See this system control value for more information on identifying and reviewing outbound emails for a customer.

Order history message: When a shipment or return confirmation email or *Outbound Email XML Message (CWEmailOut)*) is sent, Order Administration creates an order history message such as Retrn Conf to acustomer@example.com. You can review order history messages at the Display Order History Screen.

No emails generated? If the Shipment Confirmation Program (G51) system control value is blank, or if you are generating an actual email (rather than the *Outbound Email XML Message (CWEmailOut)*) and the system control value is not set to ShpConf, no shipment confirmation emails are generated. Similarly, if the Return Confirmation E-Mail Program (H53) system control value is blank, or if you are generating an actual email (rather than the *Outbound Email XML Message (CWEmailOut)*) and the system control value is not set to RetConf, no return confirmation emails are generated.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Send Internet Shipment Confirmations Screen

How to display this screen: Enter ESCF in the Fast path field at the top of any menu, or select Send Internet Order Ship Confirmation from a menu.

Field	Description
From...	The first shipment date to include when generating shipment confirmations. All eligible orders with shipments on or after this date, and not later than the To date, are included for shipment confirmation. The current date defaults. Numeric, 6 positions (in user date format); required.
To...	The last shipment date to include when generating shipment confirmations. All eligible orders with shipments on or before this date, and not before the From date, are included for shipment confirmation. The current date defaults. Numeric, 6 positions (in user date format); required.

Instructions: To generate shipment confirmation emails and return confirmation emails or the *Outbound Email XML Message (CWEmailOut)*), override the From and To dates if necessary. Select Accept to generate the confirmation emails for the selected date(s).

For more information see the Web Services Guide on My Oracle Support (ID 2953017.1).

Stopping and Restarting Shipment and Return Confirmation Emails

Overview: When you generate shipment and return confirmation emails through the Send Internet Shipment Confirmations Screen or through the ECSHCNF periodic function, the system can keep track of the last email generated based on invoice number, enabling you to:

- generate confirmation emails throughout the day for new shipments
- continue email generation if you need to interrupt the process for any reason

Supported when? Stopping and restarting shipment and return confirmations is supported only if:

- the Consolidated Invoice (B49) system control value is not selected
- you do not enter a range of dates at the Send Internet Shipment Confirmations Screen. To be able to restart generation where you left off, you must make sure that the To...and From...dates are the same.

Otherwise, you do not have the option to restart the email generation process without generating duplicate emails.

How to stop email generation: To interrupt the generation of shipment and return confirmation emails, use the Purge Active Procedures Across Users (MACX) option to delete the active procedure with a Type of SC and a Program of ECR0154. After you delete the active procedure, the generation process might generate approximately 25 more confirmations before it stops.

Restarting email generation: To restart email generation where it left off for the date, simply run the periodic function or use the Send Internet Shipment Confirmations Screen to generate confirmations for the same date. Using the periodic function generates email confirmations for the current date, while the Send Internet Shipment Confirmations Screen enables you to specify a single date for email generation.

How does the system keep track? When you generate shipment and return email confirmations, the system writes a record in the Report Generic table noting the date and the last invoice number with a confirmation email generated. If you generate email confirmations again for that same date, the process starts with the next invoice number. Similar to the Active Procedure record, the Report Generic record has a Report type of SC. If for any reason you ever need to regenerate a group of confirmation emails again, you can use SQL to reset the last invoice number in that table before you restart the email generation process.

Workflow Management

Topics in this part: The following topics describe the functions available for workflow management.

- Workflow Management Overview and Setup provides an overview on workflow management and required setup.

- Working with Tickler User Groups (WTUG) explains how to create and work with tickler user groups.
- Working with Tickler Category (WTCT) explains how to create and work with tickler categories.
- Working with Tickler Resolution Reasons (WTRR) explains how to create and work with tickler resolution reasons.
- Working with Tickler Events (WTEV) explains how to define tickler event settings at the event level and event rule level and create, change, delete, and define procedures for event rules.
- Working with Tickler Users/User Groups (WTIC) allows workflow users to review and work with ticklers in the user's or user group's tickler work queue.
- Workflow Management (WWFM) allows workflow supervisors to review and work with ticklers in a tickler work queue.
- Purging Ticklers (MPTK) allows you to purge resolved ticklers by date range.

Working with Tickler User Groups (WTUG)

Purpose: Use this menu option to create, change, or display a tickler user group.

Tickler groups are groups of users that work with and resolve ticklers. You can assign users to a tickler user group on the Work with User Tickler Group Screen.

The Type field for the tickler group defines whether the users in the group are:

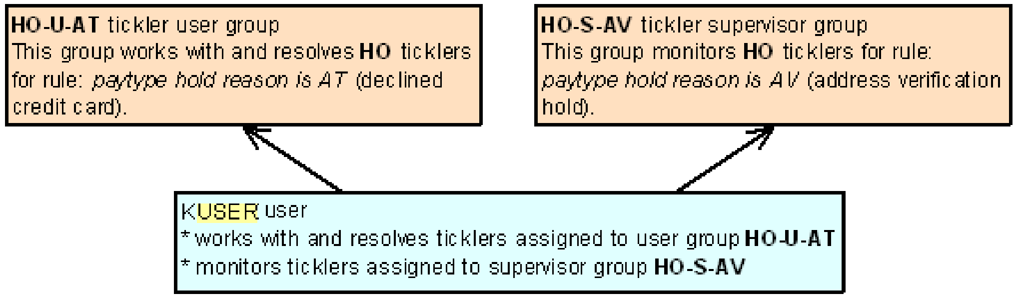
- tickler users (tickler group type U), indicating they work with ticklers assigned to their tickler user group using the Working with Tickler Users/User Groups (WTIC) menu option. Tickler users can work with ticklers assigned to them or their user group, but do not have access to any other ticklers.
- tickler supervisors (tickler group type S), indicating they monitor the ticklers assigned to their tickler user group using the Workflow Management (WWFM) menu option. Tickler supervisors can monitor all ticklers, regardless of the user or tickler user group assigned to the tickler.

When the system creates a tickler, the system assigns the tickler:

- to a tickler user group, if the event rule or event that created the tickler has an Assign to user group defined. Tickler users can work with ticklers for their group at the Work with Tickler Screen (group view).
- to a tickler supervisor group, if the event rule or event that created the tickler has a Supervisor group defined. Supervisors can monitor ticklers for their group at the Workflow Management screen (supervisor group view).

A user can belong to multiple tickler groups.

Example: User KBROWN belongs to the HO-U-AT user group (ticklers created for the HO event and the rule is paytype hold reason AT) and the HO-S-AV supervisor group (ticklers created for the HO event and the rule is paytype hold reason is AV).



In this topic:

- Work with Tickler User Group Screen
- Create Tickler User Group Screen
- Display Users In Group Screen

For more information:

- Workflow Management Overview and Setup
- Tickler Assignment

Work with Tickler User Group Screen

Purpose: Use this screen to create, change, or delete a tickler group. You can also define the users that belong to a tickler group.

> **Note:**
>
> This menu option is not company specific; tickler user groups are created across companies.

How to display this screen: Enter WTUG in the Fast path field or select Work with Tickler User Group from a menu.

Field	Description
Group ID	A code for a group of users that work with ticklers. Alphanumeric, 10 positions; optional.
Description	A description of the tickler group. Alphanumeric, 40 positions; optional.
Type	The type of tickler group. S = Tickler supervisor group. U = Tickler user group. Alphanumeric, 1 position; optional.

Screen Option	Procedure
Create a tickler group	Select Create to advance to the Create Tickler User Group Screen.

Screen Option	Procedure
Change a tickler group	Select Change for a tickler group to advance to the Change Tickler User Group Screen. You can change any field except the group ID code. See the Create Tickler User Group Screen for field descriptions.
Delete a tickler group	Select Delete for a tickler group to delete it. **Note:** The system allows you to delete a tickler group that is currently assigned to a tickler event, event rule, or open or in use tickler.
Display a tickler group	Select Display for a tickler group to advance to the Display Tickler User Group Screen. You cannot change any information at this screen. See the Create Tickler User Group Screen for field descriptions.
Review the users in a tickler group	Select Users in group for a tickler group to advance to the Display Users In Group Screen.

Create Tickler User Group Screen

Purpose: Use this screen to create a tickler group.

How to display this screen: Select Create at the Work with Tickler User Group Screen.

Field	Description
Group ID	A code for a tickler group. You cannot create a duplicate tickler user group: Tickler User Group already exists. The system considers a tickler group a duplicate if the group ID code is used for another tickler group, regardless of the setting of the Type field. For example, you cannot have a UP supervisor tickler group and a UP user tickler group. Alphanumeric, 10 positions. Create screen: required. Change screen: display-only.
Description	A description of the tickler group. Alphanumeric, 40 positions; required.
Type	Indicates the type of tickler group. Supervisor = Supervisor tickler group; users in this group monitor ticklers assigned to their group. User = User tickler group; users in this group work with and resolve ticklers assigned to their group. Alphanumeric, 1 position; required.

Field	Description
E-mail address	The email address associated with the tickler supervisor group; this is the email address where ticklers assigned to this tickler group are sent. You can enter an email address only for supervisor (type S) tickler groups. You can enter only one email address in this field. When you enter an email address, the system verifies that: • there is an @ sign and a period (.) • there is some text before the @ sign • there is some text between the @ sign and the period • there is some text after the period The system confirms that your entry meets certain minimum formatting requirements, but not that it represents a valid, active email address. Alphanumeric, 50 positions; optional.

Display Users In Group Screen

Purpose: Use this screen to review the users assigned to a tickler group.

You can assign users to a tickler group at the Work with User Tickler Group Screen.

How to display this screen: Select Users in group for a tickler group at the Work with Tickler User Group Screen.

Field	Description
Group ID	The code and description of the tickler group assigned to the displayed users. Code: Alphanumeric, 10 positions; display-only. Description: Alphanumeric, 40 positions; display-only.
User	The user ID of the user assigned to the tickler group. Alphanumeric, 10 positions; display-only.
Name	The name of the user assigned to the tickler group. Alphanumeric, 30 positions; display-only.

Working with Tickler Category (WTCT)

Purpose: Use this menu option to create, change, or delete a tickler category.

Tickler categories allow you to group ticklers by the event or event rule associated with the tickler. When you define settings for a tickler event or event rule, you can define the tickler category to assign to the ticklers created for the event/rule. You can scan for ticklers by tickler category at the Work with Tickler Screen (user/group view) (tickler users) and Workflow Management Screen (tickler supervisors).

Example: To view only ticklers created for a specific HO rule, create a tickler category for each HO rule you create. This way you can view all ticklers created for HO rule 1 (pay type hold reason is AT) versus ticklers created for HO rule 2 (order hold reason is SF). In this example, tickler category for rule 1 may be HAT and tickler category for rule 2 may be HSF.

In this topic:

- Work with Tickler Category Screen
- Create Tickler Category Screen

For more information:

- Workflow Management Overview and Setup.
- Working with Tickler Events (WTEV)

Work with Tickler Category Screen

Purpose: Use this screen to create, change, or delete a tickler category.

How to display this screen: Enter WTCT in the Fast path field or select Work with Tickler Category from a menu.

Field	Description
Cat (Category)	A code for a tickler category, used to group ticklers. Alphanumeric, 3 positions; optional.
Description	The description of the tickler category. Alphanumeric, 40 positions; optional.

Screen Option	Procedure
Create a tickler category	Select Create to advance to the Create Tickler Category Screen.
Change a tickler category	Select Change for a tickler category to advance to the Change Tickler Category Screen. You can change the description. See the Create Tickler Category Screen for field descriptions.
Delete a tickler category	Select Delete for a tickler category to delete it. **Note:** The system allows you to delete a tickler category that is currently assigned to a tickler event, event rule, or open or in process tickler.

Create Tickler Category Screen

Purpose: Use this screen to create a tickler category.

How to display this screen: Select Create at the Work with Tickler Category Screen.

Field	Description
Category	A code for a tickler category, used to group ticklers. You cannot create a duplicate tickler category: Tickler Category already exists. The system considers a tickler category a duplicate if the category code is used for another tickler category. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	A description of a tickler category. Alphanumeric, 40 positions; required.

Working with Tickler Resolution Reason (WTRR)

Purpose: Use this menu option to create, change, and delete tickler resolution reasons.

Tickler resolution reasons are assigned to ticklers once they are resolved, indicating the reason why the tickler is resolved.

You can define a tickler resolution reason for a tickler event or event rule; when the system creates a tickler for the tickler event/rule, the system updates the Resolution reason field in the Tickler table.

It is recommended you create at least 2 ticklers resolution reasons: one reason to use when the system resolves the tickler, and one reason to use when you manually resolve a tickler.

In this topic:

- Work with Tickler Resolution Reason Screen
- Create Tickler Resolution Reason Screen

For more information:

- Workflow Management Overview and Setup
- Working with Tickler Events (WTEV)

Work with Tickler Resolution Reason Screen

Purpose: Use this screen to create, change, and delete tickler resolution reasons.

How to display this screen: Enter WTRR in the Fast path field or select Work with Tickler Resolution Reason from a menu.

Field	Description
Rsn (Tickler resolution reason code)	A code for a tickler resolution reason, indicating the reason why the tickler is resolved. Alphanumeric, 3 positions; optional.
Description	A description of the tickler resolution reason. Alphanumeric, 40 positions; optional.

Screen Option	Procedure
Create a tickler resolution reason	Select Create to advance to the Create Tickler Resolution Reason Screen.
Change a tickler resolution reason	Select Change for a tickler resolution reason to advance to the Change Tickler Resolution Reason Screen. You can change the description. See the Create Tickler Resolution Reason Screen for field descriptions.
Delete a tickler resolution reason	Select Delete for a tickler resolution reason to delete it. **Note:** The system allows you to delete a tickler resolution reason that is currently assigned to a tickler event, event rule, or open or in process tickler.

Create Tickler Resolution Reason Screen

Purpose: Use this screen to create a tickler resolution reason.

How to display this screen: Select Create at the Work with Tickler Resolution Reason Screen.

Field	Description
Reason (Tickler resolution reason code)	A code for a tickler resolution reason, indicating the reason why the tickler is resolved. You cannot create a duplicate tickler resolution reason: Tickler Resolution Reason already exists. The system considers a tickler resolution reason a duplicate if the tickler resolution reason code is used for another tickler resolution reason. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Description	A description of the tickler resolution reason. Alphanumeric, 40 positions; required.

Working with Tickler Events (WTEV)

Purpose: Use this menu option to set up each system delivered tickler event, including:

- tickler event settings at the event level
- tickler event settings at the event rule level
- event rule criteria for each rule you create
- event rule procedures for each rule you create

In this topic:

- Defining Tickler Events and Event Rules
- Tickler Event Settings
  - Active Tickler Events and Rules
  - Tickler Assignment
  - Tickler Notification
  - Allowing Multiple Ticklers
  - Tickler Work Notes
  - Tickler Priority
  - Tickler Category
  - Tickler Resolution Reason
- Event Rule Settings
  - Event Rule Processing Sequence
  - Event Rule Criteria
  - Event Rule Procedures

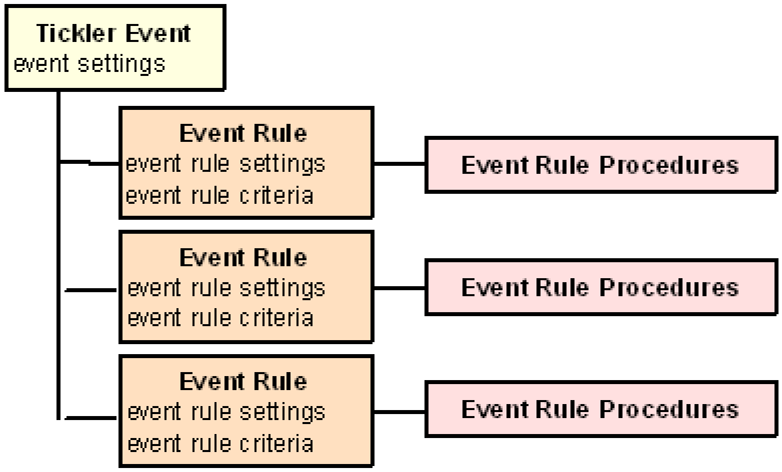
For more information: See Workflow Management Overview and Setup for an overview on workflow management.

Defining Tickler Events and Event Rules

To create a tickler, you must define:

- the tickler events that can create a tickler. There are system actions that can create ticklers. You cannot create other tickler events for the system to evaluate for tickler creation. Also, each tickler event is delivered as not active.
- BO: backorders
- CO: cancelled orders
- HO: held orders
- MN: manually created ticklers
- NO: new orders
- OO: aged open orders
- SD: stored value card activation decline
- SO: soldout orders
- SV: stored value card number assignment
- UP: unconfirmed pick tickets
- VP: voided pick tickets
- WF: ticklers received from a remote system
- Tickler Event Settings
- event rule settings that override the settings defined at the event level and determine how the event rule is processed; see Event Rule Settings.
- event rule criteria that define the criteria the system action must meet to create a tickler; see Event Rule Criteria.
- event rule procedures that define the instructions a user should follow to work with and resolve a tickler created by the event rule; see Event Rule Procedures.

Tickler event hierarchy: For each tickler event, you can define multiple event rules. For each event rule, you can define procedures to resolve the tickler.



Working with Tickler Users/User Groups (WTIC)

Purpose: Use this menu option to review, work with, and resolve ticklers in a tickler work queue. Users can work with ticklers assigned to themselves or their tickler user groups.

Tickler supervisors: Tickler supervisors can review and work with ticklers assigned to their tickler supervisor group, or review all ticklers regardless of assignment, using the Workflow Management (WWFM) menu option.

In this topic:

- Work with Tickler Screen (user/group view)
- Create Tickler Screen
- Change Tickler Screen
- Work with Tickler Notes Screen
- Work with Tickler History Screen
- Display Tickler History Screen
- Resolve Tickler Window
- Current Tickler Count Window
- Select User Tickler Group Screen
- Select Tickler User Group Screen

Work with Tickler Screen (user/group view)

Purpose: Use this screen to review, work with, and resolve ticklers assigned to a particular user's work queue or the tickler user groups defined for the user.

View current or future ticklers? The word CURRENT or FUTURE displays in the upper right corner of the screen indicating if you are viewing:

- ticklers whose Assigned date is equal to or past the current date (current), or
- ticklers whose Assigned date is later than the current date (future)

Select Current/future to toggle between viewing current ticklers or future ticklers; when you first advance to this screen, current ticklers display.

View open or resolved ticklers? The word OPEN or RESOLVED displays in the upper right corner of the screen indicating if you are viewing:

- ticklers whose Status is O (open) or I (in process), or
- ticklers whose Status is R (resolved)

Select Open/resolved to toggle between viewing open and in process ticklers or resolved ticklers; when you first advance to this screen, open ticklers display.

View FIFO or LIFO sequence? The word FIFO or LIFO displays in the left column to indicate how ticklers sort on the screen:

- select FIFO to display ticklers in FIFO (first in, first out; meaning oldest to newest) sequence, or
- select LIFO to display ticklers in LIFO (last in, first out; meaning newest to oldest) sequence

When you first advance to this screen, ticklers display in FIFO sequence (meaning the word LIFO displays in the left column, indicating you can switch the view to LIFO sequence).

View ticklers for user or tickler group? The User field or Group field displays at the top of the screen indicating if you are viewing:

- ticklers assigned to a particular user, or
- ticklers assigned to a particular tickler group for the user

Select User or Group to toggle between viewing ticklers for a particular user or tickler group for the user; when you first advance to this screen, ticklers display for the user who advanced to the screen. If the user is assigned to more than one tickler group, the Select User Tickler Group Screen displays when you toggle to view ticklers for a tickler group.

Searching for ticklers: You can search for specific ticklers by tickler status, tickler priority, assigned date, event code, tickler category, tickler number, order number, sold to customer number, bill to customer number, and item number.

How to display this screen: Enter WTIC in the Fast path field or select Work with Tickler by User/User Group from a menu.

Field	Description
User	The user ID and description of the user assigned to work with the displayed ticklers. This field displays only if you are viewing ticklers for the signed-in user; you can view ticklers for a tickler user group defined for the user by selecting Group; if the user is assigned to more than one tickler user group, the system advances you to the Select User Tickler Group Screen where you can select the tickler user group whose ticklers you wish to review. User ID: Alphanumeric, 10 positions; display-only. User description: Alphanumeric, 30 positions; display-only.
Group	The tickler user group ID and description of the tickler user group assigned to resolve the displayed ticklers. This is a tickler user group assigned to the user reviewing ticklers. This field displays only if you viewing ticklers for a tickler user group; you can view ticklers for the signed-in user by selecting User. Group ID: Alphanumeric, 10 positions; display-only.

Field	Description
S (Tickler status)	The status of the tickler. • O = Open; the tickler is open and is available to work on in the assigned tickler work queue. • I = In process; the tickler is currently being worked on by the assigned user. • R = Resolved; the tickler has been resolved. Alphanumeric, 1 position; optional.
P (Tickler priority)	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is the lowest priority and 9 is the highest priority). Numeric, 1 position; optional.
Assign date	The date the tickler was assigned to the user or tickler user group. Numeric, 6 positions (user date format); optional.
Event code	The code for the tickler event that created the tickler. • BO = Backorders • CO = Cancelled orders • HO = Held orders • MN = Manually created • NO = New orders • OO = Aged open orders • SO = Sold out orders • UP = Unconfirmed pick tickets • VP = Voided pick tickets • WF = Remote workflow See System Delivered Tickler Events. Alphanumeric, 2 positions; optional.
Event Cat (Event category)	The tickler category assigned to the tickler. Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT). Alphanumeric, 3 positions; optional.
Tickler number	The tickler number assigned to the tickler, from the Tickler Number number assignment record. Numeric, 9 positions; optional.
Order status	The status of the order associated with the tickler. • Open • Archived (This option is not currently implemented) • Cancelled • Held (**Note:** The system highlights the held status in a different color (for example fuchsia) if the sold to customer is a new customer, based on purchase history. A new customer has placed an order, but no orders have shipped (# orders LTD is equal to or greater than 1 and # sales LTD is equal to 0 in the Customer Sold To Order History table)). • Purged • Suspended • Closed Alphanumeric, display-only.

Field	Description
Order number	The order associated with the tickler. Numeric, 8 positions; optional.
Sold to	The sold to customer associated with the tickler. Numeric, 9 positions; optional.
Bill to	The bill to customer associated with the tickler. Numeric, 7 positions; optional.
Item	The item associated with the tickler. Alphanumeric, 12 positions; optional.

Screen Option	Procedure
Change a tickler	Select Change for a tickler to advance to the Change Tickler Screen.
Delete a MN tickler	Select Delete for a tickler to delete it. You can only delete MN (manually created) ticklers.
Display a tickler	Select Display for a tickler to advance to the Display Tickler Screen. You cannot change any fields on this screen. See the Change Tickler Screen for field descriptions.
Release the order associated with the tickler from hold	Select Release for a tickler to advance to the Release Reason Prompt Pop-Up Window (order header hold), Release Reason Prompt Pop-Up Window (recipient hold), and/or Release Order Payment Method Window (pay type hold). If you release an order from hold for an HO tickler, the system automatically resolves the tickler. Also, the system evaluates any other ticklers associated with the order to determine if they can be resolved. **Pick slip preparation:** When you release an order from hold, the system determines whether the order is eligible for pick slip preparation; see Preparing Orders for Pick Slip Generation. Errors: • If you select Release for a tickler not associated with a held order, an error message indicates: Order not on hold. • If you select Release for a tickler not associated with an order, an error message indicates: Tickler not eligible for this option. **Note:** You must have authority to the Release Held Orders (ERHO) menu option to release the order from hold.
Select a tickler to work on	Select In Process for a tickler to change the status of the tickler from open (O) to in process (I). You can only select to work with a tickler that is in an open status; if you select In process for a tickler that is in an in process (I) or resolved (R) status, an error message indicates: Tickler status cannot be changed - resolved or already in process. Selecting this option automatically assigns the tickler to the user and creates a tickler history record. If you are on the Work with Tickler screen (group view), the tickler is cleared from the screen; you can view the tickler on the Work with Tickler screen (user view).

Screen Option	Procedure
Enter or review tickler work notes	Select Notes for a tickler to advance to the work notes screen, based on the note type defined for the tickler. Note type A advances you to the Edit Customer Actions Window. Note type B advances you to the Work with Bill To Notes Screen. Note type O advances you to the Work with Order Messages Screen. Note type S advances you to the Edit Customer Notes Screen. Note type T advances you to the Work with Tickler Notes Screen.
Review the tickler source	Select Detail for a tickler to advance to the source screen, based on the tickler event associated with the tickler. BO, CO, HO, NO, OO, SO, UP, VP, and WF ticklers advance you to the Order Inquiry Header Screen. You cannot view the source for MN ticklers: Requested tickler has no source reference.
Review tickler history	Select History for a tickler to advance to the Work with Tickler History Screen.
Resolve a tickler	Select Resolve for a tickler to advance to the Resolve Tickler Window.
Review procedures for a tickler	Select Procedure for a tickler to advance to the Work with Tickler Event Rule Procedure Screen. You cannot add or change tickler procedures when you advance from the Work with Tickler screen. You cannot review procedures for MN ticklers.
Toggle between viewing ticklers for a user or ticklers for a tickler group	Select Group or User. The system toggles between displaying: • ticklers assigned to the user (the user ID and description displays at the top of the screen). • ticklers assigned to the user's tickler group (the group ID and description displays at the top of the screen). If the user is associated with more than one tickler group, you advance to the Select User Tickler Group Screen. If the user is not associated with a tickler group an error message indicates: Current user is not associated with any group.
Create a tickler for the MN (manually created) tickler event	Select Create to advance to the Create Tickler Screen. **Note:** To create a MN tickler, you must have authority to the Create Manual Tickler (B13) secured feature and the MN tickler event must be active.
Toggle between displaying ticklers in LIFO sequence (last in, first out; meaning newest to oldest) or FIFO sequence (first in, first out; meaning oldest to newest)	Select LIFO or FIFO. • The word LIFO displays when you are viewing ticklers in FIFO sequence. • The word FIFO when you are viewing ticklers in LIFO sequence.
Toggle between displaying ticklers in a current status or future status	Select Current/Future. The word CURRENT or FUTURE displays in the top right corner of the screen, depending on which ticklers you are viewing.
Review the number of ticklers in the work queue, based on the selection criteria you have defined	Select Count to advance to the Current Tickler Count Window.

Screen Option	Procedure
Review ticklers for a selected tickler user group	Select Group to advance to the Select User Tickler Group Screen. This option is available only when you are viewing ticklers in a tickler user group work queue.
Toggle between displaying open and in process ticklers or resolved ticklers	Select Open/Resolved. The system toggles between displaying: • ticklers in an open (O) or in process (I) status. • ticklers in a resolved (R) status.

Create Tickler Screen

Purpose: Use this screen to create a tickler for the MN (manually created) tickler event.

You cannot create a tickler for any tickler event except MN (manually created).

When you manually create a tickler you can associate the tickler with a specific:

- order number and ship to number
- customer sold to number
- customer ship to number
- customer bill to number
- existing tickler number

Depending on how you advance to the Create Tickler screen, the system automatically associates the tickler with a specific order or customer. For example, if you advance to the Create Tickler screen from the Work with Ticklers Screen (sold to customer view), the system automatically associates the manually created tickler with the sold to customer.

Secured feature: To create a MN tickler, you must have authority to the Create Manual Tickler (B13) secured feature.

How to display this screen: Select Create at the Work with Tickler Screen (user/group view) or Workflow Management Screen (tickler supervisor).

You can also advance to this screen from the:

- Work with Ticklers Screen (sold to customer view)
- Work with Ticklers Screen (ship-to customer view)
- Work with Ticklers Screen (bill-to customer view)
- Work with Ticklers Screen (order view)
- Work with Return Authorization Detail Screen
- Work with Returns for Order Screen
- Work with Email by Order Number Screen
- Work with Email by Customer Sold To Number Screen
- Work with Email by Customer Ship To Number Screen
- Work with Email by Customer Bill To Number Screen
- Display Item Availability Screen

Field	Description
Tickler number	The next number available from the Tickler Number number assignment record. Numeric, 9 positions; display-only.
Category	The tickler category assigned to the tickler. The tickler category defined for the MN tickler event defaults, but you can override it. Alphanumeric, 3 positions; required.
Priority	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is lowest priority, 9 is highest priority). The priority defined for the MN tickler event defaults, but you can override it. Numeric, 1 position; optional.
Notify user	Indicates whether the system sends a Tickler Notification email to the assigned user or to all of the users in the assigned tickler user group when a tickler is created for this tickler event. • selected = Notify the assigned user/user group when a tickler is created; use the email address defined for the user in the User Extended table. If the tickler is assigned to a user group, send a notification to each user in the group, using the email address defined for each user in the User Extended table. • unselected = Do not notify the assigned user/user group when a tickler is created; the user can review the ticklers in his queue at the Work with Tickler Screen (user/group view). See Tickler Notification for a sample email.
Assign to user	The user ID of the user assigned to resolve the tickler. The assign to user defined for the MN tickler event defaults, but you can override it. You can define either an assign to user or assign to user group for the tickler, but not both. Users are defined in and validated against the User table; see Working with User Records (WUSR). See Tickler Assignment. Alphanumeric, 10 positions; optional.

Field	Description
Assign to group	The group ID of the tickler group assigned to resolve the tickler; when you manually create a tickler, the tickler group can be either a user group or supervisor group. The assign to group defined for the MN tickler event defaults, but you can override it. You can define either an assign to user or assign to user group for the tickler, but not both. The tickler user group you enter must be defined as a user type and not a supervisor type. Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG). See Tickler Assignment. Alphanumeric, 10 positions; optional.
Assigned date	The date the tickler is assigned to the assigned to user or assigned to tickler user group. The current date defaults, but you can enter a future date. If you enter a future date, the tickler does not display in the assigned to tickler work queue until the assigned date is equal to the current date. **Note:** When you manually create a tickler and assign the tickler a future date, the system sends a Tickler Notification email when the tickler is created, not when the assigned future date is reached. You cannot enter a past date or an error message indicates: Must enter current date or future date. Numeric, 6 positions (user date format); required.
Note type	The type of notes you enter for this tickler. The note type defined for the MN tickler event defaults, but you can override it. • Sold To Action Notes = Action notes; you use the Edit Customer Actions Window to enter tickler notes. • Bill To Notes = Bill to notes; you use the Work with Bill To Notes Screen to enter tickler notes. • Order Notes = Order notes; you use the Work with Order Messages Screen to enter tickler notes. • Sold To Notes = Sold to notes; you use the Edit Customer Notes Screen to enter tickler notes. • Tickler Notes (default) = Tickler notes; you use the Work with Tickler Notes Screen to enter tickler notes. Alphanumeric, required.
Short note	A brief note you can enter for the tickler. The short note you enter displays on the Tickler Notification email and, if you reassign this tickler to another user or tickler user group, the short note displays on the Tickler Reassignment email. See Tickler Notification for a sample email. Alphanumeric, 60 positions; optional.

Field	Description
Order number	The order number and ship to number associated with the tickler. If you define an order number, you must also define the customer ship to number; if the order is associated with only 1 ship to, ship to number 1 defaults. Order numbers are defined in and validated against the Order Header table. Numeric, 8 positions; optional.
Cust sold to number	The customer sold to number associated with the tickler. Sold to customers are defined in and validated against the Customer Sold To table. Numeric, 9 positions; optional.
Cust ship to number	The customer ship to number associated with the tickler. If the order number you define is associated with only 1 ship to customer, ship to 1 defaults. Ship to customers are defined in and validated against the Customer Ship To table. Numeric, 3 positions; optional.
Cust bill to number	The customer bill to number associated with the tickler. Bill to customers are defined in and validated against the Customer Bill To table. Numeric, 7 positions; optional.
Related tickler number	The tickler number associated with the tickler. Tickler numbers are defined in and validated against the Tickler table. Numeric, 9 positions; optional.

Screen Option	Procedure
Enter work notes for the newly created tickler	Select OK to advance to the work notes screen, based on the note type defined for the tickler. • Note type Sold To Action Notes advances you to the Edit Customer Actions Window. • Note type Bill To Notes advances you to the Work with Bill To Notes Screen. • Note type Order Notes advances you to the Work with Order Messages Screen. • Note type Sold To Notes advances you to the Edit Customer Notes Screen. • Note type Tickler Notes advances you to the Work with Tickler Notes Screen.

Change Tickler Screen

Purpose: Use this screen to change a tickler.

You can change the following information for a tickler:

- tickler status

- tickler priority
- tickler category
- assigned to user/user group
- assigned date; you can enter a future assigned date to have a tickler assigned to a user or tickler user group in the future; ticklers with a future assign date do not display in a tickler work queue until the assign date is equal to the current date.
- short note

> **Note:**
>
> Each time you advance to this screen to change a tickler, the system creates a tickler history record; see Work with Tickler History Screen.

How to display this screen: Select Change for a tickler at the Work with Tickler Screen (user/group view) or Workflow Management Screen (tickler supervisor).

Field	Description
Tickler #	The tickler number whose information you are reviewing. Numeric, 9 positions; display-only.
Sts (Status)	The status of the tickler. • Open = Open; the tickler is open and is available to work on in the assigned user's or user group's work queue. • In Process = In process; the tickler is currently being worked on by the assigned user. **Note:** You cannot change the status of an open or in process tickler to resolved; to resolve a tickler select Resolve for a tickler at the Work with Tickler Screen (user/group view) or Workflow Management (WWFM) (tickler supervisor). You cannot change the status of a resolved tickler. The system creates a tickler history record when you change the tickler status, indicating the "from status" and the "to status"; see Work with Tickler History Screen. Alphanumeric, required.
Pty (Priority)	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is the lowest priority, 9 is the highest priority). The system creates a tickler history record when you change the tickler priority, indicating the "from priority" and "to priority"; see Work with Tickler History Screen. Numeric, 1 position; required.

Field	Description
Note type	The type of notes you enter for this tickler. • Sold To Action Notes = Action notes; you use the Edit Customer Actions Window to enter tickler notes. • Bill To Notes = Bill to notes; you use the Work with Bill To Notes Screen to enter tickler notes. • Order Notes = Order notes; you use the Work with Order Messages Screen to enter tickler notes. • Sold To Notes = Sold to notes; you use the Edit Customer Notes Screen to enter tickler notes. • Tickler Notes (default) = Tickler notes; you use the Work with Tickler Notes Screen to enter tickler notes. Alphanumeric, display-only.
Event	The code and description for the tickler event that created the tickler. • BO = Backorders • CO = Cancelled orders • HO = Held orders • MN = Manually created • NO = New orders • OO = Aged open orders • SO = Sold out orders • UP = Unconfirmed pick tickets • VP = Voided pick tickets • WF = Remote workflow Alphanumeric, 2 positions; display-only.
Rule number	The rule sequence number and description defined for the event rule that created the tickler. Numeric, 3 positions; display-only.
Category	The tickler category assigned to the tickler. The system creates a tickler history record when you change the tickler category, indicating the “from category” and “to category”; see Work with Tickler History Screen. You must define a tickler category for manually created ticklers: Tickler category is required for manually created ticklers. Alphanumeric, 3 positions; optional.
Assign to user	The user ID and description of the user assigned to resolve the tickler. The system creates a tickler history record when you change the assign to, indicating the “from assign to” and “to assign to”; see Work with Tickler History Screen. You can define either an assign to user or assign to user group for the tickler, but not both. Users are defined in and validated against the User table; see Working with User Records (WUSR). See Tickler Assignment. Alphanumeric, 10 positions; optional.

Field	Description
Assign to group	The group code and description of the tickler group assigned to resolve the tickler; when you change a tickler, the tickler group can be either a user group or supervisor group. The system creates a tickler history record when you change the assign to, indicating the “from assign to” and “to assign to”; see Work with Tickler History Screen. You can define either an assign to user or assign to user group for the tickler, but not both. The tickler user group you enter must be defined as a user type and not a supervisor type. Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG). See Tickler Assignment. Alphanumeric, 10 positions; optional.
Supervisor group	The code and description for the supervisor group assigned to manage the tickler. This is the supervisor group the system sends a Supervisor Notification Count email when the date in the Date to notify supervisor field is reached. The system sends an email to the email address defined for the supervisor group in the Tickler User Group table. Alphanumeric, 10 positions; display-only.
Assigned date	The date the tickler was assigned to the user or tickler user group. You can enter a future assigned date to have a tickler assigned to a user or user group in the future. The system creates a tickler history record when you change the assigned date, indicating the “from assigned date” and “to assigned date”; see Work with Tickler History Screen. If you enter a future date, the tickler does not display in the assigned to tickler work queue until the assigned date is equal to the current date. You cannot enter a past date or an error message indicates: Must enter current date or future date. Numeric, 6 positions (user date format); required.
Date to notify supervisor	Indicates the date the system sends a Supervisor Notification Count email to the assigned supervisor group, notifying the supervisor that the tickler has not yet been resolved. The system sends a Supervisor Notification Count email if the date to notify supervisor is equal to or past the current date. The system uses this calculation to determine the next notification date when a tickler is first created: tickler creation date + value in Number of days to notify supervisor field for the event/rule that created the tickler = next notification date. The system does not update the next notification date after a tickler is created. The system sends the email to the email address defined for the supervisor user group in the Tickler User Group table. The system continues sending an email to the supervisor group as long as the tickler assigned to the supervisor group is in an open or in process status. See Tickler Notification for a sample email. Numeric, 6 positions (user date format); display-only.

Field	Description
Created by user	The user ID of the user that created the tickler. Alphanumeric, 10 positions; display-only.
Created on...at	The date and time when the tickler was created. Created date: Numeric, 6 positions (user date format); display-only. Created time: Numeric, 6 positions (HHMMSS format); display-only.
Source	The program that created the tickler. Alphanumeric, 10 positions; display-only.
Original user	The user ID of the user originally assigned to resolve the tickler. Alphanumeric, 10 positions; display-only.
Original group	The code for the tickler user group originally assigned to resolve the tickler. Alphanumeric, 10 positions; display-only.
Short note	A brief note you can enter to further describe the tickler. This note displays on the Tickler Notification email and Tickler Reassignment email. Alphanumeric, 60 positions; optional.
Order #	The order number and ship to number associated with the tickler. Order number: Numeric, 8 positions; display-only. Ship to number: Numeric, 3 positions; display-only.
Cust sold to #	The customer sold to number associated with the tickler. Numeric, 9 positions; display-only.
Cust ship to #	The customer ship to number associated with the tickler. Numeric, 3 positions; display-only.
Cust bill to #	The bill to customer number associated with the tickler. Numeric, 7 positions; display-only.
Item/SKU	The item and optionally, SKU, associated with the tickler. Item: Alphanumeric, 12 positions; display-only. SKU: Alphanumeric, 14 positions; display-only.
Pick control #	The pick control number associated with the tickler. Numeric, 7 positions; display-only.
Related tickler #	The tickler number associated with the tickler. Numeric, 9 positions; display-only.
Email sequence #	The email sequence number associated with the tickler. Numeric, 11 positions; display-only.

Screen Option	Procedure
Enter or change work notes for the tickler	Select Notes to advance to the work notes screen, based on the note type defined for the tickler. • Note type Sold To Action Notes advances you to the Edit Customer Actions Window. • Note type Bill To Notes advances you to the Work with Bill To Notes Screen. • Note type Order Notes advances you to the Work with Order Messages Screen. • Note type Sold To Notes advances you to the Edit Customer Notes Screen. • Note type Tickler Notes advances you to the Work with Tickler Notes Screen.

Work with Tickler Notes Screen

Purpose: Use this screen to enter work notes regarding the activity a user performed to resolve the tickler.

Tickler work notes screen: The screen where you enter activity notes for a tickler varies, depending on the note type defined for the tickler in the Tickler table.

Tickler work notes screen: The screen where you enter activity notes for a tickler varies, depending on the note type defined for the tickler in the Tickler table.

- Note type Sold To Action Notes advances you to the Edit Customer Actions Window.
- Note type Bill To Notes advances you to the Work with Bill To Notes Screen.
- Work with Order Messages Screen
- Note type Sold To Notes advances you to the Edit Customer Notes Screen.
- Note type Tickler Notes advances you to the Work with Tickler Notes Screen.

When you enter work notes on the Work with Tickler Notes screen and select OK, the system updates the work notes with the user ID of the user who entered the notes and the date when the work notes were entered.

Types of work notes: Select Resolution notes or Activity notes at this screen to toggle between entering and updating activity notes or resolution notes.

- activity notes describe the actions taken against a tickler that do not resolve the tickler. For example, if a tickler is created for a declined credit card, a user might enter activity notes indicating he reviewed the reason why the credit card was declined and assigned the tickler to another user to re-send for authorization. When a tickler is first created, the system creates an activity note: XX Tickler# 000003140 HAS BEEN CREATED. RULE:INITIAL B/O IS Y, where XX is the tickler event associated with the tickler and the RULE is the event rule associated with the tickler.
- resolution notes describe the actions taken against a tickler that resolve the tickler. For example, if a ticker is created for a declined credit card, a user might enter resolution notes indicating he resent the credit card for authorization and received an approval (resolving the tickler). When a tickler is resolved, the system creates a resolution note: XX Tickler# 000003140 HAS BEEN RESOLVED. REASON: BO BY: KBROWN RULE:INITIAL B/O IS Y, where XX is the tickler event associated with the tickler, REASON is the resolution reason code, BY is the user ID of the person that resolved the tickler, and RULE is the event rule associated with the tickler.

How to display this screen: You can advance to this screen by:

- selecting Notes for a tickler at the Work with Tickler Screen (user/group view) or Workflow Management Screen (tickler supervisor).
- selecting OK at the Create Tickler Screen.
- selecting Notes at the Change Tickler Screen or Display Tickler Screen.

Field	Description
Tickler #	The tickler number for which you are entering or updating work notes. Numeric, 9 positions; display-only.
Activity notes /Resolution notes	Free-form lines where you can describe the activity performed against the tickler. • The name of the field is Activity notes if you are entering activity notes. • The name of the field is Resolution notes if you are entering resolution notes. Alphanumeric, 60 positions; optional.
User	The user ID of the user who entered the tickler work notes or who performed the activity that created the work notes. Alphanumeric, 10 positions; display-only.
Date	The date the tickler work notes were entered. Numeric, 6 positions (user date format); display-only.

Screen Option	Procedure
Enter new work notes or update existing work notes	Select Add/Change to toggle between adding new lines and updating existing lines.
Enter or update tickler resolution notes or tickler activity notes	Select Resolution notes or Activity notes to toggle between adding and updating tickler activity notes and adding and updating tickler resolution notes.

Work with Tickler History Screen

Purpose: Use this screen to review the history of a tickler, indicating the activity performed against the tickler.

The system creates a tickler history record when:

- the tickler is created
- the tickler is changed
- work notes for the tickler are added/updated, regardless of the type of work notes you enter
- the tickler is resolved

How to display this screen: Select History at the Work with Tickler Screen (user/group view) or Workflow Management Screen (tickler supervisor).

Field	Description
Tickler #	The tickler number whose history you are reviewing. Numeric, 9 position; display-only.
Activity date	The date when the system created the tickler history record; this is the date when the tickler was created or updated. Numeric, 6 positions (user date format); optional.
Activity time	The time when the system created the tickler history record; this is the time when the tickler was created or updated. Numeric, 6 positions (HH:MM:SS format); display-only.
Activity user	The user ID of the user that updated the tickler, creating the tickler history record. Alphanumeric, 10 positions; optional.
To user	The user ID of the user assigned to work with the tickler, based on the update performed against the tickler. Alphanumeric, 10 positions; display-only.
To group	The code for the user group assigned to work with the tickler, based on the update performed against the tickler. Alphanumeric, 10 positions; display-only.
To sts (To status)	The status of the tickler, based on the update performed against the tickler. • O = Open; the tickler is open and is available to work on in the assigned tickler work queue. • I = In process; the tickler is currently being worked on by the assigned user. • R = Resolved; the tickler has been resolved. Alphanumeric, 1 position; display-only.
To pty (To priority)	The priority assigned to the tickler, based on the update performed against the tickler (1 is the lowest priority and 9 is the highest priority). Numeric, 1 position; display-only.
To cat (To category)	The category assigned to the tickler, based on the update performed against the tickler. Alphanumeric, 3 positions; display-only.
Assign date	The date the tickler was assigned to the current user or tickler user group. Numeric, 6 positions (user date format); display-only.

Screen Option	Procedure
Review tickler history details	Select Display for a tickler to advance to the Display Tickler History Screen.

Display Tickler History Screen

Purpose: Use this screen to review the tickler history details.

This screen indicates the tickler detail changed from this (previous tickler detail), to that (current tickler detail), where the specific detail being updated is:

- assigned to user
- assigned to user group
- assigned to supervisor group
- tickler status
- tickler priority
- next notification date
- rule sequence number
- assigned date
- graduated date
- short note
- tickler category
- note change (indicating tickler work notes were added or updated)
- source program (indicating the program that created or updated the tickler)

> **Note:**
>
> The From detail is identical to the To detail if the detail was not updated for the tickler history record. For example, the From tickler status is identical to the To tickler status if the history record was created as a result of the tickler category changing from S1 to S2.

How to display this screen: Select Display for a tickler history record at the Work with Tickler History Screen.

Field	Description
Tickler #	The tickler number whose history you are reviewing. Numeric, 9 position; display-only.
Date	The date and time when the tickler was updated, creating this tickler history record. Date: Numeric, 6 positions (user date format); display-only. Time: Numeric, 6 positions (HH:MM:SS format); display-only.
User	The user ID of the user that updated the tickler, creating this tickler history record. Alphanumeric, 10 positions; display-only.
From user	The user ID and description of the user previously assigned to the tickler. Alphanumeric, 10 positions; display-only.
To user	The user ID and description of the user currently assigned to the tickler. Alphanumeric, 10 positions; display-only.

Field	Description
From user group	The code and description of the tickler user group previously assigned to the tickler. Alphanumeric, 10 positions; display-only.
To user group	The code and description of the tickler user group currently assigned to the tickler. Alphanumeric, 10 positions; display-only.
From supervisor group	The code and description of the tickler supervisor group previously assigned to the tickler. Alphanumeric, 10 positions; display-only.
To supervisor group	The code and description of the tickler supervisor group currently assigned to the tickler. Alphanumeric, 10 positions; display-only.
From status	The code for the status previously assigned to the tickler. Alphanumeric, 1 position; display-only.
To status	The code for the status currently assigned to the tickler. Alphanumeric, 1 position; display-only.
From priority	The priority previously assigned to the tickler. Numeric, 1 position; display-only.
To priority	The priority currently assigned to the tickler. Numeric, 1 position; display-only.
From next notify date	The next notification date previously assigned to the tickler. The next notification date is updated only for graduating ticklers (AR, OO, and UP tickler events). Numeric, 6 positions; display-only.
To next notify date	The next notification date currently assigned to the tickler. Numeric, 6 positions; display-only.
From rule seq #	The rule sequence number and description previously assigned to the tickler. Numeric, 3 positions; display-only.
To rule seq #	The rule sequence number and description currently assigned to the tickler. Numeric, 3 positions; display-only.
From assigned date	The assigned date and time previously assigned to the tickler. Date: Numeric, 6 positions (user date format); display-only. Time: Numeric, 6 positions (HH:MM:SS format); display-only.
To assigned date	The assigned date and time currently assigned to the tickler. Date: Numeric, 6 positions (user date format); display-only. Time: Numeric, 6 positions (HH:MM:SS format); display-only.
From graduated date	The graduated date previously assigned to the tickler. Numeric, 6 positions (user date format); display-only.
To graduated date	The graduated date currently assigned to the tickler. Numeric, 6 positions (user date format); display-only.

Field	Description
From note	The short note previously assigned to the tickler. Alphanumeric, 60 positions; display-only.
To note	The short note currently assigned to the tickler. Alphanumeric, 60 positions; display-only.
From category	The tickler category previously assigned to the tickler. Alphanumeric, 3 positions; display-only.
To category	The tickler category currently assigned to the tickler. Alphanumeric, 3 positions; display-only.
Note change	Indicates if the tickler work notes have been updated. • Y = Tickler work notes have been added/updated. • N = Tickler work notes have not been added/updated.
Source program	The program that created or updated the tickler. Alphanumeric, 10 positions; display-only.

Resolve Tickler Window

Purpose: Use this window to select a resolution reason and resolve a tickler.

You can resolve ticklers that are in an O (open) or I (in process) status.

How to display this screen: Select Resolve for a tickler at the Work with Tickler Screen (user/group view) or Workflow Management Screen (tickler supervisor).

Field	Description
Tickler #	The tickler number you are resolving. Numeric, 9 positions; display-only.
Resolution reason	The tickler resolution reason, to identify the reason why the tickler is resolved. Tickler resolution reasons are defined in and validated against the Tickler Resolution Reason table; see Working with Tickler Resolution Reasons (WTRR). Alphanumeric, 3 positions; required.

