Allow mult	<p>Indicates whether to apply the promotion multiple times if the order includes a sufficient required and BOGO quantity:</p> <ul style="list-style-type: none"> <i>Selected</i> = Orders can qualify for this BOGO discount multiple times if the number of qualifying items are multiples of the Req qty plus the BOGO qty. For example, if the promotion specifies “buy one, get one free,” selecting this field enables the customer to also buy two, get two free; buy three, get three free; and so on. <i>Unselected</i> = Apply this BOGO discount once only per order. For example, if the promotion specifies “buy one, get one free,” the customer still receives the BOGO discount on just one unit even if the order includes four, six, or more units.
Free	<p>Indicates whether the BOGO order line is discounted, changed to no charge, or added automatically at no charge.</p> <ul style="list-style-type: none"> <i>No</i> = The item is discounted but not free. With this setting, you need to specify the <i>BOGO qty</i>, <i>BOGO price code</i>, and either the <i>Disc %</i>, <i>Disc \$</i>, or <i>Price</i>. <i>Free</i> = The promotion changes the price of an item on the order to no charge. With this setting, you need to specify the <i>BOGO qty</i> and <i>BOGO price code</i>, but no other discount options. <i>Free auto add</i> = The system adds the <i>Auto add item</i> to the order at no charge. With this setting, you need to specify the <i>Auto add item</i> and a SKU if the item has SKUs. The system adds a unit of the item to the order regardless of whether the item is already on the order.
Auto add item	<p>Indicates the item to add to the order automatically at no charge. You can specify an auto-add item only if the Free field is set to Free auto add; in this case, the item is required, as well as a SKU if the item has SKUs.</p>

 **Note:**
If the Prorate flag is selected, the price of the free item is prorated across the Req qty and the free item.

 **Note:**
This field is labeled Auto item at the *BOGO Discount by Item/Price Code Screen* and the *BOGO Discount by Item/Price Code Screen (Display Mode)*.

Item: 12 positions; required if the Free field is set to Free auto add.
SKU: three 4-position fields; required if the item has SKUs.

Option	Procedure
Create a BOGO discount promotion by price code	See the field descriptions above for more information and BOGO (Buy One/Get One) Discount or Free Gift by Price Code for more information.
	<div data-bbox="1029 428 1378 659" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;">  Note: You can create only one discount for a BOGO promotion by price code. </div>
Change the existing BOGO discount promotion	Select <i>Change</i> for the existing promotion to advance to the <i>BOGO Discount by Item/Price Code Screen</i> . Each field on this screen is described above.
Display the existing BOGO discount	Select <i>Display</i> for the existing promotion to advance to the <i>BOGO Discount by Item/Price Code Screen (Display Mode)</i> . Each field on this screen is described above.

BOGO Discount by Item/Price Code Screen

Purpose: Use this screen to review or change the existing discount set up for a BOGO promotion by price code.

How to display this screen: Select *Change* for the existing discount at the [Work with BOGO Discounts by Item/Price Code Screen](#).

For more information: See the [Work with BOGO Discounts by Item/Price Code Screen](#) for field descriptions.

BOGO Discount by Item/Price Code Screen (Display Mode)

Purpose: Use this screen to review the existing discount set up for a BOGO promotion by price code.

How to display this screen: Select *Display* for the existing discount at the [Work with BOGO Discounts by Item/Price Code Screen](#), or select *Display* for a BOGO promotion at the *Work with Promotions Screen* and click *OK* through the displayed screens.

For more information: Each field on this screen is display-only. See the [Work with BOGO Discounts by Item/Price Code Screen](#) for field descriptions.

Work with Item/Category Exclusions Screen

Purpose: Use this screen to work with items and item categories that are excluded from receiving an order, tiered, item category, or BOGO promotion.

Things to note about item and item category exclusions:

- *Excluded items still included as qualifiers:* Even though the system does not apply a percentage discount or prorated dollar discount amount against the items or item categories you specify here, they are still included when determining whether the

order qualifies for the promotion based on the Qualifying \$ amount, Qualifying qty, and Max qty specified for the promotion, provided the order does not consist entirely of excluded items or item categories.

Example: A promotion requires a Qualifying \$ amount of \$50.00 and an order includes two lines: one for an excluded item with an extended price of \$20.00, and one for a non-excluded item with an extended price of \$35.00. The order qualifies for the promotion based on the merchandise total of \$55.00, even though that total is partially based on an excluded item, although the discount does not apply to the excluded item.

- *Order must include at least one non-excluded item:* Even though the excluded items or item categories are included in the qualifiers, an order still cannot receive the promotion if all of the items on the order are excluded.
- *Discount tier based on entire merchandise total:* When a tiered promotion specifies a percentage discount, the percentage that applies is based on the qualifying merchandise total.

Example: An order includes two lines: one for an excluded item with an extended price of \$20.00, and one for a non-excluded item with an extended price of \$20.00. The promotion specifies a 10% discount for a merchandise total of \$20.00, and a 15% discount for a merchandise total of \$40.00. The system applies a 15% discount to the non-excluded item based on the merchandise total of \$40.00, resulting in a discount amount of \$3.00.

- *Freight and additional freight promotions:* You cannot set up item/category exclusions for freight or additional freight promotions.

How to display this screen: Select *Item/Item Category Exclusions* for a promotion at the *Work with Promotions Screen*.

Field	Description
Promotion code	The promotion that you are creating, or that you selected at the <i>Work with Promotions Screen</i> . Alphanumeric, 7 positions; display-only
Promotion description (unlabeled field to the right of the promotion code)	The description of the promotion. Alphanumeric, 30 positions; display-only.
Category	Enter an item category code to exclude items in the category from the promotion. Category codes are defined in and validated against the Item Category table. See Working with Item Category Codes (WITG) for more information. Alphanumeric, 4 positions; optional.
Item	Enter an item code to exclude the item from the promotion.

 **Note:**

You cannot specify an individual SKU of an item to exclude. If you enter a SKU'd item, all SKU's of the item are excluded.

Item codes are defined in and validated against the Item table. See [Performing Initial Item Entry \(MITM\)](#) for more information.

Alphanumeric, 12 positions; optional.

Instructions: Enter an item category or enter an item code to add a record to the Promotion Item Exclusion table. If you enter an item category or item in error, or if the item or item category is no longer excluded for the promotion, you can delete it.

 **Note:**

You cannot scan for additional records at this screen by entering information in search fields; pressing *Enter* adds your entry to the Promotion Item Exclusion table.

Work with Promotions by Start Date Screen

Purpose: Use this screen to review and work with promotions in ascending start date sequence. Within start date, promotions sorts in ascending promotion code sequence. See [Working with Promotions \(WPRO\)](#) for an overview of how promotions work, examples of each type, and setup instructions.

How to display this screen: Enter *WPRO* in the Fast path field at the top of any menu or select Work with Promotion Values option from a menu.

 **Note:**

The system retains the last view you used in Work with Promotions; instead of advancing to the Work with Promotions by Start Date screen, you may advance to the *Work with Promotions Screen* or [Work with Promotions by End Date Screen](#).

For more information: See the *Work with Promotions Screen* for a description of the fields on this screen and the available screen options.

Work with Promotions by End Date Screen

Purpose: Use this screen to review and work with promotions in ascending end date sequence. Within end date, promotions sorts in ascending promotion code sequence. See [Working with Promotions \(WPRO\)](#) for an overview of how promotions work, examples of each type, and setup instructions.

How to display this screen: Enter *WPRO* in the Fast path field at the top of any menu or select Work with Promotion Values option from a menu.

 **Note:**

The system retains the last view you used in Work with Promotions; instead of advancing to the Work with Promotions by End Date screen, you may advance to the *Work with Promotions Screen* or [Work with Promotions by Start Date Screen](#).

For more information: See the *Work with Promotions Screen* for a description of the fields on this screen and the available screen options.

Promotion Upload

Purpose: Use the promotion upload to create or delete promotions and related tables based on the information in the Promotion Upload table.

You can process the upload by:

1. Creating a Promotion Upload text file. See below for information on file contents.
2. Populating the Promotion Upload table with the contents of the file by:
 - Using the [File Storage API](#) to upload the file contents to the FILE_STORAGE table, and then running the *UPPROMO Upload Promotion Code File* (Program name *PFR0134*, Parameter *PRMUPLD*) periodic function to populate the Promotion Upload table, or
 - Using the [Work with File Uploads \(WUPL\)](#) menu option to upload the records in the file to the Promotion Upload table.

See [Fields Used in the Promotion Upload by Record Type](#) for a sample record of each type of promotion you can upload.
3. Using the contents of the Promotion Upload table to create or update promotions by:
 - selecting *Upload* at the Work with Promotions screen in [Working with Promotions \(WPRO\)](#), or
 - submitting the *PRMOUPL Create or Delete Promotions* periodic function (Program name *PRMOUPL*). See [How to Schedule a Job](#) for information on how to schedule when the system executes a periodic process.

When you submit the update to the promotion records:

- For each Promotion Upload record that is not in error, the upload creates the specified record in the Promotion or related table and deletes the Promotion Upload record.
- For each Promotion Upload record in error, the upload sets the [Processed Flag](#) to *E* and updates the [Error Desc](#) field.

Note:

The upload does not delete records in error from the table or attempt to process them again unless the [Processed Flag](#) and [Error Desc](#) fields are cleared.

- The upload generates the [Promotion Upload Error Records Report](#) regardless of whether there are any errors.
- The upload then clears the PROMOTION_CACHE, which caches Promotion BOGO, Promotion Item Category, and Promotion Source tables. It does not clear the PROMOTION_LIST_CACHE, which caches the Promotion Customer and Promotion Item Exclusion tables. See [Caching](#) for background.

The discussion of the promotion upload in this topic includes:

- [General Rules for Promotion Uploads](#)
- [Promotion Upload Table \(PRMUPLD\)](#)
- [Fields Used in the Promotion Upload by Record Type](#)

- [Promotion Upload Errors](#)
- [Promotion Upload Error Records Report](#)

General Rules for Promotion Uploads

Creation: You can use the upload to create a record in the Promotion table or any of the related tables:

- Promotion BOGO: see [Promotion Creation \(PRM\)](#)
- Promotion BOGO by Price Code: see [Promotion BOGO Creation \(PRB\)](#)
- Promotion Customer: see [Promotion BOGO by Price Code Creation \(PBP\)](#)
- Promotion Discount: see [Promotion Discount Creation \(PMD\)](#)
- Promotion Item Category: see [Promotion Item Category Creation \(PIC\)](#)
- Promotion Item Exclusion: see [Promotion Item Exclusion Creation \(PIE\)](#)
- Promotion Source: see [Promotion Source Creation \(PRS\)](#)

Deletion: You can use the upload to delete a record in the Promotion table and all its related records. The upload does not provide an option to delete a record in a related table without deleting the Promotion record itself.

Update: It is not possible to update a record through the upload.

Note:

To leave any field in the upload file blank, pass a space in an alphanumeric field and a 0 in a numeric field so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.

Promotion Upload Table (PRMUPLD)

The following is a complete list of the fields in the Promotion Upload table. The table includes fields used for all possible record types, creating records in the Promotion table and all related tables.

For more information: See:

- [General Rules for Promotion Uploads](#)
- [Fields Used in the Promotion Upload by Record Type](#)
- [Promotion Upload Errors](#)
- [Promotion Upload Error Records Report](#)

Field	Attributes	Description
Company	numeric, 3 positions	<p>The company where the record should be created or deleted. Defined in and validated against the Company table; see Working with Companies (WCMP) for background.</p> <p><i>Used for record type:</i> All.</p> <p><i>Conditions:</i> Required.</p> <p><i>Error:</i> Invalid Company: the company specified is not valid; however, the record is not listed on the <i>Promotion Upload Error Records Report</i>.</p>
Record Type	alphanumeric, 3 positions	<p>The table where the record should be created or deleted.</p> <p><i>Used for record type:</i> All.</p> <p><i>Conditions:</i> Required.</p> <ul style="list-style-type: none"> • <i>PRM</i> = Promotions: Create a new promotion, or delete an existing promotion and all related records. See Promotion Creation (PRM). • <i>PRB</i> = Promotion BOGO: Used only if the <i>BOGO Grouping by Price Code or Category (L62)</i> system control value is set to <i>CATEGORY</i>. See Promotion BOGO Creation (PRB). • <i>PBP</i> = Promotion BOGO by Price Code: Used only if the <i>BOGO Grouping by Price Code or Category (L62)</i> system control value is set to <i>PRICE CODE</i>. See Promotion BOGO by Price Code Creation (PBP). • <i>PMD</i> = Promotion Discount: Tiered promotion details. See Promotion Discount Creation (PMD). • <i>PRS</i> = Promotion Source: A source code eligible for a promotion. See Promotion Source Creation (PRS). • <i>PIC</i> = Promotion Item Category: Item categories eligible for an item category promotion. See Promotion Item Category Creation (PIC). • <i>PRC</i> = Promotion Customer: Customers or customer price groups eligible for a promotion. See Promotion Customer Creation (PRC). • <i>PIE</i> = Promotion Item Exclusion: Items or item categories excluded from a promotion. See Promotion Item Exclusion Creation (PIE). <p>See General Rules for Promotion Uploads.</p> <p><i>Error:</i> Record type not found: the record type does not match one of the values listed above, or is blank. The record type is case-sensitive, so lowercase entries are invalid.</p>
Request Type	alphanumeric, 1 position	<p>Indicates whether to add a record, or delete a promotion and all related records.</p> <p><i>Used for record type:</i> All.</p> <p><i>Conditions:</i> Required. Valid values:</p> <p><i>A</i> = add a promotion or a related record type</p> <p><i>D</i> = delete a promotion and all its related records. This setting is valid only for a record type of <i>PRM</i> (Promotion). To delete any other record type, you can use the screens in Working with Promotions (WPRO) or use the upload to delete the promotion and all its related records.</p> <p><i>Errors:</i></p> <ol style="list-style-type: none"> 1. Record Already Exists: the Request Type is <i>D</i>, and the Record Type is <i>PIE</i> or <i>PRB</i> 2. Invalid Request Type: 3. Request Type is <i>D</i>, and the Record Type is <i>PRS</i>, <i>PIC</i>, <i>PRC</i>, <i>PMD</i>, or 4. the Request Type is not <i>A</i> or <i>D</i>. The request type is case-sensitive.

Field	Attributes	Description
Sequence #	numeric, 9 positions (CYMMDD format)	A unique number to identify a record in the Promotion Upload table. <i>Used for record type: All.</i> <i>Conditions: Optional; however, required to upload multiple related records for the same promotion and record type at the same time (for example, multiple Promotion Source records for the same promotion).</i>
Record Date	numeric, 7 positions (CYMMDD format)	The date when the record was added. <i>Used for record type: All.</i> <i>Conditions: Required.</i> <i>Error: Invalid Date: no record date is specified.</i>
Processed Flag	alphanumeric, 1 position	The upload sets this flag to <i>E</i> when the record is in error.
Promotion Code	alphanumeric, 7 positions	If the Record Type is <i>PRM</i> , this is the promotion to create or delete; otherwise, this is the promotion associated with the related record, such as a Promotion Source. <i>Used for record type: All.</i> <i>Conditions: Required.</i> <i>Errors:</i> <ol style="list-style-type: none"> 1. Duplicate Promotion Code: the Record Type is <i>PRM</i> and the promotion already exists. 2. Missing Promotion Code: the Promotion Code field is blank for any Record Type. 3. Invalid Promotion Code: the Promotion Code field is invalid for any Record Type. <p>Note:</p> <ol style="list-style-type: none"> 1. The upload does not prevent you from entering the promotion code in lower case; however, you would not be able to enter the promotion code in order entry, and instead would need to select it from a list. 2. If the promotion code is blank for a delete request (the Request Type is <i>D</i>), the upload record is flagged as an error, but the Error Desc remains blank.
Description	alphanumeric, 30 positions	The description of the promotion. <i>Used for record type: PRM.</i> <i>Conditions: Required.</i> <i>Error: Missing Description: the Record Type is PRM and there is no description.</i>
Start Date	numeric, 7 positions (CYMMDD format)	The first date when the promotion is effective. <i>Used for record type: PRM.</i> <i>Conditions: Required.</i> <i>Error: Invalid Start Date: the Record Type is PRM and there is no start date specified, or the date specified is not valid.</i>

Field	Attributes	Description
End Date	numeric, 7 positions (CYYMMDD format)	The last date when the promotion is effective. Must be on or later than the Start Date. <i>Used for record type: PRM.</i> <i>Conditions: Required.</i> <i>Error: Invalid End Date: the Record Type is PRM and:</i> <ul style="list-style-type: none"> • there is no end date specified, or • the end date is earlier than the start date, or • the end date is not a valid date
Popup 1-4	alphanumeric, 30 positions each	The text to display in a pop-up window in order entry. See Pop up window messages 1-4 for background. <i>Used for record type: PRM.</i> <i>Conditions: Optional.</i>
Priority	numeric, 3 positions	The priority in which the system evaluates whether this promotion applies to an order. See Priority for background. <i>Used for record type: PRM.</i> <i>Conditions: Required.</i> <i>Error: Invalid Priority: the Record Type is PRM and the priority is 0.</i>
Promotion Type	alphanumeric, 1 position	The type of discount to apply to orders that qualify for this promotion. <i>Used for record type: PRM.</i> <i>Conditions: Required if you define any order promotion values. Possible settings are:</i> A = Additional freight B = BOGO C = Item Category F = Freight O = Order T = Tiered discount blank = a message-only promotion See About Messaging Promotions or About Discount Promotions for background. <i>Error: Invalid Promotion Type: the Record Type is PRM and the promotion type specified is not one of the values listed above. The promotion type is case-sensitive, so lowercase entries are invalid.</i>
Promotion ID	alphanumeric, 7 position	A code used to identify or group promotion codes for reporting and analysis. <i>Used for record type: PRM.</i> <i>Conditions: Optional.</i>

Field	Attributes	Description
Qualify Amount	numeric, 13 positions with a 2-place decimal	<p>Optionally, specify the total merchandise amount required for the order to qualify for the promotion. See the Qualifying \$ amount (Qualifying dollar amount) for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Valid only for an order, freight, additional freight, or item category promotion (Promotion Type is <i>A, C, F, or O</i>). Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Qualifier for Tier Promotion: there is a qualifying amount and the Promotion Type is <i>T</i> Qualifier Not Valid For Promo Type: there is a qualifying amount and the Promotion Type is <i>B</i>
Free Freight	alphanumeric, 1 position	<p>Set to <i>Y</i> if freight is free of charge with this promotion; otherwise set this field to <i>N</i>. See Free freight for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>F</i> (freight) and there is not a Freight override, PRM Dollar Discount, or PRM Percent Discount specified; a freight promotion must specify only one type of discount.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Discount conflict: both Free freight and Freight override are specified, or no freight discount is specified Only Valid for Freight Promotion: this is not a freight promotion Qualifier Not Valid for Free Freight: The Free freight field was not set to <i>Y, N, or blank</i> for a freight promotion. The field is case-sensitive, so lowercase values are invalid.

 **Note:**

This field is optional when you create a promotion; however, if it is blank instead of set to *N*, you will not be able to apply the promotion to an order. The error message displayed in order entry is *Qualifying criteria not met for this promotion*. To update the field and prevent the error from occurring after you initially create the promotion, you can select *Change* for the promotion at the [Work with Promotions Screen](#) and then click *OK* at the Change Promotion screen.

Field	Attributes	Description
Freight Override	numeric, 13 positions with a 2-place decimal	<p>The override amount to charge for freight with this promotion. See Freight override amount for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>F</i> (freight). Cannot be selected if Free freight, PRM Dollar Discount, or PRM Percent Discount is also selected; a freight promotion must specify only one type of discount.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Discount conflict: both Free freight and Freight override are specified, or no freight discount is specified Qualifier Not Valid for Promo Type: this is not a freight promotion
PRM Dollar Discount	numeric, 13 positions with a 2-place decimal	<p>The dollar discount to apply for an order, item category, freight, or additional freight promotion. See Discount amount for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when Promotion Type is <i>A</i>, <i>C</i>, or <i>O</i> (additional freight, item category, or order). Cannot be specified in combination with another discount. Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Discount required: no discount amount or percent is specified for an additional freight, item category, or order promotion Discount conflict: more than one discount amount or percent is specified for an additional freight, item category, or order promotion

 **Note:**

If a dollar discount is specified for a freight promotion, the [Additional Charge](#) field should specify a valid additional charge code.

Field	Attributes	Description
PRM Percent Discount	numeric, 5 positions with a 2-place decimal	<p>Specify the percentage discount to apply for an order, item category, freight, or additional freight promotion. See Discount percent for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>A, C, F, or O</i> (additional freight, item category, freight, or order). Cannot be specified in combination with another discount. Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Discount required: if no discount amount, percent, or freight override is specified Discount conflict: if more than one discount amount, percent, special price (item category promotion) or freight override is specified
<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If a percentage discount is specified for a freight promotion, the Additional Charge field should specify a valid additional charge code.</p> </div>		
From SCF	alphanumeric, 3 positions	<p>The first (lowest) SCF eligible for a ship via override).</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>A, C, F, or O</i> (additional freight, item category, freight, or order). Valid entry only if there is a Ship Via Override specified; in this case, the From SCF and To SCF are required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Qualifier Not Valid for Promotion Type: this is a BOGO, tiered, or item category promotion (the Promotion Type is <i>B, T, or C</i>), or the SCF range is not valid, and the country does not match the <i>Default Country for Customer Address (B17)</i> Invalid From SCF: The SCF is not valid for the country (either the Override Country, if specified, otherwise, for the <i>Default Country for Customer Address (B17)</i>) The SCF range is not valid, and the country matches the <i>Default Country for Customer Address (B17)</i>

Field	Attributes	Description
To SCF	alphanumeric, 3 positions	<p>The last (highest) SCF eligible for a ship via override). See To SCF for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is A, C, F, or O (additional freight, item category, freight, or order). Valid entry only if there is a Ship Via Override specified; in this case, the From SCF and To SCF are required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> • Qualifier Not Valid for Promotion Type: • this is a BOGO, tiered, or item category promotion (the Promotion Type is B, T, or C), or • the SCF range is not valid, and the country does not match the <i>Default Country for Customer Address (B17)</i>. • Invalid From SCF: • The SCF is not valid for the country (either the Override Country, if specified, otherwise, for the <i>Default Country for Customer Address (B17)</i>). • The SCF range is not valid, and the country matches the <i>Default Country for Customer Address (B17)</i>.
Discount Receipt	alphanumeric, 1 position	<p>Not currently implemented.</p> <p><i>Error: Fields Not In Use: this field is populated.</i></p>
Customer Pct Discount	alphanumeric, 1 position	<p>Not currently implemented.</p> <p><i>Error: Fields Not In Use: this field is populated.</i></p>
Qualify Qty	numeric, 5 positions	<p>The total unit quantity required for an order to qualify for the promotion. See Qualifying quantity for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is NOT B or T (tiered or BOGO). Optional.</p> <p><i>Error: Qualifier Not Valid for Promotion Type: this is a BOGO or tiered promotion (the Promotion Type is B or T).</i></p>

Field	Attributes	Description
US Only	alphanumeric, 1 position	<p>Set this field to <i>Y</i> to restrict a freight or additional freight promotion discount, or ship via override, to states in the continental U.S.A; otherwise set it to <i>N</i>. See Continental USA only for a discussion. <i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>A</i> or <i>F</i> (additional freight or freight). Valid entry only if there is a Ship Via Override specified. Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Continental USA Only Flag: this field is not set to <i>Y</i> or <i>N</i>. This field is case-sensitive, so a lowercase entry causes an error. Qualifier Not Valid for Promotion Type: this is not an additional freight or freight promotion (Promotion Type of <i>A</i> or <i>F</i>).

 **Note:**

This field is optional when you create a promotion; however, if it is blank instead of set to *N*, you will not be able to apply the promotion to an order. The error message displayed in order entry is [Qualifying criteria not met for this promotion](#). To update the field and prevent the error from occurring after you initially create the promotion, you can select [Change](#) for the promotion at the [Work with Promotions Screen](#) and then click [OK](#) at the Change Promotion screen.

Additional Charge	alphanumeric, 2 positions	<p>The additional charge to use when adding a non-prorated discount to an order. See Additional charge code for a discussion. <i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>A</i>, <i>F</i>, or <i>O</i> (additional freight, freight, or order). Optional. Not case-sensitive.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Qualifier Not Valid for Promo Type: The Promotion Type is not <i>A</i>, <i>F</i>, or <i>O</i> (additional freight, freight, or order). Invalid Add'l Chg Code: The additional charge code specified does not exist. Additional Charge Code Required: There is no additional charge code specified for a freight promotion.
--------------------------	---------------------------	--

Field	Attributes	Description
Offer Number	alphanumeric, 3 positions	<p>The offer that must be associated with the source code on the order header for the order to qualify for the promotion. You cannot specify both an offer and a source code as a promotion qualifier. See Qualifying offer for a discussion. Not case-sensitive.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions: Optional.</i></p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Offer: The offer specified is not valid. Either Source code or offer: Both an offer and Source Code are specified.
Pay Type	numeric, 2 positions	<p>The pay type that must be used on the order for the order to qualify for the promotion. See Qualifying pay type for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions: Optional.</i></p> <p><i>Error: Invalid Pay Type: The pay type specified is not valid.</i></p>
Ship Via Override	numeric, 2 positions	<p>The ship via to replace the current ship via on an order as part of the promotion. See Ship Via Override for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions: Used only when the Promotion Type is A, F, or O (additional freight, freight, or order). Optional, but required if the record specifies an Override Country.</i></p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Ship Via Override: The ship via specified is not valid. Override Option Not Valid for Promo Type: The promotion type is not A, F, or O (additional freight, freight, or order).

Field	Attributes	Description
Override Country	alphanumeric, 3 positions	<p>The country eligible to receive the ship via override. See Ship via override and Ship via country for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>A, F, or O</i> (additional freight, freight, or order). Optional, but required if the record specifies a Ship Via Override.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none">Invalid Ship Via Override Country: The country specified is not valid.Ship Via Override Required: The upload record specifies an override country but no Ship via override.

 **Note:**

This field is not case-sensitive; however, if the override country is lower case, you will not be able to apply the promotion to an order. The error message displayed in order entry is *Qualifying criteria not met for this promotion*. To update the field and prevent the error from occurring after you initially create the promotion, you can select *Change* for the promotion at the *Work with Promotions Screen*, correct the Ship via country, and then click *OK* at the Change Promotion screen.

Field	Attributes	Description
Source Code	alphanumeric, 9 positions	<p>The source code that must be on the order header for an order to qualify for the promotion. You cannot specify both a source code and an offer as qualifiers. See Qualifying source for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions: Optional.</i></p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Source Code: The source code specified is not valid. Either Source code or offer: Both an Offer Number and source code are specified.
Required Entry	alphanumeric, 1 position	<p>Set this field to <i>Y</i> to require entry of this promotion in order entry, and to require that it must be included in the order message for the order API; otherwise, set this field to <i>N</i> if the promotion should apply automatically to qualifying orders. See Required entry for a discussion.</p> <p><i>Used for record type: PRM.</i></p> <p><i>Conditions: Optional.</i></p>

 **Note:**

This field is not case-sensitive; however, if the source code is lower case, you will not be able to apply the promotion to an order. The error message displayed in order entry is *Qualifying criteria not met for this promotion*. To update the field and prevent the error from occurring after you initially create the promotion, you can select *Change* for the promotion at the [Work with Promotions Screen](#), click *OK* to advance to the [Work with Qualifying Source Codes Screen](#), and use that screen to delete and re-add the source code.

 **Note:**

This field is optional when you create a promotion; however, if it is blank instead of set to *N*, you will not be able to apply the promotion to an order. The error message displayed in order entry is *Qualifying criteria not met for this promotion*. To update the field and prevent the error from occurring after you initially create the promotion, you can select *Change* for the promotion at the [Work with Promotions Screen](#) and then click *OK* at the *Change Promotion* screen.

Field	Attributes	Description
First Buyer	alphanumeric, 1 position	<p>Set this field to:</p> <p><i>O</i> = to restrict the promotion to customers who have not previously placed any orders</p> <p><i>S</i> = to restrict the promotion to customers who have not previously had an order shipped to them</p> <p>See First time buyer for a discussion.</p> <p><i>Used for record type:</i> PRM.</p> <p><i>Conditions:</i> Optional.</p> <p><i>Error:</i> Invalid First Time Buyer: The field is set to any character other than <i>O</i> or <i>S</i>. This field is case-sensitive, so a lowercase entry causes an error.</p>
Qualify Code	alphanumeric, 1 position	<p>Set this field to:</p> <p><i>O</i> = to include all order lines in the qualifiers for the promotion</p> <p><i>I</i> = to include only items in a specified item category as qualifiers for the promotion</p> <p>See Qualifying \$ amount type for a discussion.</p> <p><i>Used for record type:</i> PRM.</p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>C</i> (item category). Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Qualify Code required: No Qualify Code is specified, but there is a Qualify Amount specified for the item category promotion. Qualifier Not Valid for Promo Type: Possible reasons: <ul style="list-style-type: none"> This is not an item category promotion. The field is not set to <i>O</i> or <i>I</i>. The record type is case-sensitive, so lowercase entries are invalid.
Ship Via Priority	numeric, 1 position	<p>The priority that must be assigned to the ship via on the order header for the order to qualify for the promotion. See Qualifying via priority for a discussion.</p> <p><i>Used for record type:</i> PRM.</p> <p><i>Conditions:</i> Optional.</p>
Special Price	numeric, 13 positions with a 2-place decimal	<p>The price to apply to qualified items for an item category promotion. See Item category special price for a discussion.</p> <p><i>Used for record type:</i> PRM.</p> <p><i>Conditions:</i> Used only when the Promotion Type is <i>C</i> (item category). Optional, but you need to specify either a PRM Dollar Discount, PRM Percent Discount, or Special Price for an item category promotion.</p> <p><i>Error:</i></p> <ul style="list-style-type: none"> Special Price Not Valid: A special price is specified even though the promotion type is not <i>C</i>. Discount Conflict: There is more than one discount (PRM Dollar Discount, PRM Percent Discount, or Special Price) specified for an item category promotion.
Max Qty	numeric, 5 positions	<p>The maximum number of units an order can include to qualify for the promotion. See Max qty for a discussion.</p> <p><i>Used for record type:</i> PRM.</p> <p><i>Conditions:</i> Optional.</p>

Field	Attributes	Description
		The fields that are labeled <i>PRB</i> update the Promotion BOGO table. This table is used only if the <i>BOGO Grouping by Price Code or Category (L62)</i> system control value is set to <i>CATEGORY</i> . See the Work with BOGO Discount Screen (Item Category or Item) for background.
PRB Item Cgy	alphanumeric, 4 positions	<p>An item category that qualifies for the BOGO promotion. See the <i>Item category</i> field at the Work with BOGO Discount Screen (Item Category or Item) for a discussion.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Optional, but you need to specify either a PRB Item Cgy or <i>PRB Item</i> for an item category promotion.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Item Category: The specified item category is invalid. Item Cat or Item as Qualifier: Both PRB Item Cgy and the <i>PRB Item</i> are specified. Item Category Not Valid for Auto Add: You cannot set the <i>PRB Free</i> field to <i>A</i> if you use item category as a qualifier. Missing Item or Item Cat: Neither the PRB Item Cgy or the <i>PRB Item</i> is specified.
PRB Item	alphanumeric, 12 positions	<p>An item that qualifies for the BOGO promotion. See the <i>Item</i> field at the Work with BOGO Discount Screen (Item Category or Item) for a discussion.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Optional, but you need to specify either a PRB Item or <i>PRB Item Cgy</i>.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Item: The item specified is not valid. Item Cat or Item as Qualifier: Both PRB Item Cgy and the PRB Item are specified. Missing Item: A PRB SKU is specified but not an item. Missing Item or Item Cat: Neither the PRB Item Cgy or the <i>PRB Item</i> is specified.

 **Note:**

If you set the *PRB Free* field to *A* to automatically add an item, you should either use the PRB Item field to specify a non-SKU'd item, or use both the PRB Item and PRB SKU fields to specify the particular SKU of a SKU'd item.

Field	Attributes	Description
PRB SKU	alphanumeric, 14 positions	<p>A SKU that qualifies for the BOGO promotion. See the <i>Item</i> field at the <i>Work with BOGO Discount Screen (Item Category or Item)</i> for a discussion.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Optional.</p> <p><i>Errors:</i></p> <ol style="list-style-type: none"> 1. Invalid SKU: The SKU is invalid, or specified for a non-SKU'd item 2. Missing Item: A SKU is specified, but not a PRB Item
PRB Required Qty	numeric, 5 positions	<p>The quantity of the item category, item, or SKU required for the BOGO promotion. Updates the <i>Req qty (required quantity)</i> field for the BOGO Promotion.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Required.</p> <p><i>Error:</i> Missing Required Qty: No required quantity is specified.</p>
PRB BOGO Qty	numeric, 5 positions	<p>The quantity of the item to receive the discount, to be set to no charge, or to be added at no charge. Updates the <i>BOGO qty</i> field for the BOGO Promotion.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Required.</p> <p><i>Error:</i> Missing BOGO Qty: No BOGO quantity is specified.</p>
PRB Discount Pct	numeric, 5 positions with a 2-place decimal	<p>Specify the percentage discount to apply to the BOGO order line. Updates the Disc % at the <i>Work with BOGO Discount Screen (Item Category or Item)</i>. If you do not set the <i>PRB Free</i> field to Y (free) or A (Free Auto Add), you can specify either a PRB Discount Pct, PRB Discount Amt, or PRB Spc Price.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Optional.</p>
PRB Discount Amt	numeric, 13 positions with a 2-place decimal	<p>Specify the discount amount to apply to the BOGO order line. Updates the Disc \$ at the <i>Work with BOGO Discount Screen (Item Category or Item)</i>. If you do not set the <i>PRB Free</i> field to Y (free) or A (Free Auto Add), you can specify either a PRB Discount Pct, PRB Discount Amt, or PRB Spc Price.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Optional.</p>
PRB Spc Price	numeric, 13 positions with a 2-place decimal	<p>Specify the special price to apply to the BOGO order line. Updates the Price at the <i>Work with BOGO Discount Screen (Item Category or Item)</i>. If you do not set the <i>PRB Free</i> field to Y (free) or A (Free Auto Add), you can specify either a PRB Discount Pct, PRB Discount Amt, or PRB Spc Price.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Optional.</p>

Field	Attributes	Description
PRB Multiple Allowed	alphanumeric, 1 position	<p>Set this field to <i>Y</i> to allow the BOGO discount to apply multiple times to an order, or set it to <i>N</i> to allow the discount to apply just once per order. See the Allow mult (allow multiples) field for background.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Optional (but if you leave this field blank, the system treats it as a setting of <i>N</i> when evaluating the BOGO promotion for an order). Case-sensitive.</p> <p><i>Error:</i> Invalid Multiple Allowed: The setting was not <i>N</i>, <i>Y</i>, or blank.</p>
PRB Free	alphanumeric, 1 position	<p>Use this field to indicate whether the BOGO order line is discounted, changed to no charge, or added automatically at no charge. Valid values:</p> <p><i>N</i> = The item already on the order is discounted. You need to specify either a PRB Discount Pct, PRB Discount Amt, or PRB Spc Price.</p> <p><i>Y</i> = The item already on the order is changed to no charge. With this setting, you should not specify a PRB Discount Pct, PRB Discount Amt, or PRB Spc Price.</p> <p><i>A</i> = The promotion adds the PRB Item (and PRB SKU, if the item has SKU's) to the order at no charge. With this setting, you should not specify a PRB Discount Pct, PRB Discount Amt, or PRB Spc Price, and you should use the PRB Item and PRB SKU fields to specify a valid non-SKU'd item or a particular SKU of a SKU'd item.</p> <p><i>Used for record type: PRB.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>CATEGORY</i>. Required.</p> <p><i>Error:</i> Required for Record Type: This field is not set to <i>N</i>, <i>Y</i>, or <i>A</i> for a <i>PRB</i> record.</p> <p>The fields that are labeled <i>PBP</i> update the Promotion BOGO by Price Code table. This table is used only if the <i>BOGO Grouping by Price Code or Category (L62)</i> system control value is set to <i>PRICE CODE</i>. See the Work with BOGO Discounts by Item/Price Code Screen for more information.</p>
PBP Price Code	numeric, 3 positions	<p>The price code required to qualify for the promotion. Updates the Price code at the Work with BOGO Discounts by Item/Price Code Screen.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. The promotion can use either a price code or an item as a qualifier. Required if there is no PBP Item specified.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Price Code or Item as Qualifier: Both the PBP Price Code and the PBP Item are specified, or neither is specified. Invalid Price Code: The PBP Price code specified is invalid.

Field	Attributes	Description
PBP Item	alphanumeric, 12 positions	<p>The item required to qualify for the promotion. Updates the Item at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. The promotion can use either a price code or an item as a qualifier. Required if there is no PBP Price Code specified. Not case-sensitive.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Price Code or Item as Qualifier: Both the PBP Price Code and the PBP Item are specified, or neither is specified Invalid Item: The PBP Item specified is invalid. Missing Item: There is a PBP Sku specified but no PBP Item.
PBP Sku	alphanumeric, 14 positions	<p>The SKU required to qualify for the promotion. Updates the SKU at the <i>Work with BOGO Discounts by Item/Price Code Screen</i></p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO), the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>, and the PBP Item is a SKU'd item. Optional, even if the PBP Item has SKU's.</p> <p><i>Error:</i> Invalid SKU:</p> <ul style="list-style-type: none"> The PBP Item is not a SKU'd item, but a SKU is specified. The PBP Sku specified is not valid for the PBP Item.
PBP Required Amount	numeric, 13 positions with a 2-place decimal	<p>The dollar value total required for the PBP Required Qty to qualify for the promotion. Updates the Req Amt at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. Required if there is no PBP Required Qty; otherwise, optional (you can specify both a required quantity and a required amount).</p> <p><i>Error:</i> Missing Bogo Qualifier: No PBP Required Qty or PBP Required Amount is specified.</p>
PBP Required Qty	numeric, 5 positions	<p>The total quantity required of the PBP Price Code or PBP Item to qualify for the promotion. Updates the Req Amt at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. If there is also a PBP Required Amount, then the number of units specified here must meet or exceed the PBP Required Amount; however, if the PBP Required Qty is 99999, that means that a quantity of 1 or more meets the requirement for the promotion. Required if there is no PBP Required Amount; otherwise, optional (you can specify both a required quantity and a required amount).</p> <p><i>Error:</i> Missing Bogo Qualifier: No PBP Required Qty or PBP Required Amount is specified.</p>

Field	Attribute	Description
PBP BOGO Prc	numeric, 3 positions	<p>The price code eligible for the promotion discount or special price. Updates the BOGO price code at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. With this setting, the PBP Free flag should be set to <i>N</i>, no PBP Auto Add item or PBP Add SKU should be specified, and the PBP BOGO Qty and a discount (either the PBP Discount Pct, PBP Discount Amount, or PBP Special Price) are required. Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid BOGO Price Code: The PBP BOGO Prc specified is not valid. Price Code or Item As Qualifier: A PBP BOGO Prc is specified and the PBP Free flag is set to <i>A</i>.
PBP BOGO Qty	numeric, 5 positions	<p>The quantity of the item to receive the discount percentage, discount amount, or special price. Updates the BOGO qty at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO), and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. With this setting, the PBP Free flag should be set to <i>N</i>, no PBP Auto Add item or PBP Add SKU should be specified, and the PBP BOGO Prc (price code) and a discount (either the PBP Discount Pct, PBP Discount Amount, or PBP Special Price) are required. Required if the PBP Free setting is not <i>Y</i> or <i>A</i>.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Price Code or Item as Benefit: A PBP BOGO Qty is specified and the PBP Free flag is set to <i>A</i>. Auto Add Not Selected: No PBP BOGO Qty is specified, and the PBP Free flag is not set to <i>A</i>.
PBP Discount Pct	numeric, 5 positions with a 2-place decimal	<p>The percentage discount to apply to the PBP BOGO Qty. Updates the Disc % at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO), the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>, and the PBP Free setting is <i>N</i>; in this case, either the PBP Discount Pct, PBP Discount Amount, or the PBP Special Price is required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Missing Bogo Discount: None of the required discounts (PBP Discount Pct, PBP Discount Amount, or the PBP Special Price) are specified. BOGO Discount Conflict: More than one of the required discounts (PBP Discount Pct, PBP Discount Amount, or the PBP Special Price) is specified.

Field	Attributes	Description
PBP Discount Amount	numeric, 13 positions with a 2-place decimal	<p>The discount amount to the PBP BOGO Qty. Updates the Disc \$ at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO), the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>, and the PBP Free setting is N; in this case, either the PBP Discount Pct, PBP Discount Amount, or the PBP Special Price is required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Missing Bogo Discount: None of the required discounts (PBP Discount Pct, PBP Discount Amount, or the PBP Special Price) is specified. BOGO Discount Conflict: More than one of the required discounts (PBP Discount Pct, PBP Discount Amount, or the PBP Special Price) is specified.
PBP Special Price	numeric, 13 positions with a 2-place decimal	<p>The special price to apply to the PBP BOGO Qty. Updates the Price at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO), the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>, and the PBP Free setting is N; in this case, either the PBP Discount Pct, PBP Discount Amount, or the PBP Special Price is required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Missing Bogo Discount: None of the required discounts (PBP Discount Pct, PBP Discount Amount, or the PBP Special Price) are specified. BOGO Discount Conflict: More than one of the required discounts (PBP Discount Pct, PBP Discount Amount, or the PBP Special Price) is specified.
PBP Prorate Disc	alphanumeric, 1 position	<p>Set this flag to N to apply the total discount amount to the discounted or free item, or set it to Y to prorate the discount across the required quantity and the BOGO quantity. Updates the Prorate flag at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. PBP Multiple Allowed	alphanumeric, 1 position	<p>Set this flag to N if the promotion can apply just once to an order, or set it to Y if the promotion can apply multiple times when there is a sufficient quantity of the specified item or price code. Updates the Allow mult flag at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is B (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. Case-sensitive. Required.</p> <p><i>Error: Invalid Allow Multiples Value:</i> The PBP Multiple Allowed flag is not set to Y or N.</p>

Field	Attributes	Description
PBP Free	alphanumeric, 1 position	<p>Indicates the type of benefit for the promotion:</p> <p><i>A</i> = Free Auto Add: Add the PBP Auto Add item to the order automatically.</p> <p><i>N</i> = No: There is no auto-add item. Apply a discount or a special price to the BOGO quantity.</p> <p><i>Y</i> = Free: There is no auto-add item. Set the BOGO quantity to no charge.</p> <p>Updates the Free field at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO) and the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>. Case-sensitive. Required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> • <i>Price Code or Item as Benefit:</i> The PBP Free field is set to <i>A</i> (auto-add), but there is also a PBP BOGO Qty specified; or there is no PBP Auto Add item specified; or the PBP Add SKU is not a valid SKU for the PBP Auto Add. • <i>Price Code or Item As Qualifier:</i> The PBP Free field is set to <i>A</i> (auto-add), but there is also a PBP BOGO Prc specified. • <i>Required Field For This Type:</i> The PBP Free field is not set to <i>A, N, or Y</i>. • <i>Missing Bogo Discount:</i> The PBP Free field is set to <i>N</i>, but a PBP Auto Add item is specified.
PBP Auto Add	alphanumeric, 12 positions	<p>Indicates the item to add to the order. Updates the Auto add item field at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO), the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>, and the PBP Free flag is set to <i>A</i>. Required if the PBP Free flag is set to <i>A</i>. Case-sensitive only for non-SKU'd items.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> • <i>Missing Bogo Qualifier:</i> An auto-add item is specified as well as a PBP Discount Pct or PBP Discount Amount. • <i>Price Code or Item As Qualifier:</i> An auto-add item is specified as well as a PBP BOGO Prc. • <i>Invalid Auto Add Item:</i> The item specified is invalid. • <i>Missing Auto Add SKU:</i> The item specified has SKU's, but no PBP Add SKU is specified. • <i>Auto Add Not Selected:</i> An item is specified, but the PBP Free flag is set to <i>Y</i> rather than <i>A</i>. • <i>Price Code or Item as Benefit:</i> The PBP Add SKU specified is not a valid SKU for this item.

Field	Attributes	Description
PBP Add SKU	alphanumeric, 14 positions	<p>The SKU of the PBP Auto Add item to add to the order. Updates the SKU for the Auto add item at the <i>Work with BOGO Discounts by Item/Price Code Screen</i>.</p> <p><i>Used for record type: PBP.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>B</i> (BOGO), the <i>BOGO Grouping by Price Code or Category (L62)</i> is set to <i>PRICE CODE</i>, and the PBP Free flag is set to <i>A</i>. Required if the PBP Free flag is set to <i>A</i> and the PBP Auto Add item has SKU's. Not case-sensitive.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Auto Add SKU: A PBP Add SKU is specified, but the PBP Auto Add item does not have SKU's. Missing Auto Add SKU: No PBP Add SKU is specified, and the PBP Auto Add item has SKU's. <p>The fields that are labeled <i>PMD</i> update the Promotion Discount table. This table is used only if for tiered promotions. See the Work with Promotion Discounts Screen for background.</p>
PMD Discount Pct	numeric, 5 positions with a 2-place decimal	<p>The percentage to discount the order when it meets the requirement for this tier but not the next. See the Percent discount field on the <i>Work with Promotion Discounts Screen</i> for a discussion.</p> <p><i>Used for record type: PMD.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>T</i> (tiered). You can specify either the PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's) for each record. Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Tier Discount Conflict: The record includes a PMD Discount Amt or PMD Item (and PMD SKU if the item has SKU's) in addition to the PMD Discount Pct. Missing Tier Discount: The record did not include a PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's).
PMD Discount Amt	numeric, 13 positions with a 2-place decimal	<p>The amount to discount the order when it meets the requirement for this tier but not the next. See the Dollar discount field on the <i>Work with Promotion Discounts Screen</i> for a discussion.</p> <p><i>Used for record type: PMD.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>T</i> (tiered). You can specify either the PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's) for each record. Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Tier Discount Conflict: The record includes a PMD Discount Amt or PMD Item (and PMD SKU if the item has SKU's) in addition to the PMD Discount Pct. Missing Tier Discount: The record did not include a PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's).

Field	Attributes	Description
PMD Dollars	numeric, 13 positions with a 2-place decimal	<p>The merchandise total required for the order to qualify for the tier. See the Merch amount field on the <i>Work with Promotion Discounts Screen</i> for a discussion.</p> <p><i>Used for record type: PMD.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>T</i> (tiered). Required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> • Missing PMD Dollars: No PMD Dollars amount is specified. • Record Already Exists : There is already a Promotion Discount record for the specified promotion and merchandise total.
PMD Item	alphanumeric, 12 positions	<p>The item to add to the order when it meets the requirement for this tier but not the next. See the Free item field on the <i>Work with Promotion Discounts Screen</i> for a discussion.</p> <p><i>Used for record type: PMD.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>T</i> (tiered). You can specify either the PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's) for each record. Optional. The PMD SKU is required if this is a SKU'd item.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> • Tier Discount Conflict: The record includes a PMD Discount Pct, or PMD Discount Amt in addition to the PMD Item (and PMD SKU if the item has SKU's). • Missing Tier Discount: The record did not include a PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's). • Invalid Discount Item: The item specified is invalid.
PMD SKU	alphanumeric, 14 positions	<p>The SKU of the PMD item to add to the order. See the Free item field on the <i>Work with Promotion Discounts Screen</i> for a discussion.</p> <p><i>Used for record type: PMD.</i></p> <p><i>Conditions:</i> Used only when the promotion type is <i>T</i> (tiered), and there is a PMD Item specified. You can specify either the PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's) for each record. Optional.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> • Tier Discount Conflict: The record includes a PMD Discount Pct, or PMD Discount Amt in addition to the PMD Item (and PMD SKU if the item has SKU's). • Missing Tier Discount: The record did not include a PMD Discount Pct, PMD Discount Amt, or PMD Item (and PMD SKU if the item has SKU's). Invalid Discount SKU: • Invalid Discount SKU: The SKU specified is invalid; the PMD Item does not have SKU's; or there is no PMD Item specified. <p>The following field updates the Promotion Source table. You can create one or more Promotion Source records for any promotion type. The Source Code field, used in the PRM record type, also creates a record in the Promotion Source table.</p>

Field	Attributes	Description
PRS Source	alphanumeric, 9 positions	<p>A source code that qualifies an order for the promotion if the source is on the order header. If you specify a source code in this field, it creates a record in the Promotion Source table. See Qualifying source for a discussion.</p> <p><i>Used for record type: PRS.</i></p> <p><i>Conditions: Required.</i></p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Source Code: The source code specified is not valid. Missing Source: No source code is specified. Record Already Exists: There is already a Promotion Source record for the specified promotion and source code.

 **Note:**

This field is not case-sensitive; however, if the source code is lower case, you will not be able to apply the promotion to an order. The error message displayed in order entry is Qualifying criteria not met for this promotion. To update the field and prevent the error from occurring after you initially create the promotion, you can select *Change* for the promotion at the [Work with Promotions Screen](#), click *OK* to advance to the [Work with Qualifying Source Codes Screen](#), and use that screen to delete and re-add the source code.

The following fields that are labeled *PRC* update the Promotion Customer table. You can create one or more Promotion Customer records for any promotion type. See the [Work with Qualifying Customer/Price Groups Screen](#) for background.

PRC Cust Num	numeric, 9 positions	<p>A customer who is eligible for the promotion. See the Work with Qualifying Customer/Price Groups Screen for a discussion.</p> <p><i>Used for record type: PRC.</i></p> <p><i>Conditions: Either the PRC Cust Num or the PRC Cust Group is required.</i></p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Customer Number: The customer number specified is invalid. Missing Customer/CPG: Neither a customer number or a customer price group is specified. Customer/CPG Conflict: Both a customer number and a customer price group are specified.
---------------------	----------------------	---

Field	Attributes	Description
PRC Cust Group	alphanumeric, 4 positions	<p>A customer price group that is eligible for the promotion. See the <i>Work with Qualifying Customer/Price Groups Screen</i> for a discussion.</p> <p><i>Used for record type: PRC.</i></p> <p><i>Conditions:</i> Either the PRC Cust Num or the PRC Cust Group is required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Customer Price Group: The customer price group specified is invalid. Missing Customer/CPG: Neither a customer number or a customer price group is specified. Customer/CPG Conflict: Both a customer number and a customer price group are specified. <p>The following field updates the Promotion Item Category table. You can create one or more Promotion Item Category records for an item category promotion. See the <i>Work with Qualifying Item Categories Screen</i> for background.</p>
PIC Item Cgy	alphanumeric, 4 positions	<p>An item category that is eligible for the promotion. See the <i>Work with Qualifying Item Categories Screen</i> for a discussion.</p> <p><i>Used for record type: PIC.</i></p> <p><i>Conditions:</i> Required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Item Category: The item category code is not valid. Missing Item Category: No item category code is specified. <p>The following fields that are labeled <i>PIE</i> update the Promotion Item Exclusion table. You can create one or more Promotion Item Exclusion records for any promotion type. See the <i>Work with Item/Category Exclusions Screen</i> for background.</p>
PIE Item	alphanumeric, 12 positions	<p>An item that is ineligible for the promotion. See the <i>Work with Item/Category Exclusions Screen</i> for a discussion.</p> <p><i>Used for record type: PIE.</i></p> <p><i>Conditions:</i> Either the PIE Item or the PIE Item Cgy is required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Item: The item specified is invalid. Missing Item\Item Category: Neither the PIE Item or the PIE Item Cgy is specified. Item\Item Category Conflict: Both the PIE Item or the PIE Item Cgy are specified.
PIE Item Cgy	alphanumeric, 4 positions	<p>An item category that is ineligible for the promotion. See the <i>Work with Item/Category Exclusions Screen</i> for a discussion.</p> <p><i>Used for record type: PIC.</i></p> <p><i>Conditions:</i> Either the PIE Item or the PIE Item Cgy is required.</p> <p><i>Errors:</i></p> <ul style="list-style-type: none"> Invalid Item Category: The item category specified is not valid. Field	Attributes	Description
The upload updates the following field if the upload record is in error.		
Error Desc	alphanumeric, 45 positions	The description of the error. See Promotion Upload Errors for a list.

Fields Used in the Promotion Upload by Record Type

In this topic:

- [Promotion Creation \(PRM\)](#)
- [Promotion Deletion](#)
- [Promotion BOGO Creation \(PRB\)](#)
- [Promotion BOGO by Price Code Creation \(PBP\)](#)
- [Promotion Discount Creation \(PMD\)](#)
- [Promotion Source Creation \(PRS\)](#)
- [Promotion Customer Creation \(PRC\)](#)
- [Promotion Item Category Creation \(PIC\)](#)
- [Promotion Item Exclusion Creation \(PIE\)](#)

Promotion Creation (PRM)

Use a [Record Type](#) of *PRM* to create or update a record in the Promotion table. See the [Create Promotion Screen](#) for background on the fields in this table.

The required and optional fields vary based on the [Promotion Type](#).

For details, see:

- [Order Promotion Fields](#)
- [Freight Promotion Fields](#)
- [Additional Freight Promotion Fields](#)
- [Item Category Promotion Fields](#)
- [Tiered Promotion Fields](#)
- [BOGO Promotion Fields](#)

Order Promotion Fields

Required fields:

- *Company*
- *Record Type: PRM*
- *Request Type: A or D*
- *Record Date*
- *Promotion Code*
- *Description*
- *Start Date*
- *End Date*
- *Priority*
- *Promotion Type: O*
- *PRM Dollar Discount OR PRM Percent Discount*

Optional fields:

- *Popup 1-4*
- *Promotion ID*
- *Qualify Amount*
- *From SCF*
- *To SCF*
- *Qualify Qty*
- *US Only*
- *Additional Charge*
- *Offer Number OR Source Code*
- *Pay Type*
- *Ship Via Override*
- *Override Country*
- *Required Entry*
- *First Buyer*
- *Ship Via Priority*
- *Max Qty*

Sample PRM Order promotion upload record:

```
7|PRM|A|1|1150414||PUORDER|PUORDER PROMOTION DESCRIPTION|1150401|1150601|POPUP
WINDOW MESSAGE 1|POPUP WINDOW MESSAGE 2|POPUP WINDOW MESSAGE 3|POPUP WINDOW
MESSAGE 4|1|O|PROMOID|5.95||.00||||1|OA|WEB|4|4|US|N|O|1|.00|10||||0|
0|.00|.00|.00||0|||.00|0|0|0|.00|.00|.00|||||.00|.00||||0|||||0|.00|5.00|.00
```

Additional uploads for an order promotion: You can also upload one or more Promotion Source, Promotion Customer, and Promotion Item Exclusion records for an order promotion. See *Promotion Source Creation (PRS)*, *Promotion Customer Creation (PRC)*, and *Promotion Item Exclusion Creation (PIE)* for more information.

Freight Promotion Fields

Required fields:

- *Company*
- *Record Type: PRM*
- *Request Type: A*
- *Record Date*
- *Promotion Code*
- *Description*
- *Start Date*
- *End Date*
- *Priority*
- *Promotion Type: F*
- *Free Freight OR Freight Override OR PRM Dollar Discount OR PRM Percent Discount (with Additional Charge required for PRM Dollar Discount OR PRM Percent Discount)*

Optional fields:

- *Popup 1-4*
- *Promotion ID*
- *Qualify Amount*
- *From SCF*
- *To SCF*
- *Qualify Qty*
- *US Only*
- *Offer Number OR Source Code*
- *Pay Type*
- *Ship Via Override*
- *Override Country*
- *Required Entry*
- *First Buyer*
- *Ship Via Priority*
- *Max Qty*

Sample PRM Freight promotion upload record:

```
7|PRM|A|2|1150414||PUFRT|PUFRT PROMOTION DESCRIPTION|1150401|1150601|POPUP
WINDOW MESSAGE 1|POPUP WINDOW MESSAGE 2|POPUP WINDOW MESSAGE 3|POPUP
WINDOW MESSAGE 4|2|F|PROMOID|6.95|Y|.00|||||1|Y||WEB|4|4|US|N|O||1|.00|

0|.00|.00|.00
```

Additional uploads for a freight promotion: You can also upload one or more Promotion Source or Promotion Customer records for a freight promotion. See *Promotion Source Creation (PRS)* and *Promotion Customer Creation (PRC)* for more information.

Additional Freight Promotion Fields

Required fields:

- *Company*
- *Record Type: PRM*
- *Request Type: A*
- *Record Date*
- *Promotion Code*
- *Description*
- *Start Date*
- *End Date*
- *Priority*
- *Promotion Type: A*
- *PRM Dollar Discount OR PRM Percent Discount*

Optional fields:

- *Popup 1-4*
- *Promotion ID*
- *Qualify Amount*
- *From SCF*
- *To SCF*
- *Qualify Qty*
- *US Only*
- *Offer Number OR Source Code*
- *Pay Type*
- *Ship Via Override*
- *Override Country*
- *Required Entry*
- *First Buyer*
- *Ship Via Priority*
- *Max Qty*

Sample PRM Additional Freight promotion upload record:

```
7|PRM|A|3|1150414||PUADLFR|PUADLFR PROMOTION DESCRIPTION|1150401|1150601|POPUP
WINDOW MESSAGE 1|POPUP WINDOW MESSAGE 2|POPUP WINDOW MESSAGE 3|POPUP WINDOW
MESSAGE 4|3|A|PROMOID|5.00||.00|||||1|Y|A|WEB|4|4|US||N|O||1|.00|10|||0|
0|.00|.00|.00|||0|||.00|0|0|0|.00|.00|.00|||||.00|.00|||||0|||||0|.00|.00|.00
```

Additional uploads for an additional freight promotion: You can also upload one or more Promotion Source or Promotion Customer records for an additional freight promotion. See *Promotion Source Creation (PRS)* and *Promotion Customer Creation (PRC)* for more information.

Item Category Promotion Fields**Required fields:**

- [Company](#)
- [Record Type](#): PRM
- [Request Type](#): A
- [Record Date](#)
- [Promotion Code](#)
- [Description](#)
- [Start Date](#)
- [End Date](#)
- [Priority](#)
- [Promotion Type](#): C
- [PRM Dollar Discount](#) OR [PRM Percent Discount](#) OR [Special Price](#)

Optional fields:

- [Popup 1-4](#)
- [Promotion ID](#)
- [Qualify Amount](#)
- [Qualify Qty](#)
- [Offer Number](#) OR [Source Code](#)
- [Pay Type](#)
- [Required Entry](#)
- [First Buyer](#)
- [Qualify Code](#)
- [Max Qty](#)

Sample PRM Item Category promotion upload record:

```
7|PRM|A|4|1150414||PUITMCT|PUITMCT PROMOTION DESCRIPTION|1150401|1150601|
POPUP WINDOW MESSAGE 1|POPUP WINDOW MESSAGE 2|POPUP WINDOW MESSAGE 3|POPUP
WINDOW MESSAGE 4|4|C|PROMOID|5.95||.00|||||1|||WEB|4|0|||N|O|O|1|10.00|
10||||0|0|.00|.00|.00|||0|||.00|0|0|0|.00|.00|.00|||||.00|.00||||0|||||
0|.00|.00|.00
```

Additional uploads for an item category promotion: An item category promotion also requires one or more Promotion Item Category records; see *Promotion Item Category Creation (PIC)* for more information.

You can also upload one or more Promotion Source or Promotion Customer records for an item category promotion. See *Promotion Source Creation (PRS)* and *Promotion Customer Creation (PRC)* for more information.

Tiered Promotion Fields**Required fields:**

- [Company](#)

- *Record Type*: PRM
- *Request Type*: A
- *Record Date*
- *Promotion Code*
- *Description*
- *Start Date*
- *End Date*
- *Priority*
- *Promotion Type*: T

Optional fields:

- *Popup 1-4*
- *Offer Number OR Source Code*
- *Pay Type*
- *Required Entry*
- *First Buyer*
- *Qualify Code*
- *Max Qty*

Sample PRM Tiered promotion upload record:

```
7|PRM|A|5|1150414||PUTIERD|PUTIERD PROMOTION DESCRIPTION|1150401|1150601|POPUP
WINDOW MESSAGE 1|POPUP WINDOW MESSAGE 2|POPUP WINDOW MESSAGE 3|POPUP WINDOW
MESSAGE 4|5|T|PROMOID|0|.00|||0|||0|0|||1|.00|0|||0|0|.00|.00|.00||
0|||.00|0|0|0|.00|.00|.00|||.00|.00|||0|||0|.00|.00|.00
```

Additional uploads for a tiered promotion: A tiered promotion also requires one or more Promotion Discount records; see *Promotion Discount Creation (PMD)* for more information.

You can also upload one or more Promotion Source, Promotion Customer, and Promotion Item Exclusion records for a tiered promotion. See *Promotion Source Creation (PRS)*, *Promotion Customer Creation (PRC)*, and *Promotion Item Exclusion Creation (PIE)* for more information.

BOGO Promotion Fields**Required fields:**

- *Company*
- *Record Type*: PRM
- *Request Type*: A
- *Record Date*
- *Promotion Code*
- *Description*
- *Start Date*
- *End Date*
- *Priority*

- *Promotion Type: B*

Optional fields:

- *Popup 1-4*
- *Offer Number OR Source Code*
- *Pay Type*
- *Required Entry*
- *First Buyer*
- *Qualify Code*
- *Max Qty*

Sample PRM BOGO promotion upload record:

```
7|PRM|A|6|1150414||PUBOGO|PUBOGO PROMOTION DESCRIPTION|1150401|1150601|
POPUP WINDOW MESSAGE 1|POPUP WINDOW MESSAGE 2|POPUP WINDOW MESSAGE 3|POPUP
WINDOW MESSAGE 4|6|B|PROMOID|0.00||.00|||0||WEB|4|0||N|0||1|.00|10|||
0|0|.00|.00|.00|||0|||.00|0|0|0|.00|.00|.00||||.00|.00|||0|||
0|.00|.00|.00
```

Additional uploads for a BOGO promotion: Depending on the setting of the *BOGO Grouping by Price Code or Category (L62)* system control value, a BOGO promotion also requires:

- one or more Promotion BOGO records if the system control value is set to *CATEGORY*; see *Promotion BOGO Creation (PRB)* for more information.
- one or more Promotion BOGO by Price Code records if the system control value is set to *PRICE CODE*; see *Promotion BOGO by Price Code Creation (PBP)* for more information.