Screen Option	Procedure
Enter tickler resolution notes	Select OK to advance to the work notes screen, based on the note type defined for the tickler. • Note type Sold To Action Notes advances you to the Edit Customer Actions Window. • Note type Bill To Notes advances you to the Work with Bill To Notes Screen. • Note type Order Notes advances you to the Work with Order Messages Screen. • Note type Sold To Notes advances you to the Edit Customer Notes Screen. • Note type Tickler Notes advances you to the Work with Tickler Notes Screen.

Current Tickler Count Window

Purpose: Use this window to review the number of ticklers currently in view, based on the selection criteria you defined at the Work with Tickler Screen (user/group view).

The selection criteria you can define is:

- tickler status
- tickler number
- priority
- assigned date
- event
- category
- current user
- supervisor group
- order number
- customer sold to number
- customer bill to number
- item

A value displays next to the fields you have selected as criteria.

Work with Tickler Screen (user/group view)
How to display this screen: Select Count at the Work with Tickler Screen (user/group view) or Workflow Management Screen (tickler supervisor).

Field	Description
Tickler count is	The number of ticklers currently in view, based on the selection criteria you defined at the Work with Tickler Screen (user/group view). Numeric, 9 positions; display-only.
Status	The status of the ticklers currently in view. Alphanumeric, 1 position; display-only.
Tickler #	The tickler number currently in view. Numeric, 9 positions; display-only.
Priority	The priority assigned to the ticklers currently in view. Numeric, 2 positions; display-only.
Assigned date	The assigned date of ticklers currently in view. Numeric, 6 positions (user date format); display-only.
Event	The event code assigned to ticklers currently in view. Alphanumeric, 2 positions; display-only.
Category	The tickler category assigned to ticklers currently in view. Alphanumeric, 3 positions; display-only.
Current user	The user ID of the user assigned to ticklers currently in view. Alphanumeric, 10 positions; display-only.

Field	Description
Supervisor group	The supervisor group assigned to ticklers currently in view. Alphanumeric, 10 positions; display-only.
Order #	The order number assigned to ticklers currently in view. Numeric, 8 positions; display-only.
Customer sold to #	The sold to customer assigned to ticklers currently in view. Numeric, 9 positions; display-only.
Customer bill to #	The bill to customer assigned to ticklers currently in view. Numeric, 7 positions; display-only.
Item	The item associated with the ticklers currently in view. Alphanumeric, 12 positions; display-only.

Select User Tickler Group Screen

Purpose: Use this screen to select the tickler group whose ticklers you wish to review.

How to display this screen:

- Select Group at the Work with Tickler Screen (user/group view). All tickler groups (both user and supervisor) assigned to the signed-in user display.
- Select Supervisor at the Workflow Management Screen. All tickler supervisor groups assigned to the signed-in user display.

Field	Description
User	The user ID of the signed-in user; this is the user whose tickler groups you are reviewing. Alphanumeric; 10 positions; display-only.
Group ID	The tickler group ID code of the tickler groups assigned to the signed-in user. Alphanumeric, 10 positions; optional.

Screen Option	Procedure
Select the tickler group whose ticklers you wish to review	Select a tickler group to advance to the: Work with Tickler Screen (user/group view) **for the group view.** Workflow Management Screen **for the supervisor view.**

Select Tickler User Group Screen

Purpose: Use this screen to select the tickler group whose ticklers you wish to review. You can also view the users assigned to each group.

The tickler group type indicates if the tickler group is a user group (type U) or supervisor group (type S).

How to display this screen:

- Select Select Group at the Work with Tickler Screen (user/group view). All tickler groups (both user and supervisor) assigned to the signed-in user display.

- Select Select Group at the Workflow Management Screen (supervisor view). All tickler supervisor groups (both user and supervisor) assigned to the signed-in user display.

Field	Description
Group ID	Work with Tickler Screen (user/group view): The group ID code of the tickler groups assigned to the signed-in user. Workflow Management Screen: The group ID code of a tickler supervisor group. This screen displays ALL tickler supervisor groups, regardless of tickler assignment. Tickler user groups do not display on the screen. Alphanumeric, 10 positions; optional.
Description	A description of the tickler group. Alphanumeric, 40 positions; optional.
Type	The type of tickler group. • S = Tickler supervisor group. • U = Tickler user group. Alphanumeric, 1 position; optional.

Screen Option	Procedure
Select the tickler group whose ticklers you wish to review	Select a tickler group to advance to the: Work with Tickler Screen (user/group view) for the group view. Workflow Management Screen for the supervisor group view.
Review the users in a tickler group	Select Users in group for a tickler group to advance to the Display Users In Group Screen.

Workflow Management (WWFM)

Purpose: Use this menu option to review, work with, and resolve ticklers in a tickler work queue. Tickler supervisors can work with ticklers assigned to their tickler supervisor groups or work with all ticklers, regardless of the tickler supervisor group assigned to the tickler.

Tickler users/groups: Tickler users can review and work with ticklers assigned to themselves or their tickler user groups using the Working with Tickler Users/User Groups (WTIC) menu option.

In this topic:

- Workflow Management Screen
- Reassign Ticklers Window

Workflow Management Screen

Purpose: Use this screen to review, work with, and resolve ticklers in a tickler work queue.

View current or future ticklers? The word CURRENT or FUTUREdisplays in the upper right corner of the screen indicating if you are viewing:

- ticklers whose Assigned date is equal to or past the current date (current), or
- ticklers whose Assigned date is later than the current date (future)

Select Current/future to toggle between viewing current ticklers or future ticklers; when you first advance to this screen, current ticklers display.

View open or resolved ticklers? The word OPEN or RESOLVED displays in the upper right corner of the screen indicating if you are viewing:

- ticklers whose Status is O (open) or I (in process), or
- ticklers whose Status is R (resolved)

Select Open/resolved to toggle between viewing open and in process ticklers or resolved ticklers; when you first advance to this screen, open ticklers display.

View FIFO or LIFO sequence? The word FIFO or LIFO displays in the upper left corner of the screen indicating if you are viewing:

- ticklers in FIFO (first in, first out; meaning oldest to newest) sequence, or
- ticklers in LIFO (last in, first out; meaning newest to oldest) sequence

Select FIFO or LIFO to toggle between viewing ticklers in FIFO sequence or LIFO sequence; when you first advance to this screen, ticklers display in FIFO sequence.

View all ticklers or for supervisor group? The word ALL or the Supervisor group field displays at the top of the screen indicating if you are viewing:

- all ticklers, regardless of the supervisor group assigned to the ticklers
- ticklers assigned to a particular tickler supervisor group for the signed-in user

Select Supervisor to toggle between viewing all ticklers or ticklers for a specific tickler supervisor group. When you first advance to this screen, ticklers for the supervisor group display if you are assigned to only one supervisor group. If you are assigned to none or more than one supervisor group, all ticklers display.

Searching for ticklers: You can search for specific ticklers by tickler status, tickler priority, created date, assigned date, event code, tickler category, tickler number, user group, user, and order number.

How to display this screen: Enter WWFM in the Fast path field or select Workflow Manager from a menu.

Field	Description
Supervisor group	The group ID and description of the tickler supervisor group assigned to monitor the displayed ticklers. This is a tickler supervisor group assigned to the user reviewing ticklers. This field displays only if you are viewing ticklers for a tickler supervisor group; you can view all ticklers by selecting All. Group ID: Alphanumeric, 10 positions; display-only.
Status	The status of the tickler. Open = The tickler is open and is available to work on in the assigned tickler work queue. In process = The tickler is currently being worked on by the assigned user. Resolved = The tickler has been resolved. Alphanumeric, 1 position; optional.

Field	Description
P (Tickler priority)	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is the lowest priority and 9 is the highest priority). Numeric, 1 position; optional.
Create date	The date the tickler was created. Numeric, 7 positions (in user date format); optional.
Assign date	The date the tickler was assigned to the user or tickler user group. Numeric, 7 positions (in user date format); optional.
Cd (Event code)	The code for the tickler event that created the tickler. BO = Backorders CO = Cancelled orders HO = Held orders MN = Manually created NO = New orders OO = Aged open orders SO = Sold out orders UP = Unconfirmed pick tickets VP = Voided pick tickets WF = Remote workflow See System Delivered Tickler Events. Alphanumeric, 2 positions; optional.
Cat (Event category)	The tickler category assigned to the tickler. Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT). Alphanumeric, 3 positions; optional.
Tickler number	The tickler number assigned to the tickler, from the Tickler Number number assignment record. Numeric, 9 positions; optional.
User group	The tickler user group assigned to the tickler. Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG). Alphanumeric, 10 positions; optional.
User	The user assigned to the tickler. Users are defined in and validated against the User table; see Working with User Records (WUSR). Alphanumeric, 10 positions; optional.

Field	Description
Sts (Order status)	The status of the order associated with the tickler. blank = Open. A = Archived to optical disk. This option is not currently implemented. C = Cancelled. H = Held. **Note:** The system highlights the held status in a different color (for example fuchsia) if the sold to customer is a new customer, based on purchase history. A new customer has placed an order, but no orders have shipped (# orders LTD is equal to or greater than 1 and # sales LTD is equal to 0 in the Customer Sold To Order History table). P = Purged. S = Suspended. X = Closed. Alphanumeric, 1 position; display-only.
Order number	The order associated with the tickler. Numeric, 8 positions; optional.

Screen Option	Procedure
Change a tickler	Select Change for a tickler to advance to the Change Tickler Screen.
Delete a MN tickler	Select Delete for a tickler to delete it. You can only delete MN (manually created) ticklers.
Display a tickler	Select Display for a tickler to advance to the Display Tickler screen. See the Change Tickler Screen for more information.
Release the order associated with the tickler from hold	Select Release for a tickler to advance to the Release Reason Prompt Pop-Up Window (order header hold), Release Recipient Hold Reason Pop-Up Window (recipient hold), and/or Release Order Payment Method Window (pay type hold). If you release an order from hold for an HO tickler, the system automatically resolves the tickler. Also, the system evaluates any other ticklers associated with the order to determine if they can be resolved. If you select Release for a tickler not associated with a held order, an error message indicates: Order not on hold. If you select Release for a tickler not associated with an order, an error message indicates: Tickler not eligible for this option. **Note:** You must have authority to the Release Held Orders (ERHO) menu option to release the order from hold.

Screen Option	Procedure
Select a tickler to work on	Select In Process for a tickler to change the status of the tickler from open (O) to in process (I). You can only select to work with a tickler that is in an open status; if you select In process for a tickler that is in an in process (I) or resolved (R) status, an error message indicates: Tickler status cannot be changed - resolved or already in process. Selecting this option automatically assigns the tickler to the user and creates a tickler history record. If you are on the Workflow Management screen (supervisor view), the tickler is cleared from the screen; you can view the tickler on the Workflow Management screen (all ticklers view) or in the Working with Tickler Users/User Groups (WTIC) menu option.
Enter or review tickler work notes	Select Notes for a tickler to advance to the work notes screen, based on the note type defined for the tickler. Note type A advances you to the Edit Customer Actions Window. Note type B advances you to the Work with Bill To Notes Screen. Note type O advances you to the Work with Order Messages Screen. Note type S advances you to the Edit Customer Notes Screen. Note type T advances you to the Work with Tickler Notes Screen.
Review the tickler source	Select Detail for a tickler to advance to the source screen, based on the tickler event associated with the tickler. BO, CO, HO, NO, OO, SO, UP, VP, and WF ticklers advance you to the Order Inquiry Header Screen. You cannot view the source for MN ticklers: Requested tickler has no source reference.
Review tickler history	Select History for a tickler to advance to the Work with Tickler History Screen.
Resolve a tickler	Select Resolve for a tickler to advance to the Resolve Tickler Window.
Review procedures for a tickler	Select Procedure for a tickler to advance to the Work with Tickler Event Rule Procedure Screen. You cannot add or change tickler procedures when you advance from the Work with Tickler screen. You cannot review procedures for MN ticklers.

Screen Option	Procedure
Toggle between viewing all ticklers or ticklers for a tickler supervisor group	Select All or Supervisor. The system toggles between displaying: • all ticklers (the word ALL displays at the top right of the screen). • ticklers assigned to the user's tickler supervisor group (the supervisor group ID and description displays at the top of the screen). If the user is associated with more than one supervisor group, you advance to the Select User Tickler Group Screen. If the user is not associated with a tickler supervisor group an error message indicates: Current user is not associated with any group.
Create a tickler for the MN (manually created) tickler event	Select Create to advance to the Create Tickler Screen. **Note:** To create a MN tickler, you must have authority to the Create Manual Tickler (B13) secured feature and the MN tickler event must be active.
Toggle between displaying ticklers in LIFO sequence (last in, first out; meaning newest to oldest) or FIFO sequence (first in, first out; meaning oldest to newest)	Select LIFO or FIFO. The word LIFO or FIFO displays in the top left corner of the screen, depending on which tickler order you are viewing.
Toggle between displaying ticklers in a current status or future status	Select Current/future. The word CURRENT or FUTURE displays in the top right corner of the screen, depending on which ticklers you are viewing.
Review the number of ticklers in the work queue, based on the selection criteria you have defined	Select Count to advance to the Current Tickler Count Window.
Review ticklers for a selected tickler supervisor group	Select Select Group to advance to the Select User Tickler Group Screen. This option is available only when you are viewing tickles in a tickler supervisor group work queue.
Toggle between displaying open and in process ticklers or resolved ticklers	Select Open/resolved. The system toggles between displaying: • ticklers in an open (O) or in process (I) status. • ticklers in a resolved (R) status.
Reassign ticklers to another user/user group	Select Reassign to advance to the Reassign Tickler window.
Print the Tickler Listing By Current User/Group report	Enter a Supervisor group, User group, or User and select List. The system displays the message Job TKL_LIST submitted to job queue QBATCH and generates the Tickler Listing by Current User/Group report. This report lists the ticklers assigned to the specified user or group. **Note:** The error message A user, user group, or supervisor group must be entered first displays if you do not indicate the user or group for which you wish to generate the report.

Reassign Ticklers Window

Purpose: Use this window to reassign ticklers to another user or tickler user group.

The system reassigns all ticklers currently assigned to the From tickler user/group to the To tickler user/group; you cannot select a range of ticklers to reassign.

You can reassign a specific tickler to another tickler user or tickler user group at the Change Tickler Screen.

How to display this screen: Select Reassign at the Workflow Management Screen.

Field	Description
From tickler user	The user ID of the user currently assigned to the ticklers you wish to reassign. You can reassign ticklers from a user or tickler group, but not both. Users are defined in and validated against the User table; see Working with User Records (WUSR). Alphanumeric, 10 positions; required if From tickler group is blank.
From user group	The group ID of the tickler group currently assigned to the ticklers you wish to reassign; this can be a tickler user group or tickler supervisor group. You can reassign ticklers from a user or tickler group, but not both. Tickler groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG). Alphanumeric, 10 positions; required if From tickler user is blank.
To tickler user	The user ID of the user reassigned to the ticklers. You can reassign ticklers to a user or tickler user group, but not both. Users are defined in and validated against the User table; see Working with User Records (WUSR). Alphanumeric, 10 positions; required if To tickler group is blank.
To tickler user group	The group code of the tickler user group reassigned to the ticklers; this can be a tickler user group or tickler supervisor group. You can reassign ticklers to a user or tickler user group, but not both. Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG). Alphanumeric, 10 positions; required if To tickler user is blank.

Purging Ticklers (MPTK)

Purpose: Use this menu option to purge resolved ticklers that are older than a specified purge date.

The system purges ticklers that are in an R (resolved) status; the system does not purge ticklers that are in an O (open) or I (in process) status.

Which date? The system looks at the Resolution date in the Tickler table for the resolved tickler to determine if the tickler is older than the purge date you specify.

Purge Tickler Screen

Use this screen to define the date you wish to use for purging ticklers. The system purges resolved ticklers whose Resolution date is older than the purge date you specify.

How to display this screen: Enter MPTK in the Fast path field or select Purge Ticklers from a menu.

Field	Description
Purge date	The date you wish to use for purging ticklers. The system purges ticklers that are in a resolved status whose Resolution date is older than the purge date you specify. Numeric, 6 positions (in user date format); required.

Screen Option	Procedure
Submit the Tickler Purge job to purge ticklers	Select Submit. The system displays the Confirm Accept window; select OK to submit the TKL_PURGE job.

Point of Sale Integration

Topics in this part: This part describes integration between Order Administration and a POS (point of sale) system.

- Point of Sale Integration Overview provides a brief overview of the various integrations available.
- *Generic Inventory Transaction Upload* describes the process of uploading inventory transactions.
- *Generic Item Download API* describes the process of downloading item/SKUs.
- *Generic Vendor Download API* describes the process of downloading vendors.
- *Generic Invoice Download API* describes the process of downloading invoices.
- Working with Outbound Interface Transactions (WOIT) allows you to review triggers in the IL Outbound Trigger table.
- Generating Outbound Interface Triggers (GOIT) describes how to create triggers in the IL Outbound Trigger table for item/SKUs, vendors, and/or invoices.
- *Generic Customer History API* describes how the system responds to requests for customer or order history information.
- *Generic Inventory Inquiry API* describes how the system responds to requests for inventory information about an item/SKU.
- *Generic Inventory Download API* describes the process of downloading item availability information.
- *Generic Customer Inquiry (Search) API* describes how the system responds to requests for customer records based on various search criteria.

- Work with Store Cross Reference (WSCR) describes how to set up a cross reference table to map store locations between Order Administration and an external system such as Order Orchestration or a POS application.
- Store Upload explains how to upload store cross reference information from an external system to create or update records the Store Cross Reference table.
- *Generic Customer Download API* describes the process of downloading customer information.
- Customer Engagement Batch Customer and Sales Integration describes the process of sending customer, item, sales and return information from Order Administration to Oracle Retail Customer Engagement.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Working with Outbound Interface Transactions (WOIT)

Purpose: Use this option to review triggers in the IL Outbound Trigger table.

Certain actions in Order Administration triggers the system to create IL outbound triggers.

In this topic:

- IL Outbound Triggers
- Work with Outbound Interface Transactions Screen
- Reset All Window

You can create triggers for the following information.

Information	Generated When	See:	File/ Key
stored value card authorization reversals	a cancellation is processed against a stored value card payment or the stored value card payment is deactivated and an open, unused authorization amount exists	Stored Value Card Authorization Reversal	AHR
credit card authorization reversals	the Send reversal field for the service bureau is selected and a cancellation is processed against a credit card payment or the credit card payment is deactivated and an open, unused authorization amount exists	Credit Card Authorization Reversal	AHR

Information	Generated When	See:	File/ Key
ChannelAdvisor shipments	the BILL_ASYNC job processes a shipment for an order whose type matches the ChannelAdvisor Order Type (L90)	ChannelAdvisor Integration Overview	CAS
customers	the Create Generic Customer Download Triggers (L12) system control value is selected	*Generic Customer Download API* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	CST
invoices	the Create Generic Invoice Download Trigger Records (I17) system control value is selected	*Generic Invoice Download API* and Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	IHD
inventory	the Create Generic Inventory Download Triggers (I32) system control value is selected	*Generic Inventory Download API* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	ITW
pick slips	the Create Generic Pick Download Triggers (I31) system control value is selected	*Generic Pick Out API* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	PCH
purchase orders	the Use WMS Integration (K25) and/or Create Generic PO Download Triggers (K26) and/or Create Generic PO Download Trigger for PO Receipt (K27) system control values are **selected**	*Generic Outbound Purchase Order API* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	POH
return authorizations	the Create Return Download Triggers (K28) system control value is selected		RAD
items/SKUs	the Create Generic Item Download Trigger Records (I15) system control value is selected	*Generic Item Download API* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	SKU
stored value cards	a stored value card item is processed through billing	Stored Value Card Overview and Setup	SVC

Information	Generated When	See:	File/ Key
vendors	the Create Generic Vendor Download Trigger Records (I16) system control value is selected	*Generic Vendor Download API* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	VND

Mass trigger creation: Additionally, you can create triggers for all item/SKUs, vendors, item warehouses (inventory), and/or invoices using the Generating Outbound Interface Triggers (GOIT) menu option.

Jobs in the Working with Integration Layer Processes (IJCT) menu option monitor the triggers in the IL Outbound Trigger table. At certain intervals the jobs process the triggers and generate a download XML message to send to another system.

Each trigger in the IL Outbound Trigger table contains a File code, indicating the Order Administration table(s) associated with the trigger, the key fields necessary to retrieve the information, and which IL Process job processes the trigger record.

Trigger rules: You can define trigger rules for the following IL Process jobs to determine when the system generates a trigger, based on criteria defined. The record for which you wish to create a trigger must meet the trigger rule criteria in order to create a trigger in the IL Outbound Trigger table; see Defining Outbound Interface Trigger Rules.

Example: If a trigger rule for the Item Outbound job is that the item's Allow SKU field must equal 'Y', the system creates a trigger only for SKU'ed items.

If you generate triggers for:	look at trigger rules for IL Process job:	trigger rules are based on criteria for this table:
customers	Customer Download Outbound	Customer Sold To (Company, Customer class, Inactive?, Country)
item	Item Outbound	Item (INITEM) SKU (INSKU) See *Item Outbound Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
vendor	Vendor Outbound	Vendor (POVEND) See *Vendor Outbound Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
invoice	Invoice Outbound	Invoice Header (OEINHD) Order Header (OEORDR) See *Invoice Outbound Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

If you generate triggers for:	look at trigger rules for IL Process job:	trigger rules are based on criteria for this table:
inventory	Inventory Download	Item (INITEM) Item Warehouse (INIWRE) SKU (INSKU) Warehouse (INWRHS Item UPC (ITMUPC) See *Inventory Download Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
pick slips	Pick Outbound	Pick Control Header (FLPCTH) See *Pick Out Processing*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
purchase order	Purchase Order Outbound	Purchase Order Header (POH) See *Purchase Order Download Trigger Rules* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
return authorization	Return Authorization Outbound	Order Header (OEORDR)

Note:

Direct table updates are not captured in the IL Outbound Trigger table.

IL Outbound Triggers

This table indicates:

- when the system creates a trigger
- the File code assigned to each trigger created
- the referenced tables, based on the File code
- the key data captured in the Key field
- the IL Process job that processes the trigger.

File code	Created when	Refers to table(s)	Key	IL Process job
AHR	A cancellation is processed against a stored value card or credit card payment or the stored value card or credit card payment is deactivated and an open, unused authorization amount exists.	Auth History SVC Reversal	11122222222333444555 where: **111** is the company code **22222222** is the order number **333** is the order payment method sequence number **444** is the authorization sequence number **555** is the authorization reversal sequence number	SVC_REVRSL (for stored value cards)
CAS	The BILL_ASYNC job processes a shipment for an order whose type matches the ChannelAdvisor Order Type (L90)	Order Header Invoice Header	111222222223333333 where: **111** is the company code **22222222** is the order number **3333333** is the invoice number	N/A (processed by the CASHIP periodic function)
CST	You create, change, or delete a customer	Customer Sold To	11122222222333444555 where: **111** is the company code **222222222** is the customer number	CUST_OUT
IHD	An invoice is created or updated, if the Create Generic Invoice Download Trigger Records (I17) system control value is selected	Invoice Header Order Header	111222222223333333 where: **111** is the company code **22222222** is the order number **3333333** is the invoice number	INVOIC_OUT

File code	Created when	Refers to table(s)	Key	IL Process job
ITW	The item/SKU's availability threshold is breached, if the Create Generic Inventory Download Triggers (I32) system control value is selected, and when you create or maintain a purchase order for the item, if the Include PO Updates (J93) system control value is selected	Item Warehouse	11122222222222333 33333333333 where: **111** is the company code **222222222222** is the item number **33333333333333** is the SKU code	INV_ DOWNLD
PCH	A pick slip is generated, if the Create Generic Pick Download Triggers (I31) system control value is selected	Pick Control Header	1112222222 where: **111** is the company code **2222222** is the pick control number	PICK_OUT
POH	A purchase order outbound trigger is generated, if the Create Generic PO Download Triggers (K26) system control value is selected.	PO Header	1112222222 where: **111** is the company code **2222222** is the purchase order number	PO_OUT
RAD	A return authorization is created, changed, or deleted if the Create Return Download Triggers (K28) system control value is selected	RA Detail	111222222223334445 55 where: **111** is the company code **22222222** is the order number **333** is the ship to number **444** is the return authorization number **555** is the return authorization line number	RETURN_OUT

File code	Created when	Refers to table(s)	Key	IL Process job
SKU	An item or SKU is added, updated or deleted, if the Create Generic Item Download Trigger Records (I15) system control value is selected	Item SKU	11122222222222233333333333 where: **111** is the company code **222222222222** is the item number **33333333333333** is the SKU code	ITEM_OUT
SVC	An order containing a stored value card item that is assigned a number is processed through the Billing Async; see Stored Value Card Purchase and Activation	Stored Value Card	111222222223334444455555 where: **111** is the company code **22222222** is the order number **333** is the ship to number **44444** is the order detail line sequence number **55555** is the stored value card sequence number	SVC_OUT
VND	A vendor is added, updated or deleted, if the Create Generic Vendor Download Trigger Records (I16) system control value is selected	Vendor Vendor Extended	1112222222 where: **111** is the company code **2222222** is the vendor code	VENDOR_ OUT

Work with Outbound Interface Transactions Screen

Purpose: Use this screen to review the triggers in the IL Outbound Trigger table.

How to display this screen: Enter WOIT in the Fast path field or select Work with Outbound Interface Transactions from a menu.

Field	Description
File	A code identifying the Order Administration table(s) containing records you wish to download. This code also indicates which IL Process job processes the trigger record. • AHR = Trigger associated with a stored value card or credit card authorization reversal. The SVC_REVRSL job processes the stored value card triggers. • CAS = Trigger associated with an invoice for a ChannelAdvisor order. The CASHIP periodic function processes these triggers. • CST = Trigger associated with a customer. The CUST_OUT job processes these triggers. • IHD = Trigger associated with an invoice. The INVOIC_OUT job processes these triggers. • ITW = Trigger associated with an item warehouse. The INV_DOWNLD job processes these triggers. • PCH = Trigger associated with a pick slip. The PICK_OUT job processes these triggers. • POH = Trigger associated with an outbound purchase order. The PO_OUT job processes these triggers. • RAD = Trigger associated with a return authorization. The RETURN_OUT job processes these triggers. • SKU = Trigger associated with an item/SKU. The ITEM_OUT job processes these triggers. • SPU = Not currently implemented. • SVC = Trigger associated with a stored value card. The SVC_OUT job processes these triggers. • VND = Trigger associated with a vendor. The VENDOR_OUT job processes these triggers. Example: If you create an item, the system creates an item download trigger in the IL Outbound Trigger table with a File code of SKU, indicating a change has been made to the Item and SKU table and an item download message should be generated. The Key field identifies the particular Order Administration company and data, in this example, item and SKU record, that has been updated. Alphanumeric, 3 positions; optional.
S (status)	The status of the IL outbound trigger. • R (Ready) = Trigger record is ready to be processed. • P (Pending) = Trigger record processing is pending. • X (Processed) = Trigger record has been processed. • E (Error) = Item delete trigger did not process correctly; see *Processing Item Delete Triggers*. • For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). The system purges processed (X) trigger records, based on the setting of the Outbound Interface Trigger File Purge Days (I14) system control value, when you run the PURGIJT periodic function (program name ILR0026) or select the Purge option at this screen. Alphanumeric, 1 position; optional.
Capture date	The date the activity occurred which created the trigger. Numeric, 6 positions (in user date format); optional.
Capture time	The time the activity occurred which created the trigger. Numeric, 6 positions (HH:MM:SS format); display-only.

Field	Description
Orig process date	The date the trigger was originally processed by the system. Blank if the trigger has not yet been processed. Numeric, 6 positions (in user date format); display-only.
Orig process time	The time the trigger was originally processed by the system. Blank if the trigger has not yet been processed. Numeric, 6 positions (HH:MM:SS format); display-only.
Last process date	The date the trigger was last re-processed by the system. You can reprocess a specific trigger by selecting Reset for a trigger. You can reprocess a group of triggers by selecting Reset All. You can only reprocess triggers that are in a pending (P) or processed (X) status. Numeric, 6 positions (in user date format); display-only.
Last process time	The time the trigger was last re-processed by the system. Numeric, 6 positions (HH:MM:SS format); display-only.
From	The name of the program associated with the Order Administration action that created the trigger. Alphanumeric, 8 positions; display-only.
A/C	A code that indicates whether the Order Administration activity represents creation of a new record, a change to an existing record, or a delete of an existing record. • A = a new record was added • C = an existing record was maintained • an existing record was deleted Alphanumeric, 1 position; display-only.
Key	A code used to identify the Order Administration company and data that has been updated. The File field identifies the table where the updated data is located. The Key is then used to identify the record in the table that has been updated. ChannelAdvisor shipment If the file code is CAS, the key is company code + order number + invoice number. For example, 0060000123400000123 indicates the trigger is for company 6, order number 1234, and invoice number 123. Customer If the file code is CST, the key is company code + customer number. For example, 006000013049 indicates the trigger is for company 6, customer 13049. Item/SKU If the file code is SKU, the key is company code + item number + SKU code. For example, 555ABC101020 RED GRLS LRGE indicates the trigger is for company 555, item number ABC101020, and SKU code RED GRLS LRGE. If the item is non-SKU'ed, the SKU code is not part of the key. Invoice If the file code is IHD, the key is company code + order number + invoice number. For example, 5550000596900000495 indicates the trigger is for company 555, order number 5969, and invoice number 495.

Field	Description
	Inventory If the file code is ITW, the key is company code + item number + SKU code, as described above for Item/SKU. Purchase Order Download If the file code is **POH**, the key is company code + purchase order number. For example, 0120000636 indicates the purchase order is from company 12 and the purchase order number is 636. Vendor If the file code is VND, the key is company code + vendor code. For example, 55520002 indicates the trigger is for company 555 and vendor number 20002. Stored Value Card If the file code is SVC, the key is company code + order number + ship to number + order detail sequence number + stored value card sequence number. For example, 55500006676001000010004 indicates the trigger is for company 555, order number 6676, ship to number 1, order detail sequence number 1, and stored value card sequence number 4. Return Authorization Download If the file code is RAD, the key is company code + order number + ship to number + return authorization number + return authorization line number. For example, the Key 00700001446001001001 indicates the return authorization download information is located in company 7 for order number 1446, ship to number 1, return authorization number 1, and return authorization line number 1. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Delete an IL outbound trigger	Select Delete for a trigger to advance to the Confirm Delete window; select OK to delete it. **Note:** The system allows you to delete any trigger, regardless of whether the status is ready (R) or processed (X).
Reprocess a processed trigger	Select Reset for a trigger to update the status of the trigger from pending (P) or processed (X) to ready (R). The system also updates the Last processed date and Last processed time fields once the trigger is reprocessed. The next time the IL Process job monitors the IL Outbound Trigger table for unprocessed triggers, the job will reprocess the trigger. **Pick triggers associated with a drop ship invoice/pick:** If a PCH trigger is associated with a drop ship invoice/pick, you will not be able to re-send a CWPickOut message for the trigger because the system deletes the pick records immediately after the drop ship forms are generated.
Reprocess a group of triggers	Select Reset All to advance to the Reset All Window.
Purge processed triggers	Select Purge to submit the PURGE_IL job. This job deletes processed (X) trigger records, based on the setting of the Outbound Interface Trigger File Purge Days (I14) system control value. You can also purge records through the PURGIJT periodic function (program name ILR0026).

Reset All Window

Use this window to update the status of a group of triggers from Pending or Processed to Ready.

To reset: Enter the File code, Capture date, and the current Status of the group of triggers you wish to reprocess and select OK.The system changes the status of the group of triggers to Ready.

The next time the IL Process job monitors the IL Outbound Trigger table for unprocessed triggers, the job will reprocess the triggers.

Pick triggers associated with a drop ship invoice/pick: If a PCH trigger is associated with a drop ship invoice/pick, you will not be able to re-send a CWPickOut message for the trigger because the system deletes the pick records immediately after the drop ship forms are generated.

How to display this screen: Select Reset All at the Work with Outbound Interface Transactions Screen.

Field	Description
File code	A code identifying the type of triggers you wish to reprocess. • AHR = Trigger associated with a stored value card or credit card authorization reversal. The SVC_REVRSL job processes the stored value card triggers. • CAS = Trigger associated with a shipment on a ChannelAdvisor order. The CASHIP periodic function processes these triggers. • CST = Trigger associated with a customer. The CUST_OUT job processes these triggers. • IHD = Trigger associated with an invoice. The INVOIC_OUT job processes these triggers. • ITW = Trigger associated with an item warehouse. The INV_DOWNLD job processes these triggers. • PCH = Trigger associated with a pick slip. The PICK_OUT job processes these triggers. • POH = Trigger associated with an outbound purchase order. The PO_OUT job processes these triggers. • RAD = Trigger associated with a return authorization. The RETURN_OUT job processes these triggers. • SKU = Trigger associated with an item/SKU. The ITEM_OUT job processes these triggers. • SPU = Not currently implemented. • SVC = Trigger associated with a stored value card. The SVC_OUT job processes these triggers. • VND = Trigger associated with a vendor. The VENDOR_OUT job processes these triggers. Alphanumeric, 3 positions; required.
Capture date	The date the activity occurred which created the group of triggers you wish to reprocess. Numeric, 6 positions (in user date format); required.

Field	Description
Status	The status of the group of triggers you wish to reprocess. • Ready = Triggers are ready to be processed. Selecting this status does not perform any updates since the group of triggers will already be processed the next time the IL Process job monitors for unprocessed triggers. • Error = Item delete trigger did not process correctly; see *Processing Item Delete Triggers* • Hold = Not currently implemented. • Pending = Trigger processing is pending. • Processed = Triggers have been processed. Select Pending or Processed in this field to change the status of the group of triggers to Ready. The next time the IL Process job monitors the IL Outbound Trigger table for unprocessed triggers, the job will reprocess the triggers. Alphanumeric, 1 position; required. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Generating Outbound Interface Triggers (GOIT)

Purpose: Use this menu option to create triggers in the IL Outbound Trigger table. You have the option to create triggers for:

- item/SKUs (if the Create Generic Item Download Trigger Records (I15) system control value is selected)
- vendors (if the Create Generic Vendor Download Trigger Records (I16) system control value is selected)
- invoices (if the Create Generic Invoice Download Trigger Records (I17) system control value is selected)
- inventory (if the Create Generic Inventory Download Triggers (I32) system control value is selected)

You can use the Working with Outbound Interface Transactions (WOIT) menu option to review the triggers the system generated.

In this topic:

- Trigger Rules
- Processing Sequence of Item Triggers
- Generate Outbound Interface Trigger Screen

Trigger Rules

You can define trigger rules for each IL Process job to determine when the system generates a trigger, based on criteria defined. The record for which you wish to create a trigger must meet the trigger rule criteria in order to create a trigger in the IL Outbound Trigger table; see Defining Outbound Interface Trigger Rules.

If you generate triggers for:	look at trigger rules for IL Process job:	trigger rules are based on criteria for these tables:
item	Item Outbound	Item (INITEM) SKU (INSKU) See *Item Outbound Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
vendor	Vendor Outbound	Vendor (POVEND) See *Item Outbound Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
invoice	Invoice Outbound	Invoice Header (OEINHD) Order Header (OEORDR) See *Invoice Outbound Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
inventory	Inventory Download	Item (INITEM) Item Warehouse (INIWRE) SKU (INSKU) Warehouse (INWRHS Item UPC (ITMUPC) See *Inventory Download Trigger Rules*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Processing Sequence of Item Triggers

The system generates item download triggers alphabetically by item number and SKU code in Kit type sequence. This way all items that are components of any type of kit are processed before the main kit item is processed.

1. The system generates triggers alphabetically by item number and SKU code for all items/ SKUs whose Kit type is blank.
2. The system generates triggers alphabetically by item number and SKU code for all items/ SKUs whose Kit type is F (finished good kit).
3. The system generates triggers alphabetically by item number and SKU code for all items/ SKUs whose Kit type is S (set kit).
4. The system generates triggers alphabetically by item number and SKU code for all items/ SKUs whose Kit type is V (variable set kit).

Example: The system generates item download triggers in the following sequence, based on the item's Kit type.

Item number	Kit type	Sequence
204I	blank	1

Item number	Kit type	Sequence
204J	blank	2
204K	blank	3
204C	F	4
204F	F	5
204B	S	6
204G	S	7
204D	V	8
204E	V	9

Generate Outbound Interface Trigger Screen

Use this screen to define the type of triggers you wish to create in the IL Outbound Trigger table.

How to display this screen: Enter GOIT in the Fast path field or select Generate Outbound Interface Triggers from a menu.

Field	Description
Item	Indicates whether you wish to create triggers in the IL Outbound Trigger table for items/SKUs. • Selected = Generate item/SKU triggers. The system creates a trigger for each SKU in the SKU table that is associated with an item in the Item table and assigns item/SKU triggers a File code of SKU. • Unselected (default) = Do not generate item/SKU triggers. See *Generic Item Download API* for more information on processing item download triggers. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** The Create Generic Item Download Trigger Records (I15) system control value must be selected to generate item triggers. **Process sequence:** The system generates item download triggers alphabetically by item number and SKU code in Kit type sequence. This way all items that are components of any type of kit are processed before the main kit item is processed. See Processing Sequence of Item Triggers for an example.

Field	Description
Invoice	Indicates whether you wish to create triggers in the IL Outbound Trigger table for invoices. • Selected = Generate invoice triggers. The system creates a trigger for each invoice in the Invoice Header table and assigns invoice triggers a File code of IHD. • Unselected (default) = Do not generate invoice triggers. See *Generic Invoice Download API* for more information on processing invoice download triggers. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** The Create Generic Invoice Download Trigger Records (I17) system control value must be selected to generate invoice triggers.
Vendor	Indicates whether you wish to create triggers in the IL Outbound Trigger table for vendor information. • Selected = Generate vendor triggers. The system creates a trigger for each vendor in the Vendor table and assigns vendor triggers a File code of VND. • Unselected (default) = Do not generate vendor triggers. See *Generic Vendor Download API* for more information on processing vendor download triggers. **Note:** The Create Generic Vendor Download Trigger Records (I16) system control value must be selected to generate vendor triggers. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Inventory	Indicates whether you wish to create triggers in the IL Outbound Trigger table for inventory information. • Selected = Generate inventory triggers. The system creates a trigger for each SKU in the Item Warehouse table and assigns inventory triggers a File code of ITW. If the Include Non-Allocatable Warehouses (I34) system control value is unselected, the system creates a trigger record for an item only if it has an Item Warehouse record in an allocatable warehouse. • Unselected (default) = Do not generate inventory triggers. See *Generic Inventory Download API* for more information on processing inventory download triggers. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** The Create Generic Inventory Download Triggers (I32) system control value must be selected to generate inventory triggers.

Completing this screen:

1. Select the triggers you would like to generate.
2. Select OK to validate your selection.
3. Select Submit to submit the triggers.

The system submits the:

- ITMDWNLD job to generate item triggers; see *Generic Item Download API*.

- INVDWNLD job to generate invoice triggers; see *Generic Invoice Download API*.
- VNDDWNLD job to generate vendor triggers; see *Generic Vendor Download API*.
- INVENDL job to generate inventory triggers; see *Generic Inventory Download API*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Screen Option	Procedure
Submit the generation of IL outbound triggers	Select Submit. The system submits the: • ITMDWNLD job to generate item triggers; see *Generic Item Download API*. • INVDWNLD job to generate invoice triggers; see *Generic Invoice Download API*. • VNDDWNLD job to generate vendor triggers; see *Generic Vendor Download API*. • INVENDL job to generate inventory triggers; see *Generic Inventory Download API*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Work with Store Cross Reference (WSCR)

Purpose: Use this screen to set up cross-reference information between a store location and Order Administration. This information can be used to:

- display a description of the store location assigned to fulfill a brokered backorder. See the Work with Order Broker Screen for an example, and see Brokered Backorders for background.
- enable the customer to select a store location for pickup of a ship-for-pickup order at the Store Location Screen, or for a store pickup order at the Store Pickup Search Results Screen. When the customer selects the store, the store's shipping address defaults to the order. See Ship-for-Pickup Orders and Store Pickup Orders for background.
- indicate the source code to default to a retail pickup or delivery order. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for background.
- display a description of an Order Administration warehouse at the Work with Order Broker Screen when it is assigned to fulfill a retail pickup or delivery order. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for background.
- display a description of an Order Administration warehouse at the Work with Order Broker Screen for a ship-for-pickup order. See Ship-for-Pickup Orders for background.
- provide default information for your unique POSLog extract. See the Default Location for ORCE Integration (K69) system control value for more information.
- provide the pickup location displayed in the store pickup notification email. See Store Pickup Confirmation Email Program (L48) for more information.
- provide the store name, address, and phone number to include in the *OriginatingStore* element of the *Outbound Email XML Message (CWEmailOut)* for:

- a retail pickup, delivery, ship-for-pickup, or store pickup order; or,
- for a sales rep's Home store, if it is flagged as active, or for the Originating store from the Order Header table

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> The Store Cross Reference record is not used:

- as part of the Merchandise Locator API.
- to display store descriptions or addresses at the Store Pickup Search Results Screen, although the Store Cross Reference record defaults to the Order Ship To Address when you accept the order.

Other ways to create store cross references: You can also create records in the Store Cross Reference table by:

- uploading them from an external system: see Store Upload for instructions. Using this option, you can also update existing records.
- importing them from Order Orchestration through a web service: see Importing Store Cross Reference Locations through Order Orchestration's Discovery Web Service for more information. Using this option, you can create records, but cannot update them.

In this topic:

- Work with Store Cross Reference Screen
- Create Store Cross Reference Screen

Work with Store Cross Reference Screen

How to display this screen: Enter WSCR in the Fast path field at the top of any menu or select Work with Store Cross Reference from a menu.

When you first advance to this screen, stores display in ascending store code sequence.

Column sort: You can sort on any column on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
Store	A code identifying an external store location. Can also act as a cross-reference to an Order Administration warehouse. Enter a full or partial store code to display stores that begin with your entry. Alphanumeric, 10 positions.

Field	Description
Description	The description of the store location or warehouse. This description is displayed in Working with Order Broker (WOBR) as the name of the store assigned to fulfill a brokered backorder, or the description of the warehouse assigned to fulfill a retail pickup or delivery order or that is shipping a ship-for-pickup order; also, it defaults to the Company field at the Create One Time Ship To Address Screen when you select this store location at the Store Location Screen for a ship-for-pickup order. See the Order Orchestration Integration for a discussion. Enter a full or partial description to display stores that contain your entry. Alphanumeric, 40 positions.

Option	Procedure
Create a store cross reference	Select Create for a store cross reference to advance to the Create Store Cross Reference Screen. **Note:** You can also use the Importing Store Cross Reference Locations through Order Orchestration's Discovery Web Service process or the Store Upload to create store cross reference records.
Change a store cross reference	Select Change for a store cross reference to advance to the Change Store Cross Reference screen. See the Create Store Cross Reference Screen for field descriptions.
Display a store cross reference	Select Display for a store cross reference to advance to the Display Store Cross Reference screen. You cannot change any information on this screen. See the Create Store Cross Reference Screen for field descriptions.
Delete a store cross reference	Select Delete for a store cross reference. At the Confirm Delete window, select Yes to delete the record; otherwis

Create Store Cross Reference Screen

Purpose: Use this screen to enter store cross-reference information for:

- transferring invoice data or sales transactions to your unique POSLog integration.
- integration with Order Orchestration; see the Order Orchestration Integration for background.

> **Note:**
>
> You can also use the Importing Store Cross Reference Locations through Order Orchestration's Discovery Web Service process or the Store Upload to create store cross reference records.

How to display this screen: Select **Create** at the Work with Store Cross Reference Screen.

Field	Description
Store #	A code identifying an external store location. Can also act as a cross-reference to an Order Administration warehouse. Used in certain integrations: • POSLog: Set the Default Location for ORCE Integration (K69) t to the store number representing Order Administration. • Order Orchestration: Set up a cross-reference for each store location to send retail pickup or delivery orders to Order Administration, or where you will send ship-for-pickup or pickup orders from Order Administration. Also, set up a cross-reference record for each Order Administration warehouse that you integrate with Order Orchestration if you would like to display the related description at the Work with Order Broker Screen. Alphanumeric, 10 positions. Create screen: required. Change screen: display-only.
Phone Number	The phone number for the store. Included in the *OriginatingStore* element of the *Outbound Email XML Message (CWEmailOut)*; see the *OriginatingStore* in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) element for more information. Alphanumeric, 14 positions; optional.
Description	The description to: • display in Working with Order Broker (WOBR) as the name of the store assigned to fulfill a brokered backorder. See Brokered Backorders for a discussion. • display as the fulfilling location for the warehouse assigned to fulfill a retail pickup or delivery order. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders. • display as the fulfilling location for the warehouse shipping a ship-for-pickup order. See Ship-for-Pickup Orders. • default to the Company field at the Create One Time Ship To Address Screen when you select this store location at the Store Location Screen for a ship-for-pickup order. See Ship-for-Pickup Orders for a discussion. • identify Order Administration in your POSLog integration. • include in the *OriginatingStore* element of the *Outbound Email XML Message (CWEmailOut)*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** If the description exceeds 30 positions, it is truncated at the Store Location Screen and at the Create One Time Ship To Address Screen. Also, any additional characters do not print on the pick slip and are not sent to Order Orchestration. Alphanumeric, 40 positions. Create screen: required. Change screen: optional.

Field	Description
Active?	Defines whether the store location is active. • Selected = The store location is active. • Unselected = The store location is not active. The system validates that the store location is active when you define the store on the Work with Order Ship to Properties Screen in Order Entry or receive an order through the *Generic Order Interface (Order API)* that specifies a sales_rep_store location. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
System Code	The system associated with the store location in Order Orchestration. Used to identify the fulfilling location when sending a SubmitOrder request to Order Orchestration for a store pickup or ship-for-pickup order, and acts as an override to the Name in OROB for Point of Sale (L09). If this field is: • blank, the Name in OROB for Point of Sale (L09) is used instead • not a valid system code in Order Orchestration that is associated with the selected location, Order Orchestration cannot create the order, and returns an error Your entry must be a valid system code associated with the fulfilling location in Order Orchestration and the case must match exactly. Used only for store pickup and ship-for-pickup orders. **Note:** You still need to complete the Name in OROB for Point of Sale (L09) system control value, or you cannot create a ship-for-pickup order even if a valid system code is specified here.
Register #	The register number for transactions to pass to the point-of- sale (POS) system as part of a POSLog integration. Numeric, 3 positions; optional.
Employee ID	The employee identification to pass to the POS system as part of a POSLog integration. Alphanumeric, 12 positions; optional.
Discount Code	The discount code used to pass discount information for items to the POS system as part of a POSLog integration. Alphanumeric, 12 positions; optional.
Price Override Code	The price override reason code used as a cross reference as part of a POSLog integration. Not validated against the Price Override Reason Code table. Alphanumeric, 3 positions, optional.
Item Hierarchy Level 1-4	Optionally, select the level of the item hierarchy in Order Administration that matches to the hierarchy level in an external system. Possible settings: • L/S (Long SKU) Division • L/S Department • L/S Class • Item Class • Item Category Optional.

Field	Description
Ship for Pickup	Indicates whether the store location is available for selection as a destination for a ship-for-pickup order. Only store locations that have this field selected are listed at the Store Location Screen in order entry. See Ship-for-Pickup Orders for an overview. If you select this field, the system validates that you enter: • the first Address line • a valid Country code • a valid State for the Country if state is required for the country • a Postal code that starts with a valid SCF for the State if postal code is required for the country **Note:** Select this field only for stores whose Ship For Pickup Receiving/Pickup Available setting is selected in Order Orchestration.
Source Code	The source code to assign to retail pickup or delivery orders received from Order Orchestration. Used as follows for orders created through the fulfillments response message based on whether the order originated in Order Administration: • If the order did originate in Order Administration: • Use the Order Broker Source Code (K93), if specified; otherwise, if this system control value is blank, • Use the source code, if any, specified for the store cross reference record for the originating location, which is based on the Originating Location to Pass to OROB (M32) system control value; otherwise, • Use the source code passed in the fulfillments response message from Order Orchestration, which would be from the originating order. • If the order did not originate in Order Administration: • Use the source code, if any, passed in the fulfillments response message from Order Orchestration; otherwise, • Use the source code, if any, specified for the store cross reference record for the originating location; otherwise, • Use the Order Broker Source Code (K93), if specified; otherwise, if this system control value is blank, • The order is created in error status because of the missing source code. See e Retail Pickup (including Ship-for-Pickup) or Delivery Orders for an overview. Your entry must be an existing source code. See Working with Source Codes (WSRC) for more information. Alphanumeric, 9 positions; optional.
OriginatingStore element in the CWEmailOut message	The following address fields, plus the Phone Number, are included in the *OriginatingStore* element of the *Outbound Email XML Message (CWEmailOut)*. See the *OriginatingStore* for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Address	The address to default to the Address fields at the Create One Time Ship To Address Screen when you select this store location at the Store Location Screen for a ship-for-pickup order. See Ship-for-Pickup Orders for a discussion. Alphanumeric, four 32-position fields; optional.

Field	Description
City	The address to default to the Address fields at the Create One Time Ship To Address Screen when you select this store location at the Store Location Screen for a ship-for-pickup order. See Ship-for-Pickup Orders for a discussion. Alphanumeric, four 32-position fields; optional.
State	The state to default to the Create One Time Ship To Address Screen when you select this store location at the Store Location Screen for a ship-for-pickup order. See Ship-for-Pickup Orders for a discussion. Required only if the Ship for Pickup flag is selected, and if the Require state? flag is selected for the country (see Setting Up the Country Table (WCTY)). Alphanumeric, 2 positions; required if you select the Ship for Pickup flag; otherwise, optional.
Postal code	The postal or zip code to default to the Postal code field at the Create One Time Ship To Address Screen when you select this store location at the Store Location Screen for a ship-for-pickup order. See Ship-for-Pickup Orders for a discussion. Required only if the Require postal code? flag is selected for the country (see Setting Up the Country Table (WCTY)) and if the Ship for Pickup flag is selected for the store cross reference. If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP). Alphanumeric, 10 positions; required if you select the Ship for Pickup flag; otherwise, optional.
Country	The country code to default to the Country field at the Create One Time Ship To Address Screen when you select this store location at the Store Location Screen for a ship-for-pickup order. See Ship-for-Pickup Orders for a discussion. If the Ship for Pickup flag is selected, you need to enter a valid country code. The Default Country for Customer Address (B17) defaults. Alphanumeric, 3 positions; required if you select the Ship for Pickup flag; otherwise, optional.

Order Orchestration Integration

Topics in this part: This part describes integration between Order Administration and Order Orchestration.

- Order Orchestration Integration Overview describes the components of the integration between Order Orchestration and Order Administration, including the extract processes that occur automatically as well as the Order Orchestration and Merchandise Locator API's, and describes required setup.
- Order Orchestration Integration provides details on how the integration with Order Orchestration handles each order type.
- Merchandise Locator API describes how to search for a store location where the customer can pick up an item.

Working with Order Broker (WOBR)

Purpose: Use this menu option to review the records and history of all order lines sent to or received from Order Orchestration for shipment or customer pickup. You can also use this menu option to cancel fulfillment of a brokered backorder request to Order Orchestration and leave the order line open, so you can fulfill it from your warehouse using your standard process.

Determining the Order Orchestration type: A *Delivery type* of retail pickup, delivery, store pickup, or ship-for-pickup is indicated on the Display Order Broker Screen. The *Delivery type* at this screen is blank for a brokered backorder. This screen is available by selecting Display for an Order Orchestration record at the Work with Order Broker screen.

Both originating and fulfilling orders listed: If the Use OROB for Fulfillment Assignment (M31) system control value is selected, both the originating order submitted to Order Orchestration and the fulfilling order assigned in Order Administration to fulfill it are included in these totals.

Example: Order 12345 was submitted to Order Orchestration for assignment, and Order Orchestration submitted the order to Order Administration to fulfill from the warehouse. Order Administration created order 12346 to fulfill order 12345. Lines from both order 12345 and 12346 are listed with their respective statuses.

For more information: See the Order Orchestration Integration for an overview.

In this topic:

- Work with Order Broker Screen

  – Order Orchestration Aging Report

Work with Order Broker Screen

How to display this screen: Enter WOBR in the *Fast path* field at the top of any menu, or select Work with Order Broker from a menu.

Column sort: You can sort on any column except *Line #* on this screen by clicking on the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

When you first advance to this screen, Order Orchestration records display in ascending create date, order number sequence.

Field	Description
Status	The current status of the Order Orchestration request. Possible statuses are described at the Order Orchestration Status Summary Table. Search: Select a status and select OK to display Order Orchestration records that match your entry.
Create date	The date when the Order Orchestration request was created. *Search: Enter a date and select OK to display Order Orchestration records that match your entry.* *Numeric, 6 positions (user date format); optional.*
Order #	The order number and ship-to number that originated a brokered backorder, store pickup, or ship-for-pickup order, or was created as a result of a retail pickup or delivery request. The ship-to number is set to 1 if there is a single shipping address. **Note:** Ship-for-pickup orders are not listed here until you generate a pick slip and Order Administration submits the order to Order Orchestration. Search: Enter an order number and select OK to display Order Orchestration records that match your entry. *Order number: numeric, 8 positions; optional.* *Ship-to number: numeric, 3 positions; optional.*
Line #	The sequence number in the Order Detail table that identifies the order line to be fulfilled through the Order Orchestration integration. The sequence number might differ from the order line number displayed in order maintenance or order inquiry if, for example, you deleted one of the previous lines on the order. *Numeric, 5 positions; optional.*
Item/SKU	The item to be fulfilled through Order Orchestration. If the item has SKU's, the SKU code also displays. Search: Enter a valid item number and select OK to display Order Orchestration records that contain your entry. If the item has SKU's, you can search on item number only. *Alphanumeric, 12 positions; optional.*
Qty	The current quantity to be fulfilled at the *Fulfilling location*. Displayed regardless of status. *Numeric, 5 positions; display-only.*
Fulfilling location	See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. Search: Enter a full or partial fulfilling location code and select OK to display Order Orchestration records that contain your entry. *Alphanumeric, 50 positions; optional.*

Field	Description
Request ID	A unique ID number assigned by Order Orchestration to identify the order. If the Use Split Order (L56) system control value is: • unselected: each individual brokered backorder item submitted to Order Orchestration receives a unique request ID, and Order Orchestration treats it as a separate order. • selected: Order Administration sends a single submit order request for all backordered lines that are eligible for brokering. The Use Split Order (L56) system control value does not affect how Order Administration creates or processes ship-for-pickup, retail pickup, delivery, or store pickup orders. The request ID is blank for requests whose status is: • **Z: Canceled** • **C: Closed** • **J: Rejected** • **R: Ready** • **W: Waiting** The field might also be blank for requests in E (Error) status, depending on the nature of the error. For example, requests that Order Orchestration did not receive and create successfully are not assigned request ID's. Although the field in Order Administration is up to 25 positions, Order Orchestration does not support a request ID longer than 10 positions. Search: Enter a valid request ID and select OK to display Order Orchestration records that match your entry. *Numeric, 25 positions; optional.*

Option	Procedure
Display details of an Order Orchestration request	In the *Action* field, select Display to advance to the Display Order Broker Screen.
Review history for an Order Orchestration request	In the *Action* field, select History to advance to the Display Order Orchestration History Screen.

Option	Procedure
Cancel an Order Orchestration request	In the *Action* field, select Cancel to cancel a brokered backorder and return the order line to standard backorder processing. See Canceling a Brokered Backorder Request for more information. **Note:** • To cancel both the Order Orchestration request and the order line itself, use the cancel option in order maintenance. See the discussion under Canceling a Brokered Backorder Request for background. • The Cancel option is available only for brokered backorders, only if you have authority under the Cancel Order Broker Lines (B19) secured feature, and only if the Order Orchestration request is in a status eligible for cancellation (not closed, shipped, canceled, cancel pending, unfulfillable or error).
Print the Order Orchestration Aging Report	Select Print to advance to the Print Aging Report Window. See Printing the Order Orchestration Aging Report for more information.

Display Order Broker Screen

Purpose: Use this screen to review details about an Order Orchestration request.

How to display this screen: Select Display in the *Action* field for a record at the Work with Order Broker Screen.

Field	Description
Order #	The order number that originated the brokered backorder, store pickup, or ship-for-pickup, or that was created as a result of the retail pickup or delivery request. The order number is separated from the ship-to number by a hyphen. *Numeric, 8 positions; display-only.*
Ship To #	The order ship to number that originated the brokered backorder, store pickup, or ship-for-pickup, or that was created as a result of the retail pickup or delivery request. The order number is separated from the ship-to number by a hyphen. *Numeric, 3 positions; display-only.*

Field	Description
Line #	The sequence number in the Order Detail table that identifies the order line to be fulfilled through the Order Orchestration integration. The sequence number might differ from the order line number displayed in order maintenance or order inquiry if, for example, you deleted or canceled one of the previous lines on the order. *Numeric, 5 positions; display-only.*
Item/SKU	The item and SKU fulfilled through the Order Orchestration integration. *Item: alphanumeric, 12 positions; display-only.* *SKU: alphanumeric, three 4-position fields; display-only.*
Description	A description of the item. If the item has SKUs, the SKU description displays. *Alphanumeric, 120 positions (item) or 40 positions (SKU); display-only.*
Order qty	The ordered quantity for the order detail line. This field is used for all order types. *Numeric, 5 positions; display-only.*
Qty	The quantity of a brokered backorder line that is currently assigned to Order Orchestration for fulfillment, or has been fulfilled or canceled. Might be less than the ordered quantity if this is a brokered backorder, the Use Split Order (L56) system control value is selected, and *the Allow Split Order* and *Allow Split Line* preferences in Order Orchestration are also selected. See the Use Split Order (L56) system control value for a discussion. *Numeric, 5 positions; display-only.*
Status	The current status of the Order Orchestration request. The description is to the right. Possible statuses are described at the Order Orchestration Status Summary Table. *Alphanumeric, 1 position; display-only.*
Create date	The date when the Order Orchestration request was created. *Numeric, 6 positions (user date format); display-only.*
Create time	The time when the Order Orchestration request was created. *Numeric, 6 positions (HH:MM:SS format); display-only.*
Last request date	The last date when Order Administration sent an order or status request to Order Orchestration. *Numeric, 6 positions (user date format); display-only.*
Last request time	The last time when Order Administration sent an order or status request to Order Orchestration. *Numeric, 6 positions (HH:MM:SS format); display-only.*

Field	Description
Request ID	A unique ID number assigned by Order Orchestration to identify the order. If the Use Split Order (L56) system control value is: • unselected: each individual brokered backorder item submitted to Order Orchestration receives a unique request ID, and Order Orchestration treats it as a separate order. • selected: Order Administration sends a single submit order request for all backordered lines that are eligible for brokering. The request ID is blank for requests whose status is: • **Z: Canceled** • **C: Closed** • **J: Rejected** • **R: Ready** • **W: Waiting** The field might also be blank for requests in E: Error status, depending on the nature of the error. For example, requests that Order Orchestration did not receive and create successfully are not assigned request ID's. *Numeric, 30 positions; display-only.*
Originating location	See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*
Fulfilling location	See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*
Pickup location	See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*
Broker delivery type	The type of order: • blank = brokered backorder. See Brokered Backorders. • D - DELIVERY = See Retail Pickup (including Ship-for-Pickup) or Delivery Orders. • P - STORE PICKUP = See Store Pickup Orders. • R - RETAIL PICKUP = See Retail Pickup (including Ship-for-Pickup) or Delivery Orders. • S - SHIP FOR PICKUP = See Store Pickup Orders.

Option	Procedure
Review history for the Order Orchestration request	Select History to advance to the Display Order Orchestration History Screen.

Display Order Orchestration History Screen

Purpose: Use this screen to review the order, status, and cancel requests sent from Order Administration to Order Orchestration, and the responses received. History is listed in chronological order (oldest to newest).

Not included in this history:

- Fulfillments request and response messages
- SubmitOrder request and response messages for store pickup or ship-for-pickup orders
- Changes to a brokered backorder's *Under Review* flag that can occur if the Send Held Orders to OROB (M18) system control value is selected

How to display this screen: Select History in the *Action* field for a record at the Work with Order Broker Screen, or select History at the Display Order Broker Screen.

Field	Description
Order #	The order number and ship-to number related to the Order Orchestration request. The order number is separated from the ship-to number by a hyphen. *Order number: numeric, 8 positions; display-only.* *Ship-to number: numeric, 3 positions; display-only.*
Line #	The sequence number in the Order Detail table that identifies the order line to be fulfilled through the Order Orchestration integration. The sequence number might differ from the order line number displayed in order maintenance or order inquiry if, for example, you deleted or canceled one of the previous lines on the order. *Numeric, 5 positions; display-only.*
Item/SKU	The item and SKU to be fulfilled through the Order Orchestration integration. *Item: alphanumeric, 12 positions; display-only.* *SKU: alphanumeric, three 4-position fields; display-only.*
Item/SKU description (unlabeled field to the right of the Item/SKU)	The description of the item and SKU. This field displays up to 52 positions; however, if the SKU description is truncated, you can display the rest by putting your cursor in the field and advancing it to the right. *Item description: alphanumeric, 120 positions; display-only.* *SKU description: alphanumeric, 40 positions; display-only.*
Order qty	The ordered quantity for the order detail line. This field is used for all order types. *Numeric, 5 positions; display-only.*
Originating Location	See Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*
Pickup Location	See Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*
For each Order Orchestration History record:	

Field	Description
Date/Time	The date and time when the request was sent to Order Orchestration, or when the response was received in Order Administration. There might be a difference between the time of the Send Status Request and Receive Status Response activities, because the status list request can include up to 1000 records, resulting in a delay between generating the request and processing the response for an individual order line. *Date: numeric, 6 positions (user date format); display-only.* *Time: numeric, 6 positions (HH:MM:SS format); display-only.*
Transaction type	The type of activity that occurred. Possible transaction types are: A - Send Order Request = Order Administration sent the initial submit order message to Order Orchestration (brokered backorders). B - Receive Order Response = Order Administration received the order response message from Order Orchestration (brokered backorders). C - Send Status Request = Order Administration sent an request to Order Orchestration to inquire about the order's current status. D - Receive Status Response = Order Administration received the status inquiry response message from Order Orchestration. M - Maintenance Transaction = You canceled the brokered backorder or store pickup request. You can cancel a brokered backorder either through order maintenance, or by canceling the Order Orchestration request itself (but not the order line) at the Work with Order Broker Screen; however, you can only cancel a store pickup request through order maintenance. E - Send Update Request = Order Administration sent a status update request message to Order Orchestration. F - Receive Update Response = Order Administration received the status update response message from Order Orchestration. See Sample Order Orchestration Messages for examples of the different messages generated or received by Order Administration as part of the Order Orchestration integration. *Alphanumeric, 25 positions; display-only.*
Status	The current status of the Order Orchestration request. The description is to the right. Possible statuses are described at the Order Orchestration Status Summary Table. *Alphanumeric, 1 position; display-only.*
Fulfilling location	See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*
Qty	The quantity of the Order Orchestration line at the time of the activity. Might be less than the ordered quantity if this is a brokered backorder, the Use Split Order (L56) system control value is selected, and the *Allow Split Order* and *Allow Split Line* preferences in Order Orchestration are also selected. See the Use Split Order (L56) system control value for a discussion. *Numeric, 5 positions; display-only.*

Field	Description
OROB Ln #	The sequence number in the Order Detail table that identifies the order line to be fulfilled through the Order Orchestration integration. The sequence number might differ from the order line number displayed in order maintenance or order inquiry if, for example, you deleted or canceled one of the previous lines on the order. *Numeric, 5 positions; display-only.*
Error	The error, if any, received from Order Orchestration. The error message is truncated if it exceeds 30 positions. An error of `Null response from OROB` indicates that the OROB Account (K49) system control value is not set correctly. See Troubleshooting the Order Orchestration Integration and the Order Orchestration Operations Guide for more information on possible errors. *Alphanumeric, 30 positions; display-only.*

Canceling a Brokered Backorder Request

Overview: Your options in canceling a brokered backorder request in Order Administration are:

Cancel the brokered backorder request and reassign fulfillment: to return the order line to standard backorder and fulfillment processing in Order Administration, use the cancel option from the Work with Order Broker Screen.

Cancel both the brokered backorder request and the order line itself: to prevent the order line from shipping to the customer, use the:

- Cancel option at the Work with Order Lines Screen for an order line: cancels just the selected order line. If you enter a different cancel quantity at the Enter Cancel Reason Window, any remaining uncanceled quantity returns to standard backorder and warehouse processing in Order Administration.
- Cancel Order option at the Work with Order Screen in Order Maintenance or Work with Order Lines Screen: cancels the entire order.

> **Important:**
>
> - Before canceling a brokered backorder request, it is important to confirm that the assigned fulfilling location is not in the process of shipping it. Even if the current status in Order Administration indicates that the order is not in the process of fulfillment, depending on the setting of the *Order Broker Status Update Interval (K10)* this information could be out of date.
> - If the Use OROB for Fulfillment Assignment (M31) system control value is selected you can cancel the delivery order that was created to fulfill the originating broker backorder. In this situation, the system changes the Order Orchestration record's status to Canceled and sends a status inquiry request to Order Orchestration. See Canceling an Item in Order Maintenance for more information.
> - If you broker ship-for-pickup orders for fulfillment assignment (the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS and the Send B/O to OROB (K08) system control value is selected), when you cancel a ship-for-pickup order, the system sends an update to Order Orchestration so that the order can be updated to canceled. In addition, if a retail pickup order was created in Order Administration to fulfill the ship-for-pickup order, when you run pick slip generation for the retail pickup order, the system does not generate a pick slip and assigns the hold reason defined in the Order Broker Hold Reason (Cancel) (L02) system control value to the order. The system also writes an order transaction history message for the retail pickup order: `Order held - line(s) canceled in Order Orchestration.`

Secured feature: The Cancel Order Broker Lines (B19) secured feature controls the authority to cancel a brokered backorder. If you do not have authority under this secured feature:

- the Cancel option is not available at the Work with Order Broker Screen
- you cannot cancel a brokered backorder line in order maintenance
- if you select the Cancel Order option in order maintenance, Order Administration does not cancel any brokered backordered lines and displays an error message: `Not authorized to cancel Order Broker line.`

> **Note:**
>
> You cannot use the e-commerce cancel request message to cancel a backordered line assigned to Order Orchestration. See E-Commerce Cancel Process for background.

Confirm Order Orchestration Cancel Window

How to display this window: Select Cancel for:

- an Order Orchestration request at the Work with Order Broker Screen
- in order maintenance:

  - a backordered order line assigned to Order Orchestration
  - an order that includes a backordered order line assigned to Order Orchestration

Cancel option available? The Cancel option is available only if you have authority under the Cancel Order Orchestration Lines (B19) secured feature and if the Order Orchestration request has not already been shipped or submitted for cancellation, it is not in error, and Order Orchestration has not indicated that it is unfulfillable.

Field	Description
Status	The current status of the Order Orchestration request. A brokered backorder request is eligible for cancellation only if its status is: • A - Accepted = The assigned fulfilling location has accepted the order. • K - Acknowledged = Order Orchestration has received the order request, assigned a request ID, selected a fulfilling location, and created the order in its database. • P - Polled = The assigned fulfilling the location has polled Order Orchestration for new orders and been notified of this order. • R - Ready = The request is ready to be sent to Order Orchestration, but the BROKER process has not yet generated the request message. • W - Waiting = The order request message has been sent to Order Orchestration, but Order Administration has not yet received the response.
Item/SKU	The backordered item and SKU to be fulfilled through Order Orchestration. *Item: alphanumeric, 12 positions; display-only.* *SKU: alphanumeric, three 4-position fields; display-only.*
Fulfilling location	The code identifying the store location assigned to fulfill the backorder. In the case of a retail pickup or delivery order, this is the Order Administration warehouse. See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*

Completing this screen: Click OK to submit.

Updates at accept: When you confirm the cancellation:

- An Order Orchestration History message tracks the activity. The *Transaction type* is M - Maintenance Transaction.
- The order detail line is updated immediately. If you cancel the Order Orchestration request but not the order line itself, the *Drop ship* flag and *Printed quantity* are cleared, and the order line returns to standard backorder processing.
- **Order Orchestration status change:**
  - *If the order has not yet been sent to Order Orchestration* (the status of the Order Orchestration request is R (ready), the status of the Order Orchestration request changes to C (closed). No further updates take place.
  - *If the order has been sent to Order Orchestration* (the status of the Order Orchestration request is W (waiting), K (acknowledged), P (polled), or A (accepted): the status of the Order Orchestration request changes to Y (pending cancel). Once the BROKER job receives confirmation of the cancellation from Order Orchestration,

it changes the status of the Order Orchestration request to Z (canceled), and writes an Order Transaction History message (for example, `Ln#: 2 Cancel Acknowledged by Broker`).

Status update message: The status update message includes the cancel reason code and description. See the Order Status Update Cancel Request Message Sample (Brokered Backorder or Store Pickup) for information about the fields submitted to Order Orchestration for the cancellation of a brokered backorder.

Printing the Order Orchestration Aging Report

Purpose: Use the Order Orchestration Aging Report to review order lines that have been assigned to Order Orchestration for fulfillment.

Print Aging Report Window

How to display this window: Select Print at the Work with Order Broker Screen.

Field	Description
Status	Optionally, select a status to include Order Orchestration records that are currently in this status, or leave this field unselected to include records regardless of status. Statuses that are eligible for selection are: • A (Accepted) = Brokered backorder or store pickup: The location assigned to fulfill the order has accepted it. • F (Picking) = Retail pickup, delivery, or ship-for-pickup: The pick slip has been printed. (Status in Order Orchestration is *New_Order* or *Picked*). • G (Resend Fulfilled) = Delivery: The Order Status Update request message to change the status in Order Orchestration to fulfilled did not generate a response message from Order Orchestration, possibly because message authentication failed or communication is down. In this case, the BROKER_ORD job re-sends the Order Status Update request the next time it runs. • H (Resend Intransit) = Ship-for-pickup: The Order Status Update request message to change the status in Order Orchestration to intransit did not generate a response message from Order Orchestration, possibly because message authentication failed or communication is down. In this case, the BROKER_ORD job re-sends the Order Status Update request the next time it runs. • I (In Process) = Retail pickup or delivery: The order was received from Order Orchestration and created without error. (Status in Order Orchestration is *Accepted*.) • J (Rejected) = – Retail pickup or delivery: The order was sold out after creation in Order Administration. – Store pickup: The selected store location has rejected the order. • K (Acknowledged) = Brokered backorder or store pickup: Order Orchestration has received the order request, assigned a request ID, selected a fulfilling location, and created the order in its database. (Status in Order Orchestration is *New_Order*.) • L (Partial Fulfill) = Retail pickup, ship-for-pickup, or store pickup: The customer has picked up one or more items on the order, but not the complete order. (Status in Order Orchestration is *Partially Fulfilled*.) • N (New) = Retail pickup or delivery: The order was received from Order Orchestration but is in error. (Status in Order Orchestration is *Polled*.) • O (Posted) = Brokered backorder, store pickup, or ship-for-pickup: Order Orchestration has submitted the order or order line for enterprise fulfillment. See Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing) for background. • P (Polled) = Brokered backorder or store pickup: The assigned fulfilling location has polled Order Orchestration for new orders and been notified of this order. (Status in Order Orchestration is *Polled*.) • R (Ready) =

Field	Description
	– Brokered backorder: The request is ready to be sent to Order Orchestration, but the BROKER process has not yet generated the request message. – Store pickup: Order Administration attempted to send the order to Order Orchestration, but Order Orchestration has not responded. In this case, Order Administration retains the order information in the Store Pickup tables until communication with Order Orchestration resumes. • S (Received by Store) = Retail pickup or ship-for-pickup: The order has been received by the store location but not yet picked up by the customer. (Status in Order Orchestration is *Received*.) • T (In Transit) = Retail pickup or ship-for-pickup: You have confirmed shipment of the order to the store. (Status in Order Orchestration is *Intransit*.) • W (Waiting) = Brokered backorder: The request message has been sent to Order Orchestration, but the response has not yet been received. • Y (Pending Cancel) = – Brokered backorder: You have canceled the order line (including the Order Orchestration request), or you have canceled just the Order Orchestration request at the Work with Order Broker Screen, but you have not yet received a confirmation of the cancellation from Order Orchestration. – Store pickup: You have canceled the order through order maintenance, but have not yet received the confirmation of the cancellation from Order Orchestration. **Note:** You cannot include Order Orchestration records on the report if their status is Unfulfillable (U), Closed (C), Completed (X), or Error (E). *Optional.*
Fulfilling location	Optionally, select a single store location, or leave this field blank to select records regardless of fulfilling location. This information is from Work with Store Cross Reference (WSCR). See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion. *Alphanumeric, 50 positions; optional.*

Field	Description
Older than	Optionally, enter a number of days to have the report include Order Orchestration records only if their age exceeds this number, or leave this field set to 00000 to select records that are at least two days old. **Note:** It is not possible to include Order Orchestration records from the current or previous day on the report. Only records that are at least two days old are eligible for selection. *Numeric, 5 positions; optional.*

Note:

The Order Orchestration Aging Report is accessible at the Document Management Screen. It is not available by selecting a submitted job at the Job Management Screen.

Stored Value Card Integration

Topics in this part: The following topics describe the functions available for stored value card integration.

- Stored Value Card Overview and Setup provides an overview of stored value card processing and required setup.
- Stored Value Card Purchase and Activation describes the processing that occurs when a stored value card is purchased and activated.
- Working with Physical Stored Value Card Assignment (WPSA) describes how to assign a number to a physical stored value card.
- Stored Value Card Balance Inquiry (MSVB) describes the processing that occurs when you perform a stored value card balance inquiry.
- Stored Value Card Authorization Reversal describes the processing that occurs when you reimburse a stored value card payment a cancellation or deactivation amount.
- Transmitting Activation and Reversal Transactions (SSVC) describes how to process stored value card download triggers and generate stored value card XML messages to send to the service bureau for processing.
- Generating Stored Value Card Refunds describes how to generate a new stored value card to send to the sold to customer when you process a stored value card credit.
- Customer Engagement Stored Value Card Integration describes the integration between Order Management System and the Oracle Retail Customer Engagement stored value card system.

Working with Physical Stored Value Card Assignment (WPSA)

Purpose: Before you can activate a stored value card, you must first assign a number to the card. Assigning a number to a physical stored value card occurs after pick slip generation. Use this menu option to assign a number to a physical stored value card by selecting the associated pick control number.

Assigning numbers using an external system: You can use the Pick Message from Order Administration (CWPickOut) to send physical stored value card information to an external system. The external system assigns a number to the card and returns the number in the *svc_card_nbr* tag in the *CWPickIn XML Message*. When Order Administration receives a CWPickIn message that contains a stored value card number, the system creates a record in the Billing SVC Data Queue table and sends the information to billing. See Billing a Stored Value Card.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

For more information: See:

- Assigning Numbers to Virtual Stored Value Cards for more information on assigning a number to a virtual stored value card.
- Assigning a Stored Value Card Number for an overview on assigning a number to a physical or virtual stored value card.

In this topic:

- Pick SVC Assignment/Billing Screen
- Stored Value Card Assignment Screen

Pick SVC Assignment/Billing Screen

Use this screen to select the physical stored value card for which you wish to assign a number, by selecting the associated pick control number.

An error message indicates if you enter a pick control number that does not contain a physical stored value card item (*SVC type* is Physical Card or Physical Card/Early Notify): `Pick control# not valid for SVC number assignment.`

Once you select a physical stored value card by pick control number, select OK to advance to the Stored Value Card Assignment Screen.

How to display this screen: Enter WPSA in the *Fast path* field or select Work with Stored Value Card Assignment from a menu.

Field	Description
Pick control #	The pick control number containing the physical stored value card item for which you wish to assign a number. An error message indicates if you enter a pick control number that does not contain a physical stored value card: `Pick control# not valid for SVC number assignment.` *Numeric, 7 positions; required.*

Stored Value Card Assignment Screen

Purpose: Use this screen to define a number for each physical stored value card associated with the selected pick control number.

Typically, the stored value card number is printed on the physical card. You can enter this number in the *Stored value card number* field on this screen. A separate line displays for you to enter a number for each physical card associated with the pick control number.

> **Note:**
>
> Depending on the user's authority to credit card information, the system writes a record to the Credit Card Audit table when this screen is displayed. See *Logging Credit Card Data Access* in the Data Security Guide on My Oracle Support (2953017.1) for more information.

Stored value card number validation

- The system performs a modulus check against the stored value card number if a method is specified in the Stored Value Card Modulus Checking Method (I24) system control value. If the stored value card number fails the modulus check, an error message indicates: `Card number failed modulus check.`
- If MU is selected as the type of modulus check to perform and the User Defined Modulus Check Program (E94) system control value is blank, an error message indicates `Modulus check program has not been specified for SCV E94.`
- You must define a number for each stored value card associated with the pick control number. An error message indicates if you do not define a number for each physical stored value card: `All stored value card numbers must be entered before accepting.`
- You cannot assign the same number to more than one stored value card on the pick control record or an error message indicates: `Duplicate card number on pick# 9999 line# 2.`
- You cannot enter a number that is already assigned to an existing stored value card or an error message indicates: `Card number entered already used.`

How to display this screen: Select OK at the Pick SVC Assignment/Billing Screen after entering a pick control number associated with a physical stored value card.

Field	Description
Control#	The pick control number containing the physical stored value cards to which you wish to assign numbers. *Numeric, 7 positions; display-only.*
Billing batch#	The billing batch number associated with the pick control number containing the physical stored value card. *Numeric, 7 positions; display-only.*
Order#	The order number and ship to number where the physical stored value cards were purchased. *Order #: Numeric, 8 positions; display-only.* *Ship to #: Numeric, 3 positions; display-only.*

Field	Description
Line#	The pick control line number associated with the physical stored value card. *Numeric, 3 positions; display-only.*
Item	The item number of the physical stored value card item. *Alphanumeric, 12 positions; display-only.*
SKU	The SKU code of the physical stored value card item. *Alphanumeric, 14 positions; display-only.*
Description	A description of the physical stored value card item. The first 25 positions display. *Alphanumeric, 25 positions; display-only.*
Qty	The quantity of the physical stored value card associated with the pick control number. This is the number of cards to which you must assign a number. *Numeric, 5 positions; display-only.*
Amount	The issue amount assigned to each physical stored value card purchased. *Numeric, 13 positions with a 2-place decimal; display-only.*
Stored value card number	The number you wish to assign to the physical stored value card. Typically, this number is printed on the physical card. A separate line displays for you to enter a number for each physical card associated with the pick control number. The full stored value card number displays, regardless if a default credit card number format is defined at the Credit Card Number Layout Screen. This allows you to verify the stored value card number you are entering. See Stored value card number validation for additional edits the system performs against the stored value card number. *Numeric, 20 positions; required.*

Screen Option	Procedure
Accept the stored value card number assignment	Select Accept to assign the stored value card number to the physical card, linking the stored value card to the recipient card holder.
Reject the stored value card number assignment	Select Reject. The system does not assign the number to the stored value card.

If you accept: If you accept the stored value card number assignment, the system:

- assigns the number to the physical stored value card and updates the Pick Stored Value Card Table.
- sends the pick control number associated with the physical stored value card item to billing if the Use Streamlined Stored Value Card Billing (I23) system control value is selected; otherwise the system sends the card to billing once it is wanded and billed at your manifesting station.

> **Note:**
>
> If you do not Use Streamlined Stored Value Card Billing (I23), you can update the stored value card number at the Pick SVC Assignment/Billing Screen by entering a new number over the existing number. Once you bill the stored value card item, you cannot update the stored value card number.

Stored Value Card Balance Inquiry (MSVB)

Overview: You can inquire on the remaining amount available on a stored value card:

- Using the Stored Value Card Balance Inquiry (MSVB) menu option; see Stored Value Card Balance Inquiry (MSVB).
- In order entry and maintenance; see Order Entry/Maintenance Balance Inquiry.
- Before performing batch authorization against the card during pick slip generation or drop ship processing; see Batch Authorization Balance Inquiry.

> **Note:**
>
> This option is also available in Modern View.

In this topic:

- Stored Value Card Balance Inquiry (MSVB)
- Stored Value Card Balance Inquiry Screen (MSVB)
- Order Entry/Maintenance Balance Inquiry
  - Balance Inquiry For Window
- Batch Authorization Balance Inquiry

Stored Value Card Balance Inquiry (MSVB)

Purpose: Use the Stored Value Card Balance Inquiry menu option to submit a stored value card balance inquiry request.

For more information: See Stored Value Card Balance Inquiry (MSVB).

Stored Value Card Balance Inquiry Screen (MSVB)

Use this screen to specify the stored value card whose balance you wish to know.

> **Note:**
>
> Depending on the user’s authority to credit card information, the system writes a record to the Credit Card Audit table when this window is displayed. See *Logging Credit Card Data Access* in the Data Security Guide on My Oracle Support (2953017.1) for more information.

How to display this screen:

- Enter MSVB in the *Fast path* field or select Stored Value Card Balance Inquiry from a menu.
- Select Balance Inquiry on the Customer Selection Screen.

> **Note:**
>
> The system returns you to the Customer Selection screen after you complete the balance inquiry.

Field	Description
Pay type	The code for the stored value card pay type assigned to the stored value card number whose remaining balance you are inquiring. The pay type you enter must be a stored value card pay type or an error message indicates: `Pay type not eligible for balance inquiry.` *Numeric, 2 positions; required.*
Card number	The stored value card number whose balance you are inquiring. *Alphanumeric, 20 positions; required.*
SVC ID #	The ID number assigned to the stored value card. Include only if your stored value card processor supports it. *Numeric, 9 positions; optional.*
Balance	The remaining balance on the stored value card. This field is blank until you receive a balance inquiry response from the service bureau. However, the service bureau may return a blank balance if the stored value card number exists, but has not yet been activated or the remaining balance is zero. *Numeric, 13 positions with a 2-place decimal; display-only.*

Screen Option	Procedure
Submit a stored value card balance inquiry request	Select Submit Request.

Instructions: Use the following steps to submit a stored value card balance inquiry request from the Stored Value Card Balance Inquiry Screen (MSVB).

#	Step
1.	Enter a stored value card pay type, card number, and optionally ID number, and select OK.
2.	The system looks at the *Authorization service* field defined for the stored value card pay type to determine the service bureau that performs balance inquiries for the stored value card pay type.

#	Step
3.	The system looks at the *Communication type* field defined for the service bureau to determine the method of communication used to transmit balance inquiry transactions between Order Administration and the service bureau. Integration Layer indicates Order Administration communicates with the external system using advanced queuing. • The system looks at the *SVC balance inquiry integration layer process* field defined for the service bureau to determine the integration layer process used to process stored value card balance inquiries. • The integration layer process sends the stored value card balance inquiry request to the service bureau and waits for a balance inquiry response, based on the number of seconds defined in the *Wait time* field for the integration layer process. Payment Link indicates Order Administration communicates with the external system using a point-to-point integration instead of using advanced queuing. The system looks at the settings in the Interface Properties to communicate with the service bureau using a point-to-point integration. **Note:** This option is available for the Customer Engagement Stored Value Card Integration. The system uses the Customer Engagement Inquiry Request to send the balance inquiry request to Oracle Retail Customer Engagement and receives the response in the Customer Engagement Inquiry Response.
4.	If a response is received from the service bureau, the system displays the remaining balance amount for the stored value card in the *Balance* field. However, this field may remain blank if the stored value card number exists, but has not yet been activated.00 displays if the remaining balance is zero. If a response is not received from the service bureau, the system displays the message: `No response from service.`

Order Entry/Maintenance Balance Inquiry

Purpose: Use the following steps to submit a stored value card balance inquiry request from order entry/maintenance.

1. At the Enter Payment Method screen, select Balance Inquiry for a stored value card payment method.

   You can also select this option at the Enter Credit Card For window. However, an error message indicates if you have not yet created the stored value card payment method on the order: `Must create pay method before Balance Inquiry.`

2. The system looks at the *Authorization service* field defined for the stored value card pay type to determine the service bureau that performs balance inquiries for the stored value card pay type.

3. The system looks at the *Communication type* field defined for the service bureau to determine the method of communication used to transmit balance inquiry transactions between Order Administration and the service bureau.

- Integration Layer indicates Order Administration communicates with the external system using advanced queuing.
  - The system looks at the *SVC balance inquiry integration layer process* field defined for the service bureau to determine the integration layer process used to process stored value card balance inquiries.
  - The integration layer process sends the stored value card balance inquiry request to the service bureau and waits for a balance inquiry response, based on the number of seconds defined in the *Wait time* field for the integration layer process.
- Payment Link indicates Order Administration communicates with the external system using a point-to-point integration instead of using advanced queuing.

  The system looks at the settings in the Interface Properties to communicate with the service bureau using a point-to-point integration.

  > **Note:**
  >
  > This option is available for the Customer Engagement Stored Value Card Integration. The system uses the Customer Engagement Inquiry Request to send the balance inquiry request to Oracle Retail Customer Engagement and receives the response in the Customer Engagement Inquiry Response.

4. If a response is received from the service bureau, the system displays the Balance Inquiry For Window, indicating the remaining balance on the stored value card.

If a response is not received from the service bureau, the system displays the message: `No response from service.`

Balance Inquiry For Window

Use this window to review the remaining balance on a stored value card during order entry/maintenance.

When a balance is received, you can:

- Select OK to add the stored value card balance as the amount to charge for the stored value card payment on the order. You can also enter a lesser amount in the *Balance* field if you wish to use a partial amount of the remaining balance on the card as payment on the order.
- Select Exit to return to the previous screen without adding the stored value card balance as the amount to charge on the order.

Note:

- Depending on the user's authority to credit card information, the system writes a record to the Credit Card Audit table when this window is displayed. See *Logging Credit Card Data Access* in the Data Security Guide on My Oracle Support (2953017.1) for more information.
- This screen may return a blank balance if the stored value card number exists, but has not yet been activated by the service bureau or the remaining balance is zero.

How to display this screen: This screen displays when a balance inquiry response is received from the service bureau, after you send a stored value card balance inquiry request to the service bureau by:

- Selecting Balance Inquiry for a stored value card payment method at the Enter Payment Method screen.
- Selecting Balance Inquiry at the Enter Credit Card For window.

Field	Description
Pay type	The code and description of the stored value card pay type assigned to the stored value card number whose remaining balance you are inquiring. *Code: Numeric, 2 positions; display-only.* *Description: Alphanumeric, 30 positions; display-only.*
Card #	The stored value card number whose balance you are inquiring. *Alphanumeric, 20 positions; display-only.*
Balance	The remaining balance on the stored value card. *Numeric, 13 positions with a 2-place decimal; required.*

Batch Authorization Balance Inquiry

Purpose: Use the following steps to submit a stored value card balance inquiry request before performing batch authorization against the stored value card.

Note:

In order to perform a balance inquiry before batch authorization, the Perform Balance Inquiry during Batch Authorizations (J19) system control value must be selected.

#	Step
1.	Submit pick slip generation or drop ship processing that includes an order with an active stored value card pay type that requires batch authorization. **Note:** The system compares the authorized amount across all stored value card pay types on the order against the pick total to determine if the stored value card requires batch authorization. If the authorized amount across all stored value card pay types on the order is equal to or greater than the pick total, the system does not send perform batch balance inquiry against the card.
2.	The system looks at the *Authorization service* field defined for the stored value card pay type to determine the service bureau that performs balance inquiries for the stored value card pay type.
3.	The system looks at the *Communication type* field defined for the service bureau to determine the method of communication used to transmit balance inquiry transactions between Order Administration and the service bureau. Integration Layer indicates Order Administration communicates with the external system using advanced queuing. • The system looks at the *SVC balance inquiry integration layer process* field defined for the service bureau to determine the integration layer process used to process stored value card balance inquiries. • The integration layer process sends the stored value card balance inquiry request to the service bureau and waits for a balance inquiry response, based on the number of seconds defined in the *Wait time* field for the integration layer process. Payment Link indicates Order Administration communicates with the external system using a point-to-point integration instead of using advanced queuing. The system looks at the PAY_LINK properties in Working with Customer Properties (PROP) to communicate with the service bureau using a point-to-point integration. **Note:** This option is available for the Customer Engagement Stored Value Card Integration. The system uses the Customer Engagement Inquiry Request to send the balance inquiry request to Oracle Retail Customer Engagement and receives the response in the Customer Engagement Inquiry Response.

#	Step
4.	If a response is received from the service bureau, and: • The balance is equal to or greater than the charge amount, the system continues with authorization processing to authorize the stored value card for the charge amount. • The balance is less than the charge amount and the stored value card payment is the catch-all payment on the order, the system does not authorize the stored value card and does not generate a pick slip for the order. In addition, the system writes an order payment history message indicating the stored value card did not have the available funds: `H INSUFFICIENT FUNDS ON STORED VALUE CARD SVC_BALANC`. Also, if a Hold Reason for Stored Value Cards with Insufficient Funds (J18) is defined, the system places the order on hold. **Note:** If two or more pick slips are generated for the same order and one of the pick slips fails balance inquiry for insufficient funds, the system declines all pick slips for the order. For example, if the available balance on a stored value card is 100.00 and during pick slip generation, the system generates two pick slips for an order, the first pick slip requiring a stored value card balance of 60.00 and the second pick slip requiring a stored value card balance of 70.00, the system will fail both pick slips even though the first pick slip required a balance that was less than the balance on the stored value card. • The balance is less than the charge amount and the stored value card payment is not the catch-all payment on the order, the system authorizes the stored value card for the remaining balance and authorizes the catch-all payment for the remaining amount to authorize. In addition, the system writes an order payment history message indicating the charge amount for the stored value card pay type was changed to the remaining balance: `M Amount: 50.00 to 25.00 SVC_BALANC`.

Note:

If a balance inquiry response is not received from the service bureau, for example, due to communication errors, the system will continue with batch authorization.

Examples: The following examples explain what happens to a stored value card pay type on an order, based on the remaining balance on the card.

Example:	Balance:	Results:
Order total = $100.00 Stored value card = catch-all	$120.45	The system authorizes the stored value card pay type for $100.00. Once the stored value card on the order is authorized, the system generates a pick slip. The remaining balance on the stored value cad is $20.45.

Example:	Balance:	Results:
Order total = $100.00 Stored value card = catch-all Credit card = $25.00	$45.50	Because the stored value card does not have $75.00 remaining to apply to the order, the system does not authorize the pay types on the order and does not generate a pick slip for the order. If a Hold Reason for Stored Value Cards with Insufficient Funds (J18) is defined, the system places the order on hold. The remaining balance on the stored value card is $45.50.
Order total = $100.00 Stored value card = $75.00 Credit card = catch-all	$45.50	The system authorizes the stored value card for $45.50 and authorizes the credit card for $54.50. Once the pay types on the order are authorized, the system generates a pick slip. The remaining balance on the stored value card is zero. An order payment history message is created: `M Amount: 75.00 to 45.50 SVC_BALANC`

Transmitting Activation and Reversal Transactions (SSVC)

Purpose: Use this menu option to process activation and authorization reversal download triggers and generate the corresponding messages to send to the service bureau for processing.

System control value: The Use Activation / Reversal Batch Processing (I50) system control value controls whether activation and authorization reversal transactions are processed immediately or in batch.

- If selected, the system does not process activation or authorization reversal trigger records until you submit the batch process using this menu option or a periodic function.
  - Periodic function SVCACT (program name PFR0076) processes activation trigger records.
  - Periodic function SVCREV (program name PFR0077) processes authorization reversal trigger records.

  In this situation, the SVC Activation and SVC Reversal integration layer jobs can remain inactive.
- If unselected, when active, the Activation and Reversal integration layer jobs monitor for activation and authorization reversal trigger records to process at defined intervals, based on the *Outbound delay time*.

For more information: See:

- Stored Value Card Purchase and Activation for more information on activating a stored value card.
- Stored Value Card Authorization Reversal for more information on performing a stored value card authorization reversal.

- Credit Card Authorization Reversal for more information on performing a credit card authorization reversal.
- Working with Outbound Interface Transactions (WOIT) for more information on reviewing triggers.

Transmit SVC/CC Transactions Screen

Use this screen to submit a batch job to process activation and authorization reversal download triggers and generate the corresponding messages to send to the service bureau for processing.

You can select to process activations or authorization reversals from this screen.

How to display this screen: Enter SSVC in the *Fast path* field or select Transmit Stored Value Card Transactions from a menu.

Field	Description
Activations	Indicates if the submitted batch job processes activation download triggers. Valid values: Selected = The submitted batch job processes activation download triggers. Unselected = The submitted batch job does not process activation download triggers. Activation download triggers are identified by: • *File code*: SVC. • *Key*: identifies the specific company, order number, ship to number, order detail sequence number, and stored value card sequence number associated with the SVC download trigger. For example, the *Key* `555000066760010000100004` indicates the stored value card information is located in company 555 for order number 6676, ship to number 1, order detail sequence number 1, and stored value card number 4. See Activating a Stored Value Card for additional processing information.

Field	Description
Reversals	Indicates if the submitted batch job processes authorization reversal download triggers. Valid values: Selected = The submitted batch job processes authorization reversal download triggers. Unselected = The submitted batch job does not process authorization reversal download triggers. Authorization reversal download triggers are identified by: • *File code*: AHR. • *Key*: identifies the specific company, order number, order payment method sequence number, authorization sequence number, and authorization reversal sequence number in the SVC Authorization Reversal table. For example, the *Key* `5550000006794001001001` indicates the authorization reversal information is located in company 555 for order number 6794, order payment method sequence number 001, authorization sequence number 001, and authorization reversal sequence number 001. See: • Stored Value Card Authorization Reversal Process for more information on processing stored value card authorization reversals. • Credit Card Authorization Reversal for more information on processing credit card authorization reversals.

Screen Option	Procedure
Submit the batch job to process download triggers	Select Submit. See: • Activating a Stored Value Card • Stored Value Card Authorization Reversal • Credit Card Authorization Reversal

Importing Item/SKU and Set Data

Topics in this part: The following topics describe how to import item/SKU and set data into Order Administration from an external system.

- Importing Item-Related Supporting Data (SDUP) provides details on importing items/SKU information, item-related supporting table information, and set components into Order Administration.
- Importing Set Components (WCUP) provides details on building sets, including finished goods and variable sets.
  - Work with Component Upload Screen (WCUP)

Importing Item-Related Supporting Data (SDUP)

Purpose: Use the Submit Supporting Data Upload option to import supporting data related to items and order maintenance.

In this topic:

- Submit Supporting Data Upload Screen (SDUP)
- Supporting Data Upload Table
- Understanding Supporting Data Upload Errors

Periodic function: You can also submit the upload through the UPLSDTA periodic function.

Submit Supporting Data Upload Screen (SDUP)

Purpose: Use this screen to create new records in supporting tables based on the records that are currently in the Supporting Data Upload table for your company. You can use this screen to create records in the following tables:

- Long SKU Division
- Long SKU Department
- Long SKU Class
- Item Class
- SKU Elements 1, 2, and 3
- Item Status
- Retail Class
- Return Reason
- Exchange Reason

How to display this screen: Enter SDUP in the *Fast path* field at the top of any menu, or select Submit Supporting Data Upload from a menu.

When you select Submit at this screen, the system submits the SUPPUPLOAD job.

Job processing:

- The job evaluates each record in the Supporting Data Upload table that is associated with your current company.
- If the job can create the record in the specified table without error, it creates the record and deletes the Supporting Data Upload record.
- If the Supporting Data Upload record is in error for any reason, the job leaves the record in the table and updates it with a description of the error.
- Since the job selects records in your company, records that do not have a valid company number remain in the table.

Supporting Data Upload Table

The contents of this table are described below.

Company field: The company field is required for all record types. The company number is numeric, three positions, and is validated against the Company table.

Additional fields ignored: If the record includes information in additional fields not listed below, the system ignores the information. For example, if the *Misc1* field is populated for a record type that does not require this information, the contents of the field are discarded.

When you select Submit at the Submit Supporting Data Upload Screen (SDUP), the system process all error-free records whose *Company* field matches the submitting company, and ignores any records in the table whose *Company* does not match or that have already been flagged with an error reason.

Type	Updates	Additional Fields Used to Create Records
EXR	Exchange Reason: Establishing Exchange Reason Codes (WEXR)	*Code* = Numeric, 3 positions. The exchange reason code. *Description* = Alphanumeric, 30 positions. Each of the above fields is required. You can use Establishing Exchange Reason Codes (WEXR) to enter additional information. See that menu option for more information.
ICL	Item Class: Working with Item Classes (WICL)	*Code* = Alphanumeric, 3 positions. The item class code. *Description* = Alphanumeric, 30 positions. Each of the above fields is required. **Note:** You can use Working with Item Classes (WICL) to enter additional information for an item class. See that menu option for more information.
IST	Item Status: Working with Item Status (WIST)	*Code* = Alphanumeric, 1 position. The item status code. *Description* = Alphanumeric, 30 positions. Each of the above fields is required. **Note:** You can use Working with Item Status (WIST) to enter order entry messages and a return disposition code. See that menu option for more information.

Type	Updates	Additional Fields Used to Create Records
LDV	Long SKU Division: Creating and Maintaining Long SKU Divisions (WLDV)	*Code* = Alphanumeric, 3 positions. The long SKU division code. **Note:** Although the long SKU division field is 4 positions elsewhere, the supporting data upload supports just 3 positions. *Description* = Alphanumeric, 30 positions. Each of the above fields is required.
LSC	Long SKU Class: Working with Long SKU Classes (WLSC)	*Code* = Numeric, 4 positions. The long SKU class code. *Description* = Alphanumeric, 30 positions. Each of the above fields is required. You cannot upload or work with long SKU classes if the Use Retail Integration (H26) system control value is selected.
LSD	Long SKU Department: Working with Long SKU Departments (WLSD)	*Code* = Numeric, 4 positions. The long SKU department code. *Description* = Alphanumeric, 30 positions. Each of the above fields is required. *Misc1* = Long SKU division. Alphanumeric, 3 positions. Required if the Require Long SKU Division with Long SKU Department (E85) system control value is selected; otherwise, optional. Must be a valid long SKU division.