You can also upload one or more Promotion Source, Promotion Customer, and Promotion Item Exclusion records for a tiered promotion. See *Promotion Source Creation (PRS)*, *Promotion Customer Creation (PRC)*, and *Promotion Item Exclusion Creation (PIE)* for more information.

Promotion Deletion

To delete a promotion and all its related records:

Required fields:

- *Company*
- *Record Type: PRM*
- *Request Type: D*
- *Record Date*
- *Promotion Code*

Any records for the promotion in the following tables are deleted:

- Promotion BOGO
- Promotion BOGO by Price Code
- Promotion Customer
- Promotion Discount

- Promotion Item Category
- Promotion Item Exclusion
- Promotion Source

Sample PRM Delete promotion upload record:

```
7|PRM|D|7|1150414||PUDELTE|PUDELTE PROMOTION DESCRIPTION|1150401|1150601|POPUP
WINDOW MESSAGE 1|POPUP WINDOW MESSAGE 2|POPUP WINDOW MESSAGE 3|POPUP WINDOW
MESSAGE 4|7||PROMOID|5.00||.00|||1|Y|N|WEB|4|4|US|SOURCE7|N|O|O|1|.00|10|||0|
0|.00|.00|.00|||0|||.00|0|0|0|.00|.00|.00|||1|.00|.00|||0|||1|0|.00|.00|.00
```

Promotion BOGO Creation (PRB)

You can create one or more Promotion BOGO records for a BOGO promotion. The system uses this table only if the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *CATEGORY*; otherwise, the system uses the Promotion BOGO by Price Code table when evaluating and applying BOGO promotions.

See the *Work with BOGO Discount Screen (Item Category or Item)* for background on BOGO promotions that use these records.

Note:

Setting the *BOGO Grouping by Price Code or Category (L62)* system control value to *PRICE CODE* does not prevent you from creating records in the Promotion BOGO table; however you cannot advance to the *Work with BOGO Discount Screen (Item Category or Item)* with this setting, and the system does not use the Promotion BOGO records to evaluate or apply BOGO promotions.

All fields required except where indicated:

- *Company*
- *Record Type: PRB*
- *Request Type: A*
- *Record Date*
- *Promotion Code*
- *PRB Item Cgy OR PRB Item (PRB SKU is optional)*
- *PRB Required Qty*
- *PRB BOGO Qty*
- *PRB Discount Pct OR PRB Discount Amt OR PRB Spc Price*
- *PRB Free*
- *PRB Multiple Allowed* is optional

Sample PRB BOGO promotion upload record:

```
7|PRB|A|8|1150414||BOGO1|PUBOGOB PROMOTION DESCRIPTION|0|0|||0|||
0.00||.00|||0|||0|0|||0|.00|0||SKU|RED|1|1|5.00|.00|.00|Y|N|0|||.00|0|0|
0|.00|.00|.00|||1|.00|.00|||0|||1|0|.00|.00|.00
```

Promotion BOGO by Price Code Creation (PBP)

You can create one Promotion BOGO by Price Code record for a BOGO promotion. The system uses this table only if the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *PRICE CODE*; otherwise, the system uses the Promotion BOGO table when evaluating and applying BOGO promotions.

See the [BOGO Discount by Item/Price Code Screen](#) for background on BOGO promotions by price code.

Note:

Setting the *BOGO Grouping by Price Code or Category (L62)* system control value to *CATEGORY* does not prevent you from creating records in the Promotion BOGO by Price Code table; however you cannot advance to the *BOGO Discount by Item/Price Code Screen* with this setting, and the system does not use the Promotion BOGO by Price Code records to evaluate or apply BOGO promotions.

All fields required except where indicated:

- [Company](#)
- [Record Type](#): PBP
- [Request Type](#): A
- [Record Date](#)
- [Promotion Code](#)
- [PBP Price Code OR PBP Item](#) and [PBP Sku](#) (optional)
- [PBP Required Amount](#) or [PBP Required Qty](#), or both
- if [PBP Free](#) is set to N or Y:
- [PBP BOGO Prc](#) and [PBP BOGO Qty](#)
- [PBP Discount Pct OR PBP Discount Amount OR PBP Special Price](#)
- if [PBP Free](#) is set to A:
- [PBP Auto Add](#) and [PBP Add SKU](#) (required if the PBP Auto Add item has SKU's)
- [PBP Prorate Disc](#)
- [PBP Multiple Allowed](#)
- [PBP Free](#)

Sample PBP BOGO by Price Code promotion upload record:

```
7|PBP|A|9|1150414||BOG01|PUBOGOP PROMOTION DESCRIPTION|0|0|||0|||
0.00||.00|||0|||0|0|||0|.00|0|||0|0|.00|.00|.00|||101||50.00|1|
101|1|5.00|.00|.00|N|Y|N|||.00|.00|||0|||0|.00|.00|.00
```

Promotion Discount Creation (PMD)

You can create one or more Promotion Discount records for a tiered promotion. At least one record is required. See the *Work with Promotion Discounts Screen* for more information.

Required fields:

- [Company](#)
- [Record Type](#): *PMD*
- [Request Type](#): *A*
- [Record Date](#)
- [Promotion Code](#)
- [PMD Discount Pct](#) OR [PMD Discount Amt](#) OR [PMD Item](#) (and [PMD SKU](#) if the [PMD Item](#) has SKU's)
- [PMD Dollars](#)

Sample PMD Discount promotion upload record:

```
7|PMD|A|10|1150414||TG|TG TIER PROMOTION DESCRIPTION|0|0|||0|||0.00|.00|||
0|||0|0|||0|.00|0|||0|0|.00|.00|.00|||0|||.00|0|0|0|.00|.00|.00|||
0.00|.00|SKU|PINK||0|||25.00|.00|.00|.00
```

Promotion Source Creation (PRS)

You can create Promotion Source records for any promotion type. See the [Work with Qualifying Source Codes Screen](#) for more information.

Note:

The [Source Code](#) field, used in the *PRM* record type, also creates a record in the Promotion Source table.

Required fields:

- [Company](#)
- [Record Type](#): *PRS*
- [Request Type](#): *A*
- [Record Date](#)
- [Promotion Code](#)
- [PRS Source](#)

Sample PRS Source promotion upload record:

```
7|PRS|A|11|1150414||OP|OPSORCS PROMOTION DESCRIPTION|0|0|||0|||0.00|.00|||
0|||0|0|||0|.00|0|||0|0|.00|.00|.00|||0|||.00|0|0|0|.00|.00|.00|||
0.00|.00|||SOURCE7|0|||0|.00|.00|.00
```

Promotion Customer Creation (PRC)

You can create Promotion Customer records for any promotion type. See the [Work with Qualifying Customer/Price Groups Screen](#) for more information.

Required fields:

- [Company](#)
- [Record Type](#): *PRC*
- [Request Type](#): *A*

- [Record Date](#)
- [Promotion Code](#)
- [PRC Cust Num OR PRC Cust Group](#)

Sample PRC Customer promotion upload record:

```
7|PRC|A|12|1150414||OP|OPCUSTC PROMOTION DESCRIPTION|0|0|||||0|||
0.00||.00|||||0||||0|0|||||0|.00|0||||0|0|.00|.00|.00||||0|||.00|0|0|
0|.00|.00|.00|||||0.00|.00||||55|||||0|.00|.00|.00
```

Promotion Item Category Creation (PIC)

You can create Promotion Item Category records for item category promotions. See the *Work with Qualifying Item Categories Screen* for more information.

Required fields:

- [Company](#)
- [Record Type: PIC](#)
- [Request Type: A](#)
- [Record Date](#)
- [Promotion Code](#)
- [PIC Item Cgy](#)

Sample PIC Item Category promotion upload record:

```
7|PIC|A|13|1150414||ITMCATP|PUIITMC PROMO DESCRIPTION|0|0|||||0|||
0.00||.00|||||0||||0|0|||||0|.00|0||||0|0|.00|.00|.00||||0|||.00|0|0|
0|.00|.00|.00|||||0.00|.00||||0|DFLT|||||0|.00|.00|.00
```

Promotion Item Exclusion Creation (PIE)

You can create Promotion Item Exclusion records for any promotion type except for freight and additional freight. See the *Work with Item/Category Exclusions Screen* for background.

Required fields:

- [Company](#)
- [Record Type: PIE](#)
- [Request Type: A](#)
- [Record Date](#)
- [Promotion Code](#)
- [PIE Item OR PIE Item Cgy](#)

Sample PIE Item Exclusion promotion upload record:

```
7|PIE|A|14|1150414||ITMCATP|PUIITMX PROMO DESCRIPTION|0|0|||||0|||
0.00||.00|||||0||||0|0|||||0|.00|0||||0|0|.00|.00|.00||||0|||.00|0|0|
0|.00|.00|.00|||||0.00|.00||||0|DFLT|||0|.00|.00|.00
```

Promotion Upload Errors

The errors possible through the promotion upload are listed below. See the [Promotion Upload Table \(PRMUPLD\)](#) and [Fields Used in the Promotion Upload by Record Type](#) for background.

Error	Record Types	Description
Additional Charge Code Required	PRM	There is no <i>Additional Charge</i> specified for a freight promotion.
Auto Add Not Selected	PBP	No <i>PBP BOGO Qty</i> is specified, and the <i>PBP Free</i> flag is not set to A.
BOGO Discount Conflict	PBP, PRB	<i>PBP</i> : More than one of the required discounts (<i>PBP Discount Pct</i> , <i>PBP Discount Amount</i> , or <i>PBP Special Price</i>) is specified. <i>PRB</i> : More than one of the required discounts (<i>PRB Discount Pct</i> , <i>PRB Discount Amt</i> , <i>PRB Spc Price</i> , or <i>PRB Free</i>) is specified.
Customer/CP G Conflict	PRC	Both a <i>PRC Cust Num</i> and a <i>PRC Cust Group</i> are specified.
Discount conflict	PRM	<ul style="list-style-type: none"> Both <i>Free Freight</i> and <i>Freight Override</i> are specified, or no freight discount is specified, and the <i>Promotion Type</i> is F More than one <i>PRM Dollar Discount</i> or <i>PRM Percent Discount</i> is specified for an additional freight order promotion There is more than one discount (<i>PRM Dollar Discount</i>, <i>PRM Percent Discount</i>, or <i>Special Price</i>) specified for an item category promotion
Discount required	PRM	No <i>PRM Dollar Discount</i> or <i>PRM Percent Discount</i> is specified for an additional freight, item category, or order promotion.
Duplicate Promotion Code	PRM	The <i>Promotion Code</i> specified already exists.
Either Source code or offer	PRM, PRS	<ul style="list-style-type: none"> <i>PRM</i>: Both the <i>Offer Number</i> and <i>Source Code</i> were specified. <i>PRS</i>: the promotion already specifies a qualifying offer.
Fields Not In Use	PRM	A <i>Discount Receipt</i> or <i>Customer Pct Discount</i> is specified.
Invalid Add'l Chg Code	PRM	The <i>Additional Charge</i> code specified does not exist.
Invalid Allow Multiples Value	PBP	The <i>PBP Multiple Allowed</i> flag is not set to Y or N.
Invalid Auto Add SKU	PBP	A <i>PBP Add SKU</i> is specified, but the <i>PBP Auto Add</i> item does not have SKU's.
Invalid BOGO Price Code	PBP	The <i>PBP BOGO Prc</i> specified is not valid.

Error	Record Types	Description
Invalid Company	any	The <i>Company</i> specified is not valid.
<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When the company, is invalid, the record is not listed on the Promotion Upload Error Records Report.</p> </div>		
Invalid Continental USA Only Flag	PRM	The <i>US Only</i> flag is not set to Y or N for a freight or additional freight promotion (the Promotion Type is A or F). This field is case-sensitive, so a lowercase entry causes an error.
Invalid Customer Number	PRC	The <i>PRC Cust Num</i> specified is invalid.
Invalid Date	any	No <i>Record Date</i> is specified.
Invalid Discount Item	PMD	The <i>PMD Item</i> specified is invalid.
Invalid End Date	PRM	There is no end date specified; or the <i>End Date</i> is earlier than the <i>Start Date</i> ; or the date specified is not valid.
Invalid First Time Buyer	PRM	The <i>First Buyer</i> setting is not O or S. This field is case-sensitive, so a lowercase entry causes an error.
Invalid From SCF	PRM	<ul style="list-style-type: none"> The <i>From SCF</i> or <i>To SCF</i> is not valid for the country (either the Override Country, if specified, otherwise, for the <i>Default Country for Customer Address (B17)</i>) The SCF range is not valid, and the country matches the <i>Default Country for Customer Address (B17)</i>
Invalid Item	PBP, PIE, or PRB	The <i>PBP Item</i> , <i>PIE Item</i> , or <i>PRB Item</i> specified is invalid.
Invalid Item Category	PIC or PRB	The <i>PIC Item Cgy</i> or <i>PRB Item Cgy</i> is not valid.
Invalid Multiple Allowed	PRB	The <i>PRB Multiple Allowed</i> setting was not N, Y, or blank.
Invalid Offer	PRM	The <i>Offer Number</i> specified is not valid.
Invalid Pay Type	PRM	The <i>Pay Type</i> specified is not valid.
	PBP	The <i>PBP Price Code</i> specified is invalid.

Error	Record Types	Description
Invalid Priority	PRM	The <i>Priority</i> is 0.
Invalid Promotion Code	any except PRM	The <i>Promotion Code</i> specified is invalid.
Invalid Promotion Type	PRM	The promotion type specified is not one of the values listed under <i>Promotion Type</i> . The promotion type is case-sensitive, so lowercase entries are invalid.
Invalid Qualifier for Tier Promotion	PRM	There is a <i>Qualify Amount</i> specified and the <i>Promotion Type</i> is T.
Invalid Request Type	any	The <i>Request Type</i> is D and the <i>Record Type</i> is PRS, PIC, PRC, PMD; or the Request Type specified is not A or D. The request type is case-sensitive.
Invalid Ship Via Override	PRM	The <i>Ship Via Override</i> specified is not valid.
Invalid Ship Via Override Country	PRM	The <i>Override Country</i> specified is not valid.
Invalid SKU	PBP or PRB	<i>PBP</i> : The <i>PBP Item</i> is not a SKU'd item, but a <i>PBP Sku</i> is specified; or the <i>PBP Sku</i> specified is not valid for the <i>PBP Item</i> . <i>PRB</i> : The <i>PRB SKU</i> is invalid, or specified for a non-SKU'd <i>PRB Item</i> .
Invalid Source Code	PRM or PRS	<i>PRM</i> : The <i>Source Code</i> specified is not valid. <i>PRS</i> : The <i>PRS Source</i> specified is not valid.
Invalid Start Date	PRM	There is no <i>Start Date</i> specified, or the date specified is not valid.
Item Cat or Item as Qualifier	PRB	Both <i>PRB Item Cgy</i> and the <i>PRB Item</i> are specified.
Item Category Not Valid for Auto Add	PRB	The <i>PRB Free</i> field is set to A, and <i>PRB Item Cgy</i> is specified as a qualifier.
Item\Item Category Conflict	PIE	Both the <i>PIE Item</i> or the <i>PIE Item Cgy</i> are specified.

Error	Record Types	Description
Missing Auto Add SKU	PBP	No <i>PBP Add SKU</i> is specified, and the <i>PBP Auto Add</i> item has SKU's.
Missing Bogo Discount	PBP	None of the required discounts (<i>PBP Discount Pct</i> , <i>PBP Discount Amount</i> , or the <i>PBP Special Price</i>) is specified; or, the <i>PBP Free</i> field is set to <i>N</i> , but a <i>PBP Auto Add</i> item is specified.
Missing BOGO Qty	PRB	No <i>PRB BOGO Qty</i> is specified.
Missing Bogo Qualifier	PBP	No <i>PBP Required Qty</i> or <i>PBP Required Amount</i> is specified.
Missing Customer/CPG	PRC	Neither a <i>PRC Cust Num</i> or a <i>PRC Cust Group</i> is specified.
Missing Description	PRM	There is no <i>Description</i> specified.
Missing Item	PBP or PRB	<i>PBP</i> : There is a <i>PBP Sku</i> specified but no <i>PBP Item</i> . <i>PRB</i> : A <i>PRB SKU</i> is specified, but not a <i>PRB Item</i> .
Missing Item Category	PIC	No <i>PIC Item Cgy</i> is specified.
Missing Item\Item Category	PIE	Neither the <i>PIE Item</i> or the <i>PIE Item Cgy</i> is specified.
Missing Item or Item Cat	PRB	Neither the <i>PRB Item Cgy</i> or the <i>PRB Item</i> are specified.
Missing PMD Dollars	PMD	No <i>PMD Dollars</i> amount is specified.
Missing Promotion Code	any	The <i>Promotion Code</i> is blank.
Missing Required Qty	PRB	No <i>PRB Required Qty</i> is specified.

 **Note:**

If the promotion code is blank for a delete request (the Request Type is *D*), the upload record is flagged as an error, but the Error Desc remains blank.

Error	Record Types	Description
Missing Source	PRS	No <i>PRS Source</i> is specified.
Missing Tier Discount	PMD	The record did not include one of the following: <i>PMD Discount Pct</i> , <i>PMD Discount Amt</i> , or <i>PMD Item</i> (and <i>PMD SKU</i> if the item has SKU's).
Only Valid for Freight Promotion	PRM	<i>Free Freight</i> is specified, but the <i>Promotion Type</i> is not <i>F</i> .
Override Option Not Valid for Promo Type:	PRM	A <i>Ship Via Override</i> is specified, and the promotion type is not <i>A</i> , <i>F</i> , or <i>O</i> (additional freight, freight, or order).
Price Code or Item as Benefit	PBP	The <i>PBP Free</i> field is set to <i>A</i> (auto-add), but there is also a <i>PBP BOGO Qty</i> specified; or there is no <i>PBP Auto Add</i> item specified; or the <i>PBP Add SKU</i> is not a valid SKU for the <i>PBP Auto Add</i> item.
	PBP	Both the <i>PBP Price Code</i> and the <i>PBP Item</i> are specified; or neither is specified; or a <i>PBP BOGO Prc</i> is specified and the PBP Free flag is set to <i>A</i> .
Prorate Discount Invalid	PBP	The <i>PBP Prorate Disc</i> flag is not set to <i>Y</i> or <i>N</i> .
Promotion Type Conflict	any except PRM	<ul style="list-style-type: none"> The <i>Promotion Code</i> specified for a <i>PIC Record Type</i> is not an item category promotion. The <i>Promotion Code</i> specified for a <i>PMD Record Type</i> is not a tiered promotion. The <i>Promotion Code</i> specified for a <i>PRB</i> or <i>PBP Record Type</i> is not a BOGO promotion.
Promotion/Record Type Mismatch	PIE	The <i>Promotion Code</i> specified for a <i>PIE Record Type</i> is a freight or additional freight promotion.
Qualifier Not Valid for Free Freight	PRM	The <i>Free Freight</i> field was not set to <i>Y</i> , <i>N</i> , or blank for a freight promotion. The field is case-sensitive, so lowercase values are invalid.
Qualifier Not Valid For Promo Type	PRM	<ul style="list-style-type: none"> There is a <i>Qualify Amount</i> specified and the <i>Promotion Type</i> is <i>B</i>. Either <i>Free Freight</i> and <i>Freight Override</i> is specified, and the <i>Promotion Type</i> is not <i>F</i>. A <i>Freight Override</i> is specified and the <i>Promotion Type</i> is not <i>F</i>. An <i>Additional Charge</i> code is specified and the Promotion Type is not <i>A</i>, <i>F</i>, or <i>O</i> (additional freight, freight, or order). A <i>Qualify Code</i> is specified but this is not an item category promotion. A <i>Qualify Code</i> is not set to <i>O</i> or <i>I</i>. The record type is case-sensitive, so lowercase entries are invalid.

Error	Record Types	Description
Qualifier Not Valid for Promotion Type	PRM	<ul style="list-style-type: none"> A <i>From SCF</i> or <i>To SCF</i> is specified for a BOGO, tiered, or item category promotion (the Promotion Type is <i>B</i>, <i>T</i>, or <i>C</i>). the SCF range in the <i>From SCF</i> to <i>To SCF</i> is not valid, and the country does not match the <i>Default Country for Customer Address (B17)</i> The <i>US Only</i> flag is populated for promotion that is not an additional freight or freight promotion (Promotion Type of <i>A</i> or <i>F</i>). A <i>Qualify Qty</i> is specified for a BOGO or tiered promotion (the Promotion Type is <i>B</i> or <i>T</i>)
Qualify Code required	PRM	No <i>Qualify Code</i> is specified, but there is a <i>Qualifying \$ amount type</i> specified for an item category promotion.
Record Already Exists	PIE, PRB, PRS, PMD	<ul style="list-style-type: none"> The <i>Request Type</i> is <i>D</i>, and the <i>Record Type</i> is <i>PIE</i> or <i>PRB</i>. The <i>Record Type</i> is <i>PRS</i>, and the Promotion Source record already exists. The <i>Record Type</i> is <i>PMD</i>, and the Promotion Discount record already exists. In this situation, a duplicate is identified by the <i>PMD Dollars</i>.
Record type not found	N/A	The record type does not match one of the values listed under <i>Record Type</i> . The record type is case-sensitive, so lowercase entries are invalid.
Required Field For This Type	PBP	The <i>PBP Free</i> field is not set to <i>A</i> , <i>N</i> , or <i>Y</i> .
Required for Record Type	PRB	This <i>PRB Free</i> field is not set to <i>N</i> , <i>Y</i> , or <i>A</i> .
Ship Via Override Required	PRM	The upload record specifies an <i>Override Country</i> but no <i>Ship via override</i> .
Special Price Not Valid	PRM	A <i>Special Price</i> is specified even though the promotion type is not <i>C</i> .
Tier Discount Conflict	PMD	The record includes more than one of the following: <i>PMD Discount Pct</i> , <i>PMD Discount Amt</i> , or <i>PMD Item</i> (and <i>PMD SKU</i> if the item has SKU's).

Introducing Offer and Source Codes

Purpose: This topic contains a brief overview of the offer and source code tables, including how to select them and set them up. The offer and source code tables must be set up before you can set up pricing information.

A reporting hierarchy showing the relationship between offers, source codes, and other Marketing tables is presented at the end of this topic.

You need to create a record for every offer (catalog, space ad, TV ad) for which you accept orders. Information for each field on the offer record is not provided here. Only information that you may need from other tables in order to set up an offer is presented here.

Setting up Offers

	Use in	Related Menu Option
Season codes	produce reporting and analysis by season	Working with Season Codes (WSEA)
Additional charge codes	add service charges defined in the offer or with Working with Dollar Chart by Offer (WDCO)	Establishing Additional Charge Codes (WADC)
Currency	required if you process orders in multiple currencies (the Multi Currency by Offer (E03) system control value <i>selected</i>).	Working with Currency (WCUR)

Other information that you can add using the Work with Offers function includes:

- Free gift items
- Freight by dollar chart
- Flat freight by offer (set the source code freight method to *F*, flat rate by ship-to)
- Service charges by dollar chart
- Dollar discounts

Setting up Source Codes

You need to create source codes for all of the offers that generate orders. Source codes control the pricing and freight methods used on the order.

Information for each field on the source code record is not provided here. Only included is information that you may need from other tables in order to set up a source code, or information that needs to be set up in other tables in order for some feature to work. For example, all pricing methods are not discussed -- only those that send you to another table.

See [Working with Source Codes \(WSRC\)](#).

Divisions

You can create your divisions before you set up source codes ([Working with Divisions \(WDIV\)](#)) or while you are using [Working with Source Codes \(WSRC\)](#). You *click* on the arrow in the Division field and when the Select Division pop-up window displays you can select *Create* to create a division.

Creating a division requires that you have already created entities ([Working with Entities \(WENT\)](#)).

Offer Codes

You can create your offers before you set up source codes ([Working with Offers \(WOFR\)](#)) or while you are using [Working with Source Codes \(WSRC\)](#) *Click* on the arrow to prompt a pop-up window and select *Create* for a code.

Source Category Codes

You can create your category codes before you set up source codes [Working with Source Categories \(WSCT\)](#) or while you are using Working with Source Codes (WSRC). *Click* on the arrow to prompt a pop-up window and select *Create* for a code.

Pricing Method

You need to determine how pricing will be calculated for orders for a source code. The *Reg Hierarchy* and *Reg Plus Reprice* pricing methods require that the [Pricing Values \(B31\)](#) parameters in the System Control table (WSYS) be established for these pricing methods to work.

Freight Charges

You can use one of the following freight methods to add freight to an order.

Freight Method	Description
Order Level Freight Methods:	
Dollar chart by offer (Allows you to charge freight based on the dollar amount of the merchandise ordered for each shipping address on an order.

Note:

If the [Include Handling in Freight Charge Calculation \(D77\)](#) system control value is selected, the system will also include handling along with merchandise in the freight charge calculation.

To use:

- Select *\$ Chart by Ofr* in the Freight method field in Working with Source Codes (WSRC).
- Define the dollar tier levels and the corresponding freight charges in Working with Dollar Chart by Offer (WDCO).

Freight Method	Description
Dollar chart by source (<p>Allows you to charge freight or service charges based on the dollar amount of the merchandise ordered for each shipping address on an order.</p> <div data-bbox="938 426 1068 464" style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;">  Note: If the Include Handling in Freight Charge Calculation (D77) system control value is selected, the system will also include handling along with merchandise in the freight charge calculation. </div> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>\$ Chart by Src</i> in the Freight method field in Working with Source Codes (WSRC) • Define the dollar tier levels and the corresponding freight or service charges in Working with Dollar Chart by Source Code (WDCS).
Actual billing amount (<p>Uses the total weight of all the items on the order and the shipper to determine the actual freight charge during Confirmation or Billing.</p> <p>The actual freight charge is determined by:</p> <ul style="list-style-type: none"> • Entering the freight manually using the Meter charge field in Manually Confirming Shipments (MCON). <p>The system then recalculates the order totals based on any new or additional freight amounts.</p> <p>To use: Select <i>Actual Bill Amt</i> in the Freight method field in Working with Source Codes (WSRC)</p>
Flat rate by ship-to (<p>Uses the flat freight amount defined for the source code as the amount of freight to charge a customer on an order. If a flat freight amount is not defined for the source code, the system uses the flat freight amount defined for the offer as the amount of freight to charge the customer on an order.</p> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>Flat Rt/Ship To</i> in the Freight method field in Working with Source Codes (WSRC). • Enter an amount in the Flat Freight Rate field in Working with Offers (WOFR), or • Enter an amount in the Flat amt (Flat amount) field in Working with Source Codes (WSRC)

Freight Method	Description
Percentage by source (Multiplies the merchandise amount of the order by a freight percentage defined for the source code, rounding up or down to the nearing two-position decimal. This method also considers the freight minimum and freight maximum defined for the source code. The system adjusts the freight fee to the maximum or minimum charge if the calculation results in a freight fee over or under the maximum or minimum value.

 **Note:**

If the Include Handling in Freight Charge Calculation (D77) system control value is selected, the system will also include handling along with merchandise in the freight charge calculation.

To use:

- Select \$ *Source* in the Freight method field in Working with Source Codes (WSRC).
- Enter a percentage in the Freight % (Freight percentage) field in Working with Source Codes (WSRC).
- Enter an amount in the Frt min (Freight minimum) and Frt max (Freight maximum) fields in [Working with Source Codes \(WSRC\)](#).

Freight Method	Description
Percentage by ship via (Multiplies the merchandise amount of the order by freight percentage defined for the shipper, rounding up or down to the nearest two-position decimal. This method also considers the freight minimum and freight maximum defined for the shipper. The system adjusts the freight fee to the maximum or minimum charge if the calculation results in a freight fee over or under the maximum or minimum value.

 **Note:**

If the Include Handling in Freight Charge Calculation (D77) system control value is selected, the system will also include handling along with merchandise in the freight charge calculation.

To use:

- . Select % *Ship Via* in the Freight method field in Working with Source Codes (WSRC).
- . Enter a percentage in the Freight percent field in Working with Ship Via Codes (WVIA).
- Enter an amount in the Freight minimum and Freight maximum fields in Working with Ship Via Codes (WVIA).

Freight Method	Description
Recipient freight	<p>Calculates freight by dollar based on the merchandise total of the order including all recipient orders. The Maximum number of ship to's field defined for the source code is checked. If the number of recipients on the order is less than or equal to this value, the Dollar Chart by Offer will determine the freight fee, based on the merchandise total.</p> <p>Once the maximum number of recipient orders is reached, the system includes a flat amount with the freight amount for each additional recipient order.</p>

 **Note:**

If the Include Handling in Freight Charge Calculation (D77) system control value is selected, the system will also include handling along with merchandise in the freight charge calculation.

To use:

- Select *Recipient* in the Freight method field in Working with Source Codes (WSRC).
- Enter a number in the Max shp tos-frt (Maximum ship to's, freight) field in [Working with Source Codes \(WSRC\)](#)
- Enter an amount in the Flat amt (Flat amount) field in Working with Source Codes (WSRC).
- Define freight by dollar in [Working with Dollar Chart by Offer \(WDCO\)](#).

Recipient freight example

Maximum ship to's freight = 2

Flat amount = 10.00

Dollar chart by offer (WDCO)

dollar amount \$10.00 = freight charge 1.00

dollar amount \$20.00 = freight charge 2.00

dollar amount \$30.00 = freight charge 3.00

An order contains 3 recipients:

1st recipient: merchandise amount = 10.00, freight amount = 1.00

2nd recipient: merchandise amount = 10.00, freight amount = 1.00

3rd recipient: merchandise amount = 10.00, freight amount = 11.00 (flat amount + freight)

Total freight across recipients = 13.00

Freight Method	Description
By Offer Price freight	<p>Uses a dollar chart by offer to calculate freight, based on the total merchandise value of the order. For this freight method, the merchandise value is calculated by adding the extended single-unit offer price for each item/SKU, disregarding any discounts, associate pricing, price overrides, quantity break pricing, etc.</p> <p><i>Prorate freight?</i> If the <i>Prorate Freight Charges (D39)</i> system control value is selected, freight will be prorated based on the percentage of the merchandise total shipped, rather than on the appropriate level on the dollar chart. See the Prorate Freight Charges (D39) system control value for examples.</p> <p><i>No-charge items:</i> Even items that are added to the order at no charge, such as package inserts identified through <u>Package Insert Processing (WPIP)</u> are included in the merchandise total for the purposes of calculating freight.</p> <p><i>Freight-exempt items:</i> Items that you identify as freight-exempt through the <u>Working with Freight Exempt Items (WFED)</u> menu option are not included if the <u>Use Item Freight Exemption File (E73)</u> system control value is selected.</p>

Freight Method	Description
	<p><i>Tax-inclusive pricing:</i> If the order uses tax-inclusive pricing, the system uses the tax-inclusive offer price rather than the regular offer price to determine the total merchandise value. See the Tax Included in Price (E70) system control value for more information.</p> <p><i>Include handling?</i> If the Include Handling in Freight Charge Calculation (D77) system control value is selected, then any handling charges will be added to the merchandise total for the purpose of determining the freight charge.</p> <p><i>Override item offer price?</i> If you add an item to the order using a price override reason code whose Override item offer price flag is selected, then the Offer price stored in the Order Detail table is set to the actual price charged for the item. In this situation, the system uses the actual price as the offer price for the purposes of calculating freight by offer price. See Establishing Price Override Reason Codes (WPOR) for more information on price override reason codes.</p>

 **Note:**

If the Include Handling in Freight Charge Calculation (D77) system control value is selected, the system will also include handling along with merchandise in the freight charge calculation.

To use:

- Select *By Offer Price* in the Freight method field in Working with Source Codes (WSRC).
- Define a dollar chart in Working with Dollar Chart by Offer (WDCO).
- Create an item/offer or SKU/offer (*MITM*).

Freight Method	Description
Freight by order weight (<p>This freight method is based on the total weight of the order and the number of cartons required to ship the order. The system uses the following information to calculate freight:</p> <ul style="list-style-type: none"> • the total weight of the items. • the maximum weight you can pack in each carton. • the extra weight to add for each carton. <p>The system calculates the total number of cartons required to ship the order and the expected weight of each using the above information. The system then uses the freight table defined for the source code to calculate the rate to charge for each carton.</p> <p>If the item is a ship-alone item, the system determines the weight for each unit and adds an extra weight amount before checking the freight table.</p> <p>See Working with Weight Tables for Order Weight (WFTB) for more information on how to define freight tables and examples of how this freight method is calculated.</p> <p>When calculated: In order entry, the system calculates freight by order weight during repricing, the initial and final order accept, and when you select to change the last line on the order if you do not change its order quantity. The Freight field on the order does not include order weight freight charges as you add lines to the order; however, the system does display ship via service charges and ship via weight charges immediately. When the system calculates freight by order weight, the system updates the Freight field for the order with the complete freight amount.</p> <p>In order maintenance, the system calculates freight by order weight as you add or change each line on the order. The Freight field on the order includes all freight charges as changes to freight are made to the order.</p> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>Order Weight</i> in the <i>Freight method</i> field in Working with Source Codes (WSRC) • Define a weight table in Working with Weight Tables for Order Weight (WFTB). • Enter the weight table in the <i>Freight table</i> field in Working with Source Codes (WSRC). • Enter a weight for each item in the Sell wgt. (Selling weight) field in Enter/Maintain Items (MITM). • Enter a weight in the <i>Maximum carton weight</i> field in Working with Ship Via Codes (WVIA). Enter a weight in the Extra Weight for Order Weight Freight Method (D85) system control value.

Line Level Freight Methods:

Freight Method	Description
Flat rate by item (<p>Allows you to charge one freight amount per item, regardless of the quantity ordered of the item. The freight amount is defined for each item in the Item Offer or SKU Offer table. The freight total represents the accumulation of each item's flat freight fee.</p> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>Flat Rt/Item</i> in the <i>Freight method</i> field in Working with Source Codes (WSRC). • . Enter a freight amount in the Freight field for each item in the Item Offer or SKU Offer (<i>MITM</i>).
Flat rate by quantity (<p>Allows you to charge a flat rate for a certain number of units ordered and add an additional charge for each unit thereafter.</p> <p>The calculation is: Flat amt + ((Qty ord - Up to Frt Qty) * Secondary freight)</p> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>Flat Rt/Qty</i> in the <i>Freight method</i> field in Working with Source Codes (WSRC). • Enter an amount in the <i>Flat amt</i> (Flat amount) field in Working with Source Codes (WSRC). • Enter a number in the <i>Up to frt qty</i> (Up to freight quantity) field in Working with Source Codes (WSRC). • Enter an amount in the <i>Secondary frt</i> (Secondary freight) field in Working with Source Codes (WSRC).
Flat rate by item source (<p>Uses a flat freight charge for each unit ordered multiplied by the number of units ordered.</p> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>Flat Rt/Itm Src</i> in the Freight method field in Working with Source Codes (WSRC). • Enter an amount in the Flat amt (Flat amount) field in Working with Source Codes (WSRC).
Item (<p>Uses the freight amount for the item offer or SKU offer, multiplied by the quantity ordered.</p> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>By Item</i> in the <i>Freight method</i> field in Working with Source Codes (WSRC). • Enter an amount in the <i>Freight</i> field for the item offer or SKU offer (<i>MITM</i>).

Freight Method	Description
Weight freight	<p>This freight method uses the weight of each item and the rate for the shipper. The weight of the item is multiplied by the quantity ordered to calculate the total weight for the order line. In order to determine the freight charge, the system references the associated rate chart for each line, based on the total weight and delivery zone.</p> <p>The total weight is rounded up for the purposes of freight by weight if the partial pound is .50 or more; otherwise, the total weight is rounded down. For example, if the total weight is 3.51 pounds, the 4 pound rate is used; if the total weight is 3.49 pounds, the 3 pound rate is used. Because partial pounds of .49 or lower are rounded down, no freight will be added to the order if the total weight is under a half pound.</p> <p><i>Example:</i> You are shipping an order to a business address in zip code 01760. The ship via on the order is 1, and the total weight of the shipment is 4.5 pounds. The shipping rate for ship via 1, zone 01 (for 01760), and 5 pounds is \$2.00.</p> <p>If the total shipping weight in the above example were 4.4 pounds, the system would round this total down and use the 4 pound shipping rate.</p> <p>To use:</p> <ul style="list-style-type: none"> • Select <i>Weight</i> in the Freight method field in Working with Source Codes (WSRC). • Enter a sell weight for each item in Enter/Maintain Items (MITM). • . Define shipping rates for each ship via in Working with Shipping Rates (WSHR).

Promotional Codes

If you want to collect data at the promotion code level, create promotion codes before you set up source codes [Working with Promotions \(WPRO\)](#)). Promotion codes give another level of reporting between source codes and offers.

You can also use promotion codes to:

- display a pop-up message in order entry
- apply a merchandise, freight, or additional freight discount in order entry
- override the ship via in order entry

Other information that can be added using Working with Source Codes (WSRC):

- Item special pricing
- Free gift items
- Freight by dollar chart
- Service charges by dollar chart
- Dollar discounts

For more information: See [Working with Entities \(WENT\)](#) for the Order Administration sales reporting hierarchy.

About Messaging Promotions

Purpose: You can use a promotion to display a pop-up message in order entry by:

- entering up to four lines of pop-up message text for the promotion code through the Work with Promotion Values menu option;
- assigning the promotion code to one or more source codes through the Work with Source Codes menu option.

When you have entered header information for an order whose source code is associated with the promotion, the promotional pop-up window opens. The window opens only for the range of dates you specify for the promotion. If you also set up pop-up window messages for the source code, this window opens first, and then the window with the promotion window opens.

Single promotion message: You can set up only one promotion message to display in order entry for each source code.

Message-only promotions through the order API: If the CWorkOrderIn message specifies a message-only promotion and the *Allow Manual Entry of Promotion Code (163)* system control value is *selected*, the message-only promotion applies to the order and the API writes an Order Transaction History message, such as `SPRING13 - CHECK OUT OUR SPRING SPECIALS applied by web`. These messages are available for review at the *Display Order History Screen*. See the *Generic Order Interface (Order API)* for background on using the order API.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Message plus discount: You can set up a promotion that will both display a pop-up message and apply a discount to the order. See [About Discount Promotions](#)

Setting Up Pricing Information

Topics in this part: The following topics describe how to set up and change pricing information:

- [Understanding Promotional Pricing](#) provides an overview of promotional pricing and the basic information you need to set up pricing information on the system.
- [Work with Promotional Pricing Groups \(WPRG\)](#) describes how to create and change a promotional pricing group.
- [Work with Promotional Pricing \(WPRP\)](#) describes how to create and change a promotional pricing record. This record establishes the eligibility requirements and the incentives available in promotional pricing.
- [Working with Price Codes \(WPCD\)](#) describes how to create price codes that you can assign to various items, so that you can offer your customers special price breaks when they order a sufficient combined quantity of these items.
- [Assigning Price Codes \(APCD\)](#) describes how to assign price codes to items based on source code or offer.
- [Price Code Upload](#) describes how to upload price code information from an external system to create, update, or delete records in the Price Code, Price Code Customer, and Price Code Details tables.

- [Display Price Code Assignments \(DPCA\)](#) allows you to review the items/SKUs assigned to a price code by offer or source code and the requirements that must be met for an order to be eligible for the price code.
- [Working with Price Tables \(WPTB\)](#) describes how price table pricing works and how to create and maintain price tables from items and groups of items.
- [Package Insert Processing \(WPIP\)](#) describes how to create package insert/promotional items that will be automatically added to an order in Order Entry/Maintenance.
- [Working with Coupon Promotions \(WCPR\)](#) describes how to set up coupons for percentage or dollar discounts on an order, or for selected item(s), and provides an overview of how coupon discounts work.
- [Working with Customer Price Groups \(WCPG\)](#) describes how to create and work with customer price groups used during quantity price matrix pricing, customer price group pricing, and as a qualifier for a discount promotion.
- [Customer Price Group SKU Exclusion Upload](#) describes how to upload customer price group SKU exclusion information from an external system to create or update records in the Customer Price Group SKU Exclusion table.
- [Customer Price Group Pricing](#) provides an overview of the customer price group pricing method, required setup, and processing details.
- [Working with Quantity Price Matrix \(WQPM\)](#) describes how to create and work with the quantity price matrix pricing method.
- [Pricing Upload Interface](#) describes how to upload source discount and quantity price matrix pricing from an external system.

Work with Price Codes Screen

Purpose: Use this screen to create and work with price codes used to define price breaks you offer for orders of a group of items.

How to display this screen: Enter *WPCD* in the Fast path field at the top of any menu or select Work with Price Codes from a menu.

Field	Description
Price code	This code defines a repricing method you offer to your customers when they order a sufficient quantity of items associated with this price code. Enter a price code and select <i>OK</i> to display price codes in numeric order, beginning with your entry. Numeric, 7 positions; Optional
Description	A description of the price code. Enter a full or partial description and select <i>OK</i> to display price codes that contain your entry. Alphanumeric, 30 positions; Required.
Seq (Sequence number)	This number controls the order in which the system evaluates pricing for an item; if two or more price codes would apply, the system uses the price code with the lowest sequence number. Numeric, 7 positions; display-only.

Field	Description
Discount	<p>The type of discount:</p> <ul style="list-style-type: none"> • <i>Price Code Special Price Discount</i>: Displays as <i>Sp</i>: followed by the <i>Special price</i>. For orders subject to VAT, displays as <i>Tax incl price</i>: followed by the <i>Tax inclusive price for special price</i>. The discount is a special price for the qualifying items associated with the price code. • <i>Price Code Dollar Off Discount</i>: Displays as <i>\$</i>: followed by the <i>Dollar discount</i>. The discount is a dollar amount to subtract from the regular item price for the qualifying items associated with the price code. • <i>Price Code Percent Off Discount</i>: Displays as <i>%</i>: followed by the <i>Percent discount</i>. The discount is a percentage to subtract from the regular item price for the qualifying items associated with the price code. • <i>Price Code Group Price Discount</i>: Displays as <i>Grp</i>: followed by the <i>Group price</i>. For orders subject to VAT, displays as <i>Grp tax incl</i>: followed by the <i>Tax inclusive price for group price</i>. The discount is a group price for the qualifying items associated with the price code. <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
Start Date	<p>The beginning date when the price code discount becomes effective. The system compares this date to the date on the Order Header to determine whether the order qualifies for the price code discount.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
End Date	<p>The end date when the price code discount becomes effective. The system compares this date to the date on the Order Header to determine whether the order qualifies for the price code discount.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Screen Option	Procedure
Create a price code	Select <i>Create</i> to advance to the <i>Create Price Code Screen</i> .
Change a price code	Select <i>Change</i> for a price code to advance to the Change Price Code screen. You can change any information on this screen except the Price code field. For field descriptions, see <i>Create Price Code Screen</i> .
Delete a price code	Select <i>Delete</i> for a price code to delete it. When you delete a price code, the system deletes any associated records in the Price Code Customer table.
Display a price code	Select <i>Display</i> for a price code to advance to the Display Price Code screen. You cannot change any fields on this screen. For field descriptions, see <i>Create Price Code Screen</i> .
Define the customer price group or sold to customer number eligible for the price code discount	Select <i>Customer</i> for a price code to advance to the <i>Work with Qualifying Customer/Price Groups Screen</i> .

Screen Option	Procedure
Create, update, and delete records in the Price Code, Price Code Customer, and Price Code Details tables from an external system	Select <i>Upload</i> . See Price Code Upload for processing details.

Create Price Code Screen

Purpose: Use this screen to create a price code.

How to display this screen: Select *Create* at the *Work with Price Codes Screen*.

Field	Description
Price code	This code defines a repricing method to apply in Order Entry when the customer orders a sufficient quantity of qualifying items. Numeric, 7 positions. Create screen: required. Change screen: display-only.
Description	A description of the price code. Alphanumeric, 30 positions; required.
Start date	The beginning date when the price code discount becomes effective. Numeric, 6 positions (in user date format); optional.
End date	The end date when the price code discount becomes effective. Numeric, 6 positions (in user date format); optional.
Qty required	The total quantity the customer must order of all qualifying items to get the price break.

 **Note:**

The system evaluates minimum price code quantity by ship-to address.

Numeric, 7 positions; required.

Field	Description
Distinct By	<p>The method the system uses to determine whether the customer ordered the quantity required to receive the group price.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>Item</i> = The quantity required is by item. • <i>SKU</i> = The quantity required is by SKU. • <i>Category</i> = The quantity required is by item category. <p>Optional.</p>
Allow Multiples	<p>Defines whether the order qualifies for a discount multiple times if the correct number of qualifying items/SKUs is added to the order.</p> <ul style="list-style-type: none"> • <i>Selected</i> = Allow multiples. • <i>Unselected</i> = Do not allow multiples. <p>This field must be selected if you define a Distinct By setting or Group price.</p>
One of the following repricing methods is required:	NA
<ul style="list-style-type: none"> • Special price • Dollar discount • Percent discount • Group price 	<p>The special price to charge the customer for all qualifying items associated with the price code.</p> <p>Numeric, 13 positions with a 2-place decimal; required if dollar discount percent discount, or group price not entered.</p>

Field	Description
Tax inclusive price for special price	<p>The special price to charge the customer for all qualifying items associated with the price code on orders subject to VAT. Displayed only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>.</p> <div data-bbox="1136 451 1461 913" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If an order is subject to VAT, but the item is subject to a price code with a only a special price and not a Tax-inclusive price, the system uses the special price for the price code.</p> </div>
Dollar discount	<p>Numeric, 13 positions with a 2-place decimal; optional.</p> <p>The dollar amount to subtract from the regular price of each qualifying item associated with the price code.</p> <p>If the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>, the system applies the discount against the regular tax-inclusive price to calculate the tax-inclusive price code price.</p> <p>Numeric, 13 positions with a 2-place decimal; required if special price, percent discount, or group price not entered.</p>
Percent discount	<p>The percentage of the regular item price to subtract for each qualifying item associated with the price code.</p> <p>If the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>, the system applies the discount against the regular tax-inclusive price to calculate the tax-inclusive price code price.</p> <p>Numeric, 5 positions with a 2-place decimal; required if special price, dollar discount, or group price not entered.</p>
Group price	<p>The group price to charge the customer for all qualifying items associated with the price code.</p> <p>Numeric, 13 positions with a 2-place decimal; required if special price, dollar discount, or percent discount not entered.</p>

Field	Description
Tax inclusive price for group price	The group price to charge the customer for all qualifying items associated with the price code on orders subject to VAT. Displayed only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> .

 **Note:**

If an order is subject to VAT, but the item is subject to a price code with a only a special price and not a Tax-inclusive price, the system uses the special price for the price code.

Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Sequence	<p>The order in which the system evaluates whether a price code applies to an order.</p> <p><i>Regular Price Code Pricing:</i> If an order qualifies for two or more price codes, the system uses the price code with the lowest sequence number. If two price codes have the same sequence number, the system uses the price code with the lowest price code number.</p> <p><i>Customer Price Group Price Code Pricing:</i> If an order qualifies for two or more price codes, the system uses the price code that provides the greatest discount to the order. If two price codes provide the same discount, the system uses the price code with the lowest sequence number. If two price codes have the same sequence number, the system uses the price code with the lowest price code number.</p> <p>Numeric, 7 positions; required.</p>

 **Note:**

The system will not prevent you from defining a repricing method that would change the item price into a credit (that is, a discount of more than 100% the item price).

Work with Qualifying Customer/Price Groups Screen

Purpose: Use this screen to define the customer price groups and sold to customers that qualify for the price code discount.

 **Important:**

If you do not define any sold to customers or customer price groups for a price code, then ALL sold to customers and customer price groups qualify for the price code.

How to display this screen: Select *Customer* for a price code at the *Work with Price Codes Screen*.

Qualifying customers display on this screen in alphanumeric sold to customer number, price group code sequence.

Fields	Description
Price Code	The code and description of the price code. Code: Numeric, 7 positions; display-only. Description: Alphanumeric, 30 positions; display-only.
Group	The code for the customer price group that qualifies for the price code discount. Customer price group codes are defined in and validated against the Customer Price Group table. Alphanumeric, 4 positions; Required if a customer is not defined.
Customer	The sold to customer number that qualifies for the price code discount. Sold to customer numbers are defined in and validated against the Customer Sold To table. Numeric, 9 positions; Required if a customer price group is not defined.
Name	The description of the customer price group code or the name of the sold to customer. <ul style="list-style-type: none"> If a company is not defined for the customer, the last name followed by the first name displays; for example: LAST, FIRST. If a company is defined for the customer, the company name followed by the last name and first name displays; for example: MILL VILLAGE ATTN:NONNIE, NO. The system truncates the name to 30 positions. Alphanumeric, 30 positions; display-only.

Screen Option	Procedure
Define a qualifying customer price group	Enter a valid customer price group code and select <i>OK</i> . The qualifying customer price group displays in the bottom half of the screen.
Define a qualifying sold to customer	Enter a valid sold to customer number and select <i>OK</i> . The qualifying sold to customer number display in the bottom half of the screen.
Delete a qualifying customer price group or sold to customer	Select <i>Delete</i> for a qualifying customer price group or sold to customer to delete it.

Price Code Upload

Overview: The Price Code Upload allows you to upload price code information from an external system to create, update, or delete records in the Price Code, Price Code Customer, and Price Code Details tables.

In this topic:

- [Price Code Upload Setup](#)
- [Price Code Upload Process](#)

- [Price Code Upload Errors](#)
- [Price Code Upload Errors Report](#)

For more information: See [Working with Price Codes \(WPCD\)](#) and [Assigning Price Codes \(APCD\)](#).

Price Code Upload Setup

The setup required to use the price code upload includes:

- [Price Code Upload Table \(PriceCdUpload\)](#)
- [PCUPLD Price Code Upload Periodic Function](#)

File for Upload

Create a Price Code text file for the price code information you wish to create, update, or delete. The file should be named `PRICECDUPLOAD.txt`.

Note:

- The [Request Type](#) identifies the type of upload record.
- You must create records in this file in the correct order; for example, you must process a Price Code upload record before you can upload a Price Code Customer upload record and Price Code Detail upload record for that price code. The system processes the records in ascending [Seq #](#) order.
- Decimals in this file are explicit and not implied; for example, pass 19.99 and not 1999.
- To leave any field in the upload file blank, pass a space in an alphanumeric field and a 0 in a numeric field so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.

See the [Price Code Upload Process](#) for more information on using the data in the text file.

Sample data: You can use the sample data below to create a price code upload file.

Sample PCO Price Code Upload record type:

```
7|1|PCO|U|1150416|1234567|PRICE CODE UPLOAD|1|1|5.00|0.00|0.00|0.00|0.00|0.00|
ITEM|Y|1150401|1150501|||||0||||
```

Sample PCC Price Code Customer Upload record type:

```
7|2|PCC|U|1150416|1234567||0|0|.00|.00|.00|.00|.00|.00|||0|0|||||55||||
```

Sample PCD Price Code Detail Upload record type:

```
7|3|PCD|U|1150416|1234567||0|0|.00|.00|.00|.00|.00|.00|||0|0|SKU|RED||SOURCE7|0||||
```

Price Code Upload Table (PriceCdUpload)

This table contains upload records for the Price Code, Price Code Customer, and Price Code Detail tables. The [Request Type](#) identifies the type of upload record.

Field	Description
Company	<p>Required for all Record Types.</p> <p>A code for the company associated with the Price Code Upload record. The system processes only records associated with the company from where the Price Code Upload Process was submitted.</p> <p>Company codes are defined in and validated against the Company table.</p> <p><i>Price Code</i>: Updates Company in the Price Code table.</p> <p><i>Price Code Customer</i>: Updates Company in the Price Code Customer table.</p> <p><i>Price Code Detail</i>: Updates Company in the Price Code Details table.</p> <p>Numeric, 3 positions.</p>
Seq #	<p>Required for all Record Types.</p> <p>A unique number assigned to each Price Code Upload record. The system processes the records in the Price Code Upload table in ascending sequence number order.</p> <p>Numeric, 9 positions.</p>
Record Type	<p>Required for all Record Types.</p> <p>The type of Price Code Upload record.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>PCO</i> = Price Code upload record; this record creates, updates, or deletes a record in the Price Code table. • <i>PCC</i> = Price Code Customer upload record; this record creates or updates a record in the Price Code Customer table. • <i>PCD</i> = Price Code Detail upload record; this record creates or updates a record in the Price Code Details table. <p>Alphanumeric, 3 positions.</p>
Request Type	<p>Required for all Record Types.</p> <p>Indicates whether the Price Code Upload record creates, updates, or deletes a record.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>U</i> = Valid for all Record Types. Create or update a record. The system determines whether the Price Code Upload record creates or updates an existing record by comparing the information in the Price Code Upload record with the existing records in the Order Management System table. See Price Code Upload Process for more information on how the system determines if the Price Code Upload record creates a new record or updates an existing record. • <i>D</i> = Valid only for Record Type PCO Price Code. Delete a Price Code record and its associated Price Code Customer records and Price Code Detail records. The system uses the information in the Price Code Upload record to determine which records to delete. <p>Alphanumeric, 1 position.</p>
Record Date	<p>Required for all Record Types.</p> <p>The date the Price Code Upload record was created.</p> <p>Numeric, 7 positions (CYMMDD format).</p>

Field	Description
PCO Price Code	<p>Required for all <i>Record Types</i>.</p> <p>A code to identify the price code to upload.</p> <p>Price codes are defined in and validated against the Price Code table.</p> <p><i>Price Code</i>: Updates PCO Price Code in the Price Code table.</p> <p><i>Price Code Customer</i>: Updates Price Code Code in the Price Code Customer table.</p> <p><i>Price Code Detail</i>: Updates PCO Price Code in the Price Code Details table.</p> <p>Numeric, 7 positions.</p>
Description	<p>Required for <i>Record Type</i> PCO Price Code. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>A description of the price code.</p> <p>Updates PCO Description in the Price Code table.</p> <p>Alphanumeric, 30 positions.</p>
PCO Sequence	<p>Required for <i>Record Type</i> PCO Price Code. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The order in which the system evaluates whether a price code applies to an order.</p> <p><i>Regular Price Code Pricing</i>: If an order qualifies for two or more price codes, the system uses the price code with the lowest sequence number. If two price codes have the same sequence number, the system uses the price code with the lowest price code number.</p> <p><i>Customer Price Group Price Code Pricing</i>: If an order qualifies for two or more price codes, the system uses the price code that provides the greatest discount to the order. If two price codes provide the same discount, the system uses the price code with the lowest sequence number. If two price codes have the same sequence number, the system uses the price code with the lowest price code number.</p> <p>Updates PCO Sequence in the Price Code table.</p> <p>Numeric, 7 positions.</p>
PCO Qty Required	<p>Required for <i>Record Type</i> PCO Price Code. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The total quantity the customer must order of all qualifying items to get the price break.</p> <p>Updates PCO Qty Required in the Price Code table.</p> <p>Numeric, 7 positions.</p>

Field	Description
PCO Percent Discount	<p>Required for <i>Record Type</i> PCO Price Code if a <i>PCO Dollar Discount</i>, <i>PCO Special Price</i>, or <i>Group Price</i> is not defined. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The percentage of the regular item price to subtract for each qualifying item associated with the price code.</p> <p>If the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>, the system applies the discount against the regular tax-inclusive price to calculate the tax-inclusive price code price.</p> <p>Updates PCO Percent Discount in the Price Code table.</p> <p>Numeric, 7 positions with a 2-place decimal.</p>
PCO Dollar Discount	<p>Required for <i>Record Type</i> PCO Price Code if a <i>PCO Percent Discount</i>, <i>PCO Special Price</i>, or <i>Group Price</i> is not defined. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The dollar amount to subtract from the regular price of each qualifying item associated with the price code.</p> <p>If the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>, the system applies the discount against the regular tax-inclusive price to calculate the tax-inclusive price code price.</p> <p>Updates PCO Dollar Discount in the Price Code table.</p> <p>Numeric, 13 positions with a 2-place decimal.</p>
PCO Special Price	<p>Required for <i>Record Type</i> PCO Price Code if a <i>PCO Percent Discount</i>, <i>PCO Dollar Discount</i>, or <i>Group Price</i> is not defined. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The special price to charge the customer for all qualifying items associated with the price code.</p> <p>Updates PCO Special Price in the Price Code table.</p> <p>Numeric, 13 positions with a 2-place decimal.</p>

Field	Description
PCO Tax Special Price	<p>Required for <i>Record Type</i> PCO Price Code if a <i>PCO Percent Discount</i>, <i>PCO Dollar Discount</i>, or <i>Group Price</i> is not defined and the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The special price to charge the customer for all qualifying items associated with the price code on orders subject to VAT. Used only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>.</p>

 **Note:**

If an order is subject to VAT, but the item is subject to a price code with a only a special price and not a Tax-inclusive price, the system uses the special price for the price code.

	<p>Updates PCO Tax Special Price in the Price Code table. Numeric, 13 positions with a 2-place decimal.</p>
Group Price	<p>Required for <i>Record Type</i> PCO Price Code if a <i>PCO Percent Discount</i>, <i>PCO Dollar Discount</i>, or <i>PCO Special Price</i> is not defined. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The group price to charge the customer for all qualifying items associated with the price code.</p> <p>Updates PCO Group Price in the Price Code table. Numeric, 13 positions with a 2-place decimal.</p>
PCO Tax Group Price	<p>Required for <i>Record Type</i> PCO Price Code if a <i>PCO Percent Discount</i>, <i>PCO Dollar Discount</i>, or <i>PCO Special Price</i> is not defined and the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>. Not used by <i>Record Type</i> PCC Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The group price to charge the customer for all qualifying items associated with the price code on orders subject to VAT. Used only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>.</p>

 **Note:**

If an order is subject to VAT, but the item is subject to a price code with a only a group price and not a Tax-inclusive price, the system uses the group price for the price code.

Updates PCO Tax Special Price in the Price Code table.
Numeric, 13 positions with a 2-place decimal.

Field	Description
Distinct By	<p>Optional for <i>Record Type PCO</i> Price Code. Not used by <i>Record Type PCC</i> Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The method the system uses to determine whether the customer ordered the quantity required to receive the group price.</p> <p>Valid values:</p> <ul style="list-style-type: none"> Blank = Distinct By setting not defined. <i>ITEM</i> = The quantity required is by item. <i>SKU</i> = The quantity required is by SKU. <i>CATEGORY</i> = The quantity required is by item category. <p>Updates PCO Distinct By in the Price Code table.</p> <p>Alphanumeric, 10 positions.</p>
Multiples	<p>Required for <i>Record Type PCO</i> Price Code if a Distinct By setting or Group Price is defined. Not used by <i>Record Type PCC</i> Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>Defines whether the order qualifies for a discount multiple times if the correct number of qualifying items/SKUs is added to the order.</p> <ul style="list-style-type: none"> Blank = Multiples setting not defined. <i>Y</i> = Allow multiples. Must be <i>Y</i> if the Distinct By field is populated. <i>N</i> = Do not allow multiples. <p>Updates PCO Allow Multiples in the Price Code table.</p> <p>Alphanumeric, 1 position.</p>
Start Date	<p>Optional for <i>Record Type PCO</i> Price Code. Not used by <i>Record Type PCC</i> Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The beginning date when the price code discount becomes effective.</p> <p>Updates PCO Start Date in the Price Code table.</p> <p>Numeric, 7 positions (CYMMDD format).</p>
End Date	<p>Optional for <i>Record Type PCO</i> Price Code. Not used by <i>Record Type PCC</i> Price Code Customer or <i>PCD</i> Price Code Detail.</p> <p>The end date when the price code discount becomes effective. The end date cannot be earlier than the start date or earlier than the current date.</p> <p>Updates PCO End Date in the Price Code table.</p> <p>Numeric, 7 positions (CYMMDD format).</p>
ITM Number	<p>Required for <i>Record Type PCD</i> Price Code Detail. Not used by <i>Record Type PCO</i> Price Code or <i>PCC</i> Price Code Customer.</p> <p>A code for the item to assign to the price code.</p> <p>Item codes are defined in and validated against the Item table.</p> <p>Updates ITM Number in the Price Code Details table.</p> <p>Alphanumeric, 12 positions.</p>

Field	Description
SKU Code	<p>Required for <i>Record Type PCD</i> Price Code Detail if the item contains SKUs and you want to specify which SKUs qualify for the price code; leave blank if all SKUs for the item qualify for the price code. Not used by <i>Record Type PCO</i> Price Code or <i>PCC</i> Price Code Customer.</p> <p>A code for the SKU to assign to the price code.</p> <p>SKU codes are defined in and validated against the SKU table.</p> <p>Updates SKU Code in the Price Code Details table.</p> <p>Alphanumeric, 14 positions.</p>
Offer Number	<p>Required for <i>Record Type PCD</i> Price Code Detail if a <i>SRC Source Code</i> is not defined. Not used by <i>Record Type PCO</i> Price Code or <i>PCC</i> Price Code Customer.</p> <p>A catalog, advertisement, or other means you use to present merchandise to your customers. The price code defined for an item/offer combination applies to orders whose header-level source code points to the offer.</p> <p>Offers are defined in and validated against the Offer table. See <i>Working with Offers (WOFR)</i>.</p> <p>Updates Offer Number in the Price Code Details table.</p> <p>Alphanumeric, 3 positions.</p>
SRC Source Code	<p>Required for <i>Record Type PCD</i> Price Code Detail if a <i>Offer Number</i> is not defined. Not used by <i>Record Type PCO</i> Price Code or <i>PCC</i> Price Code Customer.</p> <p>A code you use to group a segment of your customers. The price code defined for this item/source code combination applies to orders with this source code on the order header.</p> <p>Source codes are defined in and validated against the Source Code table. See <i>Working with Source Codes (WSRC)</i>.</p> <p>Updates SRC Source Code in the Price Code Details table.</p> <p>Alphanumeric, 9 positions.</p>
Customer	<p>Required for <i>Record Type PCC</i> Price Code Customer if a <i>Customer Price Group</i> is not defined. Not used by <i>Record Type PCO</i> Price Code or <i>PCD</i> Price Code Detail.</p> <p>The sold to customer number that qualifies for the price code.</p> <p>Sold to customer numbers are defined in and validated against the Customer Sold To table.</p> <p>Updates Customer # in the Price Code Customer table.</p> <p>Numeric, 9 positions.</p>
Customer Price Group	<p>Required for <i>Record Type PCC</i> Price Code Customer if a <i>Customer</i> is not defined. Not used by <i>Record Type PCO</i> Price Code or <i>PCD</i> Price Code Detail.</p> <p>The code for the customer price group that qualifies for the price code discount.</p> <p>Customer price group codes are defined in and validated against the Customer Price Group table.</p> <p>Updates Customer Price Group in the Price Code Customer table.</p> <p>Alphanumeric, 4 positions.</p>

Field	Description
Error Description	Updated by the system during the Price Code Upload Process . The reason why the Price Code Upload record has been placed in an error status. See Price Code Upload Errors . Alphanumeric, 20 positions.
Processed	Updated by the system during the Price Code Upload Process . The status of the Price Code Upload record. Valid values: <ul style="list-style-type: none"> • Blank = The Price Code Upload record has not yet been processed. • P = The Price Code Upload record has processed successfully. The system removes these records at the end of the Price Code Upload Process. • E = The Price Code Upload record contains errors. See Price Code Upload Errors. Alphanumeric, 1 position.