Type	Updates	Additional Fields Used to Create Records
RTC	Retail Class: Working with Long SKU Departments (WLSD)	*Code* = Numeric, 4 positions. The retail class code. *Description* = Alphanumeric, 30 positions. *Misc1* = The long SKU department to which the retail class is being assigned. Numeric, 4 positions. Must be a valid long SKU department. Each of the above fields is required. **Note:** • You can assign a retail class to a long SKU department only if the Use Retail Integration (H26) system control value is selected. • You cannot create a retail class without assigning it to a specific long SKU department. • You can assign the same retail class to more than one long SKU department; however, you cannot assign a retail class to more than one long SKU department at a time. Since the *Misc1* field is not a key field for the Supporting Data Upload table, creating a second RTC record for the same retail class would be a duplicate record.

Type	Updates	Additional Fields Used to Create Records
RTR	Return Reason: Establishing Return Reason Codes (WRTR)	*Code* = Numeric, 3 positions. The return reason code. *Description* = Alphanumeric, 30 positions. Each of the above fields is required. You can use Establishing Return Reason Codes (WRTR) to enter additional information. See that menu option for more information.
SEO	SKU Element 1: Working with SKU Elements (WSK1, WSK2, WSK3)	*Code* = Alphanumeric, 4 positions. The SKU element. *Description* = Alphanumeric, 10 positions. *Misc1* = Sort sequence number. Numeric, 5 positions. All fields except *Misc1* are required.
SET	SKU Element 3: Working with SKU Elements (WSK1, WSK2, WSK3)	*Code* = Alphanumeric, 4 positions. The SKU element. *Description* = Alphanumeric, 10 positions. *Misc1* = Sort sequence number. Numeric, 5 positions. All fields except *Misc1* are required.
SEW	SKU Element 2: Working with SKU Elements (WSK1, WSK2, WSK3)	*Code* = Alphanumeric, 4 positions. The SKU element. *Description* = Alphanumeric, 10 positions. *Misc1* = Sort sequence number. Numeric, 5 positions. All fields except *Misc1* are required.

Understanding Supporting Data Upload Errors

When you run the upload, the job clears any Supporting Data Upload records if it was able to create a new record in the related target table. It updates each remaining record with a description of the error that prevented the update of the target table.

The information in the Supporting Data Upload table (MSSDUP) is not displayed on any screen.

Error	Notes
All record types	See the Supporting Data Upload Table for a summary of the requirements of each record type.
`Missing Code`	No code was specified for the Supporting Data Upload record.

Error	Notes
`Record already exists`	The record already exists in the related table. **Note:** See the RTC record type above for additional considerations related to retail class uploads.
`Missing Description`	No description was specified for the Supporting Data Upload record.
Exchange Reason	
`Exchange reason cannot exceed 999` or `Exchange Reason must be numeric`	The exchange reason is a three-position numeric code. See Establishing Exchange Reason Codes (WEXR) for background.
ICL (item class)	
`Item Class code cannot exceed 3 characters`	The item class code is a three-position alphanumeric field. See Working with Item Classes (WICL) for background.
IST (item status)	
`Item Status code cannot exceed 1 character`	The item status code is a one-position alphanumeric field. See Working with Item Status (WIST) for background.
LSC (long SKU class)	
`Long SKU Class not allowed when SCV H26 is set to Yes`	You cannot upload a long SKU class if the Use Retail Integration (H26) system control value is not selected.
`Long SKU Class cannot exceed 9999Long SKU Class must be numeric` `Long SKU Class is zero`	The long SKU class is a four-position numeric code.
LSD (long SKU department)	
`Long SKU Division code cannot exceed 3 characters`	The long SKU division code specified in the *Misc1* field exceeds three positions.
`Long SKU Division code is required`	No long SKU division code was specified in the *Misc1* field, and the Require Long SKU Division with Long SKU Department (E85) system control value is selected.
`Long SKU Department cannot exceed 9999`	The long SKU department code cannot exceed four positions.

Error	Notes
`Long SKU Division code does not exist`	The long SKU division code specified in the *Misc1* field is not valid. **Note:** This error occurs even if the Require Long SKU Division with Long SKU Department (E85) system control value is unselected.
`Long SKU Department must be numeric`	The long SKU department specified cannot include non-numeric characters.
RTC (retail class)	You can assign a retail class to a long SKU department if the Use Retail Integration (H26) system control value is selected. Also, you can assign the same retail class code to multiple long SKU departments, but not through the same supporting table upload process. See Working with Long SKU Departments (WLSD) for background.
`Retail Class valid only when SCV H26 is set to Yes`	The Use Retail Integration (H26) system control value is not selected.
`Long SKU Department code does not exist`	The long SKU department code specified in the *Misc1* field is not valid.
`Long SKU Department must be numeric`	The long SKU department code specified in the *Misc1* field is not numeric, or no long SKU department was specified.
`Long SKU Class cannot exceed 9999`	The retail class is a four-position numeric code.
`Long SKU Class must be numeric`	The retail class is a four-position numeric code.
RTR (return reason)	
`Return reason cannot exceed 999` or `Return reason must be numeric`	The return reason is a three-position numeric code. See Establishing Return Reason Codes (WRTR) for background.
SEO, SEW, SET (SKU element 1, 2, or 3)	See Working with SKU Elements (WSK1, WSK2, WSK3) for background on the SKU element fields.
`SKU Element code cannot exceed 4 characters`	The first, second, and third SKU elements are each four-position alphanumeric fields.
`Sort sequence must be numeric`	The first, second, and third SKU sort sequence numbers are each five-position numeric fields.

Error	Notes
`Description exceeds 10 characters`	The first, second, and third SKU descriptions are each ten-position alphanumeric fields.

Importing Set Components (WCUP)

Purpose: Use the set component upload to build sets, including standard sets, and variable sets.

Process overview: To create sets:

- Create the main set item. Use Performing Initial Item Entry (MITM) or the RI Item Upload Process to create the main set item, specifying the appropriate *Kit type*. For example, to create a variable main set item, select a *Kit type* of Variable Set.
- Specify additional information about the main set. Set up any additional information specific to the main set item, such as the item offer and item price.
  - Variable set? For a variable set, you need to first use either Entering Variable Set Information (WVST) or the set component upload to create variable set groups before you add variable set components to each group.
- Build the set components. You can use either the menu options described under Working with Sets or the set component upload to specify the component items included in the set.

Example:

To sell an assortment of pens as a set:

1. Use Performing Initial Item Entry (MITM) or the RI Item Upload Process to create the item PE123 with a *Kit type* of Set. At this time, you can assign the item to an offer and specify pricing for the set.
2. If necessary, use Performing Initial Item Entry (MITM) or the RI Item Upload Process to create each component item that will be included in the set.
3. Create the main set item if you are using Entering Set Information (WSET). (If you are using the set component upload, this step takes place automatically when you build components.)
4. Using Entering Set Information (WSET) or the set component upload, assign each component item to the set, specifying the quantity to add. Optionally, you can specify additional information, such as cost percentage or a coordinate group number to make sure the components ship together.

In this topic:

- Work with Component Upload Screen (WCUP)
- Submitting the Set Component Upload
  - Set Component Upload Table (INSCUP)
  - Understanding Set Component Upload Errors
- Component Upload Screen (Change Mode)

Work with Component Upload Screen (WCUP)

Purpose: Use this screen to create new sets and set components based on the records in the Set Component Upload table for your company. You can use this screen to create records in the following tables:

- Kit and Kit Detail
- Set and Set Detail
- Variable Set, Variable Set Detail, and Variable Set Group

Background on sets: See Working with Sets for general background on sets in Order Administration.

How to display this screen: Enter WCUP in the *Fast path* field at the top of any menu, or select Work with Set Component Upload from a menu.

Field	Description
Type	The type of set record being uploaded. Valid values are: • Set: See Entering Set Information (WSET) for background. • Variable Set Group: See Entering Variable Set Information (WVST) for background. • Variable Set Item: See Entering Variable Set Information (WVST) for background. If the *Type* in the Set Component Upload table is set to any other value, that value is displayed. The *Type* is an alphanumeric, 2-position field. Optionally, select a *Type* to restrict display to upload records of that type.
Master item	The main set item specified in the Set Component Upload record. You identify an item as a main set item through the *Kit type* field. The SKU fields, if any, are to the right. **Note:** To determine the set component item, select Change or Display. See the Component Upload Screen (Change Mode) for more information. *Item code: alphanumeric, 12 positions; optional.* *SKU codes: alphanumeric, three 4-position fields; optional.*
Error	The description of the error, if any, flagged by the upload program. This field is blank if you have not yet attempted to upload the record, or if you have corrected the error and the record can be resubmitted. See Understanding Set Component Upload Errors for more information.

Option	Procedure
Submit the set component upload process	Select Process to generate set headers and components based on the information in the Set Component Upload table. See Submitting the Set Component Upload for more information.

Option	Procedure
Change a set component upload record	Select Change for a record to advance to the Component Upload Screen (Change Mode) in Change mode.
Review a set component upload record	Select Display for a record to advance to the Component Upload screen in Display mode to review the set component and other detail information. You cannot change any information at this screen. See the Component Upload Screen (Change Mode) for field descriptions.
Delete a set component upload record	Select Delete to delete a set component record.

Submitting the Set Component Upload

Upload process: You can create set component records from the contents of the Set Component Upload table:

1. Create a Set Component file (INSCUP) file that you will use to populate the Set Component Upload Table (INSCUP) by:
   - Creating your own, using a text editor, or
   - Copying the sample file upload data, pasting the data into a text editor, and saving it with the file extension `.TXT`.

   > **Note:**
   >
   > To leave any field in the upload file blank, pass a space in an alphanumeric field or a 0 in a numeric field so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.

2. Use the contents of the upload file to create records in the Set Component Upload table:
   - Use the File Storage API to upload the contents of the file to the FILE_STORAGE table, and then use the UPSETCM periodic function (*Program name* PFR0134, *Parameter* INSCUP) to use the file contents to populate the Set Component Upload Table (INSCUP), or
   - Use the Work with File Upload Screen to upload the Set Component file and automatically populate the Set Component Upload table.
3. Use the contents of the Set Component Upload table to create or update set components:
   - Run the UPLSETS periodic function (*Program name* PFR0095), or
   - Select Process at the Work with Component Upload Screen (WCUP).

   Job processing:

   - Regardless of whether you use the UPLSETS periodic function or select Process at the Work with Component Upload Screen (WCUP), the job evaluates each record in the Set Component Upload table that is associated with your current company.

- If the job can create the record in the specified table without error, it creates the record and deletes the Set Component Upload record.
- If the Set Component Upload record is in error for any reason, the job leaves the record in the table and updates it with a description of the error.
- Since the job selects records in your company, records that do not have a valid company number remain in the table.

Set Component Upload Table (INSCUP)

The contents of this table are described below.

Sample Set Component Upload data: You can use the sample data below to create a record in the Set Component Upload table.

Sample Type S: Set and Set Detail upload record:

```
7|S|SET||||SETCOMP1||||1|50.00|1|0|0||0|
```

Sample Type VG: Variable Set and Variable Set Group upload record:

```
7|VG|VARIABLE||||VARIABLECMP1||||0|0|0|0|1|VARIABLE GROUP 1|2|
```

Sample Type VI: Variable Set Detail upload record:

```
7|VI|VARIABLE||||VARIABLECMP2||||0|0|0|0|1||0|
```

Additional information: Any additional information beyond the fields listed below is discarded in most cases; however, if a non-SKUed main set item or component item includes SKU fields, the process puts the record in error. See Understanding Set Component Upload Errors for more information.

Field	Description
Company	The company field is required for all record types and is validated against the Company table. *Numeric, 3 positions; required.*
Set type	Indicates the type of record to create. Valid values: • Type S: Set and Set Detail • Type VG: Variable Set and Variable Set Group • Type VI: Variable Set Detail **Note:** This field is not case-sensitive; the process treats f the same as F. *Alphanumeric, 2 positions; required.*
Master item	The finished good item for which you are building the components. If the Kit Header does not already exist, the process creates it when you upload the first component. *Alphanumeric, 12 positions; required.*
Master SKU elements 1, 2, and 3	*Alphanumeric, three 4-position fields. A valid SKU is required if the kit master item has SKU's.*

Field	Description
For each component used to make the finished good:	
Component item	*Alphanumeric, 12 positions; required.*
Component SKU elements 1, 2, and 3	*Alphanumeric, three 4-position fields. A valid SKU is required if the item has SKU's.*
Quantity	The quantity of the item used to create the finished good. *Numeric, 5 positions; required.*
Type S: Set and Set Detail	See Entering Set Information (WSET) for background.
Master item	The main set item for which you are building the components. The item must have its *Kit type* set to Set. If the Set record does not already exist, the process creates it when you upload the first component. *Alphanumeric, 12 positions; required.*
Master SKU elements 1, 2, and 3	*Alphanumeric, three 4-position fields. A valid SKU is required if the set item has SKU's.*
For each component to add to the order when the customer orders the set:	
Component item	*Alphanumeric, 12 positions; required.*
Component SKU elements 1, 2, and 3	*Alphanumeric, three 4-position fields. A valid SKU is required if the item has SKU's.*
Quantity	The quantity of the component to add to the order. *Numeric, 5 positions; required.*
Cost %	The percentage of the set's total cost contributed by this component. *Numeric, 5 positions with a 2-place decimal; optional.*
Coordinate group	A common coordinate group number assigned to components to make sure they ship together. *Numeric, 3 positions; optional.*

Field	Description
Type VG: Variable Set and Variable Set Group	**Note:** • When you use the Set Component Upload, you can create only one group for each variable set at a time. Because the group code is not part of the key to the table, creating more than one group for the same variable set would produce a duplicate key error. • You cannot create a variable set item as part of the VG set type. You need to use the VI set type to create a variable set item and assign it to the group. See Entering Variable Set Information (WVST) for background.
Master item	The main set item for which you are building the variable set group(s). The item must have its *Kit type* set to Variable Set. If the Variable Set record does not already exist, the process creates it when you upload the first variable set group. *Alphanumeric, 12 positions; required.*
Master SKU elements 1, 2, and 3	*Alphanumeric, three 4-position fields. A valid SKU is required if the variable set item has SKU's.*
For each group to add to the variable set:	
Group	The code identifying the group of like items from which the customer selects in order entry. *Numeric, 3 positions; required.*
Group description	The description of the group. Displayed in order entry. *Alphanumeric, 30 positions; required.*
# of items	The number of items or units that the customer can order from this group. *Numeric, 3 positions; required.*
Type VI: Variable Set Detail	
Master item	The main set item for which you are building the variable set components. The item must have its *Kit type* set to Variable Set, and the Variable Set record and Variable Set Group must already exist. *Alphanumeric, 12 positions; required.*
Master SKU elements 1, 2, and 3	*Alphanumeric, three 4-position fields. A valid SKU is required if the variable set item has SKU's.*
For each component item to add to the variable set group:	
Component item	*Alphanumeric, 12 positions; required.*

Field	Description
Component SKU elements 1, 2, and 3	*Alphanumeric, three 4-position fields. A valid SKU is required if the item has SKU's.*
Group	The variable set group in which to include the item. *Numeric, 3 positions; required.*

Understanding Set Component Upload Errors

When you run the upload, the job clears any Set Component Upload records if it was able to create a new record in the related target table. It updates each remaining record with a description of the error that prevented the update of the target table.

Which errors can you correct?

- You can use the Component Upload Screen (Change Mode) to correct errors related to any additional fields beyond the company, set type, component item and SKU, and component item and SKU.
- Otherwise, you can correct the record directly in the Set Component Upload table, or delete the record and recreate it, or create the record in the target table using the standard menu option.

Error	Notes
All component upload types	See the Set Component Upload Table (INSCUP) for a summary of the requirements of each record type.
`Record already exists`	The record already exists in the destination table.
`Invalid Type`	The *Type* was not K, S, VG, or VI. The error displayed at the Component Upload Screen (Change Mode) is `Master Item kit type not F,S,V.`
`Invalid Master Item`	The main set item specified does not exist.
`Invalid Master SKU`	The main set item specified is a SKU'd item, and no SKU's were specified in the upload table; or the main set item specified is a non-SKU'd item, and SKU's were specified.
`Missing Type`	No type was specified.
For all types except Variable Set Group (VG):	
`Invalid Component Item`	The component item specified does not exist.
`Invalid Component SKU`	The component item specified is a SKU'd item, and no SKU's were specified in the upload table; or the component item specified is a non-SKU'd item and SKU's were specified.
`Master Item kit type must be F`	The master item specified does not have its *Kit type* set to Finished Good.
`Quantity Required for record type`	No *Quantity* was specified for the component. The *Quantity* is a required field.

Error	Notes
`Work Order exists`	There is an open work order for the finished good. See Finished Good Work Order Processing (WWOR) for information. **Note:** The following do not cause errors when you upload finished good components: • Additional fields populated (except for SKU fields for a non-SKU'd item) • Adding components to an existing finished good • Creating a finished good with just one component
Set (Type S)	When you upload the first component for a main set item, the system automatically creates the Set header. See Entering Set Information (WSET) for background.
`Master Item kit type must be S`	The master item specified does not have its *Kit type* set to Set.
`Quantity Required for record type`	No *Quantity* was specified for the component. The *Quantity* is a required field. **Note:** The following do not cause errors when you upload set components: • Additional fields populated (except for SKU fields for a non-SKU'd item) • Adding components to an existing set • Creating a set with just one component • The *Cost %* amounts not adding up to 100%

Error	Notes
Variable Set Group (Type VG)	When you upload the first group for a variable main set item, the system automatically creates the Variable Set header. **Note:** • You must create the Variable Set Group before you can upload any of the items assigned to that group. • You cannot create multiple groups at a time for the same variable set. Because the group code is not part of the key to the table, creating more than one group for the same variable set would produce a duplicate key error. See Entering Variable Set Information (WVST) for background.
`Master Item kit type must be V`	The master item specified does not have its *Kit type* set to Variable Set.
`Missing # of items`	No *# of items* was specified for the group. The *# of items* is a required field.
`Missing Group`	No *Group* number was specified. The *Group* is a required field.
`Missing Group Description`	No *Group description* was specified. The *Group description* is a required field. **Note:** Populating additional fields (except for SKU fields for a non-SKU'd item) does not create an error when you upload a variable set group.
Variable Set Item (Type VI)	The variable set header and group must already exist before can upload a variable set item. See Entering Variable Set Information (WVST) for background.
`Master Item kit type must be V`	The master item specified does not have its *Kit type* set to Variable Set.
`Missing Group`	No *Group* number was specified. The *Group* is a required field.
`Invalid Group`	The *Group* number specified does not exist for the variable set.

Component Upload Screen (Change Mode)

Purpose: Use this screen to review or change the information in a Set Component Upload record.

For more information: See the Set Component Upload Table (INSCUP) for information on how to create Set Component Upload records.

What can you change? At this screen, you can change any of the information except the upload type, the main item/SKU, and the component item/SKU. If this information is incorrect, you can delete the upload record and create the component another way, such as sending a correct upload record or using the related menu option to create the component manually.

Errors flagged at this screen: This screen flags:

- All of the errors identified under Understanding Set Component Upload Errors, with the exception of the `Record already exists` error. The upload program identifies this error by comparing the information for the upload record with the information in the target table. You can delete records flagged with this error, as the upload will not process them. Also,
- Errors related to additional information that is not used for the component upload type. This is information that the upload program ignores. These errors are described below under the fields that trigger the errors.

How to display this screen: Select Change for a Set Component Upload record at the Work with Component Upload Screen (WCUP).

Field	Description
Type	The type of component to upload: • FINISHED GOOD: See Entering Finished Goods Information (WFGD) for background. • SET: See Entering Set Information (WSET) for background. • VARIABLE SET GROUP: See Entering Variable Set Information (WVST) for background. • VARIABLE SET ITEM: See Entering Variable Set Information (WVST) for background. If the *Type* in the Set Component Upload table is set to any other value, that value is displayed. The *Type* is an alphanumeric, 2-position field. *Alphanumeric; display-only.*
Master item	The main set item specified in the Set Component Upload record. You identify an item as a main set item through the *Kit type* field. *Alphanumeric, 12 positions; display-only.*
Master SKU	Additional information identifying the master item, such as its color or size. *Alphanumeric, three 4-position fields; display-only.*
Component item	The component item to upload. *Alphanumeric, 12 positions; display-only.*
Component SKU	Additional information about the component item, such as its color or size. *Alphanumeric, three 4-position fields; display-only.*
Quantity	The quantity of the component item/SKU to add to the order. Required for set components (type S). Not valid for variable set group or variable set items (types VG or VI). *Numeric, 5 positions; required or invalid depending on type.*

Field	Description
Cost	The percentage of the set's cost represented by the component. Used only for set components (type S). Invalid for other record types. *Numeric, 5 positions with a 2-place decimal; optional or invalid depending on type.*
Coordinate group#	A number you can assign to components to make sure they ship together. Valid for set components (type S). Invalid for other record types. You cannot assign a coordinate group number of 999 to a component of a regular set (type S). *Numeric, 3 positions; optional or invalid depending on type.*
Interval	Not currently implemented. *Numeric, 5 positions.*
Group	The code identifying the group of like items from which the customer selects in order entry for a variable set. Required for variable set groups and components (types VG and VI). Invalid for other record types. *Numeric, 3 positions; required or invalid depending on type.*
Description	The description of the variable set group. Required for variable set groups (type VG). Invalid for other record types. *Numeric, 3 positions; required or invalid depending on type.*
# of items	The number of items or units that the customer can order from the variable set group. Required for variable set groups (type VG). Invalid for other record types. *Numeric, 3 positions; required or invalid depending on type.*
Error	The error assigned by the upload program. See Understanding Set Component Upload Errors for a list of errors.

ChannelAdvisor Integration

Topics in this part: The following topics describe the integration between Order Administration and ChannelAdvisor.

- ChannelAdvisor Integration Overview provides an overview of the various components of the integration.
- ChannelAdvisor Setup provides information on the setup required within Order Administration to support the integration.
- Working with ChannelAdvisor Accounts (WCAA) describes the screens you use to up accounts, marketplaces, and offers for integration with ChannelAdvisor.

Working with ChannelAdvisor Accounts (WCAA)

Purpose: Use this option to set up your ChannelAdvisor account and marketplaces.

Background: See ChannelAdvisor Integration Overview for background on the ChannelAdvisor integration.

Additional setup: See ChannelAdvisor Setup for information on additional required setup for the ChannelAdvisor integration.

In this topic:

- Work with ChannelAdvisor Accounts Screen
- Create ChannelAdvisor Account Screen
- Work with ChannelAdvisor Marketplaces Screen
- Create ChannelAdvisor Marketplace Screen
- Work with ChannelAdvisor Offers Screen
- Create ChannelAdvisor Offer Screen

> **Note:**
>
> The ChannelAdvisor integration has been designed and tested to work for the Amazon Marketplace. To use the ChannelAdvisor integration with a marketplace other than Amazon, contact your Order Administration project manager.

Work with ChannelAdvisor Accounts Screen

Use this screen to work with ChannelAdvisor accounts and marketplaces.

How to display this screen: Enter WCAA in the *Fast path* field at the top of any menu, or select ChannelAdvisor Work with Accounts from a menu.

Field	Description
Account	The account ID assigned by ChannelAdvisor for your account. Upper and lower case. **Note:** You may be able to verify the account ID by logging into ChannelAdvisor, selecting the account, and then My Account > Account Authorizations. *Alphanumeric, 50 positions; optional.*
Description	The description of your ChannelAdvisor account. *Alphanumeric, 30 positions; optional.*

Option	Procedure
Create a new ChannelAdvisor account	Select Create to advance to the Create ChannelAdvisor Account Screen.

Option	Procedure
Change an existing ChannelAdvisor account	In the *Action* field, select Change to advance to the Change ChannelAdvisor Account screen. At this screen, you can change any information except the *ChannelAdvisor account ID*. See the Create ChannelAdvisor Account Screen for field descriptions.
Display an existing ChannelAdvisor account	In the *Action* field, select Display to advance to the Display ChannelAdvisor Account screen. You cannot change any information at this screen. See the Create ChannelAdvisor Account Screen for field descriptions.
Delete an existing ChannelAdvisor account	In the *Action* field, select Delete. At the Confirm Delete window, select Yes to delete the account; otherwise, select No.
Work with ChannelAdvisor marketplaces	In the *Action* field, select Marketplaces to advance to the Work with ChannelAdvisor Marketplaces Screen.
Work with ChannelAdvisor offers	In the *Action* field, select Integration Offers to advance to the Work with ChannelAdvisor Offers Screen.

Create ChannelAdvisor Account Screen

Purpose: Use this screen to set up the ChannelAdvisor account you use to integrate with ChannelAdvisor, including information required for the inventory and pricing uploads to ChannelAdvisor and authentication information required for ChannelAdvisor web services (orders, shipments, and refunds).

How to display this screen: Select Create at the Work with ChannelAdvisor Accounts Screen.

Field	Description
Account (ChannelAdvisor account ID)	The account ID assigned by ChannelAdvisor for your account. Upper and lower case. This ID is a GUID (globally unique identifier) composed of a string of hexadecimal digits, such as 21ec2020-3aea-1069-A2dd-08002b30309d. Not the same as the user ID you use to log into the ChannelAdvisor web site. **Note:** You may be able to verify the account ID by logging into ChannelAdvisor, selecting the account, and then My Accounts > Developer Network > Account Authorizations. *Alphanumeric, 50 positions.* *Create screen: Required.* *Change screen: Display-only.*
Description	The description of your ChannelAdvisor account. *Alphanumeric, 30 positions; required.*

Field	Description
Web Developer Key	A unique ID assigned by ChannelAdvisor. Upper and lower case. The developer key, Account (ChannelAdvisor account ID), and Web Developer Password are required for any call to a ChannelAdvisor API that accesses your account information. The developer key and password are included in the messages sent to ChannelAdvisor to request a list of orders, confirm shipments, and submit refunds. See ChannelAdvisor Integration Overview for descriptions of these processes. *Alphanumeric, 50 positions; optional, but required for the ChannelAdvisor integration.*
Web Developer Password	The password associated with the Web Developer Key. Upper and lower case. Not the same as the password you use to log into the ChannelAdvisor web site. The developer key and password are included in the messages sent to ChannelAdvisor to request a list of orders, confirm shipments, and submit refunds. See ChannelAdvisor Integration Overview for descriptions of these processes. *Alphanumeric, 50 positions; optional, but required for the ChannelAdvisor integration.*
Price Filename	The file name for the CAPRICE periodic function to use when creating the pricing upload file. Upper and lower case. **Note:** Both the inventory import and the pricing import may be listed with a *File Type* of Inventory in ChannelAdvisor. *Alphanumeric, 50 positions; optional, but required for the ChannelAdvisor integration.*
Local Price Folder	The folder on the Order Administration server for the CAPRICE periodic function to use when creating the price upload file. Set by Oracle, and cannot be changed. *Alphanumeric, 50 positions; display-only.*
When creating your application in ChannelAdvisor, record the following fields so that you can enter them correctly when creating or updating your ChannelAdvisor account in Order Administration.	

Field	Description
Application Id	A code generated automatically by ChannelAdvisor, identifying your system during authentication. Displayed at the Your Applications screen in ChannelAdvisor. Required for price and inventory integration with ChannelAdvisor. Case-sensitive. *Alphanumeric, 60 positions; optional, but required for the ChannelAdvisor integration.*
Shared Secret	A code generated automatically by ChannelAdvisor to authentication your system. Displayed at the Your Applications screen in ChannelAdvisor. Required for price and inventory integration with ChannelAdvisor. Case-sensitive. *Alphanumeric, 60 positions; optional, but required for the ChannelAdvisor integration.*
Refresh Token	A value generated by ChannelAdvisor during the initial authorization request. Required for price and inventory integration with ChannelAdvisor. Case-sensitive. **Generating the Refresh Token:** To generate the request token: • Log into the ChannelAdvisor Developer Console at https://api.channeladvisor.com/DeveloperConsole/Account/DevLogin. using your *Developer Key* and *Password*. • Create a new application if it does not exist already. • Highlight the client and select **Select Client**. • Select **Grant Access**. • At the New Integration Created window, copy the *Refresh Token* and paste it into the *Refresh Token* field at the **Create or Change ChannelAdvisor Account** screen in Order Administration. You need to retrieve the token before closing the window. **For more information:** See https://developer.channeladvisor.com/authorization/developer-console-token. If the refresh token is not correct, the log indicates: `Problem in retrieving Access Token.` *Alphanumeric, 60 positions; optional, but required for the ChannelAdvisor integration.*

Work with ChannelAdvisor Marketplaces Screen

Purpose: Use this screen to work with marketplaces where you sell through ChannelAdvisor. The CAORDUP periodic function matches the marketplace with the `ItemSaleSource` passed for an order to identify the:

- source code to apply to the order, based on your entry at this screen
- payment method to apply to the order, based on the pay type's *CA cross reference #*

See Importing Orders from ChannelAdvisor for background.

> **Note:**
>
> The ChannelAdvisor integration has been designed and tested to work for the Amazon Marketplace. To use the ChannelAdvisor integration with a marketplace other than Amazon, contact your Order Administration project manager.

How to display this screen: Select Marketplaces from the *Action* field for your ChannelAdvisor account at the Work with ChannelAdvisor Accounts Screen.

Field	Description
Account (ChannelAdvisor account)	The account ID assigned by ChannelAdvisor for your account. This ID is a GUID (globally unique identifier), as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 50 positions; display-only.*
Description (unlabeled field)	The description of your ChannelAdvisor account, as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 30 positions; display-only.*
Source	The source code to use on orders from this marketplace. Typically associated with the offer specified through the Work with ChannelAdvisor Offers Screen option. If the `ItemSaleSource` indicated for an order created through the CAORDUP periodic function matches the Marketplace, the periodic function applies this source code to the order. Enter a full or partial source code to display marketplaces that start with your entry. **Note:** The source code specified must use a line-level freight method. *Alphanumeric, 9 positions; optional.*

Field	Description
Marketplace	The name of the marketplace, such as Amazon, where you sell merchandise through ChannelAdvisor. If the `ItemSaleSource` indicated for an order received from ChannelAdvisor through the CAORDUP periodic function matches this setting, the periodic function: • applies the *Source* indicated here to the order • selects the pay type whose *CA cross reference #* matches this setting for the order **Note:** If there is more than one pay type whose *CA cross reference #* matches, the function selects the highest pay type code. Enter a full or partial marketplace name to display marketplaces that start with your entry. *Alphanumeric, 30 positions; optional.*

Option	Procedure
Create a new marketplace	Select Create to advance to the Create ChannelAdvisor Marketplace Screen.
Change an existing marketplace	Select Change from the *Action* field to advance to the Change ChannelAdvisor Marketplace screen. At this screen, you can change the *Source* or the *Marketplace*. See the Create ChannelAdvisor Marketplace Screen for field descriptions.
Delete a marketplace	Select Delete for a marketplace. At the Confirm Delete window, select Yes to delete the marketplace; otherwise, select No.

Create ChannelAdvisor Marketplace Screen

Purpose: Use this screen to create a new marketplace where you sell through ChannelAdvisor. The CAORDUP periodic function matches the marketplace with the `ItemSaleSource` passed for an order to identify the:

- source code to apply to the order, based on your entry at this screen
- payment method to apply to the order, based on the pay type's *CA cross reference #*

Purpose: See Importing Orders from ChannelAdvisor for background.

How to display this screen: Select Create at the Work with ChannelAdvisor Marketplaces Screen.

Field	Description
Account (ChannelAdvisor account)	The account ID assigned by ChannelAdvisor for your account. This ID is a GUID (globally unique identifier), as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 50 positions; display-only.*
Description	The description of your ChannelAdvisor account, as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 30 positions; display-only.*
Source	The source code to use on orders from this marketplace. Typically associated with the offer specified through the Work with ChannelAdvisor Offers Screen option. If the `ItemSaleSource` indicated for an order created through the CAORDUP periodic function matches the *Marketplace*, the periodic function applies this source code to the order. **Note:** The source code specified must use a line-level freight method. *Alphanumeric, 9 positions; required.*
Marketplace	The name of the marketplace, such as Amazon, where you sell merchandise through ChannelAdvisor. If the `ItemSaleSource` indicated for an order received from ChannelAdvisor through the CAORDUP periodic function matches this setting, the periodic function: • applies the *Source* indicated here to the order • selects the pay type whose *CA cross reference #* matches this setting for the order The marketplace name needs to match a ChannelAdvisor Site Token value. **Note:** If there is more than one pay type whose *CA cross reference #* matches, the function selects the highest pay type code. *Alphanumeric, 30 positions; required.*

Work with ChannelAdvisor Offers Screen

Purpose: Use this screen to set up the offer you use to control pricing for the ChannelAdvisor integration, including the label for the ChannelAdvisor offer price. You send pricing information to ChannelAdvisor through the CAPRICE periodic function. This offer should match the ChannelAdvisor SKU X-Ref Offer (L92).

> **Note:**
>
> Although you can set up multiple offers with this menu option, typically you use a single offer for integration with ChannelAdvisor.

Background: SeeChannelAdvisor Integration Overview for background on the ChannelAdvisor integration, especially Sending Current Prices to ChannelAdvisor.

Additional setup:

- See Working with ChannelAdvisor Accounts (WCAA) for information on setting up accounts and marketplaces for integration with ChannelAdvisor.
- See Working with ChannelAdvisor Accounts (WCAA) for information on additional required setup for the ChannelAdvisor integration.

> **Note:**
>
> The ChannelAdvisor integration has been designed and tested to work for the Amazon Marketplace. To use the ChannelAdvisor integration with a marketplace other than Amazon, contact your Order Administration project manager.

How to display this screen: Select Integration Offers for a ChannelAdvisor account on the Work with ChannelAdvisor Accounts Screen.

Field	Description
Account	The account ID assigned by ChannelAdvisor for your account. Upper and lower case. This ID is a GUID (globally unique identifier), as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 50 positions; optional.*
Description	The description of your ChannelAdvisor account, as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 30 positions; optional.*
Offer	The offer that controls pricing for ChannelAdvisor. You send pricing information to ChannelAdvisor through the CAPRICE periodic function. This offer should match the ChannelAdvisor SKU X-Ref Offer (L92). *Alphanumeric, 3 positions; optional.*
Price Output	The label of the third price included in the price extract file by the CAPRICE periodic function. Upper and lower case. From the SKU Price, if any, for the specified offer; otherwise, from the Item Price for the specified offer. If there is no SKU Price or Offer Price for an item/SKU, this field is blank in the price file. *Alphanumeric, 30 positions; optional.*

Option	Procedure
Create a Channeladvisor offer	Select Create to advance to the Create ChannelAdvisor Offer Screen.
Change a Channeladvisor offer	Select Change for a Channeladvisor offer to advance to the Change ChannelAdvisor Offer screen. See the Create ChannelAdvisor Offer Screen for a description of the fields on this screen.

Create ChannelAdvisor Offer Screen

Purpose: Use this screen to set up the offer you use to control pricing for the ChannelAdvisor integration, including the label for the ChannelAdvisor offer price. You send pricing information to ChannelAdvisor through the CAPRICE periodic function. This offer should match the ChannelAdvisor SKU X-Ref Offer (L92).

Background: SeeChannelAdvisor Integration Overview for background on the ChannelAdvisor integration, especially Sending Current Prices to ChannelAdvisor.

How to display this screen: Select Create at the Work with ChannelAdvisor Offers Screen.

Field	Description
Account	The account ID assigned by ChannelAdvisor for your account. Upper and lower case. This ID is a GUID (globally unique identifier), as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 50 positions; display-only.*
Description	The description of your ChannelAdvisor account, as set up through the Create ChannelAdvisor Account Screen. *Alphanumeric, 30 positions; display-only.*
Offer	The offer that controls pricing for ChannelAdvisor. You send pricing information to ChannelAdvisor through the CAPRICE periodic function. This offer should match the ChannelAdvisor SKU X-Ref Offer (L92). *Alphanumeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Price output	The field label of the third price included in the price extract file by the CAPRICE periodic function. Upper and lower case. From the SKU Price, if any, for the specified offer; otherwise, from the Item Price for the specified offer. If there is no SKU Price or Offer Price for an item/SKU, this field is blank in the price file. *Alphanumeric, 30 positions; required.*

Merchandising Integration

Topics in this part: The following topics describe the integration between Order Administration and Oracle Retail merchandising applications.

- Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration: Provides information on importing items and pricing from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and from Oracle Retail Pricing Cloud Service (RPCS).

> **Note:**
>
> This integration will be deprecated in a future release. Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS) can be used instead to import items and pricing.

- Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service; Provides information on transmitting sales and returns information to the Sales Audit module of the Oracle Retail Merchandising Foundation Cloud Service, details on the information mapped, and the setup required to support the integration.
- Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS): Provides information on importing enterprise foundation data, including items, prices, merchandise hierarchy, and item images from other retail applications through Oracle Omnichannel Cloud Data Service (OCDS).
- Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing): Provides information on importing future availability information for pre-orders, processing updates as pre-order items become available, and controlling the submission of these orders to Order Orchestration.

Print User Security Audit Reports (PUSA)

Purpose: Use this option to generate a report of:

- changes to users, user classes, and secured features, or
- users with changed passwords, or
- both

You need to specify a date range for the reports, and have the option of restricting the user authority change report to a specific user or to updates for a particular table. Only administrative users should have authority to generate these reports.

> **Note:**
>
> Not all activity tracked in the User Audit table is included on the generated reports. See Tracking User, Authority, and Password Updates for background.

Print Security Audit Reports Screen

How to display this screen: Enter PUSA in the *Fast path* field at the top of any menu, or select Print User Security Audit Reports from a menu.

Field	Description
Start date	The first date to include on the User Authority Change Report and Password Change Report. *Numeric, 6 positions (user date format); required.*

Field	Description
End date	The last date to include on the User Authority Change Report and Password Change Report. The end date must be on or after the start date. *Numeric, 6 positions (user date format); required.*
User authority changes	Select this option to generate the ’User Authority Change Report.
Password changes	Select this option to generate the Password Change Report. No data is created for this report when you use Oracle Identity Cloud Service for password authentication.
User	Enter a valid user ID to restrict the User Authority Change Report to activity related to that user. Only updates to tables whose Authority changed matches the specified user ID can be included. This field does not affect the results included on the Password Change Report. *Alphanumeric, 10 positions; optional.*

Field	Description
Table	Select a table from the drop-down list to restrict the User Authority Change Report to activity for that table. Options and corresponding tables are: • Authorized User Class Company: Auth User Class Company • Authorized User Class Feature: Auth User Class Feature • Authorized User Class Option: Auth User Class Option • Authorized User Company: Auth User Company • Authorized User Feature: Auth User Feature • Authorized User Menu Option: Auth User Menu Option • External Authorization Service: External Auth Service • Secured Feature: Secured Feature • Usr: User • User Class: User Class • User Class Field Authority: User Class Field Auth • User Class Vendor Authority: User Class Vend Auth • User Extended: User Extended • User Field Authority: User Field Authority • User Tickler Group: User Tickler Group • Users: Users **Note:** • This field does not affect the results included on the Password Change Report. • The Active Procedure table is not available for selection, and these records are not included on the report if you generate it without selecting a specific table. • If you also specify a User for the User Authority Change Report, the screen does not verify that the selected table includes user updates rather than updates related to user class or secured feature. For example, if you specify a user ID and also select the User Class Field Authority table, the User Authority Change Report will not include any results, because the User Class Field Authority table is not related to user updates. Only updates to tables whose Authority changed is a user ID can be included when you generate the report for a specified user.

Completing this screen:

- Complete the *Start date* and *End date*.
- Select either *User authority changes* to generate the User Authority Change Report, *Password changes* to generate the Password Change Report, or both options.
- Optionally, specify a *User* or a *Table* to restrict the results on the User Authority Change Report to activity for your selections.
- Select OK to validate your entries.

Completing this screen: Select Submit.

Order Volume Report (OVOL)

Purpose: Use this menu option to generate the Order Count report, which provides the total number of orders entered in Order Administration broken out by company, and optionally, order type for a specified date range.

Order Count Report Screen

Use this screen to specify the criteria used to generate the Order Count report.

Field	Description
From...To	The date range you wish to use to generate the Order Count report. The system totals the number of orders entered within this date range for each Order Administration company. *Numeric, 6 positions (user date format); required.*
Sort by order type	Select this field to generate the Order Count Report by Order Type, which provide a break out of the total number of orders entered for a company by order type. Deselect this field to generate the Order Count Report, which provides an order count for each company across all order types. *Optional.*

Screen Option	Procedure
Generate the Order Count Report or Order Count Report by Order Type	Select Submit to generate the report.

To generate the report:

1. Enter the date range you wish to use to generate the Order Count report in the *From* and *To* fields.
2. Select the *Sort by order type* field to generate the Order Count Report by Order Type, which provides a break out of the total number of orders entered for each company by order type; otherwise, deselect this field to generate the Order Count Report, which provides an order count for each company across all order types.
3. Select OK to validate your entries.
4. Select Submit to generate the Order Count report.
   - If you did not select the *Sort by order type* field, the system generates the Order Count Report, which provides the total number of orders entered in Order Administration broken out by company for a specified date range.

- If you selected the *Sort by order type* field, the system generates the Order Count Report by Order Type, which provides the total number of orders entered in Order Administration broken out by order type within company for a specified date range.

Process New Secured Features (NSEC)

Purpose: Use the Process New Secure Features option to create new secure features in each company in your environment, and define the default settings for each.

Prompting to process new secure features: When a new update that includes one or more new secure features is applied to your environment, a window prompts you to use this option. The prompt occurs for the first user to log in after the update was applied, and is no longer displayed once a user has worked through the new secure features for all companies.

You can also use this option on demand to process new secure features by selecting Process New Secure Features or entering NSEC in the *Fast path* field.

> **Note:**
>
> Oracle recommends that you process new secure features when they are added through an update, to prevent inconsistent results if a new secure feature has not been created for a company.

How to process new secure features: When you select this option, the Change Secure Feature screen opens for each new secure feature in each existing company in your environment. Each time the screen opens, the user can select the setting for the new secure feature, or exit to set the secured feature to its default value.

When you select this option, an error message indicates if there are no new secure features.

Process New System Control Values (NSCV)

Purpose: Use the Process New System Control Values option to create new system control values in each company in your environment, and define the default settings for each.

Prompting to process new system control values: When a new update that includes one or more new system control values is applied to your environment, a window prompts you to use this option. The prompt occurs for the first user to log in after the update was applied, and is no longer displayed once a user has worked through the new system control values for all companies.

You can also use this option on demand to process new system control values by selecting Process New System Control Values or entering NSCV in the *Fast path* field.

> **Note:**
>
> Oracle recommends that you process new system control values when they are added through an update, to prevent inconsistent results if a new system control value has not been created for a company.

How to process new system control values: When you select this option, the Change System Control Value screen opens for each new system control value in each existing company in your environment. Each time the screen opens, the user can select the setting for the new system control value, or exit to set the system control value to its default value.

When you select this option, an error message indicates if there are no new system control values.

Work with Warehouse Drop Point (WWDP)

Purpose: This menu option is the same as EWDP; see Editing Warehouse Drop Points (EWDP) for more information.

13 Warehousing

Performing Inventory Transactions

Topics in this part: This part describes how to perform inventory transactions.

- Working with Inventory Transactions (WITI) tells you how to perform transactions which change inventory immediately.
- Working with Inventory Transaction Errors (WITE) allows you to review all of the errors that have occurred while performing inventory transactions.
- Finished Good Work Order Processing (WWOR) allows you to reserve component items while you assemble a finished good.

Working with Inventory Transactions (WITI)

Purpose: Use the Work with Inventory Transactions/Immediate menu option to enter transactions that should update inventory immediately. While your company can create additional transaction types, inventory transactions typically include:

- Adjusting an item quantity (such as the on-hand balance, because the item has been damaged)
- Returning an item to the vendor
- Transferring items between warehouses
- Transferring items between locations
- Converting inventory for an existing item to a different existing item
- Increasing the quantity of a finished good and decreasing the quantity of its component parts

Inventory transaction codes and reasons: There are two types of codes used during inventory transactions: inventory transaction codes and inventory transaction reason codes. Both are created by your System Administrator according to your company's needs.

Inventory Transaction codes tell the system:

- whether the transaction has a positive (+) or negative (-) effect on inventory
- the General Ledger account number to updated as a result of this transaction
- whether a reason code is required

Certain inventory transaction codes that are delivered with the system are available for batch inventory transactions. You can also create your own codes. You cannot delete the system-delivered codes; however, you can change the General Ledger account associated with a code, or whether a reason code is required.

The table below lists the system-supplied codes.

Code	Description	Effect on Inventory Levels
A	Adjustment	Increases on-hand if you enter a positive quantity. Decreases on-hand amount if you enter a negative quantity.
G	Item to Item Transfer	Increases on-hand amount of the target item. Decreases on-hand amount of the source item.
M	Make Up Set	Increases on-hand amount for the finished good item. Decreases on-hand amount for the components.
T	Transfer	Increases on-hand amount in the target warehouse/ location. Decreases on-hand amount in the source warehouse/ location.
V	Return to Vendor	Decreases on-hand amount if you enter a positive quantity. Increases on-hand amount if you enter a negative quantity.
O	On Hand	Overrides on-hand amount to the amount you entered.

Transaction reason codes describe why a specific transaction is being performed. You can establish these codes through the Work with Inventory Transaction Reasons menu option. You can specify whether a reason is required for each inventory transaction type.

In this topic:

- Work with Inventory Transactions Screen
- Enter To Location Window (Inventory Transfers)
- Warehouse Selection Screen
- Select Item Location Screen
- Item to Item Transfers Window
- Transfer Item's Primary Location Screen
  - Pick Locations Exist Window
- Create Item Location for Transfer Screen
- Perform Location Transfer - Non Primary Screen
- Perform Whs to Whs Location Transfer - Non Primary Screen

Work with Inventory Transactions Screen

Purpose: Use this screen to update inventory immediately.

How to display this screen: Enter WITI in the *Fast path* field at the top of any menu or select Work with Inventory Transactions/Immediate from a menu.

Field	Description
Code	A code to identify the type of transaction. These codes are validated against the Inventory Transaction Code table. You can define your own codes in addition to using the following system-supplied codes: • A = Adjustment • G = Item to item transfer • T = Transfer • V = Return to vendor • O = On-hand *Alphanumeric, 1 position, required.*
Item	A code for a unit of inventory. Item codes are defined in and validated against the Item table. *Alphanumeric, 12 positions; optional.*
Item description (Unlabeled field below the item)	The description associated with the item. This field is included if the Display Item Description (D45) system control value is selected. *Alphanumeric, 120 positions; display-only.*
SKU (Stock keeping unit)	The item's unique characteristics, such as its size and color. SKU codes are defined in and validated against the SKU table. *Alphanumeric, three 4-position fields; required if the item has SKU's.*
Quantity	The amount of inventory that this transaction affects. For adjustments (A code), you can enter a negative or positive quantity. To enter a negative quantity, enter the minus sign before the quantity. **Note:** You cannot enter a transaction that will make the on-hand quantity negative. *Numeric, 8 positions; required.*
Whs (Warehouse)	A code for the warehouse that contains the item. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions, required.*

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Location</td><td>The code for the area within the warehouse that contains the item.
The location code is validated against the Location table and the Item Location table. If the item location specified does not exist, you can create it by selecting Create Loc and advancing to the Create Item Location Screen.
Select OK to display a default location, determined by the following system control values:
• Default Primary Location (C05): defines whether the primary location from the SKU table defaults.
• Default Primary Location from an Item Warehouse (G06): defines whether a primary location for the item in the specified warehouse defaults; in this case the system will default the first primary location, in alphanumeric order, for the item in the specified warehouse.
• If both system control values are selected, the item warehouse location for the receiving warehouse will override the item's primary location from the SKU table.
If the system cannot find a primary location for an item in the specified warehouse, the following message indicates:
<code>No Default Location was found. Please enter a Location.</code>
The following message indicates that you entered a location whose location class does not match the location class for the item and the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected:
<code>Item is not compatible with location.</code>
Click on the arrow in the field to display item location information for the item in the warehouse you have specified in the Warehouse field:
Typically the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates:
<code>Zone Aisle Shelf Bin</code>
<code>A 01 02 01</code>
Alphanumeric, 7 positions; required.</td></tr>
<tr><td>Reason</td><td>A code that represents a reason to perform an inventory transaction. These codes are defined in and validated against the Transaction Reason Code table. The reason could be damaged, inventory miscount, etc.
The reason code will be required if you are using an inventory transaction code with the Reason required field selected.
Numeric, 2 positions; may be required depending on the type of transaction.</td></tr>
</table>

Field	Description
ID#	The identification number or text associated with this inventory transaction record. This number appears in Item Transaction History. **Note:** The system assigns an ID number for item to item transfers (transaction code = G); you cannot enter any information in this field for this transaction type. If you accept a transaction (select OK) with an ID # specified, the number or text defaults for the following transactions, but you can override it. *Alphanumeric, 10 positions; optional.*
PO#	The system validates that the item for the transaction appears on the purchase order whose number you enter; otherwise, it displays an error message. You can enter a purchase order number only for an adjustment (A) transaction, and only if you have the proper authority. Authority to this field is controlled by the Allow Entry of PO Number in Inventory Transactions (A86) secured feature. *Numeric, 7 positions; optional.*
On Hand	
Old	The quantity of the item in this warehouse and location before processing the transaction. *Numeric, 7 positions; display-only.*
New	The quantity of the item in this warehouse and location after processing the transaction. *Numeric, 7 positions; display-only.*

Instructions:

1. Complete the necessary fields. If the designated location does not exist, the system prompts you to create it by selecting Create Loc.
2. When completing the process, the transaction you entered is indicated on this screen. Inventory has been updated in the item/warehouse and item/location records. You can perform another inventory transaction or select Exit to return to the previous screen.

> **Note:**
>
> When performing an inventory transaction with a G, M, or T transaction code, at least two transactions are performed: a transaction for the "from" location and a transaction for the "to" location. See Display Inventory Transaction History (DITH).

Code	Description	Inventory Transaction process
A	Adjustment	The transaction is indicated on this screen.
G	Item to Item Transfer	You advance to the Item to Item Transfers Window.
M	Make Up Set	You advance to the Work with Kit Makeup Screen. If you want to take a component item out of more than one location, you advance to the Create Kit Makeup Location Screen.
T	Transfer	You advance to the Enter To Location Window (Inventory Transfers). You advance to the Warehouse Selection Screen if you need to select an item warehouse, or the Select Item Location Screen if you need to select an item location. You advance to the Create Item Location for Transfer Screen if you need to create an item location.
V	Return to Vendor	The transaction is indicated on this screen.
O	On-hand	The transaction is indicated on this screen.

Serial numbers: If the transaction affects the total on-hand quantity for a serial numbered item in your warehouse, you advance to the Enter Serial Number screen.

Screen Option	Procedure
Create an item location if there is no record of the item in the designated location	Select Create Loc to advance to the Create Item Location Screen. This option is available only after you have attempted to enter a transaction and the system has displayed an error message such as `Location (PRIM2 ) specified for this item does not exist; click "Create Loc" button to create.`
Change an item's primary location	Select Primary Transfers to advance to the Transfer Item's Primary Location Screen.
Transfer all of the items in one non-primary location to another non-primary location	Select Location Transfers to advance to the Perform Location Transfer - Non Primary Screen.

Enter To Location Window (Inventory Transfers)

Purpose: Use this window to enter a target location when you process an inventory transfer (inventory transaction code = T).

How to display this screen: Enter valid information for an inventory transfer at the Work with Inventory Transactions Screen.

Completing this window:

1. Enter the code of an alternate company in the company (Cmp) field if you are working in a multi-company environment and are transferring stock to another company. The company code is a three-position, numeric field, defined in the company table; the code of your current company defaults in this field. See Working with Companies (WCMP).

2. Enter the code of the target warehouse and location. See Work with Inventory Transactions Screen for field descriptions.
   - You can prompt on the *Warehouse* field to advance to the Warehouse Selection Screen, where you can select an existing item warehouse or create a new item warehouse record.
   - You can prompt on the *Location* field to advance to the Select Item Location Screen, where you can select an existing item location. If you would like to create a new item location record, enter the location code in the *Location* field and select OK to advance to the Create Item Location for Transfer Screen, where you can create the item location record.
3. Select OK.
   - If you did not define a warehouse, the system advances you to the Warehouse Selection Screen, where you can select an item warehouse or create a new item warehouse record.
   - If you did not define a location, the system advances you to the Select Item Location Screen, where you can select an existing item location. If you would like to create a new item location record, enter the location code in the *Location* field and select OK to advance to the Create Item Location for Transfer Screen, where you can create the item location record.

The system processes the transfer and returns to the Work with Inventory Transactions Screen. The transfer you just entered appears on the screen.

Serial numbers: If the transfer affects the total on-hand quantity for a serial numbered item in a warehouse, you advance to the Enter Serial Number screen.

Warehouse Selection Screen

Purpose: Use this screen to select the warehouse that carries the item displayed on the "To" Location pop-up window when you process an inventory transfer (transaction code = T).

How to display this screen: At the Enter To Location Window (Inventory Transfers), prompt on the *Warehouse* field or select OK before completing the *Warehouse* field.

Field	Description
Item	A code representing the unit of inventory to transfer. *Alphanumeric, 12 positions; display-only.*
SKU (Stock keeping unit)	The item's unique characteristics, such as its size and color. SKU codes are defined in and validated against the SKU table. *Alphanumeric, three 4-position fields; display-only.*
Whs (Warehouse)	A code for the warehouse that contains the item. Two warehouse fields display on this screen; the first one is for scanning and the second one is display-only. *Numeric, 3 positions; display-only.*
Name (Warehouse name)	The description of the warehouse that contains the item. *Alphanumeric; 30 positions; display-only.*
On hand	The number of units of the item across all locations in the warehouse. *Numeric, 7 positions; display-only.*
Available	The quantity of the item that is available to sell. *Numeric, 5 positions; display-only.*

Field	Description
Pickable	The total quantity of pickable stock in the warehouse. *Numeric, 7 positions; display-only.*
On order	The total quantity of the item in the warehouse that is due to be received on open purchase orders. *Numeric, 7 positions; display-only.*

Completing this screen: Select a warehouse. You return to the Enter To Location Window (Inventory Transfers), where the warehouse you selected defaults.

Screen Option	Procedure
Create an item warehouse	Select Create to advance to the Create Item Location Screen.

Select Item Location Screen

Purpose: Use this screen to select the location where you wish to transfer an item when you process an inventory transfer (transaction code = T).

How to display this screen: At the Enter To Location Window (Inventory Transfers), prompt on the *Location* field or select OK before completing the *Location* field.

Field	Description
Item	A code representing the unit of inventory to transfer. *Alphanumeric, 12 positions; display-only.*
SKU (Stock keeping unit)	The item's unique characteristics, such as its size and color. SKU codes are defined in and validated against the SKU table. *Alphanumeric, three 4-position fields; display-only.*
Whs (Warehouse)	A code for the warehouse specified on the Enter To Location Window (Inventory Transfers). *Numeric, 3 positions; display-only.*
Location	A code for an area within the warehouse that contains the item or item SKU. Two location fields display on this screen; the first one is for scanning and the second one is display-only. The following message indicates that you selected a location whose location class does not match the location class for the item and the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected: `Item is not compatible with Location.` The location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For example, the location A010203 indicates: `Zone Aisle Shelf Bin` `A 01 02 03` *Alphanumeric, 7 positions; optional.*

Field	Description
Pickable	Indicates whether inventory can be picked from this location to fulfill an order. Valid values are: • YES = pickable • NO = non-pickable
Zone	Identifies the area in the warehouse where the location is situated. *Alphanumeric, 1 position; display-only.*
Aisle	Identifies the aisle within the warehouse location. *Numeric, 2 positions; display-only.*
Shelf	Identifies the location's shelf number within the aisle. *Numeric, 2 positions; display-only.*
Bin #	This code identifies the location's bin number on the shelf. *Numeric, 2 positions; display-only.*
Freeze (Reservation freeze flag)	Indicates whether the item location or SKU location is frozen. Valid values are: • YES = The item/SKU location is frozen. • NO = The item/SKU location is not frozen. If a location is frozen, Pick Slip Generation does not print picks. See Performing Pick Slip Generation. **Note:** Even though a pick slip does not print for an item from a frozen item location, the system still reserves the item on the Order Lines Fields in Order Entry.
Available	The quantity of the item that is available to sell. This field is not currently implemented. *Numeric, 5 positions; display-only.*

How to use this screen: Select a location. You return to the Enter To Location Window (Inventory Transfers) with the location you have selected displayed.

If you wish to create a new item location, do not select a location at this screen; instead, return to the Enter To Location Window (Inventory Transfers) and enter the new location in the *Location* field. When you select OK, the system advances you to the Create Item Location for Transfer Screen.

Item to Item Transfers Window

Purpose: Use this window to enter target item information when you process an item to item transfer (inventory transaction code = G).

An item to item transfer converts inventory for an existing item, in the quantity you specify, to a different existing item. You might want to process an item to item transfer if you will discontinue offering an item on its own, and sell it only as part of a grab bag instead.

How to display this screen: Enter valid information for an item to item transfer at the Work with Inventory Transactions Screen.

Soldout control code: Each field on this window except the *Soldout control* code is described under Work with Inventory Transactions Screen. The system uses the soldout control code if, as a result of processing this transfer, the source item will be sold out. If the Default Soldout Control Code for Item to Item Transactions (D94) system control value is not blank, the value appears here. The soldout control code is a 2-position, alphanumeric code; see Working with Soldout Controls (WSLD).

List price and changing quantity: The system requires that the list price of the source and target item be identical for item to item transactions. The list price is defined in the SKU table for SKUed items, and displayed on the second base item screen for non-SKUed items. See Performing Initial Item Entry (MITM).

If the quantity of the source and target items are different, you must select Change at the pop-up window to change the quantity of the target item. The *Quantity* field appears below the *Warehouse* field; this is a numeric, 8-position field.

The system will consider the relationship between the source item quantity and the target item quantity when validating that the list prices are the same. In the following example, a target item would constitute a set of three of the source item.

Source item	Target item
quantity = 150	quantity = 50
list price = $3.00	list price = $1.00

The system divides $3.00 by 3 and confirms that the list price of the target item is $1.00.

If the list prices are not identical, the following message indicates:

```
List prices, qtys of "From" and "To" item do not match.
```

Completing this window: Complete the necessary fields on this window. The system processes the transfer and returns to the Work with Inventory Transactions Screen, where the transfer you just entered appears.

Transfer Item’s Primary Location Screen

Purpose: Use this screen to transfer an existing item's primary location when you process an inventory transfer (inventory transaction code = T). The system requires that an item/location exist before you can perform this transaction.

The location you are transferring the item to becomes the item's “primary primary” location. A “primary primary” location is the first primary location the system searches when performing any action dealing with inventory. The “primary primary” location is stored in the Primary location field in the SKU table.

When you complete this screen, the system:

- updates the “primary primary” location in the SKU table.
- moves all the inventory from the original location to the new location.

How to display this screen: Select Primary Transfers at the Work with Inventory Transactions Screen.

Field	Description
Item	A code for a unit of inventory. Item codes are defined in and validated against the Item table. *Alphanumeric, 12 positions; required.*
SKU (Stock keeping unit)	The item's unique characteristics, such as its size and color. SKU codes are defined and validated against the SKU table. *Alphanumeric, three 4-position fields; required if the item has SKUs.*
Warehouse	A code for the warehouse that contains the item. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; required.*
Transfer from location	The original location within the warehouse that the item is taken from. If you enter a location other than the item's "primary primary," the system does not perform the transfer and displays an error message: Location not Primary for item. *Alphanumeric, 7 positions; required.*
Transfer to location	The location within the warehouse that the item will be transferred to. This location becomes the "primary primary" location for this item. *Alphanumeric, 7 positions; required.*
Transfer reason	A code that represents a reason to perform an inventory transaction. These codes are defined in and validated against the Transaction Reason Code table. The reason code will be required if you are using an inventory transaction code with the *Reason required* field selected. *Numeric, 2 positions; may be required depending on the type of transaction.*
Delete "from" location	Indicates whether or not to delete location the item's from location. Valid values are: • Selected = the system will delete the item/location • Unselected = the system will not delete the item/location **Note:** If the "from" location is not deleted, the item will have multiple primary locations. In order to have multiple primary locations, you must have the Allow Multiple Primary Item Locations (D12) system control value set to CONFIRM or ALLOW.

Pick Locations Exist Window

A pop-up window appears automatically when you select OK to perform a location transfer if printed pick slips exist for the "from" location:

To continue the transfer, select the *Continue* field, or deselect the *Continue* field to perform the location transfer at a later time when the pick slips are confirmed.

If you enter a location that has not been assigned this item, the system brings you to the Create Item Location for Transfer Screen.

Create Item Location for Transfer Screen

Purpose: Use this screen to create an item location.

How to display this screen:

- Enter a new location for an item on the Transfer Item's Primary Location Screen.
- Enter a new location for an item on the Enter To Location Window (Inventory Transfers).

Field	Description
Reservation Freeze (Freeze flag)	Indicates whether the item location or SKU location is frozen. Valid values are: • Selected = The item/SKU location is frozen. • Unselected = The item/SKU location is not frozen. If a location is frozen, Pick Slip Generation does not print picks. See Performing Pick Slip Generation. **Note:** Even though a pick slip does not print for an item from a frozen item location, the system still reserves the item on the Order Lines Fields in Order Entry.
Min qty	The minimum amount of stock for this item or SKU that can be kept in this location. You should perform an inventory transaction or restock procedure when the inventory reaches the minimum level. *Numeric, 7 positions; optional.*
Max qty	The maximum amount of stock for this item or SKU that can be kept in this location. *Numeric, 7 positions; optional.*

Completing this screen: When you return to the Work with Inventory Transactions Screen, all previous transactions are cleared from the screen.

Perform Location Transfer - Non Primary Screen

Purpose: Use this screen to transfer all of the items in a non-primary location to another non-primary location.

The non-primary location transfer process transfers the on-hand quantity for all item locations in the specified *Transfer From Location* to the *Transfer To Location*. If the item location does not already exist in the *Transfer To Location*, the system creates it. If the item location already exists in the *Transfer To Location*, the system adds the on-hand quantity to transfer to the existing item location. You can review each item location transfer in Display Inventory Transaction History (DITH).

In order to complete a non-primary location transfer:

- inventory sharing must not be turned on for the warehouse where the non-primary location transfer will take place (the *Sharing warehouse* field for the warehouse must be unselected and the *Shared company* and *Shared warehouse* fields for the warehouse must be blank).
- the *Transfer From Location* and *Transfer To Location* must be non-primary locations (the *Location type* for the location must not be P Primary) in the warehouse specified. See Transfer Item's Primary Location Screen to transfer an existing item's primary location.
- items must exist in the *Transfer From Location*. The item locations for the *Transfer From Location*:
  - must have an on-hand quantity to transfer.
  - must have a 0 printed quantity.
  - must have a 0 pending quantity.
- the *Transfer From Location* and *Transfer To Location* cannot be the same location.
- if the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected, the item's location class must match the *Transfer To Location's* location class.

How to display this screen: Select Location Transfers at the Work with Inventory Transactions Screen.

Field	Description
Warehouse	A code for the warehouse where the location transfer will take place. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). The system does not perform the transfer and displays an error message if the warehouse shares inventory with a warehouse in a different company: `Cannot transfer to a whs (111) which shares inventory with another whs (222).` *Numeric, 3 positions; required.*

Field	Description
Transfer From Location	The original location within the warehouse that the items are taken from. Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC). The system does not perform the transfer and displays an error message if: • the location is a primary location: `Location (B010101) is a primary location. Transfer not allowed using this function`. Use the Transfer Item's Primary Location Screen to transfer an existing item's primary location. • no items exist in the *Transfer From Location* with an on-hand quantity to transfer: `No items to transfer from B010101 to B020202`. • a printed quantity exists for one or more item locations: `Printed quantity exists against one or more item locations for location B010101`. • a pending quantity exists for one or more item locations: `Pending quantity exists against one or more item locations for location B010101`. • the *Transfer From Location* and *Transfer To Location* are the same location: `The From location and To location must not be the same`. *Alphanumeric, 7 positions; required.*
Transfer To Location	The location within the warehouse where the items will be transferred to. Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC). The system does not perform the transfer and displays an error message if: • the location is a primary location: `Location (A010101) is a primary location. Transfer not allowed using this function`. Use the Transfer Item's Primary Location Screen to transfer an existing item's primary location. • the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected and the item's location class does not match the *Transfer To Location's* location class: `One or more items is not compatible with location (B010101)`. • the *Transfer From Location* and *Transfer To Location* are the same location: `The From location and To location must not be the same`. *Alphanumeric, 7 positions; required.*

Field	Description
Transaction Reason	A code that represents the reason to perform the inventory transaction. Inventory transaction reason codes are defined in and validated against the Transaction Reason Code table; see Work with Inventory Transaction Reason Codes (WIT1). A transaction reason code is required if the *Reason required* field for the T Transfer inventory transaction code is selected. *Numeric, 2 positions; required if the Reason required field for the T Transfer code is selected.*

Completing this screen:

1. In the Warehouse field, enter the warehouse code where the non-primary location transfer will take place.
2. In the Transfer From Location field, enter the non-primary location where the items will be transferred from.
3. In the Transfer To Location field, enter the non-primary location where the items will be transferred to.
4. In the Transaction Reason field, enter the reason for the non-primary location transfer.
5. Select OK to validate your entries. If necessary, correct any errors and select OK again.
6. If no errors are found, the system displays a Confirm Transfer window. Select OK to confirm the transfer; otherwise, select Exit to cancel. If you select OK and:
    - there are less than 50 item locations to transfer, the system interactively completes the non-primary location transfer and displays the message `Transfer from B010101 to B020202 complete`.
    - If there are 50 or more item locations to transfer, a Large Transfer Warning window displays with the message: `50 or more items exist to be transferred. Process will be submitted to batch` . When you select OK on this window, the system submits the non-primary location transfer as a batch job and displays the message `Job (LOC_TRANS) has been submitted to batch`. You can review the LOC_TRANS batch job on the Job Management (My Jobs) screen.

The non-primary location transfer process:

- Transfers the on-hand quantity for all item locations in the specified *Transfer From Location* to the *Transfer To Location*.
- Deletes the *from* item location records.
- If the item location does not already exist in the *Transfer To Location*, the system creates it.
- If the item location already exists in the *Transfer To Location*, the system adds the on-hand quantity to transfer to the existing item location.
- If serial numbers are associated with the *Transfer From Location*, the system does NOT update the serial numbers to use the new *Transfer To Location*.

You can review each item location transfer in Display Inventory Transaction History (DITH).

Perform Whs to Whs Location Transfer - Non Primary Screen

Purpose: Use this screen to transfer all of the items in a non-primary location to another non-primary location. The two locations can be in different warehouses, although they do not need to be.

When you use this screen, the system transfers the on-hand quantity for all item locations in the specified *Transfer From Warehouse* and *Transfer From Location* to the specified *Transfer To Warehouse* and *Transfer To Location*. If the item warehouse and item location do not already exist in the *Transfer To Warehouse* and *Transfer To Location*, the system creates them. If the item location already exists in the *Transfer To Location*, the system adds the on-hand quantity being transferred to the existing item location. You can review each transfer in Display Inventory Transaction History (DITH).

In order to complete a non-primary warehouse-to-warehouse location transfer:

- the *Transfer From Location* and *Transfer To Location* must be non-primary locations (the *Location type* for the location must not be P Primary). See Transfer Item's Primary Location Screen for information on how to transfer an existing item's primary location.
- there must be at least one item location in the *Transfer From Warehouse* and *Transfer From Location*. The item locations for the *Transfer From Location*:
  - must have an on-hand quantity to transfer.
  - must have a 0 printed quantity.
  - must have a 0 pending quantity.
- the *Transfer From Location* and *Transfer To Location* cannot be the same location in the same warehouse.
- if the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected, the item's location class must match the *Transfer To Location's* location class.

How to display this screen: Select Warehouse Transfers at the Work with Inventory Transactions Screen.

Field	Description
Transfer From Warehouse	A code for the warehouse associated with the *Transfer from Location*. Can be the same as the Transfer To Warehouse. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; required.*

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Transfer From Location</td><td>The original location within the Transfer From Warehouse where the items are currently stored.
Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC).
The system does not perform the transfer and displays an error message if:
• the location is a primary location: <code>Location (B010101) is a primary location. Transfer not allowed using this function</code>. Use the Transfer Item's Primary Location Screen to transfer an existing item's primary location.
• no items exist in the Transfer From Location with an on-hand quantity to transfer: <code>No items to transfer from B010101 to B020202</code>.
• a printed quantity exists for one or more item locations: <code>Printed quantity exists against one or more item locations for location B010101</code>.
• a pending quantity exists for one or more item locations: <code>Pending quantity exists against one or more item locations for location B010101</code>.
• the Transfer From Location and Transfer To Location are the same location in the same warehouse: <code>The From location and To location must not be the same</code>.
Alphanumeric, 7 positions; required.</td></tr>
<tr><td>Transfer To Warehouse</td><td>A code for the warehouse associated with the Transfer To Location. Can be the same as the Transfer From Warehouse.
Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS).
Numeric, 3 positions; required.</td></tr>
<tr><td>Transfer To Location</td><td>The location within Transfer To Warehouse where the items will be transferred to.
Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC).
The system does not perform the transfer and displays an error message if:
• the location is a primary location: <code>Location (A010101) is a primary location. Transfer not allowed using this function</code>. Use the Transfer Item's Primary Location Screen to transfer an existing item's primary location.
• the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected and an item's location class does not match the Transfer To Location's location class: <code>One or more items is not compatible with location (B010101)</code>.
• the Transfer From Location and Transfer To Location are the same location in the same warehouse: <code>The From location and To location must not be the same</code>.
Alphanumeric, 7 positions; required.</td></tr>
</table>

Field	Description
Transaction Reason	A code that represents the reason to perform the inventory transaction. Inventory transaction reason codes are defined in and validated against the Transaction Reason Code table; see Work with Inventory Transaction Reason Codes (WIT1). A transaction reason code is required if the *Reason required* field for the T Transfer inventory transaction code is selected. *Numeric, 2 positions; required if the Reason required field for the T Transfer code is selected.*

Completing this screen:

1. In the Transfer From Warehouse field, enter the warehouse code identifying where the non-primary location transfer originates.
2. In the Transfer From Location field, enter the non-primary location where the items will be transferred from.
3. In the Transfer To Warehouse, enter the warehouse code identifying where the items will be transferred to.
4. In the Transfer To Location field, enter the non-primary location where the items will be transferred to.
5. In the Transaction Reason field, enter the reason for the non-primary location transfer.
6. Select OK to validate your entries. If necessary, correct any errors and select OK again.
7. If no errors are found, the Confirm Transfer window opens. Select OK to confirm the transfer; otherwise, select Exit to cancel. If you select OK and:
   - there are less than 50 item locations to transfer, the system interactively completes the non-primary location transfer and displays the message `Transfer from B010101 to B020202 complete`.
   - If there are 50 or more item locations to transfer, a Large Transfer Warning window opens with the message: `50 or more items exist to be transferred. Process will be submitted to batch`. When you select OK on this window, the system submits the non-primary location transfer as a batch job and displays the message `Job (LOC_TRANS) has been submitted to batch`. You can review the LOC_TRANS batch job on the Job Management (My Jobs) screen.

The non-primary warehouse location transfer process:

- Transfers the on-hand quantity for all item locations in the specified *Transfer From Warehouse* and *Transfer From Location* to the *Transfer To Warehouse* and *Transfer To Location*.
- Deletes the *From* item location records.
- If the item warehouse does not already exist in the *Transfer To Warehouse*, the system creates it.

- If the item location does not already exist in the *Transfer To Location*, the system creates it.
- If the item location already exists in the *Transfer To Location*, the system adds the on-hand quantity to transfer to the existing item location.
- If serial numbers are associated with the *Transfer From Location*, the system does NOT update the serial numbers to use the new *Transfer To Location*.

> **Note:**
>
> The process does not prevent you from performing the transfer regardless of whether the "from" warehouse or the "to" warehouse uses inventory sharing.

You can review each item location transfer in Display Inventory Transaction History (DITH).

Working with Inventory Transaction Errors (WITE)

Purpose: Use the Work with Inventory Transaction Errors function to review all of the errors that occurred while performing inventory transactions, either through processing within Order Management System (system errors) or through the generic inventory transaction upload.

How do system errors occur? Errors can occur when you enter transactions in batch mode or automated transaction mode, or through transactions the system performs, such as issuing or express billing items. The system, or the person performing an inventory transaction, can cause the errors if inventory levels in related tables become out of sync, such as when an interface performs an update before the transaction is complete.

For example, the system attempts to perform an issue transaction when you confirm shipment of an item. However, the on-hand quantity for the item/warehouse is less than the shipment quantity. In this situation, the system creates a "negative on hand" transaction error record.

Correcting system errors: You can reprocess "negative on hand" errors using this menu option, and complete the attempted inventory transaction. In the example above, you would first need to reset the on-hand quantity of the item through a purchase order receipt or adjustment inventory transaction before submitting the reprocess.

> **Note:**
>
> You cannot process inventory resets if there are any inventory transaction errors; you must first correct or delete all errors. See Working with Inventory Resets.

Generic upload errors: In addition to the errors that can occur within the system, either through batch or system transactions, the *Generic Inventory Transaction Upload* can generate errors based on invalid, inconsistent, or missing information provided in the uploaded message. Unlike with most system errors, you can normally correct and resubmit generic upload errors.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

- Work with Inventory Transaction Errors Screen
- Display Inventory Transaction Errors Screen
- Generic Interface Error Screen
- Reprocessing Transactions

Work with Inventory Transaction Errors Screen

Purpose: Use this screen to display all of the errors that have occurred during inventory transactions.

How to display this screen: Enter WITE in the *Fast path* field at the top of any menu or select this option from a menu.

Field	Description
I (Interface error)	Indicates whether the error resulted from invalid, inconsistent or missing information in a transaction received through the *Generic Inventory Transaction Upload*. Valid values are: • Y = generic inventory transaction upload error: When you select Change for this type of error, you advance to the Generic Interface Error Screen, where you can change information before resubmitting and processing the transaction. • N = error resulting from an interactive or system transaction: You cannot change information for the transaction. When you select Change for this type of error, the system displays an error message: `System generated transactions cannot be changed`. However, you can reprocess "negative on hand" errors using this menu option, and complete the attempted inventory transaction, if you have corrected the situation that produced the error. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** Uploaded inventory transactions can have this flag unselected if the information in the upload was correct and complete, but a regular transaction error occurred once the upload was processed. For example, an upload error could have this flag unselected if the transaction would produce a "negative on hand" situation.
Date (Inventory transaction error date)	The date when the transaction error occurred. *Numeric, 6 positions (user date format); optional.*

Field	Description
Item	A code for a unit of inventory. Item codes are defined in and validated against the Item table. *Alphanumeric, 12 positions; optional.*
SKU (Stock keeping unit)	The item's unique characteristics, such as its size and color. SKU codes are defined in and validated against the SKU table. *Alphanumeric, three 4-position fields; display-only.*
Cde (Transaction code)	The inventory transaction code that was used when the error occurred. Valid values include: • A =Adjustment • C = Customer Return • E = Express Bill • G = Item to item transfer • I = Issue • T = Transfer • V = Return to vendor • O = On-hand • R = Receiving You can also create user-defined transaction codes. See Work with Inventory Transaction Codes (WITC). *Alphanumeric, 1 position; display-only.*
Qty (Quantity)	The number of units that this transaction error affects. *Numeric, 8 positions; display-only.*
Error (Inventory transaction error description)	A description of the transaction error that occurred. For example: `Negative On hand` See *Inventory Transaction Upload Errors* for information on the types of errors that can occur through the generic inventory transaction upload. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Alphanumeric, 25 positions; display-only.*

Screen Option	Procedure
Change an uploaded transaction or automated transaction	Select Change for an uploaded transaction or automated transaction to advance to the Generic Interface Error Screen. **Note:** You cannot change a transaction error that occurred through batch inventory transactions or system processing; instead, the system displays an error message: `System generated transactions cannot be changed`. See the I (Interface error) flag for more information.
Delete a transaction error	Select Delete for the error you want to delete.
Display a transaction error	Select Display for an error to advance to the Display Inventory Transaction Errors Screen for a system error, or the Generic Interface Error Screen for an generic upload error. See the I (Interface error) flag for more information.
Advance to inventory inquiry	Select Inv Inquiry for an error to advance to the Display Item/ Warehouse Information Screen.
Attempt to reprocess the inventory transaction	Select Reprocess for the error to reprocess it. See Reprocessing Transactions.
Advance to standard order inquiry	Select Order Inquiry for an error to advance to the Order Inquiry Header Screen or the Order Inquiry Detail Screen, depending on the setting of the Default Version for Order Inquiry (C34) system control value.
Advance to item transaction history	Select Item Transaction History to advance to the Inventory Transaction History Screen (1 of 2).
Attempt to reprocess all inventory transactions in error	Select Reprocess. See Reprocessing Transactions.
Delete all inventory transaction error records	Select Delete all. The system displays a confirmation window. If you confirm the deletion at this window, the system submits the job DLT_WITE, which deletes all transaction errors and produces a listing of each deleted error.

Display Inventory Transaction Errors Screen

Purpose: Use this screen to display a specific system transaction error.

How to display this screen: Select Display for a system inventory transaction error at the Work with Inventory Transaction Errors Screen.

> **Note:**
>
> When you select Display for a generic upload transaction error (the I (Interface error) flag is selected), you advance to the Generic Interface Error Screen.

Field	Description
Date (Inventory transaction error date)	The date when the transaction error occurred. *Numeric, 6 positions (user date format); display-only.*
Time (Inventory transaction error time)	The time when the inventory transaction error occurred. *Numeric, 6 positions (HHMMSS format); display-only.*
Transaction code (Inventory transaction code)	The code identifying the inventory transaction that was attempted when the transaction error occurred. *Alphanumeric, 1 position; display-only.*
Order #	The order, ship-to number, and shipment number, each separated by hyphens, associated with the transaction error. *Order number: numeric, 7 positions; display-only.* *Ship-to number: numeric, 3 positions; display-only.* *Shipment number: numeric, 3 positions; display-only.*
Invoice #	The invoice number identifying a shipment against an order, if the inventory transaction error occurred when attempting an issue transaction. *Numeric, 7 positions; display-only.*
Item#/SKU (Item number and stock keeping unit)	The unit of inventory and its unique characteristics that was affected by the transaction. *Item: Alphanumeric, 12 positions; display-only.* *SKU: Alphanumeric, three 4-position fields; display-only.*
Transaction qty (Transaction quantity)	The amount of inventory that this transaction error affects. *Numeric, 8 positions; display-only.*
From whs/location (From warehouse and location)	The original warehouse and location that the item was taken from. *Whs: Alphanumeric, 3 positions; display-only.* *Location: Alphanumeric, 7 positions; display-only.*
To cmp/whs/location (To company, warehouse and location)	The company, warehouse and location that the item was transferred to. *Cmp: Alphanumeric, 3 positions; display-only.* *Whs: Alphanumeric, 3 positions; display-only.* *Location: Alphanumeric, 7 positions; display-only.*
Called by	The name of the function that performed this inventory transaction. This field is not currently implemented. *Alphanumeric, 40 positions; display-only.*
Error (Inventory transaction error description)	A description of the transaction error that occurred. *Alphanumeric, 25 positions; display-only.*
Cost	The unit cost of the item. *Numeric, 13 positions with a 4-place decimal; display-only.*

Field	Description
Price	The unit price of the item on the order, if the transaction error involved an order. *Numeric, 13 positions with a 2-place decimal; display-only.*
Batch #	The number of the batch containing the attempted inventory transaction, if this error was a result of immediate or batch inventory transactions. *Numeric, 13 positions; display-only.*
Transaction reason	The code identifying the reason for the inventory transaction, if one was specified. *Numeric, 2 positions; display-only.*
Express bill	This flag indicates whether the transaction represented an express bill, or an order that bypasses reservation, pick slip generation, and shipment confirmation. An order is processed as an express bill if the ship via on the order header has a Billing code of Express Bill. Valid values are: • Selected = Transaction was an express bill • Unselected = Transaction was not an express bill
S/H	This flag indicates whether the item associated with the transaction required special handling. Valid values are: • Selected = Item required special handling • Unselected = Item did not require special handling
Auto restock	This flag indicates whether the transaction was a replenishment to the *Auto restock location* in the “to” warehouse. Valid values are: • Selected = Transaction was a replenishment to an auto restock location • Unselected = Transaction was not a replenishment to an auto restock location
Delete location	This flag indicates whether the item location record should be deleted when the transaction is complete. Ordinarily, the system deletes an item location record when the on-hand falls to zero, unless it is a primary location. Valid values are: • Selected = Item location should be deleted • Unselected = Item location should not be deleted

Generic Interface Error Screen

Purpose: Use this screen to review or work with errors that occur through the *Generic Inventory Transaction Upload*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

How to display this screen:

- Select Change for a generic upload error at the Work with Inventory Transaction Errors Screen to display this screen in Change mode.

- Select Display for a generic upload error Work with Inventory Transaction Errors Screen to display this screen in Display mode; in this case, all fields are display-only.

> **Note:**
>
> You cannot display this screen for a system transaction error (the I (Interface error) flag is unselected).

Field	Description
Date	The date when the transaction error occurred. *Numeric, 6 positions (user date format); display-only.*
Transaction code	The code identifying the inventory transaction that was attempted when the transaction error occurred. For upload transactions, the *transaction_code* from the inventory transaction upload message defaults. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Defined in and validated against the Item Transaction Code table; see Work with Inventory Transaction Codes (WITC). *Alphanumeric, 1 position; required.*
Time	The time when the inventory transaction error occurred. *Numeric, 6 positions (HHMMSS format); display-only.*
Transaction reason	Defined in and validated against the Item Transaction Reason Code table; see Work with Inventory Transaction Reason Codes (WIT1). Required if the inventory transaction code has the Reason required flag selected. For upload transactions, the *transaction_reason*, if any specified in the inventory transaction upload message defaults. *Numeric, 2 positions; optional or required.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Error	The description of the error that occurred. It is possible for an uploaded transaction to have more than one error. See *Inventory Transaction Upload Errors* for a list of errors and descriptions. *Alphanumeric, 25 positions; display-only.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Allow partial	The setting of the *allow_partial* flag from the inventory transaction upload message. Valid values are: • unselected = do not process a partial quantity; put the transaction in error if the full quantity cannot be processed See *Processing Partial Quantities* for a discussion. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
Batch #	The batch number to identify a transaction or group of transactions. The *batch_number*, if any, specified in the inventory transaction upload message defaults. *Numeric, 7 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Create item warehouse	The setting of the *create_item_warehouse* flag from the inventory transaction upload message. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values are: • unselected = do not create a new Item Warehouse record; put the transaction in error if the Item Warehouse does not exist In the case of a transfer (T) or item-to-item transfer (G) transaction, this value refers to the To warehouse; otherwise, it refers to the warehouse specified in the Warehouse.
Identification #	A number to identify the transaction. Not valid with item-to-item (G) transactions. The *identification_nbr*, if any, specified in the inventory transaction upload message defaults. *Numeric, 10 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Create item location	The setting of the *create_item_location* flag from the inventory transaction upload message. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Valid values are: • unselected = do not create a new Item Location record; put the transaction in error if the Item Location does not exist • In order to create both a new Item Warehouse and a new Item Location, both this flag and the Create item warehouse flag must be selected. • In the case of a transfer (T) or item-to-item transfer (G) transaction, this value refers to the To location; otherwise, it refers to the warehouse specified in the Location.
Entered by user	The user ID of the user that entered the inventory transaction. The *entered_by_user*, if any, specified in the inventory transaction upload message defaults. *Alphanumeric, 10 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
To company	Used for transfer (T) and item-to-item transfer (G) transactions only, and only when the "to" company is different from the "from" (current) company. See *Summary of Transaction Rules* for a summary. The *company*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 3 positions; optional.*

Field	Description
Item	Defined in and validated against the Item table; see Performing Initial Item Entry (MITM). See *Resolving the Item and SKU* for information on how the system identifies the correct item and SKU. The *item_number*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. *Alphanumeric, 12 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
To item #	Defined in and validated against the Item table; see Performing Initial Item Entry (MITM). See *Resolving the Item and SKU* for information on how the system identifies the correct item and SKU. The *item_number*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. Used for item-to-item transfer (G) transactions only. See *Summary of Transaction Rules* for a summary. *Alphanumeric, 12 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
SKU	The item's unique characteristics, such as its color and size. Required if the Item is specified and the item has SKUs. The *sku_code*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Alphanumeric, 14 positions; optional.*
To SKU	The item's unique characteristics, such as its color and size. Required if the *item_number* is specified and the item has SKUs. See *Resolving the Item and SKU* for more information. The *sku_code*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. Used for item-to-item transfer (G) transactions only. See *Summary of Transaction Rules* for a summary. *Alphanumeric, 14 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Short SKU	An additional code to identify an item and SKU. The *short_sku*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 7 positions; optional.*

Field	Description
To short SKU	The *short_sku*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. Used for item-to-item transfer (G) transactions only. See *Summary of Transaction Rules* for a summary. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 7 positions; optional.*
Retail ref #	An additional code or reference number to identify an item and SKU. The *retail_reference_nbr*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. For more information see the Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 15 positions; optional.*
To retail ref #	The *retail_reference_nbr*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. Used for item-to-item transfer (G) transactions only. See *Summary of Transaction Rules* for a summary. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 15 positions; optional.*
UPC type	A code to identify the format of the Universal Product Code. The *upc_type*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Alphanumeric, 3 positions; optional.*
To UPC type	The *upc_type*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. Used for item-to-item transfer (G) transactions only. See *Summary of Transaction Rules* for a summary. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Alphanumeric, 3 positions; optional.*

Field	Description
UPC	The Universal Product Code. The *upc_code*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** Include any leading zeros. For example, if the UPC code is 06012011, enter `06012011` and not `6012011`. *Alphanumeric, 14 positions; optional.*
To UPC	The *upc_code*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. See *Resolving the Item and SKU* for more information. Used for item-to-item transfer (G) transactions only. See *Summary of Transaction Rules* for a summary. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). **Note:** Include any leading zeros. For example, if the UPC code is 06012011, enter `06012011` and not `6012011`. *Alphanumeric, 14 positions; optional.*
Warehouse	A code to identify the warehouse where the item is located. Defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). For upload transactions, the *warehouse*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. Represents the "from" warehouse for transfer (T) and item-to-item transfer (G) transactions. *Numeric, 3 positions; required.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
To warehouse	A code to identify the warehouse to move the item. Defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). For upload transactions, the *warehouse*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. Used for transfer (T) and item-to-item transfer (G) transactions only. *Numeric, 3 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Location	A code to identify the location in the warehouse where the item is located. Defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC). For upload transactions, the *location*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. Represents the "from" location for transfer (T) and item-to-item transfer (G) transactions. *Alphanumeric, 7 positions; required.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
To location	A code to identify the location in the warehouse to move the item. Defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC). For upload transactions, the *transaction_quantity*, if any, specified in the *TransactionTo* element of the inventory transaction upload message defaults. Used for transfer (T) and item-to-item transfer (G) transactions only. *Alphanumeric, 7 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Quantity	The quantity of the item and SKU that is affected by the transaction. For upload transactions, the *transaction_quantity*, if any, specified in the inventory transaction upload message defaults. The actual effect on inventory varies with the transaction. See *Summary of Transaction Rules* for more information. *Numeric, 5 positions; required.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
S/O control	Updates the SKU table if the item will be sold out as a result of an item-to-item (G) transfer. Validated against the Soldout Control table; see Working with Soldout Controls (WSLD). If a soldout control code is indicated, it must represent a valid code even if it is not required for the transaction. For upload transactions, the *so_control*, if any, specified in the *Transaction* element of the inventory transaction upload message defaults. *Alphanumeric, 2 positions; optional.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Completing this screen: See *Inventory Transaction Upload Errors* for a discussion of each error.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Correct any fields and Select OK. The system validates your entries and highlights any fields you need to correct. If the system does not highlight any errors, you can reprocess it; see Reprocessing Transactions.

> **Note:**
>
> After you correct an error and reprocess the transaction, it is possible for the transaction to remain in error status if there is an additional problem. You can repeat the correction and reprocessing steps; alternatively, you can delete the transaction error and use Working with Inventory Transactions (WITI) to process the transaction.

Reprocessing Transactions

Purpose: You can complete unprocessed inventory transactions at the Work with Inventory Transaction Errors Screen, provided that:

- the error was “negative on hand” or occurred through the *Generic Inventory Transaction Upload*.
- you have corrected the condition that produced the error

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Reprocess an individual transaction: Select Reprocess for a transaction error to reprocess it. If it is possible to complete the inventory transaction at this time, the error will be deleted from the screen, and the following message indicates:

```
Transaction was successfully reprocessed!
```

Otherwise, the system displays an error message.

Reprocess all transactions: Select Reprocess to reprocess all eligible transactions. The Process Item Transaction Errors window opens.

Optionally, enter the item and SKU to complete inventory transactions for that item/SKU only, or select Reprocess to reprocess transactions for all items. The system submits the job PROC_WITE, which reprocesses each eligible transaction. Transaction errors remain for any transactions that were not eligible for completion.

Pick slip preparation: If a transaction causes the system to unreserve an order because the on hand quantity was reduced below the reserved quantity, the system removes any pick slip preparation from the order and then reevaluates the order for pick slip preparation; see Preparing Orders for Pick Slip Generation.

Finished Good Work Order Processing (WWOR)

Purpose: A finished good is an item, comprised of one or more component items, that requires assembly prior to picking and packing. Work order processing is the ability to reserve component items while you assemble a finished good. A work order builds a finished good item by increasing the inventory of the finished good and decreasing the inventory of its component items.

The work order process:

- identifies the finished good to create
- suggests where to pick the component items to make up the finished good
- creates a make up finished good inventory transaction (transaction code = M)
- writes inventory transaction history for the finished good and its component items

> **Note:**
>
> You cannot add a new component to a finished good if it has an open work order. See Entering Finished Goods Information (WFGD) and Importing Set Components (WCUP).

Work with Work Orders Screen

Purpose: Use this screen to:

- create a work order
- change, delete or display an existing work order
- process a work order

How to display this screen: Enter WWOR in the *Fast path* field at the top of any menu or select Work with Work Orders from a menu.

Field	Description
Work # (Work order number)	The number used to identify the work order. The system assigns work order numbers from the Purchase Order Header field in the Number Assignment table. *Numeric, 7 positions; optional.*
Item number	The finished good to be produced. *Alphanumeric, 12 positions; optional.*
COLR SIZE OTHR	The SKU of the finished good item to be produced. *Alphanumeric, three 4-position fields; optional.*
Created on	The date the work order was created. *Numeric, 8 positions (user date format); optional.*
Due date	The date the finished good item is scheduled to be available for sale. This date is indicated in Order Entry, Order Maintenance, standard or streamlined Order Inquiry, and in Item Availability. *Numeric, 8 positions (user date format); optional.*
Vendor	The code for the vendor who is responsible for producing the finished good item. *Numeric, 7 positions, display-only.*

Screen Option	Procedure
Change a work order	Select Change for a work order to advance to the Change Work Orders Screen.
Delete a work order	Select Delete for a work order to delete it. When you delete a work order: • The Protected qty (Protected quantity) field for each component item in the Item Warehouse table is reduced by the amount specified in the work order • The Protected qty (Protected quantity) field for each component item in the Item Location table is reduced by the amount specified in the work order • The On order field for the finished good in the Item Warehouse table is reduced by the quantity deleted in this work order
Display a work order	Select Display for a work order to advance to the Display Work Order Screen.

Screen Option	Procedure
Process a work order	Select Process for a work order to advance to the Select Location pop-up window. See Processing Work Orders.
Create a work order	Select Create to advance to the Create Work Orders Screen.

Create Work Orders Screen

Purpose: Use this screen to create the header information for a finished good work order. The header information includes:

- the work order number
- the warehouse where the finished good and its component items are located
- the quantity of the finished good to be produced
- the date the finished good is expected to be available for sale

How to display this screen: Select Create at the Work with Work Orders Screen.

Field	Description
Work order #	The number used to identify the work order. The system assigns work order numbers from the Purchase Order Header field in the Number Assignment table. *Numeric, 7 positions; display-only if system-assigned; required if manually entered.*
Warehouse	The warehouse code and description where the finished good and its component items are stored. The warehouse code defaults from the Default Warehouse (A04) system control value. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Warehouse code: Numeric, 3 positions; required.* *Warehouse description: Alphanumeric, 30 positions; display-only.*
Item and SKU	The item code and SKU of the finished good to be produced. You define an item as a finished good by entering an F in the *Kit type* field in the Item table. The following message indicates that the item entered is not a finished good item: `Item is not Finished Good` A message similar to the following indicates that an Item Warehouse record does not exist for the item and warehouse you have entered: `Item/SKU (DOLL KIT/) does not exist for this warehouse (10)` *Item: Alphanumeric, 12 positions; required.* *SKU: Alphanumeric, three 4-position fields; required if the item has SKUs.*
Qty (Quantity)	The quantity of the finished good to be produced. *Numeric, 7 positions; required.*

Field	Description
Due date	The date the finished good is scheduled to be available for sale. This date is indicated in Order Entry, Order Maintenance, standard or streamlined Order Inquiry, and in Item Availability. *Numeric, 8 positions (user date format); required.*
Vendor	The code for the vendor who is responsible for producing the finished good. Vendor codes are defined in and validated against the Vendor table; see Working with Vendors (WVEN). *Numeric, 7 positions; required.*

Completing this screen: The message `'Suggesting locations, please wait'` is displayed at the bottom of the screen. The system checks the available on-hand quantity of each component item in the warehouse and determines the locations from which each component item is picked to make up the finished good before advancing to the Create Work Order Details Screen. See Work Order Validations.

System updates: When a work order header is created:

- The Protected qty (Protected quantity) field in the Item Warehouse table for each component item is increased by the quantity needed to make up the finished good.
- The On order field in the Item Warehouse table for the finished good is increased by the amount being assembled for the work order.
- The Pending transfer quantity field in the Item Location table for each component item is increased by the quantity needed to make up the finished good. This quantity is a negative quantity since the component items will be transferred from their locations to the location for the finished good.

Work Order Validations

The system performs the following validations when a work order is created:

1. Determines the available on-hand quantity of the component items in the warehouse entered on the Create Work Orders Screen, using the following calculation:

   ```
   Component quantity < on-hand - (reserved + protected) = available on-hand
   quantity
   ```

   An error message similar to the following indicates if the component quantity is greater than the available on-hand quantity:

   ```
   Component FNHCMP34 - Warehouse qty (9) less than the requested qty (12)
   ```

2. Determines the available on-hand quantity of the component items in the warehouse locations using the location type sequence. The system uses the following calculation:

   ```
   On-hand - (printed - negative pending transfer quantity) = available on-hand
   location quantity
   ```

   An error message similar to the following indicates if the system cannot find one or more locations that can fulfill the entire quantity needed to make up the finished good:

   ```
   Component FNHCMP36 - Warehouse qty (9) less than requested qty (12)
   ```

3. Checks that the locations are not frozen.
4. Checks that the item locations are not frozen.

Create Work Order Details Screen

Purpose: This screen displays all of the component items needed to make up the finished good you have entered on the Create Work Orders Screen. Use this screen to accept, reject or change the locations the system has suggested to pick each component item.

How to display this screen: Select OK to accept the work order you have created on the Create Work Orders Screen.

> **Note:**
>
> Component items are highlighted if an error occurred while the system was suggesting component locations to pick. The system will not accept the work order until you correct all items in error.

Field	Description
Work order #	The work order number assigned to this work order. *Numeric, 7 positions; display-only.*
Warehouse (Warehouse and description)	The warehouse code and warehouse description where the finished good and its component items are stored. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Warehouse code: Numeric, 3 positions; required.* *Warehouse description: Alphanumeric, 30 positions; display-only.*
Kit	The item, SKU and description of the finished good entered on the Create Work Orders Screen. *Item: Alphanumeric, 12 positions; display-only. SKU: Alphanumeric, three 4-position fields; display-only.* *Description: Alphanumeric, 30 positions; display-only.*
Quantity	The quantity of the finished good to be produced. The quantity defaults from the Create Work Orders Screen. If you change the amount in the Quantity field, the system recalculates the available quantities in each location. *Numeric, 7 positions; required.*
Component	The item/SKU of the component items that make up the finished good item. The component items default from the Kit Detail table. *Item: Alphanumeric, 12 positions; display-only.* *SKU: Alphanumeric, three 4-position fields; display-only.*
Description	The description of the component item. *Alphanumeric, 25 positions; display-only.*
Kit qty (Kit quantity)	The quantity of the component item used to make up one finished good item. The kit quantity defaults from the Quantity field in the Kit Detail table. *Numeric, 5 positions; display-only.*

Field	Description
Tot qty (Total quantity)	The total quantity of the component item needed to make up the total quantity of finished goods. The system determines the total quantity of component items needed using the following calculation: `kit quantity x total quantity of finished good = total quantity of component items needed` Example: `Kit quantity = 2` `Total quantity of finished goods = 10` `kit quantity (2) x total quantity (10) = total quantity of components needed (20)` *Numeric, 7 positions; display-only.*
Location	The location where the system suggests to pick the component items. If more than one location has been suggested, the location field appears blank and a plus (+) sign is displayed. If you change the location for a component item, the system checks that: • the item exists in that location • the item/location reservation freeze flag = Unselected • the location freeze flag = Unselected • the available quantity in the location is equal to or greater than the quantity needed to make up the finished good The system determines the available on-hand quantity in a location using the following calculation: `On-hand - (printed - negative pending transfer quantity) = available on-hand quantity` You can also add locations to a component item by selecting Locations for the component you wish to change. See Work with Work Order Detail Locations Screen. *Alphanumeric, 7 positions; required.*

Instructions:

1. *Optionally*, you can change the *Quantity and/or Location* fields. The system recalculates the quantities in each location to determine if each component item needed is available.
2. *Optionally*, you can add locations to a component item by selecting Locations for the item. See the Work with Work Order Detail Locations Screen.
3. Select Accept to accept the work order details or select Reject to reject them. You return to the Create Work Orders Screen, where you can enter another work order.