PCUPLD Price Code Upload Periodic Function

Use the *PCUPLD* periodic function to update the Price Code table after you have completed the [File for Upload](#).

Option	Setting
Function:	PCUPLD
Description:	PRICE CODE UPLOAD
Program name:	PFPRCCODUP
Company	The Company flag must be <i>selected</i> . The Price Code Upload process creates, updates, and deletes records in the Price Code, Price Code Customer, and Price Code Details tables based on the records in the Price Code Upload Table (PriceCdUpload) using the company you entered when you submitted the <i>PCUPLD</i> periodic function.

- The PCUPLD periodic function is delivered with the system; use the [Working with Periodic Functions \(WPER\)](#) menu option to review it.
- Use the [Working with Periodic Processes \(WPPR\)](#) menu option to assign the UPPRCCD and PCUPLD periodic function to a periodic process.
- Once you have created the periodic process, you can use the Execute Periodic Process screen (located in the [Working with Periodic Processes \(WPPR\)](#) or [Executing Periodic Processes \(EPRO\)](#)) to define a schedule for the job. See [Defining the Job Schedule](#).

For more information: See delivered with the system; use the [Scheduling Jobs](#) for more information on [How to Schedule a Job](#).

Price Code Upload Process

Use the following steps to upload Price Code records from an external system.

-
- | # | Step |
|---|------|
|---|------|
-
1. Create a text file named `PRICECDUPLOAD.txt` containing the price code data. See *File for Upload* for more information.
Update *Price Code Upload Table (PriceCdUpload)* with price code information from the text file:
 - Use the *File Storage API* to create a record of the `PRICECDUPLOAD` file in the `FILE_STORAGE` table, and then run the *UPPRCCD Upload Price Code File* (Program name `PFR0134`, Parameter `PRICECDUPLOAD`) periodic function, or
 - Place the file in the `CWDIRECTCP_UPLOAD_DIRECTORY` if the file storage API is not enabled, and then run the *UPPRCCD Upload Price Code File* (Program name `PFR0134`, Parameter `PRICECDUPLOAD`) periodic function, or
 - Use the *Work with File Uploads (WUPL)* menu option to upload the file.
 2. Submit the Price Code Upload process:
 - Execute the *PCUPLD Price Code Upload Periodic Function*. The system submits the process for the specified company.
 - Select *Upload* on the *Work with Price Codes Screen*. The system submits the process for the company you are currently in.The *Record Type* identifies the type of upload record:
 - `PCO` = Price Code upload record.
 - `PCC` = Price Code Customer upload record.
 - `PCD` = Price Code Detail upload record.
 3. The system updates the *Processed* field for each record in the Price Code Upload table to blank to include all records in the upload process.
 4. The system processes the records in the Price Code Upload table in *Seq #* order.
 5. The system validates each record in the *Price Code Upload Table (PriceCdUpload)*.

Step

PCO Price Code Upload Record Validation

The required fields for Record Type *PCO* Price Code are:

- *Company*: Validated against the Company table.
- *Seq #*
- *Record Type*: Must be *PCO*.
- *PCO Price Code*: Validated against the Price Code table.
- *Request Type*: *U* = Create or update. *D* = Delete.
- If the Request type is *U* and the price code does not exist in the Price Code table for the specified company, the system creates a new record in the Price Code table.
- If the Request type is *U* and the price code exists in the Price Code table for the specified company, the system overlays the existing record in the Price Code table with the values that are passed in the upload.
- If the Request type is *D* and the price code exists in the Price Code table for the specified company, the system deletes the existing record in the Price Code table and the associated records in the Price Code Customer and Price Code Details tables.
- If the Request type is *D* and the price code does not exist in the Price Code table for the specified company, the system places the upload record in an error status.
- *Description*
- *PCO Sequence*
- *PCO Qty Required*
- Enter only one of the following:
- *PCO Percent Discount*
- *PCO Dollar Discount*
- *PCO Special Price*; also *PCO Tax Special Price* if the *Tax Included in Price (E70)* system control value is *selected*.
- *Group Price*; also *PCO Tax Group Price* if the *Tax Included in Price (E70)* system control value is *selected*.

Optionally, you can define:

- *Start Date* and *End Date*: The end date cannot be earlier than the start date.
- *Distinct By*: Valid values are *ITEM*, *SKU*, and *CATEGORY*.
- *Multiples*: Valid values are *Y* and *N*; must be *Y* if a Distinct By setting or Group Price is defined.

PCC Price Code Customer Upload Record Validation

The required fields for Record Type *PCC* Price Code Customer are:

- *Company*: Validated against the Company table.
- *Seq #*
- *Record Type*: Must be *PCC*.
- *PCO Price Code*: Validated against the Price Code table.
- *Request Type*: *U* = Create or update.
- If the Request type is *U* and the price code does not exist in the Price Code Customer table for the specified company and customer or customer price group, the system creates a new record in the Price Code Customer table.
- If the Request type is *U* and the price code exists in the Price Code Customer table for the specified company and customer or customer price group, the system overlays the existing record in the Price Code Customer table with the values that are passed in the upload.
- Enter one of the following:
- *Customer*: Validated against the Customer Sold To table.
- *Customer Price Group*: Validated against the Customer Price Group table.

Step

PCD Price Code Detail Upload Record Validation

The required fields for Record Type *PCD* Price Code Detail are:

- *Company*: Validated against the Company table.
- *Seq #*
- *Record Type*: Must be *PCD*.
- *PCO Price Code*: Validated against the Price Code table.
- *Request Type*: *U* = Create or update.
- If the Request type is *U* and the price code does not exist in the Price Code Details table for the specified company and item/SKU/offer or item/SKU/source code combination, the system creates a new record in the Price Code Details table.
- If the Request type is *U* and the price code exists in the Price Code Details table for the specified company and item/SKU/offer or item/SKU/source code combination, the system overlays the existing record in the Price Code Details table with the values that are passed in the upload.
- *ITM Number*: Validated against the Item table.
- Enter one of the following:
 - *Offer Number*: Validated against the Offer table.
 - *SRC Source Code*: Validated against the Source Code table.

Optionally, you can define:

- *SKU Code*: Validated against the SKU table. Must be a valid SKU for the specified *ITM Number*.
- If you define a SKU code, the price code applies only to the SKUs specified for the item in the Price Code Details table.
- If you do not define a SKU Code, the price code applies to all SKUs of the item.

6. If the record in the Price Code Upload table does not pass validation, the system:
 - Retains the record in the *Price Code Upload Table (PriceCdUpload)* and updates the *Processed* field to *E Error*.
 - Prints the record on the *Price Code Upload Errors Report*.

A record in error remains in the Price Code Upload table until you fix or delete it. The system validates the record again the next time you submit the Price Code Upload Process.

7. If the record in the Price Code Upload table passes validation, the system:
 - Creates, updates, or deletes the appropriate record in the Order Management System database, based on the *Record Type* and *Request Type*.
 - Deletes the record from the *Price Code Upload Table (PriceCdUpload)*.
 - Prints the record on the *Price Code Upload Errors Report*

You can review or maintain:

- Price Code records on the *Work with Price Codes Screen* in the *dWorking with Price Codes (WPCD)* menu option.
 - Price Code Customer records on the *Work with Qualifying Customer/Price Groups Screen* in the *dWorking with Price Codes (WPCD)* menu option.
 - Price Code Detail records using the *Assigning Price Codes (APCD)* menu option.
-

Price Code Upload Errors

The system includes Price Code Upload records that are in error on the *Price Code Upload Errors Report*.

Error	Reason
General Errors	
The following errors can occur for any <i>Record Type</i> .	
Invalid Company	The <i>Company</i> is missing, invalid, or inactive.
Invalid Seq#	The <i>Seq #</i> is missing.
Record Type not found	The <i>Record Type</i> is missing or invalid. Valid values: <ul style="list-style-type: none"> • <i>PCO</i> = Price Code upload record; this record creates, updates, or deletes a record in the Price Code table. • <i>PCC</i> = Price Code Customer upload record; this record creates or updates a record in the Price Code Customer table. • <i>PCD</i> = Price Code Detail upload record; this record creates or updates a record in the Price Code Details table.
Invalid Request Type	The <i>Request Type</i> is missing or invalid. Valid values: <ul style="list-style-type: none"> • <i>U</i> = Valid for all <i>Record Types</i>. Create or update a record. The system determines whether the Price Code Upload record creates or updates an existing record by comparing the information in the Price Code Upload record with the existing records in the Order Management System table. • <i>D</i> = Valid only for <i>Record Type PCO</i> Price Code. Delete a Price Code record and its associated Price Code Customer records and Price Code Detail records. The system uses the information in the Price Code Upload record to determine which records to delete.
Invalid Record Date	The <i>Record Date</i> is missing or invalid. Must be in <i>CYYMMDD</i> format.
Invalid Price Code	The <i>PCO Price Code</i> is missing or invalid.
Price Code Table Errors	
The following errors can occur if the <i>Record Type</i> for the record in the Price Code Upload table is <i>PCO</i> Price Code.	
Invalid Seq #	The <i>PCO Sequence</i> is missing or invalid.
Invalid Qty Req'd	The <i>PCO Qty Required</i> is missing or invalid.
Discount Missing	You must enter a <i>PCO Percent Discount</i> , <i>PCO Dollar Discount</i> , <i>PCO Special Price</i> , or <i>Group Price</i> .
Discount Conflict	You can define only one type of discount: <i>PCO Percent Discount</i> , <i>PCO Dollar Discount</i> , <i>PCO Special Price</i> , or <i>Group Price</i> .
Invalid Distinct by	The <i>Distinct By</i> field is invalid. Valid values: <ul style="list-style-type: none"> • Blank = Distinct By setting not defined. • <i>ITEM</i> = The quantity required is by item. • <i>SKU</i> = The quantity required is by SKU. • <i>CATEGORY</i> = The quantity required is by item category.

Error	Reason
Invalid Multiples	The <i>Multiples</i> field is invalid or the <i>Distinct By</i> field is populated and the Multiples field is not set to Y. Valid values: <ul style="list-style-type: none"> Blank = Multiples setting not defined. Y = Allow multiples. N = Do not allow multiples.
Invalid Start Date	The <i>Start Date</i> is invalid.
Invalid End Date	The <i>End Date</i> is invalid. This error can occur if the End Date is earlier than the current date.
Invalid Field Populated	Fields not related to the <i>PCO Record Type</i> are populated.
Price Code Customer Table Errors	
The following errors can occur if the <i>Record Type</i> for the record in the Price Code Upload table is <i>PCC Price Code Customer</i> .	
Invalid Customer	The <i>Customer</i> is invalid.
Cust\CPG Conflict	You must define a <i>Customer</i> or <i>Customer Price Group</i> for a <i>PCC Price Code Customer</i> upload record, but not both.
Invalid Cust Prc Grp	The <i>Customer Price Group</i> is invalid.
Invalid PCC Record	Fields not related to the <i>PCC Record Type</i> are populated.
Price Code Detail Table Errors	
The following errors can occur if the <i>Record Type</i> for the record in the Price Code Upload table is <i>PCD Price Code Detail</i> .	
Invalid Item	The <i>ITM Number</i> is missing or invalid.
Invalid SKU	The <i>SKU Code</i> is invalid.
Invalid Offer	The <i>Offer Number</i> is invalid.
Offer\Src Conflict	You must define an <i>Offer Number</i> or <i>SRC Source Code</i> for a <i>PCD Price Code Detail</i> upload record, but not both.
Invalid Source	The <i>SRC Source Code</i> is invalid.
Invalid PCD Record	Fields not related to the <i>PCD Record Type</i> are populated.

Customer Price Group SKU Exclusion Upload

Overview: The Customer Price Group SKU Exclusion Upload allows you to upload customer price group SKU exclusion information from an external system to create or update records in the Customer Price Group SKU Exclusion table.

Customer Price Group SKU Exclusion allows you to define the items/SKUs that are not eligible for the customer price group discount applied to an order during *Customer Price Group Pricing*.

If an item contains SKUs, you can exclude all SKUs for the item or indicate the specific SKUs you wish to exclude from the customer price group discount.

In this topic:

- [Customer Price Group Exclusion Upload Setup](#)
- [Customer Price Group SKU Exclusion Upload Process](#)
- [Customer Price Group Exclusion Upload Errors](#)
- [CPG Item/SKU Exclusions Upload Error Records Report](#)

For more information: See [Working with Customer Price Groups \(WCPG\)](#).

Customer Price Group Exclusion Upload Setup

The setup required to use the customer price group SKU exclusion upload includes:

1. [Customer Price Group SKU Exclusion Upload Table](#)
2. [CPGIXUP Customer Price Group Item Exclusion Upload Periodic Function](#)

Customer Price Group SKU Exclusion Upload Process

Use the following steps to upload Customer Price Group SKU Exclusion records from an external system.

#	Step
1.	<p>Create a customer price group SKU exclusion text file that contains the records to upload. See the Customer Price Group SKU Exclusion Upload Table for details on file contents.</p> <p>Populate the Customer Price Group SKU Exclusion Upload Table using the contents of the text file:</p> <ul style="list-style-type: none">• Use the File Storage API to upload the file to the FILE_STORAGE table, and then run the UPCSTPG Upload Customer Price Group Exclusion File (Program name PFR0134, Parameter CUSTPGEUP) periodic function, or• Place the file in the CWDIRECTCP_UPLOAD_DIRECTORY if the file storage API is not enabled, and then run the UPCSTPG Upload Customer Price Group Exclusion File (Program name PFR0134, Parameter CUSTPGEUP) periodic function, or• Use the Work with File Uploads (WUPL) menu option to upload the records in the text file to the Customer Price Group SKU Exclusion Upload table.
2.	<p>Execute the CPGIXUP Customer Price Group Item Exclusion Upload Periodic Function to submit the Customer Price Group Exclusion Upload process. The system submits the process for the specified company.</p>
3.	<p>The system updates the Processed field for each record in the Customer Price Group Exclusion Upload table to blank to include all records in the upload process.</p>
4.	<p>The system processes the records in the Customer Price Group Exclusion Upload table in Seq # order.</p>

#	Step
5.	<p>The system validates each record in the <i>Customer Price Group SKU Exclusion Upload Table</i>.</p> <p>The required fields are:</p> <ul style="list-style-type: none"> • <i>Company</i>: Validated against the Company table. • <i>Seq #</i> • <i>Customer Price Group</i>: Validated against the Customer Price Group table. • <i>Item</i>: Validated against the Item table. <p>Optionally, you can define:</p> <ul style="list-style-type: none"> • <i>SKU</i>: Validated against the SKU table. Must be a valid SKU for the specified <i>Item</i>. • If the item contains SKUs and you leave this field blank, all SKUs of the item are excluded from the customer price group discount. • If the item contains SKUs and you specify a SKU in this field, only the SKU specified is excluded from the customer price group discount.
6.	<p>If the record in the Customer Price Group SKU Exclusion Upload table does not pass validation, the system:</p> <ul style="list-style-type: none"> • Retains the record in the <i>Customer Price Group SKU Exclusion Upload Table</i> and updates the <i>Processed</i> field to <i>E Error</i>. • Prints the record on the <i>CPG Item/SKU Exclusions Upload Error Records Report</i>. <p>A record in error remains in the Customer Price Group SKU Exclusion Upload table until you fix or delete it. The system validates the record again the next time you submit the <i>Customer Price Group SKU Exclusion Upload Process</i>.</p>
7.	<p>If the record in the Customer Price Group SKU Exclusion Upload table passes validation, the system:</p> <ul style="list-style-type: none"> • Creates or updates the appropriate record in the Order Administration database. • Deletes the record from the <i>Customer Price Group SKU Exclusion Upload Table</i>. <p>You can review and maintain customer price group SKU exclusions on the <i>Work with Customer Price Group Exclusions Screen</i> in the <i>Working with Customer Price Groups (WCPG)</i> menu option.</p>

Customer Price Group SKU Exclusion Upload Table

Create records in the Customer Price Group SKU Exclusion Upload table to create or update records in the Customer Price Group SKU Exclusion table.

To populate:

1. Create a customer price group SKU exclusion text file that contains the records to upload.
2. Upload the records from the file to the Customer Price Group SKU Exclusion Upload table:
3. Use the *File Storage API* to upload the file to the FILE_STORAGE table, and then run the *UPCSTPG Upload Customer Price Group Exclusion File* (Program name *PFR0134*, Parameter *CUSTPGEUP*) periodic function, or
4. Use the *Work with File Uploads (WUPL)* menu option to upload the records in the text file to the Customer Price Group SKU Exclusion Upload table.

You can use the sample data below to create records in the text file for upload.

```
7|1|CPG|RF123SKU4567|ROSE XSML WMNS||
```

 **Note:**

To leave any field in the upload file blank, pass a space in the field so that the file can be processed without errors. Leaving a field with no space is interpreted as null in the database and causes errors.

For more information: See [Customer Price Group SKU Exclusion Upload Process](#) for a discussion of the complete upload process.

Field	Description
Company	<p>Required.</p> <p>A code for the company associated with the Customer Price Group SKU Exclusion Upload record. The system processes only records associated with the company from where the Customer Price Group SKU Exclusion Upload Process was submitted.</p> <p>Company codes are defined in and validated against the Company table.</p> <p>Updates Company in the Customer Price Group SKU Exclusion table.</p> <p>Numeric, 3 positions.</p>
Seq #	<p>Required.</p> <p>A unique number assigned to each Customer Price Group SKU Exclusion Upload record. The system processes the records in the Customer Price Group SKU Exclusion Upload table in ascending sequence number order.</p> <p>Numeric, 9 positions.</p>
Customer Price Group	<p>Required.</p> <p>The code for the customer price group associated with the item/SKU exclusion.</p> <p>Customer price group codes are defined in and validated against the Customer Price Group table.</p> <p>Updates Customer Price Group in the Customer Price Group SKU Exclusion table.</p> <p>Alphanumeric, 4 positions.</p>
Item	<p>Required.</p> <p>A code for the item you wish to exclude from the customer price group discount.</p> <p>Item codes are defined in and validated against the Item table.</p> <p>Updates Excluded Item in the Customer Price Group SKU Exclusion table.</p> <p>Alphanumeric, 12 positions.</p>

Field	Description
SKU	<p>Optional.</p> <p>The SKU of the item you wish to exclude from the customer price group discount.</p> <ol style="list-style-type: none"> 1. If the item contains SKUs and you leave this field blank, all SKUs of the item are excluded from the customer price group discount. 2. If the item contains SKUs and you specify a SKU in this field, only the SKU specified is excluded from the customer price group discount. <p>SKU codes are defined in and validated against the SKU table.</p> <p>Updates Excluded SKU in the Customer Price Group SKU Exclusion table.</p> <p>Alphanumeric, 14 positions.</p>
Error Description	<p>Updated by the system during the Customer Price Group SKU Exclusion Upload Process.</p> <p>The reason why the Customer Price Group Exclusion Upload record has been placed in an error status. See Customer Price Group Exclusion Upload Errors.</p> <p>Alphanumeric, 20 positions.</p>
Processed	<p>Updated by the system during the Customer Price Group SKU Exclusion Upload Process.</p> <p>The status of the Customer Price Group Exclusion Upload record.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • Blank = The Customer Price Group Exclusion Upload record has not yet been processed. • P = The Customer Price Group Exclusion Upload record has processed successfully. The system removes these records at the end of the Customer Price Group SKU Exclusion Upload Process. • E = The Customer Price Group Exclusion Upload record contains errors. See Customer Price Group Exclusion Upload Errors. <p>Alphanumeric, 1 position.</p>

CPGIXUP Customer Price Group Item Exclusion Upload Periodic Function

Use the *CPGIXUP* periodic function to submit the *Customer Price Group SKU Exclusion Upload Process* based on the contents of the *Customer Price Group SKU Exclusion Upload Table*.

Option	Setting
Function:	CPGIXUP
Description:	CPG ITEM EXCLUSION UPLOAD
Program name:	PFRCPGEXUP

Option	Setting
Company	The Company flag must be <i>selected</i> . The Customer Price Group SKU Exclusion Upload process creates, updates, and deletes records in the Customer Price Group SKU Exclusion table based on the records in the <i>Customer Price Group SKU Exclusion Upload Table</i> using the company you entered when you submitted the <i>CPGIXUP</i> periodic function.

1. The *CPGIXUP* periodic function is delivered with the system; use the [Working with Periodic Functions \(WPER\)](#) menu option to review it.
2. Use the [Working with Periodic Processes \(WPPR\)](#) menu option to assign the *UPCSTPG* and *CPGIXUP* periodic functions to a periodic process.
3. Once you have created the periodic process, you can use the Execute Periodic Process screen (located in the [Working with Periodic Processes \(WPPR\)](#) or [Executing Periodic Processes \(EPRO\)](#)) to define a schedule for the job. See [Defining the Job Schedule](#).

For more information: See [Scheduling Jobs](#) for more information on [How to Schedule a Job](#).

Customer Price Group Exclusion Upload Errors

The system includes records in the [Customer Price Group SKU Exclusion Upload Table](#) that are in error on the [CPG Item/SKU Exclusions Upload Error Records Report](#).

Error	Reason
Invalid Company	The Company is missing, invalid, or inactive.
Invalid Cust Prc Grp	The Customer Price Group is missing or invalid.
Invalid Item	The Item is missing or invalid.
Invalid SKU	The SKU is not valid for the specified item.

Customer Price Group Pricing

Customer price group pricing allows you to price the items on an order based on the customer price group assigned to the sold to customer on the order. The system determines the initial price of the item based on the Price type assigned to the customer price group and applies any qualifying discounts to the order during line-level pricing and end-of-order pricing.

In this topic:

- [Customer Price Group Pricing Setup](#)
- [Line Level Customer Price Group Pricing](#)
- [Examples: Line Level Customer Price Group Pricing](#)
- [Customer Price Group Price Code Pricing](#)
- [Examples: Customer Price Group Price Code Pricing](#)
- [Customer Price Group Best Price Comparison](#)
- [Examples: Customer Price Group Best Price Comparison](#)

- [Customer Price Group Pricing in Order Maintenance](#)

Customer Price Group Pricing Setup

Before you can use the customer price group pricing method, you must complete the necessary setup.

- [Menu Options for Customer Price Group Pricing](#)
- [System Control Values for Customer Price Group Pricing](#)

Menu Options for Customer Price Group Pricing

Menu Option	Description
Working with Customer Price Groups (WCPG)	<p>Create customer price groups to assign to sold to customers. For each customer price group:</p> <ul style="list-style-type: none"> • Use the <i>Price Type</i> field to define the price the system uses as the initial price of an item during customer price group line level pricing. • <i>Original</i> = Use the <i>Orig retail \$</i> (Original retail price) field in the SKU table as the initial price. • <i>Regular</i> = Use the <i>List price</i> field in the SKU table as the initial price. • Optionally, use the <i>Discount</i> field at the customer price group level or customer price group detail level to define a percent discount to prorate across the items on an order for a sold to customer assigned to this customer price group. • Optionally, select the <i>Best Price Comparison</i> field to have the system perform customer price group best price comparison logic for the customer price group during end-of-order pricing and repricing. Customer price group best price comparison determines if the price available for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is a better price than the price available for the customer price group assigned to the sold to customer. Whichever customer price group provides the best price, the system applies this price to the item on the order. • Optionally, use the Work with Customer Price Group Exclusions Screen to define the items/SKUs that are not eligible for the customer price group discount applied to the order during customer price group pricing.

Menu Option	Description
Creating and Updating Sold-to Customers (WCST)	Use the <i>Price group</i> field to assign sold to customers to a customer price group.

 **Note:**

You can also pass the price group code in the *Inbound Order XML Message (CWORDERIN)* or the *Inbound Customer Message (CWCUSTOMERIN)*. When you assign the customer price group through the order API, the new order is eligible for any pricing or promotions associated with the price group. If you create an order for a customer that is not assigned to a customer price group, or is assigned to an invalid customer price group code, the system assigns the customer price group code defined in the [Customer Price Group Code for CPG Pricing Only \(L58\)](#) system control value to the customer.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Creating and Working with Items (MITM)	<p>For each item/SKU:</p> <p>Define the <i>Original</i> price of the item.</p> <ul style="list-style-type: none"> non-SKUed item: Use the <i>Orig retail \$</i> field on the Create Item (Base Information) Screen. SKUed item: Use the <i>Orig retail \$</i> field on the Create SKU 1 of 2 (With Overrides) Screen. <p>Define the <i>Regular</i> price of the item.</p> <ul style="list-style-type: none"> non-SKUed item: Use the <i>List price</i> field on the Create Item (Base Information) Screen. SKUed item: Use the <i>List price</i> field on the Create SKU 1 of 2 (With Overrides) Screen. Select the <i>Discountable</i> field on the Create Item Screen if the item is eligible for customer price group discounts. <p>Assign the item/SKU to an offer in order to assign the item/SKU to a price code using the Assigning Price Codes (APCD) menu option.</p>
--	---

Menu Option	Description
Working with Price Codes (WPCD)	<p>Create price codes to offer a special price or discount for an item or group of items.</p> <p>Optionally, use the Work with Qualifying Customer/Price Groups Screen to define the sold to customers and customer price groups that qualify for the price code. Note: If you do not define any sold to customers or customer price groups for a price code, then ALL sold to customers and customer price groups qualify for the price code.</p> <div data-bbox="1036 577 1458 1234" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Order lines that are assigned to a price code do not qualify for the discount defined for the customer price group assigned to the sold to customer on the order. To apply the customer price group discount to order lines that are assigned to a price code, embed the customer price group discount in the price defined for the price code. <i>Example:</i> If the customer price group provides a 30% discount, create the price code discount so that it includes the 30% discount.</p> </div>
Assigning Price Codes (APCD)	<p>Define which items are eligible for the special price or discount specified in a price code. You can assign the item to one or more price codes by offer or source code.</p>
Establishing Price Override Reason Codes (WPOR)	<p>Create the price override reason code to assign to order lines that are priced using a customer price group price and cannot be further discounted. However, you can still apply an order-level coupon to these order lines.</p>
Working with Source Codes (WSRC)	<p>To perform End of Order Customer Price Group Pricing during repricing, the Price method field for the source code on the order header must be set to <i>Reg Plus Reprice</i>.</p>
Working with Promotions (WPRO)	<p>Create promotions to apply a further discount to eligible order lines.</p>

System Control Values for Customer Price Group Pricing

Entity level override: You can set up pricing value overrides for an entity that should use different pricing logic from your company-wide standard. In order entry, the system checks the entity associated with the source code on the order header to determine if entity-level

pricing overrides are in effect. However, if you enter a customer price group in the [Customer Price Group Code for CPG Pricing Only \(L58\)](#) system control value, entity-level pricing overrides are NOT in effect. The system always uses the customer price group pricing method, regardless of the pricing values defined at the entity level.

System Control Value	Description
Customer Price Group Code for CPG Pricing Only (L58)	<p>Enter a customer price group code if you wish to use customer price group pricing. The system uses this customer price group:</p> <ul style="list-style-type: none"> As the default customer price group to apply to an order when the sold to customer on the order is not assigned to a customer price group. During customer price group best price comparison to determine if the price available for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is a better price than the price available for the customer price group assigned to the sold to customer. Whichever customer price group provides the best price, the system applies this price to the item on the order.
Price Override Reason Code for CPG Pricing (L59)	<p>Enter the price override reason code to assign to order lines that are priced using a customer price group price and cannot be further discounted. However, you can still apply an order-level coupon to these order lines.</p>

 **Note:**

If you enter a customer price group code in this system control value:

- the system uses only customer price group pricing to perform line-level pricing. The system does NOT use the pricing hierarchy to search for a price for an item and does not perform best way pricing based on the setting of the [Best Way Pricing \(A78\)](#) system control value.
- you must select the [Price Codes \(D93\)](#) system control value to perform end-of-order pricing and you cannot select any other type of end-of-order pricing method.

Line Level Customer Price Group Pricing

The system uses the following steps when you add an item to an order and the system uses customer price group line-level pricing to calculate the price of the order line.

- [Determine the Customer Price Group to Use](#)
- [Determine the Initial Price of the Item](#)
- [Determine the Customer Price Group Discount](#)
- [Compare List Price to Order Line Price](#)
- [Calculate Order Header Discounts](#)
- [Apply Final Customer Price Group Price to Order](#)

Determine the Customer Price Group

Determine the Customer Price Group to Use

The system uses the customer price group assigned to the sold to customer on the order. If a customer price group code is not assigned to the sold to customer on the order, or if it is invalid, the system uses the customer price group code defined in the [Customer Price Group Code for CPG Pricing Only \(L58\)](#) system control value.

Determine the Initial Price of the Item

If a price override reason code is defined for the order line, the system does not price the item using customer price group pricing, and instead, uses the price defined for the order line.

If a price override reason code is not defined for the order line, the system looks at the [Price Type](#) defined for the customer price group to determine the initial price of the item.

- *Original* = Original Price. The system uses the price defined in the [Orig retail \\$](#) (Original Retail Price) field in the SKU table as the initial price of the item.
- *Regular* = Regular Price. The system uses the price defined in the [List price](#) field in the SKU table as the initial price of the item.

If an initial price is not found for the item: If the system cannot determine the initial price for the item (an Original retail price or List price was not defined for the item), the system displays an error message in interactive order entry: `Price Not Found`.

Determine the Customer Price Group Discount

Item eligible for discount? An item is NOT eligible for customer price group discounting if:

- The [Discountable](#) field for the item is unselected.
- The item/SKU is excluded from the customer price group discount. These items display on the [Work with Customer Price Group Exclusions Screen](#) and exist in the Customer Price Group SKU Exclusion table.

If the Discountable field for the item is *selected* and the item/SKU is not excluded from the customer price group discount, the system will apply qualifying discounts and promotions to the item.

Customer price group discount hierarchy: The system determines if a discount exists for the customer price group on the order. The system uses the following hierarchy to determine the customer price group discount.

1. Use the discount defined in the Customer Price Group Detail table with an effective date that is equal to or earlier than the current date. If more than one Customer Price Group Detail record exists with a qualifying effective date, the system uses the discount with the most current effective date. You can review these discounts on the [Work with Customer Price Group Details Screen](#).

2. If a discount is not defined in the Customer Price Group Detail table with a qualifying effective date, use the discount defined in the Customer Price Group table. You can review this discount on the [Work with Customer Price Groups Screen](#).
3. If a discount is not defined in the Customer Price Group table, do not apply a customer price group discount to the order.

Customer price group discount calculation: Original or Regular Price - Customer Price Group Discount % = Updated Order Line Price

Compare List Price to Order Line Price

The system compares the list price defined for the item to the order line price.

- If the list price is lower than the order line price, the system applies the list price to the order line.
- If the list price is equal to or greater than the order line price, the system retains the order line price.

Display Order Detail: If the list price was lower than the order line price, the system displays a message on the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#) in Order Inquiry: LIST PRICE < ORIGINAL RETAIL \$ PRICE.

Calculate Order Header Discounts

The system applies any qualifying order header discounts to the order, such as:

- The discount defined in the *Disc %* field on the [Work with Order Screen](#).
- The discount defined for the source code on the [Work with Order Screen](#). Use the *Discount %* field on the [Create Source Code Screen \(1 of 2\)](#) to define a source discount.

Discount calculation messages: If the calculated order line price is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you add the item to the order, indicating the order line number of the discounted item, the offer price (this is initial price of the item), the actual price (this is the discounted price the customer is paying), the dollar amount of the discount, and the discount percentage. For example, if the initial price is \$10.00 and the order line price is \$5.00, the discount calculation message displays as: Line 1: Offer = 10.00 Actual = 5.00 Discount = 5.00: 50.00%.

Apply Final Customer Price Group Price to Order

After calculating any Order Header discounts for the order, the system applies the final customer price group price to the lines on the order.

The system updates the following fields in the Order Detail table during customer price group line level pricing.

Field	Order Detail Update
ODT Offer Price	<p>The initial price of the item, based on the Price type defined for the customer price group.</p> <ul style="list-style-type: none"> If Price type is <i>Original</i>, this is the Original Retail Price from the SKU table. If Price type is <i>Regular</i>, this is the List Price from the SKU table. <p>You can use this field to determine the initial price of the order line before the system applied any discounts or promotions to the order line.</p>
ODT Original Price	The <i>List price</i> defined for the item/SKU in the SKU table.
ODT Pre-Discount Price	<p>The price of the item after applying the customer price group discount and order header discount.</p> <p>This is the initial price - the customer price group and order header discount; however, if the list price is lower than this price, this is the list price of the item.</p>
ODT Price	<p>The final calculated price of the item after applying the customer price group discount and order header discount.</p> <p>This is the initial price - the customer price group and order header discount; however, if the list price is lower than this price, this is the list price of the item. Note: The final price of the order line may update during <i>Customer Price Group Price Code Pricing</i>.</p>
Price Method	<p>The method the system used to calculate the price of an item, but before applying an order-level discount, such as a source code discount percentage.</p> <p><i>F Customer Price Group</i> displays for lines priced using Customer Price Group Line Level pricing; see the <i>Order Pricing Window</i> for a complete list of price methods.</p> <p>The system uses this value to display the <i>Pricing method</i> on the <i>Work with Order Line Screen (Changing/Adding an Item)</i>.</p>

! Important:

The system may reprice the order line during *Customer Price Group Price Code Pricing* and *Customer Price Group Best Price Comparison*. The system performs price code pricing and best price comparison during repricing and end-of-order pricing.

Examples: Line Level Customer Price Group Pricing

- *Example: Original Customer Price Group Line Pricing*
- *Example: Regular Customer Price Group Line Pricing*
- *Example: Customer Price Group Line Pricing With Customer Price Group Discount*
- *Example: Customer Price Group Line Pricing with Order Header Discount*
- *Example: Customer Price Group Line Pricing with Customer Price Group and Order Header Discount*

Example: Original Customer Price Group Line Pricing

1. Determine the Customer Price Group to Use A customer assigned to customer price group CPGO places an order.

2. Determine the Initial Price of the Item The Price type for customer price group CPGO is set to *Original*, indicating the system uses the Original retail price in the SKU table as the initial price of the item.

The customer adds item ITO to the order. Item ITO has the following prices defined:

- List price of \$25.00
- Original retail price of \$20.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 20.00 as the initial price of the item.

The customer adds item ITR to the order. Item ITR has the following prices defined:

- List price of \$10.00
- Original retail price of \$15.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 15.00 as the initial price of the item.

3. Determine the Customer Price Group Discount. The Discountable flag for items ITO and ITR is selected, indicating the items are eligible for customer price group discounting, however, a discount is not defined for customer price group CPGO, so a customer price group discount is not applied to the order.

4. Compare List Price to Order Line Price. The system compares the list price defined for the item to the order line price.

- The list price for item ITO is \$25.00 and the order line price is \$20.00. Since the order line price is lower than the list price, the system retains \$20.00 as the order line price.
- The list price for item ITR is \$10.00 and the order line price is \$15.00. Since the order line price is greater than the list price, the system updates the order line price to \$10.00.

5. Calculate Order Header Discounts. the order does not qualify for any Order Header discounts.

6. Apply Final Customer Price Group Price to OrderThe system applies the final customer price group price to the lines on the order:

- The order line price for item ITO is \$20.00
- The order line price for item ITR is \$10.00.

Because the calculated order line price for item ITR is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you add the item to the order: Line 2:Offer = 15.00 Actual = 10.00 Discount = 5.00 :33.33%

The system updates the Order Detail table with the customer price group line level price.

Field	Item ITO	Item ITR
ODT Offer Price	Initial price: 20.00	Initial price: 15.00
ODT Original Price	List price: 25.00	List price: 10.00
ODT Pre-Discount Price	Price after discounts: 20.00	Price after discounts: 10.00
ODT Price	Order line price: 20.00	Order line price: 10.00
Price Method	F = Customer Price Group.	F = Customer Price Group.

Example: Regular Customer Price Group Line Pricing

1. Determine the Customer Price Group to Use .A customer assigned to customer price group CPGR places an order.

2. Determine the Initial Price of the Item The Price type for customer price group CPGR is set to *Regular*, indicating the system uses the List price in the SKU table as the initial price of the item.

The customer adds item ITO to the order. Item ITO has the following prices defined:

- List price of \$25.00
- Original retail price of \$20.00

Since the Price type for customer price group CPGR is set to *Regular*, the system uses 25.00 as the initial price of the item.

The customer adds item ITR to the order. Item ITR has the following prices defined:

- List price of \$10.00
- Original retail price of \$15.00

Since the Price type for customer price group CPGR is set to *Regular*, the system uses 10.00 as the initial price of the item.

3. Determine the Customer Price Group Discount The Discountable flag for items ITO and ITR is selected, indicating the items are eligible for customer price group discounting, however, a discount is not defined for customer price group CPGO, so a customer price group discount is not applied to the order.

4. Compare List Price to Order Line Price The system compares the list price defined for the item to the order line price.

- The list price for item ITO is \$25.00 and the order line price is \$25.00. Since the order line price is equal to the list price, the system retains \$25.00 as the order line price.
- The list price for item ITR is \$10.00 and the order line price is \$10.00. Since the order line price is equal to the list price, the system retains \$10.00 as the order line price.

5. Calculate Order Header Discounts The order does not qualify for any Order Header discounts.

6. Apply Final Customer Price Group Price to Order The system applies the final customer price group price to the lines on the order:

- The order line price for item ITO is \$25.00
- The order line price for item ITR is \$10.00.

The system updates the Order Detail table with the customer price group line level price.

Field	Item ITO	Item ITR
ODT Offer Price	Initial price: 25.00	Initial price: 10.00
ODT Original Price	List price: 25.00	List price: 10.00
ODT Pre-Discount Price	Price after discounts: 25.00	Price after discounts: 10.00
ODT Price	Order line price: 25.00	Order line price: 10.00
Price Method	F = Customer Price Group.	F = Customer Price Group.

Example: Customer Price Group Line Pricing With Customer Price Group Discount

1. Determine the Customer Price Group to Use A customer assigned to customer price group CPGO places an order.

2. Determine the Initial Price of the Item The Price type for customer price group CPGO is set to *Original*, indicating the system uses the Original retail price in the SKU table as the initial price of the item.

The customer adds item ITO to the order. Item ITO has the following prices defined:

- List price of \$25.00
- Original retail price of \$20.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 20.00 as the initial price of the item.

The customer adds item ITR to the order. Item ITR has the following prices defined:

- List price of \$10.00
- Original retail price of \$15.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 15.00 as the initial price of the item.

3. Determine the Customer Price Group Discount The Discountable flag for items ITO and ITR is selected, indicating the items are eligible for customer price group discounting. Customer price group CPGO has the following discounts defined:

- 10.00% discount at the Customer Price Group Detail level with an effective date of 1/16/12.
- 30.00% discount at the Customer Price Group Detail level with an effective date of 2/14/12.
- 5.00% discount at the Customer Price Group level.

Because the current date is 2/15/12, the system applies the 30.00% discount to the order.

- Item ITO: initial price \$20.00 - 30.00% = \$14.00.
- Item ITR: initial price \$15.00 - 30.00% = \$10.50.

4. Compare List Price to Order Line Price The system compares the list price defined for the item to the order line price.

- The list price for item ITO is \$25.00 and the order line price is \$14.00. Since the order line price is lower than the list price, the system retains \$14.00 as the order line price.
- The list price for item ITR is \$10.00 and the order line price is \$10.50. Since the order line price is greater than the list price, the system updates the order line price to \$10.00.

5. Calculate Order Header Discounts The order does not qualify for any Order Header discounts.

6. Apply Final Customer Price Group Price to Order The system applies the final customer price group price to the lines on the order:

Because the calculated order line price for item ITO is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you add the item to the order:

Line 2:Offer = 20.00 Actual = 14.00 Discount = 6.00 :30.00%

Because the calculated order line price for item ITR is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you add the item to the order:

Line 2:Offer = 15.00 Actual = 10.00 Discount = 5.00 :33.33%

The system updates the Order Detail table with the customer price group line level price.

Field	Item ITO	Item ITR
ODT Offer Price	Initial price: 20.00	Initial price: 15.00
ODT Original Price	List price: 25.00	List price: 10.00
ODT Pre-Discount Price	Price after discounts: 14.00	Price after discounts: 10.00
ODT Price	Order line price: 14.00	Order line price: 10.00
Price Method	F = Customer Price Group.	F = Customer Price Group.

Example: Customer Price Group Line Pricing with Order Header Discount

1. Determine the Customer Price Group to Use A customer assigned to customer price group CPGO places an order.

2. Determine the Initial Price of the Item The Price type for customer price group CPGO is set to *Original*, indicating the system uses the Original retail price in the SKU table as the initial price of the item.

The customer adds item ITO to the order. Item ITO has the following prices defined:

- List price of \$25.00
- Original retail price of \$20.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 20.00 as the initial price of the item.

The customer adds item ITR to the order. Item ITR has the following prices defined:

- List price of \$10.00
- Original retail price of \$15.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 15.00 as the initial price of the item.

3. Determine the Customer Price Group Discount The Discountable flag for items ITO and ITR is selected, indicating the items are eligible for customer price group discounting,

however, a discount is not defined for customer price group CPGO, so a customer price group discount is not applied to the order.

4. Compare List Price to Order Line Price The system compares the list price defined for the item to the order line price.

- The list price for item ITO is \$25.00 and the order line price is \$20.00. Since the order line price is lower than the list price, the system retains \$20.00 as the order line price.
- The list price for item ITR is \$10.00 and the order line price is \$15.00. Since the order line price is greater than the list price, the system updates the order line price to \$10.00.

5. Calculate Order Header Discounts The order qualifies for a 25% source discount.

The system applies the 25% source discount to the order.

- Item ITO: current order line price \$20.00 - 25.00% = \$15.00.
- Item ITR: current order line price \$10.00 - 25.00% = \$7.50.

6. Apply Final Customer Price Group Price to Order The system applies the final customer price group price to the lines on the order:

Because the calculated order line price for item ITO is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you add the item to the order: Line 2:Offer = 20.00 Actual = 15.00 Discount = 5.00 :25.00%

Because the calculated order line price for item ITR is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you add the item to the order: Line 2:Offer = 15.00 Actual = 7.50 Discount = 7.50 :50.00%

The system updates the Order Detail table with the customer price group line level price.

Field	Item ITO	Item ITR
ODT Offer Price	Initial price: 20.00	Initial price: 15.00
ODT Original Price	List price: 25.00	List price: 10.00
ODT Pre-Discount Price	Price after discounts: 15.00	Price after discounts: 7.50
ODT Price	Order line price: 15.00	Order line price: 7.50
Price Method	F = Customer Price Group.	F = Customer Price Group.

Example: Customer Price Group Line Pricing with Customer Price Group and Order Header Discount

1. Determine the Customer Price Group to Use A customer assigned to customer price group CPGO places an order.

2. Determine the Initial Price of the Item The Price type for customer price group CPGO is set to *Original*, indicating the system uses the Original retail price in the SKU table as the initial price of the item.

The customer adds item ITO to the order. Item ITO has the following prices defined:

- List price of \$25.00
- Original retail price of \$20.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 20.00 as the initial price of the item.

The customer adds item ITR to the order. Item ITR has the following prices defined:

- List price of \$10.00
- Original retail price of \$15.00

Since the Price type for customer price group CPGO is set to *Original*, the system uses 15.00 as the initial price of the item.

3. Determine the Customer Price Group Discount The Discountable flag for items ITO and ITR is selected, indicating the items are eligible for customer price group discounting. Customer price group CPGO has the following discounts defined:

- 10.00% discount at the Customer Price Group Detail level with an effective date of 1/16/12.
- 30.00% discount at the Customer Price Group Detail level with an effective date of 2/14/12.
- 5.00% discount at the Customer Price Group level.

Because the current date is 2/15/12, the system applies the 30.00% discount to the order.

- Item ITO: initial price \$20.00 - 30.00% = \$14.00.
- Item ITR: initial price \$15.00 - 30.00% = \$10.50.

4. Compare List Price to Order Line Price The system compares the list price defined for the item to the order line price.

- The list price for item ITO is \$25.00 and the order line price is \$14.00. Since the order line price is lower than the list price, the system retains \$14.00 as the order line price.
- The list price for item ITR is \$10.00 and the order line price is \$10.50. Since the order line price is greater than the list price, the system updates the order line price to \$10.00.

5. Calculate Order Header Discounts The order qualifies for a 25% source discount.

The system applies the 25% source discount to the order.

- Item ITO: current order line price \$14.00 - 25.00% = \$10.50.
- Item ITR: current order line price \$10.00 - 25.00% = \$7.50.

6. Apply Final Customer Price Group Price to Order The system applies the final customer price group price to the lines on the order:

Because the calculated order line price for item ITO is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you add the item to the order:
Line 2:Offer = 20.00 Actual = 10.50 Discount = 9.50 :47.50%

Because the calculated order line price for item ITR is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you add the item to the order:
Line 2:Offer = 15.00 Actual = 7.50 Discount = 7.50 :50.00%

The system updates the Order Detail table with the customer price group line level price.

Field	Item ITO	Item ITR
ODT Offer Price	Initial price: 20.00	Initial price: 15.00
ODT Original Price	List price: 25.00	List price: 10.00
ODT Pre-Discount Price	Price after discounts: 10.50	Price after discounts: 7.50
ODT Price	Order line price: 10.50	Order line price: 7.50
Price Method	F = Customer Price Group.	F = Customer Price Group.

Customer Price Group Price Code Pricing

If a customer price group is defined in the [Customer Price Group Code for CPG Pricing Only \(L58\)](#) system control value and the [Price Codes \(D93\)](#) system control value is selected, the system reevaluates the entire order during repricing to find the best price code price to apply to each qualifying order line.

See [When Repricing Occurs](#) for more information on when repricing occurs during interactive order entry.

Source code setting: To do end of order customer price group pricing, the Price method field for the source code on the order header must be set to *Reg Plus Reprice*.

Note:

If the [Customer Price Group Code for CPG Pricing Only \(L58\)](#) system control value does not contain a customer price group code, the system performs [Regular Price Code Pricing](#) instead of Customer Price Group Price Code Pricing.

The system performs the following steps during customer price group price code pricing.

- [Determine Whether the Order Qualifies for a Price Code](#)
- [Apply the Price Code to the Order](#)
- [Apply Discounts and Promotions to the Order](#)

Important:

Order lines that are assigned to a price code do not qualify for the discount defined for the customer price group assigned to the sold to customer on the order. To apply the customer price group discount to order lines that are assigned to a price code, embed the customer price group discount in the price defined for the price code. *Example:* If the customer price group provides a 30% discount, create the price code discount so that it includes the 30% discount.

Determine Whether the Order Qualifies for a Price Code

To qualify for a price code:

#	Step
1.	The date on the Order Header must fall within the Start date and End date defined for the price code in the Price Code table. You can review the start and end dates for price codes on the Work with Price Codes Screen .
2.	The sold to customer on the order must be defined for the price code in the Price Code Customer table. You can review the customers and customer price groups that qualify for a price code on the Work with Qualifying Customer/Price Groups Screen .

 **Note:**

If you do not define any sold to customers or customer price groups for a price code, then ALL sold to customers and customer price groups qualify for the price code.

3. The items on the order must be assigned to the price code and meet the price code requirements.
- Which items are assigned to the price code?** The system looks at the Price Code Details table to determine which items on the order are assigned to the price code. When assigning an item to a price code, you assign the item to the price code by offer or source code. The system uses the source code on the order header to determine whether the item on the order qualifies for the price code.
- If the item contains SKUs and a SKU is not defined in the Price Code Details table, all SKUs for the item qualify for the price code.
 - If the item contains SKUs and a SKU is defined in the Price Code Details table, only the specified SKUs qualify for the price code.

#	Step
	<p>Price code requirements: The system looks at the Price Code table to determine if the items on the order that are assigned to the price code meet the price code requirements.</p> <p><i>Quantity required:</i> The total quantity the customer must order of all qualifying items to get the price break. Note: The system evaluates price code quantity by ship-to address.</p> <p><i>Allow multiples?</i></p> <ul style="list-style-type: none"> • <i>Unselected</i> = Once an order qualifies for the price code based on the price code quantity requirement, the system applies the price code discount to all qualifying items on the order that are not already assigned to a price code. • <i>Selected</i> = Once an order qualifies for the price code based on the price code quantity requirement, the remaining items on the order that are not already assigned to a price code must meet the price code quantity requirement again in order to qualify for the price code. The Distinct By setting defines how the system determines whether the order meets the price code multiple requirement. <p><i>Distinct By:</i></p> <ul style="list-style-type: none"> • <i>Blank</i> = The order must meet the price code quantity requirement again in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three items/SKUs defined for the price code in order to qualify. If the order contains 7 items that qualify, the system applies the price code to 6 of the items. • <i>Item</i> = The quantity requirement for the price code requires separate <i>items</i> in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three separate items defined for the price code in order to qualify. • <i>SKU</i> = The quantity requirement for the price code requires separate <i>SKUs</i> in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three separate SKUs defined for the price code in order to qualify. • <i>Category</i> = The quantity requirement for the price code requires separate <i>item categories</i> in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three separate item categories for the items defined for the price code in order to qualify. <p>See Examples: Customer Price Group Price Code Pricing for examples of how price codes are applied to an order based on the price code requirements.</p>

Apply the Price Code to the Order

You can apply only one price code to an order line.

Best way price code hierarchy: If an order qualifies for more than one price code and you are using *Customer Price Group Price Code Pricing*, the system calculates the discount that each price code provides and:

1. Applies the price code that provides the greatest discount to the qualifying items on the order.
2. If more than one price code offers the same discount, the system uses the price code with the lowest Sequence number.
3. If more than one price code has the same sequence number, the system uses the price code with the lowest numeric price code.

The system applies the price code to the lines on an order in ascending price, order line number sequence.

Once you apply a price code to an order line, it no longer qualifies for another price code.

Starting price: When calculating the price code discount, the system starts with the initial price defined for the order line. This is the price of the item determined during [Line Level Customer Price Group Pricing](#) and stored in the ODT Price field.

After the system applies the first price code to the order, the system reevaluates the order to determine if it qualifies for another price code. The system applies the next price code that provides the greatest discount to the order in ascending price, order line number sequence.

The system continues to apply price codes to the order, using the best way price code hierarchy, in ascending price, order line number sequence, until all of the eligible lines on the order are assigned to a price code.

Applying a price code to a portion of an order line: To easily determine the price code discount applied to the lines on an order, enter each order line for a quantity of 1. If an order line contains a quantity greater than 1 and only part of the quantity on the order line qualifies for the discount, the system applies the discount to the quantity that qualifies for the discount and leaves the remaining quantity on the order line at its initial price. The extended price of the order line represents the discounted quantity price + the non-discounted quantity price.

Partial price code line example: An order line qualifies for a price code discount: \$3.00 off 2. The Multiples field is selected for the price code, indicating the order must meet the price code requirement again to apply the price code to the order multiple times. The order line quantity is 3 with a unit price of 10.00. The system applies the price code discount to 2 units of the item ($10.00 - 3.00 = 7.00$). The third unit remains priced at 10.00. The extended price for the order line is 24.00 ($7.00 + 7.00 + 10.00$) and the unit price for the order line is 8.00 ($24.00 / 3$).

 **Note:**

There may be a rounding discrepancy if the extended price of an order line does not divide evenly by the order quantity. This discrepancy should be no more than a few pennies. *Example:* Change the discount in the example above from \$3.00 off 2 to \$2.00 off 2. The order line quantity is 3 with a unit price of 10.00. The system applies the price code discount to 2 units of the item ($10.00 - 2.00 = 8.00$). The third unit remains priced at 10.00. The extended price for the order line is 26.01 and the unit price is 8.67 ($26.00 / 3 = 8.666$, which rounds to 8.67; $8.67 + 8.67 + 8.67 = 26.01$).

Price method: The system updates the Price method for any order line whose price was updated during customer price group price code pricing to *E Price Code*.

Order lines not eligible for price code discounts:

- Price code repricing does not apply to manually priced order lines associated with a price override reason code.
- Order lines that are assigned to the price override reason code defined in the [Price Override Reason Code for CPG Pricing \(L59\)](#) system control value cannot be further discounted except by order-level coupons or source% discounts. However, the system includes the dollar amount and quantity for order lines assigned to the Customer Price Group price override reason code in the eligibility calculations as qualifiers for promotions and price code pricing that may apply to other items on the order.

Apply Discounts and Promotions to the Order

Discounts and promotions: Once the system completes customer price group price code pricing, the system applies any non-freight discounts, detail-level coupon promotions, and any other promotions to the lines on the order.

Determining the best price: If the *Best Price Comparison* field for the customer price group assigned to the sold to customer is *selected*, the system performs *Customer Price Group Best Price Comparison* to determine if the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value provides a better price than the customer price group assigned to the sold to customer on the order.

Order-level coupon promotions: When using customer price group pricing, the system applies order-level coupon promotions, as defined in *Working with Coupon Promotions (WCPR)*, as the last discount applied to the lines on the order. See *Order-Level Coupon Promotions when using Customer Price Group Pricing* for further details.

Examples: Customer Price Group Price Code Pricing

- [Example: Price Code Special Price Discount](#)
- [Example: Price Code Dollar Off Discount](#)
- [Example: Price Code Percent Off Discount](#)
- [Example: Price Code Group Price Discount](#)
- [Example: Applying Multiple Price Codes to the Order](#)
- [Example: Item Qualifies for More than One Price Code](#)
- [Example: Price Code Multiples and Distinct By](#)

Example: Price Code Special Price Discount

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	4	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
303	2	2/1/12	4/1/12	3	<i>Special price: \$20.00 each for 3</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
303	10	

Determine price code item assignment: The item on the order that qualifies for price code 303 in the Price Code Details table is:

Price Code	Item	SKU	Source Code
303	C1		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	none	Price remains \$10.00
2	B1	\$20.00	none	Price remains \$20.00
3	C1	\$30.00	303	Special price: \$20.00 each for 3 Price changes from \$30.00 to \$20.00
4	D1	\$40.00	none	Price remains \$40.00

Because the calculated order line price for item C1 is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you reprice the order: Line 3: Offer = 30.00 Actual = 20.00 Discount = 10.00 :33.33%

Example: Price Code Dollar Off Discount

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	4	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off:</i> \$2 off 1
202	3	2/1/12	4/1/12	2	<i>Percent off:</i> 10% off 2
303	2	2/1/12	4/1/12	3	<i>Special price:</i> \$20.00 each for 3
404	1	2/1/12	4/1/12	3	<i>Group price:</i> \$60.00 total for 3

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
101	10	

Determine price code item assignment: The item on the order that qualifies for price code 101 in the Price Code Details table is:

Price Code	Item	SKU	Source Code
101	A1		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	101	Dollar off: \$2.00 off 1 Price changes from \$10.00 to \$8.00
2	B1	\$20.00	none	Price remains \$20.00
3	C1	\$30.00	none	Price remains \$30.00
4	D1	\$40.00	none	Price remains \$40.00

Because the calculated order line price for item A1 is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you reprice the order:
Line 1: Offer = 10.00 Actual = 8.00 Discount = 2.00 :20.00%

Example: Price Code Percent Off Discount

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	4	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
303	2	2/1/12	4/1/12	3	<i>Special price: \$20.00 each for 3</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
202	10	

Determine price code item assignment: The item on the order that qualifies for price code 202 in the Price Code Details table is:

Price Code	Item	SKU	Source Code
202	B1		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	none	Price remains \$10.00
2	B1	\$20.00	202	Percent off: 10% off 2 Price changes from \$20.00 to 18.00
3	C1	\$30.00	none	Price remains \$30.00
4	D1	\$40.00	none	Price remains \$40.00

Because the calculated order line price for item A1 is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you reprice the order: Line 2: Offer = 20.00 Actual = 18.00 Discount = 2.00 :10.00%

Example: Price Code Group Price Discount

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	SKU	Quantity	Price
1	SKA	RED	1	\$40.00
2	SKB	BLUE	1	\$20.00
3	SKC	GRN	1	\$30.00
4	SKD	GREY	1	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off:</i> \$2 off 1
202	3	2/1/12	4/1/12	2	<i>Percent off:</i> 10% off 2
303	2	2/1/12	4/1/12	3	<i>Special price:</i> \$20.00 each for 3
404	1	2/1/12	4/1/12	3	<i>Group price:</i> \$60.00 total for 3

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
404	10	

Determine price code item assignment: The items on the order that qualify for price code 404 in the Price Code Details table are:

Price Code	Item	SKU	Source Code
404	SKA		7
404	SKB		7
404	SKC		7
404	SKD		7

 **Note:**

If an item contains SKUs and no SKUs are defined for the item in the Price Code Details table, all SKUs for the item qualify for the price code.

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices in ascending price, order line number sequence

Line#	Item	SKU	Initial Price	Price Code	Reprice
2	SKB	BLUE	\$20.00	404	Group price: \$60.00 total for 3 Price changes from \$20.00 to \$13.33
3	SKC	GRN	\$30.00	404	Group price: \$60.00 total for 3 Price changes from \$30.00 to \$20.00
1	SKA	RED	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$26.67
4	SKD	GREY	\$40.00	none	Price remains \$40.00

merchandise total for lines assigned to price code 404 = \$90.00

\$90.00 merchandise total - \$60.00 group price = \$30.00 discount amount to prorate

 **Note:**

Order line 4 does not qualify for the price code 404 discount because you must order the qualifying items in groups of 3. If the customer ordered 2 more qualifying items, the order would qualify for the price code 404 discount two times because it would have two qualifying groups of 3 on the order.

Prorating the Group Price

The system applies the group price discount to each qualifying order line on a pro-rata basis.

Order line 2 calculations:

20.00 extended amount of the detail line before applying discounts / 90.00 discountable order merchandise total = .2222 discount percentage

20.00 pre-discount unit price of the detail line - [(30.00 total discount amount to prorate * .2222 discount percentage from above calculation) / 1 line unit quantity] = 13.33 unit selling price

Order line 3:

30.00 extended amount of the detail line before applying discounts / 90.00 discountable order merchandise total = .3333 discount percentage

30.00 pre-discount unit price of the detail line - [(30.00 total discount amount to prorate * .3333 discount percentage from above calculation) / 1 line unit quantity] = 20.00 unit selling price

Order line 1:

40.00 extended amount of the detail line before applying discounts / 90.00 discountable order merchandise total = .4444 discount percentage

40.00 pre-discount unit price of the detail line - [(30.00 total discount amount to prorate * .4444 discount percentage from above calculation) / 1 line unit quantity] = 26.67 unit selling price

Discount message: Because the calculated order line price for lines 1-3 is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you reprice the order: Line 3:Offer = 30.00 Actual = 20.00 Discount = 10.00 :33.33%

Example: Applying Multiple Price Codes to the Order

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	3	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off:</i> \$2 off 1
202	3	2/1/12	4/1/12	2	<i>Percent off:</i> 10% off 2
303	2	2/1/12	4/1/12	3	<i>Special price:</i> \$20.00 each for 3
404	1	2/1/12	4/1/12	3	<i>Group price:</i> \$60.00 total for 3

Determine price code customer assignment: The sold to customer on the order qualifies for the following price codes in the Price Code Customer table:

Price Code	Customer#
101	10
202	10
303	10
404	10

Determine price code item assignment: The details in the Price Code Details table for the items on the order are:

Price Code	Item	Source Code
101	A1	7
202	B1	7
303	C1	7
404	D1	7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	101	Dollar off: \$2 off 1 Price changes from \$10.00 to \$8.00
2	B1	\$20.00	202	Percent off: 10% off 2 Price changes from \$20.00 to 18.00
3	C1	\$30.00	303	Special price: \$20.00 each for 3 Price changes from \$30.00 to \$20.00
4	D1	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$20.00

Example: Item Qualifies for More than One Price Code

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	SKU	Quantity	Price
1	SKA	RED	1	\$40.00
2	SKA	BLUE	1	\$40.00
3	SKB	GRN	1	\$20.00
4	SKC	GREY	1	\$30.00
5	SKD	BLCK	1	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price codes in the Price Code Customer table:

Price Code	Customer#
101	10
202	10
404	10

Determine price code item assignment: The details in the Price Code Details table for the items on the order are:

Price Code	Item	Source Code
101	SKA	7
101	SKB	7
101	SKC	7
101	SKD	7
202	SKA	7
202	SKB	7
202	SKC	7
202	SKD	7
404	SKA	7
404	SKB	7
404	SKC	7
404	SKD	7

Note:

If an item contains SKUs and no SKUs are defined for the item in the Price Code Details table, all SKUs for the item qualify for the price code.

! Important:

You can apply only one price code to an order line. If an order line qualifies for more than one price code and you are using *Customer Price Group Price Code Pricing*, the system uses the price code that provides the greatest discount. If more than one price code offers the same discount, the system uses the price code with the lowest Sequence number. If more than one price code has the same sequence number, the system uses the price code with the lowest numeric price code.

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices the lines on the order in ascending price, order line number sequence.

Of the price codes that were eligible to apply to the order, price code 404 provided the greatest discount. Because the Multiples field for price code 404 was selected, only the first 3 order lines in ascending price, order line number sequence were eligible for the price code; the remaining order lines did not meet the quantity requirement for price code 404. The system assigned the next price code with the greatest discount (price code 202) to the two remaining items on the order.