System updates: When you select Accept to accept the work order details:

- The system creates the details of a work order (this work order is displayed on the Work with Work Orders Screen).
- The Protected qty (Protected quantity) field in the Item Warehouse table for each component item is increased by the amount needed to make up the finished good.

- The Pending transfer quantity field in the Item Warehouse table for each component item is increased by the quantity needed to make up the finished good. This quantity is a negative quantity since the component items are transferred from their locations to the location for the finished good.
- The On Order field in the Item Warehouse table for the finished good is increased by the quantity being assembled.

Screen Option	Procedure
Add locations to a component item	Select Locations for a component item to advance to the Work with Work Order Detail Locations Screen.
Accept the work order details	Select Accept to accept the work order details.
Reject the work order details	Select Reject to reject the work order details.

Work with Work Order Detail Locations Screen

Purpose: This screen is used to pick component items from more than one location, or to display, change or delete the system-recommended locations.

How to display this screen: Select Locations for a component at the Create Work Order Details Screen.

The system-recommended locations display in the lower half of the screen.

Field	Description
Work order #	The work order number for this component item. *Numeric, 7 positions; display-only.*
Ln. (Line number)	The line number where this component item is located on the work order. *Numeric, 3 positions; display-only.*
Item (Item/SKU and description)	The item number, SKU and item description for this component item. *Item: Alphanumeric, 12 positions; display-only.* *SKU: Alphanumeric, three 4-position fields; display-only.* *Item description: Alphanumeric, 120 positions; display-only.*
Qty needed	The quantity of this component item needed to make up the finished goods. This amount defaults from the Create Work Order Details Screen. *Numeric, 7 positions; display-only.*
Qty selected	The total quantity of this component item selected for the finished good across all locations. This field is updated as you add, change or delete locations to pick this component item in order to make up the finished good. The total quantity selected must equal the amount in the *Quantity needed* field or the following error message indicates: `Qty needed (1) must equal Qty selected (2)` *Numeric, 7 positions; display-only.*

Field	Description
Qty	The quantity of this component item to be picked from the associated location. The total quantity entered for all locations must equal the amount in the Quantity needed field. *Numeric, 7 positions; optional.*
Whs	The code for the warehouse where the component items are picked for the finished good. The warehouse code entered on the Create Work Orders Screen defaults and cannot be overridden. Warehouse codes are defined in and validated against the Warehouse table. *Alphanumeric, 3 positions; display-only.*
Location	The location from which the associated quantity is picked. *Alphanumeric, 7 positions; optional.*

Screen Option	Procedure
Change a detail location	Select Change for a location to advance to the Change Work Order Location Window.
Delete a detail location	Select Delete for the location you want to delete. The location and its associated quantity clears from the screen.
Accept the detail locations	Select Accept to accept the locations and their associated quantities.
Reject the detail locations	Select Reject to reject the locations and their associated quantities.

Instructions:

1. Review the system-suggested locations. See Change Work Order Location Window for more information on changing or deleting detail locations.
2. Enter the quantity of the component item you want to pick in the *Quantity* field.
3. In the *Location* field, enter the location code where the quantity will be picked. You must enter a valid warehouse location for the component item. A message similar to the following indicates if the location you enter is invalid: `Item Location does not exist for Item (DRAWING PAD)`.
4. The system displays the quantity, warehouse and location at the bottom of the screen and increases the amount in the *Quantity selected* field in the top of the screen.
5. Select Accept to accept the locations you have created. The system verifies that the *Quantity needed* field equals the *Quantity selected* field. The following message indicates if the quantities are not the same: `Qty needed (1) must equal Qty selected (2)`
6. Select Reject to reject the changes you have made.

System updates: When you select Accept to accept the locations you have created, the Pending transfer quantity field in the Item Location table is increased by the quantity you entered. This quantity is a negative quantity since the component item is transferred from this location to the location for the finished good.

See Work Order Validations for a list of validations the system performs before accepting a work order detail location.

Change Work Order Location Window

Changing detail locations: To change a work order detail location for a component item, select Change for the location at the Work with Work Order Detail Locations Screen. Enter an amount in the *Quantity* field to change the amount picked from the location to make up the finished good item. See Work Order Validations for more information on the validations the system performs when you change a work order detail location.

Change Work Orders Screen

To change a work order: Select Change for a work order on the Work with Work Orders Screen to advance to the Change Work Orders screen. You can change only the *Due date* field on this screen. See Create Work Orders Screen for field descriptions. The following message indicates if the date you entered is less than today's date:

```
Due date must be Greater than or equal to today's date
```

Change the due date if necessary and select Accept to accept the change. You return to the Work with Work Orders Screen.

Display Work Order Screen

To display a work order: Select Display for a work order on the Work with Work Orders Screen to advance to the Display Work Order screen. The Display Work Order screen indicates the details of a finished good work order including:

- the work order number
- the warehouse where the finished good and its component items are located
- the vendor who is responsible for producing the finished good
- the quantity of the finished good to be assembled
- the date the finished good is available for sale
- the component items that make up the finished good
- the locations the component items are taken from to make up the finished good

See Create Work Order Details Screen for a description of the fields on this screen.

You can also display a component's locations from this screen by selecting a component item. You advance to the Display Work Order Locations screen.

An error message similar to the following indicates if you select Locations for a component item that is not taken from more than one location:

```
This record does not have multiple locations to display
```

See Work with Work Order Detail Locations Screen for a description of the fields on this screen.

Processing Work Orders

Purpose: Once you have assembled all of the finished goods for a work order, you can process it. Processing work orders increases the inventory of the finished good and decreases the inventory of its component items through the make up finished good inventory transaction (transaction code = M).

To perform the make up finished good inventory transaction you must:

- define the location where the finished good is stored
- define the location or locations from which the component items are picked from to make up the finished good

Select Location Window

You can process a work order on the Work with Work Orders Screen by selecting Process for a work order. The Select Location pop-up window opens.

Field	Description
Work order #	The number of the work order you are processing. *Numeric, 7 positions; display-only.*
Kit	The item, SKU and description of the finished good you are processing. *Item: Alphanumeric, 12 positions; display-only.* *SKU: Alphanumeric, three 4-position fields; display-only.*
Warehouse	The warehouse code and description in which the finished good you are processing is stored. Warehouse codes are defined in and validated against the Warehouse table. *Warehouse code: Numeric, 3 positions; display-only.* *Warehouse description: Alphanumeric, 30 positions; display-only.*
Quantity	The total quantity of finished goods to be produced on this work order. The quantity you entered when you created the work order defaults, but can be overridden. You can process a portion of the finished goods that are ready on the work order by entering a quantity less than the total quantity available. The finished goods that are not processed, remain open on the work order until you process them. *Numeric, 7 positions; required.*
Location	The location where the finished good will be placed once it is processed. The primary location for this finished good defaults if you have selected the Default Primary Location (C05) system control value. You can prompt on this field to advance to the Select Item Location screen, where you can select an item location to default to the *Location* field on the Select Location window. If you do not select a location at the Select Item Location screen, you return to the Select Location window and the *Location* field updates to blank. *Alphanumeric, 7 positions; required.*

Instructions: Use the following steps to select the quantity of the finished good you want to process and the location where the finished goods will be placed once they are assembled.

1. Review the quantity of the finished goods to assemble for this work order. To change the amount, enter a different quantity in the *Quantity* field. The following message indicates if you enter a quantity that is greater than the original quantity: `Quantity entered cannot be greater than original quantity.`
2. Enter the location where you want the finished goods to be placed once they are assembled.

3. Select OK to accept the quantity and location you entered. You advance to the Work with Kit Makeup Screen, where you can arrange the component items on the work order and process a make up finished good inventory transaction (transaction code = M).

System validations: When you select OK, the system checks that;

- The location you entered exists. A message similar to the following indicates if the location you entered does not exist:

  ```
  Location (K010104) does not exist.
  ```

- The location you entered is not frozen. A message similar to the following indicates if the location you entered is frozen:

  ```
  Location K010104 frozen
  ```

- The item/location you entered is not frozen. A message similar to the following indicates if the item/location you entered is frozen:

  ```
  Location K010104 frozen
  ```

- If the location you entered is a primary location, the Allow Multiple Primary Item Locations (D12) system control value is set to ALLOW.
- The location class for the location matches the location class for the item if the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected. An error message similar to the following indicates if the location's location class does not match the item's location class:

  ```
  Item is not compatible with Location.
  ```

- The quantity you entered in the *Quantity* field is not greater than the original quantity. An error message similar to the following indicates if you enter a quantity that is greater than the original quantity:

  ```
  Quantity entered cannot be greater than original quantity.
  ```

- The Default Primary Location (C05) system control value is selected. An error message similar to the following indicates if you have not selected this field:

  ```
  No Default Location was found. Please enter a location.
  ```

Work with Kit Makeup Screen

Purpose: Use this screen to arrange the component items on a finished good work order and process a make up finished good inventory transaction (transaction code = M).

How to display this screen: Select OK on the Select Location Window. You can also display this screen by entering valid information for a finished good at the Work with Inventory Transactions Screen.

Field	Description
Batch #	The number of the batch assigned to this work order. The batch number is used to keep track of the component items that make up the finished good. *Numeric, 7 positions; display-only.*
Work order #	The number used to identify the work order that this finished good is assigned to. *Numeric, 7 positions; display-only.*

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Kit</td><td>The item, SKU and description of the finished good on this work order.
Item: Alphanumeric, 12 positions; display-only.

SKU: Alphanumeric, three 4-position fields; display-only.
Description: Alphanumeric, 30 positions; display-only.</td></tr>
<tr><td>Control quantity</td><td>The quantity of the component that is needed to make up the finished good.
Numeric, 7 positions; display-only.</td></tr>
<tr><td>Actual quantity</td><td>The quantity of the component that is taken from a location. If you are taking a component from more than one location, be sure the actual quantity matches the control quantity.
Numeric, 7 positions; required.</td></tr>
<tr><td>Whs (Warehouse)</td><td>A code for the warehouse that contains the component item. Warehouse codes are defined in and validated against the Warehouse table. The warehouse code for this work order defaults.
Numeric, 3 positions; display-only.</td></tr>
<tr><td>Location</td><td>The location from which the system suggests to pick the component items. If more than one location has been suggested, the Location field is blank and a plus (+) sign is displayed.
If you change the location for a component item, the system checks that:
• the item exists in that location
• the item/location freeze flag = Unselected
• the available quantity in the location is equal to or greater than the quantity needed to make up the finished good
You can add locations to a component item by selecting Locations for the component item you wish to change. See Select Location Window.
Alphanumeric, 7 positions; required.</td></tr>
</table>

Instructions:

1. Complete the necessary fields.
2. Select Accept.
3. You return to the Work with Work Orders Screen, where you can process another finished good work order.

System validations: When you select Accept to process a work order, the system checks that:

- The component items exist in the locations specified. A message similar to the following indicates if a component item does not exist in the location specified:

```
The system could not reserve the entire Qty required. Qty available
(0)
```

- There is enough available on-hand quantity in each location for each component item to make up the finished good. If the on-hand quantity is not enough, the system will not process the work order and displays the following message: `Trans qty (-100) will cause on hand quantity in item location to be negative`. The system uses the following calculation to determine the amount available in each location:

  ```
  On-hand - [printed - (pending quantity - pending work order quantity)
  = available on-hand
  ```

- The amount of component items taken from each location will not reduce the on-hand quantity below the reserved quantity.
- The locations are not frozen.
- The item locations are not frozen.

System updates: When you select Accept to process a work order:

- The make up finished good inventory transaction is processed (this increases the amount of finished goods and decreases the amount of each component item).
- Inventory transaction history records are created for the finished good and its component items. See Display Inventory Transaction History (DITH).
- The Pending transfer quantity field in the Item Location table for each component item is reduced by the quantity processed.
- The work order record is deleted if the entire quantity of finished goods on the work order has been processed; if not, the quantity in the Work Order Header table is reduced by the quantity processed.
- The Protected qty (Protected quantity) field in the Item Warehouse table for each component item is reduced by the quantity processed.
- The On order field in the Item Warehouse table for the finished good is reduced by the quantity processed.

Screen Option	Procedure
Add a component location	Select Add location for the component to advance to the Create Kit Makeup Location Screen.
Accept the kit	Select Accept. You return to the Work with Work Orders Screen.

Create Kit Makeup Location Screen

Purpose: Use this screen to add locations to component items. Adding locations allows you to take a component item from more than one location to make up the finished good. There must be a quantity in each location before you can perform this transaction.

How to display this screen: Select Add location for the component item at the Work with Kit Makeup Screen.

Field	Description
Actual quantity	The quantity of the component item that is taken from a location. If you are taking a component item from more that one location, be sure the actual quantity matches the control quantity. *Alphanumeric, 7 positions; required.*
Location	The location from which the system suggests to pick the component items. If more than one location has been suggested, the Location field is blank and a plus (+) sign is displayed. If you change the location for a component item, the system checks that: • the item exists in that location • the item/location freeze flag = Unselected • the available quantity in the location is equal to or greater than the quantity needed to make up the finished good *Alphanumeric, 7 positions; required.*

System validations: When you add a location to a component item, the system checks that:

- The item location exists. A message similar to the following indicates if the item location you enter does not exist:

  ```
  Location (K010105) does not exist.
  ```

- The item location Reservation freeze flag is unselected. A message similar to the following indicates if the Reservation freeze flag in the item location table is selected:

  ```
  The system could not reserve the entire Qty required. Qty available (0)
  ```

- the location Freeze field is unselected. The following message indicates if the *Freeze* field in the location table is selected:

  ```
  No available location found for component item
  ```

- the Cls (Location class) for the location matches the Loc class (Location class) for the item if the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected. An error message similar to the following indicates if the location's location class does not match the item's location class:

  ```
  Item is not compatible with Location.
  ```

- There is enough available on-hand quantity in the location for each component item to make up the finished good. The system uses the following calculation to determine the amount available in a location:

  ```
  On-hand - (printed - negative pending transfer quantity) = available on-hand
  ```

Transaction History

Topics in this part: The following topics describe the history information maintained for inventory transactions and how to display and print this information.

- Display Inventory Transaction History (DITH) describes the amount of history available, describes the inventory transaction history scan screen, and tells you how to display a specific record.
- Print Inventory Transaction History (PITH) tells you how to use the selection screen and how to print inventory transaction history. It also describes a sample report.

Display Inventory Transaction History (DITH)

Purpose: Inventory transaction history provides a record of all the transactions performed in your company. Transactions you enter, transactions the system performs in the background, and transactions processed through the Generic Inventory Transaction Upload are available through this menu option. You can restrict the display by scanning on different fields, including location, date, item number, SKU, and transaction codes.

How long is history available? Inventory transaction history remains on the system for at least the number of days specified in the Inventory Transaction History Retention Days (A24) system control value. When you run the Inventory Transaction History Purge function (*Fast path* = MITH), the system deletes any inventory transaction history older than this number of days.

Batch inventory overlay: The Batch Inventory Overlay Upload does not create inventory transaction history records.

In this topic:

- Inventory Transaction History Screen (1 of 2)
- Inventory Transaction History Screen (2 of 2)

Inventory Transaction History Screen (1 of 2)

Purpose: Use this screen to review inventory transactions or to select a particular transaction for detail review.

How to display this screen: Enter DITH in the *Fast path* field at the top of any menu or select Display Inventory Transaction History from a menu.

When you first advance to this screen, item transaction history records display in ascending item, SKU, warehouse code, transaction date, transaction time, item transaction history sequence number sequence. This is the sequence of records when you select View By FIFO.

Select View By LIFO to display item transaction history records in ascending item, SKU, warehouse code, descending transaction date, ascending transaction time, and item transaction history sequence number sequence.

Maximum number of records to display: The system displays the first 500 records in the Item Transaction History table for your company that meet your search criteria. The following message displays if there are more than 500 records to display:

The maximum number of records was exceeded. Please refine search criteria. Showing records 1-500.

You can use the fields on this screen to refine the item transaction history records you wish to review. In order to refine the records that display you must select OK after you enter your search criteria.

Column sort: You can sort on any of the columns on this screen by clicking the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
Warehouse	The number of the warehouse where the transactions took place. Enter a valid warehouse code and select OK to display inventory transaction history for the specified warehouse. The description of the warehouse displays next to this field. Leave this field blank if you want to display inventory transaction history for all warehouses; in this situation, the text `ALL WAREHOUSES` displays next to this field. *Numeric, 3 positions, optional.*
Date From **Date To**	The date the transaction took place. • Enter a date range and select OK to display inventory transaction history for the specified date range. The *From* date must be equal to or earlier than the *To* date. • Enter a valid date in the first date field and select OK to display inventory transaction history, beginning with the date you entered. • Enter a valid date in the second date field and select OK to display inventory transaction history, ending with the date you entered. *Numeric, 6 positions (user date format); optional* A separate row displays for the first 500 item transaction history records that meet your search criteria.
Item	A code that represents a unit of inventory. Enter a valid item code and select OK to display inventory transaction history that matches your entry. *Alphanumeric, 12 positions; optional.*
Clr/size/wdth (SKU codes)	The item's unique characteristics, such as its color and size. Enter a valid SKU code and select OK to display inventory transaction history for items associated with this SKU. *Alphanumeric, three 4-position fields; optional.*
Date (Transaction date)	The date the transaction took place. *Numeric, 6 positions; display-only.*

Field	Description
Code	The inventory transaction code. Enter a valid inventory transaction code and select OK to display inventory transaction history for the specified inventory transaction code. These may be system- or user-defined. The system-defined codes are: • A = Adjustment • C = Customer Return • E = Express Bill • G = Item to Item Transfer • I = Issue **Note:** The system writes an issue (I) type transaction history record when non-inventory and drop ship items go through billing if the Create Item Transaction History for Non-Inventory Items (E39) system control value is selected. • O = Reset On-Hand Quantity • R = Receiving • T = Transfer • V = Return to Vendor See Work with Inventory Transaction Codes (WITC). *Alphanumeric, 1 position; optional.*
Location	The item's location at the time the transaction took place. The location is blank for drop shipments and non-inventory transactions. Enter a valid location and select OK to display inventory transaction history for the specified location. *Alphanumeric, 7 positions; optional.*
Reason	A code that represents the reason why the inventory transaction was performed. See Work with Inventory Transaction Reason Codes (WIT1). Enter a valid reason code and select OK to display inventory transaction history for the specified reason code. *Numeric, 2 positions; optional*
Qty (Quantity)	The number of units that this transaction affected. *Numeric, 8 positions; display-only.*
On-Hand Fields	
Old	The on-hand quantity for the item/location before the transaction was processed. The old on-hand quantity is blank for drop shipments and non-inventory transactions. *Numeric, 6 positions; display-only.*

Field	Description
New	The on-hand quantity for the item/location after the transaction was processed. The new on-hand quantity is blank for drop shipments and non-inventory transactions. *Numeric, 6 positions; display-only.*

Screen Option	Procedure
Display details of a transaction's history	Select Display for a transaction to display its history. See Inventory Transaction History Screen (2 of 2).
Toggle the display of transaction history records between ascending and descending date order	Select View by LIFO/FIFO. • FIFO displays in the upper left corner of the screen when you are viewing inventory transaction history in first in, first out sequence. • LIFO displays in the upper left corner of the screen when you are viewing inventory transaction history in last in, first out sequence.

Inventory Transaction History Screen (2 of 2)

Purpose: Use this screen to review detail information about an inventory transaction.

How to display this screen: From the Inventory Transaction History Screen (1 of 2), select Display for a transaction.

Field	Description
Warehouse	A code that represents the warehouse where the transaction was performed. The warehouse is 0 for drop shipments and non-inventory transactions. *Numeric, 3 positions.*
Item/SKU	Item = A code representing a unit of inventory. *Alphanumeric, 12 positions.* SKU = The item's unique characteristics, such as its color and size. *Alphanumeric, three 4-position fields.* Item description = A description of the item. The item description displays below the item code. *Alphanumeric, 120 positions.*
Date/Time/Seq# (Date, time and sequence number)	The date and time when the transaction was performed, and a unique number to identify how many transactions for the same warehouse and item/SKU took place at this same date and time. *Date: Numeric, 8 positions (user date format).* *Time: Numeric, 8 positions (HHMMSS format).* *Sequence number: Numeric, 3 positions.*

Field	Description
Code	A code that identifies types of inventory transactions. Certain codes are supplied by the system, and you can also create your own. System-supplied codes are: • A = Adjustment • C = Customer Return • E = Express Bill • G = Item to Item Transfer • I = Issue • M = Make up Finished Good • O = Reset On-Hand Quantity • R = Receiving • T = Transfer • V = Return to Vendor See Work with Inventory Transaction Codes (WITC). *Alphanumeric, 1 position.*
Location	The warehouse location affected by the inventory transaction. For example, if you are viewing an adjustment transaction, the location where the inventory was adjusted is indicated. The location is blank for drop shipments and non-inventory transactions. Two inventory transaction history records are created for transfer transactions: One record contains the “from” location; the other contains the “to” location. *Alphanumeric, 7 positions.*
Quantity	The number of units that this transaction affected. *Numeric, 8 positions.*
Old O/H (Old on-hand quantity)	The on-hand quantity before this transaction took place. This field is blank for non-inventory items and drop ship items, since inventory is not affected. *Numeric, 8 positions.*
New O/H (New on-hand quantity)	The on-hand quantity after this transaction took place. This field is blank for non-inventory items and drop ship items, since inventory is not affected. *Numeric, 8 positions.*

Field	Description
ID# Item transaction history ID	An identification number or description of the inventory transaction, either entered when the inventory transaction was created or assigned by the system. **Label settings:** Possible *ID#* labels assigned by the system include: • DROP SHIP = identifies a drop shipment inventory transaction. • NONINVISSU = identifies an inventory transaction record for a non-inventory item. **Note:** The system creates inventory transaction history records for drop ship and non-inventory items only if the Create Item Transaction History for Non-Inventory Items (E39) system control value is selected. **ID numbers:** The system also uses the *ID#* field to provide additional information for the following types of inventory transactions: • item-to-item transfers (transaction code = G) = a system-assigned ID number. Both the “from” and “to” transactions share the same ID number. • finished good make-up transaction (transaction code = M) = the work order number for the finished good created through the work order process. See Finished Good Work Order Processing (WWOR) for background. *Alphanumeric, 10 positions.*
Batch#	The number of the batch containing the inventory transaction. The system assigns batch numbers in both immediate and batch inventory transactions. *Numeric, 7 positions.*
Transaction#	The number of transactions within the batch. *Numeric, 7 positions.*
Order #	The number of the order affected by the inventory transaction. *Numeric, 7 positions.*
Invoice #	The number of the invoice affected by the inventory transaction. *Numeric, 7 positions.*
Purchase order #	The number of the purchase order affected by the inventory transaction. *Numeric, 7 positions.*
Reason	A code that represents the reason the inventory transaction was performed. Not all transactions have reason codes. See Work with Inventory Transaction Reason Codes (WIT1). *Numeric, 2 positions.*

Field	Description
User	The User ID of the person who performed the transaction. *Alphanumeric, 10 positions.*
Extended Cost	The unit cost of the item. The system uses the *Standard* cost from the SKU table for both SKU'd and non-SKU'd items. *Numeric, 13 positions with a four-place decimal.*

Print Inventory Transaction History (PITH)

Purpose: You can print transaction history in the same way that you view the history screens. You can choose the exact categories of items you want to print by specifying the warehouse, SKU, date, batch number, location, transaction code, reason code, or the user who performed the transaction.

In this topic:

- Print Inventory Transaction History Screen
- Inventory Transaction History Report

Print Inventory Transaction History Screen

How to display this screen: Enter PITH in the *Fast path* field at the top of a menu or select Print Transaction History from a menu

Selection criteria: Use the fields on the Print Inventory Transaction History screen to select the transactions you want printed. If you enter information in multiple fields, the system includes only those transactions that meet all qualifications.

Field	Description
Warehouse	A code that represents a warehouse. Validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; optional.*
(Item) colr size othr	Four fields containing the item number and the SKU, a code that represents the special characteristics of an item, such as its color, width and size. These fields are validated against the Item table and the SKU table. *(Item) Alphanumeric, 12 positions; optional.* *(SKU) Alphanumeric, three 4-position fields; optional.*
Date	The date the transaction took place. *Numeric, 6 positions; optional.*
Batch#	The number of the batch of the transaction. *Numeric, 7 positions; optional*
Location	The code representing the area within the warehouse that contains the item or SKU. Validated against the Location table; see Creating and Maintaining Locations (WLOC). *Alphanumeric, 7 positions; optional*

Field	Description
Transaction Code	A code that described the type of transaction performed; system-supplied codes that pertain to transactions include: A Adjustment C Customer Return E Express Bill G Item to Item Transfer I Issue R Receiving T Transfer V Return to Vendor See Work with Inventory Transaction Codes (WITC). *Alphanumeric, 1 position; optional.*
Reason	A code that represents the reason the inventory transaction was performed; not all transactions require codes. See Work with Inventory Transaction Reason Codes (WIT1). *Numeric, 2 positions; optional.*
User	The User ID of the person who performed the transaction. *Alphanumeric, 8 positions; optional.*

Instructions: To print the Inventory Transaction History Report.

- Complete the necessary fields.
- Select Print list to submit the I/T_TRANS job.

Inventory Transaction Setup

Topics in this part: The following topics describe the setup required to perform inventory transactions.

- Work with Inventory Transaction Codes (WITC) explains the purpose of transaction codes, tells you how to work with the code scan screen, and tells you how to create, change, display, delete, and print transaction codes.
- Work with Inventory Transaction Reason Codes (WIT1) explains how to use the Transaction Reason Code scan screen, and how to create, change, display, delete, and print a list of reason codes.
- Verifying Inventory Sharing (VISH) explains how to generate the Verify Inventory Sharing Report, which lists the items in the sharing warehouse that are not setup correctly for inventory sharing.

Work with Inventory Transaction Codes (WITC)

Introduction: Inventory transaction codes provide a concise way to describe the transactions that are performed on inventory. These codes control whether the inventory is being increased, decreased, or just moved.

In this topic:

- System Codes

- Work with Inventory Transaction Codes Screen
- Create Inventory Transaction Code Screen
- Change Inventory Transaction Code Screen

System Codes

There are codes that come with the system and cannot be deleted. You can add customized codes for any purposes you require. Note that each code must consist of a unique number or letter.

Code	Description	Effect on Inventory Levels
A	Adjustment	Used in inventory transactions to increase on-hand if positive quantity is entered; decreases on-hand if negative quantity is entered.
C	Customer Return	Used by the system when processing return merchandise via the Return Authorization module or Order Maintenance. Return transactions will always increase the on-hand quantity in the specified warehouse.
E	Express Bill	Used by the system when processing an order that will not go through the normal pick and confirmation cycle (i.e., merchandise is already picked and shipped before the order is entered).
G	Item to Item Transfer	Used in inventory transactions to transfer one item to another, such as when you stop offering an item independently and include it in a grab bag instead. ()
I	Issue	Used by the system to decrease on-hand for confirmed shipments. The system writes an issue transaction for non-inventory and drop ship items when the Create Item Transaction History for Non-Inventory Items (E39) system control value is selected. See Display Inventory Transaction History (DITH).
O	Reset On-Hand Quantity	Used in inventory transactions to reset the on-hand quantity to the entered value. ()
R	Receiving	Used in the purchase order receipts program for merchandise received. Increments the on-hand.
T	Transfer	Used in inventory transactions to increase on-hand in "to" location and decreases the on-hand in "from" locations.
V	Return to Vendor	Used in inventory transactions to decrease on-hand amount if positive quantity is entered; increases on-hand if negative quantity is entered.

Components of codes: Codes have four attributes:

- An attribute that states whether the code can be used in inventory transactions or only by the system for other updating.
- An attribute that controls whether this code must have an additional reason code entered when the code is entered; see Work with Inventory Transaction Reason Codes (WIT1)

- A plus (+) or minus (-) code that indicates whether inventory will be increased or decreased by the quantity in the transaction.

Work with Inventory Transaction Codes Screen

Purpose: Use this screen to create, change, delete, or display transaction codes.

How to display this screen: Enter WITC in the *Fast path* field at the top of any menu or select Work with Inventory Transaction Codes from a menu.

Field	Description
Cde (Code)	The code representing an inventory transaction. *Alphanumeric, 1 position; optional.*
Description	A description of the code. *Alphanumeric, 30 positions; optional.*
Allow	Indicates whether you can use this code when processing inventory transactions, or if it is reserved for system use. Selected = Transaction is allowed in inventory transactions. Unselected = Transaction is not allowed in inventory transactions. **Note:** Even if this value is unselected, you can still process a transaction of this type through the *Generic Inventory Transaction Upload*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Rsn (Reason)	This setting indicates whether you must enter an inventory transaction reason code when you process this type of inventory transaction. Reason codes are defined in and validated against the Item Transaction Reason table; see Work with Inventory Transaction Reason Codes (WIT1). Selected = Reason code required. Unselected = Reason code not required.
+/- (Add to/Subtract from inventory)	This entry indicates how inventory will be affected when a transaction is processed with this code. Valid values are: + = Transaction quantity added to on-hand. - = Transaction quantity subtracted from on-hand. The inventory transaction code used as the Inventory Transaction Code for 'Sync' Processing (I85) should have this flag set to +. *Numeric, 1 position; optional.*

Screen Option	Procedure
Create an inventory transaction code	Select Create to advance to the Create Inventory Transaction Code Screen.
Change an inventory transaction code	Select Change for a code to advance to the Change Inventory Transaction Code Screen.

Screen Option	Procedure
Delete an inventory transaction code	Select Delete for a code to delete it.
Display an inventory transaction code	Select Display for a code to advance to the Display Inventory Transaction Code Screen. You cannot change any information on this screen. See the Create Inventory Transaction Code Screen for field descriptions.

Create Inventory Transaction Code Screen

Purpose: Use this screen to create an inventory transaction code.

How to display this screen: On the Work with Inventory Transaction Codes Screen, select Create.

Field	Description
Cde (Code)	The key to the Item Transaction Code table. The following codes are supplied with the system and cannot be deleted: A = Adjustment C = Customer Return E = Express Bill G = Item to Item Transfer I = Issue O = Reset On-Hand Quantity R = Receiving T = Transfer V = Return to Vendor See System Codes. *Alphanumeric, 1 position.* *Create screen: required.* *Change screen: display-only.*
Description	A description of the code. *Alphanumeric, 30 positions.* *Create screen, or change screen for user-defined codes: required.* *Change screen for system codes: display-only.*

Field	Description
Allowable	Indicates whether you can use this code during inventory transactions or if it is for system use only. Selected = You can use this code for inventory transactions. Unselected = You cannot use this code for inventory transactions. **Note:** • This field cannot be changed for system-supplied codes. • Even if this value is unselected, you can still process a transaction of this type through the *Generic Inventory Transaction Upload*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Create screen, or change screen for user-defined codes: required.* *Change screen for system codes: display-only.*
Reason required	This field indicates whether the transaction code requires a reason code. Reason codes are defined in and validated against the Item Transaction Reason table; see Work with Inventory Transaction Reason Codes (WIT1). Reason codes should not be required for codes that you cannot use for inventory transactions (*Allow* = Unselected). Selected = Reason code required. Unselected = Reason code not required. *Alphanumeric, 1 position; required.*
+/- (Add to/Subtract from inventory)	This entry indicates how inventory will be affected when a transaction is processed with this inventory transaction code. Valid values are: **+** = Transaction quantity added to on-hand. **-** = Transaction quantity subtracted from on-hand. **Note:** You cannot change this field for system-supplied codes. *Numeric, 1 position.* *Create screen, or change screen for user-defined codes: required.* *Change screen for system codes: display-only.*

Change Inventory Transaction Code Screen

To change: Select Change for the inventory transaction code at the Work with Inventory Transaction Codes Screen to advance to the Change Inventory Transaction Code screen.

You can change any field on this screen except the *Code* field for codes you define. You can change only the *Reason* field for system-supplied codes. See the Create Inventory Transaction Code Screen for field descriptions. Change the necessary information and select OK.

> **Note:**
>
> You cannot delete the System Codes.

Work with Inventory Transaction Reason Codes (WIT1)

Purpose: Use Work with Inventory Transaction Reason Codes to create, display, change, delete, or print the reason codes that are used immediate and batch inventory transactions.

Transaction reason codes explain why a transaction was performed. These codes display in Display Inventory Transaction History and Display Inventory Transaction Summary.

Transaction reason codes are only required on some transactions. For example, a Receiving transaction would not require a code, but a Return-to-Vendor transaction may require a code. When you create inventory transaction codes you determine whether or not a specific transaction code requires a reason code.

In this topic:

- Work with Inventory Transaction Reason Screen
- Create Inventory Transaction Reason Screen

Work with Inventory Transaction Reason Screen

Purpose: Use this screen to create, display, change, delete, or print the reason codes that are used immediate and batch inventory transactions.

How to display this screen: Enter WIT1 in the *Fast Path* field at the top of a menu or select the option from a menu.

Field	Description
Reason	A code that represents a reason to perform an inventory transaction, such as an adjustment, return-to-vendor, etc. *Numeric, 2 positions; optional.*
Description	A description of the code. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Create a new code	Select Create to advance to the Create Inventory Transaction Reason Screen.
Change a code	Select Change for a code to advance to the Change Inventory Transaction Reason Screen. You can change only the description. See the Create Inventory Transaction Reason Screen for field descriptions.
Delete a code	Select Delete for a code to delete it.
Display a code	Select Display for a code to advance to the Display Inventory Transaction Reason Screen. You cannot change any information at this screen. See the Create Inventory Transaction Reason Screen for field descriptions.

Create Inventory Transaction Reason Screen

To create: Select Create at the Work with Inventory Transaction Reason Screen.

Field	Description
Reason	A code that represents a reason to perform a transaction, such as the item is damaged. *Numeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Description	A description of the code. *Alphanumeric, 30 positions; required.*

Verifying Inventory Sharing (VISH)

Purpose: Use this menu option to generate the Verify Inventory Sharing Report for a specified sharing warehouse; this report lists the items in the sharing warehouse that are not setup correctly for inventory sharing.

The Inventory Sharing (A69) system control value defines whether a company will fulfill orders from another company’s inventory. When this system control value is selected, the Sharing warehouse and Shared company/warehouse fields appear on the Create, Change, or Display Warehouse screens.

> **Note:**
>
> - The *Shared company and warehouse* is the company and warehouse that contains the actual inventory. This is the company and warehouse that shares inventory with other warehouses in other companies. In this company, you select the Sharing warehouse field for the shared warehouse.
> - The *Sharing company and warehouse* is the company and warehouse that does not contain inventory, and instead, points to the shared company and warehouse. In this company, you set the Shared company/ warehouse fields for the sharing warehouse; these fields correspond to the actual shared warehouse in the other company.

Setup for inventory sharing: Setup for sharing the inventory in a company with one or more other companies is described in the table below.

Setup	Example
System control value: Select the Inventory Sharing (A69) system control value in all companies to participate in inventory sharing, including both the company where you actually maintain the inventory and the company(ies) to share the inventory.	Select the Inventory Sharing (A69) system control value in company 1 (shared company, where you actually maintain the inventory) and company 2 (sharing company).
Shared warehouse: In the warehouse in the shared company, select the Sharing warehouse field. Do not set the Shared company/warehouse in the sharing company.	Warehouse 10 is the actual warehouse in company 1. Set the Sharing warehouse flag in warehouse 10 of company 1.
Sharing warehouse(s): In the sharing company(ies): Set the Shared company/ warehouse fields for the virtual warehouse which corresponds to the actual warehouse. Leave the Sharing warehouse field unselected.	Warehouse 10 of company 2 is a virtual warehouse. In warehouse 10 of company 2, set the Shared company/warehouse to 1 and 10.

> **Note:**
>
> You should use the same warehouse number for the warehouse in the shared company and the virtual warehouse(s) in the sharing company(ies).

Setup	Example
Locations: Create the same location(s) in the actual warehouse in the shared company and the virtual warehouse in the sharing company.	Create location A010101 in warehouse 10 of company 1 and warehouse 10 of company 2.
Items: Create the same item(s) in the shared company and in the sharing company, with consistent item warehouse and item location records across the companies.	Item AB100 has a default warehouse of 10 and primary location of A010101 in both company 1 and company 2.

Verify Inventory Sharing Screen

Use this screen to generate the Verify Inventory Sharing Report for a specified sharing warehouse; this report lists the items in the sharing warehouse that are not setup correctly for inventory sharing.

> **Note:**
>
> The *sharing warehouse* is the warehouse in the company that does not contain the actual inventory. This is the warehouse whose Shared company/warehouse fields contain the company and warehouse that contains the actual inventory. If you generate the Verify Inventory Sharing report from the company and warehouse that shares inventory, the report will be blank.

How to display this screen: Enter VISH in the *Fast path* field or select Verify Inventory Sharing from a menu.

Field	Description
Enter warehouses	Enter a code for the warehouse you wish to verify is setup for inventory sharing. *Numeric, 3 positions. required.*

Instructions: Enter a warehouse code in the *Enter warehouse* field that represents a sharing warehouse and select OK.

- If the Shared company/warehouse fields for the warehouse are blank, a message similar to the following displays: `Warehouse 1 does not share inventory with another warehouse.`
- If the Shared company/warehouse fields for the warehouse are populated, the system submits the VFY_INV_SH job, which generates the Verify Inventory Sharing Report. This report lists the items that are not set up correctly for inventory sharing.

For more information: See the description of the Inventory Sharing (A69) system control value for more information on inventory sharing.

Item Where Used

Topics in this part: The following topics describe the finished good explosion functions and the reports they produce.

- Where Finished Good Component Item Usage (MKCU) defines the purpose of this function, displays the Where F. Good Component Item Usage screen, and explains the sample report.
- Where Set Component Item Usage (MSCU) defines the purpose of this function, displays the Where Set Component Item Usage screen, and explains the sample report.
- Where Variable Set Component Item Usage (MVCU) defines the purpose of this function, displays the Where Variable Set Component Item Usage screen, and describes the sample report.

Explode Finished Good Items (MKEX)

Finished Goods Explosion Screen

How to display this screen: Enter MKEX in the *Fast path* field at the top of any menu or select Explode Finished Good Items from a menu.

Field	Description
Warehouse	Defaults from the Default Warehouse (A04) system control value. Warehouse codes are validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions, required.*
Selection option	Enter the number of the orders to include on the report. Valid values: • **Include only open orders** • **Include both open and held orders** *Required.*

Where Finished Good Component Item Usage (MKCU)

Where Finished Good Component Item Usage Screen

How to display this screen: Enter MKCU in the *Fast path* field at the top of any menu or select Where Finished Good Component Item Usage from a menu.

Field	Description
Component item	The item number and, if applicable, the SKU. The system validates this number against the Item table. The system also checks to be sure that the entered item is a component of at least one finished good. If the item is not a component, an error message similar to the following indicates: `Kit component item (MTNS RED SMLL) does not exist.` *(Item) Alphanumeric, 12 positions; required.* *(SKU) Alphanumeric; three 4-position fields; required if item has SKU.*

Where Set Component Item Usage (MSCU)

Purpose: Use this option to generate the Where Set Component Item Used Report, which provides a listing of all sets that use the component item you specified.

Where Set Component Item Usage Screen

How to display this screen: Enter MSCU in the *Fast path* field at the top of any menu or select Where Set Component Item Usage from a menu.

Field	Description
Component item	The item number and, if applicable, the SKU to include on the Where Set Component Item Used Report. The system validates this number against the Item table. The system also checks to be sure the entered item is a component of at least one set. If the item is not a component, an error message similar to the following indicates: `Kit component item (MTNS RED SMLL) does not exist.` *(Item): Alphanumeric, 12 positions; required.* *(SKU): Alphanumeric, 3 4-position fields; required if the item has a SKU.*

Completing this screen: Enter to item to include on the Where Set Component Item Used Report and select Accept.

Where Variable Set Component Item Usage (MVCU)

Purpose: Use this option to generate the Where Variable Set Component Used Report, which provides a list of all variable sets that use the component item you specified.

Where Variable Set Component Usage Screen

How to display this screen: Enter MVCU in the *Fast path* field at the top of any menu or select Where Variable Set Component Item Usage from a menu.

Field	Description
Component item	The item number and, if applicable the SKU to include on the Where Variable Set Component Used Report. The system validates this number against the Item table. The system also checks to be sure the item is a component of at least one variable set. If the item is not a component, an error message similar to the following indicates: `Variable set component item (MTNS RED SMLL) does not exist.` *(Item): Alphanumeric, 12 positions; required.* *(SKU): Alphanumeric, 3 4-position fields; required it the item takes a SKU*

Purchase Order Receipts

Topics in this part: The following topics describe the functions available when using receiving merchandise from your vendors.

- Purchase Order Receiving Overview describes the options available when receiving purchase orders, explains how the system determines the cost of an item and how the Suggest Warehouse Placement function works, and shows you how to locate the function.
- Working with P/O In Transit Information (MPIT) shows you how to quickly update a purchase order with shipping information.
- Selecting Purchase Orders for Receipt (PORC) shows you how to enter the purchase order number you want to post receipts against, and how to scan for open purchase orders.
- Receiving Purchase Orders (PORC) describes the various methods of posting receipts to a purchase order, shows you how to post receipts using each of the available methods, and describes each of the options available in PO receipts.
- Placing Suspended Stock (SUSP) shows you how to transfer merchandise from suspense to inventory.

Purchase Order Receipts (PORC)

For information on:	See:
the options available when receiving purchase orders, how the system determines the cost of an item, and how the Suggest Warehouse Placement function works (overview)	Purchase Order Receiving Overview
selecting purchase orders for receipt, including scanning options	Selecting Purchase Orders for Receipt (PORC)
available options for posting receipts	Receiving Purchase Orders (PORC)

Working with P/O In Transit Information (MPIT)

Purpose: The Work With P/O In Transit Information function provides a fast path method to update a purchase order with information about incoming shipments from your vendors. You can quickly update the purchase order with the:

- quantity of an item in transit
- date an item is due from the vendor
- date you will cancel an item if it has not been received
- date you can promise an item to your customers.

The Purchase Order Detail table is updated with the information entered here. This information can also be updated using the PO Maintenance - Change PO Detail screen. It can be viewed using the Display PO Detail screen. See Maintaining Purchase Orders (MPOE) and Purchase Order Inquiry (MPOI).

In this topic:

- Purchase Orders In Transit Select Prompt Screen
- Update In Transit Information Screen

Purchase Orders In Transit Select Prompt Screen

Purpose: Use this screen o select the purchase order you want to update. You can enter the purchase order number or you can use the prompt function to display a list of purchase orders on the system.

How to display this screen: Enter MPIT in the *Fast path* field at the top of any menu or select Maintain PO In-Transit Information from a menu.

Field	Description
PO #	Enter the number of the purchase order you want to update in the *PO#* field to display the Update In Transit Information Screen. The purchase order number entered is validated against the Purchase Order table. *Numeric, 7 positions; required.*

Update In Transit Information Screen

Purpose: This screen displays each line item on the selected purchase order and is used to update the quantity in transit, the cancel date, the due date or the promise date for a line item that has not yet been received.

How to display this screen: Select a purchase order number at the Purchase Orders In Transit Select Prompt Screen.

Field	Description
Lin (Line #)	The purchase order line number. *Numeric, 3 positions; optional.*
Sts	The status of the line. Valid status codes are: O - Open X - Closed C - Canceled *Alphanumeric, 1 position; optional.*
Item	The code of the item ordered on the purchase order line. *Alphanumeric, 12 positions; optional.*
Clr/Size/Wdth	The SKU elements, which further define the item. *Alphanumeric, three 4-position fields; optional.*
Open	The number of units of the item due from the vendor. *Numeric, 7 positions; display only.*

Field	Description
Transit	The number of units that are due to arrive from the vendor. Enter an amount in this field when the vendor confirms the quantity that has been shipped. The *Transit qty (Transit quantity)* field in the Purchase Order Detail record will be updated. *Numeric, 7 positions; optional.*
Cancel	The user-defined date when the purchase should be canceled if you have not received the items, or confirmation that the items have been shipped. The Cancel date from the Purchase Order Detail table is indicated if one exists. Enter a new cancel date if applicable. The *Cancel date* in the Purchase Order Detail table will be updated. *Numeric, 9 positions; optional.*
Due	The user-defined date when the item is due from the vendor. The Due date from the Purchase Order Detail table is indicated if one exists. Enter a new due date if applicable. The *Due date* in the Purchase Order Detail table will be updated. *Numeric, 9 positions; optional.*
Promise	The user-defined date after which the item can be committed to customers. The Promise date from the Purchase Order Detail table is indicated if one exists. Type a new promise date if applicable. The *Promise date* in the Purchase Order Detail table will be updated. *Numeric, 9 positions; optional.*

Instructions:

1. Scan for the line item you wish to update using the fields at the top of the screen, or use the Scroll keys to scroll forward and backward through the purchase order lines.
2. Enter the number of units that have been shipped but not received in the *Transit* field.
3. Enter a new cancel date in the *Cancel* field, if applicable.
4. Enter a new due date in the *Due* field, if applicable.
5. Enter a new promise date in the *Promise* field, if applicable.
6. Continue with the above steps until all applicable lines have been updated.

Placing Suspended Stock (SUSP)

Purpose: Use Place Suspended Stock to transfer inventory from suspense to actual locations in your warehouse. Generally, you transfer inventory from suspense to inventory when your quality assurance is complete and you have decided where the inventory should be placed.

You can use Suggest Location Placement (MSLO) to have the system recommend the locations to place the merchandise being transferred from suspense. You can override the system recommended locations if necessary. The Suggest Location Placement (A27) system control values determine how the system suggests locations.

You can print bar-coded labels listing the placement quantity and location. The Labels at PO Receipts (C16) system control value controls whether labels will print at this time.

If suspended items are defective or if they are being returned to the vendor, you can still transfer them from suspense and place them into inventory so that you can track damaged inventory and inventory that is being returned to the vendor. You can place these items in a defective warehouse or a non-reservable warehouse to exclude them from your active inventory, if necessary.

When you place suspended stock, the system:

- decreases the quantity of the item in suspense
- increases the on-hand quantity of the item
- creates an Inventory Transaction History record
- performs vendor item analysis

In this topic:

- Suspense Placement Screen
- Suspense Placement By Item Screen
- Suspense Placement By PO Screen
- Suspense Placement By PO Control # Screen

Suspense Placement Screen

Purpose: Use this screen to select the suspended items you want to place. You can select items by item code, purchase order number or purchase order receipt control number.

How to display this screen: Enter SUSP in the *Fast path* field at the top of any menu or select Place Suspended Stock from menu.

Field	Description
By item	The code of the item in suspense. *Alphanumeric, 12 positions; optional.*
By P/O #	The number of the purchase order the items in suspense were received against. *Numeric, 7 positions; optional.*
By P/O control #	The receipt control number, or batch number, assigned to the purchase order containing items that were received into suspense. *Numeric, 7 positions; optional.*

Instructions: To select items in suspense for placement:

- By item code: Enter the item code in the *By item* field. Each suspended receipt for the item is in purchase order number sequence on the Suspense Placement By Item Screen. The following message indicates if there are no suspended receipts for the item:

  ```
  No SKUs to place for item. Please reenter.
  ```

- By purchase order number: Enter the purchase order number in the *By P/O #* field. Each suspended item on the purchase order is in item code sequence on the Suspense Placement By PO Screen. The following message indicates if there are no suspended receipts for the purchase order:

```
No items to place for PO# XXX.
```

- By receipt control number: Enter the control number in the *By P/O control #* field. Each suspended item in the batch is in item code sequence on the Suspense Placement By PO Control # Screen. The following message indicates if there are no suspended receipts for batch:

```
No items to place for P/O Control # 2.
```

Suspense Placement By Item Screen

Purpose: This screen displays all suspended receipts for the item in purchase order number sequence. This screen is used to record the quantity that is being transferred to inventory and the warehouse and location where the stock will be placed.

> **Note:**
>
> If suspended items are defective, or if they are being returned to the vendor, they must still be transferred from suspense and placed into inventory. You can place these items in a defective warehouse or a non-reservable warehouse to exclude them from your active inventory if necessary.

How to display this screen: Enter an item code in the *By item* field on the Suspense Placement Screen.

Field	Description
P/O #	The number of the purchase order the suspended item was received against. *Numeric, 7 positions; display-only.*
SKU	The item's unique characteristics, such as its color and size. Your company can give these fields some other name. *Alphanumeric, three 4-position fields; optional.*
Suspense	The number of units of the item received against the purchase order that are currently in suspense. *Numeric, 7 positions; display-only.*
Placed	The number of units you are transferring from suspense. *Numeric, 7 positions; required.*
Whs	The code of the warehouse where you are placing the suspended stock. The warehouse code is defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). Leave this field blank if you are placing the inventory in more than one warehouse; you will advance to the Work with PO Receipt Locations Screen. *Numeric, 3 positions; optional.*

Field	Description
Location	The code of the location where you are placing the suspended stock. The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM. Leave this field blank if you are placing the inventory in more than one warehouse; you will advance to the Work with PO Receipt Locations Screen. The system may update the item's primary location in the SKU table (the "primary primary") depending on the setting of the Update Primary Primary Location for Item During Receiving (I35) system control value. See that system control value for more information. *Alphanumeric, 7 positions; optional.*
Disp locs	The system displays a plus (+) sign in this field if you have defined more than one location for the item on the Work with PO Receipt Locations Screen. *Alphanumeric, 1 position; display-only.*

Screen Option	Procedure
View, add or delete location placements for an item	Select Work with Locations for an item to advance to the Work with PO Receipt Locations Screen.
Enter serial numbers for a suspended item	Select Serial #s for the item to advance to the Enter Serial Numbers Screen . This option is available only after you have entered a quantity to place, and only for items flagged as serial numbered items.
Accept the suspense placements	Select Accept.
Reject the suspense placements	Select Reject. A pop-up window opens for you to confirm or cancel the reject request.

Instructions: To transfer items from suspense.

To place merchandise in one warehouse location:

1. Enter the quantity of the item you are transferring from suspense in the *Placed* field. The quantity entered cannot exceed the *Suspense* quantity, or the following message indicates: `Invalid placement quantity.`
2. Enter the code of the warehouse where you will be placing the stock in the *Whs* field. The following message indicates if an invalid warehouse code is entered: `Warehouse XXX does not exist.`
3. Enter the code of the warehouse location where you will be placing the stock in the *Location* field. The following message indicates if an invalid location code is entered: `Location does not exist.`
4. The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) is set to CONFIRM. Confirm the creation of the new primary location, or select Exit to cancel.

5. Continue with the above steps until all item quantities have been marked for placement.
6. Optionally, select Serial #s for an item to advance to the Enter Serial Numbers Screen. This screen is available only for items whose *Serial numbers* field is selected. You are required to enter a serial number for each unit of the item you are placing; see the next step.
7. Select Accept to accept your placements. The quantities will be transferred from suspense to the designated warehouses and locations. If you are placing a serial numbered item and have not yet entered a serial number for each unit you are placing, you advance automatically to the Enter Serial Numbers Screen.
8. An error message similar to the following indicates that you selected Accept to accept your placements and another user is processing placements for the same purchase order: `Suspense record for TS98 has been changed by another user.`
9. Select Reject to reject your placements.

To place merchandise in more than one location or warehouse:

1. Enter the quantity of the item you are transferring from suspense in the *Placed* field. The quantity entered cannot exceed the *Suspense* quantity, or the following message indicates: `Invalid placement quantity.`
2. Select Work with Locations for the item to display the Work with PO Receipt Locations Screen.
3. Optionally, select Serial #s for an item to advance to the Enter Serial Numbers Screen This screen is available only for items whose *Serial numbers* field is selected. You are required to enter a serial number for each unit of the item you are placing.
4. Continue with the above steps until all item quantities have been marked for placement.
5. Select Accept to accept your placements. The quantities will be transferred from suspense to the designated warehouses and locations. If you are placing a serial numbered item and have not yet entered a serial number for each unit you are placing, you advance automatically to the Enter Serial Numbers Screen.
6. An error message similar to the following indicates that you selected Accept to accept your placements and another user is processing placements for the same purchase order: `Suspense record for TS98 has been changed by another user.`
7. Select Reject to reject your placements.

To use the Suggest Location Placement function:

1. Enter the quantity of the item you are transferring from suspense in the *Placed* field. The quantity entered cannot exceed the *Suspense* quantity, or the following message indicates: `Invalid placement quantity.`
2. Select Work with Locations for the item to display the Work with PO Receipt Locations Screen.
3. Continue with the above steps until all item quantities have been marked for placement.
4. Select Accept to accept your placements. The quantities will be transferred from suspense to the designated warehouses and locations.

5. An error message similar to the following indicates that you selected Accept to accept your placements and another user is processing placements for the same purchase order: `Suspense record for TS98 has been changed by another user.`
6. Select Reject to reject your placements.

Suspense Placement By PO Screen

Purpose: This screen displays all suspended items on a purchase order in item code sequence. Use this screen to record the quantity you are placing and the warehouse and location where the stock will be placed.

> **Note:**
>
> If suspended items are defective, or if they are being returned to the vendor, they must still be transferred from suspense and placed into inventory. You can place these items in a defective warehouse or a non-reservable warehouse to exclude them from your active inventory if necessary.

How to display this screen: Enter a purchase order number in the *By PO#* field on the Suspense Placement Screen.

About this screen: Each field on this screen, available options, and how to complete this screen are described under:

- Suspense Placement Screen and Suspense Placement By Item Screen for field descriptions
- Suspense Placement By Item Screen for available options and step-by-step instructions

Suspense Placement By PO Control # Screen

Purpose: This screen displays all suspended items in a receipt batch in item code sequence. Use this screen to record the unit quantity you are placing and the warehouse and location where the stock will be placed.

> **Note:**
>
> If suspended items are defective, or if they are being returned to the vendor, they must still be transferred from suspense and placed into inventory. You can place these items in a defective warehouse or a non-reservable warehouse to exclude them from your active inventory if necessary.

How to display this screen: Enter a purchase order receipt control number in the *By PO Control #* field on the Suspense Placement Screen.

About this screen: Each field on this screen, available options, and how to complete this screen are described under:

- Suspense Placement Screen and Suspense Placement By Item Screen for field descriptions
- Suspense Placement By Item Screen for available options and step-by-step instructions

Managing Warehouses

Topics in this part: The following topics describe the functions available from the Warehouse Management menu. These functions are used to define your warehouses, establish warehouse locations and assign inventory, and analyze your current warehouse utilization.

- Creating and Maintaining Warehouses (WWHS) shows you how to establish each of your warehouses on the system. In addition, this topic explains how to define the warehouse sequence to use when you fulfill customer orders from more than one warehouse.
- Creating and Maintaining Location Classes (WLCL) explains how location classes can be used to define the type of merchandise that will be stored in a warehouse location.
- Creating and Maintaining Locations (WLOC) shows you how to define the locations in the warehouse where merchandise is stored. Warehouse locations can be comprised of a series of zone, aisle, shelf, and bin indicators, or they can be free-form user-defined location codes.
- Using the Location Generator (MLOC) explains how to use the automated location generator to create multiple warehouse locations at the same time.
- Creating Item Warehouse/Locations (MIWL) shows you how to assign an item to a warehouse location or change existing item location information, or change existing item warehouse information.
- Suggest Location Placement (MSLO) describes how to use the Suggest Warehouse Placement function to have the system determine the warehouse location where an item should be stored.
- Creating and Maintaining Item Warehouses describes how to assign items to a warehouses and how inventory history is captured for each item at the warehouse level.
- Working with Default Warehouse Locations (WWDL) describes how to create and work with the default locations the system checks automatically for certain inventory transactions.
- Pending Putaway Overview describes the updates the system performs when you place inventory into a pending putaway warehouse.

Creating and Maintaining Warehouses (WWHS)

Purpose: You can use the Work with Warehouses function to create, change, delete, or display warehouse information. A warehouse is required for each physical and logical warehouse in which you track inventory.

A logical warehouse can be:

- a section of a physical warehouse that is treated as if it were a separate warehouse. For example, if you have inventory in one building that is both a retail store and a mail order fulfillment center, you can establish this building as two separate warehouses to track retail and mail order inventory separately. Or, you might have areas in the warehouse where defective merchandise and merchandise that will be returned to the vendor is stored.

- a means to track inventory that is not kept in a warehouse; for example, you can map a logical warehouse to a retail outlet, or to represent stock that is in transit between warehouses.

> **Note:**
>
> Inventory reservation takes place at the warehouse level. Maintain separate warehouses for defective merchandise and merchandise that you are returning to the vendor, so that these quantities are not included in inventory reservation.

Additionally, you can use this function to:

- create and maintain retail store information for a warehouse that represents a retail store.
- use the Working with Warehouse Lists (WWHL) to create, change, delete, or display the sequence in which warehouses will be selected to fulfill orders if you ship merchandise from more than one warehouse.
- use the Work with Item Warehouse Screen to create, change, delete, or display item warehouse assignments.

In this topic:

- Work with Warehouses Screen
- Create Warehouse Screen
- Change Warehouse Screen
- Display Warehouse Screen
- Work with Warehouse Devices Screen
- See Working with Warehouse Lists (WWHL)

Work with Warehouses Screen

How to display this screen: Enter WWHS in the *Fast Path* field at the top of any menu, or select Work with Warehouses from a menu.

Field	Description
Warehouse	A number that identifies the warehouse. *Numeric, 3 positions; optional.*
Name	The name of the warehouse. *Alphanumeric, 30 positions; optional.*
Store	This field indicates whether the warehouse represents a retail store rather than a true warehouse. Valid values are: • selected = The warehouse represents a retail store. • unselected = The warehouse does not represent a retail store.

Field	Description
Allocatable	This field indicates whether you can reserve inventory from the warehouse. Valid values: • selected = the warehouse is allocatable. • unselected = the warehouse is not allocatable. If a warehouse is not flagged as allocatable, its on-hand quantity is not included in the availability calculation for items; also, it is not included in the product import to Order Orchestration when the Send Inventory by Warehouse to OROB (L06) system control value is unselected.
O/E (Order entry)	This field indicates whether inventory availability can be viewed in Order Entry. • selected = inventory availability is displayed in Order Entry. • unselected = inventory availability does not display in Order Entry.
Telephone #	The telephone number at the warehouse. *Numeric, 14 positions; display-only.*

Screen Option	Procedure
Create a new warehouse	Select Create to advance to the Create Warehouse Screen.
Change warehouse information	Select Change for a warehouse to advance to the Change Warehouse Screen.
Delete a warehouse	Select Delete for a warehouse to delete it.
Display warehouse information	Select Display for a warehouse to advance to the Display Warehouse Screen.
Work with warehouse device	Select Devices for a warehouse to advance to the Work with Warehouse Devices Screen.
Work with item warehouse	Select Items for a warehouse to advance to the Work with Item Warehouse Screen.
Work with user defined fields	Select User Field for a warehouse to advance to the Work with User Fields Screen.
Work with warehouse lists	Select Warehouse List for a warehouse to advance to the Working with Warehouse Lists (WWHL).

Create Warehouse Screen

To create: At the Work with Warehouses Screen, select Create.

Field	Description
Warehouse	A code to identify the warehouse. *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Name	The name of the warehouse. *Alphanumeric, 30 positions; required.*

Field	Description
Address	The address of the warehouse. *Alphanumeric; three lines, 31 positions each; optional.*
City	The city where the warehouse is located. *Alphanumeric, 25 positions; required.*
State	The code representing the state or province where the warehouse is located. See Setting Up the Country Table (WCTY). The system validates that the state you enter is assigned to the SCF in the first three positions of the postal code. *Alphanumeric, 2 positions; optional.*
Zip code	The zip code or postal code where the warehouse is located. See Setting Up the Zip/City/State (Postal Code) Table (WZIP). *Alphanumeric, 25 positions; optional.*
Country	The country where the warehouse is located. Country codes are validated against the Country Code table. See Setting Up the Country Table (WCTY). *Alphanumeric, 3 positions; optional.*

Field	Description
Drop point	The shipping point associated with the warehouse, or carrier pick-up point. The drop point is used in determining the correct destination UPS zone for a shipment in relation to the warehouse or carrier pick-up point from which it is shipped, and ultimately the shipping charge for the order. The code is validated against the Drop Point table. Example: If you have a warehouse in Boston and a warehouse in Chicago, the UPS zone assignments will be different for each warehouse. If you ship an order from Boston to Los Angeles, Los Angeles is zone 8 in relation to Boston. If you ship an order from Chicago to Los Angeles, Los Angeles is Zone 4 in relation to Chicago. By assigning different drop points to each warehouse, you can establish the correct UPS zones for each warehouse and have the correct meter charges calculated. The drop point also represents a carrier pick-up point when zone skipping is used. In zone skipping, orders are shipped from your warehouse to a UPS pick-up point by another carrier. The UPS zone to which the orders are shipped and the meter charges are determined in relation to the carrier pick-up point, and not your warehouse. Example: If your warehouse is located in Boston, you may ship your west coast orders via common carrier to a UPS pick-up point in Chicago, and then ship the orders via UPS from Chicago to their final destination. The UPS zone and the meter charges must be based upon the zone assignments for Chicago even though your warehouse is actually located in Boston. **Note:** If you are using the *Freight by order weight* freight method, the drop point for the warehouse must match the drop point for the SCF/Ship Via on the order. See Working with Weight Tables for Order Weight (WFTB). The drop point field is required even if you have only one warehouse and are not using zone skipping.

Field	Description
	Numeric, 3 positions; required.
Manager	The name of the warehouse manager. *Alphanumeric, 30 positions; optional.*
Telephone #	The telephone number of the warehouse. You can define a telephone number format to map to the phone numbers you enter into the system. The system defaults the telephone number formats for the Default Country for Customer Address (B17) for any phone number entered on this screen. See Setting Up the Country Table (WCTY). *Numeric, 11 positions; optional.*
Fax #	The fax number of the warehouse. See the *Telephone number* field description above for information on telephone number formats. *Numeric, 11 positions; optional.*
Allocatable flag	The allocatable flag indicates whether merchandise in the warehouse can be reserved to fulfill consumer orders. Valid values are: • Selected = merchandise in this warehouse can be reserved to fulfill orders. The inventory reservation program considers inventory quantities in the warehouse when evaluating whether merchandise is available for shipment. • Unselected = merchandise in the warehouse will not be used to fulfill orders. Examples of non-allocatable warehouses include non-saleable and defective item warehouses. If a warehouse is not flagged as allocatable, its on-hand quantity is not included in the availability calculation for items. This field also controls whether the system displays item availability for the warehouse on the Display Item Availability Screen; also, a non-allocatable warehouse is not included in the product import to Order Orchestration when the Send Inventory by Warehouse to OROB (L06) system control value is unselected.
Viewable in O/E (Viewable in Order Entry)	This flag indicates whether inventory availability for the warehouse can be viewed in Order Entry. When you view item availability in Order Entry, a list of all viewable warehouses and the item quantity available in each warehouse is displayed. Valid values are: • Selected = inventory quantities in this warehouse can be viewed in Order Entry. • Unselected = inventory quantities in this warehouse cannot be viewed in Order Entry.

Field	Description
OROB location	The code that identifies the warehouse to Order Orchestration as a location. If this code matches the location code set up in Order Orchestration and if the Send Inventory by Warehouse to OROB (L06) system control value is selected: • Order Administration sends inventory information for each item flagged as OROB eligible if it has a record in this warehouse when a system import is initiated in Order Orchestration. • The BROKER process in Working with Integration Layer Processes (IJCT) sends fulfillment requests to Order Orchestration requesting any new retail pickup or delivery orders assigned to this warehouse for fulfillment. **Note:** If the Send Inventory by Warehouse to OROB (L06) system control value is selected but you do not define an OROB location here, fulfillment requests for the warehouse are not sent to Order Orchestration. If the Send Inventory by Warehouse to OROB (L06) system control value is unselected, then these activities are aggregated under the OROB Default Location (K51), and item warehouse records are included only if the warehouse is flagged as allocatable. See Order Orchestration's Product, Product Location, and Incremental Inventory Import Process for an overview and examples. If the location code set up in Order Orchestration contains any non-numeric characters, they should be uppercase. *Alphanumeric, 10 positions; optional.*
The Sharing warehouse and Shared company/warehouse fields appear only if the Inventory Sharing (A69) system control value is selected.	N/A

Field	Description
Sharing warehouse	This field indicates whether the warehouse serves as a sharing warehouse for orders you take in another company. Valid values are: • Selected = This warehouse provides inventory to fulfill orders you take in another company. • Unselected (default) = This is not a sharing warehouse
Shared company/warehouse	These fields indicate whether to reserve and fulfill orders from a different warehouse in a different company. **Company** The company where the sharing warehouse (the warehouse that provides the inventory) is located. Company codes are defined in and validated against the Company table; see Working with Companies (WCMP). *Numeric, 3 positions; optional.* **Warehouse** The warehouse in the company, specified in the Company field, that is providing the inventory to fulfill orders against the current company and warehouse. *Numeric, 3 positions; optional.*

Change Warehouse Screen

To change: Select Change for the warehouse at the Work with Warehouses Screen to advance to the Change Warehouse screen. At this screen you can change any information except the warehouse code. See the Create Warehouse Screen for field descriptions.

Display Warehouse Screen

To display: Select Display for a warehouse at the Work with Warehouses Screen to advance to the Display Warehouse screen. You cannot change any information on this screen. See Create Warehouse Screen for field descriptions.

Work with Warehouse Devices Screen

Purpose: Use this screen to define the default pick slip, and report output devices for a warehouse.

How to display this screen: Select Devices a warehouse on the Work with Warehouses Screen.

Field	Description
Type	The type of output device. Valid values are: • **Pick Output Queue** • **Report Output Queue** *Optional.*

Field	Description
Description	The description of the device type. Types and descriptions are system-defined. *Alphanumeric, 25 positions; display-only.*
Device	The name of the output device. *Alphanumeric, 10 positions; optional.*

Screen Option	Procedure
Create a new warehouse device	Select Create to advance to the Create Warehouse Device Window. At this window, you can enter the device type and name. See above for field descriptions.
Change warehouse device information	Select Change for a warehouse device to advance to the Change Warehouse Device Window. At this window, you can change the device name. See above for more information.
Delete a warehouse device	Select Delete for a warehouse device to delete it.

Working with Warehouse Lists (WWHL)

Warehouse lists are used to more efficiently allocate an order when you ship from more than one warehouse.

Each list contains the warehouse codes of the warehouses the system will use to fulfill an order, and the sequence in which the warehouse will be considered. A warehouse list is usually created for each region to which you ship.

> **Important:**
>
> To use warehouse lists to consolidate reserve warehouses for an order you must select the Ship Complete from 1 Warehouse (B16) system control value.

If you ship from three warehouses, you might use the following shipping strategy to fulfill orders:

Destination	Whs 1	Whs 2	Whs 3
East Coast	New York	Chicago	na
Mid West	Chicago	New York	Los Angeles
West Coast	Los Angeles	Chicago	na

For orders being shipped to the East Coast, the New York warehouse would be the first warehouse on the list. For orders being shipped to West Coast, the Los Angeles warehouse would be the first warehouse on the list.

> **Note:**
>
> The Warehouse list is assigned in the SCF table. The system uses the country code/SCF combination to determine which warehouse list to use. If a postal code is not defined for the order ship to address on the order, the system uses the warehouse list defined for the country code/# combination. See Create SCF Screen.

Warehouse List Logic: Warehouse lists are used to arrive at warehouse ranking, and warehouse ranking determines which warehouse an item will be reserved (and shipped) from. If two warehouses have equal rank, then the first warehouse on the list is used to reserve the item.

When you enter an order line for an item, the system checks all the warehouses on the warehouse list. Each warehouse that can fulfill the order is given 1 ranking point; no ranking points are given for the ability to partially fulfill an order line. Ranking points for each warehouse accumulate as you add order lines to the order.

Warehouse rank does not apply to order lines for inventory which is completely unavailable in all warehouses, however. If an order line is completely unavailable in all warehouses, the system backorders it in the first warehouse on the warehouse list, regardless of warehouse rank.

Example 1:

Line 1: For an order being shipped to the east coast, you enter item AB1111. The item is available in both the New York warehouse and the Chicago warehouse, so both warehouses would receive 1 ranking point. Because both warehouses have the same rank, item AB1111 would be reserved in the New York warehouse, because it is the first warehouse on the list:

First order line: item AB1111	First order line: item AB1111	First order line: item AB1111
Warehouse List	**Rank**	**Reserve Warehouse?**
New York	1	YES
Chicago	1	na

Line 2: The next item you add to the order is AB2222. The item is available only in the Chicago warehouse, so only the Chicago warehouse would receive a second ranking point. The time would be reserved from the Chicago warehouse.

Second order line: AB2222	Second order line: AB2222	Second order line: AB2222
Warehouse List	**Rank**	**Reserve Warehouse?**
New York	1	na
Chicago	1 + 1 = 2	YES

Line 3: The third item you add to the order is AB3333. The item is available in both the New York and the Chicago warehouses, so both warehouses receive an additional ranking point. The item is reserved from the Chicago warehouse (even though the New York warehouse is the first on the list) because the Chicago warehouse has a higher rank.

Third order line: AB3333	Third order line: AB3333	Third order line: AB3333
Warehouse List	**Rank**	**Reserve Warehouse?**
New York	1 + 1 = 2	na
Chicago	2 + 1 = 3	YES

For the complete order in Example 1, the first order line would be reserved in the New York warehouse, and the second and third order lines would be reserved in the Chicago warehouse.

Example 2:

For the same order, if you entered the lines in a different sequence, the results would differ.

Line 1: If the first item you add to the order is AB2222, it will be reserved in the Chicago warehouse, because it is available only in the Chicago warehouse.

First order line: AB2222	First order line: AB2222	First order line: AB2222
Warehouse List	**Rank**	**Reserve Warehouse?**
New York	0	na
Chicago	1	YES

Line 2: The next item you add to the order is AB1111. The item is available in both the Chicago and New York warehouses, so each warehouse would receive an additional ranking point. The line would be reserved from the Chicago warehouse.

Second order line: AB1111	Second order line: AB1111	Second order line: AB1111
Warehouse List	**Rank**	**Reserve Warehouse?**
New York	1	na
Chicago	1 + 1 = 2	YES

Line 3: The third item you add to the order is AB3333. The item is available in both the New York and the Chicago warehouses, so both warehouses receive an additional ranking point. The item is reserved from the Chicago warehouse because the Chicago warehouse has a higher rank.

Third order line: AB3333	Third order line: AB3333	Third order line: AB3333
Warehouse List	**Rank**	**Reserve Warehouse?**
New York	1 + 1 = 2	na
Chicago	2 + 1 = 3	YES

Line 4: The fourth item you add to the order is AB4444. The item is completely unavailable in both the New York and the Chicago warehouses, so the system ignores warehouse rank and backorders the item in the New York warehouse, because the New York warehouse is the first warehouse on the list.

Fourth order line: AB4444 (Completely unavailable)	Fourth order line: AB4444 (Completely unavailable)	Fourth order line: AB4444 (Completely unavailable)
Warehouse List	**Rank**	**Reserve Warehouse?**
New York	1 + 1 = 2	YES, because when an item is completely unavailable, the system does not consider rank, but backorders the item in the first warehouse on the list.
Chicago	2 + 1 = 3	na

For the complete order in Example 2, the first three order lines would be reserved in the Chicago warehouse. The fourth line would be backordered in the New York warehouse.

- Edit Warehouse List Details Screen
- Change Warehouse List Screen

Warehouse Lists and Single Order Lines

Warehouse lists also affect single order lines for which you do not have enough inventory in any single warehouse on the warehouse list or, if you are not using Ship Complete from 1 Warehouse (B16), you do not have enough inventory in the item's primary warehouse to fulfill the order line. If an order line cannot be entirely reserved in one warehouse, no ranking points are given to any warehouses on the warehouse list. The table describes the effect of warehouse lists on single lines:

Ship complete from 1 whs?	Warehouse list defined?	The system will:
Selected	**Yes**	• first attempt to reserve the entire line from one warehouse on the list, using warehouse rank logic. • if no warehouse on the list can fulfill the entire line, reserve as much of the order line as possible from the warehouse with the greatest inventory, then follow warehouse ranking logic to fulfill the remainder of the order line

Ship complete from 1 whs?	Warehouse list defined?	The system will:
Selected	**No**	• attempt to reserve the entire order line from the item's primary warehouse as defined in the Item table. • if the entire order line cannot be fulfilled from this warehouse, the system will reserve as much of the order line as possible and backorder the remaining quantity in the item's primary warehouse.
Unselected	**Yes**	• first attempt to reserve the entire line from the item's primary warehouse as defined in the Item table. See Performing Initial Item Entry (MITM) • if the entire order line cannot be reserved in the item's primary warehouse, reserve as much inventory as possible from the item's primary warehouse, then follow warehouse ranking logic to fulfill the remainder of the order line
Unselected	**No**	• first attempt to reserve the entire line from the item's primary warehouse as defined in the Item table. See Performing Initial Item Entry (MITM) • if the entire order line cannot be reserved in the item's primary warehouse, reserve as much inventory as possible from the item's primary warehouse, then backorder the remaining inventory in the item's primary warehouse.

Warehouse List Overrides

The system assigns warehouses using the following hierarchy:

- **A warehouse code for an individual order line:** If you enter a warehouse code for an individual order line using the Add Line option, the system will use this warehouse to reserve the order line. This warehouse assignment will override all other reserve warehouse logic.
- **A warehouse code entered on the order header:** If you enter a warehouse code in the Whs (Warehouse) field on the Work with Order screen, the system will use this warehouse to reserve all lines on the order. This warehouse assignment will

override all other warehouse assignments except a warehouse code entered for an individual order line.

- **Warehouse list:** If you have not entered a warehouse code for an individual order line, or a warehouse code on the order header, and the Ship Complete from 1 Warehouse (B16) system control value is selected, the system uses the country code/SCF combination in the SCF table to determine which warehouse list to use. If a postal code is not defined for the order ship to address on the order, the system uses the warehouse list defined for the country code/# combination. See Create SCF Screen.
- **The item's primary warehouse:** If no reserve warehouse can be assigned based on individual order lines, a warehouse code entered on the order header, or a warehouse list, the system will reserve the item in the warehouse from the Item table. See Warehouse Lists and Single Order Lines.

Work with Warehouse Lists Screen

Purpose: This screen is used to change, delete, display, or create information about the warehouse sequence to use to allocate an order when you ship from more than one warehouse.

How to display this screen: Select Warehouse List at the Work with Warehouses Screen. You can also display this screen by entering WWHL in the *Fast path* field at the top of any menu, or by selecting Work with Warehouse Lists from a menu.

Field	Description
List	A code that identifies the warehouse list. *Alphanumeric, 3 positions; optional.*
Description	The name of the warehouse list. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Create a new warehouse list	Select Create to advance to the Edit Warehouse List Details Screen.
Change the warehouse list description	Select Change for a warehouse list to advance to the Change Warehouse List Screen.
Delete warehouse list information	Select Delete for a warehouse list to delete it.
Edit warehouse list details	Select Work with List a warehouse list to advance to the Display Warehouse List Screen.
Display warehouse list information	Select Display for a warehouse list to advance to the Display Warehouse List Screen. You cannot change any information on this screen. See the Edit Warehouse List Details Screen for field descriptions.

Edit Warehouse List Details Screen

To create: At the Working with Warehouse Lists (WWHL), select Create to add a new warehouse list, or select Work with List for a warehouse list to add, change, or delete warehouses from the list, change the warehouse sequence, or delete the entire list.

Field	Description
Warehouse list	A user-defined code that identifies the warehouse list. A unique warehouse list is usually defined for each region to which you ship. The Warehouse list code is assigned to each SCF using the Work with SCF function. See Working with Warehouse Lists (WWHL). *Alphanumeric, 2 positions; required.*
Description	The description of the warehouse list. *Alphanumeric, 30 positions; required.*
Position	The sequence number assigned to the warehouse, in ascending order from 1 to 999. Orders are allocated from the warehouse assigned to position 1 first. Orders that cannot be fulfilled from the first warehouse will be allocated from the warehouse in position 2 next, and so on. *Numeric, 3 positions; required.*
Warehouse	The code of the warehouse assigned to the position. Warehouse codes are defined in and validated against the Warehouse table. *Numeric, 3 positions; required.*
Name	The name of the warehouse assigned to the position is indicated when you select OK. *Alphanumeric, 30 positions; display-only.*

Add a warehouse to the list: Enter the *Position* number and *Warehouse* code for the warehouse you want to add to the list. The warehouse description is indicated if a valid warehouse code is entered.

The following message indicates if an invalid warehouse code is entered:

```
Warehouse does not exist.
```

> **Note:**
>
> You should assign position numbers in increments of 10 so that you can easily insert warehouses if necessary, without renumbering each position. For example, if you want to add Warehouse 004 to the list below, and you want to use Warehouse 004 before Warehouse 003, you can assign position 5 to Warehouse 004. The list will be sequenced in the proper order when you select Exit.

Position	Warehouse
01	**001**
10	**003**
Add 05	**004**

Resequence the list: Select Resequence to resequence the position numbers assigned to the warehouses in the list. New position numbers are assigned to the warehouses in the list in sequential order beginning with the first warehouse (e.g., the first warehouse in the list is assigned position 01, the next warehouse in the list is assigned to position 02, and so on).

If you delete a single warehouse (see below) and then select Resequence, the system renumbers the Position. The table below illustrates how the system resequences a warehouse list.

Before selecting Resequence		After selecting Resequence	
Position	**Warehouse**	**Position**	**Warehouse**
1	990	1	990
2	1	2	1
3	993	3	2
4	2	na	na
Delete position 3 (warehouse 993)	Delete position 3 (warehouse 993)	Delete position 3 (warehouse 993)	Delete position 3 (warehouse 993)

Instructions: To edit a warehouse list.

1. Complete the necessary fields.
2. Select Resequence, if desired, to resequence the list if the entries are not in ascending order by position number.
3. Select Delete for any position entry you wish to delete.
4. Select Delete entire list to delete the entire list.

Change Warehouse List Screen

To change: Select Change for a warehouse list at the Working with Warehouse Lists (WWHL) to advance to the Change Warehouse List screen. At this screen you can change only the warehouse list description. See the Edit Warehouse List Details Screen for field descriptions.

Use this screen to change the list description. Use Edit Warehouse List Details Screen to change the warehouse sequence or the warehouses included in the list.

Creating and Maintaining Location Classes (WLCL)

Purpose: You can use the Work with Location Class Screen to create, change, delete, or display warehouse location class information. Location classes are used to identify the type of merchandise that will be assigned to the location, such as jewelry, high-ticket items, fragile items and hazardous items.

Use of location class: During Receiving Purchase Orders (PORC) and Performing Inventory Transactions, the system will verify that the item is being placed in a location that has the same location class as specified in the Loc class (Location class) field for the item. During preparation, the system will print separate picks for each location class. For example, if an order contains two items, each assigned to a different location class (e.g. electronics and jewelry), two pre-generated picks will be created for the order. In Streamlined Pick Slip Generation (WSPS), you can also select to print picks based on location class.

If the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected, the system validates the location class defined for the item against the location class defined for the location during inventory transaction processing; see this system control value for more information.

Location classes are assigned to items in the Item Table. Location classes are assigned to SKUs in the Pick SKU Location Class table. Location classes are assigned to locations in the Location Table. Use of location classes is optional.

In this topic:

- Work with Location Class Screen
- Create Location Class Screen

Work with Location Class Screen

How to display this screen: Enter WLCL in the *Fast path* field at the top of any menu or select Work with Location Classes from a menu.

Field	Description
Class	A code that identifies the location class. *Alphanumeric, 2 positions; optional.*
Description	The description of the location class. *Alphanumeric, 30 positions; optional.*

Screen Option	Procedure
Create a location class	Select Create to advance to the Create Location Class Screen.
Change location class information	Select Change for a location class to advance to the Change Location Class Screen. You can change any information except the location class code. See the Create Location Class Screen for field descriptions.
Delete location class information	Select Delete for a location class to delete it.
Display location class information	Select Display for a location class to advance to the Display Location Class Screen. You cannot change any information at this screen. See the Create Location Class Screen for field descriptions.
Work with locations	Select Work with locations for a location class to advance to the Work with Locations Screen.

Create Location Class Screen

Purpose: Use this screen to create a location class.

How to display this screen: Select Create on the Work with Location Class Screen.

Field	Description
Class	A code that defines the location class. Location classes are used to identify the type of merchandise that will be kept in the location. *Alphanumeric, 2 positions.* *Create screen: required.* *Change screen: display-only.*
Description	The name of the location class. *Alphanumeric, 30 positions; required.*

Creating and Maintaining Locations (WLOC)

Purpose: Use Work with Locations to create, change, delete or display warehouse locations. Locations are used to identify where merchandise is stored in the warehouse.

Location codes identify a specific storage unit in the warehouse and usually consist of a combination of the warehouse zone, aisle, shelf and bin number where the location is situated. The system provides two methods of defining your location codes:

- You can segregate your location codes into zone, aisle, shelf and bin identifiers with a separate field for each value. This method provides for inventory reporting by warehouse zone.
- You can define your location codes using one free form field, with each location code containing from one to seven characters. This method is used when your warehouse is not organized by zones, aisles, shelves and bins.

> **Note:**
>
> If you use the zone/aisle/shelf/bin structure to define your warehouse locations, Using the Location Generator (MLOC) is also available to create warehouse locations.

In this topic:

- Work with Locations Screen
- Create Location Screen
- Work with Items in Location Screen

Work with Locations Screen

How to display this screen: Enter WLOC in the *Fast path* field at the top of any menu or select Work with Locations from a menu.

Field	Description
Whs (Warehouse)	A code that identifies the warehouse where the location exists. *Numeric, 3 positions; optional.*
Loc (Location)	The code that identifies the location. **Note:** In order to properly scan for a location, you must enter a warehouse code in the *Warehouse* field and a full or partial location in the *Location* field. *Alphanumeric, 7 positions; optional.*

Field	Description
Zne (Zone)	The warehouse zone where the location is situated. *Alphanumeric, 2 positions; optional.*
Aisle	The aisle where the location is situated. *Alphanumeric, 2 positions; optional.*
Shlf (Shelf)	The shelf where the location is situated. *Alphanumeric, 2 positions; optional.*
Bin	The bin where the location is situated. *Alphanumeric, 2 positions; optional.*
Loc Type (Location type)	A code identifying the location type. • P = Primary, or main, picking location • S = Secondary location • B = Bulk location • T = Temporary location *Alphanumeric, 1 position; optional.*
Hang/Flat	A code indicating how merchandise is stored in the location. • H = Hanging storage • F = Flat storage • O = Other storage type *Alphanumeric, 1 position; optional.*
Pck (Pickable)	A code indicating whether inventory in the location can be picked to fulfill consumer orders. • selected = indicates the location is pickable. • unselected = indicates the location is not pickable.
Stock Type	A user-defined code that describes the type of merchandise that can be found in the location. **Note:** You must enter the full Stock Type code to scan; partial entry of the code is not allowed. *Alphanumeric, 3 positions; optional.*
Frz (Freeze)	Indicates whether the location and its merchandise are frozen. Valid values are: • Yes = The location is frozen. • No = The location not frozen. If a location is frozen: • Pick Slip Generation ignores the location when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. • Suggest Location Placement (MSLO) ignores the location when suggesting where to place stock.
Frq (Frequency code)	A code that indicates the frequency with which merchandise in the location is picked. Informational only. *Alphanumeric, 1 position; optional.*

Field	Description
Cls (Location class)	A code that identifies the location class. *Alphanumeric, 2 positions; optional.*

Screen Option	Procedure
Create a new location	Select Create to advance to the Create Location Screen.
Change location information	Select Change for a location to advance to the Change Location Screen. At this screen you can change any information except the warehouse code and the location code. See the Create Location Screen for field descriptions.
Delete location information	Select Delete for a location to delete it. A message similar to the following indicates if inventory is assigned to the location: `Item Location records exist - cannot delete location (A010101).`
Display location information	Select Display for a location to advance to the Display Location Screen. You cannot change any information at this screen. See the Create Location Screen for field descriptions.
Work with items in a location	Select Items for a location to advance to the Work with Items in Location Screen.

Create Location Screen

Purpose: Use this screen to define a location.

How to display this screen: Select Create at the Work with Locations Screen.

Field	Description
Warehouse	The warehouse code where the location is being defined. Warehouse codes are validated against the Warehouse table; see Creating and Maintaining Locations (WLOC). *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*

Field	Description
Location	A user-defined code that represents a warehouse location where merchandise is stored. The warehouse location code can consist of a zone/aisle/shelf/bin combination, or it can be any user-defined code. Locations are required for inventory placement and movement. For example, merchandise is stored and picked from specific locations. The location code prints on pick slips and reports. **Note:** If your warehouse locations consist of a warehouse zone, aisle, bin number, and shelf number combination, separate fields are provided for these values. The zone/ aisle/shelf/bin combination must still be entered in this field. *Alphanumeric, 7 positions.* *Create screen: required.* *Change screen: display-only.*

Field	Description
Type	The location type, which determines whether the location is permanent or temporary, and whether merchandise will be replenished to or from the location. **Primary location** The primary, or main locations from which items are picked. An item can be stored in more than one primary location. The system will attempt to keep the primary location fully stocked via the Replenish Primary Locations function. **Secondary location** Secondary locations are generally used for additional storage when the primary location is full. If a secondary location is pickable, the system will allocate from it when the total order quantity cannot be filled (completely) from a primary location. The system will allocate from both the primary and secondary locations when neither location contains enough stock to fulfill the entire order. Secondary locations can be used to replenish primary locations. **Bulk location** Bulk locations are additional storage locations that are generally used to store case lots or cartons that are not broken up at receiving. If a bulk location is pickable, the system will allocate from it when the total order quantity cannot be filled (completely) from either a primary or secondary location. The system will allocate from primary, secondary and bulk locations when none of the locations contain enough stock to fulfill the entire order. Bulk locations can be used to replenish primary locations. **Temporary location** Temporary locations are used to place merchandise that you want recognized as received, before a permanent location is assigned. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system deletes the item/location record. **Note:** Order Administration will not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location. *Alphanumeric, 1 position; required.*
Zne (Zone)	A user-defined code to identify the warehouse zone where the location is situated. Assigning zone codes provides for inventory analysis reporting by zone. Zone codes are also used to sort pick slips when the Cart Bin Picking method is used. *Alphanumeric, 1 position; optional.*

Field	Description
Aisle	A user-defined code to identify the warehouse aisle of the location. *Numeric, 2 positions; optional.*
Shlf (Shelf)	A user-defined code to identify the location's shelf number within the aisle. *Alphanumeric, 2 positions; optional.*
Bin	A user-defined code to identify the location's bin number on the shelf. *Alphanumeric, 2 positions; optional.*
Hang/Flat	A code indicating how inventory is stored in the location. • Hang = indicates that inventory in the location is hung. • Flat = indicates that inventory in the location is laid flat, or is stored in a conventional manner. • Other = indicates that inventory is stored in the location in some other manner. *Alphanumeric, 1 position; required.*
Picking Sequence	A user-defined sequence number which is used during Pick Slip Generation to determine the sort of the Batch Pick Sheet. When picking sequence numbers are not assigned, the system sorts the locations alphabetically by Location code. The picking sequence code is used by all pick slip generation methods. The system considers the pick sequence number when sorting picks in a batch if the Sort Picks by Pick Sequence (E89) system control value is selected. *Numeric, 7 positions; optional.*
Bar code #	A system generated sequence number assigned to the location when it is created. The sequence number prints in bar code format on the bin location labels that can be generated during Receiving Purchase Orders (PORC). *Numeric, 7 positions; display only.*
Fill factor	A user-defined percentage value that is used during the Suggest Location Placement program to determine when the location is stocked to capacity. The system evaluates the location capacity entered in the *cubic* field against the fill factor to determine location's true item capacity. Example: A location may be considered filled to capacity when 80% of its cubic volume is consumed because of the shape of the items that are stored in it. The cubic volume of a location may be 100 cubic feet, but may hold only eight items that are 10 cubic feet each because the items are spherical in shape. See Suggest Location Placement (MSLO). **Note:** The system assumes the fill factor is 100% if this field is left blank. *Alphanumeric, 5 positions with a 2- place decimal; optional.*

Field	Description
Pickable location	A code indicating whether inventory can be picked from the location. All other inventory inquiries display pickable and non-pickable quantities. • Selected - indicates that inventory can be picked from the location. • Unselected - indicates that inventory cannot be picked from the location. Bulk locations, or locations where defective merchandise is kept might be defined as non-pickable. Inventory will be reserved from all locations in the warehouse; if all locations are not pickable, it is possible to reserve more inventory than can be picked. In this situation, one of the following will occur: • The Pick Slip Generation program will print pick slips for the total quantity that can be obtained from pickable locations. The item number and the quantity that cannot be picked will print on the Stock Allocation Error Report when the Pick Slip Generation program completes. • Pick slips will be printed for the full reserve quantity using the primary location in the Item table as the picking location. The Let Down Replenishment program will determine the quantity that must be transferred from non-pickable secondary or bulk locations to fulfill the pick slip run and will process an inventory transfer transaction.
Stock type	A user-defined code that describes the type of merchandise that can be found in the location. Examples include DEF (Defective), or RTV (Return to Vendor). This field is informational only. *Alphanumeric, 3 positions; optional.*
Freeze	Indicates whether the location and its merchandise are frozen. Valid values are: • Selected = The location is frozen. • Unselected = The location not frozen. If a location is frozen: • Pick Slip Generation ignores the location when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. • Suggest Location Placement (MSLO) ignores the location when suggesting where to place stock.

Field	Description
Class (Location class)	A user-defined code that identifies the type of merchandise that will be placed in the location. This code is used to restrict the placement of certain item types to specific locations. For example, if the location is defined as a 'Jewelry' location, only items that contain the item type code for 'Jewelry' can be placed in the location. The class code entered is validated against the Location Class table; see Creating and Maintaining Location Classes (WLCL). If the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected, the system validates the location class defined for the item against the location class defined for the location during inventory transaction processing. **Note:** If this field is left blank, only items that have a blank location class can be stored in the location. *Alphanumeric, 2 positions; optional.*
Capacity	**Capacity**
Units	The total number of units that can fit in the location. *Numeric, 7 positions; optional.*
Weight	The total weight the location can hold, expressed in whole pounds. *Numeric, 7 positions with 3-place decimal; optional.*
Cubic	The total cubic volume of the location. The cubic volume can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the Height, Length, Width, and *cubic* fields. The system calculates the cubic capacity if values are entered in the height, length, and weight fields. **Note:** The value in the Fill factor field works in conjunction with this field. *Numeric, 7 positions; optional.*
Max SKUs	The maximum number of SKUs that should be stored in this location. This is an informational field that does not restrict placement above this number. *Numeric, 1 position; optional.*
Dimensions	**Dimensions**

Field	Description
Height	The total height (the distance from the top to the bottom) of the location. The height can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in all Height, Length, Width, and Cubic fields. *Numeric, 3 positions; optional.*
Length	The total length (the distance from one side to the other) of the location. The length can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in all *height, length, weight,* and *cubic* fields. *Numeric, 3 positions; optional.*
Width	The total width (the distance from the front to the back) of the location. The width can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, length, weight,* and *cubic* fields. *Numeric, 3 positions; optional.*
Comment	A user-defined comment about the location. *Alphanumeric, 20 positions; optional.*

Work with Items in Location Screen

Purpose: Use this screen to delete an item or SKU location or to display item or SKU information. Essential user-defined and system-updated quantity information is kept at the item/SKU location level.

How to display this screen: Select Items for a location at the Work with Locations Screen.

Field	Description
Item	The code of the item assigned to this warehouse location. You can enter any portion of the code to search for the item. *Alphanumeric, 12 positions; optional.*
SKU	The code defining unique item characteristics such as its color, size and width. You can enter any portion of the code to search for the SKU. *Alphanumeric, 14 positions; optional.*
On hand quantity	The number of units for the item in this location. *Numeric, 7 positions; display-only.*
Printed quantity	The number of units currently “allocated” for the item in this location, determined by the total quantity of the item on printed pick slips. When determining the locations from which to reserve items during pick slip generation, the printed quantity is subtracted from the on-hand quantity in the location to determine the quantity available for reservation. *Numeric, 7 positions; display-only.*

Field	Description
Freeze (Reservation freeze flag)	Indicates whether the item location or SKU location is frozen. Valid values are: • Y = The item/SKU location is frozen. • N = The item/SKU location is not frozen. If a location is frozen, Pick Slip Generation does not print picks. See Performing Pick Slip Generation. **Note:** Even though a pick slip does not print for an item from a frozen item location, the system still reserves the item on the Order Lines Fields in Order Entry.
Pending	Identifies the quantity of the item to be affected by a pending batch inventory transaction or work order. • A negative pending quantity indicates the quantity is to be removed from the location. • A positive pending quantity indicates the quantity to be added to the location. *Numeric, 7 positions; display-only.*

Screen Option	Procedure
To delete an item location	Select Delete for an item location to delete it. You can not delete an item location if pick slips have been printed; a transfer is pending through a finished good, an interactive or a batch inventory transaction; or if there is an on-hand quantity other than zero. The system displays the following message: `Item location cannot be deleted; On-hand, Transfer, or Printed quantity is not equal to zero.`
To display item information	Select Display for an item or SKU location to display the base item information. You advance to the Display Item Screen.

Using the Location Generator (MLOC)

Purpose: Use Generate Locations to define multiple locations at the same time when your warehouse locations are comprised of zone, aisle, shelf, and bin elements. Warehouse locations are used to identify where merchandise is stored in the warehouse.

You use this function during initial system setup to define your locations. You can also use it when adding new locations.

> **Note:**
>
> You can use the Generate Locations function only if your warehouse locations are comprised of zone, aisle, shelf, and bin elements and the aisle, shelf and bin elements are numeric. Otherwise, use Creating and Maintaining Locations (WLOC) to define your locations. You can also use Creating and Maintaining Locations (WLOC) to create, change, delete, or display individual location records, regardless of how your locations are defined.

Example: Creating location records for Zones A and B, Aisles 1 and 2, Shelf 1, and Bins 1 and 2, generates eight location records:

A 01 01 01

A 01 01 02

A 02 01 01

A 02 01 02

B 01 01 01

B 01 01 02

B 02 01 01

B 02 01 02

Each record will be created with the same attributes. You can change or delete individual records with the Work with Pending Locations Screen (WPLO) before the records are added to the Location table, or with Creating and Maintaining Locations (WLOC) if the Location table has been updated.

For more information: See Work with Pending Locations Screen (WPLO).

Location Generator Screen

How to display this screen: Enter MLOC in the *Fast path* field at the top of any menu or select Location Generator from a menu.

Field	Description
Warehouse	The warehouse code where the locations are being defined. The warehouse code defaults from the Default Warehouse (A04) control value in the Warehouse/Reservation Values section of the System Control table and can be overridden. The warehouse code is validated against the Warehouse table. *Numeric, 3 positions; required.*
Defer creation	A flag indicating whether the records will be added to the Location table immediately, or whether they will be written to a work table so you can change or delete individual records before the Location table is updated. • Selected = indicates that the requested location records will be written to a work table. Individual records can be changed or deleted before the Location table is updated. • Unselected = indicates that the requested location records will be added to the Location table immediately.

Field	Description
Zones	Enter the codes of the zones for the locations being defined. Location records for up to 10 warehouse zones can be created at one time. *Alphanumeric, 2 positions; required.*
From aisle	Enter the number of the first aisle in the location range you are creating. *Numeric, 2 positions; required.*
To aisle	Enter the number of the last aisle in the location range you are creating. *Numeric, 2 positions; required.*
From Shelf	Enter the number of the first shelf in the location range you are creating. *Numeric, 2 positions; required.*
To shelf	Enter the number of the last shelf in the location range you are creating. *Numeric, 2 positions; required.*
From bin #	Enter the number of the first bin in the location range you are creating. *Numeric, 2 positions; required.*
To bin #	Enter the number of the last bin in the location range you are creating. *Numeric, 2 positions; required.*

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Loc type (Location type)</td><td>The location type, which determines whether the location is permanent or temporary, and whether merchandise will be replenished to or from the location.

P = Primary location = The primary, or main locations from which items are picked. An item can be stored in more than one primary location.
S = Secondary location = Secondary locations are generally used for storage when the primary location is full.

If a secondary location is pickable, the system will allocate from it when the total order quantity cannot be filled (completely) from a primary location. The system will allocate from both the primary and secondary locations when neither location contains enough stock to fulfill the entire order.

Secondary locations can be used to replenish primary locations.
B = Bulk location = Bulk locations are additional storage locations that are generally used to store case lots or cartons that are not broken up at receiving.

If a bulk location is pickable, the system will allocate from it when the total order quantity cannot be filled (completely) from either a primary or secondary location. The system will allocate from primary, secondary and bulk locations when none of the locations contain enough stock to fulfill the entire order.