The system applies price code 404 to order lines 3, 4 and 1. See [Prorating the Group Price](#) for the calculations the system uses to determine the price of each order line assigned to the group price.

Line#	Item	SKU	Initial Price	Price Code	Reprice
3	SKB	GRN	\$20.00	404	Group price: \$60.00 total for 3 Price changes from \$20.00 to \$13.33
4	SKC	GREY	\$30.00	404	Group price: \$60.00 total for 3 Price changes from \$30.00 to \$20.00
1	SKA	RED	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$26.67 The system applies price code 202 to order lines 2 and 5:
2	SKA	BLUE	\$40.00	202	Percent off: 10% off 2 Price changes from \$40.00 to 36.00
5	SKD	BLCK	\$40.00	202	Percent off: 10% off 2 Price changes from \$40.00 to 36.00

Discount message: Because the calculated order line price for the order lines is lower than the initial price of the item, the system displays [Discount Calculation Messages](#) when you reprice the order: Line 4:Offer = 30.00 Actual = 20.00 Discount = 10.00 :33.33%

Example: Price Code Multiples and Distinct By

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	SKU	Item Category	Qty	Price
1	SKA	SML	A	1	\$10.00
2	SKA	SML	A	1	\$10.00
3	SKB	SML	B	1	\$10.00
4	SKC	SML	C	1	\$10.00
5	SKD	SML	D	1	\$10.00
6	SKD	MED	D	1	\$10.00
7	SKD	LRG	D	1	\$10.00

Determine eligible price codes: The order and customer qualify for price code 202 in the Price Code table:

Price Code	Seq	Start	End	Qty	Price Code Discount
202	3	2/1/12	4/1/12	2	Percent off: 10% off 2

Determine price code item assignment: The details in the Price Code Details table for the items on the order are:

Price Code	Item	Source Code
202	SKA	7
202	SKB	7
202	SKC	7
202	SKD	7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices the lines on the order in ascending price, order line number sequence.

- *Multiples Unselected*
- *Multiples Selected, Distinct By Blank*
- *Multiples Selected, Distinct By Item*
- *Multiples Selected, Distinct By SKU*
- *Multiples Selected, Distinct By Item Category*

Multiples Unselected

Because Multiples for price code 202 is unselected, once the order qualifies for the price code based on the price code quantity requirement, the system applies price code 202 to all qualifying items on the order that are not already assigned to a price code.

Line#	Item	SKU	Initial Price	Price Code	Reprice
-------	------	-----	---------------	------------	---------

The system applies price code 202 to order lines 1 and 2:

Line#	Item	SKU	Initial Price	Price Code	Reprice
1	SA	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
2	SA	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
3	SB	SML	\$10.00	202	Now that the order qualifies for price code 202, the system applies price code 202 to all qualifying items on the order that are not already assigned to a price code: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
4	SC	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
5	SD	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
6	SD	MED	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
7	SD	LRG	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00

Multiples Selected, Distinct By Blank

Because Multiples for price code 202 is selected and the Distinct By is blank, the order must meet the price code quantity requirement again in order to qualify.

Line#	Item	SKU	Initial Price	Price Code	Reprice
1	SA	SML	\$10.00	202	The system applies price code 202 to order lines 1 and 2: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
2	SA	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
3	SB	SML	\$10.00	202	The system then applies price code 202 to order lines 3 and 4: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
4	SC	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
5	SD	SML	\$10.00	202	The system then applies price code 202 to order lines 5 and 6: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
6	SD	MED	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00

Line#	Item	SKU	Initial Price	Price Code	Reprice
					Order line 7 does not qualify since it does not meet the price code quantity requirement of 2.
7	SD	LRG	\$10.00	none	Remains \$10.00

Multiples Selected, Distinct By Item

Because Multiples for price code 202 is selected and the Distinct By is *Item*, the price code requires separate items in the required quantity in order to qualify.

Line#	Item	SKU	Initial Price	Price Code	Reprice
					The system applies price code 202 to order lines 1 and 3: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
1	SA	SML	\$10.00	202	
3	SB	SML	\$10.00	202	
					The system then applies price code 202 to order lines 2 and 4: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
2	SA	SML	\$10.00	202	
4	SC	SML	\$10.00	202	
					Order lines 5, 6 and 7 do not qualify for price code 202 since they do not meet the price code quantity requirement of 2 by item.
5	SD	SML	\$10.00	none	Remains \$10.00
6	SD	MED	\$10.00	none	Remains \$10.00
7	SD	LRG	\$10.00	none	Remains \$10.00

Multiples Selected, Distinct By SKU

Because Multiples for price code 202 is selected and the Distinct By is *SKU*, the price code requires separate SKUs in the required quantity in order to qualify.

Line#	Item	SKU	Initial Price	Price Code	Reprice
					The system applies price code 202 to order lines 1 and 3: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
1	SA	SML	\$10.00	202	
3	SB	SML	\$10.00	202	
					Percent off: 10% off 2 Price changes from \$10.00 to \$9.00

Line#	Item	SKU	Initial Price	Price Code	Reprice
2	SA	SML	\$10.00	202	The system then applies price code 202 to order lines 2 and 4: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
4	SC	SML	\$10.00	202	
5	SD	SML	\$10.00	202	The system then applies price code 202 to order lines 5 and 6: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
6	SD	MED	\$10.00	202	
7	SD	LRG	\$10.00	202	Order line 7 does not qualify since it does not meet the price code quantity requirement of 2 by SKU. Percent off: 10% off 2 Price changes from \$10.00 to \$9.00

Multiples Selected, Distinct By Item Category

Because Multiples for price code 202 is selected and the Distinct By is *Item Category*, the price code requires separate item categories in the required quantity in order to qualify.

Line	Item	SKU	Category	Initial Price	Price Code	Reprice
1	SA	SML	A	\$10.00	202	The system applies price code 202 to order lines 1 and 3: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
3	SB	SML	B	\$10.00	202	
2	SA	SML	A	\$10.00	none	The system then applies price code 202 to order lines 2 and 4: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
4	SC	SML	C	\$10.00	202	

Line	Item	SKU	Category	Initial Price	Price Code	Reprice
						Order lines 5, 6 and 7 do not qualify for price code 202 since they do not meet the price code quantity requirement of 2 by item category.
5	SD	SML	D	\$10.00	none	Remains \$10.00
6	SD	MED	D	\$10.00	none	Remains \$10.00
7	SD	LRG	D	\$10.00	none	Remains \$10.00

Customer Price Group Best Price Comparison

After performing [Customer Price Group Price Code Pricing](#) and applying any non-freight discounts and promotions (and before applying any freight promotions and order-level coupon promotions), the system looks at the [Best Price Comparison](#) field for the customer price group assigned to the sold to customer to determine whether to perform customer price group best price comparison processing.

Customer Price Group Best Price Comparison determines if the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value provides a better price than the customer price group assigned to the sold to customer on the order.

- If the Best Price Comparison field for the customer price group assigned to the sold to customer is unselected, the system does not perform customer price group best price comparison.
- If the Best Price Comparison field for the customer price group assigned to the sold to customer is selected, the system performs customer price group best price comparison.

During customer price group best price comparison, the system:

1. Performs [Line Level Customer Price Group Pricing](#) for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value.
2. Performs [Customer Price Group Price Code Pricing](#) for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value.
3. Calculates the non-freight discounts, line-level coupon promotions, and any other promotions that are eligible for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value.
4. Compares the price available for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value to the price available for the customer price group assigned to the sold to customer on the order.
5. If the calculated price for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is *lower* than the calculated price for the customer price group assigned to the sold to customer on the order, the system updates the order line to this lower price.
6. If the calculated price for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is *greater* than the calculated price for the customer price group assigned to the sold to customer on the order, the system does not update the price on the order line.

- After applying the best price to each order line, the system applies any freight discounts and order-level coupon promotions to the order; see [Order-Level Coupon Promotions when using Customer Price Group Pricing](#).

Manually entered promotions: If the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is eligible for a promotion that requires manual entry to be applied to the order, the system includes this promotion in the best price comparison only if the promotion code is manually entered on the order.

Free gifts:

- If the sold to customer or order qualifies for a free gift, and after performing best price comparison, the dollar total no longer makes the order qualify, the system will not remove the free gift from the order.
- If the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value qualifies for a free gift, the system will NOT add the item to the order during customer price group best price comparison.

Price method: The system updates the Price method for any order line whose price was updated during customer price group best price comparison to *J Repriced Customer Price Group Best Price*.

Order transaction history: The system writes an order transaction history message indicating the order line was repriced during customer price group best price comparison; for example:.

Type	Transaction Note	Amount	User
UPSELL PROMO	Best Price price override - Line 2	24.99	TBROWN

Order Detail table: The system stores the calculated price for the default customer price group in the following fields in the Order Detail table.

- Basic customer price
- Basic customer prediscout price
- Basic customer original price: The final calculated price of the order line for the customer price group code defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value.
- Customer price group original price: The final calculated price of the order line for the customer price group code assigned to the sold to customer on the order.
- Basic customer price method

The system compares the Basic customer original price to the Customer price group original price to determine whether the default customer price group provides a better price than the customer price group assigned to the sold to customer on the order.

Order-Level Coupon Promotions when using Customer Price Group Pricing

When using customer price group pricing, the system applies order-level coupon promotions, as defined in [Working with Coupon Promotions \(WCPR\)](#), as the last discount applied to the lines on the order.

- The system applies order-level coupon promotions after applying all other discounts and promotions to the lines on the order, and after performing *Customer Price Group Best Price Comparison*.

- When applying order-level coupon promotions to the lines on the order, the system applies the coupons to the order as a pro-rated merchandise discount during repricing.
- The system applies the coupon promotion to all lines eligible for the coupon promotion, including non-discountable items.

Customer price group order-level coupon discount calculations: The system uses the following calculations to determine the discount amount to apply to each order line.

The system calculates the Discount Percentage for each order line:

order line extended amount after applying all other discounts and promotions and best price / order merchandise total = discount percentage

The system calculates the Unit Selling Price for each order line:

order line post-discount unit price - [(total order-level coupon amount X discount % from above calculation) / line unit quantity] = unit selling price

For more information: See:

- [How Coupons Work](#) for more information on coupon promotions.
- [Example: Line Level Best Price Comparison](#) and [Example: Price Code Best Price Comparison](#) for examples that apply order-level coupons to an order.

Examples: Customer Price Group Best Price Comparison

- [Example: Line Level Best Price Comparison](#)
- [Example: Price Code Best Price Comparison](#)

Example: Line Level Best Price Comparison

1. [Determine the Customer Price Group to Use](#). A customer assigned to customer price group CPGO places an order. The Best Price Comparison field for customer price group CPGO is *selected*, indicating the system uses the best price offered between customer price group CPGO and the default customer price group, CPG, defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value.

2. [Determine the Initial Price of the Item](#)

- The Price type for customer price group CPGO is set to *Original*, indicating the system uses the Original retail price in the SKU table as the initial price of the item.
- The Price type for customer price group CPG is set to *Regular*, indicating the system uses the List price in the SKU table as the initial price of the item.

The customer adds item ITO to the order. Item ITO has the following prices defined:

- List price of \$25.00
- Original retail price of \$20.00

CPGO customer price group	CPG customer price group
Since the Price type for customer price group CPGO is set to <i>Original</i> , the system uses 20.00 as the initial price of the item.	Since the Price type for customer price group CPG is set to <i>Regular</i> , the system uses \$25.00 as the initial price of the item.

The customer adds item ITR to the order. Item ITR has the following prices defined:

- List price of \$10.00

- Original retail price of \$15.00

CPGO customer price group	CPG customer price group
Since the Price type for customer price group CPGO is set to <i>Original</i> , the system uses 15.00 as the initial price of the item.	Since the Price type for customer price group CPG is set to <i>Regular</i> , the system uses \$10.00 as the initial price of the item.

3. Determine the Customer Price Group Discount. The Discountable flag for items ITO and ITR is selected, indicating the items are eligible for customer price group discounting.

CPGO customer price group	CPG customer price group
Customer price group CPGO provides a 30.00% discount. Item ITO: initial price \$20.00 - 30.00% = \$14.00. Item ITR: initial price \$15.00 - 30.00% = \$10.50.	Customer price group CPG provides a 25.00% discount. Item ITO: initial price \$25.00 - 25.00% = \$18.75. Item ITR: initial price \$10.00 - 25.00% = \$7.50.

4. Compare List Price to Order Line Price. The system compares the list price defined for the item to the order line price.

CPGO customer price group	CPG customer price group
The list price for item ITO is \$25.00 and the order line price is \$14.00. Since the order line price is lower than the list price, the system retains \$14.00 as the order line price. The list price for item ITR is \$10.00 and the order line price is \$10.50. Since the order line price is greater than the list price, the system updates the order line price to \$10.00.	The list price for item ITO is \$25.00 and the order line price is \$18.75. Since the order line price is lower than the list price, the system retains \$18.75 as the order line price. The list price for item ITR is \$10.00 and the order line price is \$7.50. Since the order line price is lower than the list price, the system retains \$7.50 as the order line price.

5. Calculate Order Header Discounts. The order qualifies for a 25% source discount. The system applies the 25% source discount to the order.

CPGO customer price group	CPG customer price group
Item ITO: current order line price \$14.00 - 25.00% = \$10.50. Item ITR: current order line price \$10.00 - 25.00% = \$7.50.	Item ITO: current order line price \$18.75 - 25.00% = \$14.06. Item ITR: current order line price \$7.50 - 25.00% = \$5.62.

6. Apply Final Customer Price Group Price to Order. The system applies the final customer price group price for the customer price group CPGO assigned to the sold to customer to the lines on the order:

 **Note:**

Before you reprice the order, the final calculated line level price for the customer price group assigned to the sold to customer on the order displays for each order line. The system does not apply the best price to the each order line until you reprice the order.

Because the calculated order line price for item ITO is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you add the item to the order:
Line 2:Offer = 20.00 Actual = 10.50 Discount = 9.50 :47.50%

Because the calculated order line price for item ITR is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you add the item to the order:
Line 2:Offer = 15.00 Actual = 7.50 Discount = 7.50 :50.00%

The system updates the Order Detail table with the customer price group line level price.

Field	Item ITO	Item ITR
ODT Offer Price	Initial price: 20.00	Initial price: 15.00
ODT Original Price	List price: 25.00	List price: 10.00
ODT Pre-Discount Price	Price after discounts: 10.50	Price after discounts: 7.50
ODT Price	Order line price: 10.50	Order line price: 7.50
Price Method	F = Customer Price Group	F = Customer Price Group
Basic Customer Price	default customer price group price after discounts: 14.06	default customer price group price after discounts: 5.62
Basic Customer Prediscount Price	14.06	5.62
Basic Customer Original Price	final default customer price group price: 14.06	final default customer price group price: 5.62
Customer Price Group Original Price	final sold to customer price group discount: 10.50	final sold to customer price group discount: 7.50

When you select *Reprice*, the system:

- applies any non-freight discounts, detail-level coupon promotions, and any other promotions to the lines on the order. The offer associated with the order has a free gift defined for a merchandise total of \$18.00. Because the merchandise total for the order before performing best price comparison is \$18.00 (\$10.50 + \$7.50), the system adds the free gift to the order.
- compares the prices offered by the customer price group assigned to the sold to customer on the order to the prices offered by the default customer price group and updates the lines on the order to the lowest price offered.

CPGO customer price group	CPG customer price group
Item ITO: final calculated price is \$10.50.	Item ITO: final calculated price is \$14.06.
Item ITR: final calculated price is \$7.50.	Item ITR: final calculated price is \$5.62.

Results:

- Item ITO: The final price for sold to customer price group CPGO \$10.50 is lower than the final price for the default customer price group CPG \$14.06. The system retains \$10.50 as the final price.
- Item ITR: The final price for sold to customer price group CPGO \$7.50 is greater than the final price for the default customer price group CPG \$5.62. The system updates this order line to \$5.62.

8. *Apply Order-Level Coupon Promotions to the Order.* The order qualifies for an order-level coupon that provides \$5.00 off the order.

The system applies the \$5.00 order-level coupon discount to each order line on a pro-rata basis. The merchandise total after applying all other discounts and promotions and determining the best price is \$16.12 (10.50 + 5.62).

The system uses the following calculations to determine the discount amount to apply to each order line.

The system calculates the Discount Percentage for each order line:

order line extended amount after applying all other discounts and promotions and best price / order merchandise total = discount percentage

$$\text{Line 1: } 10.50 / 16.12 = .65136$$

$$\text{Line 2: } 5.62 / 16.12 = .3486$$

The system calculates the Unit Selling Price for each order line:

order line post-discount unit price - [(total order-level coupon amount X discount % from above calculation) / line unit quantity] = unit selling price

$$\text{Line 1: } 10.50 - [(5.00 \times .65136) / 1] = \$7.24$$

$$\text{Line 2: } 5.62 - [(5.00 \times .3486) / 1] = \$3.88$$

 **Note:**

Even though the merchandise total after performing best price comparison and applying any order-level coupons to the order is now \$11.12 (while the offer free gift required a merchandise total of \$18.00), the system retains the offer free gift that was added to the order.

Order Detail table updates: The system updates the Order Detail table after repricing the order.

Field	Item ITO	Item ITR
ODT Offer Price	Initial price: 20.00	Initial price: 15.00
ODT Original Price	List price: 25.00	List price: 10.00
ODT Pre-Discount Price	Price before reprice: 10.50	Price before reprice: 7.50
ODT Price	Order line price: 7.24	Order line price: 3.88
Price Method	F = Customer Price Group	J = Repriced CPG Best Price
Basic Customer Price	default customer price group price after discounts: 10.49	default customer price group price after discounts: 4.19

Field	Item ITO	Item ITR
Basic Customer Prediscount Price	14.06	5.62
Basic Customer Original Price	default customer price group price before applying order-level coupon: 14.06	default customer price group price before applying order-level coupon: 5.62
Customer Price Group Original Price	sold to customer price group discount before applying order-level coupon: 10.50	sold to customer price group discount before applying order-level coupon: 7.50
Basic Customer Price Method	A = Repriced-prorated discount	F = Customer Price Group

Example: Price Code Best Price Comparison

Determine customer price group: You take an order for sold to customer 10 using source code 7. Sold to customer 10 is assigned to customer price group *CPGO*. The Best Price Comparison field for customer price group *CPGO* is selected.

Line#	Item	SKU	Quantity	Price
1	SKA	RED	1	\$40.00
2	SKC	BLCK	1	\$30.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>

Determine price code customer assignment: The sold to customer on the order and the *CPG* customer price group defined in the Customer Price Group Code for *CPG Pricing Only (L58)* system control value qualify for the following price codes in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
101	10	
202		CPG

Determine price code item assignment: The details in the Price Code Details table for the items on the order are:

Price Code	Item	SKU	Source Code
101	SKA		7
101	SKC		7
202	SKA		7
202	SKC		7

 **Note:**

If an item contains SKUs and no SKUs are defined for the item in the Price Code Details table, all SKUs for the item qualify for the price code.

Reprice the order: When you select *Reprice* at the Order Detail screen, the system:

- applies any non-freight discounts, detail-level coupon promotions, and any other promotions to the lines on the order. The sold to customer qualifies for a free gift with a merchandise total of \$65.00. Because the merchandise total for the order before performing best price comparison is \$66.00 (\$38.00 + \$38.00), the system adds the free gift to the order.
- determines whether the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value provides a greater discount than the customer price group assigned to the sold to customer on the order:

Line#	Item	Initial Price	Price Code	Default Customer Price Group Price	Sold To Customer Price Group Price
1	SKA	\$40.00	101	Percent off: 10% off 2 Price changes from \$40.00 to 36.00	Dollar off: \$2 off 2 Price changes from \$40.00 to \$38.00
2	SKC	\$40.00	202	Percent off: 10% off 2 Price changes from \$40.00 to 27.00	Dollar off: \$2 off 2 Price changes from \$40.00 to \$28.00

Results: The price for the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value is lower than the price for the customer price group assigned to the sold to customer on the order. Because the price is lower, the system updates the order lines to use the price offered by the default customer price group.

Apply order-level coupons: The order qualifies for an order-level coupon that provides \$5.00 off the order.

The system applies the \$5.00 order-level coupon discount to each order line on a pro-rata basis. The merchandise total after applying all other discounts and promotions and determining the best price is \$63.00 (36.00 + 27.00).

The system uses the following calculations to determine the discount amount to apply to each order line.

The system calculates the Discount Percentage for each order line:

order line extended amount after applying all other discounts and promotions and best price / order merchandise total = discount percentage

$$\text{order line 1: } 36.00 / 63.00 = .5714$$

$$\text{order line 2: } 27.00 / 63.00 = .4286$$

The system calculates the Unit Selling Price for each order line:

order line post-discount unit price - [(total order-level coupon amount X discount % from above calculation) / line unit quantity] = unit selling price

line 1: $36.00 - [(5.00 \times .5714) / 1] = \33.14

line 2: $27.00 - [(5.00 \times .4286) / 1] = \24.86

 **Note:**

Even though the merchandise total after performing best price comparison and applying any order-level coupons to the order is now \$58.00 (while the free gift for the sold to customer required a merchandise total of \$60.00), the system retains the free gift that was added to the order.

Order Detail table updates: The system updates the Order Detail table after repricing the order.

Field	Item SKA	Item SKC
ODT Offer Price	Initial price: 40.00	Initial price: 30.00
ODT Original Price	List price: 40.00	List price: 30.00
ODT Pre-Discount Price	Price before reprice: 38.00	Price before reprice: 28.00
ODT Price	Order line price: 33.14	Order line price: 24.86
Price Method	<i>J</i> = Repriced CPG Best Price	<i>J</i> = Repriced CPG Best Price
Basic Customer Price	33.14	24.86
Basic Customer Pre-Discount Price	36.00	27.00
Basic Customer Original Price	36.00	27.00
Customer Price Group Original Price	38.00	28.00
Basic Customer Price Method	<i>E</i> = Price code	<i>E</i> = Price code

Customer Price Group Pricing in Order Maintenance

During order maintenance, the system performs [Line Level Customer Price Group Pricing](#) when you add, change, or delete the lines on an order.

The system does NOT perform [Customer Price Group Price Code Pricing](#) or [Customer Price Group Best Price Comparison](#) during order maintenance. The system displays an error message when you select *Reprice*: Selected function is not valid for current processing mode (Maintain).

Understanding Promotional Pricing

Purpose: This topic discusses promotional pricing and what you need to do to set up both features.

Promotional pricing allows you to specify an item, a group of items, or a dollar amount that a customer must order to receive an incentive item at no charge or at a special price. Promotional pricing is defined for a source code or offer. When the customer meets the eligibility requirements established in the promotional pricing record, a pop-up window

appears in Order Entry allowing the customer to select from an incentive group or select an incentive item. The system automatically adds the item to the order.

You can also create promotions based on the day of the week, which you can review in Order Entry by selecting *Dsp Daily Promo* at the Select Customer Sold To for Order screen. However, you cannot offer these “daily specials” if you use tax-inclusive pricing, as there is no way to determine if the order is subject to VAT and tax-inclusive pricing before you enter the header information on an order. See the Tax Included in Price (E70) system control value.

Promotional pricing windows display only if the order type indicates to display promo windows. Typically, you would not want them to display for fax or mail orders.

Promotional Pricing

Initial steps: Use the following steps to set up promotional pricing (see *Understanding Promotional Pricing*).

- Create the offer or source codes for which promotional pricing will be valid (as described in [Introducing Offer and Source Codes](#)). The Promo pricing field for the source code must be *selected*. In addition, to receive promotional pricing for the specified offer/source code, make sure you create item/SKU offer prices for the items/SKUs assigned to the offer (associated with the source code).
- Use [Establishing Order Types \(WOTY\)](#) to indicate the order types subject to promotional pricing. (For example, you might not want promotional pricing pop-up windows to appear for mail or fax orders.) The Promo windows field in the order type record must be set to *Promo* (promotional pricing).

Promotional group setup: If you are using promotional groups, or if you want to offer a group of items as an incentive, you need to set up promotional groups before you can create a promotional pricing record.

- Select [Work with Promotional Pricing Groups \(WPRG\)](#) to create a promotional group, and assign the items the customer must order to receive the incentive.
- If you want the customer to select an incentive item from a group of items, you also use this function to set up your incentive groups.

Promotion pricing setup: Select [Work with Promotional Pricing \(WPRP\)](#) to define the requirements that will make the customer eligible for the incentive group or incentive item, what the incentive group or item will be, the maximum quantity, and whether it is offered at no charge, a special incentive price, or a discounted price.

Promotional pricing in Order Entry: You advance to a promotional pricing pop-up window or screen only when:

- The customer places an order from a source code or offer for which a promotion has been defined and
- The customer orders:
 - a specific quantity from a predefined group
 - a specific quantity of an item
 - a certain dollar amount of merchandise, and
- The [Promo pricing \(Promotional pricing\)](#) field in the source code record is *selected*, and
- The Promo windows field in the order type record is set to *Promo* (promotional pricing)

 **Note:**

Once you have added an incentive item to an order, the system will not reprice it or reassess tax, regardless of changes to the shipping address, customer tax status, etc.

Regular Price Code Pricing

If the *Price Codes (D93)* system control value is selected, the system applies price code discounts to an order during repricing and end-of-order pricing.

See *When Repricing Occurs* for more information on when repricing occurs during interactive order entry.

Source code setting: To apply price code discounting to an order, the Price method field for the source code on the order header must be set to *Reg Plus Reprice*.

 **Note:**

If the *Customer Price Group Code for CPG Pricing Only (L58)* system control value contains a customer price group code, the system performs *Customer Price Group Price Code Pricing* instead of Regular Price Code Pricing.

The system performs the following steps during regular price code pricing.

- *Determine Whether the Order Qualifies for a Price Code*
- *Apply the Price Code to the Order*
- *Apply Discounts and Promotions to the Order*

Determine Whether the Order Qualifies for a Price Code

To qualify for a price code:

#	Step
1.	The date on the Order Header must fall within the Start date and End date defined for the price code in the Price Code table. You can review the start and end dates for price codes on the <i>Work with Price Codes Screen</i> .
2.	The sold to customer on the order must be defined for the price code in the Price Code Customer table. You can review the customers and customer price groups that qualify for a price code on the <i>Work with Qualifying Customer/Price Groups Screen</i> .

 **Note:**

If you do not define any sold to customers or customer price groups for a price code, then ALL sold to customers and customer price groups qualify for the price code.

#	Step
3.	<p>The items on the order must be assigned to the price code and meet the price code requirements.</p> <p>Which items are assigned to the price code? The system looks at the Price Code Details table to determine which items on the order are assigned to the price code. When assigning an item to a price code, you assign the item to the price code by offer or source code. The system uses the source code on the order header to determine whether the item on the order qualifies for the price code.</p> <ul style="list-style-type: none"> • If the item contains SKUs and a SKU is not defined in the Price Code Details table, all SKUs for the item qualify for the price code. • If the item contains SKUs and a SKU is defined in the Price Code Details table, only the specified SKUs qualify for the price code. <p>Price code requirements: The system looks at the Price Code table to determine if the items on the order that are assigned to the price code meet the price code requirements.</p> <p><i>Quantity required:</i> The total quantity the customer must order of all qualifying items to get the price break. Note: The system evaluates price code quantity by ship-to address.</p> <p><i>Allow multiples?</i></p> <ul style="list-style-type: none"> • <i>Unselected</i> = Once an order qualifies for the price code based on the price code quantity requirement, the system applies the price code discount to all qualifying items on the order that are not already assigned to a price code. • <i>Selected</i> = Once an order qualifies for the price code based on the price code quantity requirement, the remaining items on the order that are not already assigned to a price code must meet the price code quantity requirement again in order to qualify for the price code. The Distinct By setting defines how the system determines whether the order meets the price code multiple requirement: <p><i>Distinct By:</i></p> <ul style="list-style-type: none"> • <i>Blank</i> = The order must meet the price code quantity requirement again in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three items/SKUs defined for the price code in order to qualify. If the order contains 7 items that qualify, the system applies the price code to 6 of the items. • <i>Item</i> = The quantity requirement for the price code requires separate <i>items</i> in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three separate items defined for the price code in order to qualify. • <i>SKU</i> = The quantity requirement for the price code requires separate <i>SKUs</i> in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three separate SKUs defined for the price code in order to qualify. • <i>Category</i> = The quantity requirement for the price code requires separate <i>item categories</i> in order to qualify. <i>Example:</i> If the Quantity required is 3, the order must contain three separate item categories for the items defined for the price code in order to qualify. <p>See Regular Price Code Pricing Examples for examples of how price codes are applied to an order based on the price code requirements.</p>

Apply the Price Code to the Order

You can apply only one price code to an order line.

Price code hierarchy: If an order line qualifies for more than one price code and you are using *Regular Price Code Pricing*, the system uses the Sequence number assigned to each price code to determine the order in which to apply price codes to an order.

- Use the price code with the lowest sequence number.
- If more than one price code has the same sequence number, use the price code with the lowest numeric price code.

Once you apply a price code to an order line, it no longer qualifies for another price code.

After you apply the first price code to the order, the system reevaluates the order to determine if it qualifies for another price code. The system continues to apply price codes to the order, using the price code hierarchy, until all of the eligible lines on the order are assigned to a price code.

Applying a price code to a portion of an order line: To easily determine the price code discount applied to the lines on an order, enter each order line for a quantity of 1. If an order line contains a quantity greater than 1 and only part of the quantity on the order line qualifies for the discount, the system applies the discount to the quantity that qualifies for the discount and leaves the remaining quantity on the order line at its initial price. The extended price of the order line represents the discounted quantity price + the non-discounted quantity price.

Partial price code line example: An order line qualifies for a price code discount: \$3.00 off 2. The Multiples field is selected for the price code, indicating the order must meet the price code requirement again to apply the price code to the order multiple times. The order line quantity is 3 with a unit price of 10.00. The system applies the price code discount to 2 units of the item ($10.00 - 3.00 = 7.00$). The third unit remains priced at 10.00. The extended price for the order line is 24.00 ($7.00 + 7.00 + 10.00$) and the unit price for the order line is 8.00 ($24.00 / 3$).

 **Note:**

There may be a rounding discrepancy if the extended price of an order line does not divide evenly by the order quantity. This discrepancy should be no more than a few pennies. *Example:* Change the discount in the example above from \$3.00 off 2 to \$2.00 off 2. The order line quantity is 3 with a unit price of 10.00. The system applies the price code discount to 2 units of the item ($10.00 - 2.00 = 8.00$). The third unit remains priced at 10.00. The extended price for the order line is 26.01 and the unit price is 8.67 ($26.00 / 3 = 8.666$, which rounds to 8.67; $8.67 + 8.67 + 8.67 = 26.01$).

Price method: The system updates the Price method for any order line whose price was updated during price code pricing to *E* Price Code.

Note:

- Price code repricing does not apply to manually priced order lines associated with a price override reason code.
- When calculating the price code discount, the system uses the price defined in the ODT Price field for the order line.

Apply Discounts and Promotions to the Order

After applying a price code to the lines on the order, the system applies any additional discounts to the order, such as a discount percentage defined for the source code or Order Header, free gifts based on offer or source code, additional charge dollar discounts based on the offer or source code, or package inserts.

For more information: See *Regular Price Code Pricing Examples* for examples of how the system applies each type of price code discount to an order.

Regular Price Code Pricing Examples

1. [Example: Price Code Special Price Discount](#)

2. [Example: Price Code Dollar Off Discount](#)
3. [Example: Price Code Percent Off Discount](#)
4. [Example: Price Code Group Price Discount](#)
5. [Example: Applying Multiple Price Codes to the Order](#)
6. [Example: Item Qualifies for More than One Price Code](#)

Example: Price Code Special Price Discount

On 2/17/12, you take an order for sold to customer 10 using source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	4	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
303	2	2/1/12	4/1/12	3	<i>Special price: \$20.00 each for 3</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#
303	10

Determine price code item assignment: The item on the order that qualifies for price code 303 in the Price Code Details table is:

Price Code	Item	SKU	Source Code
303	C1		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	none	Price remains \$10.00
2	B1	\$20.00	none	Price remains \$20.00

Line#	Item	Initial Price	Price Code	Reprice
3	C1	\$30.00	303	Special price: \$20.00 each for 3 Price changes from \$30.00 to \$20.00
4	D1	\$40.00	none	Price remains \$40.00

Because the calculated order line price for item C1 is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you reprice the order: Line 3: Offer = 30.00 Actual = 20.00 Discount = 10.00 :33.33%

Example: Price Code Dollar Off Discount

On 2/17/12, you take an order for sold to customer 10 and source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	4	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
303	2	2/1/12	4/1/12	3	<i>Special price: \$20.00 each for 3</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#
101	10

Determine price code item assignment: The item on the order that qualifies for price code 101 in the Price Code Details table is:

Price Code	Item	SKU	Source Code
101	A1		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Lin e#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	101	Dollar off: \$2.00 off 1 Price changes from \$10.00 to \$8.00
2	B1	\$20.00	none	Price remains \$20.00
3	C1	\$30.00	none	Price remains \$30.00
4	D1	\$40.00	none	Price remains \$40.00

Because the calculated order line price for item A1 is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you reprice the order:
Line 1: Offer = 10.00 Actual = 8.00 Discount = 2.00 :20.00%

Example: Price Code Percent Off Discount

On 2/17/12, you take an order for sold to customer 10 and source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	4	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
303	2	2/1/12	4/1/12	3	<i>Special price: \$20.00 each for 3</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
202	10	

Determine price code item assignment: The item on the order that qualifies for price code 202 in the Price Code Details table is:

Price Code	Item	SKU	Source Code
202	B1		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	none	Price remains \$10.00
2	B1	\$20.00	202	Percent off: 10% off 2 Price changes from \$20.00 to 18.00
3	C1	\$30.00	none	Price remains \$30.00
4	D1	\$40.00	none	Price remains \$40.00

Because the calculated order line price for item A1 is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you reprice the order: Line 2: Offer = 20.00 Actual = 18.00 Discount = 2.00 :10.00%

Example: Price Code Group Price Discount

On 2/17/12, you take an order for sold to customer 10 and source code 7.

Line#	Item	SKU	Quantity	Price
1	SKA	RED	1	\$40.00
2	SKB	BLUE	1	\$20.00
3	SKC	GRN	1	\$30.00
4	SKD	GREY	1	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
303	2	2/1/12	4/1/12	3	<i>Special price: \$20.00 each for 3</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price code in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
404	10	

Determine price code item assignment: The items on the order that qualify for price code 404 in the Price Code Details table are:

Price Code	Item	SKU	Source Code
404	SKA		7

Price Code	Item	SKU	Source Code
404	SKB		7
404	SKC		7
404	SKD		7

 **Note:**

If an item contains SKUs and no SKUs are defined for the item in the Price Code Details table, all SKUs for the item qualify for the price code.

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	SKU	Initial Price	Price Code	Reprice
2	SKB	BLUE	\$20.00	404	Group price: \$60.00 total for 3 Price changes from \$20.00 to \$13.33
3	SKC	GRN	\$30.00	404	Group price: \$60.00 total for 3 Price changes from \$30.00 to \$20.00
1	SKA	RED	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$26.67
4	SKD	GREY	\$40.00	none	Price remains \$40.00

Results:

- merchandise total for lines assigned to price code 404 = \$90.00
- \$90.00 merchandise total - \$60.00 group price = \$30.00 discount amount to prorate

 **Note:**

Order line 4 does not qualify for the price code 404 discount because you must order the qualifying items in groups of 3. If the customer ordered 2 more qualifying items, the order would qualify for the price code 404 discount two times because it would have two qualifying groups of 3 on the order.

Prorating the Group Price

The system applies the group price discount to each qualifying order line on a pro-rata basis.

Order line 2 calculations:

20.00 extended amount of the detail line before applying discounts / 90.00
discountable order merchandise total = .2222 discount percentage

20.00 pre-discount unit price of the detail line - [(30.00 total discount amount to prorate * .2222 discount percentage from above calculation) / 1 line unit quantity] = 13.33 unit selling price

Order line 3:

30.00 extended amount of the detail line before applying discounts / 90.00
discountable order merchandise total = .3333 discount percentage

30.00 pre-discount unit price of the detail line - [(30.00 total discount amount to prorate * .3333 discount percentage from above calculation) / 1 line unit quantity] = 20.00 unit selling price

Order line 1:

40.00 extended amount of the detail line before applying discounts / 90.00
discountable order merchandise total = .4444 discount percentage

40.00 pre-discount unit price of the detail line - [(30.00 total discount amount to prorate * .4444 discount percentage from above calculation) / 1 line unit quantity] = 26.67 unit selling price

Discount message: Because the calculated order line price for lines 1-3 is lower than the initial price of the item, the system displays *Discount Calculation Messages* when you reprice the order: Line 3:Offer = 30.00 Actual = 20.00 Discount = 10.00 :33.33%

Example: Applying Multiple Price Codes to the Order

On 2/17/12, you take an order for sold to customer 10 and source code 7.

Line#	Item	Quantity	Price
1	A1	1	\$10.00
2	B1	2	\$20.00
3	C1	3	\$30.00
4	D1	3	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Price Code Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off:</i> \$2 off 1
202	3	2/1/12	4/1/12	2	<i>Percent off:</i> 10% off 2
303	2	2/1/12	4/1/12	3	<i>Special price:</i> \$20.00 each for 3
404	1	2/1/12	4/1/12	3	<i>Group price:</i> \$60.00 total for 3

Determine price code customer assignment: The sold to customer on the order qualifies for the following price codes in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
101	10	
202	10	
303	10	
404	10	

Determine price code item assignment: The details in the Price Code Details table for the items on the order are:

Price Code	Item	SKU	Source Code
101	A1		7
202	B1		7
303	C1		7
404	D1		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Line#	Item	Initial Price	Price Code	Reprice
1	A1	\$10.00	101	Dollar off: \$2 off 1 Price changes from \$10.00 to \$8.00
2	B1	\$20.00	202	Percent off: 10% off 2 Price changes from \$20.00 to 18.00
3	C1	\$30.00	303	Special price: \$20.00 each for 3 Price changes from \$30.00 to \$20.00
4	D1	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$20.00

Example: Item Qualifies for More than One Price Code

On 2/17/12, you take an order for sold to customer 10 and source code 7.

Line#	Item	SKU	Quantity	Price
1	POLO	RED	1	\$40.00
2	POLO	BLUE	1	\$40.00
3	POLO	GRN	1	\$40.00
4	POLO	GREY	1	\$40.00
5	POLO	BLCK	1	\$40.00

Determine eligible price codes: The date on the Order Header falls within the date range for the following price codes in the Price Code table:

Price Code	Seq	Start	End	Qty	Type of Discount
101	4	2/1/12	4/1/12	1	<i>Dollar off: \$2 off 1</i>
202	3	2/1/12	4/1/12	2	<i>Percent off: 10% off 2</i>
303	2	2/1/12	4/1/12	3	<i>Special price: \$20.00 each for 3</i>
404	1	2/1/12	4/1/12	3	<i>Group price: \$60.00 total for 3</i>

Determine price code customer assignment: The sold to customer on the order qualifies for the following price codes in the Price Code Customer table:

Price Code	Customer#	Customer Price Group
101	10	
202	10	
303	10	
404	10	

Determine price code item assignment: The details in the Price Code Details table for the items on the order are:

Price Code	Item	SKU	Source Code
101	POLO		7
202	POLO		7
303	POLO		7
404	POLO		7

Note:

If an item contains SKUs and no SKUs are defined for the item in the Price Code Details table, all SKUs for the item qualify for the price code.

Important:

You can apply only one price code to an order line. If an order line qualifies for more than one price code and you are using *Regular Price Code Pricing*, the system uses the Sequence number assigned to each price code to determine the order in which to apply price codes to an order.

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices as follows:

Lin e#	Item	SKU	Initial Price	Price Code	Reprice
1	POLO	RED	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$20.00
2	POLO	BLUE	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$20.00
3	POLO	GRN	\$40.00	404	Group price: \$60.00 total for 3 Price changes from \$40.00 to \$20.00
4	POLO	GREY	\$40.00	202	Percent off: 10% off 2 Price changes from \$40.00 to 36.00
5	POLO	BLCK	\$40.00	202	Percent off: 10% off 2 Price changes from \$40.00 to 36.00

 **Note:**

Of the price codes that were eligible to apply to the order, price code 404 was assigned the lowest sequence number. The next lowest sequence number was assigned to price code 303; however, the quantity required for price code 303 was 3 and only two units of the qualifying items remained on the order that were not assigned a price code. Because of this, the system assigned the next price code with the lowest sequence number (price code 202) to the two remaining items on the order.

Example: Price Code Multiples and Distinct By

On 2/17/12, you take an order for sold to customer 10 and source code 7.

Line#	Item	SKU	Item Category	Quantity	Price
1	SKA	SML	A	1	\$10.00
2	SKA	SML	A	1	\$10.00
3	SKB	SML	B	1	\$10.00
4	SKC	SML	C	1	\$10.00
5	SKD	SML	D	1	\$10.00
6	SKD	MED	D	1	\$10.00

Line#	Item	SKU	Item Category	Quantity	Price
7	SKD	LRG	D	1	\$10.00

Determine eligible price codes: The order and customer qualify for price code 202 in the Price Code table:

Price Code	Seq	Start	End	Qty	Price Code Discount
202	3	2/1/12	4/1/12	2	Percent off: 10% off 2

Determine price code item assignment: The details in the Price Code Details table for the items on the order are:

Price Code	Item	SKU	Source Code
202	SA		7
202	SB		7
202	SC		7
202	SD		7

Reprice the order: When you select *Reprice* at the Order Detail screen, the system reprices the lines on the order in ascending price, order line number sequence.

- *Multiples Unselected*
- *Multiples Selected, Distinct By Blank*
- *Multiples Selected, Distinct By Item*
- *Multiples Selected, Distinct By SKU*
- *Multiples Selected, Distinct By Item Category*

Multiples Unselected

Because Multiples for price code 202 is unselected, once the order qualifies for the price code based on the price code quantity requirement, the system applies price code 202 to all qualifying items on the order that are not already assigned to a price code.

Line#	Item	SKU	Initial Price	Price Code	Reprice
1	SA	SML	\$10.00	202	The system applies price code 202 to order lines 1 and 2: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
2	SA	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00

Line#	Item	SKU	Initial Price	Price Code	Reprice
					Now that the order qualifies for price code 202, the system applies price code 202 to all qualifying items on the order that are not already assigned to a price code:
3	SB	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
4	SC	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
5	SD	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
6	SD	MED	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
7	SD	LRG	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00

Multiples Selected, Distinct By Blank

Because Multiples for price code 202 is selected and the Distinct By is blank, the order must meet the price code quantity requirement again in order to qualify.

Line#	Item	SKU	Initial Price	Price Code	Reprice
					The system applies price code 202 to order lines 1 and 2:
1	SA	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
2	SA	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
					The system then applies price code 202 to order lines 3 and 4:
3	SB	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
4	SC	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
					The system then applies price code 202 to order lines 5 and 6:
5	SD	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
6	SD	MED	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
					Order line 7 does not qualify since it does not meet the price code quantity requirement of 2.
7	SD	LRG	\$10.00	none	Remains \$10.00

Multiples Selected, Distinct By Item

Because Multiples for price code 202 is selected and the Distinct By is *Item*, the price code requires separate items in the required quantity in order to qualify.

Line#	Item	SKU	Initial Price	Price Code	Reprice
1	SA	SML	\$10.00	202	The system applies price code 202 to order lines 1 and 3: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00 The system then applies price code 202 to order lines 2 and 4:
3	SB	SML	\$10.00	202	
2	SA	SML	\$10.00	202	
4	SC	SML	\$10.00	202	
5	SD	SML	\$10.00	none	Remains \$10.00
6	SD	MED	\$10.00	none	Remains \$10.00
7	SD	LRG	\$10.00	none	Remains \$10.00

Multiples Selected, Distinct By SKU

Because Multiples for price code 202 is selected and the Distinct By is *SKU*, the price code requires separate SKUs in the required quantity in order to qualify.

Line#	Item	SKU	Initial Price	Price Code	Reprice
1	SA	SML	\$10.00	202	The system applies price code 202 to order lines 1 and 2: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00 The system then applies price code 202 to order lines 3 and 4:
3	SB	SML	\$10.00	202	
2	SA	SML	\$10.00	202	
4	SC	SML	\$10.00	202	
					Percent off: 10% off 2 Price changes from \$10.00 to \$9.00 The system then applies price code 202 to order lines 5 and 6:

Line#	Item	SKU	Initial Price	Price Code	Reprice
5	SD	SML	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
6	SD	MED	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
7	SD	LRG	\$10.00	202	Order line 7 does not qualify since it does not meet the price code quantity requirement of 2 by SKU. Percent off: 10% off 2 Price changes from \$10.00 to \$9.00

Multiples Selected, Distinct By Item Category

Because Multiples for price code 202 is selected and the Distinct By is *Item Category*, the price code requires separate item categories in the required quantity in order to qualify.

Line	Item	SKU	Category	Initial Price	Price Code	Reprice
1	SA	SML	A	\$10.00	202	The system applies price code 202 to order lines 1 and 3: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
3	SB	SML	B	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
2	SA	SML	A	\$10.00	none	The system then applies price code 202 to order lines 2 and 4: Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
4	SC	SML	C	\$10.00	202	Percent off: 10% off 2 Price changes from \$10.00 to \$9.00
5	SD	SML	D	\$10.00	none	Order lines 5, 6 and 7 do not qualify for price code 202 since they do not meet the price code quantity requirement of 2 by item category. Remains \$10.00
6	SD	MED	D	\$10.00	none	Remains \$10.00
7	SD	LRG	D	\$10.00	none	Remains \$10.00

Reviewing Forecasting Information

Topics in this part:

- [Inventory Status Inquiry \(ISIQ\)](#) allows you to review the current inventory status and order totals for an item by offer. [Generating Forecasting Reports](#) provides descriptions and examples of several reports that help you evaluate sales response for an offer and plan and reorder merchandise.

Using House List Options

Topic in this part:

- [Working with Merge/Purge Sold-to Names \(MMCS\)](#) describes how to generate a listing of duplicate records and merge customer sold-to records.
- [Merging and Purging Customer Bill To Names \(MMCB\)](#) describes how to merge customer bill-to records.

10

Merchandising

- [Setting Up the Item Supporting Tables](#)
- [Setting Up the Purchasing Tables](#)
- [Creating and Working with Items](#)

- [Printing Purchase Orders](#)
- [Printing Purchase Order Reports](#)
- [Performing Inventory Analyses](#)
- [Retail Integration \(External System to Order Administration\)](#)

Setting Up the Item Supporting Tables

Supporting tables: This part describes how to set up the item supporting tables. Generally, these tables contain codes and associated descriptions which you use to define and classify items.

- [Working with Hazardous Item Codes \(WHAZ\)](#) describes creating, changing, deleting, and displaying these codes.
- [Working with Item Category Codes \(WITG\)](#) describes creating, changing, deleting, and displaying these codes.
- [Working with Item Classes \(WICL\)](#) describes creating, changing, deleting, and displaying these codes.
- [Working with Item Status \(WIST\)](#) describes creating, changing, deleting, and displaying these codes.
- [Working with Long SKU Classes \(WLSC\)](#) describes creating, changing, deleting, and displaying these codes.
- [Working with Long SKU Departments \(WLSL\)](#) describes creating, changing, deleting, and displaying these codes.
- [Working with Units of Measure \(WUOM\)](#) describes creating, changing, deleting, and displaying these codes.
- [Working with Item Subscriptions \(WISB\)](#) describes creating, changing, deleting, and displaying subscription items.
- [Working with Item Keywords \(WKEY\)](#) describes creating, changing, and deleting keywords you can use when scanning for an item.

- [Working with Item Keyword Exclusions \(WEXC\)](#) describes creating, changing, and deleting words you can exclude from automatic keyword creation.
- [Working with Tax Product Code Cross References \(WTPC\)](#) describes how to set up a cross reference table to map tax product codes to an item class, long SKU division, long SKU department, and long SKU class combination.

Setting Up the Purchasing Tables

Purpose:

- [Working with Buyers \(WBUY\)](#) explains how to create, change, delete, and display buyer information.
- [Working with Purchase Order Ship Via \(WPSV\)](#) explains how to create, change, delete, and display ship via codes for purchase orders.
- [Working with Vendors \(WVEN\)](#) includes how to create, change, delete, and display vendor information.
- [Working With PO Additional Charges \(WPAC\)](#) explains how to create, change, delete, and display additional charges for purchase orders.
- [Working with Unit of Measure Conversions \(WUMC\)](#) explains how to create, change, delete, and display unit of measure conversions between your selling unit of measure and the vendor's unit of measure.
- [Working with Vendor Items \(WVNI\)](#) describes how to create, change, delete, and display vendor item information. Vendor items are a reference between the vendor's item information and the item information used by your company.
- [Working with Vendor Upload \(LVUP\)](#) explains how to upload vendor information into Order Administration.

Using Purchase Order Inquiry

Topics in this part:

- [Purchase Order Inquiry \(MPOI\)](#) describes the screens you use to review a purchase order on the system.

Printing Purchase Orders

Topic in this part:

- [Printing Purchase Orders \(MPRP\)](#) describes how to make standard print selections (sequence, date, type) and making additional print selections (vendor, buyers, and warehouses) in order to print or email the purchase order.

Creating and Working with Items

Purpose: The following chapters describe how to create and work with items.

- [Performing Initial Item Entry \(MITM\)](#) describes selecting items, creating items, creating item (base information), creating offers, and creating SKUs with overrides.

- [Working with Existing Items \(MITM\)](#) includes scanning, changing, deleting, and displaying items that have been created.
- [Working with SKUs](#) defines split SKU elements, SKU groups, and the SKU generator. This topic includes how to scan for, change, delete, and display SKUs.
- [Assigning Items/SKUs to Offers](#) includes how to work with item/SKU offers, price breaks, page letters, aliases, and accompanying items.
- [Assigning Items to Warehouses](#) discusses item warehouse information and item location information.
- [Entering Additional Item Information](#) describes comments and source prices.
- [Working with Item Tax Exemptions \(WITX\)](#) describes how to set up tax exemptions or exceptions for specific items or item classes by location.
- [Working with GST Tax Exemption Status \(MGTX\)](#) describes how to set up tax exemptions or exceptions for specific items by Canadian province.
- [Updating Harmonize Codes \(UPHC\)](#) describes how to update harmonize codes quickly for multiple items or SKUs.
- [Working with Freight Exempt Items \(WFEI\)](#) describes how to exclude items from freight.
- [Working with Item Ship Via Overrides](#) describes how to set up eligible shippers for an item.
- [Working with Item Coordinate Types \(WICT\)](#) describes how to create and work with item coordinate types.
- [Copying Items](#) describes how to copy item information from one item to a newly created item in the same company or copy item information from one item to another item, with the same item number, in one or more shared companies.

Working with SKUs

Purpose: A SKU (stock keeping unit) is used to further define an item. An item that is sold in multiple colors and sizes is often represented by a base item number, which is common to all of the colors and sizes, and a SKU, which specifically defines the color and or size. For example, the base item number for a dress might be 9201, and the SKUs associated with that item number might be RED SML, RED MED, RED LRG, BLUE SML, BLUE MED, and BLUE LRG.

All functions accessible at the base item level are accessible at the SKU level, including offers, warehouses, sets, and comments. Information entered at the SKU level overrides information defined at the base item level.

In this topic:

- [Split SKU Elements](#)
- [SKU Groups](#)
- [SKU Sort Sequence Numbers](#)
- [SKU Generator](#)
- [Work with SKUs Screen](#)

Split SKU Elements

The elements of the Split SKU are defined in the System Control table. There are three elements used in the Split SKU environment. Typically, these elements are used to represent

size, color and width for items of apparel; however, you can define the elements to meet your particular requirements. Once you set up the elements in the System Control table, you will be prompted for this information throughout the system.

SKU Groups

A SKU Group can be assigned to an item in the Item table and is used to define the standard sizes or colors in which items are sold. You can use [Working with SKU Groups \(WISG\)](#) to create groups to facilitate data entry [Using the SKU Generator \(ESKG\)](#).

For example, a SKU group can be defined for a particular manufacturer's product line for dresses. You can define an Item SKU Group for dress size. For example, the Item SKU Group 001 could be set up for dresses and would list the sizes in which these dresses are available (4, 6, 8, 10, 12, 14, regular and petite).

SKU Sort Sequence Numbers

SKU sort sequence numbers are numbers used to determine the order in which SKUs sort.

You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphanumerically by SKU code. See [SKU Sort Sequence Numbers](#) for an overview.

SKU Generator

The SKU Generator is used to create all the SKUs for an item automatically. Once you define the item and the SKU group, you can run the SKU generator to automatically build all the SKU records.

When generating SKUs for an item, you can accept the defaults as defined in the SKU Groups or you can add or subtract individual SKUs.

For more information about SKU elements, SKU groups and the SKU generator, see [Setting up SKUs](#).

Note:

Before you can work with SKUs, you must create the SKU information on the system. You can create SKUs by selecting *Create* at the [Work with SKUs Screen](#).

Work with SKUs Screen

Purpose: Use this screen to create, change, delete and display related records for a base item.

How to display this screen: At the [Work with Items Screen](#), select *SKU* for a SKUed item (the SKU field is *selected*).

Field	Description
Item	The item code and item description whose SKUs you are reviewing. Item code: Alphanumeric, 12 positions; display-only. Item description: Alphanumeric, 120 positions; display-only.

Field	Description
Colr (Color)	The color of the item/SKU. <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;">  Note: “Colr” represents SKU Element 1, which is user-defined at the System Control table. Color is used for sample purposes only. </div>
Size	Split SKU: alphanumeric, 4 positions; optional. The size of the item/SKU. <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;">  Note: “Size” represents SKU Element 2, which is user-defined at the System Control table. Size is used for sample purposes only. </div>
Othr (Other)	Alphanumeric, 4 positions; optional. The other characteristic of the item/SKU. <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;">  Note: “Othr” represents SKU Element 3, which is user-defined at the System Control table. Other is used for sample purposes only. </div>
Description	Alphanumeric, 4 positions; optional. The description of the SKU.
Color, Size, Width	Alphanumeric, 40 positions; optional. The long SKU elements (L/S Color, L/S Size, L/S Width) used to further define the item, typically for reporting purposes. Alphanumeric, three 4-position fields; optional.

Screen Option	Procedure
Create a SKU	Select <i>Create</i> to advance to the Create SKU 1 of 2 (With Overrides) Screen .
Change SKU information	Select <i>Change</i> for a SKU to advance to the Change SKU Screen. At this screen you can change any information except the SKU. See Create SKU 1 of 2 (With Overrides) Screen for field descriptions.

Screen Option	Procedure
Delete SKU information	Select <i>Delete</i> for a SKU to delete it.
	<div data-bbox="899 331 1458 508" style="background-color: #e6f2ff; padding: 10px; border: 1px solid #0070c0;"> <p> Note: If you delete a SKU, the following dependent tables are deleted:</p> <ul style="list-style-type: none"> • Item warehouse • Kit/Kit details • Lot • Set/Set details • SKU comments • SKU offer • Variable set/Variable set group/Variable set details • Vendor item • House list SKU </div>
Display SKU information	Select <i>Display</i> for a SKU to advance to the Display SKU Screen. You cannot change any information on this screen. See <i>Create SKU 1 of 2 (With Overrides) Screen</i> for field descriptions.
Comments	Select <i>Comments</i> for a SKU to display the Work with Item/SKU Comments Screen .
Finished goods	Select <i>Finished Goods</i> for a SKU to display the Work with Finished Goods Screen .
External Image and Information Link	Select <i>Image/Info Link</i> for a SKU to advance to the Item Image/Info Link Screen .
	<div data-bbox="899 1192 1458 1398" style="background-color: #e6f2ff; padding: 10px; border: 1px solid #0070c0;"> <p> Note: This option is available only if the Use External Item Image (L55) system control value is selected.</p> </div>
Offers	Select <i>Offers</i> for a SKU to advance to the Work with SKU Offers Screen .
Sets	Select <i>Sets</i> for a SKU to display the Work with Sets Screen .
UPC codes	Select <i>UPC</i> for a non-SKUed item to advance to the Work with UPC Codes Screen . You can work with UPC codes for a SKUed item by selecting <i>SKU</i> for the item and selecting the UPC option from the Work with SKUs Screen .
Work with user defined fields	Select <i>User Fields</i> for a customer to advance to the Work with User Fields Screen .
Variable Sets	Select <i>Variable Sets</i> for a SKU to display the Work with Variable Sets Screen .
Vendor Item	Select <i>Vendor Item</i> for a SKU to advance to the Work with Vendor Item Screen .

Screen Option	Procedure
Warehouse	Select <i>Warehouses</i> for a SKU to display the Work with Item Warehouse Screen .

Assigning Items to Warehouses

Purpose: Use the Work with Item Warehouse function to indicate the warehouses where you keep an item, and to define information particular to that item/warehouse combination.

In this topic:

- [Work with Item Warehouse Screen](#)
- [Create Item Warehouse Screen](#)
- [Change Item Warehouse Screen](#)

Work with Item Warehouse Screen

How to display this screen: From the [Work with Items Screen](#):

- for a non-SKU'd item, select *Warehouse* for the item
- for a SKU'd item, first select *SKU* for the item to advance to the [Work with SKUs Screen](#), then select *Whses* for the SKU

Field	Description
Whs (Warehouse)	The warehouse where you keep an item. Numeric, 3 positions; optional.
Description	The description of the warehouse. Alphanumeric, 30 positions; optional.
On hand	The number of units of this item across all locations in the warehouse. Numeric, 7 positions; optional.
On order	The number of units that are due to be received in this warehouse through purchase orders. Numeric, 7 positions; optional.
Protected	An amount of inventory protected from reservation for this item or SKU across all locations in this warehouse. Numeric, 7 positions; optional.
Resv Freeze (Reservation freeze)	Indicates whether the item or SKU in this warehouse is frozen. Valid values are: <ul style="list-style-type: none"> • <i>Yes</i> = The item/SKU warehouse is frozen. • <i>No</i> = The item/SKU warehouse is not frozen. If an item or SKU warehouse is frozen: <ol style="list-style-type: none"> 1. Pick Slip Generation ignores the item warehouse when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. 2. Inventory does not reserve during Order Entry. See Reviewing Reservation Types.

Screen Option	Procedure
Create an item warehouse record	Select <i>Create</i> to advance to the Create Item Warehouse Screen .
Change item warehouse information	Select <i>Change</i> for an item warehouse record to advance to the Change Item Warehouse Screen .
Delete item warehouse information	<p>Select <i>Delete</i> for an item warehouse record to delete it.</p> <p>If there are dependent records associated with this warehouse, the system will display a warning message. Deleting this warehouse will also delete the following dependent records:</p> <ul style="list-style-type: none"> • Item location • Item transaction history • Item transaction summary • Item warehouse history
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>You cannot delete an item/warehouse record if there are open orders, quantity on hand, or quantity on order.</p> </div>
Display item warehouse information	Select <i>Display</i> for an item warehouse record to advance to the Display Item Warehouse Screen. You cannot change any information on this screen. See Create Item Warehouse Screen for field descriptions.
Work with item locations	Select <i>Locations</i> for an item warehouse record to advance to the Work with Item Locations Screen . See Creating and Maintaining Item Warehouses .
Work with user defined fields	Select <i>User Field</i> for an item warehouse to advance to the Work with User Fields Screen .

Create Item Warehouse Screen

Purpose: At the [Work with Item Warehouse Screen](#), select *Create*.

Field	Description
Warehouse	<p>A code that represents a warehouse.</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions.</p> <p>Create screen: required.</p> <p>Change screen: display-only.</p>

Field	Description
Reservation freeze	<p>Indicates whether the item or SKU in this warehouse is frozen. Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = The item/SKU warehouse is frozen. <i>Unselected</i> = The item/SKU warehouse is not frozen. <p>If an item or SKU warehouse is frozen:</p> <ul style="list-style-type: none"> Pick Slip Generation ignores the item warehouse when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. Inventory does not reserve during Order Entry. See Reviewing Reservation Types.
Protected qty (Protected quantity)	<p>The unit quantity of this item/SKU protected from reservation. The system does not reserve this inventory except through Working with Interactive Reservation (MIRV), which you might use for large wholesale orders or preferred mail order customers. Protected quantity is included in on-hand quantity. This quantity is also protected from being used to replenish another warehouse.</p> <p>You cannot enter an amount in this field if the Use Work Order Processing (E37) system control value is <i>selected</i>.</p> <p>Numeric, 7 positions; optional.</p>
Min qty (Minimum quantity)	<p>The minimum number of units to be kept on hand in the warehouse.</p> <p>Numeric, 7 positions; optional.</p>
Protect min/max (Protect minimum and maximum quantities)	<p>This field is not currently implemented.</p> <p>Included only if the Use Store File (G15) system control value is <i>selected</i>.</p> <p>An error message indicates if you try to change this value and you do not have authority to the Maintain Item Warehouse Minimum/Maximum Quantity (A92) secured feature:</p> <p>Not authorized to change.</p>
Max qty (Maximum quantity)	<p>The maximum number of units to be kept on hand. If you do not specify a reorder quantity (below), the system uses this value to determine the quantity to reorder by subtracting the on-hand quantity from the maximum quantity.</p> <p>Numeric, 7 positions; optional.</p>
Economic order qty. (Economic order quantity)	<p>The recommended optimum ordering quantity for this item or SKU, based on a set of criteria such as quantity, cost, etc. Used for inventory reporting purposes only.</p> <p>Numeric, 7 positions; optional.</p>
Reorder qty. (Reorder quantity)	<p>The quantity of this item or SKU that should be replenished when the item or SKU reaches the minimum stock level for the warehouse.</p> <p>Numeric, 7 positions; optional.</p>
Original retail price	<p>The original price of this item in the retail store. You can use this field to track the original retail price for the item if the warehouse represents a retail store.</p> <p>Included only if the Use Store File (G15) system control value is <i>selected</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Protect price (Protect current price)	<p>This field is not currently implemented.</p> <p>Included only if the <i>Use Store File (G15)</i> system control value is <i>selected</i>.</p> <p>An error message indicates if you try to change this value and you do not have authority to the Maintain Item Warehouse Retail Price (A91) secured feature: Not authorized to change.</p>
Current retail price	<p>The current price of this item in the retail store. You can use this field to track the current retail price for the item if the warehouse represents a retail store.</p> <p>Included only if the <i>Use Store File (G15)</i> system control value is <i>selected</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
User field 1	<p>An informational field where you can enter additional item warehouse information.</p> <p>Alphanumeric, 10 positions; optional.</p>
User field 2	<p>An informational field where you can enter additional item warehouse information.</p> <p>Alphanumeric, 10 positions; optional.</p>

Change Item Warehouse Screen

To change: Select *Change* for a warehouse at the [Work with Item Warehouse Screen](#) to advance to the Change Item Warehouse screen. At this screen you can change any information except the Item and Warehouse. See [Create Item Warehouse Screen](#) for field descriptions.

Secured features:

- The system displays the following error message if you try to change the Minimum quantity, Maximum quantity, or Protect minimum/maximum field and you do not have authority to the [Maintain Item Warehouse Minimum/Maximum Quantity \(A92\)](#) secured feature:

Not authorized to change.

- The system displays the following error message if you try to change the Original retail price, Current retail price, or Protect price field and you do not have authority to the [Maintain Item Warehouse Retail Price \(A91\)](#) secured feature:

Not authorized to change.

Entering Additional Item Information

Purpose: The Work with Items screen provides the opportunity to work with additional information, such as:

- *Comments:* You can add comments or additional information about an item at the [Work with Item/SKU Comments Screen](#). You can also select where comments will be printed (e.g., pick slips, invoices, reports, pop-up windows, all areas, or no areas).
- *Special Source Prices:* You have the option to define price breaks, or special pricing for certain items, through the [Work with Special Source Price Screen](#).

- *Item Coordinates*: You can define items or SKUs that coordinate with a specific item, so that when a customer orders the item in order entry you can cross-sell the coordinates. See [Working with Item Coordinates \(WCIO\)](#).
- *UPC codes*: Use the [Work with UPC Codes Screen](#) to assign UPC codes to an item/SKU.
- *Country and State Restrictions*: You can restrict an item from being ordered in order entry if the item cannot be shipped to the country or state of the order. Use the [Work with Item Restriction by Country/State Screen](#).
- *Image Link*: If the [Use External Item Image \(L55\)](#) system control value is selected, you can define the URLs where the item image and product information for the item are stored on an external image hosting application. See [Item Image/Info Link Screen](#).

In this topic:

- [Work with Item/SKU Comments Screen](#)
- [Work with Special Source Price Screen](#)
- [Create Special Source Price Screen](#)
- [Work with UPC Codes Screen](#)
- [Work with Item Restriction by Country/State Screen](#)
- [Create Item Restriction by Country/State Screen](#)
- [Item Image/Info Link Screen](#)

Work with Item/SKU Comments Screen

Purpose: Use this screen to enter comments about an item or SKU and identify where those comments should print or display. You can specify a different print or display selection for each line of item comments.

Item and SKU comments can appear on:

- pick slips
- invoices
- both pick slips and invoices
- reports
- a pop-up window when you add the item or SKU to an order

You can also specify to have the item comment appear nowhere. In this situation, you must use the Work with Item/SKUs menu option to review the comments.

Item or SKU level: You can enter item comments at either the base item level or the SKU level. If you enter both, the comments at the SKU level override the base item-level comments. For example, if item AB100 comes in RED, BLUE, and PINK, and if you enter item comments for the base item and for the RED SKU, the SKU-level comments will appear for the RED SKU only; the base item-level comments will appear for the BLUE and PINK SKUs.

Pop-up window: Comment lines whose Print code is set to *Window* prompt the [Work with Item/SKU Comments Window](#) to open when you enter the item code in order entry or maintenance. The window also opens when you:

- enter a quantity of the item at the [Display Item Availability Screen](#) in order entry (available by selecting *Item Availability* at the Select Customer Sold To for Order screen)

- enter the item as an exchange for a customer return (see [Returning and Exchanging Items in Order Maintenance](#); or [Introducing Return Authorizations \(WRTA\)](#))

The pop-up window does not display when the item is added to an order in other ways, such as a price table premium or item coordinate.

How to display this screen:

- *Non-SKUed item:* At the [Work with Items Screen](#), select *Comments* for the item.
- *SKUed item:*
- To enter comments at the base item level by following the instructions, above, for a non-SKUed item; or,
- Select SKU for the base item at the Work with Item Screen to advance to the [Work with SKUs Screen](#), then select *Comments* for the SKU.

Field	Description
Print code	<p>This code indicates where to print or display your comments. Valid values are:</p> <ul style="list-style-type: none"> • <i>Print on picks and invoices</i> = Comments print on the base pick slip, or on your unique pick slip and unique invoice if supported by your unique printing program. Comments do not print on the base invoice print program supplied by Order Administration. • <i>Print on invoices only</i> = Comments print on invoices only if supported by your unique invoice print program. Comments do not print on the base invoice print program supplied by Order Administration. • <i>None</i> (default) = Do not print or display. • <i>Print on picks only</i> = See the Pick Slip. • <i>Print on reports only</i> = Printing on reports is not currently implemented. • <i>Window</i> = Display in the Work with Item/SKU Comments Window when you select an item to add to an order <p>Required.</p>
Comments	<p>The free-form comments that you can enter. Alphanumeric, 50 positions (each line); required.</p>

Work with Special Source Price Screen

Purpose: Use this screen to change, delete, display, or create price breaks on an item for a certain group of customers. Source prices are established at the base item level, not at the SKU level.

You can define additional special prices for associate customers (as defined in the Customer Sold To table). You can also specify a quantity required to receive the special source price.

Related system control values:

- If the [Perform Source Pricing Validation \(D62\)](#) system control value is *selected* and there are any source special pricing records set up for the source code on the order header, the system prevents you from adding any items to the order if they are not included in the special source pricing.

- The *Pricing Values (B31)* system control value controls the order in which the system evaluates pricing options for the order, based on the priority assigned to the *Special by Source Sequence # (A82)* system control value.

Note:

To enter multiple item special prices by source code, you can also use *Working with Source Codes (WSRC)* or *Working with Special Pricing by Source Code (WSPP)*.

How to display this screen: At the *Work with Items Screen*, select *Source Prices* for an item.

Field	Description
Source	A code representing a group of customers to whom you sell. Alphanumeric, 9 positions; optional.
Qty (Quantity)	The number of units of the item that the customer must purchase to receive the special price. Numeric, 5 positions; optional.
Price	The price the customer pays for the item on qualifying orders. Numeric, 13 positions with a 2-place decimal; optional.
Assoc price (Associate price)	The price an associate customer pays for the item on qualifying orders. Numeric, 13 positions with a 2-place decimal; optional.
Tax inclusive price	The price a customer pays for the item on qualifying order subject to tax-inclusive pricing and VAT. On orders subject to VAT, tax does not accumulate in the Tax bucket; instead, the customer pays a tax-inclusive price and VAT is “hidden” on the order detail line. Included only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.
Tax-inclusive associate price	The price an associate customer pays for the item on qualifying order subject to tax-inclusive pricing and VAT. On orders subject to VAT, tax does not accumulate in the Tax bucket; instead, the customer pays a tax-inclusive price and VAT is “hidden” on the order detail line. Included only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Create a source price	Select <i>Create</i> to advance to the <i>Create Special Source Price Screen</i> .
Change a source price	Select <i>Change</i> for a price to advance to the Change Source Price Screen. You can change any information on this screen except the item and source. See <i>Create Special Source Price Screen</i> for field descriptions.
Delete a source price	Select <i>Delete</i> for a price to delete it.

Screen Option	Procedure
Display a source price	Select <i>Display</i> for a price to advance to the Display Source Price Screen. You cannot change any information on this screen. See Create Special Source Price Screen for field descriptions.

Create Special Source Price Screen

To create: At the [Work with Special Source Price Screen](#), select *Create*.

Field	Description
Source	A code used to define a segment of your mailings. Validated against the Source Code table. See Working with Source Codes (WSRC) . Alphanumeric, 9 positions. Create screen: required. Change screen: display-only.
Qty (Quantity)	The quantity of the item that the customer must purchase to receive this price break. Numeric, 5 positions; required.
Price	The selling price of the item when an order meets the defined source code and quantity requirements. This price applies to all SKUs of the item on the order. Numeric, 13 positions with a 2-place decimal; required.
Tax inclusive price	The selling price of the item when an order meets the defined source code and quantity requirements and the order is subject to VAT. This price applies to all SKUs of the item on the order. Displayed only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.
Assoc price (Associate price)	The selling price of this item when an order meets the defined source code and quantity requirements and the customer is an associate. Customers are eligible for associate price breaks if they are identified as associate customers in the Customer table and if <i>Assoc = Selected</i> in Order Entry. Numeric, 13 positions with a 2-place decimal; optional
Tax inclusive associate price	The selling price of this item when an order meets the defined source code and quantity requirements, the customer is an associate, and the order is subject to VAT. Customers are eligible for associate price breaks if they are identified as associate customers in the Customer table and if <i>Assoc = Selected</i> in Order Entry. Displayed only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.

Work with UPC Codes Screen

Purpose: Use this screen to create or delete a UPC code for an item/SKU.

You can create as many UPC codes for an item/SKU as you like; however, the system validates that you do not create a duplicate UPC code.

How to display this screen:

- for a non-SKUed item, at the [Work with Items Screen](#), select *UPC* for an item. If the item has SKUs, an error message indicates: *Must set UPC at SKU level.*
- for a SKUed item, first advance to the [Work with SKUs Screen](#) (select *SKU* at the Work with Item screen); then, at this screen, select *UPC* for a SKU.

Field	Description
Item/SKU	The code and description of the item. If the item contains SKUs, the SKU code is also included. Item code: Alphanumeric, 12 positions; display-only. SKU code: Alphanumeric, three 4-position fields; display-only. Item description: Alphanumeric, 120 positions; display-only.
Type	The type of UPC code. Informational only. Valid values are: <ul style="list-style-type: none"> • <i>E13</i> = EAN-13, indicating a 13 position UPC code; however Order Administration does not validate the UPC length. • <i>E8</i> = EAN-8, indicating an 8 position UPC code; however, Order Administration does not validate the UPC length. • <i>UA</i> = UPC-A, indicating a 12 position UPC code; however Order Administration does not validate the UPC length. • <i>UE</i> = UPC-E, indicating a 6 position UPC code; however Order Administration does not validate the UPC length. The last UPC type you used defaults. Alphanumeric, 3 positions; optional.
UPC code	A UPC code defined for the item/SKU. <ul style="list-style-type: none"> • A message similar to the following indicates if the UPC code has already been assigned to another item/SKU: <i>UPC already assigned to ACB958.</i> • A message similar to the following indicates if the UPC code has already been created for the item: <i>UPC already assigned to IT948.</i>
	<div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>Include any leading zeros. For example, if the UPC code is <i>06012011</i>, enter <i>06012011</i> and not <i>6012011</i>.</p> </div>
Vendor	Alphanumeric, 14 positions; optional. A code that identifies a supplier who sells you merchandise. Vendor codes are defined in and validated against the Vendor table; see Working with Vendors (WVEN) . Numeric, 7 positions; optional.

To create: Enter the UPC type in the Type field and enter the UPC code in the UPC code field. Make sure to add any leading zeros. The bottom half of the screen displays the UPC code you just created.

- A message indicates if the UPC code has already been assigned to another item/ SKU: UPC already assigned to ABC987.
- A message indicates if the UPC code has already been created for the item: UPC already assigned to ITEX.

 **Note:**

You cannot change a UPC code once the code is created. Instead, you must delete the UPC code and create a new code.

Work with Item Restriction by Country/State Screen

Purpose: Use country/state restrictions to prevent items from being added to an order in order entry/order maintenance if the ship to address for the order is in a country or state to which you cannot ship the items.

How country/state restrictions work: When you take an order for an item which is restricted from being shipped to the country or state of the ship to address, the item will be highlighted, and a message similar to the following will display in order entry/order maintenance:

Item (XXXXXX) cannot be shipped to (COUNTRY/STATE).

Country/state restrictions are defined at the item level. For SKUed items, country/state restrictions apply to all SKUs of an item.

Setting restrictions for an entire country: Countries and states for countries are defined using the Work with Countries menu option. If the country's Require state? field is *selected*, then you must specify a valid state when you set an item restriction for that country, and you must set a separate restriction for each state to which you cannot ship the item.

Example:

You have *selected* the Require state? field for the USA.

To set an item restriction for a state: Enter the USA's code in the Country field and a valid state code in the State field.

To set an item restriction for the entire country: you must set an item restriction for each state in the country.

If the country's Require state? field is *unselected*, you can define item shipping restrictions for the entire country, or, if you wish, for valid states in that country.

Example:

You have *unselected* the Require state? field for Canada.

To set an item restriction for a province: Enter Canada's code in the Country field, and a valid state (province) in the State field.

To set an item restriction for the entire country: Enter Canada's code in the Country field. Leave the State field blank.

See [Setting Up the Country Table \(WCTY\)](#) for more information about setting up countries and states.

How to display this screen: Select *Ctry/St Restr* for an item at the [Work with Items Screen](#).

Field	Description
Item	<p>The item that you selected at the Work with Items screen which is restricted from being shipped to specific countries or states. When you try to add this item to an order with a ship to address in a restricted state or country, order entry/maintenance displays an error message such as:</p> <p>Item (XXXXXX) cannot be shipped to (COUNTRY/STATE).</p> <p>The item description is to the right. Item: alphanumeric, 12 positions; display-only. Description: alphanumeric, 120 positions; display-only.</p>
Country	<p>A country to which you cannot ship the item, or in which one or more states have shipping restrictions for the item.</p> <p>Countries are defined in and validated against the Country table. If the country's Require state? field is <i>unselected</i>, and you do not specify a state in the State field when setting up the item restriction, the restriction will apply to the entire country. See Setting Up the Country Table (WCTY) for more information on defining countries and states.</p> <p>Alphanumeric, 3 positions; optional.</p>
State	<p>A state which has a shipping restriction for the item.</p> <p>States for a country are defined using the Work with Countries menu option. See Setting Up the Country Table (WCTY).</p> <p>Alphanumeric, 2 positions; optional.</p>

Screen Option	Procedure
Create a country/state restriction for the item displayed on this screen	Select <i>Create</i> to advance to the Create Item Restriction by Country/State Screen .
Delete a country/state restriction for the item displayed on this screen.	Select <i>Delete</i> for a country/state restriction to delete it.

Create Item Restriction by Country/State Screen

Purpose: Use this screen to create a country/state restriction for the item you selected at the Work with Items screen.

How to display this screen: Select *Create* at the [Work with Item Restriction by Country/State Screen](#).

Field	Description
Item	<p>The item that you selected at the Work with Items screen. When this item is ordered by a customer whose ship to address is in a restricted country or state, order entry/maintenance displays an error message such as:</p> <pre>Item (XXXXXX) cannot be shipped to (COUNTRY/STATE).</pre> <p>Item: alphanumeric, 12 positions; display-only. Description: alphanumeric, 120 positions; display-only.</p>
Country	<p>A country to which you cannot ship the item, or in which one or more states have shipping restrictions for the item. The country will default from the Default Country for Customer Address (B17) system control value, but you can change it. Countries are defined in and validated against the Country table. If the country's Require state? field is <i>unselected</i>, and you do not specify a valid state in the State field when creating a Country/State restriction, then the item restriction will apply to the entire country. See Setting Up the Country Table (WCTY). Alphanumeric, 3 positions; required.</p>
State	<p>A state which has a shipping restriction for the item. States for a country are defined using the Work with Countries menu option. See Setting Up the Country Table (WCTY). Alphanumeric, 2 positions; required if the Require state? field for the country is selected in the Country table.</p>

Item Image/Info Link Screen

Purpose: Use this screen to define the URLs where the image and product information for an item or SKU are stored on an external image hosting application.

Note:

This option is available only if the [Use External Item Image \(L55\)](#) system control value is selected; otherwise, an error message displays: `Image/Info Link not available - enabled by SCV L55.`

Note:

You need to specify the complete URL for an item image; the [IMAGE_URL_PREFIX](#) property. is not used for item images.

Import from OCDS: You can import primary item images from Omnichannel Cloud Data Service (OCDS) as well as other item-related data. This import is available regardless of the setting of the [Use External Item Image \(L55\)](#) system control value. See [Importing Enterprise Foundation Data through Omnichannel Cloud Data Service \(OCDS\)](#) for more information.

Displaying the item image:

- [Work with Order Lines Screen \(Adding Items to the Order\)](#): This screen displays the image for each item after you enter the item, and the image of the last item entered remains on this screen until you exit. The image that displays is:
 - The image defined at the SKU level.
 - If an image is not defined at the SKU level, the image defined at the item level displays.
 - If an image is not defined at the SKU or item level, no image displays.

If you click on the image, the system opens a web browser to the URL specified in the [Information Link](#) field for the item/SKU on the Item Image/Info Link screen.

- [Work with Items Screen](#) (MITM) When you mouse over the item code, this screen displays:
 - the image defined at the item level.
 - If an image is not defined at the item level, the image defined for the first SKU in alphabetical order displays.
 - If an image is not defined for the item or SKU, no image displays.
 - *Modern View*: Various pages and windows in Modern View display the item or SKU image, if defined, including Contact Center Order Entry, the Order Summary page, Add Item window, and Frequently Purchased Items panel. See the Modern View online help for details.

Image size: The image is displayed at 150 x 150 pixels at the [Work with Order Lines Screen \(Adding Items to the Order\)](#), and at 120 x 120 pixels at the [Work with Items Screen](#) in item maintenance.

How to display this screen:

- *Item level:* Select [Image/Info Link](#) for an item at the [Work with Items Screen](#).
- *SKU level:* Select [Image/Info Link](#) for a SKU at the [Work with SKUs Screen](#).

Field	Description
Item	The item you selected at the Work with Items Screen . Alphanumeric, 12 positions; display-only.
SKU	The SKU you selected at the Work with SKUs Screen .

Note:

The SKU displays only if you are defining an image and information link for the SKU of an item.

Item Description	Alphanumeric, three 4-position fields; display-only. A description of the item. Alphanumeric, 120 positions; display-only.
-------------------------	--

Field	Description
SKU Description	A description of the SKU.
	<div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>The SKU description displays only if you are defining an image and information link for the SKU of an item.</p> </div>
Image Link	<p>Alphanumeric, 40 positions; display-only.</p> <p>The URL to the location of the item image on the external image hosting application.</p> <p>The system does not validate that the URL you enter is valid.</p> <p>Import from OCDS: See Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS) for more information on importing this information from OCDS.</p>
Information Link	<p>Alphanumeric, 256 positions; optional.</p> <p>The URL to the location of the item information on the external image hosting application.</p> <p>The system does not validate that the URL you enter is valid.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>If the URL is too long, the Work with Order Detail screen might not be aligned correctly.</p> </div>
	Alphanumeric, 256 positions; optional.

Copying Items

Overview: Copying items allows you to:

- Copy item information from one item to a new item in the same company using the [Copy Item Window](#).
- Create an item upload record to add or change item information, for an item with the same item number as the copied item, in each shared company using the [Copy Item to Company Window](#).

In this topic:

- [Copy Item Window](#)
 - [Copy Item Process](#)
- [Copy Item to Company Window](#)
 - [Copy Item to Company Process](#)

Copy Item Window

Purpose: Use this window to copy item information from one item to a new item in the same company.

Note:

The system copies item information from the Item table and SKU table; any other tables related to the item, such as Item Offer or Vendor Items, are not copied to the new item. Once the item is created, you can create additional item information for the item from the [Work with Items Screen](#) or using [Working with Retail Integration Item Upload \(RIIU\)](#).

How to display this screen: Select *Copy* for an item on the *Work with Items Screen*.

Field	Description
From item	The item number and description of the item whose item information you wish to copy to a new item in the same company. Item number: Alphanumeric, 12 positions; display-only. Item description: Alphanumeric, 120 positions; display-only.
To item	The item number you wish to create, using the item information defined for the from item. An error message indicates if you enter an item number that already exists in the current company: <i>Item already exists</i> . Alphanumeric, 12 positions; required.
To item description	(Unlabeled field to the right of the To item field.) A description of the newly created item.

Note:

Not all screens or reports will display the full description if it exceeds the available space for this field.

Alphanumeric, 120 positions; required.

Field	Description
L/S style	The long SKU style defined for the newly created item.

 **Note:**

Included only if the *Require L/S Style (I94)* system control value is selected.

An error message indicates if you enter a long SKU style that is already assigned to another item: L/S Style must be unique.

If the *Require L/S Style (I94)* system control value is unselected, the system copies the long SKU style from the copied item.

Alphanumeric, 20 positions; required.

Copy Item Process

Complete the following steps to copy item information from one item to a newly created item in the current company.

1. Enter the item number and description of the item you wish to create in the *To item* and *To item description* fields.
2. If the *Require L/S Style (I94)* system control value is selected, enter a unique long SKU style code in the *L/S style* field.
3. Select *OK*. The system presents the current screen flow required to create an item and performs existing screen validation.

 **Note:**

Unlike most other fields, the *L/S Subclass* does not default from the original item. You need to enter the L/S Subclass manually if the *Use Retail Integration (H26)* system control value is selected.

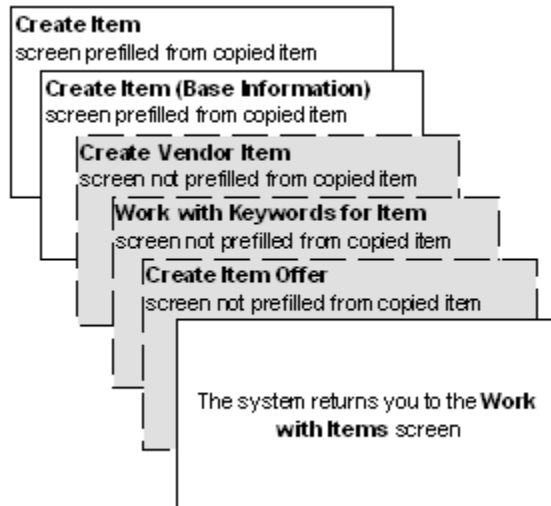

The screen flow varies, depending on whether you are creating a non-SKUed item or SKUed item. Additionally, the *Item Creation Values (J08)* umbrella system control value contains system control values that control which screens automatically display when you are creating an item.

Non-SKUed item screen flow: The system automatically advances you through the following screens if the item you are copying is a non-SKUed item.

1. *Create Item Screen*. The information on this screen defaults from the copied item; however, you can change any value.
2. *Create Item (Base Information) Screen*. The information on this screen defaults from the copied item; however, you can change any value.
3. *Create Vendor Item Screen* (only if the *Auto Advance to Vendor Item Create (E78)* system control value is *selected*). The information on this screen does not default from the copied item.

4. *First Work with Keywords for Item Screen* (only if the *Create Keywords at Item Entry (F78)* system control value is selected). The information on this screen does not default from the copied item.
5. *Create Item Offer Screen* (only if the *Auto Advance to Item Offer (J05)* system control value is selected). The information on this screen does not default from the copied item.

Once you have completed creating the item, based on copied item information, the system returns you to the *Work with Items Screen*.

SKUed item screen flow: The system automatically advances you through the following screens if the item you are copying is a SKUed item.

1. *Create Item Screen*. The information on this screen defaults from the copied item; however, you can change any value.
2. *First Work with Keywords for Item Screen* (only if the *Create Keywords at Item Entry (F78)* system control value is selected). The information on this screen does not default from the copied item.
3. *Create Item Offer Screen* (only if the *Auto Advance to Item Offer (J05)* system control value is selected). The information on this screen does not default from the copied item.

Once you have completed creating the item, the system returns you to the *Work with Items Screen*. Every SKU defined for the copied item is automatically created for the new item.

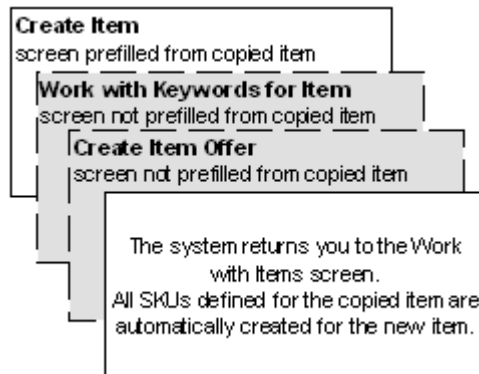

Table updates: The system copies the Item record and SKU record when you copy item information from one item to a newly created item. However, the following fields are not copied.

- [Item table](#)
- [SKU table](#)

Item table

Field	Comments
ITM number	From the To item field on the Copy Item Window .
Last phy date	Remains blank.
Last purchase cost	Remains blank.
Long SKU style	If the <i>Require L/S Style (I94)</i> system control value is selected, from the L/S style field on the Copy Item Window . If the <i>Require L/S Style (I94)</i> system control value is unselected, defaults from copied item.
Description	From the To item description field on the Copy Item Window .
Last change date	Defaults to current date.
Date last extract	Remains blank.
Last ecomm info chg	Remains blank.
Download processed	Remains blank.
Create date	Defaults to current date.
Updated by user	Defaults to current user.
Creation user	Defaults to current user.

SKU table

Field	Comments
ITM number	From the To item field on the Copy Item Window .
SKU code	The system copies all SKUs defined for the copied item to the newly created item.
Last purchase cost	Remains blank.
Cub val	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Height override	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Length override	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Makeup date	Remains blank.
Qty order direct ship	Remains blank.
Receipt date	Remains blank.
Out of stock date	Remains blank.
Selling weight override	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Short SKU	System generated unique number.

Field	Comments
Times out of stock	Remains blank.
Times picked	Remains blank.
Weight override	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Width override	Remains blank for non-SKU'ed items; copied for SKU'ed items.
D.F.O. (date of first order)	Remains blank.
D.L.O. (date of last order)	Remains blank.
Orders avail pick gen	Remains blank.
SKU open qty	Remains blank.
Future qty	Remains blank.
Suspense qty	Remains blank.
On hold qty	Remains blank.
SKU average cost	Defaults to the cost from the Cost field on the Create Item screen, not the cost defined for the copied item.
Drop ship avail qty	Remains blank.
L/S style	If the <i>Require L/S Style (I94)</i> system control value is selected, the system concatenates the item number + SKU code; for example ITEM RED WMNS SMLL. If the <i>Require L/S Style (I94)</i> system control value is unselected, defaults from copied item.
Last download qty	Remains blank.
Last extract	Remains blank.
Last ecomm info chg	Remains blank.
Last changed date	Remains blank.
SKU create date	Defaults to the current date.
CTN ID # (SKU)	Remains blank for non-SKU'ed items; copied for SKU'ed items.
UOM	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Element 1	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Element 2	Remains blank for non-SKU'ed items; copied for SKU'ed items.
Element 3	Remains blank for non-SKU'ed items; copied for SKU'ed items.

Copy Item to Company Window

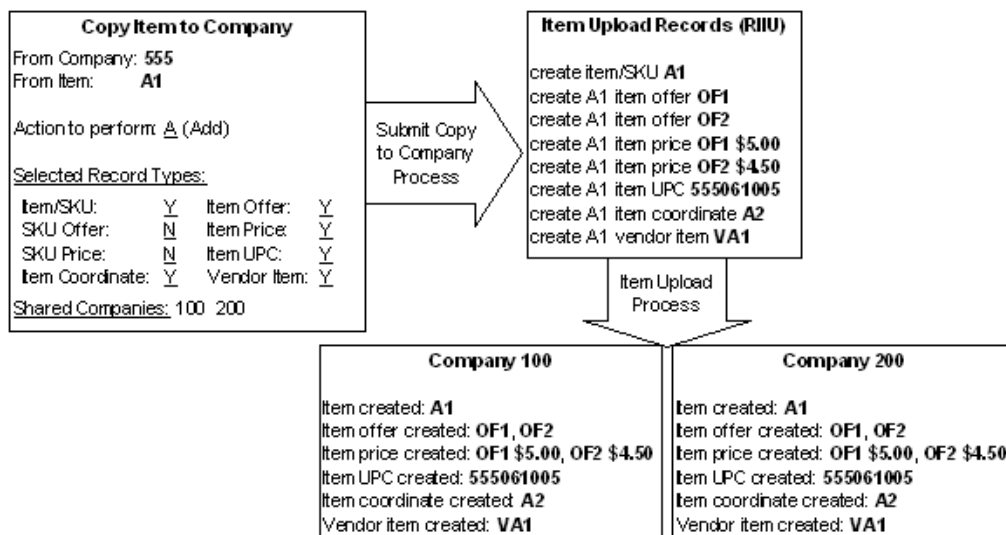

Purpose: Use this window to create an item upload record in the [RI Item Upload Table \(RIIUPP\)](#) in order to add or change item information for an item with the same item number as the copied item in each shared company.

Once the system creates the item upload record, the system follows the regular *RI Item Upload Process* to process the record. If the record contains errors, the system places the record in the *Working with Retail Integration Item Upload (RIIU)* menu option in the shared company where you can review, correct, and reprocess the record.

Copy Item to Company allows you to maintain inventory in the parent company and copy the item information over to your shared companies.

Example:

- When you create item A1 in the parent company, you can copy A1, including its offers, prices, UPC, coordinates, and vendor items, over to the shared companies.
- When you change item A1 in the parent company, you can copy the item updates to item A1 in the shared companies.

How to display this screen: Select *Copy to Company* for an item at the *Work with Items Screen*.

When you select this option:

- An error message indicates if you do not have authority to the *Copy Item to Company Security (B15)* secured feature: Not authorized to Copy.
- An error message indicates if shared companies do not exist for the current company: Shared companies do not exist for the parent. You can define shared companies for a company in *Working with Companies (WCMP)*.

The system defaults the settings selected the last time the window was accessed; however, you can change the settings.

Field	Description
From company	A code for the company where the copied item is located. This represents a parent company that is associated with one or more shared companies. Numeric, 3 positions; display-only.

Field	Description
From item	The item number and description of the copied item. Item number: Alphanumeric, 12 positions; display-only. Item description: Alphanumeric, 120 positions; display-only.
Action to perform	Indicates the type of item upload record you wish to create in the <i>RI Item Upload Table (RIIUPP)</i> . <ul style="list-style-type: none">• <i>A</i> = The system creates an item upload record with a Request type of <i>A</i> (add), indicating the system creates the item information in the shared company. However, if the system finds a record in the Order Administration database that matches the information in the RI Item Upload record, the system updates the existing record.• <i>C</i> = The system creates an item upload record with a Request type of <i>C</i> (maintain), indicating the system updates the item information in the shared company. However, if the system cannot find a record in the Order Administration database that matches the information in the RI Item Upload record, the system creates a new record. Alphanumeric, 1 position; required.

Field	Description
	<p>Select record types</p> <p>You must specify the type of item information you wish to populate in the item upload record, using the item information defined for the copied item, by selecting at least one of the following fields.</p> <p>For each record type selected, the system copies the item information from the copied item and creates an item upload record for each shared company.</p> <ul style="list-style-type: none"> • <i>Item/SKU</i> • <i>Item offer</i> • <i>SKU offer</i> • <i>Item price</i> • <i>SKU price</i> • <i>Item UPC</i> • <i>Item coordinate</i> • <i>Vendor item</i> <p>If you do not select at least one of the record type fields, an error message indicates: At least one record type required.</p> <p><i>Example:</i> If you wish to create the copied item in each shared company, enter <i>A</i> in the Action to perform field and select each Record type field. The system will copy all item information for the copied item and create the item in each shared company.</p>

 **Note:**

The system does not validate that the record type you select to copy exists for the copied item. If the selected item information does not exist, the system submits the Copy Item to Company process, but does not create an item upload record for that record type.

Item/SKU

Indicates whether the system creates an item upload record for record type *01* (item/SKU) in the *RI Item Upload Table (RIIUPP)* for each shared company, using the item/SKU information defined for the copied item.

- *Selected* = The system creates a record in the *RI Item Upload Table (RIIUPP)* for record type *01* (item/SKU) for each shared company, using the item/SKU information defined for the copied item. See *Item upload records created for record type Item/SKU* for more information on the type of item upload record created, based on the action code and record type selected, and the expected results in the shared company.
- *Unselected* = Do not create a record in the *RI Item Upload Table (RIIUPP)* for record type *01* (item/SKU).

Field	Description
Item offer	<p>Indicates whether the system creates an item upload record for record type 03 (item offer) in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, using the item offer information defined for the copied item.</p> <ul style="list-style-type: none"><i>Selected</i> = The system creates a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 03 (item offer) for each shared company, using the item offer information defined for the copied item. See Item upload records created for record type Item Offer for more information on the type of item upload created, based on the action code and record type selected, and the expected results in the shared company.<i>Unselected</i> = Do not create a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 03 (item offer).
SKU offer	<p>Indicates whether the system creates an item upload record for record type 04 (SKU offer) in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, using the SKU offer information defined for the copied item.</p> <ul style="list-style-type: none"><i>Selected</i> = The system creates a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 04 (SKU offer) for each shared company, using the SKU offer information defined for the copied item. See Item upload records created for record type SKU Offer for more information on the type of item upload created, based on the action code and record type selected, and the expected results in the shared company.<i>Unselected</i> = Do not create a record in the v for record type 04 (SKU offer).
Item price	<p>Indicates whether the system creates an item upload record for record type 05 (item price) in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, using the item price information defined for the copied item.</p> <ul style="list-style-type: none"><i>Selected</i> = The system creates a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 05 (item price) for each shared company, using the item price information defined for the copied item. See Item upload records created for record type Item Price for more information on the type of item upload created, based on the action code and record type selected, and the expected results in the shared company.<i>Unselected</i> = Do not create a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 05 (item price).

Field	Description
SKU price	<p>Indicates whether the system creates an item upload record for record type 06 (SKU price) in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, using the SKU price information defined for the copied item.</p> <ul style="list-style-type: none"> <i>Selected</i> = The system creates a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 06 (SKU price) for each shared company, using the SKU price information defined for the copied item. See Item upload records created for record type SKU Price for more information on the type of item upload created, based on the action code and record type selected, and the expected results in the shared company. <i>Unselected</i> = Do not create a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 06 (SKU price).
Item UPC	<p>Indicates whether the system creates an item upload record for record type 08 (item UPC) in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, using the item UPC information defined for the copied item.</p> <ul style="list-style-type: none"> <i>Selected</i> = The system creates a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 08 (item UPC) for each shared company, using the item UPC information defined for the copied item. See Item upload records created for record type Item UPC for more information on the type of item upload created, based on the action code and record type selected, and the expected results in the shared company. <i>Unselected</i> = Do not create a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 08 (item UPC).
Item coordinate	<p>Indicates whether the system creates an item upload record for record type 09 (item coordinate) in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, using the item coordinate information defined for the copied item.</p> <ul style="list-style-type: none"> <i>Selected</i> = The system creates a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 09 (item coordinate) for each shared company, using the item coordinate information defined for the copied item. See Item upload records created for record type Item Coordinate for more information on the type of item upload created, based on the action code and record type selected, and the expected results in the shared company. <i>Unselected</i> = Do not create a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 09 (item coordinate).

Field	Description
Vendor item	<p>Indicates whether the system creates an item upload record for record type 07 (vendor item) in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, using the vendor item information defined for the copied item.</p> <ul style="list-style-type: none"> <i>Selected</i> = The system creates a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 07 (vendor item) for each shared company, using the vendor item information defined for the copied item. See Item upload records created for record type Vendor Item for more information on the type of item upload created, based on the action code and record type selected, and the expected results in the shared company. <i>Unselected</i> = Do not create a record in the <i>RI Item Upload Table (RIIUPP)</i> for record type 07 (vendor item).
Shared companies	<p>The shared companies for which the system will create an item upload record, based on the action code and record types selected.</p> <p>Up to 10 shared companies display in company number sequence. A plus sign (+) indicates if more shared companies exist. You can select <i>Shared Comp</i> to view a complete list of the shared companies for which an item upload record will be created.</p> <p>Numeric, 3 positions; display-only.</p>

Screen Option	Procedure
Submit the copy item to company process to create item upload records in the <i>RI Item Upload Table (RIIUPP)</i> for each shared company, based on the action code and record types selected	<p>Select <i>Accept</i>. The system returns you to the Work with Items Screen with a message similar to the following: Copy Item To Company program has been submitted to batch.</p> <p>See Copy Item to Company Process for the steps the system performs.</p>
Review a list of shared companies for which the system will create an item upload record, based on the action code and record types selected	<p>Select <i>Shared Comp</i> to advance to the Shared Companies window.</p>

 **Note:**

You cannot add, change, or delete shared companies at this window. You can define shared companies for a company in [Working with Companies \(WCMP\)](#).

Copy Item to Company Process

Instructions: Complete the following steps to create an item upload record in the *RI Item Upload Table (RIIUPP)* in order to add or change item information for an item with the same

item number as the copied item in each shared company, based on the action code and record types selected at the [Copy Item to Company Window](#).

- | # | Step |
|----|---|
| 1. | <p>In the Action to perform field, indicate the type of item activity you wish to perform.</p> <ul style="list-style-type: none">• <i>A</i> = The system creates an item upload record with a Request type of <i>A</i> (add), indicating the system creates the item information in the shared company. However, if the system finds a record in the Order Administration database that matches the information in the RI Item Upload record, the system updates the existing record.• <i>C</i> = The system creates an item upload record with a record type of <i>C</i> (maintain), indicating the system updates the item information in the shared company. However, if the system cannot find a record in the Order Administration database that matches the information in the RI Item Upload record, the system creates a new record. |
| 2. | <p>Select the record types you wish to create. This represents the item information you wish to create or update, based on the specified action code. See:</p> <ul style="list-style-type: none">• Item upload records created for record type Item/SKU• Item upload records created for record type Item Offer• Item upload records created for record type SKU Offer• Item upload records created for record type Item Price• Item upload records created for record type SKU Price• Item upload records created for record type Item UPC• Item upload records created for record type Item Coordinate• Item upload records created for record type Vendor Item |
| 3. | <p>Select <i>Accept</i>. The system returns you to the Work with Items Screen with a message similar to the following: Copy Item To Company program has been submitted to batch.</p> |
| 4. | <p>The system creates item upload records in the <i>RI Item Upload Table (RIIUPP)</i>, based on the action code and record types selected. Each item upload record is created with:</p> <ul style="list-style-type: none">• A Key type of <i>IT</i> (item/SKU), indicating the system identifies the item in the shared company using the Item and SKU fields in the item upload record. The Copy Item to Company program populates these fields with the item number and optionally, SKU code, defined for the copied item.• A Status of <i>U</i> (unprocessed), indicating the item upload record is ready to be processed. |
| 5. | <p>Once the Copy Item to Company program has created all of the item upload records, the system automatically submits the RI Item Upload process to process the records in the <i>RI Item Upload Table (RIIUPP)</i>. See RI Item Upload Process for processing details.</p> |

 **Note:**

If item upload records already exist in the RI Item Upload table, the system processes those records along with the records created through the Copy Item to Company program.

#	Step
6.	The system creates supporting table values for items/SKUs through the item upload if the value does not exist in the shared company. For example, if the buyer code does not exist in the shared company, the system creates it. See Tables Updated by the RI Item Upload for a list of the tables for which the RI Item Upload process will create new records.
9.	The system places any records that contain errors in an error status in the <i>RI Item Upload Table (RIIUPP)</i> and Retail Integration Item Upload Error table. You can review the records in error on the Item Upload Error Report and on the Work with Retail Item Upload Errors Screen in <i>Working with Retail Integration Item Upload (RIIU)</i> . See Retail Item Upload Errors for a list of errors that may occur.

 **Note:**

Item upload records in error are listed in the Work with Retail Integration Item Upload (RIIU) menu option in the shared company, not the company where the copied item is located. For example, if you create the copied item in shared companies 100 and 200 and both item upload records error, you must review and correct the item upload record in error in each shared company (companies 100 and 200).

10. Once the Item Upload process completes, the system generates the following reports:
- [Item Upload Error Report](#): Indicates that item upload records failed one or more edits and remain in the Retail Integration Item Upload file.
 - [Record Deleted from RI Item Upload Report](#): Indicates that you deleted the item upload record(s) from the Retail Integration Item Upload file by selecting *Delete* for an item upload record at the [Work with Retail Item Upload Screen](#). This means that the edit program did not create, maintain, or delete any item/SKU information.

Item Upload Records Created

The table below indicates the type of item upload record created, based on the action code and record type selected.

Action / Record type	Item Upload Record Created
----------------------	----------------------------

Item upload records created for record type Item/SKU

Action / Record type	Item Upload Record Created
A Item/SKU	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 01 (item/SKU), indicating the system populates the item and SKU fields in the item upload record using the item/SKU information defined for the copied item. See Fields for 01 Item/SKU record type for a list of the fields populated. Request type A (add), indicating the system creates the item in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU.

 **Note:**

If the item already exists in the shared company, the system automatically changes the Request type to C (maintain).

Short SKU: The system generates a new short SKU code for each item/SKU created in the shared company.

Long SKU department and long SKU division: The system creates the long SKU department in the shared company if it does not already exist. In addition, if a long SKU division is defined for the long SKU department being created, the system also creates the long SKU division in the shared company. However, if the long SKU department does not need to be created, the system will not create the long SKU division in the shared company if it does not already exist.

Cost: The system copies the cost defined.

****DFLT ITEM:** If a field for the copied item is blank, the system creates the item upload record and leaves the field blank. However, if the ****DFLT ITEM Item/SKU** exists as an item in the shared company, the system defaults the value defined for the ****DFLT ITEM** item to the blank field in the RI Item Upload record. For example, if the buyer code is blank from the copied item, but the ****DFLT ITEM** contains buyer code BTM, the system defaults BTM to the item upload record and creates the item in the shared company with buyer code BTM. See ****DFLT ITEM Item/SKU** for more information on setting up this item.

Item Upload Processing Results: The system creates an item/SKU in each shared company, using the item number and item/SKU information from the copied item. If the copied item contains SKUs, the system creates a SKU for each SKU defined for the copied item.

Action / Record type	Item Upload Record Created
C Item/SKU	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type <i>01</i> (item/SKU), indicating the system populates the item and SKU fields in the item upload record using the item/SKU information defined for the copied item. See Fields for 01 Item/SKU record type for a list of the fields populated. Request type <i>C</i> (maintain), indicating the system updates the item in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. If the item does not exist, the system automatically changes the Request type to <i>A</i> (add). <p><i>Short SKU:</i> The system retains the short SKU defined for the item in the shared company instead of updating the short SKU with the short SKU defined for the copied item.</p> <p><i>Long SKU department and long SKU division:</i> The system creates the long SKU department in the shared company if it does not already exist. In addition, if a long SKU division is defined for the long SKU department being created, the system also creates the long SKU division in the shared company. However, if the long SKU department does not need to be created, the system will not create the long SKU division in the shared company if it does not already exist.</p> <p><i>Cost:</i> The system copies the cost defined for the item.</p> <p><i>**DFLT ITEM item:</i> If a field for the copied item is blank, the system creates the item upload record and leaves the field blank. However, if <i>**DFLT ITEM</i> exists as an item in the shared company, the system defaults the value defined for the <i>**DFLT ITEM</i> item to the blank field in the item upload record. For example, if the buyer code is blank from the copied item, but the <i>**DFTL ITEM</i> contains buyer code BTM, the system defaults BTM to the item upload record and updates the item in the shared company with buyer code BTM. See **DFLT ITEM Item/SKU for more information on setting up this item.</p> <p><i>*DFTCHG item:</i> If <i>*DFTCHG</i> exists as an item in the shared company, the system looks to this item to determine if the item in the shared company should be updated with the information from the copied item.</p> <ul style="list-style-type: none"> If a field in the <i>*DFTCHG</i> item is populated, the system does not update the item in the shared company with the value from the copied item. If a field in the <i>*DFTCHG</i> item is blank, the system updates the item in the shared company with the value from the copied item. <p><i>Example:</i> If the copied item has buyer code TWB and the item in the shared company has buyer code BTM, the system will retain buyer code BTM if the <i>*DFTCHG</i> item has a buyer code defined. However, if the Buyer code field for the <i>*DFTCHG</i> item is blank, the system updates the buyer code for the item in the shared company to TWB.</p> <p>See **DFTCHG Item/SKU for more information on setting up this item.</p> <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the item/SKU with the same item number as the copied item, using the item/SKU information from the copied item.</p> <p>Item upload records created for record type Item Offer</p>

Action / Record type	Item Upload Record Created
A Item Offer	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 03 (item offer), indicating the system populates the item offer fields in the item upload record using the item offer information defined for the copied item. See Fields for 03 Item Offer record type for a list of the fields populated. Request type A (add), indicating the system creates the item offer in the shared company. If the copied item contains SKUs, the system creates one item upload record for the main item only. If the item offer already exists in the shared company, the system automatically changes the Request type to C (maintain). <p><i>Item Upload Processing Results:</i> In each shared company, the system creates item offers for the item with the same item number as the copied item, using the item offers from the copied item.</p>
C Item Offer	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 03 (item offer), indicating the system populates the item offer fields in the item upload record using the item offer information defined for the copied item. See Fields for 03 Item Offer record type for a list of the fields populated. Request type C (maintain), indicating the system updates the item offer in the shared company. If the copied item contains SKUs, the system creates one item upload record for the main item only. If the item offer does not exist in the shared company, the system automatically changes the Request type to A (add). <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the item offer(s) for the item with the same item number as the copied item, using the item offer information from the copied item.</p> <p>Item upload records created for record type SKU Offer</p>
A SKU Offer	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 04 (SKU offer), indicating the system populates the SKU offer fields in the item upload record using the SKU offer information defined for the copied item. See Fields for 04 SKU Offer record type for a list of the fields populated. Request type A (add), indicating the system creates the SKU offer in the shared company. The system creates a separate item upload record for each item/SKU. If the SKU offer already exists in the shared company, the system automatically changes the Request type to C (maintain).

 **Note:**

In order to create an item upload record for Record type 04, the copied item must contain SKUs. If the item is a non-SKUed item, the system automatically deletes the item upload record and displays it on the [Record Deleted from RI Item Upload Report](#).

Item Upload Processing Results: In each shared company, the system creates SKU offers for the item with the same item number as the copied item, using the SKU offers from the copied item.

Action / Record type	Item Upload Record Created
C SKU Offer	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type <i>04</i> (SKU offer), indicating the system populates the SKU offer fields in the item upload record using the SKU offer information defined for the copied item. See Fields for 04 SKU Offer record type for a list of the fields populated. Request type <i>C</i> (maintain), indicating the system updates the SKU offer in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. <p>If the SKU offer does not exist, the system automatically changes the Request type to <i>A</i> (add).</p> <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the SKU offer(s) for the item with the same item number as the copied item, using the SKU offer information from the copied item.</p>
A Item Price	<p>Item upload records created for record type Item Price</p> <p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type <i>05</i> (item price), indicating the system populates the item price fields in the item upload record using the item price information defined for the copied item. See Fields for 05 Item Price record type for a list of the fields populated. Request type <i>A</i> (add), indicating the system creates the item price in the shared company. If the copied item contains SKUs, the system creates one item upload record for the main item only for each item price. If the item price already exists in the shared company, the system automatically changes the Request type to <i>C</i> (maintain). <p><i>Item Upload Processing Results:</i> In each shared company, the system creates item prices for the item with the same item number as the copied item, using the item prices from the copied item.</p>
C Item Price	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type <i>05</i> (item price), indicating the system populates the item price fields in the item upload record using the item price information defined for the copied item. See Fields for 05 Item Price record type for a list of the fields populated. Request type <i>C</i> (maintain), indicating the system updates the item price in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. <p>If the item price does not exist, the system automatically changes the Request type to <i>A</i> (add).</p> <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the item price(s) for the item with the same item number as the copied item, using the item price information from the copied item.</p> <p>Item upload records created for record type SKU Price</p>

Action / Record type	Item Upload Record Created
A SKU Price	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 06 (SKU price), indicating the system populates the SKU price fields in the item upload record using the SKU price information defined for the copied item. See Fields for 06 SKU Price record type for a list of the fields populated. Request type A (add), indicating the system creates the SKU price in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. If the SKU price already exists in the shared company, the system automatically changes the Request type to C (maintain). <p><i>Item Upload Processing Results:</i> In each shared company, the system creates SKU prices for the item with the same item number as the copied item, using the SKU prices from the copied item.</p>
C SKU Price	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 06 (SKU price), indicating the system populates the SKU price fields in the item upload record using the SKU price information defined for the copied item. See Fields for 06 SKU Price record type for a list of the fields populated. Request type C (maintain), indicating the system updates the SKU price in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. <p>If the SKU price does not exist, the system automatically changes the Request type to A (add).</p> <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the SKU price(s) for the item with the same item number as the copied item, using the SKU price information from the copied item.</p>
Item upload records created for record type Item UPC	
A Item UPC	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 08 (item UPC), indicating the system populates the item UPC fields in the item upload record using the item UPC information defined for the copied item. See Fields for 08 Item UPC record type for a list of the fields populated. Request type A (add), indicating the system creates the item UPC in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. If the item UPC already exists in the shared company, the system automatically changes the Request type to C (maintain). <p><i>Item Upload Processing Results:</i> In each shared company, the system creates item UPCs for the item with the same item number as the copied item, using the item UPCs from the copied item.</p>

Action / Record type	Item Upload Record Created
C Item UPC	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 08 (item UPC), indicating the system populates the item UPC fields in the item upload record using the item UPC information defined for the copied item. See Fields for 08 Item UPC record type for a list of the fields populated. Request type C (maintain), indicating the system updates the item UPC in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. <p>If the item UPC does not exist, the system automatically changes the Request type to A (add).</p> <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the item UPC(s) for the item with the same item number as the copied item, using the item UPC information from the copied item.</p>
Item upload records created for record type Item Coordinate	
A Item Coordinate	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 09 (item coordinate), indicating the system populates the item coordinate fields in the item upload record using the item coordinate information defined for the copied item. See Fields for 09 Item Coordinate record type for a list of the fields populated. Request type A (add), indicating the system creates the item coordinate in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. If the item coordinate already exists in the shared company, the system automatically changes the Request type to C (maintain). <p><i>Item Upload Processing Results:</i> In each shared company, the system creates item coordinates for the item with the same item number as the copied item, using the item coordinates from the copied item.</p>
C Item Coordinate	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 09 (item coordinate), indicating the system populates the item coordinate fields in the item upload record using the item coordinate information defined for the copied item. See Fields for 09 Item Coordinate record type for a list of the fields populated. Request type C (maintain), indicating the system updates the item coordinate in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. <p>If the item coordinate does not exist, the system automatically changes the Request type to A (add).</p> <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the item coordinate(s) for the item with the same item number as the copied item, using the item coordinate information from the copied item.</p>
Item upload records created for record type Vendor Item	

Action / Record type	Item Upload Record Created
A Vendor Item	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 07 (vendor item), indicating the system populates the vendor item fields in the item upload record using the vendor item information defined for the copied item. See Fields for 07 Vendor Item record type for a list of the fields populated. Request type A (add), indicating the system creates the vendor item in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. If the item coordinate already exists in the shared company, the system automatically changes the Request type to C (maintain). <p><i>Item Upload Processing Results:</i> In each shared company, the system creates vendor items for the item with the same item number as the copied item, using the vendor items from the copied item.</p>
C Vendor Item	<p>The item upload record contains:</p> <ul style="list-style-type: none"> Record type 07 (vendor item), indicating the system populates the vendor item fields in the item upload record using the vendor item information defined for the copied item. See Fields for 07 Vendor Item record type for a list of the fields populated. Request type C (maintain), indicating the system updates the vendor item in the shared company. If the copied item contains SKUs, the system creates a separate item upload record for each item/SKU. <p>If the vendor item does not exist, the system automatically changes the Request type to A (add).</p> <p><i>Item Upload Processing Results:</i> In each shared company, the system updates the vendor item(s) for the item with the same item number as the copied item, using the vendor item information from the copied item.</p>

Setting up SKUs

Purpose: The following topics describe working with SKU elements, groups, split SKUs, and using the SKU generator.

- [Introducing SKU Setup](#) discusses SKU concepts and provides an overview of split SKU elements, groups, and the SKU generator.
- [Working with SKU Elements \(WSK1, WSK2, WSK3\)](#) explains how to create, change, delete, and display SKU elements.
- [Working with SKU Groups \(WISG\)](#) includes how to create, change, delete, and display SKU groups.
- [Using the SKU Generator \(ESKG\)](#) describes the SKU Generator and working with input and output screens, including working with SKU base information and creating individual SKUs.
- [Resequence the SKU Collating Sequence Number \(RSCS\)](#) explains how to assign a SKU sort sequence number to each SKU of a selected item.

Introducing SKU Setup

Purpose: This topic contains an explanation of SKUs, SKU types, SKU elements, SKU groups, SKU sort sequence numbers and the SKU generator.

Definition: A SKU (stock keeping unit) is used to further define an item number. An item that is sold in multiple colors and sizes is often represented by a base item number, which is common to all of the colors and sizes, and a SKU which specifically defines the color and size. For example, the base item number for a dress could be 9201 and the SKUs associated with that item number could be RED SML, RED MED, RED LRG, BLUE SML, BLUE MED, and BLUE LRG.

Most functions accessible at the base item level are accessible at the SKU level, including offers, warehouses, sets, and comments. Information entered at the SKU level overrides information defined at the base item level.

In this topic:

- [SKU Elements](#)
- [SKU Groups](#)
- [SKU Generator](#)

SKU Elements

The three elements of the Split SKU are defined in the System Control table. Typically, these elements are used to represent size, color, and width for items of apparel; however, you can define the elements to meet your particular requirements. Once you set up the elements in the System Control table, you will be prompted for this information throughout the system.

SKU Groups

A SKU Group ([Working with SKU Groups \(WISG\)](#)) can be assigned to an item in the Item table and is used to define the standard sizes or colors in which items are sold. SKU Groups can be used to facilitate data entry in the SKU Generator (fast path = *ESKG*); see [Using the SKU Generator \(ESKG\)](#).

For example, a SKU group can be defined for a particular manufacturer's product line for dresses. You can define an Item SKU Group for dress size. For example, the Item SKU Group 001 could be set up for dresses and can list the sizes in which these dresses are available (4, 6, 8, 10, 12, 14, regular and petite).

SKU Generator

The SKU Generator is used to create an array of SKUs for an item automatically. Once you define the item and the SKU group, run the SKU generator option to automatically build all the SKU records.

When generating SKUs for an item, you can accept the defaults as defined in the SKU Groups or you can add or subtract individual SKUs.

See [Using the SKU Generator \(ESKG\)](#).

Note:

Before you can work with SKUs, you must create the SKU information on the system. You can also create SKUs by selecting *Create* at the [Work with SKUs Screen](#).

Working with Sets

In this part: The following topics describe how to create, change, delete, and display sets.

- [Introducing Sets](#) provides a brief overview of sets and how to select the set tables.
- [Entering Set Information \(WSET\)](#) describes a set; how to scan for, create, and delete sets; and how to work with set component items.
- [Entering Variable Set Information \(WVST\)](#) defines a variable set and includes how to scan for, create, and delete variable sets, and how to work with variable set groups.
- [Entering Finished Goods Information \(WFGD\)](#) defines a finished good and includes how to scan for, create, and delete finished goods sets, and how to work with finished good component items.

Introducing Sets

Purpose: There are three types of sets or kits:

Sets are a group of items which are assembled when the set is picked and packed. Sets can be made up of items which are sold individually. Each of these component items appear on the pick slip and are packed together. Component items might not appear on the same pick slip, but the picks are created at the same time.

For more information: See [Entering Set Information \(WSET\)](#).

Variable sets are lists of items that customers can choose from to make up the set they want to purchase. Like sets, variable sets are assembled when the set variable is picked and packed. The items which make up the variable set might not appear on the same pick slip, but the picks are created at the same time.

For more information: See [Entering Variable Set Information \(WVST\)](#).

Finished goods are items that require assembly prior to picking and packing. A finished good is made up of one or more components. These components are assembled to build the finished good. The finished good is picked and packed, not the individual components. The system tracks the usage of each component and will recommend re-order quantities. The system also determines demand for the finished good item and recommends the number of finished goods to be made up to meet demand.

For more information: See [Entering Finished Goods Information \(WFGD\)](#).

Updating Items and SKUs

Topics in this part:

- [Creating Item/SKU Offers \(MISO\)](#) describes how to create an item/SKU offer.
- [Updating Item/SKU Offers \(MUSO\)](#) explains the Update SKU Offer screen and its fields. This option updates information on multiple SKU offer records at one time.
- [Deleting SKUs for an Item \(MDLT\)](#) explains how to delete a SKU for a particular item.

- [Copying SKU Offer Information \(MCSO\)](#) describes how to duplicate the information in one offer to another offer.
- [Copying Item Warehouse Information \(MCIW\)](#) explains how to duplicate the item warehouse information in one warehouse to another warehouse.
- [Working with Offer Overrides by Item Class \(WSOI\)](#) explains how to override existing item/offer and SKU/offer information by item class.
- [Maintaining SKU Cross Reference Codes \(MSKR\)](#) describes how to create a cross reference between a Order Administration item and SKU and another system's item and SKU.
- [Updating SKU Offer Prices \(MUSK\)](#) allows you to create SKU/offer prices for specific SKUs of an item and specific offers.
- [Maintaining Item/SKU/Offer \(CPIM\)](#) describes how to recalculate the projected units or update other information in the Item/Offer table.
- [Maintaining Item Offers \(MIOF\)](#) describes how to update item offer information for a specific offer, or to change item information for a specific item.
- [Copying SKU/Offer Records \(CSKO\)](#) describes how to copy SKU offer information from one offer to another.

Assigning Items/SKUs to Offers

Purpose: By assigning an item or SKU to an offer, you indicate that the item or SKU is available to be sold in a particular offer. An item/SKU can be linked to multiple offers. The information you can define for the item/SKU offer includes the page number where the item/SKU appears, information on the item depiction, whether gift wrapping or special handling are available, and the expected return percentage. You can also define pricing at this level.

Item/offer vs. SKU/offer: If an item has SKUs, you can create an item offer record or SKU offer records. You need to establish SKU offer records only if the information differs for each SKU.

Use *Work with Item/SKU Offers* to change, delete, display, or create item/SKU offers. Additionally, you can advance to the following functions:

1. *Item pricing:* You can define special reduced prices for the item, based on the quantity ordered or the column assignment.
2. *Page letter assignment:* You can define a catalog page and letter for an item, which order entry operators can enter instead of the item code.
3. *Alias function:* You can use aliases to track sales for an item depending on its placement within the same catalog.

Created through SKU generator? The [Automatically Create SKU Offers \(J71\)](#) system control value indicates whether the SKU generator automatically creates SKU Offers and single-unit SKU Prices based on current or future Item Offers and Item Prices. See that system control value for more information.

In this topic:

- [Work with Item Offers Screen](#)
 - [Change Item Offer Screen](#)
- [Work with SKU Offers Screen](#)

- [Change SKU Offer Screen](#)
- [Work with Item Prices Screen \(Quantity Price Breaks by Offer\)](#)
 - [Create Item Price Screen \(Quantity Price Breaks by Offer\)](#)
 - [Change Item Price Screen](#)
- [Work with Alias Screen](#)
 - [Create Alias Screen](#)
- [Work with Accompanying Item Screen](#)

For more information: See [Create Item Offer Screen](#) to learn how to create an item (or SKU) offer.

Work with Item Offers Screen

Purpose: Item offers are merchandise presentations to your customers, such as catalogs, space advertisements, etc. Use this screen to associate an item with one or more offers. From this screen, you can create, change, delete or display item offers.

How to display this screen: At the [Work with Items Screen](#), select *Offers* for an item.

Field	Description
Offer	Represents a catalog or advertisement used to present merchandise to your customers. Alphanumeric, 3 positions; optional.
Description	The description of the offer. Alphanumeric, 40 positions; optional.
G/W (Gift wrap)	Indicates whether the item is eligible for gift wrapping in the offer. <i>Selected</i> = the item is eligible for gift wrapping in this offer <i>Unselected</i> = the item is not eligible for gift wrapping in this offer
S/H (Special handling)	Indicates whether the item is eligible for special handling in the offer. <i>Selected</i> = the item is eligible for special handling in this offer <i>Unselected</i> = the item is not eligible for special handling in this offer

Screen Option	Procedure
Create an item offer	Select <i>Create</i> to advance to the Create Item Offer Screen .
Change item offer information	Select <i>Change</i> for an offer to advance to the Change Item Offer Screen .

Screen Option	Procedure
Delete item offer information	Select <i>Delete</i> for an offer to delete the item/offer.
	<div data-bbox="1047 373 1352 718" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If there are dependent records associated with this offer, the system will display a warning message. Deleting this offer will also delete any dependent records such as:</p> </div>
	<p>Item Offer Dependent Tables:</p> <ul style="list-style-type: none"> • Item Price • Page Letter Alias <p>SKU Offer Dependent Tables:</p> <ul style="list-style-type: none"> • SKU Price • SKU Offer Page • SKU Offer Charges
Display item offer information	Select <i>Display</i> for an offer to advance to the Display Item Offer Screen. You cannot change any information on this screen. See Create Item Offer Screen for field descriptions.
Price Breaks	Select <i>Price breaks</i> for an offer to advance to the Work with Item Prices Screen (Quantity Price Breaks by Offer) .
Alias	Select <i>Alias</i> for an offer to advance to the Work with Alias Screen .
Work with accompanying items	Select <i>Accompanying Items</i> for an offer to display the Work with Accompanying Item Screen .
Work with user defined fields	Select <i>User Fields</i> for an offer to advance to the Work with User Fields Screen .

Change Item Offer Screen

Change an offer: Select *Change* for the item/SKU offer at the [Work with Item Offers Screen](#) to advance to the Change Item/SKU Offer screen. At this screen you can change any information except the item code, description, and offer number. See [Create Item Offer Screen](#) for field descriptions.

If you change the effective date or pricing, the system creates an *additional* price break record for a quantity of *1*. In this case, the system selects the most current price break for the item or SKU; the price break with the effective date closest to, but not past, the current date is used. To remove a price break record once you change any of this information for an item offer or SKU offer, select *Price breaks* for the item/SKU offer; see [Work with Item Prices Screen \(Quantity Price Breaks by Offer\)](#).