Bulk locations can be used to replenish primary locations.
T = Temporary location = Temporary locations are used to place merchandise that you want recognized as received, before a permanent location is assigned. A temporary location cannot exist without at least one item/location record associated with it. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system will delete the location and the item/location record.

Note:

Order Administration will not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location.

Alphanumeric, 1 position; required.</td></tr>
<tr><td>Weight cap (Weight capacity)</td><td>The total weight the location can hold, expressed in whole pounds.
Numeric, 7 positions with 3-place decimal; optional.</td></tr>
<tr><td>Unit cap (Unit capacity)</td><td>The total number of units that can fit in the location.
Numeric, 7 positions; optional.</td></tr>
</table>

Field	Description
Fill factor	A user-defined percentage value that is used during Suggest Location Placement (MSLO) to determine when the location is stocked to capacity. The system evaluates the location capacity entered in the *cubic* field against the Fill factor to determine the location's true item capacity. A location may be considered filled to capacity when 80% of its cubic volume is consumed because of the shape of the items that are stored in it. The cubic volume of a location may be 100 cubic feet, but may hold only eight items that are 10 cubic feet each because the items are spherical in shape. The system assumes the fill factor is 100% if this field is left blank. *Alphanumeric, 5 positions with a 2-place decimal; optional.*
Height	The total height (the distance from the top to the bottom) of the location. The height can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, length, weight,* and *cubic* fields. *Numeric, 3 positions; optional.*
Length	The total length (the distance from one side to the other) of the location. The length can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, length, weight,* and *cubic* fields. *Numeric, 3 positions; optional.*
Width	The total width (the distance from the front to the back) of the location. The width can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, length, weight,* and *cubic* fields. Numeric, 3 positions; optional.

> **Note:**
>
> The cubic volume of the location will be calculated if values are entered in the *height, length,* and *width* fields.

Field	Description
Pickable	A code indicating whether inventory can be picked from the location. • Selected - indicates that inventory can be picked from the location. • Unselected - indicates that inventory cannot be picked from the location. Bulk locations, or locations where defective merchandise is kept are examples of non-pickable locations. **Note:** Inventory Inquiry in Order Entry includes quantities in pickable locations only; all other inventory inquiries display pickable and non-pickable quantities.
Hang/Flat	A code indicating how inventory is stored in the location. This field is informational only. • H = indicates that inventory in the location is hung. • F = indicates that inventory in the location is laid flat, or is stored in a conventional manner. • O = indicates that inventory in stored in the location in some other manner. *Alphanumeric, 1 position; required.*
Class (Location Class)	A user-defined code that identifies the type of merchandise that will be placed in this location. This code is used to restrict the placement of certain item types to specific locations. For example, if the location is defined as a 'Jewelry' location, only items that contain the item type code for 'Jewelry' can be placed in the location. The class code entered is validated against the Location Class table; see Creating and Maintaining Location Classes (WLCL). **Note:** If this field is left blank, only items that have a blank location class can be stored in the location. *Alphanumeric, 2 positions; optional.*
Freeze	Indicates whether the location and its merchandise are frozen. Valid values are: • Selected = The location is frozen. • Unselected = The location not frozen. If a location is frozen: • Pick Slip Generation ignores the location when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. • Suggest Location Placement (MSLO) ignores the location when suggesting where to place stock.

Field	Description
Stock type	A user-defined code that describes the type of merchandise that can be found in the location. Examples include DEF (Defective), or RTV (Return to Vendor). This field is informational only. *Alphanumeric, 3 positions; optional.*
Freq code (Frequency Code)	A user-defined code that represents the frequency with which inventory is picked from the location. Informational only. *Alphanumeric, 1 position; optional.*
Comment	A user-defined comment about the location. *Alphanumeric, 20 positions; optional.*

Completing this screen: The Location Generator Screen opens, retaining your original entries, if you did not select to defer creation of the location records. You can create additional locations or return to a menu. The Work with Pending Locations Screen (WPLO) opens if you entered Y to defer creation.

Work with Pending Locations Screen (WPLO)

Purpose: Use this screen to change, delete, or display information about the warehouse locations you are creating during this session.

How to display this screen: Complete the Location Generator Screen and choose to defer the creation of location records. Only the location records created during the current Generate Locations session are listed.

You can also display this screen by selecting Work with Pending Locations (*Fast path* = WPLO) from a menu if you have previously used the Location Generator Screen and then exited the Work with Pending Locations screen without accepting or rejecting the pending locations.

Pending warehouse locations are locations that were created by the Location Generator in a deferred status. These records are created in a deferred status when you want to review and modify location information before updating the permanent Location Table.

Field descriptions: See the Change Pending Locations Screen for descriptions of the fields on this screen.

Screen Option	Procedure
Accept pending location information	Select Accept to add the pending location records to the Location Table. All pending location records created during the current session will be added.
Reject pending location information	Select Reject to delete all pending location records created during the current session.
Change pending location information	Select Change for a pending location to advance to the Change Pending Locations Screen.
Delete pending location information	Select Delete for a pending location to delete it.

Screen Option	Procedure
Display pending location information	Select Display for a pending location to advance to the Display Pending Locations Screen. You cannot change any information at this screen. See the Change Pending Locations Screen for field descriptions.

Change Pending Locations Screen

To change: Select Change for a pending location at the Work with Pending Locations Screen (WPLO) to advance to the Change Pending Locations Screen. At this screen you can change any information except the warehouse code and location code.

Field	Description
Warehouse	The warehouse code where the location is located. *Numeric, 3 positions; display-only.*
Location	The code identifying the pending location, comprised by concatenating the zone, aisle, shelf, and bin, as specified at the Location Generator Screen. *Alphanumeric, 7 positions; display-only.*
Zne (Zone)	The Zone from the Location Generator Screen defaults. *Alphanumeric, 1 position; optional.*
Aisle	The Aisle from the Location Generator Screen defaults. *Numeric, 2 positions; optional.*
Shlf (Shelf)	The Shelf from the Location Generator Screen defaults. *Numeric, 2 positions; optional.*
Bin	The Bin from the Location Generator Screen defaults. *Numeric, 2 positions; optional.*
Pickable	A code indicating whether inventory can be picked from the location. • Selected - indicates that inventory can be picked from the location. • Unselected - indicates that inventory cannot be picked from the location. Bulk locations, or locations where defective merchandise is kept are examples of non-pickable locations. **Note:** Inventory Inquiry in Order Entry includes quantities in pickable locations only; all other inventory inquiries display pickable and non-pickable quantities.

Field	Description
Freeze	Indicates whether the location and its merchandise are frozen. Valid values are: • Selected = The location is frozen. • Unselected = The location not frozen. If a location is frozen: • Pick Slip Generation ignores the location when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. • Suggest Location Placement (MSLO) ignores the location when suggesting where to place stock.
Hang/Flat	A code indicating how inventory is stored in the location. This field is informational only. • Hanging = indicates that inventory in the location is hung. • Flat = indicates that inventory in the location is laid flat, or is stored in a conventional manner. • Other = indicates that inventory in stored in the location in some other manner. *Required.*

Field	Description
Location type	The location type, which determines whether the location is permanent or temporary, and whether merchandise will be replenished to or from the location. • Primary = The primary, or main locations from which items are picked. An item can be stored in more than one primary location. • Secondary = Secondary locations are generally used for storage when the primary location is full. If a secondary location is pickable, the system will allocate from it when the total order quantity cannot be filled (completely) from a primary location. The system will allocate from both the primary and secondary locations when neither location contains enough stock to fulfill the entire order. Secondary locations can be used to replenish primary locations. • Bulk = Bulk locations are additional storage locations that are generally used to store case lots or cartons that are not broken up at receiving. If a bulk location is pickable, the system will allocate from it when the total order quantity cannot be filled (completely) from either a primary or secondary location. The system will allocate from primary, secondary and bulk locations when none of the locations contain enough stock to fulfill the entire order. Bulk locations can be used to replenish primary locations. • Temporary = Temporary locations are used to place merchandise that you want recognized as received, before a permanent location is assigned. A temporary location cannot exist without at least one item/location record associated with it. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system will delete the location and the item/location record. **Note:** Order Administration will not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location. *Required.*
Stock type	A user-defined code that describes the type of merchandise that can be found in the location. Examples include DEF (Defective), or RTV (Return to Vendor). This field is informational only. *Alphanumeric, 3 positions; optional.*
Capacity	**Capacity**

Field	Description
Weight	The total weight the location can hold, expressed in whole pounds. *Numeric, 7 positions with 3-place decimal; optional.*
Cubic	The total cubic volume of the location. The cubic volume can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, width,* and *cubic* fields. The system calculates the cubic capacity if values are entered in the *height, length,* and *weight* fields. **Note:** The value in the *Fill factor* field works in conjunction with this field. *Numeric, 7 positions; optional.*
Dimensions	**Dimensions**
Height	The total height (the distance from the top to the bottom) of the location. The height can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, length, weight,* and *cubic* fields. *Numeric, 3 positions; optional.*
Length	The total length (the distance from one side to the other) of the location. The length can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, length, weight,* and *cubic* fields. *Numeric, 3 positions; optional.*
Width	The total width (the distance from the front to the back) of the location. The width can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the *height, length, weight,* and *cubic* fields. *Numeric, 3 positions; optional.* **Note:** The cubic volume of the location will be calculated if values are entered in the *height, length,* and *width* fields.
Comment	A user-defined comment about the location. *Alphanumeric, 20 positions; optional.*

Creating Item Warehouse/Locations (MIWL)

Purpose: Use Create Item Warehouse/Locations to create or change an item's primary primary location in the item's primary warehouse. Item warehouse records identify the items that are stored in the warehouse. Item location records identify the items that are stored in each location.

This menu option provides a quick method of assigning an item to a primary primary location in the item's primary warehouse, or changing information about an existing primary primary location in the warehouse.

You can use this menu option to do the following:

- Create a new primary primary location for an item/SKU. See Creating a New Primary Primary Location.
- Update the location minimum quantity and location maximum quantity for the existing primary primary location for an item/SKU. See Updating the Primary Primary Min/Max Quantities.
- Remove the primary primary location for an item/SKU. See Removing the Primary Primary Location.
- Define the following information for the item:
  - shipping weight
  - selling weight
  - item cube value
  - pieces per case (case quantity)
  - UPC code

See Updating Item Information.

First Create Item Warehouse/Locations Screen

How to display this screen: Enter MIWL in the *Fast path* at the top of any menu, or select Create Item Warehouse/Locations from a menu.

Field	Description
Warehouse	The warehouse code where the item location information is being changed. This must be the Primary warehouse for an item or SKU, in order to display location information for the item through this menu option. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions; required.*
Item	The item number for which you are changing primary primary item location information. Item numbers are defined in and validated against the Item table; see Performing Initial Item Entry (MITM). The warehouse entered must be the item's primary warehouse. If it is not, the following message appears: `No data to display`. *Alphanumeric, 12 positions; required.*

Completing this screen:

1. Enter a valid warehouse code that represents the primary warehouse assigned to an item.
2. Optionally, enter an item code to position your results to a specific item.
3. Select OK.
4. The system displays the Second Create Item/Warehouse Locations Screen. This screen displays items/SKUs whose primary warehouse matches your entry. Primary primary location information, if available, is indicated for each item/SKU. The location information is blank if a primary primary location is not defined for the item/SKU.

Second Create Item/Warehouse Locations Screen

How to display this screen: Complete the First Create Item Warehouse/Locations Screen and select OK.

Field	Description
Item	A code for the item that is located in a primary location in the specified primary warehouse. *Alphanumeric, 12 positions; display-only.*
SKU	A code for the SKU of the item that is located in a primary location in the specified primary warehouse. *Alphanumeric, three 4-position fields; display-only.*
The following fields are enterable:	NA
Weight	The actual shipping weight of the item. The system can use this value to calculate carton weights and determine shipping charges. The system defaults the shipping weight defined for the SKU; if a shipping weight is not defined for the SKU, the system defaults the shipping weight defined for the item. However, you can override it. If the item contains SKUs, updates *Weight override* in the SKU table; if the item does not contain SKUs, updates *Ship weight* in the Item table. *Numeric, 7 positions with a 3-place decimal, optional.*
Cube	The cubing value of the item. This field is used in Pick Slip Generation to determine the number of units that can fit in a carton. To change the cubic value of the item, type over the existing value. The system defaults the cubing value defined for the SKU; if a cubing value is not defined for the SKU, the system defaults the cubing value defined for the item. However, you can override it. If the item contains SKUs, updates *SKU Cubing value override* in the SKU table; if the item does not contain SKUs, updates *ITM Cubing value* in the Item table. *Numeric, 7 positions with a 1-place decimal; optional.*

Field	Description
Location	The item's primary primary location. The system defaults the Primary location in the SKU table; however you can override it to create a new primary location. Remove the location defined in this field if you wish to remove the primary primary location defined for the item/SKU; see Removing the Primary Primary Location. Updates *Location* in the SKU table. Locations are defined in and validated against the Location table. See Creating and Maintaining Locations (WLOC). *Alphanumeric, 7 positions; required if a Min Qty or Max Qty is defined.*
Min Qty	The minimum quantity of the item that should be on hand in the location. The system defaults the location minimum from the SKU table; however, you can override it. Updates *Min qty* in the Item Location table and *Min qty for location* in the SKU table. *Numeric, 7 positions; optional.*
Max Qty	The maximum quantity of the item that should be on hand in the location. The system defaults the location maximum from the SKU table; however, you can override it. Updates *Max qty* in the Item Location table and *Max qty for location* in the SKU table. *Numeric, 7 positions; optional.*
Sell Wgt	The actual selling weight of the item. The system uses this value to calculate the freight charge on an item when the freight method on the order is set to By Item or Flat Rt/Item. The system defaults the selling weight defined for the SKU; if a selling weight is not defined for the SKU, the system defaults the selling weight defined for the item. However, you can override it. If the item contains SKUs, updates *Selling weight override* in the SKU table; if the item does not contain SKUs, updates *Selling weight* in the Item table. *Numeric, 7 positions with a 3-place decimal; optional.*
Case Qty	The number of units that fit in a case. The system defaults the pieces per case quantity defined for the item; however, you can override it. Updates *Pieces per case* in the Item table. **Multiple case quantities for the same item/SKU?** If you define a different case quantity for the same item/SKU for more than one item location record on this screen, the system updates the item/SKU with the case quantity that the system processes last (the lowest record that displays for the item/SKU on the screen). *Numeric, 5 positions; optional.*

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>UPC</td><td>The UPC code defined for the item/SKU.
The first UPC code defined for the item/SKU defaults; however, you can override it to create a new UPC for the item/SKU.
A message similar to the following indicates if the UPC code has already been assigned to an item: <code>UPC already assigned to XXXXXX</code>.

Note:
Include any leading zeros. For example: if the UPC code is 06012011, enter <code>06012011</code> and not <code>6012011</code>.

Creates a record in the Item UPC table.
Alphanumeric, 14 positions; required to create a UPC code.</td></tr>
<tr><td>UPC Type</td><td>If you enter a UPC code for an item location record, the system uses this UPC type to create the UPC code in the Item UPC table.
The UPC type for the first UPC code defined for the item/SKU defaults; however, you can override it to create a new UPC for the item/SKU.
Valid UPC types are:
• E13 = EAN-13, indicating a 13 position UPC code; however, Order Administration does not validate the UPC length.
• E8 = EAN-8, indicating an 8 position UPC code; however, Order Administration does not validate the UPC length.
• UA = UPC-A, indicating a 12 position UPC code; however, Order Administration does not validate the UPC length.
• UE = UPC-E, indicating a 6 position UPC code; however, Order Administration does not validate the UPC length.
Alphanumeric, 3 positions; required to create a UPC code.</td></tr>
<tr><td>UPC Vendor</td><td>If you enter a UPC vendor for an item location record, the system uses this UPC vendor to create the UPC code in the Item UPC table.
The UPC vendor for the first UPC code defined for the item/SKU defaults.
• You can override the default UPC values to create a new UPC for the item/SKU.
• You can enter a new UPC vendor to change it for the default UPC code.
Numeric, 7 positions; required to create a UPC code.</td></tr>
</table>

Updating Item Information

To update...	do the following...
the item's cube value	enter the item's cube value in the Cube field. The item's current cube value defaults, but you can override it.
the item's shipping and selling weights	enter the item's shipping and selling weights in the Weight and Sell Wgt fields. The item's current shipping and selling weights default, but you can override them.
the item's pieces per case quantity	enter the item's pieces per case quantity in the Case Qty field. The item's current pieces per case quantity defaults, but you can override it.
the item's UPC code	**To update the vendor for the existing UPC code:** 1. The UPC, UPC Type, and UPC Vendor for the first UPC code defined for the item/SKU defaults; to update this existing UPC code, retain the current value in the UPC and UPC Type fields. 2. Enter a new UPC vendor in the UPC Vendor field. **To create a new UPC for the item/SKU:** 1. Enter a UPC code for the item in the UPC field. The first UPC code defined for the item/SKU defaults; however, you can override it to create a new UPC for the item/SKU. **Note:** Include any leading zeros. For example: if the UPC code is 06012011, enter `06012011` and not `6012011`. 2. Enter a UPC type in the UPC Type field. The UPC type for the first UPC code defined for the item/SKU defaults; however, you can override it to create a new UPC for the item/SKU. 3. Enter a UPC vendor in the UPC Vendor field. The UPC vendor for the first UPC code defined for the item/SKU defaults; however, you can override it to create a new UPC for the item/SKU.

Once you have defined the item information you wish to update, click OK. The system validates your entries and performs the update.

You can review the updated item information on the following screens:

- non-SKUed item: Change Item screen to review the updated *Cube, Shipping weight, Selling weight* and *Pieces per case*. See Create Item Screen for more information.
- SKUed item: Change Item screen to review the updated *Pieces per case*; Change SKU - 2 of 2 (With Overrides) screen to review the updated *Cube, Shipping weight*, and *Selling weight*. See Create Item Screen and Create SKU 2 of 2 (With Overrides) Screen.
- Work with UPC Codes Screen to review the created or updated UPC code.

Updating the Primary Primary Min/Max Quantities

Use the following steps to update the minimum and/or maximum quantities for the item's primary primary location that is already assigned to the item.

To update...	do the following...
the minimum item location quantity	enter the minimum quantity in the Min Qty field. The item location's current minimum quantity defaults, but you can override it.
the maximum item location quantity	enter the maximum quantity in the Max Qty field. The item location's current maximum quantity defaults, but you can override it.

Once you have defined the item location information you wish to update, click OK. The system validates your entries and performs the update.

The system updates the *Min qty* for location and *Max qty* for location fields in the SKU table to the new minimum and maximum quantities you defined. The new minimum and maximum quantities display on the Change Item (Base Information screen for a non-SKUed item and on the Change SKU 1 of 2 (With Overrides) screen for a SKUed item. See Create Item (Base Information) Screen and Create SKU 1 of 2 (With Overrides) Screen for more information.

Creating a New Primary Primary Location

Use the following steps to update an item/SKU's primary primary location to the primary location you enter.

1. In the Location field, enter the location code you wish to use as the item/SKU's new primary primary location. A valid item location code must be entered. The primary primary location currently defined for the item/SKU, if any, defaults, but you can override it to assign the item to a new primary primary location.
2. Optionally, enter the minimum and maximum amounts for the item in this location in the Min Qty and Max Qty fields. The minimum and maximum quantities for the item's current primary primary location defaults, but you can type over the existing information if the minimum and maximum quantities for the new primary location differ. The existing location information will not be affected. Leave these fields 'as is' if the minimum and maximum amounts for the previous primary location and the new primary location are the same. These fields can be left blank if the minimum and maximum quantities for the item location are unknown.
3. Click OK. The system validates your entries and advances you to the Confirm Location Change window. Click OK to perform the update; otherwise, click Exit to cancel.

The system updates the *Location* field in the SKU table to the new primary location you defined. The new primary primary location displays on the Create Item (Base Information) Screen (non-SKUed item) or Create SKU 1 of 2 (With Overrides) Screen (SKUed item).

> **Note:**
>
> The system retains the item location record for the old primary primary location in the Item Location table.

Removing the Primary Primary Location

Use the following steps to delete the primary primary location defined for the item/SKU. You can delete the primary primary location for an item/SKU only if the item location does not have an On hand quantity, Pending transaction quantity, or Printed quantity in the Item Location table.

1. Remove the location defined in the Location field.
2. Remove the minimum quantity and maximum quantity defined in the Min Qty and Max Qty fields.
3. Click OK. The system advances you to the Confirm Location Change window. Notice that the *To location* is blank, indicating that you wish to remove the item/SKU from its current primary primary location and not define a new primary primary location for the item/SKU.
4. Click OK.
   - If the item location has an On hand quantity, Pending transaction quantity, or Printed quantity in the Item Location table, the system displays an error message and does not delete the primary primary location defined for the item/SKU: `Item location cannot be deleted; on-hand/transfer/printed qty > 0.`
   - If the item location does not have an On hand quantity, Pending transaction quantity, or Printed quantity in the Item Location table, the system:
   -
     – deletes the record from the Item Location table.
     – removes the location from the *Location* field in the SKU table. The primary primary location for the item/SKU is now blank on the Create Item (Base Information) Screen (non-SKUed item) or Create SKU 1 of 2 (With Overrides) Screen (SKUed item).

> **Note:**
>
> The system deletes the primary primary location only; the system retains any other primary locations defined for the item/SKU in the Item Location table.

Suggest Location Placement (MSLO)

Purpose: Use the Suggest Location for Item function when you want the system to search for available warehouse space to determine where you should place an item.

There are two different methods available for suggesting item locations:

Standard Suggest Location Placement: The system searches through the available warehouse locations and suggests where you might place the stock. You use the System Control table to specify the criteria the system uses to select locations and the order in which to search different location types.

This function is for inquiry only, and does not allow you to actually place the stock in the suggested locations. To place the stock, use

- Performing Inventory Transactions;
- Receiving Purchase Orders (PORC); or
- Placing Suspended Stock (SUSP).

The same logic is used in purchase order receiving. See Suggest Warehouse/Location Placement.

In this topic:

- Suggest Location For Item Screen
- Work with Suggested Locations Screen

Suggest Location For Item Screen

Purpose: Use this screen to enter the item and warehouse information for system-suggested placement. You enter the item/SKU, warehouse code, and quantity to place.

How to display this screen: Enter MSLO in the *Fast Path* field at the top of any menu, or select Suggest Location for Item from a menu.

Field	Description
Item	The code of the item you are placing in the warehouse. Item codes are defined in and validated against the Item table. *Alphanumeric, 12 positions; required.*
SKU fields	The item's unique characteristics, such as its color and size. *Alphanumeric, three 4-position fields; required if the item has SKUs.*
Warehouse	The code of the warehouse where the item is being placed. Warehouse code are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). Even if you use a staging warehouse, you should enter the code of the main warehouse where the stock should eventually be placed. *Numeric, 3 positions; required.*
Qty (Quantity)	The number of units of the item to be placed. *Numeric, 7 positions; required.*

Completing this screen: The system will determine the locations where the item should be placed using the criteria defined by your company in the System Control table. The following message indicates:

```
Suggesting locations...please wait
```

You advance to the Work with Suggested Locations Screen.

Work with Suggested Locations Screen

Purpose: This screen displays the suggested warehouse locations for the item.

How to display this screen: Select OK at the Suggest Location For Item Screen.

Field	Description
Item	The item code and SKU, if any, for which the system is suggesting locations for placement. *Item: Alphanumeric, 12 positions.* *SKU: Alphanumeric, three 4-position fields.*
Qty requested (Quantity requested)	The number of units of the item to place. *Numeric, 7 positions.*

Field	Description
Whs (Warehouse)	The warehouse where the system is placing the merchandise. If you use a staging warehouse, the system will always suggest this warehouse for placement. *Numeric, 3 positions.*
Location	The location where the associated quantity should be placed. *Alphanumeric, 7 positions.*
Quantity placed	The quantity to place in the location. *Numeric, 7 positions.*

Working with Default Warehouse Locations (WWDL)

Purpose: Use the Default Warehouse Locations function to define locations for the system to select automatically for certain transfers, receipts, or suggesting inventory placement.

You define default warehouse locations by type. Valid location types are:

- Bulk
- Backorder
- In Transit
- Non-Alloc Whs Receiving
- Outlet Transfer
- OTS Unallocated Location
- Pending Putaway
- Primary
- Return

In this topic:

- Defining Default Warehouse Locations for a Staging Warehouse
- Defining Default Warehouse Locations for a Pending Putaway Warehouse
- Work with Warehouse Default Locations Screen
- Create Warehouse Default Location Screen

Defining Default Warehouse Locations for a Staging Warehouse

If you use a staging warehouse location within Order Management System as part of your receiving putaway process, you must define several default location types for the staging warehouse. A staging warehouse is a warehouse code that designates an area within your actual warehouse where you keep stock that needs to be put away.

When you receive a purchase order, you can have the system suggest placement in default locations within the staging warehouse. Each staging warehouse default location refers to actual location(s) within your warehouse; for example, a default bulk location in the staging warehouse refers to a bulk storage area in your actual warehouse. You receive the stock into the bulk location in the staging warehouse; at this point, the inventory is not included in your on-hand quantity in your main warehouse. When you move the stock from the staging area to the actual bulk location, you process the inventory transaction to reflect the stock's location and update inventory levels in your main warehouse.

The default location types to assign in your staging warehouse are:

- Bulk
- Backorder
- In Transit
- Primary
- Return
- Non-Alloc Whs Receiving

The default location type to assign to your main warehouse is Intransit.

You may also wish to define a Pending Putaway default; see below.

Defining Default Warehouse Locations for a Pending Putaway Warehouse

A pending putaway warehouse is a warehouse where you keep stock that still needs to be moved to its final destination; for example, a staging area.

You can define a warehouse as a *pending putaway* warehouse by assigning a warehouse location type of PP Pending Putaway Warehouse to the warehouse. Use a *pending putaway* warehouse to temporarily store saleable inventory on its way to its final destination warehouse. Inventory received into a *pending putaway* warehouse retains its on order status so that the inventory is visible in PO Layering, yet the system recognizes the inventory as being in a warehouse location so that you can manipulate it.

See Pending Putaway Overview for more information on the updates the system performs when you receive inventory into a pending warehouse.

Work with Warehouse Default Locations Screen

How to display this screen: Enter WWDL in the *Fast path* field at the top of any menu or select Work with Default Warehouse Location from a menu.

Field	Description
Whs Warehouse	The actual or virtual warehouse where the default location is located. Warehouse codes are defined in and validated against the Warehouse table. *Numeric, 3 positions; optional.*
Type	The type of default location. Valid values are: • **Bulk** • **Back Order** • **In Transit** • Non-Alloc Whs Receiving • **Outlet transfer** • **OTS Unallocated Location** • **Pending Putaway** • **Primary** • **Return** *Optional.*
Max # items	This field is not currently implemented. *Numeric, 5 positions; optional.*

Field	Description
Alt seq Alternate sequence number	This field is not currently implemented. *Numeric, 3 positions; optional.*
Qty suggest Quantity suggested	This field is not currently implemented. *Numeric, 7 positions; optional.*
Max/bin Maximum quantity per bin	The maximum quantity for the system to suggest be placed in a bin. For example, you might restrict the amount of stock to place in a backorder location so that it does not become too crowded for efficient picking. *Numeric, 5 positions; optional.*
Location	The location within the warehouse to use as a default. The location code is a 7-position code typically comprised of: 1. Warehouse zone 2. Aisle 3. Aisle 4. Shelf 5. Shelf 6. Bin number 7. Bin number *Alphanumeric, 7 positions; optional.*

Screen Option	Procedure
Create a new default location	Select Create to advance to the Create Warehouse Default Location Screen.
Change a default location	Select Change for a default location to advance to the Change Warehouse Default Location Screen. You can change any information on this screen except for the warehouse and the type. See the Create Warehouse Default Location Screen for field descriptions.
Delete a default location	Select Delete for a default location to delete it.
Display a default location	Select Display for a default location to advance to the Display Warehouse Default Locations Screen. You cannot change any information at this screen. See the Create Warehouse Default Location Screen for field descriptions.

Create Warehouse Default Location Screen

Purpose: Use this screen to define a location for the system to check automatically when processing certain transactions.

How to display this screen: Select Create at the Work with Warehouse Default Locations Screen.

Field	Description
Warehouse	The actual or virtual warehouse where the default location is located. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). *Numeric, 3 positions.* *Create screen: required.* *Change screen: display-only.*
Location type	The type of default location. Valid values are: • **Bulk** • **Back Order** • **In Transit** • Non-Alloc Whs Receiving: If you select location type Non-Alloc Whs Receiving, the warehouse you enter must be flagged as non-allocatable. • **Outlet transfer** • **OTS Unallocated Location** • **Pending Putaway** • **Primary** • **Return** *Create screen: required.* *Change screen: display-only.*
Max# of items	This field is not currently implemented. *Numeric, 5 positions; optional.*
Alternate seq# Alternate sequence number	This field is not currently implemented. *Numeric, 3 positions; optional.*
Qty suggested	This field is not currently implemented. *Numeric, 7 positions; optional.*
Max qty per bin	The maximum quantity for the system to suggest be placed in a bin. For example, you might restrict the amount of stock to place in a backorder location so that it does not become too crowded for efficient picking. *Numeric, 5 positions; optional.*

Field	Description
Location	The location within the warehouse to use as a default. The location code is a 7-position code typically comprised of: 1. Warehouse zone 2. Aisle 3. Aisle 4. Shelf 5. Shelf 6. Bin number 7. Bin number Your entry must be a valid location for the warehouse in the Warehouse field. *Alphanumeric, 7 positions; optional.*

Printing the On Hand by Warehouse Report (POHW)

Purpose: Review total on-hand quantities for items in one or more allocatable warehouses.

Only items with on-hand quantities appear on the reports. If the on-hand quantity for an item in a warehouse is zero, it does not appear on the report.

What else is on the On Hand by Warehouse report? Depending on your selections at the On Hand by Warehouse List Prompt Screen, this report can also include for each item/SKU within the warehouse:

- unit and total cost
- total retail price and extended price, based on the price for the item or SKU in the offer specified in the Current Offer (A33) system control value
- unit and total vendor item price

What else is on the On Hand by Vendor by Warehouse report? In addition to the same information as the On Hand by Warehouse report, this report includes the total quantity returned, sold, adjusted, and received month to date.

How do you produce the On Hand by Vendor by Warehouse report? The system produces the On Hand by Vendor by Warehouse report only if your selections at the On Hand by Warehouse List Prompt screen include:

- Vendor is blank
- By warehouse/by warehouse vendor is set to Whse vendor

Otherwise, the system produces the On Hand by Warehouse report, which does not include the returned, sold, adjusted, or received quantities for the month to date.

> **Note:**
>
> The totals on these reports may not match the totals on other inventory or costing reports due to differences in calculation. For example, the decrease in total retail price on the On Hand by Warehouse report might not match the total value of sales on a sales report due to different methods of determining item or SKU prices.

In this topic:

- On Hand by Warehouse List Prompt Screen
- On Hand by Warehouse Report
- On Hand by Vendor by Warehouse Report

On Hand by Warehouse List Prompt Screen

How to display this screen: Enter POHW in the *Fast path* field at the top of any menu, or select Print On Hand by Warehouse from a menu.

Field	Description
Warehouse	The warehouse to include on the report. Leave this field blank to include all warehouses with inventory on hand. *Numeric, 3 positions; optional.*
Vendor	The vendor whose items to include on the report. Leave this field blank to include all vendors from whom you purchase inventory. The report includes items based on the primary Vendor identified in the Item table, although it is possible that you received some or all of the on-hand quantity from a different vendor. **Note:** • If the *By warehouse/by warehouse vendor* field is set to Whse: You cannot specify a vendor. • If the *By warehouse/by warehouse vendor* field is set to Whse vendor: If you specify a vendor, the system produces the On Hand by Warehouse report rather than the On Hand by Warehouse by Vendor report. *Numeric, 7 positions; optional.*

Field	Description
Print cost	Indicates which dollar value to include on the report. Valid values are: Cost: Include the standard, average, or FIFO cost on the report, based on the Costing Method (A25) system control value. If you use FIFO costing, the report does not include the unit cost of each item/SKU, only the extended cost. Retail: Include the most current price for the item/SKU, based on the latest Effective date that is not in the future. Also, the Current Offer (A33) must still be active, based on the End (End date) for the offer. If the item has SKUs, the report includes a price only if there is a SKU Price record; if the item does not have SKUs, the report selects the price from the Item Price record. Vendor list: Include the vendor/item price for the item's primary vendor. The report does not include a vendor/item price if there is no primary vendor, or if there is no vendor/item for the primary vendor. blank: Do not include any cost or price information on the report. *Optional.*
By warehouse/by warehouse vendor	Indicates whether the report should have a separate page for each vendor/warehouse combination. Valid values are: Whse: Generate the On Hand by Warehouse Report, which summarizes the on-hand quantity and dollar value (cost, price, or vendor/item price) for item/SKUs by warehouse. This report does not include the returned, sold, adjusted, or received quantities month-to-date. **Note:** If you select this value, you cannot specify a Vendor. Whse vendor: If no vendor is specified, generate the On Hand by Vendor by Warehouse Report, which summarizes the on-hand quantity and dollar value (cost, price, or vendor/item price) for items, broken out for each selected vendor/warehouse combination. This report also includes the quantities returned, issued, adjusted, and received month-to-date. Otherwise, generate the On Hand by Warehouse report. *Required.*

Completing this screen: Complete each required and any optional fields as described above. Select Submit to generate the report. If you selected Whse at the *By warehouse/by warehouse vendor* field, the system submits the job OHWLST if you selected Whse vendor, the system submits the job OHWVNDLST.

Docking Purchase Orders

Topics in this part: The following topics describe the functions available when using the Dock Purchase Orders function.

- Docking Purchase Orders (MDPO) shows you how to record a purchase order as “docked” before you receive it.
- Printing the Purchase Orders in Docked Status Report (PDPO) shows you how to print the Docked Purchase Order Report and describes the information on the report.
- Printing the Docked but Past Due Purchase Order Report (PDPD) shows you how to create and print the Past Due Docked Purchase Order Report and describes the information on the report.

Docking Purchase Orders (MDPO)

Purpose: You have the option of recording a purchase order as "docked" before you receive it. A docked status indicates that you have received inventory associated with the purchase order, but have not yet confirmed items or quantities. You can dock a purchase order just once, or many times for different deliveries. Until you actually receive the purchase order, inventory inquiries do not indicate that any of the associated inventory is on-hand in your warehouse.

A standard process would include:

- dock the purchase order
- count the merchandise and perform quality control
- receive the purchase order

Docking stock provides a record of when the inventory actually arrived at your warehouse, as opposed to when you completed quality control and recorded the receipt. This may be helpful if there is a question on whether the vendor delivered the merchandise on time.

If you dock stock, the system assigns a purchase order receipt control number at the time you dock it. In a multicompany situation, you can define a unique range of numbers in the Number Assignment table for each company. This will keep each company's data separate.

If you partially receive a docked purchase order, the purchase order status changes back to Open.

In this topic:

- Dock Purchase Orders Screen
- Primary Location Not Defined for PO

Dock Purchase Orders Screen

Use this screen to record a purchase order as "docked" before you receive it through PO Receiving.

How to display this screen: Enter MDPO in the *Fast path* field at the top of any menu or select this option from a menu.

Field	Description
Purchase order number	The number of the purchase order you are docking. You cannot dock a closed purchase order. The system validates that the purchase order number is associated with an open or docked PO. If the purchase order number you enter is not found in your current company, the system will search other companies until it finds a match. Active companies will search only other active companies and inactive companies will search only other inactive companies, based on the setting in the Company table. You must have the Cross company scan field selected in the Company table in order to use this function. *Numeric, 7 positions; required.*
Total number of cartons	The total number of cartons you are docking. *Numeric, 5 positions; required.*
Total weight	The total weight of all the cartons you are docking. *Numeric, 7 positions with a 2 place decimal; optional.*
Shipper tracking number	The tracking number assigned by the delivery company for this shipment. *Numeric, 20 positions; optional.*
Ship via	A code that represents a carrier who delivers merchandise from vendors to your company. Ship via codes are validated against the Purchase Order Ship Via table; see Working with Purchase Order Ship Via (WPSV). *Numeric, 2 positions; optional.*
Comments	A free-form entry field where you can add any additional information to appear on the purchase order you are docking. *Alphanumeric, 25 positions; optional.*
Generate labels	Indicates whether to print carton labels for the purchase order. Valid values are: • Selected (default) = print carton labels • Unselected = do not print carton labels The system will generate one label for each carton. **Note:** Generating carton labels is not currently implemented.
Label printer	The ID of the printer used to print carton labels. The system validates that the printer ID you enter is a valid printer ID defined in Working with Admin Properties (CPRP); if the printer ID you enter is not valid, an error message displays: `Invalid Printer`. *Alphanumeric, 10 positions; required if the Generate labels field is selected.*

Primary Location Not Defined for PO

A message such as the following displays when you try to dock a purchase order containing one or more items not assigned to a primary location:

```
Primary Location not defined for PO (222/1/CRATE).
```

You cannot dock this purchase order until you define a primary location for all of the items on the purchase order. This message is shown if you have the Validate Primary Locations for Purchase Orders (E19) system control value selected.

Printing the Purchase Orders in Docked Status Report (PDPO)

Purpose: The Purchase Orders in Docked Status Report is a list of all the purchase orders that have been docked but not yet received.

When to use: Use the Purchase Orders in Docked Status Report to track the purchase orders that are docked and need to be received. Docking stock provides a record of when the inventory actually arrived at your warehouse, as opposed to when you completed quality control and recorded the receipt. See Docking Purchase Orders (MDPO) .

Printing the Docked but Past Due Purchase Order Report (PDPD)

Purpose: The Docked but Past Due Purchase Orders Report is a list of all the purchase orders that are in a docked status but arrived past their expected delivery date.

When to use: Use the Docked but Past Due Purchase Orders Report to track how many shipments were late in arriving and which vendors exceeded their promised delivery date. This report may be helpful if there is a question on whether the vendor delivered the merchandise on time. See Docking Purchase Orders (MDPO).

Docked But Past Due Screen

Purpose: Use this screen to select the date range to include on the Docked but Past Due Purchase Orders Report.

How to display this screen: Enter PDPD in the *Fast path* field at the top of any menu or select Print Past Due Docked Report from a menu.

Field	Description
Docked start date	The starting date from which you want to run this report. *Numeric, 6 positions (user date format); required.*
Docked end date	The ending date up through which you want to run this report. Enter the same date you entered in the *Docked start date* field if you want to run the report for a single day. *Numeric, 6 positions (user date format); required.*

Instructions: To print the Docked but Past Due Purchase Orders Report.

1. Complete the *Docked start date* and *Docked end date* fields.
2. Select Accept to print the report.

Warehouse Management Integration

In this part: This part includes the following topics:

- Warehouse Management System Integration Overview: Provides an overview of the Warehouse Management Integration.
- Generic Outbound Purchase Order API: Describes how to send purchase order information to an external system.
- Purchase Order Receipt In API: Describes how to process PO receipts received through the generic API.
- Generic Pick In API (Shipments, Voids, and Backorders): Describes how to confirm shipments or void pick slips through the generic API.

For more information see the Order Administration Web Services Guide on https://support.oracle.com My Oracle Support (ID 2953017.1).

Working with PO Receipt Errors (WPRE)

Purpose: Use this menu option to review errors resulting from the *Purchase Order Receipt In API*. These errors are stored in the PO Receipt Error table. See *Purchase Order Receipt In API* for more information, and see *PO Receipt Errors* for an explanation of errors.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Work with PO Receipt Errors Screen

Use this screen to review errors in the *PO Receipt In XML Message (CWReceiptIn)* received from another system.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Errors display on this screen in error date, PO #, PO line # sequence.

How to display this screen: Enter WPRE in the *Fast path* field at the top of any menu or select Work with PO Receipt Errors from a menu.

Field	Description
Error date	The date when the *PO Receipt In XML Message (CWReceiptIn)* was received. This might be different from the *receipt_date* in the message. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Enter a valid date and select OK to display PO receipt errors that match your entry. *Numeric, 6 positions (user date format); optional.*
PO#	The *po_nbr* passed in the message. *Numeric, 7 positions; display-only.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Field	Description
PO Line#	The *po_line_seq_nbr* passed in the message. For more information see the Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 5 positions; display-only.*
Quantity	The *quantity* passed in the message. *Numeric, 7 positions; display-only.* For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Error	A description of the error. See *PO Receipt Errors* for a list of errors. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Alphanumeric, 40 positions; display-only.*

Screen Option	Procedure
Correct a PO receipt that is in error	Select Change for a PO receipt error record to advance to the Change PO Receipt Error Screen.
Delete a PO receipt that is in error	Select Delete for a PO receipt error record to delete it.
Review a PO receipt that is in error	Select Display for a PO receipt error record to advance to the Display PO Receipt Error screen. You cannot change any information on this screen. See the Change PO Receipt Error Screen for field descriptions.
Advance to Inventory Inquiry for the item associated with the PO receipt that is in error	Select Inventory Inquiry for a PO receipt error record to advance to the Display Item/Warehouse Information Screen. An error message similar to the following displays if the item/SKU for the PO receipt that is in error cannot be determined: `PO Detail not found.`
Advance to Purchase Order Inquiry for the PO associated with the PO receipt that is in error	Select PO Inquiry for a PO receipt error record to advance to the First Display Purchase Order Detail Screen. An error message similar to the following displays if the PO # for the PO receipt that is in error cannot be determined: `PO# is invalid.`
Reprocess a PO receipt that is in error	Select Reprocess for a PO receipt error record to reprocess it.
Reprocess all PO receipt records that are in error	Select Reprocess to reprocess all PO receipt error records.
Delete all PO receipt records that are in error	Select Delete all to advance to the Confirm Delete window. Select OK to delete all records; otherwise select Exit to cancel the delete.

Change PO Receipt Error Screen

Purpose: Use this screen to correct the error associated with a PO receipt transaction received through the *Purchase Order Receipt In API*.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

> **Note:**
>
> When you select OK on this screen the system validates that the PO receipt transaction no longer contains errors. If an error exists for the PO receipt transaction, the system displays the error on the screen. You will need to correct the error and select OK, or select Exit to exit the screen without correcting the error. Once you correct all errors associated with the PO receipt transaction, you will need to select Reprocess for the PO receipt transaction in order to process the transaction.

How to display this screen: Select Change for a PO Receipt Error record at the Work with PO Receipt Errors Screen.

Field	Description
Type	Receipt indicates the transaction is a PO receipt transaction. *Required.*
PO#	The PO number that contains the PO line to receive. *Numeric, 7 positions; required.*
PO Line seq#	The PO line sequence number to receive. *Numeric, 5 positions; required.*
Item/SKU	The code for the item and SKU that is defined for the PO line to receive. *Item: Alphanumeric, 12 positions; required.* *SKU: Alphanumeric, 14 positions; required if the item contains SKUs.*
Vendor item	The code for the vendor item defined for the item to receive. *Alphanumeric, 20 positions; optional.*
UPC Type	The type of UPC code defined for the item to receive. Valid values: • Blank = No UPC code. • **EAN-13** • **EAN-8** • **UPC-A** • **UPC-E**
UPC code	The UPC code defined for the item to receive. *Alphanumeric, 14 positions; optional.*
Short SKU	The short SKU code defined for the item to receive. *Numeric, 7 positions; optional.*
Retail ref#	The retail reference number defined for the item to receive. *Numeric, 15 positions; optional.*
Quantity	The quantity of the item on the PO line to receive. *Numeric, 7 positions; required.*

Field	Description
Receipt date	The date the item on the PO line was received into the specified location in the warehouse. *Numeric, 6 positions (user date format); required.*
Receipt time	The time the item on the PO line was received into the specified location and warehouse. *Numeric, 6 positions (HH:MM:SS format); required.*
Cost	The cost of the item. In order to update this field you must have authority to the Override PO Cost (A17) secured feature; otherwise, the *Cost* field is display-only. *Numeric, 11 positions with a 4-place decimal; optional.*
Currency rate	The currency rate defined for the item. *Numeric, 11 positions with a 7-place decimal; optional.*
Customs date	The customs date defined for the item to receive. *Numeric, 6 positions (user date format); optional.*
Whs	A code for the warehouse where the item on the PO line is received. *Numeric, 3 positions; required.*
Location	A code for the location in the warehouse where the item on the PO line is received. *Alphanumeric, 7 positions; required.*
Non-inventory	Indicates whether the item is a non-inventory item. • Selected = The item is a non-inventory item. • Unselected = The item is an inventoried item.
Error	A description of the error associated with the PO receipt transaction. *Alphanumeric, 40 positions; display-only.*

Working with Pick Invoice Errors (WPIE)

Purpose: Use this menu option to review errors resulting from the *Generic Pick In API (Shipments, Voids, and Backorders)*. These errors are stored in the Pick In Error table. See *Pick In Process Overview* for more information, and see Pick Invoice Errors for an explanation of errors.

You cannot correct and resubmit pick in messages through this option. To correct any errors, use the *Generic Pick In API (Shipments, Voids, and Backorders)* to submit a new message.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

In this topic:

- Work with Pick Invoice Errors Screen
- Pick Invoice Errors

Work with Pick Invoice Errors Screen

How to display this screen: Enter WPIE in the *Fast path* field at the top of any menu, or select Work with Pick Invoice Errors from a menu.

Field	Description
Date	The date when the *CWPickIn XML Message* was received. This might be different from the `date_sent` in the message. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). *Numeric, 6 positions (user date format): optional.*
Pick ctrl #	The `pick_control` number passed in the message. *Numeric, 7 positions; optional.*
Order #	The order number associated with the `pick_control` number. The order number is 0 if the system cannot find an order number to match the `pick_control` number. *Numeric, 8 positions; optional.*
Pick Line #	The pick detail line number related to the error. Included only if the error is `Shipped Quantity cannot exceed Printed`; otherwise, the pick line number displayed is 0. *Numeric, 5 positions; display-only.*
Carton #	The carton number related to the error. Included only if the error is `Invalid/Missing Carton Number` or if the error is related to information in the carton elements; otherwise, the carton number displayed is 0. *Numeric, 5 positions; display-only.*

Deleting errors: Select Delete for an error to delete it, or select Delete All to delete all existing errors in your company.

Pick Invoice Errors

The following errors are tracked in the Pick In Error table and are available for review at the Work with Pick Invoice Errors Screen. See *Troubleshooting the Pick In API* for more information on correcting problems with the Pick In API.

For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Error	Explanation
Active Procedure exists	Occurs when: • Someone is in the process of working with the pick slip in Reprinting and Voiding Pick Slips (WVRP or WSVP). • The system is processing a *CWPickIn XML Message* or performing manifesting for the same pick number and pick control number; the system creates the active procedure for the specific pick control number and label number and removes the active procedure once processing completes. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Error	Explanation
Invalid Pick Control Number	The pick control number does not exist or is not in a valid status for update through the Pick In API (for example, the pick control number is in a pre-generated pick status (G Generated No Authorization or H Generated Has Authorization status) or V Voided status).
Invalid Pick Control Number-Pick has been billed	You have already confirmed shipment of the pick control number.
Invalid Ship Via on Carton Header	The `ship_via` indicated in the `CartonHeader` element does not exist in the ship via table; see Working with Ship Via Codes (WVIA) for more information. Occurs for confirmation (C), void/keep reservation (R), or partial backorder (B) transaction types only.
Invalid Transaction Type	The `transaction_type` was something other than B, C, U, R, or V, or was not specified.
Invalid/Missing Carton Number	Occurs if no `carton_nbr` is indicated.
Invalid/Missing Pick Line on Carton Detail	The `pick_line_nbr` indicated in a `CartonDetail` element is not a valid line number for the pick slip, or no `pick_line_nbr` was indicated. Occurs for confirmation (C), void/keep reservation (R), or partial backorder (B) transaction types only.
Invalid/Missing Pick Line on Pick Detail	There is a `pick_line_nbr` indicated `PickDetail` element that is not a valid line number for the pick slip. Occurs for the partial backorder (B) and void/keep reservation (R) transaction types only.
Pick Detail required for Backorder	There was not at least one `PickDetail` element specified. Occurs for partial backorder (B) transaction types only.
Set component quantity not divisable into set qty.	There were inconsistent shipped quantities indicated for set components that would result in incomplete shipment of a set. For example, this error can occur if a set consists of 1 unit of COMPONENT1 and 2 units of COMPONENT2, and the message indicated a shipment of 1 unit of each component. The CWPickIn message for a set item should include a shipped quantity for just the main set item and not the components, as described above under *Pick In Process Overview*. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). If you would like the CWPickIn message to include the components as well as the main set item, the shipped quantities must represent a complete shipment of one or more units of the set. Occurs for partial backorder (B) transaction types only.
Shipped Quantity cannot exceed Printed	The `qty_shipped` indicated in a `PickDetail` element exceeds the printed quantity on the pick slip. Occurs for partial backorder (B) and void/keep reservation (R) transaction types only.

Working with Warehouse Cross-Reference (WWXR)

Purpose: This option is not currently supported.