Work with SKU Offers Screen

Purpose: Use this screen to work with SKU/offers, which define the pricing and available options, such as gift wrap and special handling, for individual SKUs within an offer. If you have defined a SKU/offer, the system uses this information in order entry. If there is no SKU/offer, the item/offer information applies. It is not necessary to create SKU/offers for SKU'ed items except, optionally, to override the item/offer information.

How to display this screen: Select *Ofrs* for a SKU at the [Work with SKUs Screen](#).

Field descriptions: See [Work with Item Offers Screen](#).

Screen Option	Procedure
Create a SKU offer	Select <i>Create</i> to advance to the Create SKU Offer Screen .
Change SKU offer information	Select <i>Change</i> for an offer to advance to the Change SKU Offer screen. See Change Item Offer Screen .
Delete SKU offer information	Select <i>Delete</i> for an offer to delete the SKU offer.
Display SKU offer information	Select <i>Display</i> for an offer to advance to the Display SKU Offer screen. You cannot change any information on this screen. See Create SKU Offer Screen .
Price Breaks	Select <i>Price breaks</i> for an offer to advance to the Work with SKU Prices screen. See Work with Item Prices Screen (Quantity Price Breaks by Offer) .
Work with accompanying items	Select <i>Accompanying Items</i> for an offer to display the Work with Accompanying Item Screen .

 **Note:**

If you add an accompanying item from the [Work with SKU Offers Screen](#), the accompanying item is added to the order only when the customer orders this specific SKU.

Work with user defined fields	<i>User Fields</i> for an offer to advance to the Work with User Fields Screen .
-------------------------------	--

Change SKU Offer Screen

To change: Select *Change* for an offer at the [Work with SKU Offers Screen](#) to advance to the Change SKU Offer screen. At this screen, you can change anything except the item, SKU, and offer. See [Create SKU Offer Screen](#).

Work with Item Prices Screen (Quantity Price Breaks by Offer)

Purpose: Use this screen to create, change, delete, or display price breaks for an item in an offer. The *Quantity Break/Item (A87)* system control value controls whether the system reprices an order by the Quantity Break by Item method in Order Entry.

This function also allows you to specify a pricing column for each price break. A customer assigned to a pricing column in the Customer table receives the price break automatically, regardless of the order quantity. You can establish separate price breaks by quantity for regular and associate customers.

 **Note:**

If you have selected “Best Way” pricing in the System Control table, the customer will always receive the best available price for the item and quantity. If the best available price is a column price, the customer receives this price even if not flagged for column pricing.

Creating Item Price or SKU Price records through Item Offer or SKU Offer: You create a record in the Item Price table each time you create *or change* an item offer record that includes a price; similarly, you create a record in the SKU price table each time you create *or change* a SKU offer record with a price. Also, if you create a SKU Offer but do not specify an Effective date and Price at that time, the system automatically creates a SKU Price using the single-unit Item Price record with the latest Effective date. If the latest Item Price record has an Effective date in the future, then the SKU Price also has a future Effective date.

How to display this screen: At the *Work with Item Offers Screen*, select *Price break* for an item offer.

Field	Description
Effective date	The date the price or quantity break discount becomes valid. Numeric, 6 positions (in user date format); optional.
Quantity	The amount of an item that the customer must order to receive the discounted (quantity break) price. Numeric, 7 positions; optional.
Price	The price at which the item will be sold. Numeric, 13 positions with a 2-place decimal; required.
Associate price	The price at which the item will be sold to associate customers. Numeric, 13 positions with a 2-place decimal; required.
Column	Indicates the pricing column associated with this price. Alphanumeric, 1 position; optional.
Tax inclusive price	The price at which the item will be sold on orders subject to tax-inclusive pricing and VAT. Included only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.
Tax-inclusive associate price	The price at which the item will be sold to associate customers on orders subject to tax-inclusive pricing and VAT. Included only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.

Screen Option	Procedure
Create item pricing	Select <i>Create</i> to advance to the Change Item Price Screen .
Change item price information	Select <i>Change</i> for an item price to advance to the Change Item Price Screen .
Delete item price information	Select <i>Delete</i> for an item price to delete it.
Display item price information	Select <i>Display</i> for an item price to advance to the Display Item Price Screen. You cannot change any information on this screen. See Create Item Price Screen (Quantity Price Breaks by Offer) for field descriptions.

Create Item Price Screen (Quantity Price Breaks by Offer)

Purpose: At the [Work with Item Prices Screen \(Quantity Price Breaks by Offer\)](#), select *Create*.

Field	Description
Effective date	<p>The date the price or quantity break discount becomes valid. This date should be equal to or greater than the effective date of the offer. The customer will receive the price when the order date is on or after this date and the appropriate quantity ordered is achieved.</p> <p>If there are multiple effective dates established for the same item/offer, the system will use the price associated with the effective date closest to, but not greater than, the order date.</p> <p><i>Example:</i> If you establish effective dates of Feb. 20, and Mar. 31 and the customer places an order on April 1, the customer receives the price associated with the effective date of March 31.</p> <p>Numeric, 6 positions (in user date format); required.</p>
Qty (Quantity)	<p>The amount of an item that the customer must order to receive the discounted (quantity break) price. Applies to all SKUs for the item unless it is overridden at the SKU level. An unlimited number of quantity break levels may be defined for an item.</p> <p>If you are defined as a single price record (meaning there is no minimum quantity required), use a quantity of one.</p> <p>Numeric, 7 positions; required.</p>
Price	<p>The price at which the item will be sold in this offer, if no discounts are applied, and the order date is on or after than the effective date. Multiple effective dates and prices can be established for the same item/offer.</p> <p>Numeric, 13 positions with a 2-place decimal; required.</p>
Associate price	<p>The price at which the item will be sold in this offer to associate customers. Associate price is used when the Associate field on the order is <i>selected</i> and the order date is on or after the effective date.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Tax inclusive price	The price at which the item will be sold in this offer on orders subject to VAT. When an order is subject to VAT, tax does not accumulate in the Tax bucket on the order; instead, the customer pays a tax-inclusive price for the items and VAT is included as a "hidden tax" on the order detail line. Displayed only if the Tax Included in Price (E70) system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.
Tax-inclusive associate price	The price at which the item will be sold in this offer to associate customers on orders subject to VAT. Displayed only if the Tax Included in Price (E70) system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.
Price column	The pricing column associated with the price entered. In the Customer table, you may assign a customer to a pricing column. This means that the customer will be charged the column price, even if the customer does not order the number of units specified for the price break. Alphanumeric, 1 position; optional.

Change Item Price Screen

To change: Select *Change* for a price at the [Work with Item Prices Screen \(Quantity Price Breaks by Offer\)](#) to advance to the Change Item Price screen. At this screen you can change the prices or price column. See [Create Item Price Screen \(Quantity Price Breaks by Offer\)](#) for field descriptions.

Work with Alias Screen

Purpose: Use this screen to create, change, delete or display alternate item codes for an item. You can use various aliases for an item within an offer, presenting the item on different pages in different ways. This helps you track how different placement and presentation of an item within the catalog affects demand. The system maintains inventory information at the actual item level, not at the alias level.

If the [Display Item Alias \(D56\)](#) system control value is *selected*, the alias the customer selects will display in Order Entry, Order Maintenance, and Order Inquiry. If this field is *unselected*, the actual item code will display.

Note:

Note: If an item has SKUs, you define an alias for the base item rather than at the SKU level. Your customers can place orders for the item using the alias code, but the original SKUs. For example, a base item code is A1000, and is available in BLUE and RED, while it has aliases X2000 and Z3000. The system accepts orders for A1000, X2000 or Z3000, but requires a SKU of either BLUE or RED regardless of the item code or alias.

How to display this screen: At the [Work with Item Offers Screen](#), select *Alias* for an item offer. You can also advance to this screen by selecting *Work with Alias* at the [Create Item Offer Screen](#), the [Change Item Offer Screen](#), or the Display Item Offer screen.

Field	Description
Alias	The alternate item code for an actual item. Alphanumeric, 12 positions; optional.

Screen Option	Procedure
Create a new alias	Select <i>Create</i> to advance to the Create Alias Screen .
Change alias information	Select <i>Change</i> for an alias to advance to the Change Alias Screen. At this screen you can change any information except the item code and offer. See Create Alias Screen for field descriptions.
Delete alias information	Select <i>Delete</i> for an alias to delete it.
Display alias information	Select <i>Display</i> for an alias to advance to the Display Alias Screen. You cannot change any information on this screen. See Create Alias Screen for field descriptions.

Create Alias Screen

To create: At the [Work with Alias Screen](#), select *Create*.

Field	Description
Alias	The alternate item code for an actual item. You can create multiple aliases for an offer, but each alias must have a unique code. You can use aliases to track how demand varies for an item depending on placement and presentation within an offer. When you enter an alias code in Order Entry, the system reserves stock and performs all other inventory transactions against the actual item code, but tracks demand for the alias. If the Display Item Alias (D56) system control value is <i>selected</i> , the alias rather than the actual item code will display in Order Entry, Order Maintenance, and Order Inquiry. Alphanumeric, 12 positions; required.

Work with Accompanying Item Screen

Purpose: Use this screen to create, change, delete, or display additional items that are offered along with the original item and automatically added to the order.

Accompanying items are added to the order automatically at no charge or for a set price when the customer orders the originating item, or “trigger item”, in a specific quantity and for a specific offer. This activity is automated, so that the order entry operator does not have to remember to add this item to the order. No pop-up window opens to notify the operator that the system is adding an accompanying item to the order. In addition, certain updates to the originating item in order entry also update the accompanying item. When you ship the order, the system ensures that the originating item and accompanying item ship together.

The system also adds accompanying items to an order in order maintenance if the system control value is selected.

To define accompanying items: Use the *Add/Change* option at the [Work with Accompanying Item Screen](#) to define accompanying items for a specified item/SKU and offer. When you select the *Add/Change* option, the system toggles the fields for any existing accompanying items between being enterable and display-only.

For each accompanying item that you define, you must indicate:

- [Add Accompanying Items in Order Maintenance \(H28\)](#)
- the required order quantity of the originating item in order to add the accompanying item to the order; for example, you must order 2 of the originating item to add the accompanying item to the order
- the accompanying item/SKU to add to the order
- the quantity of the accompanying item to add to the order (either a specific quantity or the same quantity as the originating item)
- whether there is a charge for the accompanying item (accompanying items are added at no charge, or at the regular price according to your pricing hierarchy)

Cannot add accompanying item with set: The system does not add an accompanying item to the order if it is associated with a set item.

For more information: See [Upselling with Accompanying Items](#) for an overview of the accompanying item process in order entry and order maintenance.

How to display this screen: At the [Work with Item Offers Screen](#), select *Accompanying Item* for an item offer.

Field	Description
Offer	<p>The code and description of offer that must be used for the originating item in order for the accompanying item to qualify for the order; this is the offer you selected at the Work with Item Offers Screen.</p> <p>Offer code: Alphanumeric, 3 positions; display-only. Offer description: Alphanumeric, 40 positions; display-only.</p>
Item/SKU	<p>The code and description of the originating item; this is the item that “triggers” adding the accompanying item to the order. If you are defining an accompanying item at the SKU level, the SKU for the originating item also displays.</p> <p>Item code: Alphanumeric, 12 positions; display-only. Item description: Alphanumeric, 120 positions; display-only. SKU code: Alphanumeric, three 4-position fields; display-only.</p>

Field	Description
Required qty (Originating item required quantity)	<p>The quantity of the originating item that must be ordered in order to qualify for the accompanying item.</p> <p>The screen displays an error message if you try to create more than one accompanying item for the same required quantity: An accompanying item has already been defined for this quantity.</p> <p>If you define multiple accompanying items for the originating item, the system adds the accompanying item whose Required qty is closest to, but not greater than, the order quantity of the originating item on the order.</p> <p>If you decrease the order quantity of the originating item on the order so that it no longer meets the Required quantity for the accompanying item, the system deletes the accompanying item from the order.</p> <p>See Updating the Originating Item in Order Entry for more information on when the system updates the accompanying item based on updates made to the originating item in order entry.</p> <p>Numeric, 5 positions; required.</p>
Item	<p>The accompanying item to add to the order if the customer orders the required quantity of the originating item. Validated against the Item table.</p> <p>Alphanumeric, 12 positions; required.</p>
SKU	<p>The SKU elements that are used to further define the accompanying item. Validated against the SKU Element (1, 2, 3) tables.</p> <p>Alphanumeric, three 4-position fields; required (if SKU item).</p>
Acc qty (Accompanying item quantity)	<p>The quantity of the accompanying item to add to the order.</p> <p>You must complete this field if the Use Order Quantity field is <i>No</i>. Leave this field blank if you select the Use order quantity field.</p>

 **Note:**

If you define an Accompanying item quantity and also select the Use order quantity field, the system ignores the quantity defined in the Accompanying item quantity field and instead adds the accompanying item to the order using the same order quantity as the originating item.

Updating the Originating Item in Order Entry

If you change the order quantity of the originating item in order entry and you define an Accompanying item quantity instead of selecting the Use order quantity field, the system does not update the order quantity of the accompanying item when you change the order quantity of the originating item in order entry.

See [Updating the Originating Item in Order Entry](#) for more information on when the system updates the accompanying item based on updates made to the originating item in order entry.

Numeric, 5 positions; required if Use Order Qty is *No*.

Field	Description
Use order qty (Use originating item order quantity)	<p>Defines whether the system adds the accompanying item to the order using the same order quantity as the originating item.</p> <p>Valid values:</p> <p><i>Yes</i> = Add the accompanying item to the order in the same quantity as the originating item.</p> <p><i>No</i> = Add the accompanying item to the order using the quantity defined in the <i>Acc qty (Accompanying item quantity)</i> field.</p> <p>Updating the Originating Item in Order Entry</p> <p>When you change the order quantity of the originating item on the order, the system looks at the setting of the Use Order Quantity field for the accompanying item to determine if the order quantity of the accompanying item should also change.</p> <ol style="list-style-type: none"> 1. If the Use Order Quantity field for the accompanying item is set to <i>No</i>, the system does not update the order quantity for the accompanying item when the order quantity for the originating item increases. 2. If the Use Order Quantity field for the accompanying item is set to <i>Yes</i>, the system updates the order quantity for the accompanying item to match the quantity of the originating item. <p>See <i>Updating the Originating Item in Order Entry</i> for more information on when the system updates the accompanying item based on updates made to the originating item in order entry.</p>
Free?	<p>Defines whether the system adds the accompanying item to the order free of charge.</p> <p>Valid values:</p> <p><i>Yes</i> = The accompanying item is being offered free of charge.</p> <p><i>No</i> = The accompanying item is not free of charge. The system uses the price assigned in item/offer or SKU/offer.</p>

Maintaining Purchase Orders

Topics in this part:

- *Maintaining Purchase Orders (MPOE)* tells you how to select a purchase order for maintenance, enter any changes, and accept your entries.

Performing Inventory Analyses

Topics in this part:

- *Using Inventory Inquiry (DINI)* describes how to use the Inventory Quantity Inquiry menu option to review inventory information for items and SKUs.
- *Printing Item Sales Analysis Reports (MISA)* includes how to access this function, how to set up the report, and a sample report.
- *Printing Item Stock Status Reports (MISS)* includes how to access this function, how to set up the report, and a sample report.

- [Inventory Inquiry by Item \(IIQI\)](#) describes how to review order activity on screen for a group of SKUs sharing the same first SKU element.
- [Item Availability API](#) describes how the system responds to requests for item availability about an item or group of items.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Retail Integration (External System to Order Administration)

Topic in this part: The following topics describe the processes, setup requirements, and functions available to upload item information from your retail system into Order Administration.

- [Retail Integration \(External System into Order Administration\) Overview and Setup](#) explains how you can keep merchandise information at your retail merchandising system in sync with merchandise information in Order Administration.
- [Working with Retail Integration Item Upload \(RIIU\)](#) explains how to upload item information from your retail merchandising system into Order Administration.
- [Creating and Maintaining Long SKU Divisions \(WLDV\)](#) explains how to create and modify long SKU division codes.

Retail Integration (External System into Order Administration) Overview and Setup

Generic retail integration from an external system into Order Administration allows you to keep merchandise information in Order Administration in sync with merchandise information in your external merchandising system. Using this integration, you can provide your customers with a consistent shopping experience across your retail store, catalog, and online channels. You can carry the same merchandise and offer your customers the same merchandise pricing in your retail store, catalog, and online channels. This allows you to maintain the image and service levels customers have come to expect.

RMFCS integration: The item import from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) also creates records in the RI Item Upload table and uses the ****DFLT ITEM Item/SKU** and ****DFTCHG Item/SKU**; however, the RMFCS import uses a different set of files to populate the RI Item Upload table, and a different periodic function. See [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\) and Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#) for more information.

In this topic:

- [Uses for the Generic Retail Integration from an External System into Order Administration](#)
- [Item Upload Overview](#)
 - [Item Upload Batch Processing](#)
- [Setup for Generic Retail Integration from External System into Order Administration](#)
 - [Populating the RI Item Upload Table \(RIIUPP\)](#)
 - [System Control Values](#)

- [Secured Feature](#)
- [Menu Options and Subfile Options](#)
- [Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG](#)
- [Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG](#)
 - [**DFLT ITEM Item/SKU](#)
 - [**DFTCHG Item/SKU](#)
 - [Updating an Existing Item/SKU Value using Both **DFLT ITEM and **DFTCHG](#)

Uses for the Generic Retail Integration from an External System into Order Administration

Using this integration, you can:

- upload new or changed merchandise information located in your retail store to Order Administration, such as:
 - item and SKU
 - item offer
 - SKU offer
 - item price
 - SKU price
 - vendor item
 - item UPC
 - item and SKU coordinate
- create a hierarchy between a long SKU division, long SKU department, and retail class in Order Administration.

Item Upload Overview

You can use the [RI Item Upload Process](#) to create and maintain item and SKU information in Order Administration that corresponds to your retail store merchandise. You can upload items and SKUs, item/SKU offers, item/SKU prices, item/SKU UPC codes, vendor items, and coordinate items, and optionally create many other supporting values using [Item Upload Batch Processing](#).

The [Use Retail Integration \(H26\)](#) system control value determines whether Order Administration changes certain table structures so that it can read records you upload from your retail system. When this system control value is *selected*, the system:

- uses long SKU class codes from the Retail Class table instead of long SKU class codes from the Long SKU Class table. This allows you to create a hierarchy of retail class within long SKU department. You can link retail classes to a long SKU department in [Working with Long SKU Departments \(WLS D\)](#).
- requires a value in the Long SKU department, Long SKU class (retail class), Long SKU style, and Long SKU subclass fields when you create or maintain a base item.

If you wish to selectively require certain long SKU values, you can select one or more of the following system control values instead of selecting the [Use Retail Integration \(H26\)](#) system control value:

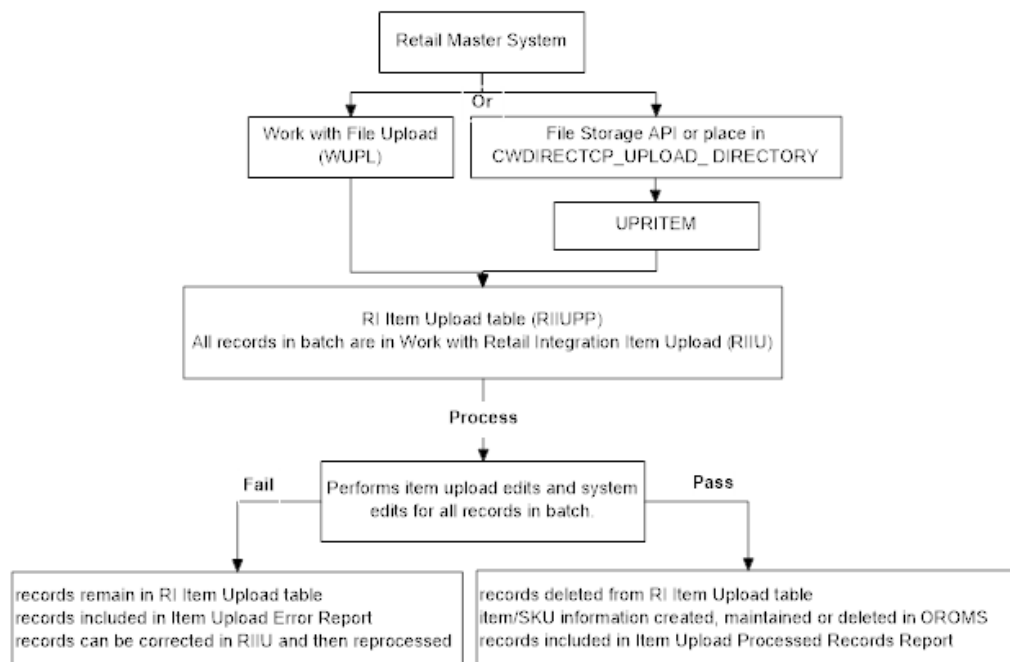

- [Require L/S Department \(I92\)](#)
- [Require L/S Class \(I93\)](#)
- [Require L/S Style \(I94\)](#) (This system control value also validates that the long SKU style code is unique at both the item and SKU level.)

Create supporting tables? Order Administration creates supporting table values, such as buyer code, for items/SKUs created or updated through the item upload if they do not already exist in the Order Administration table. See [Tables Updated by the RI Item Upload](#).

RMFCS integration: The item import from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) also creates records in the RI Item Upload table and uses the ****DFLT ITEM Item/SKU** and ****DFTCHG Item/SKU**; however, the RMFCS import uses a different set of files to populate the RI Item Upload table, and a different periodic function. See [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\) and Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#) for more information.

Item Upload Batch Processing

Batch processing overview: This flowchart summarizes the process of passing batch item upload records from a retail system other than RMFCS to Order Administration.

RMFCS integration: See [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\) and Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#) for more information on the process of importing item data from RMFCS.

How do you upload retail merchandise information? Use the [File Storage API](#) or [Work with File Uploads \(WUPL\)](#) to upload retail merchandise information into the [RI Item Upload Table \(RIIUPP\)](#).

- If you use the [File Storage API](#) to upload the generic Retail Integration Item file named RIIUPP into the FILE_STORAGE table in the database, you need to use the [UPRITEM Upload Retail Item File](#) (Program name PFR0134, Parameter RIIUPP) periodic function to create records in the RI Item Upload Table (RIIUPP).

- If you use [Work with File Uploads \(WUPL\)](#), the RI Item Upload Table records are created through the upload process.

How do you process records in the RI Item Upload table? Once you have passed item upload records from your retail master system to the RI Item Upload table, you can view all the records in the batch using the [Working with Retail Integration Item Upload \(RIIU\)](#) menu option. In order to process the records in the RI Item Upload table:

- Select *Process* at the [Work with Retail Item Upload Screen](#).
- Select *Accept* at the [Copy Item to Company Window](#) in [Working with Existing Items \(MITM\)](#).
- Submit the RIUPLD function using the *PFR0084* program. See [Scheduling Jobs](#) for background.

Records that pass all edits: The system deletes these records from the RI Item Upload table and the requested update (create or maintain) is made in Order Administration.

Records that fail one or more of the edits: The system retains these records in the RI Item Upload table and also creates a record for each RI Item Upload record in error in the RI Item Upload Error table. You can review and correct the errors, or delete the record(s) using [Working with Retail Integration Item Upload \(RIIU\)](#). You can review item upload records in error on the:

- [Item Upload Error Report](#): lists item upload records that are in error.
- [Record Deleted from RI Item Upload Report](#): lists item upload records that you manually deleted at the [Work with Retail Item Upload Screen](#).

Retail Item Upload email: If a valid email is defined in the Email address field for the user that submitted the RI Item Upload Program, the system sends a [Retail Item Upload Email](#) to the user's email address when the job completes indicating whether all records were processed successfully or whether any records contain errors.

For more information: See [Working with Retail Integration Item Upload \(RIIU\)](#).

Setup for Generic Retail Integration from External System into Order Administration

Before you can use the generic retail integration from an external system (other than RMFCS) into Order Administration, you must perform the necessary setup. Information requiring creation and setup includes:

- [Populating the RI Item Upload Table \(RIIUPP\)](#)
- [System Control Values](#)
- [Secured Feature](#)
- [Menu Options and Subfile Options](#)
- [Creating Default and Change Item/SKU Upload Values: **DFLT ITEM and **DFTCHG](#)
 - [**DFLT ITEM Item/SKU](#)
 - [**DFTCHG Item/SKU](#)
 - [Updating an Existing Item/SKU Value using Both **DFLT ITEM and **DFTCHG](#)

Populating the RI Item Upload Table (RIIUPP)

Create an RI Item Upload text file that contains the records to upload.

To upload the text file:

- If you use the [File Storage API](#) to upload the Retail Integration Item file named `RIIUUP` or `RIIUP.txt` (the `.txt` extension is not case-sensitive) into the `FILE_STORAGE` table in the database, you need to use the *UPRITEM Upload Retail Item File* (Program name `PFR0134`, Parameter `RIIUUP`) periodic function to create records in the RI Item Upload Table (`RIIUUP`).
- If you use [Work with File Uploads \(WUPL\)](#) to upload the text file named `RIIUUP`, the RI Item Upload Table records are created through the upload process.

See [Sample Retail Integration Items Upload Data](#) for information on the contents of the text file.

Note:

When populating the RI Item Upload table, the information should be entered in all upper case.

RMFCS integration: The item import from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) also creates records in the RI Item Upload table and uses the `**DFLT ITEM Item/SKU` and `**DFTCHG Item/SKU`; however, the RMFCS import uses a different set of files to populate the RI Item Upload table, and a different periodic function. See [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\) and Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#) for more information.

System Control Values

This table contains the system control values you should set up to use generic retail integration from an external system into Order Administration.

System Control Value	Description
Use Retail Integration (H26)	<p>Select this field if you wish the system to:</p> <ul style="list-style-type: none"> • use long SKU class codes from the Retail Class table instead of long SKU class codes from the Long SKU Class table. This allows you to create a hierarchy of retail class within long SKU department. You can link retail classes to a long SKU department in Working with Long SKU Departments (WLSD). • require a value in the Long SKU department, Long SKU class (retail class), Long SKU style, and Long SKU subclass fields when you create or maintain a base item. <p>Leave this field blank if you do not wish to link a long SKU class (retail class) to a long SKU department. In addition, leave this field blank if you wish to selectively indicate which long SKU values are required.</p>

System Control Value	Description
Require L/S Department (I92)	<p>Select this field if you want to require a value in the Long SKU department when you create or maintain a base item.</p> <div data-bbox="1040 394 1378 743"><p> Note:</p><p>The system ignores the setting of this system control value if the Use Retail Integration (H26) system control value is selected.</p></div>
Require L/S Class (I93)	<p>Select this field if you want to require a value in the Long SKU class when you create or maintain a base item.</p> <div data-bbox="1040 909 1378 1260"><p> Note:</p><p>The system ignores the setting of this system control value if the Use Retail Integration (H26) system control value is selected.</p></div>
Require L/S Style (I94)	<p>Select this field if you want to require a value in the Long SKU style when you create or maintain a SKU. The system also validates that the long SKU style at the item level and SKU level is a unique value.</p> <div data-bbox="1040 1480 1378 1829"><p> Note:</p><p>The system ignores the setting of this system control value if the Use Retail Integration (H26) system control value is selected.</p></div>

System Control Value	Description
Auto-Generate Item Keywords from Description (F79)	Select this field if you want the system to automatically create keywords for items created through the RI Item Upload process for record type 01 Item/SKU.

 **Note:**

The system creates new keywords for the item based on its current description; however, any existing keywords for the item will remain.

Secured Feature

The [Maintain Long SKU Values in MITM \(B05\)](#) secured feature determines whether a user has authority to change long SKU values in Work with Item/SKUs.

Menu Options and Subfile Options

This table contains the menu options and subfile options you use for retail integration from external system into Order Administration.

Menu Option	Purpose
Working with Retail Integration Item Upload (RIIU)	Use this menu option to process, review and correct batch item upload records passed to Order Administration from your retail master system.

Menu Option	Purpose
Performing Initial Item Entry (MITM)	<p>Enter values in these fields when you create or modify an item and you are using retail integration from an external system into Order Administration:</p> <ul style="list-style-type: none"> • Long SKU department • Long SKU class • Long SKU style • Long SKU subclass <p>optionally (also, optional overrides for SKUs):</p> <ul style="list-style-type: none"> • Retail style number • Original retail price • Long SKU color • Long SKU size • Long SKU width • Long SKU vendor • UPC code <p>Creating default item/SKU values You can create the **DFLT ITEM Item/SKU to update blank fields in the item upload records with the values from the corresponding fields in the **DFLT ITEM. See **DFLT ITEM Item/SKU for setup instructions.</p> <p>Changing item/SKU values You can create the **DFTCHG Item/SKU to determine when the system updates the fields for an existing item/SKU with the values defined for a change item upload record.</p> <ul style="list-style-type: none"> • If a value has been defined for a field in the **DFTCHG item, the system does not update the value defined for the existing item with the value from the change item upload record. • If a value has not been defined for a field in the **DFTCHG item, the system updates the value defined for the existing item with the value from the change item upload record. See **DFTCHG Item/SKU for setup instructions.
Working with Periodic Functions (WPER)	<p>You can schedule the periodic functions, including the UPRITEM Upload Retail Item File (Program name PFR0134,ParameterRIIUPP), the RI Item Upload Translation Program, and RI Item Upload Edit Program to run the Item Upload Process periodically. See Scheduling Jobs for background.</p>

Creating Default and Change Item/SKU Upload Values: ****DFLT ITEM** and ****DFTCHG**

You can create the following items in Order Administration for the system to consider when uploading RI item upload records for record type *01* (item/SKU information).

- ****DFLT ITEM**: create this item in Order Administration to define the values to *default* to add or change item upload records; see ****DFLT ITEM Item/SKU**.
- ****DFTCHG**: create this item in Order Administration to determine *when* the system updates an existing item/SKU with the values defined in a change item upload record; see ****DFTCHG Item/SKU**.

 **Note:**

You are not required to create the ****DFLT ITEM** item or ****DFTCHG** item, however it is recommended.

RMFCS integration: The item import from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) also creates records in the RI Item Upload table and uses the ****DFLT ITEM Item/SKU** and ****DFTCHG Item/SKU**. See [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\) and Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#) for more information.

****DFLT ITEM Item/SKU**

You can create an item in Order Administration to define the values to default to add or change item upload records. This is helpful if there are certain values that are always the same for each item; instead of entering the value for each item upload record, you can have the value default. For example, if the buyer code for each item is always BTM, you can enter BTM as a default value to default to each of your item upload records.

The system defaults a value to the item upload record only if the current value for the item upload record is blank; if the field in the item upload record is not blank, the system does not default a value.

Example: If you enter A01 in the Location field for ****DFLT ITEM**, the system defaults location A01 when you upload an add or change item upload record and the Location field for the item upload record is blank. If the Location field for the item upload record is *not* blank, the system does not use the value in ****DFLT ITEM**.

 **Note:**

The system defaults values to add or change item upload records only for record type 01 (item/SKU information). You cannot default values for any other record type, such as item/offer or vendor item.

Many fields are unique to an item/SKU; nevertheless, when you pass item upload records, every blank field in the item upload record defaults a value from the ****DFLT ITEM** (if you've defined one) except these fields:

- Allow SKUs
- Item Description
- SKU Description

Instructions: Use the following steps to create the ****DFLT ITEM** item and SKU.

1. Create the SKU element NA for SKU Element 1 in the Work with SKU Element 1 (WSK1) menu option. **Important:** You need to create the SKU element NA if you wish to default information at the SKU level.
2. Create the item ****DFLT ITEM** in the Work with Items/SKUs (MITM) menu option. See [Performing Initial Item Entry \(MITM\)](#). When creating this item:
 - Select the **SKUs (Stock keeping unit)** field to indicate the item contains SKUs.

- Populate the fields that you want to establish as company-wide item default values for any blank fields that you pass for an *01* item/SKU record type. **Note:** If you define a default SKU group, the system uses this value for SKUed items only since this field does not apply to non-SKUed items.
- Advance to the [Create SKU 1 of 2 \(With Overrides\) Screen](#) and enter *NA* in the first SKU element field.
- Populate the fields that you want to set up as SKU default values for any blank fields that you pass for an *01* item/SKU record type.
- When you are finished entering the SKU default values, select *OK* to start using these item and SKU default values for item uploads.

When does the system use the **DFLT ITEM** value?** This table explains when the system updates the value defined for the existing item/SKU, based on the value defined for the existing item, ****DFLT ITEM**, and item upload record.

 **Note:**

This table assumes the [Retail Integration \(External System into Order Administration\) Overview and Setup](#) does not exist; see [Updating an Existing Item/SKU Value using Both ****DFLT ITEM** and ****DFTCHG**](#) to review a table that explains how the system updates the value defined for an existing item/SKU, based on the value defined for the existing item, ****DFLT ITEM**, ****DFTCHG**, and the upload record.

Results based on the setting of the Buyer field are indicated below.

Existing item/SKU	**DFLT ITEM	Upload record	Results
new item	blank	blank	The system updates the Buyer field for the new item/SKU to blank.
new item	AAA	blank	The system updates the Buyer field for the new item/SKU to <i>AAA</i> .
new item	blank	AAA	The system updates the Buyer field for the new item/SKU to <i>AAA</i> .
new item	AAA	BBB	The system updates the Buyer field for the new item/SKU to <i>BBB</i> .
AAA	blank	blank	The system updates the Buyer field for the existing item/SKU to blank.
blank	AAA	blank	The system updates the Buyer field for the existing item/SKU to <i>AAA</i> .
blank	blank	AAA	The system updates the Buyer field for the existing item/SKU to <i>AAA</i> .
AAA	BBB	blank	The system updates the Buyer field for the existing item/SKU to <i>BBB</i> .
AAA	blank	BBB	The system updates the Buyer field for the existing item/SKU to <i>BBB</i> .
blank	AAA	BBB	The system updates the Buyer field for the existing item/SKU to <i>BBB</i> .

Existing item/SKU	**DFLT ITEM	Upload record	Results
AAA	BBB	CCC	The system updates the Buyer field for the existing item/SKU to CCC.

**DFTCHG Item/SKU

You can create an item in Order Administration to determine when the system updates an existing item/SKU with the values defined in a change item upload record. This is helpful if you only want to enter values in the change item upload record for the fields you wish to change, not the fields you wish to keep the same. For example, if you wish to only change the buyer code for an existing item, you can upload an item upload record with a value in the Buyer field and all other optional fields blank; if a value is defined for the **DFTCHG item, the system knows that you do not want to update the other fields for the existing item/SKU to blank, but rather, keep the existing values. However, if the **DFTCHG item does not exist or a value is not defined for the **DFTCHG item, the system updates the other fields for the existing item/SKU to blank.

Example: If you enter A01 in the Location field for **DFTCHG, the system does not update the Location field for an existing item/SKU when you upload a change item upload record; if you do not enter a value in the Location field for **DFTCHG, the system updates the Location field for an existing item/SKU when you upload a change item upload record.

Note:

The system uses the **DFTCHG item only for record type 01 (item/SKU information) upload records in change mode. The system does not use **DFTCHG for any other record type, such as item/offer or vendor item, and does not use **DFTCHG for add mode or delete mode.

Instructions: Use the following steps to create the **DFTCHG item and SKU.

1. Create the SKU element *DFT for SKU Element 1 in the Work with SKU Element 1 (WSK1) menu option. **Important:** You need to create the SKU element *DFT if you wish to determine change information at the SKU level.
2. Create the item **DFTCHG in the Work with Items/SKUs (MITM) menu option. See [Performing Initial Item Entry \(MITM\)](#). When creating this item:
 - Select the [SKUs \(Stock keeping unit\)](#) field to indicate the item contains SKUs
 - Populate the fields that you want to establish as company-wide item values that you do not wish to change for existing item/SKUs when you upload a change item/SKU upload record. **Note:** The values you enter in the fields are meaningless; the value only indicates that you do not wish this field to update for an existing item.
 - Advance to the [Create SKU 1 of 2 \(With Overrides\) Screen](#) and enter *DFT in the first SKU element field.
 - Populate the fields that you want to set up as SKU values that you do not wish to change for existing item/SKUs. **Note:** The values you enter in the fields are

meaningless; the value only indicates that you do not wish this field to update for an existing SKU.

- When you are finished entering the SKU default values, select *OK* to start using these item and SKU values for item uploads.

Required fields: Certain fields are required when you create the ****DFTCHG** item and ***DFT** SKU (for example, the Warehouse field). In order to update these fields based on information passed for a record in the RI Item Upload table for record type *01* (item/SKU information) in change mode, you must manually update these fields to blank in the Order Administration database. **Note:** If you manually clear a required field for the ****DFTCHG** item or ***DFT** SKU in the database, you can no longer change the item and SKU using the Work with Items/SKUs (MITM) menu option. If you try to change the item or SKU in Work with Items/SKUs (MITM), the system will require an entry in each required field.

Check box fields: Certain fields defined for an item (such as the Drop ship flag) and defined for a SKU (such as the Suppress backorder card flag) display as check boxes in the Work with Items/SKUs (MITM) menu option.

- If you *select* a check box field, the system updates the record in the database to *Y* and considers the field populated with a value.
- If you leave a checkbox field *unselected*, the system updates the record in the database to *N* and also considers the field populated with a value.

Because a check box field is always populated in the database with a *Y* or *N*, the system will never update this field based on information passed in the RI Item Upload table for record type *01* (item/SKU information) upload records in change mode. In order for the system to consider the field unpopulated (blank), and allow you to update the field based on information passed in the RI Item Upload table, you must manually update the check box fields for the ****DFTCHG** item in the Item table and manually update the check box fields for the ***DFT** SKU in the SKU table so that the field does not contain a *Y* or an *N*.

Note:

If you manually update the check box fields for the ****DFTCHG** item and ***DFT** SKU in the database, you can no longer change the item and SKU using the Work with Items/SKUs (MITM) menu option. If you try to change the item or SKU in Work with Items/SKUs (MITM), the system will update the check box fields that you set to blank in the database to *N* (unselected).

When does the system use the **DFTCHG** value?** This table explains when the system updates the value defined for the existing item/SKU, based on the buyer field value defined for the existing item, ****DFTCHG**, and item upload record.

Note:

This table assumes the ****DFLT ITEM** Item/SKU does not exist; see *Updating an Existing Item/SKU Value using Both ****DFLT ITEM** and ****DFTCHG*** to review a table that explains how the system updates the value defined for an existing item/SKU, based on the value defined for the existing item, ****DFLT ITEM**, ****DFTCHG**, and the upload record.

Existing item/SKU	**DFTCHG	Upload record	Results
AAA	blank	blank	The system updates the Buyer field for the existing item/SKU to blank.
blank	AAA	blank	The system does not update the Buyer field for the existing item/SKU; the field remains blank.
blank	blank	AAA	The system updates the Buyer field for the existing item/SKU to AAA.
AAA	BBB	blank	The system does not update the Buyer field for the existing item/SKU; the field remains AAA.
AAA	blank	BBB	The system updates the Buyer field for the existing item/SKU to BBB.
blank	AAA	BBB	The system does not update the Buyer field for the existing item/SKU; the field remains blank.
AAA	BBB	CCC	The system does not update the Buyer field for the existing item/SKU; the field remains AAA.

Updating an Existing Item/SKU Value using Both ****DFLT ITEM** and ****DFTCHG**

If you have both the ****DFLT ITEM Item/SKU** and ****DFTCHG Item/SKU** set up, the system uses the following hierarchy when uploading a change item upload record:

- Is the field in the item upload record blank? If yes, the system defaults the value defined in the ****DFLT ITEM Item/SKU**.
- Does a value exist for the field in the ****DFTCHG Item/SKU**?
 - If yes, the system should not update the exiting item/SKU with the uploaded value, regardless if the value defaulted from ****DFLT ITEM**.
 - If no, the system should update the existing item/SKU with the uploaded value, regardless if the uploaded value is blank or defaulted from ****DFLT ITEM**.

This table explains when the system updates the value defined for the existing item/SKU, based on the value defined for the existing item, ****DFLT ITEM**, ****DFTCHG**, and item upload record, based on the Buyer field value.

Existing item/SKU	**DFLT ITEM	**DFTCHG	Upload record	Results
AAA	blank	blank	blank	The system updates the Buyer field for the existing item/SKU to blank.
blank	AAA	blank	blank	The system updates the Buyer field for the existing item/SKU to AAA.
blank	blank	AAA	blank	The system does not update the Buyer field for the existing item/SKU; the field remains blank.
blank	blank	blank	AAA	The system updates the Buyer field for the existing item/SKU to AAA.

Existing item/SKU	**DFLT ITEM	**DFTCHG	Upload record	Results
AAA	BBB	blank	blank	The system updates the Buyer field for the existing item/SKU to <i>BBB</i> .
AAA	blank	BBB	blank	The system does not update the Buyer field for the existing item/SKU; the field remains <i>AAA</i> .
AAA	blank	blank	BBB	The system updates the Buyer field for the existing item/SKU to <i>BBB</i> .
blank	blank	AAA	BBB	The system does not update the Buyer field for the existing item/SKU; the field remains blank.
blank	AAA	BBB	blank	The system does not update the Buyer field for the existing item/SKU; the field remains blank.
blank	AAA	blank	BBB	The system updates the Buyer field for the existing item/SKU to <i>BBB</i> .
AAA	BBB	CCC	blank	The system does not update the Buyer field for the existing item/SKU; the field remains <i>AAA</i> .
AAA	BBB	blank	CCC	The system updates the Buyer field for the existing item/SKU to <i>CCC</i> .
AAA	blank	BBB	CCC	The system does not update the Buyer field for the existing item/SKU; the field remains <i>AAA</i> .
blank	AAA	BBB	CCC	The system does not update the Buyer field for the existing item/SKU; the field remains blank.
AAA	BBB	CCC	DDD	The system does not update the Buyer field for the existing item/SKU; the field remains <i>AAA</i> .

Performing Initial Item Entry (MITM)

Items are units of inventory that are defined to the system by item codes. The item code consists of the code itself and, optionally, a SKU, which allows you to define the item further by characteristics such as color, size, etc.

You can use the Work with Items/SKUs function not only to work with the item and/or SKU, but also supporting information such as item codes, offer and warehouse, and item keywords. See [Working with Existing Items \(MITM\)](#) for an overview.

Copying items: Copying items allows you to:

- Copy item information from one item to a new item in the same company using the [Copy Item Window](#).
- Add, change or delete item information, for an item with the same item number as the copied item, in one or more shared companies using the [Copy Item to Company Window](#).

See *Copying Items* for an overview.

In this topic:

- [Select Items Screen](#)
- [Creating Items Screen Flow](#)
- [Creating Non-SKU'ed Items Screen Flow](#)
- [Creating SKU'ed Items Screen Flow](#)
- [Create Item Screen](#)
- [Create Item \(Base Information\) Screen](#)
- [Create Item Offer Screen](#)
- [Create SKU 1 of 2 \(With Overrides\) Screen](#)
- [Create SKU 2 of 2 \(With Overrides\) Screen](#)
- [Create SKU Offer Screen](#)

Select Items Screen

Purpose: Use this screen to select an item to work with or review. You can also select an item directly by entering a valid item code in the Item field.

How to display this screen: Enter *MITM* in the Fast path field at the top of any menu or select Work with Items/SKUs from a menu.

Field	Description
Item	Your item code. Enter a valid item code to advance to the Change Item screen for that item. If you enter a partial item code, you advance to the Work with Items Screen . Alphanumeric, 12 positions; optional.
Clr Size Wdth	The SKU elements. You can enter any portion of the item's elements along with the item code. If you enter just a SKU element (e.g., blue), the system displays every item in the table, not just blue items. Alphanumeric, three 4-position fields; optional.

Field	Description
Description	<p>The description of the item.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>You can search for an item based on a partial description, even if the item description exceeds the length of the field displayed on the screen, and your search entry is toward the end of the description. For example, if the item description is CHICKEN RECIPE WEIGHT MANAGEMENT DRY FOOD FOR ADULT AND SENIOR INDOOR CATS, you can still search by entering CATS, even if that word is not displayed.</p> </div>
Department	<p>Alphanumeric, 120 positions; optional.</p> <p>The long SKU <i>Department</i> to which the item belongs.</p>
Buyer	<p>Numeric, 4 positions; optional.</p> <p>A <i>Buyer</i> is a person who is authorized to make purchases for your company.</p>
Class	<p>Alphanumeric, 3 positions; optional.</p> <p>An item <i>Item Class</i> code is a grouping of similar items.</p>
Vendor (Vendor number)	<p>Alphanumeric, 3 positions; optional.</p> <p>A <i>Vendor</i> defines the supplier of an item.</p>
Reference #	<p>Numeric, 7 positions; optional.</p> <p>Represents the retail reference or alternate product number. You can use this value to cross-reference an item/SKU to an external system.</p> <p>If you enter a valid reference number for a non-SKU'ed item, you advance to the Change Item screen for that item.</p> <p>If you enter a valid reference number for an item that contains SKUs, you advance to the Change SKU with Overrides screen.</p> <p>If more than one item or SKU is associated with the reference number you entered, you advance to the Select SKU for Reference Number pop-up window, where you can select the item or SKU you wish to work with.</p> <p>The retail reference number is set to the same value as the item code when you create items through <i>Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS)</i>, and the number should not be changed.</p> <p>This number is also used for the <i>Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service</i>.</p> <p>Numeric, 15 positions; optional.</p>

Screen Option	Procedure
Create an item	Select <i>Create</i> to advance to the <i>Create Item Screen</i> .
Advance to a menu option related to item maintenance	Select <i>Supporting Files</i> to advance to the Item Support File Maintenance window. Options at this window are: <ul style="list-style-type: none"> • <i>Buyer</i>; see <i>Working with Buyers (WBUY)</i> • <i>Vendor</i>; see <i>Working with Vendors (WVEN)</i> • <i>Hazard</i>; see <i>Working with Hazardous Item Codes (WHAZ)</i> • <i>Item Category</i>; see <i>Working with Item Category Codes (WITG)</i> • <i>Item Class</i>; see <i>Working with Item Classes (WICL)</i> • <i>Item SKU Group</i>; see <i>Working with SKU Groups (WISG)</i> • <i>Item Status</i>; see <i>Working with Item Status (WIST)</i> • <i>Location Class</i>; see <i>Creating and Maintaining Location Classes (WLCL)</i> • <i>Long SKU Class</i>; see <i>Working with Long SKU Classes (WLSC)</i> • <i>Long SKU Department</i>; see <i>Working with Long SKU Departments (WLSL)</i> • <i>Ship Via</i>; see <i>Working with Ship Via Codes (WVIA)</i> • <i>Offer</i>; see <i>Working with Offers (WOFR)</i> • <i>Unit Of Measure</i>; see <i>Working with Units of Measure (WUOM)</i> • <i>Keyword</i>; see <i>Working with Item Keywords (WKEY)</i>

Creating Items Screen Flow

Purpose: Select *Create* at the *Select Items Screen* or the *Work with Items Screen* to add an item.

The screen flow varies, depending on whether you are creating a non-SKU'ed item or SKU'ed item.

Additionally, the *Item Creation Values (J08)* umbrella system control value includes values that control the screen flow when you are creating an item.

Creating Non-SKU'ed Items Screen Flow

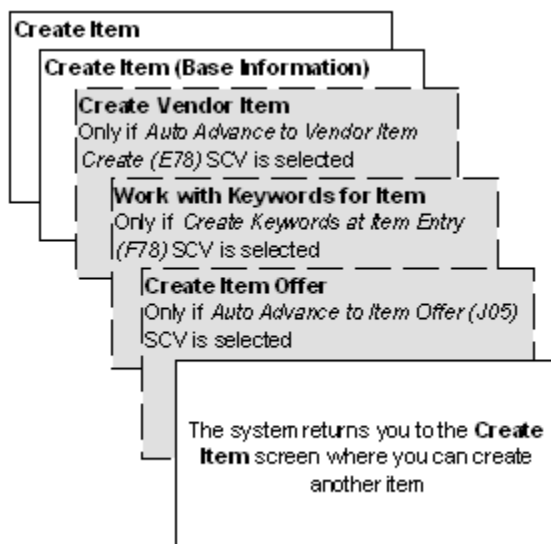

Deselect the SKUs field on the *Create Item Screen* to create a non-SKU'ed item. The system automatically advances you through the following screens to create a non-SKU'ed item.

- *Create Item Screen*
- *Create Item (Base Information) Screen*
- *Create Vendor Item Screen* (only if the *Auto Advance to Vendor Item Create (E78)* system control value is *selected*)
- *First Work with Keywords for Item Screen* (only if the *Create Keywords at Item Entry (F78)* system control value is *selected*)

- [Create Item Offer Screen](#) (only if the [Auto Advance to Item Offer \(J05\)](#) system control value is selected)

Once you have completed creating the item, the system returns you to the [Create Item Screen](#) where you can create another item.

Non-SKU'ed item screen flow:

Creating SKU'ed Items Screen Flow

Select the SKUs field on the [Create Item Screen](#) to create a SKU'ed item. The system automatically advances you through the following screens to create a SKU'ed item.

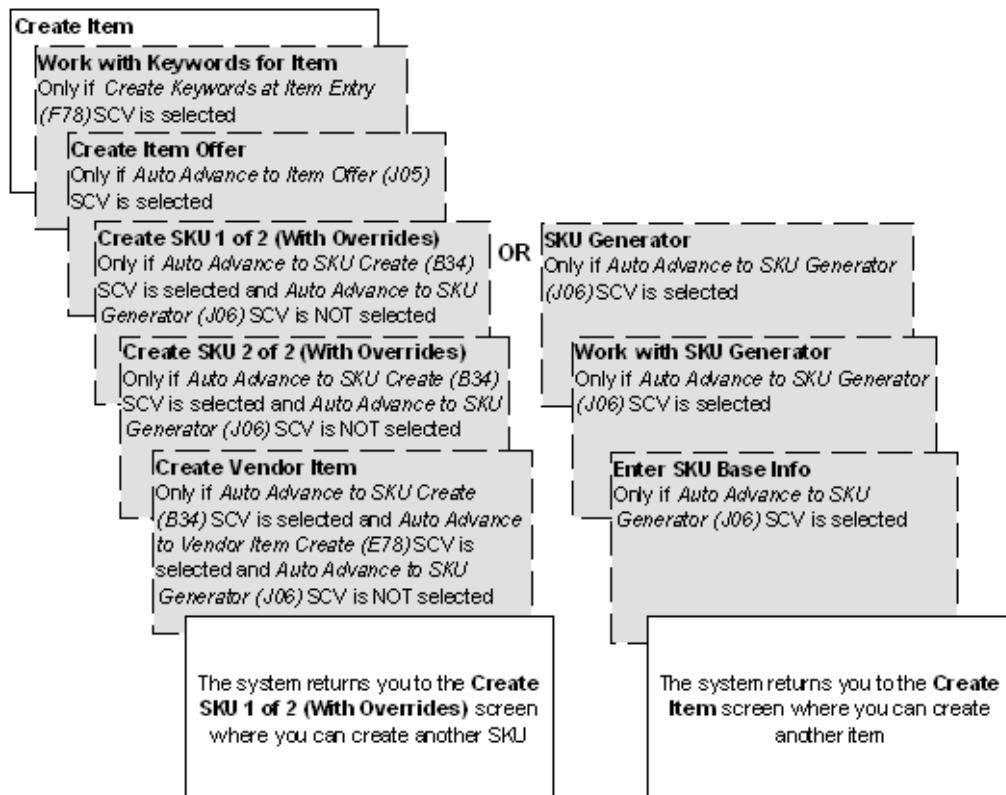

#	Step
1.	Create Item Screen
2.	First Work with Keywords for Item Screen (only if the Create Keywords at Item Entry (F78) system control value is selected)
3.	Create Item Offer Screen (only if the Auto Advance to Item Offer (J05) system control value is selected)
4.	Depending on whether you are using the SKU Generator: <ol style="list-style-type: none"> 1. Create SKU 1 of 2 (With Overrides) Screen (only if the Auto Advance to SKU Create (B34) system control value is selected and the Auto Advance to SKU Generator (J06) system control value is unselected) 2. SKU Generator Screen (Entering SKU Information) (only if the Auto Advance to SKU Generator (J06) system control value is selected)
6.	Depending on whether you are using the SKU Generator: <ol style="list-style-type: none"> 1. Create SKU 2 of 2 (With Overrides) Screen (only if the Auto Advance to SKU Create (B34) system control value is selected and the Auto Advance to SKU Generator (J06) system control value is unselected) 2. Work with SKU Generator Screen (only if the V system control value is selected)

#	Step
7.	Depending on whether you are using the SKU Generator: <ol style="list-style-type: none"> 1. Create Vendor Item Screen (only if the <i>Auto Advance to SKU Create (B34)</i> system control value is <i>selected</i>, the <i>Auto Advance to Vendor Item Create (E78)</i> system control value is <i>selected</i> and the <i>Auto Advance to SKU Generator (J06)</i> system control value is <i>unselected</i>) 2. Enter SKU Base Information Pop-Up Window (only if the <i>Auto Advance to SKU Generator (J06)</i> system control value is <i>selected</i>)

Once you have completed creating the item and SKU, you return to the:

- [Create SKU 1 of 2 \(With Overrides\) Screen](#) if you are not using the SKU Generator, where you can create another SKU.
- [Create Item Screen](#) if you are using the SKU Generator, where you can create another item.

SKU'ed item screen flow:

Create Item Screen

How to display this screen: Select *Create* at the *Select Items Screen* or the [Work with Items Screen](#).

Field	Description
Item	<p>A user-defined code that represents a unit of inventory. The system assigns an item number if the Auto assign item # system control value is <i>selected</i>; however, you can override this value. Alphanumeric, 12 positions; required.</p>
Description	<p>A user-defined description of the item.</p> <ul style="list-style-type: none"> Not all screens or reports will display the full description if it exceeds the available space for this field. Not all extracts and imports will support a description that exceeds 40 positions. <p>Alphanumeric, 120 positions; required.</p>
Second language description	<p>Not currently implemented. Alphanumeric, 40 positions; optional.</p>
SKUs (Stock keeping unit)	<p>Indicates whether the item is available in various styles, such as color, size, etc.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = This item has SKUs associated with it. <i>unselected</i> = There are no SKUs associated with this item. <p>See Creating Items Screen Flow for information on how this setting controls screen flow when you are creating an item.</p>
SKU group (Stock keeping unit group)	<p>A code that represents a group of common characteristics of a SKU item. You can use SKU groups to facilitate data entry when you use the SKU Generator; see Using the SKU Generator (ESKG).</p> <p>The following are examples of SKU groups:</p> <ol style="list-style-type: none"> SKU Group 001 lists the colors in which an umbrella is available (such as Pink, Mint, Ltbl, Yelw, Ivry, Lvnd). SKU Group 002 lists the sizes in which sheets are available (such as King, Qn, Full, and Twn). <p>If you assign a SKU group to an item, it defaults when you use the SKU generator and is display-only. You can also specify a SKU group when you are using the SKU generator.</p> <p>SKU Group codes are defined in the SKU Group table; see Working with SKU Groups (WISG).</p> <p>Numeric, 3 positions; optional.</p>
Deflt cost (Default cost)	<p>The standard cost of the item.</p> <p>Unlike the Cost field on the second Create/Change/Display Item or SKU (with Overrides) screens, this field is not updated by the system through landed cost updating.</p>

 **Note:**

The [Display Cost in Inventory \(A38\)](#) secured feature controls the display of this field at the Change Item screen and Display Item screen.

Numeric, 13 positions with a 4-place decimal; optional.

Field	Description
Vendor	<p>A user-defined code that represents the vendor or supplier of an item. Validated against the Vendor table. Used to:</p> <ul style="list-style-type: none"> • Generate vendor items. The system uses this information as the default when you use the SKU Generator; however, you can override it. • Generate drop ship pick slips or purchase orders. • Sort and print on various reports. <p>Vendor codes are defined in and validated against the Vendor table; see Working with Vendors (WVEN).</p> <p>Numeric, 7 positions; optional.</p>
Buyer	<p>A user-defined code that represents a person who is authorized to make purchases for your company. Used primarily for reporting purposes, and does not default on purchase orders.</p> <p>Buyer codes are defined in and validated against the Buyer table; see Working with Buyers (WBUY).</p> <p>Alphanumeric, 3 positions; optional.</p>
Drop ship	<p>Indicates whether you ship the item from your warehouse, or have your vendor ship it to the customer directly.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = When a customer orders the item, you order the item from your vendor and the vendor ships it directly to your customer. • <i>unselected</i> (default) = You ship the item from your warehouse. <p>If you select this flag and try to create a set item (<i>Kit type</i> of S), an error message indicates:</p> <p>Item drop ship and kit type fields are mutually exclusive. Kit type can not be equal to "S" for a drop ship item.</p> <p>Drop ship items are not eligible for zone reservation. If you select this flag and try to assign a <i>Zone reservation code</i> to an item, an error message indicates:</p> <p>SKU not eligible for zone reservation code.</p> <p>You identify a drop ship item at the item level, even if the item is SKU'ed.</p>
Mfg vendor (Manufacturing vendor)	<p>The vendor who manufactured the item. Used primarily for informational and query purposes.</p> <p>Numeric, 7 positions; optional.</p>

 **Note:**

For drop ship items, the system tries to reserve the total amount of the customer order from inventory; however, if it can't reserve the entire amount, it generates drop ship pick slips or POs when you run drop ship processing. See [Processing Drop Ship Orders by Batch \(MDSB\)](#).

Field	Description
Exclude FPO (Exclude flexible payment option)	<p>Determines whether this item is excluded from deferred and installment payment plans.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = Exclude this item from deferred and installment payment plans. Any order containing an excluded item cannot have a pay plan applied to it; instead, an error message indicates: Order is not eligible for deferred/installment billing plan. <i>unselected</i> = Do not exclude this item from deferred and installment payment plans. <p>See Deferred/Installment Billing Overview.</p>
Membership	<p>Indicates that the item represents a membership program, which you can use to generate periodic orders to a customer.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = This is a membership item <i>unselected</i> = This is not a membership item <p>When you add a membership item in order entry, the system displays a pop-up window for you to select the membership program in which to enroll the customer.</p> <p><i>Simplify creating a membership:</i> You can use the same code for the item number and the membership ID. When you enter this item code in order entry, it defaults to the membership program field in the pop-up window.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If you process orders through the web storefront, the membership item and program ID <i>must</i> be the same.</p> </div>
	<p><i>If the membership includes a discount:</i> You should deselect the Discountable field for the membership item, or the price of the membership itself will be discounted.</p> <p>You should <i>select</i> the Non/inv flag for a membership item.</p>
L/S dept (Long SKU department)	<p>A code used to group items into departments for reporting purposes. Long SKU departments are defined in and validated against the Long SKU Department table; see Working with Long SKU Departments (WLS D).</p> <p>Required if the Use Retail Integration (H26) system control value or Require L/S Department (I92) system control value is selected.</p> <p>When you upload items into Order Administration, you can identify the item using a combination of long SKU department, long SKU class, long SKU style, long SKU vendor, long SKU color, long SKU size, and long SKU width; see Retail Integration (External System into Order Administration) Overview and Setup.</p> <p>Secured Feature: If you do not have authority under the Maintain Long SKU Values in MITM (B05) secured feature, you can not enter or change this value.</p> <p>Numeric, 4 positions; required if system control value is selected.</p>

Field	Description
L/S class (Long SKU class)	<p>A code you can use to group items into classes for reporting purposes. Long SKU classes are defined in and validated against the Long SKU Class table; see Working with Long SKU Classes (WLSC).</p> <p>Required if the <i>Use Retail Integration (H26)</i> system control value or <i>Require L/S Class (I93)</i> system control value is selected.</p> <p>Retail Integration (external system to Order Administration) If the <i>Use Retail Integration (H26)</i> system control value is selected, long SKU classes are linked to long SKU departments and are called retail classes. Retail classes are department specific whereas regular long SKU classes are unique and remain constant across departments. For this reason, when the <i>Use Retail Integration (H26)</i> system control value is selected, you can only enter a retail class that is assigned to the long SKU department in this field. If you enter a long SKU class that is not linked to the long SKU department, the system does not let you proceed and displays an error message: L/S Class (xxxx) was not found in L/S Department (xx).</p> <p>Since retail classes are department specific, if you prompt in this field before entering a long SKU department, an error message indicates: L/S Department required to prompt on L/S Class.</p> <p>Retail classes are defined in and validated against the Retail Class table; see the Work with Retail Class Screen.</p> <div data-bbox="828 966 1461 1260" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When the <i>Use Retail Integration (H26)</i> system control value is selected, the system populates and validates against the Retail Class table instead of the Long SKU Class table; therefore, you cannot access Working with Long SKU Classes (WLSC).</p> </div>
Class	<p>Secured Feature If you do not have authority under the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you cannot enter or change this value.</p> <p>Numeric, 4 positions; required if system control value is selected.</p> <p>A user-defined code that identifies a group of items. Item class codes are used to</p> <ul style="list-style-type: none"> • sort inventory, • define information templates at the item class level, • assign city/state restrictions, and • assign customer class restrictions. <p>Validated against the Item Class table; see Working with Item Classes (WICL).</p> <p>An item class is required if the <i>Require Item Class in Work with Items (F06)</i> system control value is selected. An error message indicates that you left this field blank:</p> <p>Item class required.</p> <p>Alphanumeric, 3 positions; required if the <i>Require Item Class in Work with Items</i> system control value is selected.</p>

Field	Description
Unit/measure	<p>A standard by which an item is sold. Typical units of measure include:</p> <ul style="list-style-type: none"> • <i>EA</i> = each • <i>IN</i> = inches • <i>C12</i> = case of 12 <p>Validated against the Unit of Measure table (see Working with Units of Measure (WUOM)) and defaults from the Default Item Unit of Measure (B33) system control value, if a value is specified.</p> <p>Alphanumeric, 3 positions; required.</p>
Kit type	<p>Defines the type of kit or set functionality represented by this item.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>Set</i> = A predefined group of items that is grouped together when it is picked and packed. A set may be comprised of items that are sold individually or only as part of the set. An item record must exist for each component item of the set. • <i>Finished good</i> = Items that are assembled and stocked as a finished unit. These items may be comprised of items that are sold individually or of raw materials that are used only as components of a finished good. An item record must exist for each component item, so that you may track inventory and usage. • <i>Variable set</i> = Customers can choose from a list of items to make up a variable set. For example, an offer says to choose any 2 slacks, 1 jacket, and 1 belt from this page for only \$200.00. The Order Entry operator sees a screen listing the available items. You must define the pool of items. Typically, you present the items available in a variable set on the same page of the catalog. • <i>Blank</i> = none of the above. <p>Kit items are not eligible for zone reservation. If you enter a value here and try to assign a Zone reservation code to an item, the system displays an error message:</p> <p>SKU not eligible for zone reservation code.</p> <p>See Working with Sets.</p> <p>Optional.</p>
Status	<p>A code that represents an item's status, such as obsolete, discontinued, etc. This information is used for inventory reporting purposes; also, items that are assigned the Item Status for Suppressing Item During Item Selection (L21) at the item level are not listed at the Item Selection screen. See Working with Item Status (WIST) for background.</p> <p>Alphanumeric, 1 position; optional.</p>
Ship wgt. (Shipping weight)	<p>The actual shipping weight of the item. The system can use this value to calculate carton weights and determine shipping charges if you:</p> <ul style="list-style-type: none"> • perform manual confirmation • use cubing • specify an alternate shipper based on minimum shipping weight <p>Also, the system uses the shipping weight defined for the item to create item weight records in the Download Extended Manifest table (FLMNDE) when you use a PC Manifest to confirm shipments.</p> <p>Numeric, 7 positions with a 3-place decimal; optional.</p>
Sell wgt. (Selling weight)	<p>Used to calculate the freight charge on an item when the Freight method on the order is set to <i>By Item</i> or <i>Flat Rt/Item</i>.</p> <p>Numeric, 7 positions with a 3-place decimal; optional.</p>

Field	Description
Ship alone	<p>Indicates how to ship this item.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Ship Alone</i> = This item must ship by itself, and each unit prints on its own pick. • <i>Blank</i> = This item can be shipped with other items. • <i>User Defined</i> = A user-defined code for any special shipping requirements. <p>Optional.</p>
Height	<p>The height measurement for an item. The Height, Length, and Width values determine the cubic volume of an item. Can be entered in feet or centimeters, or any other measurement as long as it is consistent. Used in Suggest Location Placement (MSLO) when evaluating whether an item can be stored in a particular location.</p> <p>Numeric, 3 positions; optional.</p>
Length	<p>The length measurement for an item. The Height, Length, and Width values determine the cubic volume of an item. Can be entered in feet or centimeters, or any other measurement as long as it is consistent. Used in Suggest Location Placement (MSLO) when evaluating whether an item can be stored in a particular location.</p> <p>Numeric, 3 positions; optional.</p>
Width	<p>The width measurement for an item. The Height, Length, and Width values determine the cubic volume of an item. Can be entered in feet or centimeters, or any other measurement as long as it is consistent. Used in Suggest Location Placement (MSLO) when evaluating whether an item can be stored in a particular location.</p> <p>Numeric, 3 positions; optional.</p>
Cube factor	<p>The cubic volume of the item. Controls the number of units of this item that can fit into a carton. The system will compare the cube factor against the Cube field value from the System Control table, which defines a default box size. See Setting Up Fulfillment Values.</p> <p><i>Example:</i> If the Cube field value in the System Control table is 100 and the Cube Factor for an item is 25, then 4 of this item can fit into one box.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The Cube Factor is used to determine the number of pick slips generated.</p> </div>
Sell qty (Sell quantity)	<p>Numeric, 3 positions; optional.</p> <p>The selling quantity defines the required order quantity (or multiple of) for this item. For example, an item may be stocked in single units, but must be sold in quantities of 6 (or 12, or 18, etc.).</p> <p>If an uneven amount is ordered during Order Entry, the system displays a message and forces the operator to enter a quantity which is a multiple of this number.</p> <p>Numeric, 5 positions; optional.</p>

Field	Description
Discountable	<p>Determines whether certain discounts can be applied to the item. If this field is unselected, an item is not eligible for the discount percent at Order Entry or the discount percent defined for the source code or sold to customer's customer price group; however, the item is eligible for all other discounts.</p> <ul style="list-style-type: none"> <i>selected</i> = This item is discountable. <i>unselected</i> = This item is not discountable. <p>Non-discountable items are not included in the merchandise total for the purposes of evaluating whether the order qualifies for a promotional discount (set up through Working with Promotions (WPRO)) or dollar discount (set up through the Work with Offer Dollar Discounts Screen or the Work with Source Dollar Discounts Screen) if the discount requires an order minimum.</p>
Non/inv (Non inventory)	<p>Indicates whether inventory levels are maintained for the item. If selected, you can order this item, but the system never checks availability when reserving the item or generating a pick slip. However, non-inventory items sell out when flagged with a S/O control (Soldout control) code.</p> <p>You must select this flag for a subscription item (Subscription = <i>selected</i>); these items will be express billed.</p> <p>Pick slip preparation: The system:</p> <ul style="list-style-type: none"> Does not create a pre-generated pick for a non-inventory item if all other items on the order are backordered; when one or more backordered items are available, the system creates a pre-generated pick for the non-inventory item as well as for the available item(s). Note: If you select the Affect inv (Affect inventory?) flag on the Work with Order Lines screen in order entry, the system will create a pre-generated pick for the non-inventory item; however, this change will effect a change in inventory totals for the non-inventory item during order entry and when you ship the order. Creates a pre-generated pick for a non-inventory item if all other items on the order are not selected for pick slip preparation; see Selecting Order Lines for Pick Slip Preparation. <p>Printing pick slips: The item will still be included on a pick slip, as long as the ship via on the order is not an express bill. If you specify a location for a non-inventory item, this location appears on the pick slip; however, the location is not included in the normal sort sequence.</p> <ul style="list-style-type: none"> <i>selected</i> = This is a non-inventory item. <i>unselected</i> = This is a regular item that will be tracked. <p>Non-inventory items are not eligible for zone reservation. If you select this flag and try to assign a Zone reservation code to an item, the system displays the following error message: SKU not eligible for zone reservation code.</p>
Oversize	<p>Determines whether this item is considered an oversized item. Oversized items do not receive their own pick slip unless ship alone is indicated. This information is passed to TanData.</p> <ul style="list-style-type: none"> <i>selected</i> = This is an oversized item. <i>unselected</i> = This is not an oversized item.

Field	Description
Hazard code	<p>A user-defined code used to categorize an item as a hazardous material that requires special storage and/or handling. Validated against the Item Hazard table; see Working with Hazardous Item Codes (WHAZ). This information is passed to TanData.</p> <p>Alphanumeric, 2 positions; optional.</p>
Loc class (Location class)	<p>A code that represents a location type, such as caged area, etc. Both items and locations may be assigned location classes. Items can only be stored in locations that have the same location class. Only items with the same location class will appear on the same pick slip.</p> <p>Validated against the location class table; see Creating and Maintaining Location Classes (WLCL).</p> <p>If the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected, the system validates the location class defined for the item against the location class defined for the location during inventory transaction processing.</p> <p>Alphanumeric, 2 positions; optional.</p>
Pieces/case (Pieces per case)	<p>The number of units that fit in a case. Used when suggesting location placement.</p> <p>Numeric, 5 positions; optional.</p>
L/S style (Long SKU style)	<p>A user-defined field that you can use for tracking and queries. Long SKU style can also be defined in the SKU table but is not validated.</p> <p>Required if the Use Retail Integration (H26) system control value is selected.</p> <p>The system requires a unique long SKU style code if the Require L/S Style (I94) system control value is selected.</p> <p>When you upload items into Order Administration, you can identify the item using a combination of long SKU department, long SKU class, long SKU style, long SKU vendor, long SKU color, long SKU size, and long SKU width; see Retail Integration (External System into Order Administration) Overview and Setup.</p> <p>Secured Feature If you do not have authority to the Maintain Long SKU Values in MITM (B05) secured feature, you can not enter or change this value.</p> <p>Alphanumeric, 20 positions; required if system control value is selected.</p>
L/S vendor (Long SKU vendor)	<p>A user-defined field that you can use for tracking and queries. Long SKU vendors are defined in the SKU table but are not validated.</p> <p>Secured Feature If you do not have authority under the Maintain Long SKU Values in MITM (B05) secured feature, you can not enter or change this value.</p> <p>Alphanumeric, 7 positions; optional.</p>
Season	<p>Defines the season associated with this item, such as spring.</p> <p>Season codes are defined in and validated against the Season table; see Working with Season Codes (WSEA).</p> <p>Alphanumeric, 3 positions; optional.</p>
Royalty	<p>This flag indicates whether sales of the item require royalty payments to an author or owner, and is used for query and reporting purposes only. Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = This is a royalty item <i>unselected</i> = This is not a royalty item

Field	Description
Entity	<p>A business unit within your company that is held accountable for sales performance; for example, mail order, retail, or e-commerce.</p> <p>If the system control value Require Entity in Item File (G44) is selected, you must enter an entity code for each item you set up; entity codes for items and SKUs are defined at the item level. Informational only.</p> <p>An order is associated with an entity through the source code on the order header; for the purposes of accounting, tracking order history, determining vendor response codes, and overriding system control values at the entity level, this source code entity will override any entity assigned to an item on the order. See Setting Up Order Entry Values, and Setting Up Customer Service Values, for information on the system control values that determine how you use entity for these purposes.</p> <p>Entities are defined in an validated against the Entity table. See Working with Entities (WENT).</p> <p>Alphanumeric, 3 positions; required if the Require Entity in Item Table system control value is selected.</p>
Ship via	<p>A code that represents the shipper that must be used when shipping this item.</p> <p>When a customer orders the item, the system assigns this ship via code, but you or the system can override the ship via.</p> <p>You can set up an additional shipping charge for the item delivered by this ship via using the Create Ship Via/Item Screen for the ship via. See Working with Ship Via Codes (WVIA).</p> <p>Item Ship Via Override</p> <p>If item ship via overrides exist for the item, the ship via you define must exist in the Item Ship Via Override table or an error message indicates: Invalid ship via for item.</p> <p>Additionally, if you prompt on the Ship via field, the system displays the Work with Item Ship Via Overrides screen containing only those ship vias eligible to ship the item.</p> <p>When a customer orders the item, the system assigns this ship via code, but you or the system can override the ship via to another eligible ship via, based on records in the Item Ship Via Override table.</p> <p>If item ship via overrides do not exist for the item, you can define any valid ship via code in this field. See Working with Item Ship Via Overrides for more information on defining eligible shippers for an item.</p> <p>Alphanumeric, 3 positions; optional.</p>
L/S Subclass	<p>A user-defined field that you can use for tracking and queries. Long SKU subclass can also be defined in the SKU table but is not validated.</p> <p>Displayed and required only if the Use Retail Integration (H26) system control value is selected.</p> <p>Secured Feature</p> <p>If you do not have authority under the Maintain Long SKU Values in MITM (B05) secured feature, you can not enter or change this value.</p> <p>Numeric, 4 positions; required.</p>
Carton	<p>The type of carton in which this item must be shipped.</p> <p>If present, the carton ID is passed to TanData when confirming the item for shipment. This information is used to calculate best way shipping, which determines the lowest price to ship the carton.</p> <p>Numeric, 2 positions; optional.</p>

Field	Description
Avail thrshld (Item-level availability threshold)	<p>Indicates when to trigger an automatic download of item availability information through the generic inventory API. The system creates a trigger record for an item when its available quantity breeches the threshold, and an integration layer process generates the <i>Inventory Download XML Message (CWINventoryDownload)</i> message to send inventory information to an external system. See <i>Generic Inventory Download API</i> for an overview of message generation rules and processing.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Availability threshold hierarchy: If you leave this field blank, the system checks the <i>Availability threshold (item class-level)</i>; if there is no item class-level setting, the system checks the <i>Quantity Available Threshold for Inventory Downloads (G36)</i> system control value. See this system control value for a complete description of how the availability threshold hierarchy works.</p> <p>Numeric, 5 positions; optional.</p>
Rtl style (Retail Style #)	<p>A user-defined code used to identify the item.</p> <p>Retail Integration (external system to Order Administration) When you upload item information into Order Administration, you can identify the item using the retail style number; see <i>Working with Retail Integration Item Upload (RIIU)</i>.</p> <p>Alphanumeric, 20 positions; optional.</p>

Field	Description
OROB eligible	<p>Indicates whether to include this item when:</p> <ul style="list-style-type: none"> • sending item and inventory information from Order Administration to Order Orchestration through a stored procedure; however, this flag does not control whether to include the item through an API that uses an XML message, such as the <i>Generic Item Download API</i> or the <i>Generic Inventory Download API</i>. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • sending backordered order lines to Order Orchestration for fulfillment. See Order Orchestration Integration for an overview, and see Rules for Submitting Backorders to Order Orchestration for more rules that govern eligibility for Order Orchestration. • sending ship-for-pickup orders to Order Orchestration. See Order Orchestration Integration for an overview, and see Ship-for-Pickup Orders for more details. <p>Valid values:</p> <p><i>Selected</i> (default) = Include this item when you use a stored procedure to send item and inventory information to Order Orchestration; also, the item is eligible to be sent to Order Orchestration on brokered backorders or ship-for-pickup orders.</p> <p><i>Unselected</i> = Do not include this item when you use the stored procedure to send item and inventory information to Order Orchestration; also, the item is not eligible to be sent to Order Orchestration on brokered backorders or ship-for-pickup orders.</p>
SVC type	<p>A code that indicates the item is a stored value card, and whether the stored value card is a physical or virtual card.</p> <ul style="list-style-type: none"> • <i>blank</i> (default) = The item is not a stored value card. • <i>Physical</i> = The item is a physical stored value card. • <i>Physical/Early Notify</i> = The item is a physical stored value card and, as soon as the stored value card is processed through billing, the system sends an email notification to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and is in the process of being delivered. • <i>Virtual</i> = The item is a virtual (non-physical) stored value card. <p>See Creating a Stored Value Card Item for more information on setting up a stored value card item.</p> <p>Optional.</p>

Note:

When you upload items into Order Administration, this flag is *selected* by default; see [Working with Retail Integration Item Upload \(RIIU\)](#). Also, when you copy an item from one company to another, the flag is *selected* in the destination company.

Field	Description
Voucher Type	<p>Indicates the usage for a stored value card. Valid values are:</p> <ul style="list-style-type: none"> <i>Single-Purpose</i>: The stored value card is a voucher for one type of goods or service. <i>Multi-Purpose or blank</i>: The stored value card is not a single-purpose voucher. <p>You can select a voucher type only when the item is assigned an SVC Type.</p> <p>Pass hidden tax for CWInvoiceOut message? This field is used to determine whether to calculate hidden tax and pass it in the <i>Invoice Download XML Message (CWInvoiceOut)</i> for redemptions or credits against a single-use voucher that was created and sold in Order Administration on an order subject to VAT. See the Invoice Download XML Message (CWInvoiceOut) in the Order Administration Web Services Guide on My Oracle Support (2953017.1) for more information.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This field is not updated through integrations such as the retail integration item upload or the import from Omnichannel Cloud Data Service (OCDS), or passed in web service messages such as the item download XML message (CWItemOut).</p> </div>
User fields	<p>There are 4 user-definable fields. You can define these fields according to your organization's specific requirements.</p> <p>The system defaults the Vendor user field 3 in Working with Vendors (WVEN) to the Item user field 3 field when you create or change an item and the program name <i>INR1156</i> has been defined in the User function field for the <i>CHGITEM</i> and <i>ADDITMSKU</i> user exit points.</p> <p>Alphanumeric, 10 positions (each field); optional.</p>
External info	<p>Indicates if the item is eligible for item retrieval from an external system.</p> <ul style="list-style-type: none"> <i>selected</i> = The item is eligible for item retrieval from an external system. <i>unselected</i> = The item is not eligible for item retrieval from an external system. <p>Selecting this flag allows you to search for a product in an external system based on the item number entered in Order Administration. For example, the item number in Order Administration may represent a high-level item category, such as “front wheel bearing.” When you enter the item in Order Administration, the system calls the external system so that you can select the specific front wheel bearing that fits the year, make, and model of the car for which the customer is requesting the part. Once the specific product number is selected within the external system, the system returns the product number to Order Administration. If the product number matches an item number in Order Administration, the system adds the item to the order or positions you to the item number in item availability or inventory inquiry.</p>

Field	Description
Last chg date (Last change date)	The date the item, SKU of this item, or vendor item was last created or changed.

Note:

Included on the Display Item and Change Item screens only.

Numeric, 6 positions (HHMMSS format); display-only.

Completing this screen: If you are creating a SKU'ed item, you advance to the [Create Item Offer Screen](#). If you are creating a non-SKU'ed item, you advance to the [Create Item \(Base Information\) Screen](#).

Create Item (Base Information) Screen

Purpose: Use this screen to create SKU level information for a non-SKU'ed item.

How to display this screen: Complete the [Create Item Screen](#) with the SKUs field *unselected*.

Field	Description
Sort sequence number	<p>The sequence number used to determine the order in which SKUs sort.</p> <p>You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphanumerically by SKU code. See SKU Sort Sequence Numbers for an overview.</p> <p>Required if the Require Sort Sequence Number in the SKU File (F23) system control value is selected.</p> <p>Numeric, 5 positions; required if the Require Sort Sequence Number system control value is selected.</p>

Field	Description
Cost	<p>The cost of the item.</p> <div data-bbox="873 338 1459 598" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The <i>Display Cost in Inventory (A38)</i> secured feature controls the display of this field at the Change Item (Base Information) and Display Item (Base Information) screens.</p> </div> <p>The system does not calculate the cost automatically. However, you can update the standard cost with the landed cost (primary vendor item price + vendor additional charges) through:</p> <ul style="list-style-type: none"> • <i>Working with Vendor Items (WVNI)</i> or the Work with Item/SKUs screen, available by selecting <i>Vendor Item</i> for an item or SKU at the <i>Work with Items Screen</i>. Only the vendor item cost associated with the item's primary vendor (appearing on the first Create/Change/Display Item screen) can update the item's standard cost. <p>Numeric, 13 positions with a 4-place decimal; optional.</p>
Short SKU(Display screen only)	<p>A unique number that the system assigns to all items and SKUs. You can see this number only on display screens and not on any change or create screens. In Inventory Inquiry (<i>DINI</i>) see: <i>Display SKU (Base Information) Screen (Non-SKU'ed Item)</i> or <i>Display SKU - 1 of 2 (With Overrides) Screen</i>. In Work with Items (<i>MITM</i>) see: Display SKU (Base Information) screen or Display SKU screen.</p> <p>When passing item/SKU information in the e-commerce interface, the system uses the short SKU number instead of the alphanumeric value in the SKU field. See <i>Downloading E-Commerce Offer Files (EOFR)</i>.</p> <p>Numeric, 7 positions; display-only.</p>
Primary warehouse	<p>A code that represents the primary warehouse where you keep the item. The <i>Default Warehouse (A04)</i> from the System Control table defaults here, but you can override it. Warehouse codes are defined in and validated against the Warehouse table. See <i>Creating and Maintaining Warehouses (WWHS)</i>.</p> <p>Numeric, 3 positions; required.</p>
Warehouse maximum	<p>The item's recommended maximum number of units for the warehouse from the previous field.</p> <p>Numeric, 7 positions; optional.</p>
Warehouse minimum	<p>The item's recommended minimum number of units for the warehouse defined previously.</p> <p>Numeric, 7 positions; optional.</p>

Field	Description
Primary location	<p>A code that represents the primary location in the warehouse where you stock the item; sometimes referred to as the “primary primary.” The location code you enter here will default in inventory transactions, purchase order receiving, etc. Location codes are defined in and validated against the Location table. See Creating and Maintaining Locations (WLOC).</p> <p>Typically, the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates:</p> <pre>Zone Aisle Shelf Bin A 01 02 01</pre>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When you assign a location code to a non-inventory item, the location code will print on the pick slip if you use one of the base pick slip printing programs; however, the non-inventory item will not be sorted correctly on the batch pull sheet.</p> </div>
Location maximum	<p>Alphanumeric, 7 positions; optional.</p> <p>The item's recommended maximum number of units to be stored in the primary pick location, from the previous field.</p>
Location minimum	<p>Numeric, 7 positions; optional.</p> <p>The item's recommended minimum number of units to be stored in the primary pick location, from the Primary location field.</p> <p>Numeric, 7 positions; optional.</p>

Field	Description
Zone reservation code	<p>A code assigned to weather-sensitive items such as plant stock to insure that the items will ship to different regions of the country within time windows suited to the regions.</p> <p>Items processed through the zone reservation program will not be reserved during order entry; instead they will be assigned a backorder status of Z (Zoned reservation), and will be reserved or backordered during pick generation, at an optimal time for shipping.</p> <p>Zone reservation processing requires:</p> <ul style="list-style-type: none"> • The item/SKU must be assigned a zone reservation code • The offer associated with the order must be assigned a season code • The shipping address for the order must be assigned to a geographic zone • For each zone reservation code, you must define zone date windows for all geographic zones in the country
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Items specified as <i>Drop ship</i> items are not eligible for zone reservation codes.</p> </div>
Reserve qty (Reserve quantity limit)	<p>See Shipping Zone Reservation Overview.</p> <p>Alphanumeric, 4 positions; optional.</p> <p>If the order quantity exceeds this amount, the system does not attempt to reserve the item when you enter the order, regardless of the setting of the Immediate Reservation (A64) system control value. You will need to use Working with Interactive Reservation (MIRV) to reserve the item on open orders.</p> <p>Order Orchestration: If you use the Order Orchestration Integration, the system submits the order line to Order Orchestration for fulfillment even if the line exceeds the reserve quantity limit, provided the line is eligible based on the Rules for Submitting Backorders to Order Orchestration.</p>
Coordinate group	<p>Numeric, 7 positions; optional.</p> <p>A code assigned to items to ensure that certain items ship together when ordered together. Items with the same coordinate group code will ship together through the same shipper.</p> <p>The coordinate group number assigned to an item will default when a customer orders the item. You may override this assignment. During pick slip preparation, the system does not create a pre-generated pick until all of the coordinate grouped items on the order are eligible for pick slip preparation.</p> <p>When you use Processing Auto Soldout Cancellations (MASO) to sellout an item, you have the option of placing all related coordinate grouped items on hold.</p> <p>Numeric, 3 positions; optional.</p>

Field	Description
Item category	<p>A code assigned to the item to classify and group like items for use in the Item Relationships function. The Compatibility field should also be completed to fully use the Item Relationships function. Validated against the Item Category table; see Working with Item Category Codes (WITG).</p> <p>Numeric, 4 positions; optional.</p>
Compatibility	<p>A user-defined code assigned to an item, You can enter this code in the Item Relationships function to review a list of other compatible items. For example, you might use a compatibility code to associate PC-compatible products.</p> <p>Alphanumeric, 3 positions; optional.</p>
2nd compatblty (Second compatibility)	<p>A user-defined code assigned to the item.</p> <p>Alphanumeric, 3 positions; optional.</p>
Suppress backorder card	<p>Indicates whether to produce a backorder card for the item. You might use this field to identify promotional items, free gifts, or catalogs, to prevent them from generating backorder cards or appearing on backorder lists.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = Suppress normal backorder card generation for this item. <i>unselected</i> = Do not suppress normal backorder card generation. <p>If the Unconditional Suppression of Backorder Card (F19) system control value is selected suppressed items will never appear on a backorder card. If this system control value is unselected, suppressed items will appear only on the first backorder card for the order, and only if an unsuppressed item triggers the backorder card when you use Generate Backorder Notices (GBOC).</p>
Active PO	<p>Indicates whether this is an active purchase order item for which you can accept orders before you expect to have inventory to fulfill. The OCDSFA and pre-order periodic functions, which are part of the Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing), set this flag and handle updates and orders for active purchase order items that are fulfilled through the integration with Order Orchestration. Possible settings:</p> <ul style="list-style-type: none"> <i>selected</i> = This is an active purchase order item, and orders will be submitted to Order Orchestration as inventory becomes available. <i>unselected</i> = This is not an active purchase order item. <p>This flag is not displayed at item creation, and you cannot change its setting at a screen. Only the periodic functions mentioned above update this flag.</p> <p>Display-only.</p>

Field	Description
VAT exempt	<p>Controls whether the item is exempt from VAT or conventional tax. Has a different effect depending on how the Tax Included in Price (E70) system control value is set.</p> <p>If the Tax Included in Price (E70) system control value is selected</p> <ul style="list-style-type: none"> <i>selected</i> = The item is exempt from both VAT and conventional tax. On orders subject to VAT, the customer pays the regular (tax-exclusive) price for the item. <i>unselected</i> = The item is subject to VAT and tax-inclusive pricing and/or conventional tax. <p>If the Tax Included in Price (E70) system control value is selected:</p> <ul style="list-style-type: none"> <i>selected</i> = The item is exempt from tax only if there is a tax rate defined in the VAT % field for the customer's country. <i>unselected</i> = The item is subject to tax. <p>You can also define tax exemptions for an item in a particular U.S. state or Canadian province. See Working with GST Tax Exemption Status (MGTX).</p>
Hidden tax amt (Hidden tax amount)	<p>The amount to include in the Hidden tax field for an item subject to VAT. On orders subject to VAT and tax-inclusive pricing, tax does not accumulate in the Tax bucket for the order; instead, you charge a tax-inclusive price for items, and the tax is "hidden" on the order detail line.</p> <p>You can define either a hidden tax amount or a percentage on this screen, but not both. If you do not define either, the item takes the VAT percentage defined for the customer's country. See How Hidden Tax is Calculated by Percentage for more information.</p> <p>Included only if the Tax Included in Price (E70) system control value is selected</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Hidden tax pct (Hidden tax percentage)	<p>The percentage to use when calculating hidden tax for an item subject to VAT. On orders subject to VAT and tax-inclusive pricing, tax does not accumulate in the Tax bucket for the order; instead, you charge a tax-inclusive price for items, and the tax is "hidden" on the order detail line.</p> <p>You can define either a hidden tax amount or a percentage on this screen, but not both. If you do not define either, the item takes the VAT percentage defined for the customer's country. See How Hidden Tax is Calculated by Percentage for more information.</p> <p>Included only if the Tax Included in Price (E70) system control value is selected.</p> <p>Numeric, 5 positions with a 2-place decimal; optional.</p>

Field	Description
Restrict	<p>Indicates whether this item can be ordered.</p> <ul style="list-style-type: none"> <i>selected</i> = You cannot add this item to an order, and demand is not captured. <i>unselected</i> = You can add this item to an order, and demand is captured.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If there were existing orders for this item before it became “restricted,” those orders are processed normally.</p> </div>
S/O control (Soldout control)	<p>A code that represents how you determine when an item is sold out. If you leave this field blank, the item will never sellout automatically in Order Entry.</p> <p>You define soldout control codes in the Soldout Control table with one of the three following statuses:</p> <ol style="list-style-type: none"> Sellout the item immediately. (An item must be coded to sellout immediately in order to be picked up by Processing Auto Soldout Cancellations (MASO).) Sellout the item when the quantity available is zero, not including open purchase orders. Sellout the item when the quantity available is equal to zero, including open purchase orders. <p>See Working with Soldout Controls (WSLD) and Soldout Calculation.</p> <p>You can define a Default Soldout Control Code (D72) to default automatically when you create items and SKUs; however, you can override this value. The system might also override the soldout control code when you use the Process Auto Soldouts function.</p> <p>If the Disregard Soldout Controls for Non-Allocatable Warehouses (J27) system control value is <i>selected</i>, the system disregards soldout control rules for items reserved against a non-allocatable warehouse. If the item cannot be reserved, the system backorders the item in the non-allocatable warehouse. See this system control value for more information.</p> <p>Alphanumeric, 2 positions; optional.</p>

Field	Description
Subscription	<p>Indicates whether the item is a subscription, such as a newsletter. Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = Item is a subscription. <i>unselected</i> = Item is not a subscription. <p>If you identify an item as a subscription item,</p> <ul style="list-style-type: none"> you must select the Non/inv (non- inventory) field to indicate that inventory levels are not maintained for the subscription item and that customer will be billed (the full price of the subscription) immediately through Express Billing. you must create a record for the subscription in the Item Subscriptions table to define the particulars of the subscription, such as the current issue number, length of subscription (number of intervals and number of days between issues). <p>See Working with Item Subscriptions (WISB).</p>
Low price	<p>The lowest recommended sale price for the item; however, the item can be sold at a lower price. No message displays in Order Entry if you go below this price.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
List price	<p>The system uses this price when you process item to item transfers (inventory transaction code = G). The list price of the source and target items must be identical, or the system will not allow you to process the transfer. If you are changing the quantity as part of the transfer, the system will confirm that the list price of the source item is the same as the list price of the target item based on the target item's quantity. For example, if the target item will constitute a set of three of the source item, the list price of the target item should be three times the list price of the source item.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Reference # (Reference number)	<p>Represents the retail reference or alternate product number. You can use this value to cross-reference an item/SKU to an external system, such as through the <i>Generic Inventory Transaction Upload</i> or the <i>Generic Order Interface (Order API)</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>The retail reference number is set to the same value as the item code when you create items through Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS), and the number should not be changed.</p> <p>This number is also used for the Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service.</p> <p>Numeric, 15 positions; optional.</p>
Orig retail \$	<p>The original price of the item at the retail store. Informational only.</p> <p>Numeric, 13 positions with a 2-place decimal.</p>

Field	Description
Projected returns	<p>The number of units you expect to receive in returns for the item. The system uses this quantity when determining whether to sell out an item in order entry or maintenance if the item has a soldout control status of 2 (include on-order quantity in soldout calculation). The system backorders the projected return total plus the on-order quantity on unreceived purchase orders before selling out the item. For example, if you had 0 units on-hand, 10 units on an open purchase order, and entered 10 in this field, the system would backorder the first 20 units you entered in order entry, and sell out any units ordered after that.</p> <p><i>Automatic field update:</i> When a return is processed, the system automatically subtracts the number of units returned from the number you initially entered in the Projected returns field. The number in this field will never be less than 0, however. For example, if you initially entered 10 in the Projected returns field, and 11 units of this item are returned, the Projected returns field will show a value of 0 when the return is processed.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Updating this field does not affect any orders already entered.</p> </div> <p>See Working with Soldout Controls (WSLD) for more information on working with soldout control codes and how they work with projected return quantities.</p> <p>Numeric, 7 positions; optional.</p>
Harmonize	<p>A code that prints on customs documents for international shipments.</p> <p>If you charge duty on international orders, you use this field to define the item's duty rate. The system compares this value with the duty rates defined for the country of the shipping address, and adds a duty charge to the order if it finds a match. See Setting Up the Country Table (WCTY) for more information on defining duty rates for a country.</p> <p>You can also update the harmonize codes for multiple items quickly through the Update Harmonize Codes function; see Updating Harmonize Codes (UPHC).</p> <p>Alphanumeric, 16 positions; optional.</p>
Return/vendor	<p>Indicates whether the item is eligible for return; informational only. Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = The item is eligible for return • <i>unselected</i> (default) = This item is not eligible for return
Country of origin	<p>A code representing the country where the SKU originated. Used by the World Pack interface to determine duty for shipments to certain countries.</p> <p>Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY).</p> <p>Alphanumeric, 3 positions; optional.</p>

Field	Description
L/S color (Long SKU color)	A code, typically used in a retail environment, that represents the color portion of the Long SKU code. Used for reporting purposes. Numeric, 5 positions; optional.
L/S size (Long SKU size)	A code, typically used in a retail environment, that represents the size portion of the Long SKU code. Used for reporting purposes. Numeric, 5 positions; optional.
L/S width (Long SKU width)	A code, typically used in a retail environment, that represents the width portion of the Long SKU code. Used for reporting purposes. Numeric, 5 positions; optional.
User fields	There are 5 user-definable fields. You can define these fields according to your organization's specific requirements. Alphanumeric, 10 positions (first 3 fields); 5 positions (last 2 fields); optional.

Completing this screen: You advance to the [Create Vendor Item Screen](#) if the [Auto Advance to Vendor Item Create \(E78\)](#) system control value is *selected*; otherwise, you advance to the [Create Item Offer Screen](#).

Create Item Offer Screen

Purpose: Use this screen to assign an offer to an item.

How to display this screen:

- You advance to this screen automatically when you create a SKU'd or non-SKU'd item if the [Auto Advance to Item Offer \(J05\)](#) system control value is *selected*; see [Creating Items Screen Flow](#).
- Select *Create* at the [Work with Item Offers Screen](#).

Field	Description
Offer (Offer code)	The code for the offer (catalog) in which the item appears. Validated against the Offer table. See Working with Offers (WOFR) . Alphanumeric, 3 positions; required.
Effective date	The date the price indicated becomes valid. This date should be on or later than the start date of the offer, and on or before the stop date of the offer. If you leave this field blank, the effective date of the offer defaults. Numeric, 6 positions (in user date format); optional.
Sub page	Informational only. You can use this field to call an external program that creates an item alias outside of Order Administration. The system provides a "hook" to the program when you defines a sub page code on this screen or the Create Item/SKU Offer screen in Creating Item/SKU Offers (MISO) . Once the program completes, Order Administration returns to normal processing. Alphanumeric, 5 positions; optional.

Field	Description
Price	<p>The price at which the item will be sold in this offer, if no discounts are applied, and the order date is on or after the effective date. You can establish multiple effective dates and prices for the same item/offer. If there are multiple effective dates and prices, the single-unit price with the latest date is displayed here, even if the date is in the future.</p> <p>Although you can enter a price in this field for a variable set item, the price is informational only; the system prices variable set items by the total price of the set's components. See Entering Variable Set Information (WVST).</p> <p>Numeric, 13 positions with a 2-place decimal; required.</p>
Associate price	<p>The price at which the item will be sold in this offer to associate customers. Associate price is used when the Associate field on the order is selected (yes) and the order date is on or after the effective date.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Tax inclusive price	<p>The price at which the item will be sold in this offer on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket.</p> <p>Included only if the <i>Tax Included in Price (E70)</i> system control value is selected.</p> <p>An error message indicates in order entry if an order is subject to VAT but no tax-inclusive price has been defined.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Tax incl assoc price (Tax-inclusive associate price)	<p>The price at which the item will be sold to associate customers on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket.</p> <p>F</p> <p>Included only if the <i>Tax Included in Price (E70)</i> system control value is selected.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Special handling	<p>Indicates whether this item is eligible for any type of special handling in this offer (such as monogramming, hemming, etc.).</p> <ul style="list-style-type: none"> <i>selected</i> = This item is eligible for special handling. <i>unselected</i> = This item is not eligible for special handling. <p>If this field is selected and there is a default special handling code defined (see below), <i>OR</i> if you specify special handling for an item in order entry, you advance to the Work with Special Handling Screen or the Work with Custom Special Handling Screen; however, if the special handling code's:</p> <ol style="list-style-type: none"> Suppress S/H window field is selected: the system adds the special handling code and charge to the item without displaying the special handling screen. Bypass S/H field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the item; however, you can still advance to the special handling screen by selecting <i>Special Handling</i> for the item. <p>See Special Handling Overview for more information.</p>

Field	Description
S/H price (Special handling price)	<p>The price to charge the customer for special handling. You can specify in the Evaluate Special Handling Charges by Order Line (D67) system control value whether to add the price just once for each order line, or multiply the special handling price by the item quantity for the line.</p> <p>An error message similar to the following indicates that you defined a special handling price and the Special handling field is unselected:</p> <pre>Special handling price not allowed when not eligible.</pre> <p>If you specify a price here for a custom special handling code, it overrides any pricing defined for the custom special handling format; see Establishing Custom Special Handling Formats (WSHF).</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
S/H code (Special handling code)	<p>The additional charge code associated with the type of special handling you are offering for the item.</p> <p>The system validates that the additional charge code is defined as special handling type standard or custom; the system handles each type in a different way. See Special Handling Overview for more information.</p> <p>If you enter a special handling code here, you will advance to the Work with Special Handling Screen or Work with Custom Special Handling Screen automatically in order entry; however, if the special handling code's:</p> <ul style="list-style-type: none"> • Suppress S/H window field is selected: the system adds the special handling code and charge to the item without displaying the special handling screen. • Bypass S/H field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the item; however, you can still advance to the special handling screen by selecting Special Handling for the item. <p>See Special Handling Overview for more information.</p> <p>Alphanumeric, 2 positions; optional.</p>
Gift wrap	<p>Indicates whether gift wrapping is available for this item. If the Gift Wrap Default (F07) system control value is selected, this field defaults to selected, although you can override it; otherwise, this field defaults to unselected.</p> <ul style="list-style-type: none"> • <i>selected</i> = This item can be gift wrapped. • <i>unselected</i> = In this offer, gift wrapping is not available for this item.
G/W price (Gift wrap price)	<p>The price in this offer for gift wrapping the item. The gift wrap field must be selected to indicate that this item is eligible for gift wrap. The gift wrap price will be charged for each unit of this item that is gift wrapped.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Freight	<p>The freight amount to be charged for this item. The amount here is multiplied by the quantity ordered. Used only if the Freight method field for the Source Code table is set to <i>By Item</i> or <i>Flat Rt/Item</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Hidden freight	<p>Used only with item level freight methods, such as: Flat rate by item, flat rate by item quantity, flat rate by item source, and by item.</p> <p>Hidden freight represents the portion of the item's catalog price that is used for freight. You might define a hidden freight value when the freight charge to ship the item is very high. The hidden freight charge is included in the price of the item so the actual freight charge is not visible to the customer.</p> <p>Hidden freight is also known as “theoretical” or “buried” freight.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Sale item	<p>Indicates whether the item is on sale. Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = This is a sale item. <i>unselected</i> (default) = This is not a sale item. <p>If the Exclude Sale Item When Prorating Discounts (I65) system control value is selected, this flag controls whether the item is included in prorated discounts or when determining whether an order qualifies for a promotion. See the system control value for more information.</p>
Volume discount	<p>Indicates whether this item is eligible for an end-of-order discount that will be applied when you accept the order during Order Entry.</p> <ul style="list-style-type: none"> <i>selected</i> = The item/SKU is eligible for the volume discount. <i>unselected</i> = The item/SKU is not eligible for the volume discount. <p>See Item Volume Discounting</p>
Coupon discount \$ (Coupon discount dollars)	<p>Represents the amount that is subtracted from the price when the item/SKU is ordered from this offer.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Coupon expiration date	<p>The date the coupon expires.</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Feature/option	<p>Indicates whether the item is considered a featured or optional item in a depiction. A depiction is a photograph or drawing of several items within an offer. The featured item is the focus of the depiction; whereas, the optional items are less prominently displayed. For example, if a dining room is depicted, the dining room set may be the featured item and the individual place settings, crystal, and centerpiece may be the optional items.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Feature</i> = Item is the featured item in the depiction. <i>Option</i> = Item is an optional item in the depiction. <p>Optional.</p>

Field	Description
Column pricing	<p>Determines whether this item is eligible for column pricing discounts.</p> <ul style="list-style-type: none"> <i>selected</i> = The item is eligible for column pricing discounts. You advance to an additional screen where you can define the effective date, quantity, price, associate price, and pricing column. <i>unselected</i> = The item is not eligible for column pricing discounts. <p><i>What is column pricing?</i></p> <p>In customer maintenance, you can assign a customer to a pricing column. This means that the customer will be charged the column price, even if the customer does not order the number of units specified for the price break. If the customer orders more units than specified in the column assignment, the price break at the next level will be used on the order.</p> <p><i>Example:</i></p> <pre>Quantity Price Assoc. Price Column 1 \$100.00 \$95.50 01 5 \$ 90.00 \$85.50 02 10 \$ 80.00 \$75.95 03</pre> <p>You can create as many price breaks as you like.</p>
Pickup/new	<p>Indicates whether the item has been carried over from a previous offer or is new to your product offerings.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Pickup</i> = Item is a pickup item, previously sold in another offer. <i>New</i> = Item is a new addition in this offer. <p>Optional.</p>
Warranty	<p>Defines whether the item in this offer is a warranty item.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = The item in this offer is a warranty item. When an operator adds this item to an order in order entry or order maintenance, the system adds the item to the order at no charge. <i>unselected</i> = The item in this offer is not a warranty item. If the <i>Default Price Override Reason for Warranty Items (G01)</i> system control value contains a price override reason code, the system defaults this code to the Price override code field; otherwise, the operator must enter a code.

Field	Description
Required reason code	<p>Defines whether an <i>Order addition reason code</i> is required when the item in this offer is added to an order in order entry or order maintenance. When you specify an add reason code for an item, there is a record of the add reason code stored in an order line history record, available for review at the <i>Display Order Line History Screen</i>.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. The <i>Enter Add Reason Window</i> opens when an operator adds this item to an order in order entry or order maintenance. <i>unselected</i> = The item in this offer does not require an add reason code when the item is added to an order in order entry or order maintenance.

 **Note:**

When the item is added automatically to an order through the order API, the add reason code is not required. For example, an item might be added to an order automatically if it is set up as a free gift by source code.

Completing this screen: If you advanced to this screen through initial item creation, you return to the *Create Item Screen*.

Select *Exit* at this screen if you do not want to create an item/offer.

Create SKU 1 of 2 (With Overrides) Screen

Purpose: Use this screen to create a SKU for a SKU'd item.

How to display this screen:

- You advance to this screen automatically when you create a SKU'd item if the *Auto Advance to SKU Create (B34)* system control value is *selected* and the *Auto Advance to SKU Generator (J06)* system control value is *unselected*. See *Creating SKU'ed Items Screen Flow*.
- Select *Create* at the *Work with SKUs Screen*.

Completing this screen: Select *OK* to advance to the *Create SKU 2 of 2 (With Overrides) Screen*. This screen contains additional SKU attributes, including those related to long SKU and physical dimensions.

After you create a SKU, the system returns you to this screen, allowing you to create another SKU. You can select *Exit* when you have finished creating all SKUs.

You can also select *Exit* if you wish to create a SKU'ed item without creating the individual SKUs at this time.

Field	Description
Clr/Size/Wdth	<p>The SKU elements, such as color or size, that identify the item further.</p> <p>Elements are defined in the System Control table and validated against the SKU Element (1,2,3) tables. An item does not require all 3 elements.</p> <p>Alphanumeric, three 4-position fields; required.</p>
Description (Unlabeled field to the right of the SKU field(s))	<p>The description of the SKU element.</p> <p>The system displays the SKU description in place of the SKU elements in order entry, order maintenance and standard and streamlined order inquiry if the <i>Display SKU Description in place of SKU Element (F25)</i> system control value is selected.</p> <p>Alphanumeric, 40 positions; optional.</p>
Second language description	<p>Not currently implemented.</p> <p>Alphanumeric, 40 positions; optional.</p>
Sort sequence # (SKU sort sequence number)	<p>The sequence number used to determine the order in which SKUs sort.</p> <p>You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphabetically by SKU code. See <i>SKU Sort Sequence Numbers</i> for an overview.</p> <p>Required if the <i>Require Sort Sequence Number in the SKU File (F23)</i> system control value is selected.</p> <p>Numeric, 5 positions; required if the Require Sort Sequence Number system control value is selected.</p>
Cost	<p>The cost of the item. This cost defaults from the base item but may be overridden for the SKU being created.</p>

 **Note:**

The *Display Cost in Inventory (A38)* secured feature controls the display of this field at the Change SKU 1 of 2 (With Overrides) and Create SKU 1 of 2 (With Overrides) screens.

Standard costing: The system does not calculate a new standard cost automatically. However, you can update the standard cost with the landed cost (primary vendor item price + vendor additional charges) through:

- *Working with Vendor Items (WVNI)* or the Work with Item/ SKUs screen, available by selecting *Vendor Item* for an item or SKU at the *Work with Items Screen*. Only the vendor item cost associated with the item's primary vendor (appearing on the first Create/Change/Display Item screen) can update the item's standard cost.

Field	Description
Short SKU(Display screen only)	<p>A unique number that the system assigns to all items and SKUs. You can see this number only on display screens, not on change or create screens. In Inventory Inquiry (<i>DINI</i>) see: Display SKU (Base Information) Screen (Non-SKU'ed Item) or Display SKU - 1 of 2 (With Overrides) Screen. In Work with Items (<i>MITM</i>) see: Display SKU (Base Information) screen or Display SKU screen.</p> <p>When passing item/SKU information in the e-commerce interface, the system uses the short SKU number instead of the alphanumeric value in the SKU field. See Downloading E-Commerce Offer Files (EOFR).</p> <p>Numeric, 7 positions; display-only.</p>
Primary warehouse	<p>A code that represents a warehouse where this item is stocked. The default warehouse code from the System Control table defaults here, but you can override it. Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; required.</p>
Warehouse maximum	<p>The SKU's recommended maximum number of units for the warehouse specified in the Warehouse field.</p> <p>Numeric, 7 positions; optional.</p>
Warehouse minimum	<p>The SKU's recommended minimum number of units for the warehouse specified in the Warehouse field.</p> <p>Numeric, 7 positions; optional.</p>
Primary location	<p>A code that represents an area within the warehouse that contains the item/SKU. Sometimes referred to as the "primary primary." Validated against the Location table.</p> <p>Typically, the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates:</p> <pre>Zone Aisle Shelf Bin A 01 02 01</pre>

 **Note:**

When you assign a location code to a non-inventory item, the location code will print on the pick slip if you use one of the base pick slip printing programs; however, the non-inventory item will not be sorted correctly on the batch pull sheet.

Alphanumeric, 7 positions; optional.

Field	Description
Location maximum	<p>The SKU's recommended maximum number of units to be stored in the primary pick location.</p> <p>The primary pick location refers to the code in the Location field, displayed on this screen.</p> <p>Numeric, 7 positions; optional.</p>
Location minimum	<p>The SKU's recommended minimum quantity to be stored in the primary pick location.</p> <p>The primary pick location refers to the code in the Location field, displayed on this screen.</p> <p>Numeric, 7 positions; optional.</p>
Reserve qty. (SKU reserve limit exceed)	<p>If the order quantity exceeds this amount, the system does not attempt to reserve the item when you enter the order, regardless of the setting of the <i>Immediate Reservation (A64)</i> system control value. You will need to use <i>Working with Interactive Reservation (MIRV)</i> to reserve the item on open orders.</p> <p>Numeric, 7 positions; optional.</p>

Field	Description
Zone reservation	<p>A code assigned to weather-sensitive items/SKUs such as plant stock to insure that the items will ship to different regions of the country within time windows suited to the regions.</p> <p>Items/SKUs processed through the zone reservation program will not be reserved during order entry; instead they will be reserved during pick generation, at an optimal time for shipping.</p> <p><i>Zone reservation processing requires:</i></p> <ul style="list-style-type: none">• The SKU must be assigned a zone reservation code• The offer associated with the order must be assigned a season code• The shipping address for the order must be assigned to a geographic zone• For each zone reservation code, you must define zone date windows for all geographic zones in the country

 **Note:**

Items specified as *Drop ship* items are not eligible for zone reservation codes at the SKU level.

 **Note:**

If you have not set up the required values for zone reservation processing, a zone reservation coded item will follow standard order entry processing, except that if the item is backordered, it will not be reserved through the Evaluate Backorders process. You can reserve the item through [Working with Interactive Reservation \(MIRV\)](#).

See [Shipping Zone Reservation Overview](#).

Alphanumeric, 4 positions; optional.

Field	Description
Coordinate group	<p>A code that may be assigned to item/SKUs to ensure that certain item/SKUs ship together when ordered together. Item/SKUs with the same coordinate group code will ship together through the same shipper.</p> <p>The coordinate group number assigned to an item/SKU will default in Order Entry when the item/SKU is ordered. You may override this assignment.</p> <p>The system does not create a pre-generated pick for order lines that are assigned the same coordinate group number until all of the coordinate grouped lines are eligible for pick slip preparation.</p> <p>When you use Processing Auto Soldout Cancellations (MASO) to sell out an item, you have the option of placing all related coordinate group items on hold.</p> <p>Numeric, 3 positions; optional.</p>
Item category	<p>A code assigned to the SKU to classify and group like item/SKUs for use in the Item Relationships function. The Item Category is a level below the Item Class. For example, if the item class assignment is “Software Products,” the Item Category assignment might be “Word Processing Software” to subgroup and sort similar items. Validated against the Item Category table; see Working with Item Category Codes (WITG).</p> <p>Numeric, 4 positions; optional.</p>
Compatibility	<p>A user-defined code assigned to an item/SKU. You can enter this code in the Item Relationships function to display a list of other compatible items or SKUs.</p> <p><i>Example:</i> You can assign a compatibility code of 01 to an IBM-compatible computer and to other items such as printers, network cards, etc.</p> <p>Alphanumeric, 3 positions; optional.</p>
2nd compatibility	<p>Not currently implemented.</p> <p>Alphanumeric, 3 positions; optional.</p>
Sup B/O card (Suppress backorder card)	<p>Indicates whether to produce a backorder card for the SKU. You might use this field to identify promotional items, free gifts, or catalogs, to prevent them from generating backorder cards or appearing on backorder lists.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Suppress normal backorder card generation for this item. • <i>Unselected</i> = Do not suppress normal backorder card generation. <p>If the Unconditional Suppression of Backorder Card (F19)Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing) system control value is <i>selected</i>, suppressed SKUs will never appear on a backorder card. If this system control value is <i>unselected</i>, suppressed SKUs will appear only on the first backorder card for the order, and only if an unsuppressed item triggers the backorder card generation.</p>

Field	Description
Active PO	<p>Indicates whether this is an active purchase order item for which you can accept orders before you expect to have inventory to fulfill. The OCDSFA and pre-order periodic functions, which are part of the , set this flag and handle updates and orders for active purchase order items that are fulfilled through the integration with Order Orchestration. Possible settings:</p> <ul style="list-style-type: none"> <i>selected</i> = This is an active purchase order item, and orders will be submitted to Order Orchestration as inventory becomes available. <i>unselected</i> = This is not an active purchase order item. <p>This flag is unselected at item creation. Display-only.</p>
VAT exempt	<p>Controls whether the SKU is exempt from VAT and tax-inclusive pricing. The SKU will still be subject to conventional tax, in which the tax amount accumulates in the Tax bucket, on any order subject to conventional tax rather than VAT. Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = This SKU is exempt form VAT and tax-inclusive pricing. <i>Unselected</i> = This SKU is subject to VAT and tax-inclusive pricing. <p>Effective only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>.</p>
Hidden tax amt (Hidden tax amount)	<p>The amount to include in the Hidden tax field for an item subject to VAT. On orders subject to VAT and tax-inclusive pricing, tax does not accumulate in the Tax bucket for the order; instead, you charge a tax-inclusive price for items, and the tax is "hidden" on the order detail line.</p> <p>You can define either a hidden tax amount or a percentage on this screen, but not both. If you do not define either, the SKU takes the VAT percentage defined for the customer's country.</p> <p>Included only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Hidden tax pct (Hidden tax percentage)	<p>The percentage to use when calculating hidden tax for an item subject to VAT. On orders subject to VAT and tax-inclusive pricing, tax does not accumulate in the Tax bucket for the order; instead, you charge a tax-inclusive price for items, and the tax is "hidden" on the order detail line.</p> <p>You can define either a hidden tax amount or a percentage on this screen, but not both. If you do not define either, the SKU takes the VAT percentage defined for the customer's country. See How Hidden Tax is Calculated by Percentage for more information.</p> <p>Included only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i>.</p> <p>Numeric, 5 positions with a 2-place decimal; optional.</p>

Field	Description
Restrict	<p>Indicates whether you can accept an order for this item/SKU in Order Entry and whether demand is captured.</p> <ul style="list-style-type: none"> <i>Selected</i> = The operator cannot accept an order for this item/SKU. <i>Unselected</i> = The operator can accept an order for this item/SKU.

 **Note:**

If there were existing orders for this item before it became “restricted,” those orders are processed normally.

S/O control (Soldout control)

A code that represents how you determine when an item/SKU is soldout. If you leave this field blank, the item/SKU will never sellout automatically in Order Entry.

You define soldout control codes in the Soldout Control table with one of the three following statuses:

- Sellout the item/SKU immediately.
- Sellout the item/SKU when the quantity available is zero, not including open purchase orders.
- Sellout the item/SKU when the quantity available is equal to zero, including open purchase orders. (An item must be coded to sellout immediately in order to be picked up by [Processing Auto Soldout Cancellations \(MASO\)](#).)

You can define a [Default Soldout Control Code \(D72\)](#) in the System Control table to default automatically when you create items and SKUs; however, you can override this value.

See [Working with Soldout Controls \(WSLD\)](#).

If the [Disregard Soldout Controls for Non-Allocatable Warehouses \(J27\)](#) system control value is *selected*, the system disregards soldout control rules for items reserved against a non-allocatable warehouse. If the item cannot be reserved, the system backorders the item in the non-allocatable warehouse. See this system control value for more information.

Alphanumeric, 2 positions; optional.

Field	Description
Subscription	<p>Indicates whether the item is a subscription item. Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Item is a subscription item • <i>Unselected</i> = Item is not a subscription item <p>If you identify an item as a subscription item, you must</p> <ul style="list-style-type: none"> • select the Non/inv (non- inventory) field to indicate that inventory levels are not maintained for the subscription item and that customer will be billed (the full price of the subscription) immediately through Express Billing. • create a record for the subscription in the Item Subscriptions table to define the particulars of the subscription, such as the current issue number, length of subscription (number of intervals and number of days between issues). <p>See Working with Item Subscriptions (WISB).</p>
Low price	<p>The lowest recommended sale price for the item/SKU; however, the item/SKU can be sold at a lower price. No messages are displayed in Order Entry. Numeric, 13 positions with a 2-place decimal; optional.</p>
List price	<p>The system uses this price:</p> <ol style="list-style-type: none"> 1. When you process item to item transfers (inventory transaction code = <i>G</i>). The list price of the source and target items must be identical, or the system will not allow you to process the transfer. If you are changing the quantity as part of the transfer, the system will confirm that the list price of the source item is the same as the list price of the target item based on the target item's quantity. For example, if the target item will constitute a set of three of the source item, the list price of the target item should be three times the list price of the source item. 2. As the initial price of an item during customer price group line level pricing if the Price Type for the selected customer price group is <i>Regular</i>; see Working with Customer Price Groups (WCPG). <p>Numeric, 13 positions with a 2-place decimal; optional (required if you process an item to item transfer).</p>
Reference # (Reference number)	<p>Represents the retail reference or alternate product number. You can use this value to cross-reference an item/SKU to an external system, such as through the <i>Generic Inventory Transaction Upload</i> or the <i>Generic Order Interface (Order API)</i>. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). The retail reference number is set to the same value as the item code when you create items through Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS), and the number should not be changed. This number is also used for the Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service. Numeric, 15 positions; optional.</p>

Field	Description
Orig retail \$	<p>The original price of the item at the retail store.</p> <p>The system uses this price as the initial price of an item during customer price group line level pricing if the Price Type for the selected customer price group is <i>Original</i>; see Working with Customer Price Groups (WCPG).</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Projected returns	<p>The number of units you expect to receive in returns for the item. The system uses this quantity when determining whether to sell out an item in order entry or maintenance if the item has a soldout control status of 2 (include on-order quantity in soldout calculation). The system backorders the projected return total plus the on-order quantity on unreceived purchase orders before selling out the item. For example, if you had 0 units on-hand, 10 units on an open purchase order, and entered 10 in this field, the system would backorder the first 20 units you entered in order entry, and sell out any units ordered after that.</p> <p><i>Automatic field update:</i> When a return is processed, the system automatically subtracts the number of units returned from the number you initially entered in the Projected returns field. The number in this field will never be less than 0, however. For example, if you initially entered 10 in this field, and 11 units of this item are returned, the Projected returns field will show a value of 0.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Updating this field does not affect any orders already entered.</p> </div>
	<p>See Working with Soldout Controls (WSLD) for more information on working with soldout control codes and how they work with projected return quantities.</p> <p>Numeric, 7 positions; optional.</p>
Harmonize (Harmonize code)	<p>A code that prints on customs documents for international shipments.</p> <p>If you charge duty on international orders, you use this field to define the item's duty rate. The system compares this value with the duty rates defined for the country on the shipping address, and adds a duty charge to the order if it finds a match. See Setting Up the Country Table (WCTY) for more information on defining duty rates for a country.</p> <p>You can also update the harmonize codes for multiple items quickly through the Update Harmonize Codes function; see Updating Harmonize Codes (UPHC).</p> <p>Alphanumeric, 16 positions; optional.</p>
Return/vendor	<p>Indicates whether the item is eligible for return; informational only.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = The item is eligible for return • <i>Unselected</i> (default) = This item is not eligible for return

Field	Description
Prep code	A code used to indicate any special preparation or handling required for the SKU. Informational only. Alphanumeric, 2 positions; optional.
Country of origin	A code representing the country where the SKU originated. Used by the World Pack interface to determine duty for shipments to certain countries. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY) . Alphanumeric, 3 positions; optional.
User fields	There are 5 user-definable fields. You can define these fields according to your organization's specific requirements. Alphanumeric, 10 positions (first 3 fields) 5 positions (last 2 positions); optional.

Create SKU 2 of 2 (With Overrides) Screen

Purpose: Use this screen to enter additional information for a SKU.

The values you enter in the "override" section of the screen override the values you entered for the base item. If you leave any of these fields blank and you have entered values at the base item level, the system uses the base item values. For example, if you leave height, length, and width blank and there is a height, length, or width defined at the base item level, the system uses the values at the base item level.

How to display this screen: Select *OK* at the [Create SKU 1 of 2 \(With Overrides\) Screen](#).

Completing this screen: When you select *OK* at this screen, the system:

- If the [Auto Advance to Vendor Item Create \(E78\)](#) system control value is *selected*, automatically advances you to the [Create Vendor Item Screen](#).
- If the [Auto Advance to Vendor Item Create \(E78\)](#) system control value is *unselected*, creates the SKU after validating your entries and highlighting any errors, if necessary.

After you create a SKU, the system returns you to the [Create SKU 1 of 2 \(With Overrides\) Screen](#), allowing you to create another SKU. You can select *Exit* when you have finished creating all SKUs.

Field	Description
Description (Unlabeled field to the right of the SKU field(s))	The description of the SKU element. The system displays the SKU description in place of the SKU elements in order entry, order maintenance and standard and streamlined order inquiry if the Display SKU Description in place of SKU Element (F25) system control value is <i>selected</i> . Alphanumeric, 40 positions; optional.
Second language description	Not currently implemented. Alphanumeric, 40 positions; display-only.

Field	Description
L/S class (Long SKU class)	<p>A code you can use to group items into classes for reporting purposes. If you defined a L/S class for the base item it defaults here, but you can override it. Long SKU classes are defined in and validated against the Long SKU Class table; see Working with Long SKU Classes (WLSC).</p> <p>Retail Integration (external system to Order Administration) If the <i>Use Retail Integration (H26)</i> system control value is <i>selected</i>, long SKU classes are linked to long SKU departments and are called retail classes. Retail classes are department specific whereas regular long SKU classes are unique and remain constant across departments. For this reason, when the <i>Use Retail Integration (H26)</i> system control value is <i>selected</i>, you can only enter a retail class in this field that is assigned to the base item's long SKU department. If you enter a long SKU class that is not linked to the base item's long SKU department, the system will not let you proceed and displays an error message: L/S Class (xxxx) was not found in L/S Department (xx) .</p> <p>Since retail classes are department specific, if you prompt (<i>click on the arrow</i>) in this field before entering a long SKU department, an error message indicates: L/S Department required to prompt on L/S Class.</p> <p>Retail classes are defined in and validated against the Retail Class table; see the Work with Retail Class Screen for more information.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When the <i>Use Retail Integration (H26)</i> system control value is <i>selected</i>, the system populates and validates against the Retail Class table instead of the Long SKU Class table; therefore, you cannot access Working with Long SKU Classes (WLSC).</p> </div>
	<p>Secured Feature If you do not have authority to the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you cannot enter or change this value. Numeric, 4 positions; optional.</p>
L/S vendor (Long SKU vendor)	<p>A user-defined field that you can use for tracking and queries. If you defined a L/S vendor for the base item it defaults here, but you can override it. Long SKU vendors are defined in the SKU table, but are not validated.</p> <p>Secured Feature If you do not have authority to the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you cannot enter or change this value. Alphanumeric, 7 positions; optional.</p>

Field	Description
L/S style (Long SKU style)	<p>A user-defined field that you can use for tracking and queries. If you defined a L/S style for the base item it defaults here, but you can override it. Long SKU styles are defined the SKU table, but are not validated.</p> <p>Required if the Require L/S Style (I94) system control value is <i>selected</i>. In addition, the system validates that the value you enter is not assigned to another item/SKU.</p> <p>Secured Feature If you do not have authority to the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you cannot enter or change this value. Alphanumeric, 20 positions; optional.</p>
L/S color (Long SKU color)	<p>A code, typically used in a retail environment, that represents the color portion of the Long SKU code. Used for reporting purposes.</p> <p>If you do not have authority to the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you cannot enter or change this value. Numeric, 5 positions; optional.</p>
L/S size (Long SKU size)	<p>A code, typically used in a retail environment, that represents the size portion of the Long SKU code. Used for reporting purposes.</p> <p>If you do not have authority to the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you cannot enter or change this value. Numeric, 5 positions; optional.</p>
L/S width (Long SKU width)	<p>A code, typically used in a retail environment, that represents the width portion of the Long SKU code. Used for reporting purposes.</p> <p>If you do not have authority to the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you cannot enter or change this value. Numeric, 5 positions; optional.</p>
L/S Subclass	<p>A user-defined field that you can use for tracking and queries. Long SKU subclass can also be defined in the SKU table but is not validated.</p> <p>Displayed only if the <i>Use Retail Integration (H26)</i> system control value is selected.</p> <p>Secured Feature If you do not have authority under the <i>Maintain Long SKU Values in MITM (B05)</i> secured feature, you can not enter or change this value. Numeric, 4 positions; optional.</p>
Carton	<p>The type of carton in which this item must ship.</p> <p>If a carton ID exists, the system passes this information to TanData when confirming the item for shipment. This information is used to calculate best way shipping, which determines the lowest price to ship the carton.</p> <p>Numeric, 2 positions; optional.</p>
Height	<p>The height measurement for an item/SKU. The Height, Length, and Width values are used to determine the cubic volume of an item/SKU. You can enter the height in feet or centimeters, or any other measurement as long as it is consistent. Used in Suggest Location Placement (MSLO) when evaluating whether an item/SKU can be stored in a particular location.</p> <p>Numeric, 3 positions; optional.</p>

Field	Description
Length	<p>The length measurement for an item/SKU. The Height, Length, and Width values are used to determine the cubic volume of an item/SKU. You can enter this value in feet or centimeters, or any other measurement as long as it is consistent. <i>Suggest Location Placement (MSLO)</i> uses this value when evaluating whether an item can be stored in a particular location.</p> <p>Numeric, 5 positions; optional.</p>
Width	<p>The width measurement for an item/SKU. The Height, Length, and Width values are used to determine the cubic volume of an item/SKU. You can enter this value in feet or centimeters, or any other measurement as long as it is consistent. <i>Suggest Location Placement (MSLO)</i> uses this value when evaluating whether an item can be stored in a particular location.</p> <p>Numeric, 5 positions; optional.</p>
Ship weight	<p>The actual shipping weight of the item/SKU. The system may use this value to calculate carton weights and to determine your shipping charges if you perform manual confirmation and use cubing.</p> <p>The system uses the shipping weight of an item to create item weight records in the Download Extended Manifest table (<i>FLMNDE</i>) when you use a PC Manifest system to confirm shipments.</p> <p>Numeric, 7 positions with a 3-place decimal; optional.</p>
Sell weight	<p>The system uses this value to calculate the freight charge on a SKU when the <i>Freight method</i> on the order is set to <i>By Item</i> or <i>Flat Rt/Item</i>. Overrides the selling weight, if any, defined at the base item level.</p> <p>Numeric, 7 positions with a 3-place decimal; optional.</p>
Last purchase cost	<p>The cost of the item from the most recent purchase order, including any discounts, surcharges, or additional charges. The system uses this cost to determine the unit price for a purchase order if there is no vendor item price.</p> <p>Numeric, 13 positions with a 4-place decimal; optional.</p>
Cube factor	<p>The cubic volume of the SKU, which overrides the cubic volume defined at the base item level. Controls the number of units of this item that can fit into a carton. The system compares the cube factor against the Cube field from the System Control table, which defines a default box size. See <i>Setting Up Fulfillment Values</i>.</p> <p><i>Example:</i> If the Cube field value in the System Control table is 100 and the Cube factor for an item is 25, then 4 of this item can fit into one box. The Cube Factor determines the number of picks required to ship an order.</p> <p>Numeric, 3 positions; optional.</p>
Unit/measure	<p>A standard by which an item/SKU is sold.</p> <p>Typical units of measure include:</p> <ul style="list-style-type: none"> • <i>EA</i> = each • <i>IN</i> = inches • <i>C12</i> = case of 12 <p>Validated against the Unit of Measure table (see <i>Working with Units of Measure (WUOM)</i>) and will default from the <i>Default Item Unit of Measure (B33)</i> system control value, if a value is specified.</p> <p>Alphanumeric, 3 positions; optional.</p>

Field	Description
Status	A code that represents a SKU's status, such as obsolete, discontinued, sold out, etc. This information is used for inventory reporting purposes only. The status defined at the SKU level overrides the status defined at the base item level; however, even if the status matches the Item Status for Suppressing Item During Item Selection (L21) , the SKU-level status does not prevent the Item Selection screen from displaying the item. See Working with Item Status (WIST) . Alphanumeric, 1 position; optional.

Screen Option	Procedure
Return to the Create SKU 1 of 2 (With Overrides) Screen	Press <i>Page Up</i> .
Advance to a menu option related to item maintenance	Select <i>Supporting Files</i> to advance to the Item Support File Maintenance window. Options at this window are: <ul style="list-style-type: none"> • <i>Buyer</i>; see Working with Buyers (WBUY) • <i>Vendor</i>; see Working with Vendors (WVEN) • <i>Hazard</i>; see Working with Hazardous Item Codes (WHAZ) • <i>Item Category</i>; see Working with Item Category Codes (WITG) • <i>Item Class</i>; see Working with Item Classes (WICL) • <i>Item SKU Group</i>; see Working with SKU Groups (WISG) • <i>Item Status</i>; see Working with Item Status (WIST) • <i>Location Class</i>; see Creating and Maintaining Location Classes (WLCL) • <i>Long SKU Class</i>; see Working with Long SKU Classes (WLSC) • <i>Long SKU Department</i>; see Working with Long SKU Departments (WLSL) • <i>Ship Via</i>; see Working with Ship Via Codes (WVIA) • <i>Offer</i>; see Working with Offers (WOFR) • <i>Unit Of Measure</i>; see Working with Units of Measure (WUOM) • <i>Keyword</i>; see Working with Item Keywords (WKEY)
Display SKU offer information	Select <i>Offers</i> to advance to the Work with SKU Offers Screen .
Display base item information	Select <i>Item base info</i> to advance to the Display Base Item Information Pop-up window. See Create Item (Base Information) Screen for field descriptions.
Display comments	Select <i>Comments</i> to advance to the Display SKU Comments screen. See Work with Item/SKU Comments Screen for field descriptions.

Create SKU Offer Screen

Purpose: Use this screen to assign an offer to a SKU.

How to display this screen: Select *Create* at the [Work with SKU Offers Screen](#).

Field	Description
Offer (Offer code)	<p>The code for the offer (catalog) in which the item/SKU appears. Validated against the Offer table. See DWorking with Offers (WOFR).</p> <p>Alphanumeric, 3 positions; required (if other information is entered).</p>
Effective date	<p>The date the price becomes valid. This date should be on or after the start date of the offer, and on or before the stop date of the offer.</p> <p>The Effective date and Price are stored in the SKU Price table rather than the SKU Offer table. If you do not specify an Effective date and Price when you create a SKU Offer record, the system automatically creates a SKU Price record using the single-unit price from the Item Price table with the latest Effective date. If the latest Effective date from the Item Offer table is in the future, then the SKU Price record also has this future Effective date.</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Price	<p>The price at which the SKU will sell in this offer if no discounts are applied, and the order date is on or after the Effective date. If you leave this field blank, the single-unit offer price with the latest Effective date defaults. You can specify multiple Effective dates and prices for an item or SKU in an offer. See Work with Item Prices Screen (Quantity Price Breaks by Offer).</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Associate price	<p>The price at which the item/SKU will be sold in this offer to associate customers. Associate price is used when the Associate field on the order is selected (yes) and the order date is on or after the effective date.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Tax inclusive price	<p>The price at which the item will be sold in this offer on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket.</p> <p>Included only if the <i>Tax Included in Price (E70)</i> system control value is selected.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Tax incl assoc price (Tax-inclusive associate price)	<p>The price at which the item will be sold to associate customers on orders subject to VAT. In tax-inclusive pricing, a "hidden tax" is included in the order detail line for the item rather than accumulating in the Tax bucket.</p> <p>Included only if the <i>Tax Included in Price (E70)</i> system control value is selected.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Special handling	<p>Indicates whether this SKU is eligible for any type of special handling in this offer (such as monogramming, hemming, etc.).</p> <ul style="list-style-type: none"> <i>selected</i> = This SKU is eligible for special handling. <i>unselected</i> = This SKU is not eligible for special handling. <p>If this field is selected and there is a default special handling code defined (see below), <i>OR</i> if you specify special handling for a SKU in order entry, you advance to the Work with Special Handling Screen or the Work with Custom Special Handling Screen; however, if the special handling code's:</p> <ul style="list-style-type: none"> Suppress S/H window field is selected: the system adds the special handling code and charge to the SKU without displaying the special handling screen. Bypass S/H field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the SKU; however, you can still advance to the special handling screen by selecting <i>Special Handling</i> for the SKU. <p>See Special Handling Overview for more information.</p>
S/H price (Special handling price)	<p>The price to charge the customer for special handling. You can specify in the <i>Evaluate Special Handling Charges by Order Line (D67)</i> system control value whether to add the price just once for each order line, or multiply the special handling price by the item quantity for the line.</p> <p>An error message similar to the following indicates that you defined a special handling price and the Special handling field is unselected:</p> <pre>Special handling price not allowed when not eligible.</pre> <p>If you specify a price here for a custom special handling code, it overrides any pricing defined for the custom special handling format; see Establishing Custom Special Handling Formats (WSHF).</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
S/H code (Special handling code)	<p>The additional charge code associated with the type of special handling you are offering for the SKU.</p> <p>The system validates that the additional charge code has a special handling Type of standard or custom; the system handles each type in a different way. See Special Handling Overview for more information.</p> <p>If you enter a special handling code here, you will advance to the Work with Special Handling Screen or Work with Custom Special Handling Screen automatically in order entry; however, if the special handling code's:</p> <ul style="list-style-type: none"> • Suppress S/H window field is selected: the system adds the special handling code and charge to the SKU without displaying the special handling screen. • Bypass S/H field is selected: you do not advance automatically to the special handling screen unless you enter the special handling code when entering the SKU; however, you can still advance to the special handling screen by selecting Special Handling for the SKU. <p>See Special Handling Overview for more information.</p> <p>Alphanumeric, 2 positions; optional.</p>
Gift wrap	<p>Indicates whether this SKU is eligible for gift wrap. If the Gift Wrap Default (F07) system control value is selected, this field defaults to selected, although you can override it; otherwise, this field defaults to unselected.</p> <ul style="list-style-type: none"> • <i>selected</i> = The item/SKU can be gift wrapped. • <i>unselected</i> = In this offer, the item/SKU cannot be gift wrapped.
G/W price (Gift wrap price)	<p>The price for gift wrapping the item. The G/W field must be selected. The gift wrap price will be charged for each unit of this SKU that is gift wrapped.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Freight	<p>The freight amount to be charged for this item/SKU. Multiplied by the quantity ordered to determine the freight charge for this item. Used only if the Freight method field for the Source Code table is set to <i>By Item</i> or <i>Flat Rt/Item</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Hidden freight	<p>Used only with item/SKU level freight methods, such as: Flat rate by item, flat rate by item quantity, flat rate by item source, and by item.</p> <p>Hidden freight represents the portion of the item's catalog price that is used for freight. You might define a hidden freight value when the freight charge to ship the item/SKU is very high. The hidden freight charge is included in the price of the item/SKU so the actual freight charge is not visible to the customer.</p> <p>Hidden freight is also known as “theoretical” or “buried” freight.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Sale item	<p>Indicates whether the item is on sale.</p> <p>Valid values are:</p> <ul style="list-style-type: none"><i>selected</i> = This is a sale item.<i>unselected</i> (default) = This is not a sale item. <p>If the <i>Exclude Sale Item When Prorating Discounts (I65)</i> system control value is selected, this flag controls whether the item is included in prorated discounts or when determining whether an order qualifies for a promotion. See the system control value for more information.</p>
Volume discount	<p>Indicates whether this item is eligible for an end-of-order discount that will be applied when you accept the order during Order Entry.</p> <ul style="list-style-type: none"><i>selected</i> = The item/SKU is eligible for the volume discount.<i>unselected</i> = The item/SKU is not eligible for the volume discount. <p>See <i>Item Volume Discounting</i></p>
Coupon discount \$	<p>Represents the amount that is subtracted from the price when the SKU is ordered from this offer.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Coupon expiration date	<p>The date the coupon is effective until (i.e., the date it expires).</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Feature/option	<p>Indicates whether the item is considered a featured or optional item in a depiction. A depiction is a photograph or drawing of several items within an offer. The featured item is the focus of the depiction; whereas, the optional items are less prominently displayed. For example, if a dining room is depicted, the dining room set may be the featured item and the individual place settings, crystal, and centerpiece may be the optional items.</p> <p>Valid values are:</p> <ul style="list-style-type: none"><i>Feature</i> = Item is the featured item in the depiction<i>Option</i> = Item is an optional item in the depiction <p>Optional.</p>

Field	Description
Column pricing	<p>Determines whether this item/SKU is eligible for column pricing discounts.</p> <ul style="list-style-type: none"> <i>selected</i> = The item/SKU is eligible for column pricing discounts. You will advance to an additional screen where you may define the effective date, quantity, price, associate price, and pricing column. <i>unselected</i> = The item is not eligible for column pricing discounts. <p><i>What is column pricing?</i></p> <p>In the Customer table, you may assign a customer to a pricing column. This means that the customer will be charged the column price, even if the customer does not order the number of units specified for the price break. If the customer orders more units than specified in the column assignment, the price break at the next level will be used on the order.</p> <p><i>Example:</i></p> <pre>Quantity Price Assoc. Price Column 1 \$100.00 \$95.50 01 5 \$ 90.00 \$85.50 02 10 \$ 80.00 \$75.95 03</pre>
Pickup/new	<p>Indicates whether the item has been carried over from a previous offer or is new to your product offerings.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Pickup</i> = Item is a pickup item, previously sold in an offer <i>New</i> = Item is a new addition to your offer <p>Optional.</p>
Warranty	<p>Defines whether the item/SKU in this offer is a warranty item.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = The item/SKU in this offer is a warranty item. When an operator adds this item/SKU to an order in order entry or order maintenance, the system adds the item to the order at no charge. <i>unselected</i> = The item/SKU in this offer is not a warranty item. <p>If the <i>Default Price Override Reason for Warranty Items (G01)</i> system control value contains a price override reason code, the system defaults this code to the Price override code field, otherwise the operator must enter a code.</p>

Field	Description
Required reason code	<p>Defines whether an <i>Order addition reason code</i> is required when the item in this offer is added to an order in order entry or order maintenance. When you specify an add reason code for an item, there is a record of the add reason code stored in an order line history record, available for review at the <i>Display Order Line History Screen</i>.</p> <p>Valid values are:</p> <ol style="list-style-type: none"> <i>selected</i> = The item in this offer requires an add reason code when the item is added to an order in order entry or order maintenance. The <i>Enter Add Reason Window</i> opens when an operator adds this item to an order in order entry or order maintenance. <i>unselected</i> = The item in this offer does not require an add reason code when the item is added to an order in order entry or order maintenance.

 **Note:**

When the item is added automatically to an order through the order API, the add reason code is not required. For example, an item might be added to an order automatically if it is set up as a free gift by source code.

Item Volume Discounting

How volume discounting works: If the Volume discount field is *selected* at the *Create Item Offer Screen*, *Create SKU Offer Screen*, or another screen that allows you to set up an item/offer or SKU/offer, and if the *Item Volume Discount (B29)* system control value is selected, the system will:

- total the number of units ordered of volume- discountable items
- check the quantity break price table in the SKU/offer for the discount price for each discountable item

For example, the system calculates the volume discount for items A123 and C123, as if the customer purchased 12 units of each item.

Item	Order qty	Volume discount	Regular price/unit	Merchandise total (regular price)	Volume discount price/unit	Merchandise total (with volume discount)
A123	* 4	Y	\$10.00	\$40.00	\$7.00	\$28.00
B123	6	N	\$5.00	\$30.00	N/A	\$30.00
C123	* 8	Y	\$20.00	\$160.00	\$15.00	\$120.00
Total:	Total:	Total:	Total:	\$230.00	Total:	\$178.00

Working with Existing Items (MITM)

Purpose: An item is a unit of inventory that is defined to the system according to item codes. The item code consists of 12 alphanumeric characters, and optionally, a three 4-position alphanumeric SKUs which allow you to further define the item by characteristics such as color, size, etc.

After defining your items, you can use the item number to access an item directly, or you can enter the description, department, buyer, class, and/or vendor to obtain a list of items that closely match your entry.

Before you can locate an item or display item information, you must create the item information on the system. You can create items by selecting *Create* at the [Select Items Screen](#). See [Creating Items Screen Flow](#) for more information on the screens the system automatically displays, depending on whether you are creating a non-SKU'ed or SKU'ed item.

Item image: When you move your mouse over each item code, the screen displays the item image if you have set one up. See [Setting Up Item Images](#) for more information.

Work with Items Screen

Purpose: Use this screen to create, change, delete, display or work with items.

How to display this screen: Select *OK* at the [Select Items Screen](#).

Field	Description
Item	A code representing a unit of inventory. Alphanumeric, 12 positions; optional.
Description	The description of the item. Alphanumeric, 120 positions; optional.
Class	A class code is a grouping of similar items. See Working with Item Classes (WICL) . Alphanumeric, 3 positions; optional.
Dept (Department)	The department to which the item belongs. See Working with Long SKU Departments (WLSL) . Numeric, 4 positions; optional.
SKU	Defines whether the item contains SKUs. <ul style="list-style-type: none"> <i>NO</i> = The item is not a SKUed item. <i>YES</i> = The item is a SKUed item.

Screen Option	Procedure
Create a new item	Select <i>Create</i> to advance to the Create Item Screen .
Change item information	Select <i>Change</i> for an item to advance to the Change Item screen. See the Create Item Screen for field descriptions.

Screen Option	Procedure
Delete item information	Select <i>Delete</i> for an item to delete it.
	<div data-bbox="998 373 1347 821" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If you try to delete an item with SKUs, you must delete SKU records and change the SKUs Y/N flag to <i>N</i> before deleting the item. If you try to delete without performing these tasks, the system displays the message: Cannot delete, SKUs allowed flag is Yes.</p> </div>
	<div data-bbox="998 919 1310 1094" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>You cannot delete an item if there are open orders or on-hand quantity for the item.</p> </div>
Display item information	Select <i>Display</i> for an item to advance to the Display Item screen. See the <i>Create Item Screen</i> for field descriptions.
Comments	Select <i>Comments</i> for an item to display the Work with Item/SKU Comments Screen .
Item Coordinates	Select <i>Coordinates</i> for an item to advance to the Work with Item Coordinates Screen .
Copy item information from one item to a new item in the same company.	Select <i>Copy</i> for an item to advance to the Copy Item Window .
Add, change, or delete item information, for an item with the same item number as the copied item, in one or more shared companies	<p>Select <i>Copy to Company</i> for an item to advance to the Copy Item to Company Window.</p> <p>An error message indicates if you do not have authority to the Copy Item to Company Security (B15) secured feature: Not authorized to Copy.</p> <p>An error message indicates if shared companies do not exist for the current company: Shared companies do not exist for the parent. You can define shared companies for a company in Working with Companies (WCMP).</p>
Country/State Restriction	Select <i>Ctry/St Restr</i> for an item to advance to the Work with Item Restriction by Country/State Screen .

Screen Option	Procedure
Finished goods	Select <i>Finished Goods</i> for an item to display the Work with Finished Good Component Items Screen .
External Image and Information Link	Select <i>Image/Info Link</i> for an item to advance to the Item Image/Info Link Screen .
<div style="border: 1px solid #0070c0; padding: 10px; background-color: #e1eef6;"> <p> Note: This option is available only if the Use External Item Image (L55) system control value is selected.</p> </div>	
Item Keywords	Select <i>Keywords</i> for an item to advance to the First Work with Keywords for Item Screen .
Offers	Select <i>Offers</i> for an item to advance to the Work with Item Offers Screen .
Sets	Select <i>Sets</i> for an item to display the Work with Set Component Items Screen .
Item ship via overrides	Select <i>Ship Via Override</i> for an item to advance to the Select Ship Via for Override Screen .
SKUs	Select <i>SKU</i> for a SKUed item to advance to the Work with SKUs Screen .
SKU Generator	Select <i>SKU Generator</i> for an item to advance to the SKU Generator Screen (Entering SKU Information) .
Source Prices	Select <i>Source Prices</i> for an item to display the Work with Special Source Price Screen .
UPC codes	Select <i>UPC</i> for a non-SKUed item to advance to the Work with UPC Codes Screen . You can work with UPC codes for a SKUed item by selecting <i>SKU</i> for the item and selecting the UPC option from the Work with SKUs Screen .
Work with user defined fields	Select <i>User Fields</i> for an item to advance to the Work with User Fields Screen .
Variable Sets	Select <i>Variable Sets</i> for an item to display the Work with a Variable Set Groups Screen .
Vendor Item	Select <i>Vendor Item</i> for an item to advance to the Work with Vendor Item Screen .
Warehouse	Select <i>Warehouse</i> for an item to display the Work with Item Warehouse Screen .
Maintain supporting files	Select <i>Supporting Files</i> .

Working with Item Ship Via Overrides

Item ship via overrides are the shippers that can be used to deliver a particular item to its destination, even if the other items on the order are delivered by another ship via.

Each shipper that qualifies as an item ship via override is defined in the Item Ship Via Override table for the item.

- If the shipper qualifies as a ship via override for the item, the shipper can be used to deliver the item to its destination.
- If the shipper does not qualify as a ship via override for the item, the shipper cannot be used to deliver the item to its destination.

 **Note:**

If records do not exist in the Item Ship Via Override table for an item, any valid, qualifying shipper in the Ship Via table can be used to deliver the item to its destination.

In this topic:

- [Item Ship Via Override Logic](#)
- [Select Ship Via for Override Screen](#)

Item Ship Via Override Logic

When you add an item to an order the system looks at the Item Ship Via Override table to determine if the ship via on the order header is an eligible shipper for the item; if the ship via on the order header is not an eligible shipper for the item, the system displays a [Ship Via Overrides for Item Window](#), requesting you to select an eligible shipper for the item on the order line. The system assigns the eligible shipper to the item on the order line; however, the system does not override the existing shipper on the order header.

Example: You enter an order containing items with records in the Item Ship Via Override table.

Ship via on order header: 3	Ship via on order header: 3	Ship via on order header: 3
Item	Ship via override	Results
AB101	ship vias 1 and 2	When you add item AB101 to the order, the Ship Via Overrides for Item window opens where you must select an eligible shipper (1 or 2) for the item before adding the order line to the order.
BC202	ship vias 1 and 3	When you add item BC202 to the order, the system does not assign a ship via to the order line and instead uses the default ship via on the order header (ship via 3) as the shipper.
CD303	ship vias 1 and 2	When you add item CD303 to the order, the Ship Via Overrides for Item window opens where you must select an eligible shipper (1 or 2) for the item before adding the order line to the order.
DE404	no ship via overrides defined	When you add item DE404 to the order, the system does not assign a ship via to the order line and instead uses the ship via on the order header (ship via 3) as the shipper.

When does the item ship via override take place? The system evaluates the shipper assigned to ship the item to its destination in the following places.

Function	Validation Takes Place When
Order entry and maintenance	<p>You select <i>OK</i> to add the item to the order.</p> <p>You select <i>OK</i> to accept any changes you made to the order line at the Work with Order Line Screen (Changing/Adding an Item).</p> <p>You select <i>Accept</i> or <i>Add Recipient</i> to accept the order if the order is eligible for other ship via overrides or you have changed the ship via on the order header since adding the item to the order.</p>
Batch order entry	<p>You select <i>OK</i> to add the item to the order.</p> <p>You select <i>OK</i> to accept any changes you made to the order line at the Work with Order Line screen.</p> <p>You select <i>Accept</i> or <i>Add Recipient</i> to accept the order if the order is eligible for other ship via overrides or you have changed the ship via on the order header since adding the item to the order.</p>
Generic order processing	<p>The Order Processor job processes the incoming order. If the ship via for an item on the incoming order is not eligible to ship the item, the order is placed in an error status and must be corrected in batch order entry. See <i>Generic Order Interface (Order API)</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

 **Note:**

The system does not evaluate the ship via for items on a customer membership. However, if you go into order maintenance for that customer membership, the system will then evaluate the ship via for the items on the order.

What items are evaluated? The system evaluates every item added to an order to determine if records exist in the Item Ship Via Override table for the item, regardless of whether the item is backordered, soldout, added as a free gift, etc.

If the ship via assigned to the item is not eligible, the system displays the [Ship Via Overrides for Item Window](#), requiring you to select an eligible shipper.

 **Note:**

If you use the [Process Substitute Items Screen](#) to replace an open, unreserved item on the order with another item, the system does not validate that the ship via on the order is eligible to ship the new item; you must go into order maintenance to validate the shipper assigned to the new item.

What if you override the ship via on the order header? If you override the ship via on the order header, the system reevaluates each order line whose Ship via field is

blank to determine if the new ship via on the order header is eligible to ship the item. If the new ship via on the order header is not eligible, the system displays the [Ship Via Overrides for Item Window](#) for each item that cannot ship using the ship via on the order header, requiring you to select an eligible ship via for the item on the order line.

What if the item qualifies for more than one item ship via override? Each ship via that qualifies as an eligible shipper for the item displays in the *Ship Via Overrides for Item Window*, where you can select which shipper you wish to use to deliver the item to its destination. Any ship via that does not have a record in the Item Ship Via Override table for the item, does not display in the Ship Via Overrides for Item window.

What if you override the ship via on the order line? If you override the ship via on the order line, the system verifies that the ship via you define is eligible for the item, based on the records in the Item Ship Via Override table for the item. If the ship via you define does not exist in the Item Ship Via Override table for the item, the *Ship Via Overrides for Item Window* opens, requiring you to select an eligible ship via.

Valid SCF/Ship Via required: In order for the item ship via override to apply to an order line, the override ship via must already be set up with the SCF on the order shipping address as a valid SCF/ship via combination. If the SCF/ship via is not valid combination, the item ship via override will not apply to the order.

Downloading item ship via overrides to e-commerce: When you download items using the [Downloading E-Commerce Offer Files \(EOFR\)](#) menu option, if an item being downloaded has records in the Item Ship Via Override table, the system also downloads the item ship via override records to the EC Item Ship Via Override Download table.

**Note:**

The setting of the Download to e-commerce field defined for a ship via in the Ship Via table controls whether the ship via is eligible to download to e-commerce using the SCF/Ship Via download program; however, this field does not control the downloading of item ship via overrides.

Prompting on ship via: If records exist in the Item Ship Via Override table for an item, when you prompt on the Ship via field for an item, the system displays only those shippers that are eligible to ship the item. If you enter a ship via for an item that is not an item ship via override an error message indicates: *Invalid ship via for item*. If item ship via overrides do not exist for the item, you can define any valid ship via code in this field.

Are there other ship via overrides that might apply to the order? There are several other ways you can apply a ship via override to an order; however, item ship via overrides take precedence over any other ship via override. See [Ship Via Override Hierarchy](#) for information on the hierarchy in which the overrides take place.

Interaction Between Item Ship Via Overrides and Other Ship Via Overrides	How does this override relate to the item ship via override?
Item	<p>If there is a Ship via specified for an item, the system defaults this ship via code to the order line.</p> <p>However, if there are any records in the Item Ship Via Override table for the item, the system requires you to enter an eligible shipper in the Ship via field for the item in order entry. This way, only an eligible shipper defaults as the ship via on the order line.</p>
Promotion	<p>If an order, or shipping address on an order, qualifies for a promotion with a ship via override, the system changes the ship via on the order header when you select <i>Accept</i> or select <i>Add Recipient</i> to accept the order.</p> <p>However, if the ship via override from the promotion is not a valid shipper for each item on the order that does not already have a ship via override, the system does <i>not</i> apply the ship via override from the promotion to the order.</p> <p>See Working with Promotions (WPRO) for more information on defining a ship via override for a promotion.</p>
Zip/Ship Via	<p>If the ship via on the order header allows auto-assignment of carrier (the ship via's Allow auto assignment field is selected) and a default ship via is defined for the postal code on the order, the system changes the ship via for the ship to customer to the default ship via for the postal code.</p> <p>However, if the zip ship via override is not a valid shipper for each item on the order that does not already have a ship via on the order line, the system still defaults the zip ship via override to the order header, but displays the Ship Via Overrides for Item Window for each item that requires a valid ship via, based on the Item Ship Via Override table.</p> <p>See Working with Zip/Ship Via (WZSV).</p>
Best Way Ship Via	<p>If you select a best way ship via from the Alternate Shipping Charges by Via Window in order entry, or the system assigns a best way ship via automatically, it changes the ship via on the order header to the best way ship via. See Working with Best Way Ship Vias for more information.</p> <p>However, if the best way ship via is not a valid shipper for each item on the order that does not already have a ship via assigned, the system still defaults the best way ship via to the order header, but displays the Ship Via Overrides for Item Window for each item that requires a valid ship via, based on the Item Ship Via Override table.</p>

Interaction Between Item Ship Via Overrides and Other Ship Via Overrides	How does this override relate to the item ship via override?
Offer Ship Via	<p>If an order, or shipping address on an order, qualifies for an offer ship via override, the system changes the ship via on the order header when you select <i>Accept</i> or <i>Add Recipient</i> to accept the order.</p> <p>However, if the offer ship via override is not a valid shipper for each item on an order line whose Ship via field is blank, the system does <i>not</i> apply the offer ship via override to the order. If you add an item after the offer ship via override has been assigned to the order and the offer ship via override is not eligible for that item, the system displays the Ship Via Overrides for Item Window, requiring you to select an eligible shipper for the item.</p> <p>See Working with Offer Ship Via Assignment (WSVA).</p>
SCF Preferred Ship Via	<p>If a Preferred ship via is defined for the SCF and the Allow auto assignment field for the ship via is selected, the system updates the Ship via on the order header to the preferred ship via.</p> <p>However, if the preferred ship via for the SCF is not a valid shipper for each item on the order that does not already have a ship via assignment, the system still defaults the preferred ship via to the order header, but displays the Ship Via Overrides for Item Window for each item that requires a valid ship via, based on the Item Ship Via Override table.</p> <p>See Working with SCF Codes (WSCF).</p>

Item ship via overrides during pick slip generation: If the ship via for the pick slip is not a valid shipper for the item, based on the Item Ship Via Override table, the system continues to print the pick slip.

Additionally, if you define a ship via override during pick slip generation and the ship via override is not a valid shipper for all of the items on the pick slip, the system continues to print the pick slip using the ship via override.

Select Ship Via for Override Screen

Use this screen to review the ship via overrides eligible for an item. You can select which ship vias can be used to ship the item to its destination. All ship vias defined in the Ship Via table display on this screen.

The Selected field indicates if the shipper qualifies as a ship via override for the item. When you first advance to this screen, all ship vias are unselected.

- If the Selected field is *selected*, the shipper qualifies as a ship via override for the item and can be used to deliver the item to its destination. The system creates a record in the Item Ship Via Override table for the item and ship via combination.
- If the Selected field is *unselected*, the shipper does not qualify as a ship via override for the item and cannot be used to deliver the item to its destination.
- If the Selected field is *unselected* for all ship vias that display on the screen, you have not defined any ship via overrides for the item and all shippers are eligible to deliver the item to its destination.

How to display this screen: Select *Ship Via Override* for an item at the Work with Items screen and select *OK*.

Field	Description
Item	The code and description of the item for which you wish to define ship via overrides. Item code: Alphanumeric, 12 positions; display-only. Item description: Alphanumeric, 120 positions; display-only.
Code	The code for a shipper you can select as a ship via override for the item. Ship via codes are defined in and validated against the Ship Via table. Numeric, 2 positions; optional.
Description	A description of the shipper. Alphanumeric, 30 positions; optional.
Via pty (Ship via priority)	A value assigned to the shipper that controls how the system allocates inventory to backorders or reserves inventory during Batch Reservation. Valid values are 0 - 9, where 0 is the lowest priority and 9 is the highest priority. Numeric, 1 position; display-only.
Sel (Selected?)	Indicates if the shipper qualifies as a ship via override for the item. <i>Selected</i> = The shipper qualifies as a ship via override for the item; you can use this shipper to deliver the item to its destination. <i>Unselected</i> = The shipper does not qualify as a ship via override for the item; you cannot use this shipper to deliver the item to its destination.

 **Note:**

If this field is blank for all ship vias that display on this screen, you have not defined any ship via overrides for the item and all shippers are eligible to deliver the item to its destination.

Screen Option	Procedure
Select a shipper as a ship via override for the item; selected shippers can be used to deliver the item to its destination	<i>Select</i> the shipper. The system updates the Selected field to <i>Y</i> , indicating the shipper qualifies as a ship via override for the item.
Deselect a shipper as a ship via override for the item; unselected shippers cannot be used to deliver the item to its destination	<i>Deselect</i> the shipper. The system updates the Selected field to blank, indicating the shipper does not qualify as a ship via override for the item.

Screen Option	Procedure
Select all shippers as ship via overrides for the item; any shipper can be used to deliver the item to its destination	Select <i>Select All</i> . The system selects the Selected flag for all shippers, indicating all shippers qualify as a ship via override for the item. <div data-bbox="1029 430 1378 716" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> Note: The system creates a record in the Item Ship Via Override table for each ship via/item combination.</div>
Toggle to view all shippers or only view shippers that qualify as ship via overrides for the item	Select <i>Toggle All/Selected</i> . When you first advance to the screen, all shippers display.

Order Entry

- [Entering Orders](#)
- [Working with Error Order Batches](#)
- [Generic Order Interface](#)
- [Order Entry Appendices](#) (Integrations with AvaTax, Vertex, and Experian Data Quality (EDQ))

Entering Orders

Topic in this part: The following topics describe how to enter individual orders on the system as you receive them:

- [Introducing Order Entry](#) describes the process of entering orders on the system from a high-level point of view.
- [Setting Defaults in Order Entry](#) describes how to pre-define codes for several Order Entry fields.
- [Selecting Customers in Order Entry](#) describes how to select a customer for Order Entry.
- [Entering Orders](#) describes how to enter a complete order.
- [Working with Items on the Order](#) describes how to change, review or enhance information for items you have added to the order.
- [Upselling the Customer in Order Entry](#) describes several features available in the system that offer the customer discounts, incentive items, or free gifts, based on a quantity, item, source code, or offer on the order.
- [Expanding the Address in Order Entry](#) describes how to enter or verify additional address information that does not appear on the initial Order Entry screen.
- [Using a Permanent Shipping Address in Order Entry](#) describes how to specify a shipping address for the order that will be linked permanently to the customer who placed the order and may be used on future orders.
- [Assigning an Order Shipping Address](#) describes how to specify a shipping address for the order that will be linked to the current order only.
- [Adding a Recipient Order in Order Entry](#) describes how to enter the address to which the recipient or gift order will be shipped.
- [Assigning a Billing Address in Order Entry](#) describes how to specify a billing address for an order.
- [Defining Order Properties](#) describes several fields that are not available on the initial Order Entry screen that allow you to further define the order.
- [Adding Order Messages](#) describes how to add messages to the order for inquiry only or that may be printed on the invoice and/or pick slip.
- [Adding Miscellaneous Charges or Credits in Order Entry](#) describes how to add miscellaneous charges or credits to the order.

- [Displaying More Options in Order Entry](#) describes how to use options related to Order Entry that are not available on the Order Entry screens, including: Customer Action Notes, Customer Profile, Customer Messages, Void/Reprint Picks, and Order Totals (All Recipients).
- [Inquiring into Item Availability \(DIAV\)](#) describes how to select an item for the order prior to Order Entry, how to capture lost sales, review the current on-hand availability, review the quantity on-order with your suppliers, review the next expected delivery, review the quantities available at a given location in a warehouse, review the pending purchase order deliveries, and review important item information.
- [Entering User Fields](#) describes the Enter User Fields screen that may open automatically during Order Entry to capture any type of additional information about the customer.
- [Working with Order Summary Information](#) describes the Order Summary screen, which contains all items on the order and any recipient orders.
- [Posting a Return or Exchange Through Order Entry](#) describes the process of using Order Entry to enter a return or exchange if you do not have the original order on your system.
- [Entering Customer Memberships in Order Entry](#) describes how to create a customer membership by adding a membership item in order entry.
- [Entering Coupon Promotions on an Order](#) describes how to apply coupon discounts against an order or detail line.
- [Working with an Order-Level Email Address](#) describes how the system stores an email address specific to each order.
- [Valid Ship Vias for Window](#) describes the window you use to review all eligible ship vias for the order, including their overall shipping charges and expected delivery dates. Optionally, you can use this window to select a different ship via for the order.
- [Tracking Order/Call Disposition Activity](#) describes when the system captures order/call disposition activity.
- [Entering Pre-Order Quotes](#) describes how to create a pre-order for a customer listing the items the customer wishes to order and the order totals should the customer agree to place the order.
- [Customer Engagement Loyalty Integration](#) describes how to enroll sold to customers in the Oracle Retail Customer Engagement Loyalty program, review a customer's loyalty points and awards balances, accrue points from completed purchases, and redeem awards as a pro-rated merchandise discount on an order.

Introducing Order Entry

Purpose: This introductory topic describes different methods of entering an order, from straightforward Order Entry, in which you enter the most basic information to create an order, to full-fledged Order Entry, in which you may fine-tune order, item, or customer information.

In this topic:

- [What's Required?](#)
- [On Demand Reformatting](#)

- [Scan Order Lines Screen](#)
- [Work with Order Lines \(Adding a Line\)](#)

What's Required?

To complete an order you must define the customer placing the order, the customer receiving the merchandise, the merchandise being ordered, and how the customer is paying for the order.

Who is the customer?

Sold to customers are people placing orders. The system tables the customer's name and address and other basic information so that a customer master record is available for future use.

Ship-to customers are people receiving the merchandise. This may be the sold-to customer, the recipient of a gift, the address of a business or an address used for this order only.

Bill-to customers are people or businesses that are billed for the order. This type of customer exists when a business order is placed that will be paid "on-account."

See [Creating and Updating Customers](#) for more information on each type of customer.

What is the customer buying? This refers to the items purchased by the customer. Each item purchased represents an "order detail line."

How is the customer paying for the order? This refers to the method(s) by which the customer will pay for the order. The customer may pay by one or several payment methods (cash/check and/or credit card).

You can enter customer, item, and payment information at any point during the Order Entry process. For example, you can enter payment information:

- On the pop-up window for the payment type default
- On demand by selecting Payments to bring up the Payments screen
- On the Order Recap screen that opens automatically when you exit Order Entry (if defined in the System Control table)

You can select other functions during Order Entry to define the order further. For example, instead of entering an order in a straightforward fashion, you can select any of the functions at the bottom of the screen to add more information to the order.

Completing the order: Finally, you can take two different paths when you finish entering the order:

- Select **Accept** to accept the order if the information entered is accurate and valid
- Select **Reject** to reject the order if you make a keying error or if the customer cancels the order.

On Demand Reformatting

Purpose: Several commands are available during Order Entry that you can select at any point to use a different format, including:

- Scan order lines, which lists a single line of information for up to 8 items ordered.
- Add lines, which you use to add an item to the order and display additional fields to override standard information for the item.

Scan Order Lines Screen

Use this screen to display up to 8 lines on the order with a single line of information for each item. No item description or availability information is provided.

This format allows you to quickly review the items ordered. Select Next to review additional items on the order, as needed.

How to display this screen: Select Scan order lines at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

To return to the Work with Order Lines screen, select Detail. See the [Work with Order Lines Screen \(Adding Items to the Order\)](#) for descriptions of fields and additional options at the Scan Order Lines screen.

Work with Order Lines (Adding a Line)

Add item: Select Add line at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) to use the Add a Line function. The [Work with Order Line Screen \(Changing/Adding an Item\)](#) opens for you to add an item to the order while overriding standard item information.

Override order defaults: The order detail line information you enter on this screen overrides the defaults established for the order on the [Work with Order Screen](#). For example, you can override:

- Freight
- Future Order
- Arrival Date
- Source
- Ship Via
- Warehouse

Override item defaults: Additionally, the information you enter in these fields overrides defaults established for the item:

- Ofr (offer)
- C/G (coordinate group)
- S/H Code (special handling code)
- S/H Charge (special handling charge)
- Affect Inv (affect inventory)
- Drop Ship
- Priority
- G/W (gift wrap)
- Bypass Rsv (bypass reservation)
- Cost Override

Totals fields: Finally, the totals fields at the bottom of the screen show the quantities reserved, canceled, and soldout for the current item.

**Note:**

The totals in the *Printed* (on pick slips), *Shipped*, and *Returned* fields are updated after the order is accepted and can be reviewed through Order Maintenance or standard or streamlined Order Inquiry.

Setting Defaults in Order Entry

Purpose: You can set defaults for several order entry fields on the [Default Values for Orders screen](#).

A default is a valid code (value) for a field that will be used for each new order, until you override it manually. You can predefine values for these fields used in order entry:

- order type
- payment type
- salesrep number
- ship via
- country

In this topic:

- [Default Values for Orders screen](#)
 - [Setting a Default Order Type](#)
 - [Setting a Default Payment Type](#)
 - [Setting a Default Salesrep Number](#)
 - [Setting a Default Ship Via](#)
 - [Setting a Default Country](#)

Why set defaults? One real advantage of defining defaults for these fields is that you will not have to reenter the same information for each new order that uses the same default. For example, if you are entering orders that will be delivered by Sample Shipping, you can enter the code for Sample Shipping in the *Ship via* field. All orders will be delivered by Sample Shipping until:

- You override the default in the *Ship via* field for an order.
- You reset the *Ship via* default to ship all orders by another shipper.

The defaults you set for order entry are used until you override them for an order or you specify different defaults on this screen.

What if defaults exist? The *Order type*, *Salesrep number*, *Ship via* and *Country* fields may already contain default codes when you first enter the Default Values for Orders screen if defaults have been predefined in system control values related to these fields.

The defaults you set on this screen override the values defined in the related system control values; however, order entry uses the *Order type*, *Salesrep number*, *Ship via* and *Country* defaults from the System Control table if you do not define defaults for these fields on the Default Values for Orders screen.

Default Values for Orders screen

Purpose: Use this screen to define defaults for fields used in order entry.

How to display this screen: Enter OEOM in the *Fast path* field at the top of a menu or select Enter/Maintain Orders from a menu.

Error order batches: Select the *Error order batches* field to switch the order entry mode to batch order entry. See [Working with Error Order Batches](#).

Setting a Default Order Type

You use the order type code to:

- Group orders on the system, for example, phone orders
- Trace how orders were received
- Monitor employee performance and accuracy
- Determine the sorting sequence of some reports
- Control the format of the order entry detail screen *when using Header format only*

You can create an order type for any category of orders, but some common order types are mail, phone, fax, retail, and e-commerce.

Effect on detail screen: The format of the order entry screen (*when using default Header format only*) can be line-by-line entry or full screen entry, based on the code in the *Order type* field.

Example: Phone orders use line-by-line entry because you need to process each line and provide immediate feedback to the customer. Alternatively, mail orders use full screen entry because you work directly off an order form and you need to enter order lines as quickly as possible.

You must enter an order type code sometime during order entry; however, you are not required to define a default order type.

For more information: See [Establishing Order Types \(WOTY\)](#) for more information on order types.

Setting a Default Payment Type

Payment types used on orders fall into these categories:

- Cash/Check (prepaid)
- Credit Card

When to define this default? You might want to define a default payment type for entering mail or fax orders if you sort these orders by payment method before entry.

You can also use the System Control table to define whether to default in the pay type used on the customer's previous order. You can define a particular pay type to default, or all pay types. If you use the System Control table to specify defaulting the previous pay type, and if the pay type is a credit card, the system will provide the customer's credit card number and expiration date as well. If you use the [Default Values for Orders screen](#) to define a default pay type, however, it will override any default pay type defined in the System Control table.

For more information: See [Working with Pay Types \(WPAY\)](#) for a complete discussion of payment types.

Setting a Default Salesrep Number

The salesrep number is a code for the person who is credited for making the sale on a new order. When you enter a sales representative number on an order, you link the order to this person for sales and commission reports.

Note:

The salesrep number can be different from the person who entered the order in order entry.

You can enter a salesrep number during order entry; however, a salesrep number can default from:

- the Customer Sold-to record
- the value defined in the [Default Salesrep Number \(E86\)](#) system control value

If you prompt on the *Salesrep#* field, the system displays the Select Salesrep window where you can review and select a valid salesrep. The window indicates whether the salesrep is active and if a home store has been assigned to the salesrep.

For more information: See [Working with Sales Representatives \(WLS\)](#).

Setting a Default Ship Via

The ship via is a code that represents a carrier or service that will deliver the order. It is useful to define a default ship via when:

- The majority of your orders ship by one carrier, such as UPS.
- You are entering "rush" orders for a particular shipper, such as Federal Express.

You must enter a ship via code during order entry; however, you are not required to enter a default ship via.

For more information: See [Working with Ship Via Codes \(WVIA\)](#) for more information on ship via, including other situations when a ship via may default on an order.

Setting a Default Country

The country is a code for the country to which orders will be delivered. It is useful to define a default country if the majority of your orders ship to the same country.

You must enter a country code during order entry; however, you are not required to define a default country.

For more information: See [Setting Up the Country Table \(WCTY\)](#).

Screen Option	Procedure
Accept the defaults and advance to the Select Customer Sold To For Order Screen or the Customer Scan Screen	Select OK.
Switch to order maintenance so that you can update an existing order or quote	Select Maintain Orders. See Introducing Order Maintenance for standard order maintenance or Maintaining Quotes in Order Maintenance for quote maintenance.

Selecting Customers in Order Entry

Purpose: This topic describes how to select the customer to enter an order. You can find the customer by entering the customer number, scanning for the customer number, or selecting Create to add the customer record to the system.

This is the first step in entering a new order.

In this topic:

- [Select Customer Sold To For Order Screen](#)
- [Select Source Screen](#)
- [Entering a Customer Number](#)
- [Ghost Customer Number Warning Window](#)
- [Scan Types](#)
 - [How to Scan?](#)
 - [Using the Scan Screen](#)
 - [Carrying Forward Search Information](#)
- [Change Cust Sold to Name & Address Screen](#)
- [Creating a New Customer](#)
- [Customer Order History Window](#)
- [Customer Selection Screen](#)
- [Work with Customer Call Log Screen \(WCLL\)](#)
- [Log Telephone Call Screen \(Entering or Changing a Call\)](#)
- [Customer Scan Screen](#)

Select Customer Sold To For Order Screen

If using the Customer Selection screen: Use this screen to select a customer for order entry. This screen allows you to review customer and order information and advance to a number of additional functions. See [Customer Selection Screen](#).

You can select a customer from this screen by:

- entering a customer number
- scanning for a customer
- creating a customer during order entry

Customer Workflow Management window: The [Customer Workflow Management Window](#) automatically opens when you select a customer for order entry if open or in use ticklers exist for the sold to customer. Select Ticklers at this window to advance to the [Work with Ticklers Screen \(sold to customer view\)](#) where you can review and work with ticklers associated with the sold to customer.

How to display this screen: Select OK at the [Default Values for Orders screen](#), unless:

- If you are flagged as a *CTI user*, you advance instead to the [Customer Selection Screen](#).

- If the [ORCE Customer Integration \(L37\)](#) system control value is set to INTERACT, you advance instead to the [Customer Scan Screen](#).

Field	Description
Batch #	The number identifying the batch you are currently working with. Displayed only if you selected the <i>Error order batches</i> option at the Default Values for Orders screen. <i>Numeric, 5 positions; display-only.</i>

Field	Description
Source code	<p>A code to identify a group of customers. Use source codes to define freight methods, track your marketing efforts, and for reporting.</p> <p>Included when?</p> <p>The source code field is included and enterable only if the Cross company scan field in the Company table is selected and you do not choose to scan from the Customer Selection Screen. If the field is included, you can scan into other companies that have the same setting in the Active company field in the Company table as your company.</p> <p>If you enter a source code</p> <p>When you enter a source code in this field and select <i>OK</i>, the system:</p> <ul style="list-style-type: none">• displays the description of the source code to the right of this field.• displays the code and description of the offer associated with the source code underneath this field.• defaults the source code to the order. <p>To scan for a source code</p> <p>If you prompt on the <i>Source code</i> field, you advance to the Select Source Screen, where you can select a source code.</p>

 **Note:**

If you select a source code that is defined in multiple Order Administration companies, the system returns you to the [Select Customer Sold To For Order Screen](#) or the [Customer Scan Screen](#) in the company with the lowest company number. For example, if source code A123 is defined in companies 7 and 12 and you select A123 from the Select Source screen, the system returns you to the Select Customer For Order screen in company 7.

If you receive calls from an external order call center

If you have enabled Order Administration to receive calls from an external order call center, the system defaults the source code associated with the call to this field. In addition, if the [Capture Order/Call Disposition \(K03\)](#) system control value is set to ALL, the system creates a record in the [Order Disposition Table](#) so that you can track order/call disposition activity; see [Tracking Order/Call Disposition Activity](#).

Code: Alphanumeric, 9 positions; optional.

Description: Alphanumeric, 30 positions; display-only.

Field	Description
Offer code and description (unlabeled field below <i>Source code</i>)	The code and description of the offer associated with the source code you entered in the <i>Source code</i> field. <i>Code: Alphanumeric, 3 positions; display-only.</i> <i>Description: Alphanumeric, 30 positions; display-only.</i>
Customer (Sold-to customer number)	A number assigned by the system to identify the customer. You advance immediately to the initial order entry screen to enter an order for this customer when you enter a valid customer number. See Entering a Customer Number . Ghost? If you enter the number of a Ghost customer, the Ghost Customer Number Warning Window , informs you that the customer number you entered has been merged with another customer number. <i>Numeric, 9 positions; optional.</i>
Match code	A code that the system assembles in the format you define through the Match Code function. The match code contains elements of the customer's name and address. The system assigns a match code to every customer on the system to identify duplicate customers and to detect fraudulent addresses. Enter a match code to advance to a scan screen that lists customers whose match codes follow your entry alphanumerically. Select the customer for order entry from the scan screen. See Scan Types . Two examples of match codes are: BILHINHER12345 CHRSWE22H02062 See dSetting Up Match Codes (MMCH) . <i>Alphanumeric, 15 positions.</i>
Postal code	A postal delivery area. Enter a postal code/last name or postal code/company name combination to advance to a scan screen that lists customers whose postal codes/last names or postal codes/company names follow your entries alphanumerically. Select the customer for order entry from the scan screen. See Scan Types . Scan length: The Postal Code Scan Length (F61) system control value controls how many characters of the postal code to use when searching for a customer. See that system control value for a discussion. See dSetting Up the Zip/City/State (Postal Code) Table (WZIP) . <i>Alphanumeric, 10 positions.</i>
Last name	The sold-to customer's last name. Enter a full or partial last name to advance to a scan screen that lists customers whose names follow your entry alphanumerically. Enter a full (not partial) last name and first name to advance to a scan screen that lists customers with last names and first names that follow your entry alphanumerically. Select the customer for order entry from the scan screen. See Scan Types . <i>Alphanumeric, 25 positions.</i>

Field	Description
First name	<p>The sold-to customer's first name. Enter a last name, first name, and postal code to advance to a scan screen that lists customers by postal code, last name, and first name, positioned to the customer you entered. Select the customer for order entry from the scan screen. See Scan Types.</p> <p>You cannot scan on first name alone.</p> <p><i>Alphanumeric, 25 positions.</i></p>
Company	<p>The sold-to customer's company name. Enter a full or partial company name to advance to a scan screen that lists customers whose company names follow your entry alphanumerically. Select the customer for order entry from the scan screen. See Scan Types.</p> <p><i>Alphanumeric, 30 positions.</i></p>
Telephone #	<p>The daytime, evening, fax, or mobile telephone number of the sold-to customer. Enter a full or partial telephone number to advance to a scan screen that lists customers whose telephone numbers follow your entry alphanumerically. Select the customer for order entry from the scan screen. See Scan Types.</p> <p>You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY).</p> <p><i>Alphanumeric, 14 positions.</i></p>
Alternate customer number	<p>An additional number to identify the sold-to customer. This may be a customer number from another system.</p> <p>Field label: The field label on this screen is based on the name you enter in the Alternate Customer Number Label Description (H95) system control value; if you do not enter a name in this system control value, the field label is <i>Alt customer</i>.</p> <p>Example:</p> <div data-bbox="938 1247 1458 1537" style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>Scanning by the alternate customer number of a ghost customer is not currently implemented if the Display Alternate Customer Cross Reference Window (I84) system control value is selected.</p> </div> <p>Alternate customer number cross-reference: Enter an alternate customer number to advance to a subsequent scan screen that lists customers by alternate customer number. See Display Alternate Customer Cross Reference Window (I84) for more information.</p> <p><i>Alphanumeric, 15 positions.</i></p>

Field	Description
Email Address	An email address for the customer. When you enter a full or partial email address, you advance to the Scan Customer by Email Address screen, where you can scan by any email address on file for a sold-to customer. Not case sensitive. See Scan Types . <i>Alphanumeric, 50 positions.</i>

Screen Option	Procedure
Change the default value for one or more order entry fields	Select Change Defaults. See Setting Defaults in Order Entry .
Enter an order or quote for a new customer	Select Create. See Entering Orders for standard order entry or Entering Pre-Order Quotes for quote entry.
Change an existing order or quote	Select Maintain. See Performing Order Maintenance for standard order maintenance or Maintaining Quotes in Order Maintenance for quote maintenance.
Inquire on an item's availability, use the notepad function to select items for a new order, or capture lost sales	Select Item Avail. See Display Item Availability Screen.
Mail a catalog to a new or existing customer	Select Catalog Request. See Entering Catalog Requests (WCAT) .
Exit the screen and return to the main menu	Select Exit. If the Capture Order/Call Disposition (K03) system control value is set to ALL, and you advanced to this screen from a call received from an external order call center, the system displays the Confirm Order/Call Disposition Window where you must enter the reason for exiting this screen instead of creating an order. In addition, the system creates a record in the Order Disposition Table ; see Tracking Order/Call Disposition Activity .

Select Source Screen

Purpose: If you are working in a company that has cross-company scanning enabled and you do not use the [Customer Selection Screen](#), you can scan into other companies that also have cross-company scanning enabled. You can scan only across companies that have the same setting in the *Active company* field in the Company table; this prevents you from inadvertently scanning from a test or training company to a “live” company, or vice versa. See [Working with Companies \(WCMP\)](#).

How to display this screen:

- enter a valid source code for a different, compatible company in the [Source code](#) field at the [Select Customer Sold To For Order Screen](#); the source code and description, associated offer, and description display, and the selected company name is listed at the top of the screen; *or*
- click on the arrow in the [Source code](#) field.

 **Note:**

If the [Sort Source Codes Prompt by Description in Order Entry \(F67\)](#) system control value is selected, the system displays source codes alphanumerically by source code description instead of by source code.

Field	Description
Source	A code to define a group of customers. See Working with Source Codes (WSRC) . <i>Alphanumeric, 9 positions; optional.</i>
Description (Source code description)	The description associated with the source code. You cannot scan on this field. <i>Alphanumeric, 25 positions; display-only.</i>
Cmp (Company)	A code representing the company associated with the source code. <i>Numeric, 3 positions; optional.</i>
Ofr (Offer)	A code representing a catalog, advertisement, or other means of presenting merchandise to your customers. Each source code is associated with an offer. See Working with Offers (WOFR) . <i>Alphanumeric, 3 positions; optional.</i>
Description (Offer description)	The description associated with the offer. You cannot scan on this field. <i>Alphanumeric, 25 positions; display-only.</i>

Screen Option	Procedure
Select a source	Select a source code to return to the Select Customer Sold To For Order Screen in the company associated with the source code. For example, if you select source code A123 and it is a source code for company 7, the system returns you to the Select Customer Sold To For Order screen in company 7.

 **Note:**

If you select a source code that is defined in multiple Order Administration companies, you return to the Select Customer For Order screen in the company with the lowest company number. For example, if source code A123 is defined in companies 7 and 12 and you select A123 from the Select Source screen, you return to the Select Customer For Order screen in company 7.

Create a new source code	Select Create. See Working with Source Codes (WSRC) .
--------------------------	---

Entering a Customer Number

Purpose: Enter a customer number in the *Customer* field to select the customer placing the new order. Information on file for this customer is listed for the new order, but can be updated.

 **Note:**

The system updates customer information in the Customer table automatically when you change the customer's name or address during order entry.

Ghost Customer Number Warning Window

Ghost customers are customers whose records have been merged with the records of matching customers when you performed a merge/purge.

The ghost customer is the source customer in the merge; records for the source customer are merged with the records for a matching target customer; the system selects the most up-to-date information for target and source and saves these records in the target customer's record. When performing the merge you can elect to flag a source customer as a *Ghost* on the Working with Source Codes (WSRC). *Ghost* customer records are retained in the Customer Sold To table for informational purposes, but *Ghost* customers do not have order history, billing history, mail history or entity information, since all related history records are merged into the source (target customer) records.

When you enter the number of a ghost customer, the pop-up Warning Window opens.

Select Continue to advance to the order header screen with the target customer number entered on the order. For example, if you enter 202, a ghost customer, the system will display

this window informing you that customer 202 has been merged into customer 137. When you continue with the order process, customer 137 will default on the [Work with Order screen](#).

See *Working with Merge/Purge Sold-to Names (MMCS)* for more information on the merge/purge function.

Scanning for a Customer Number

Purpose: Enter information in any of the scan fields on the Select Customer Sold To For Order screen to locate a customer for order entry if you do not know the customer number.

Scan Types

Purpose: Enter any combination of customer information in the scan fields. You advance to a scan screen that lists the customers who closely match the information you entered. Each of these subsequent scan screens (except the Scan Customer by Phone Number and Scan Customer by E-mail Address screens) includes the customer name or company name, customer number, street address, city, state and postal code.

Several types of scans are available for customer selection, including *Scan Customer by...*

- Match Code
- Postal Code/Last Name
- Postal Code/Last Name/First Name
- Postal Code/Company Name
- Last Name
- Last Name/First Name
- Company Name
- Phone Number
- Alternate Customer Number
- E-mail Address

How to Scan?

You can enter partial or full information into any of the scan fields. For example, you can enter *J* or *JONES* in the *Last name* field to locate Howard Jones. (The *First name* field must be used in conjunction with the *Last name* and *Postal code* fields; you cannot scan on first name alone, or on last name, first name.)

Note:

Be as specific as possible when you enter scan information because the resulting scan screen will list only those customers who match the scanning criteria.

After entering scanning information, you advance to a scan screen that lists customers who closely match the information entered. The customers are listed alphabetically or numerically from the first record that matches your scan information until the end of the table.

**Note:**

The *E-mail Address* scan field is not case sensitive; an email address of `abc@example.com` matches an entry of `ABC@EXAMPLE.COM`, and vice versa.

Alphabetic Scan: For example, you receive this type of scan if you enter `J` in the *Last name* field:

JAM

JANE

JONES (etc.)

However, you receive this type of scan if you enter `JONES` in the *Last name* field:

JONES

JONESBURY

JONESTOWN (etc.)

Numeric Scan: You receive this type of scan if you enter `0` in the *Postal code* field:

01519

01527

01560 (etc.)

However, you receive this type of scan if you enter `02062` in the *Postal code* field:

02062

02069

02074

E-mail Address Scan: You receive this type of scan if you enter `aaa` or `AAA` in the *E-mail Address* field:

aadams@example.com

bcominski@example.co

zyarrow@example.com

AAAcats@example.com (etc.)

Using the Scan Screen

There are several ways to select a customer for order entry from the scan screen, depending on whether the customer is listed.

If the customer is listed: Enter a 1 next to the appropriate customer number to select the customer for order entry.

If you're not sure if this is the right customer: Select Display for a customer number to review additional information about the customer, such as telephone numbers. If the customer is correct, enter a 1 next to the customer number.

If the customer is not listed: There are two things you can do:

- Continue your search by scrolling through customer records (select Next). Additional customer records are available if a + appears in the lower right of the screen.
- Select Create to enter an order for a new customer. The system assigns a customer number to the new customer and captures the customer's name and address information in the Customer table under the new customer number.

Carrying Forward Search Information

When you select Create to create a new customer after you have scanned on postal code, company, last name, or any combination of these fields, the search information you had entered defaults onto the order header. This defaulting saves you keystrokes when you enter the information to create the new customer in your company.

For example, if you:

- enter a last name at the [Select Customer Sold To For Order Screen](#), and
- select Create at the Scan Customer by Last Name field

when you advance to the [Work with Order screen](#), the last name you entered will default into the appropriate field.

Similarly, if you:

- enter a postal code and company name at the [Select Customer Sold To For Order Screen](#), and
- select Create at the Scan Customer by Postal Code/Company screen

When you advance to the [Work with Order screen](#), the company name and postal code default into the appropriate fields. The city, state, and country associated with the postal code also default.

Note:

The most recent search information you have entered defaults onto the order header. If you enter additional or different information at a subsequent scan screen, this is the information that will default.

Change Cust Sold to Name & Address Screen

Purpose: Use this screen if you need to update the address.

How to display this screen: Select Change for the customer number at a scan screen, or select Customer Maintenance at the [Customer Selection Screen](#). You can update the customer's permanent name and address information on this screen. This is an easy way to update the customer record without exiting order entry.

 **Note:**

The [Display/Update Bill to Screen](#) opens if the Sold-to customer is linked to a permanent Bill-to account and [Update Bill-to Address with Sold-to Address Changes \(E13\)](#) is *selected* in the System Control table. The screen enables you to update the changes made to the Sold-to address to the Bill-to address.

Field	Description
Customer #	<p>A unique number to identify a customer. The system assigns a customer number automatically when you create a new Sold To Customer record.</p> <p>The system assigns the customer number whether or not you complete the customer record.</p> <p><i>Numeric, 9 positions; display-only, assigned by the system.</i></p>
Name	<p>The following 5 fields are available for you to enter the customer's full name:</p> <p>Prefix A title (such as "Mrs." or "Dr.") that precedes the customer's name. The prefix prints on labels and forms. <i>Alphanumeric, 3 positions; optional.</i></p> <p>First Name The Sold-to customer's first name. <i>Alphanumeric, 15 positions; optional.</i></p> <p>Initial The initial of the customer's middle name. <i>Alphanumeric, 1 position; optional.</i></p> <p>Last Name The customer's last name. <i>Alphanumeric, 25 positions; required if company name is not present.</i></p> <p>Suffix An addition to the customer's full name (such as "M.D.," "Fr.," or "III"). The suffix prints on labels and forms, but is not accessible to scans. <i>Alphanumeric, 3 positions, optional.</i></p>
Company	<p>The name of the company associated with the customer placing the order.</p> <p><i>Alphanumeric, 30 positions; required if last name is not present.</i></p>

Field	Description
Address	<p>The customer's street address, plus three additional lines for the customer's delivery address. This is the primary delivery address.</p> <p>Shipping to a Post Office Box</p> <p>To ship to a Post Office Box, enter POST OFFICE BOX, POST BOX, or any variation of PO BOX (with or without spaces or non-alphabet characters, such as P.O. BOX), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table).</p> <p>Example: Enter P.O. Box 9999 in the <i>Street</i> field to indicate delivery to a post office box instead of a home or company address.</p>

 **Note:**

If you type POST OFFICE BOX, POST BOX, or any variation of PO BOX in the customer's street address during order entry or through the Order API, the system automatically selects the *PO box* field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the *PO box* flag.

 **Note:**

When you create a customer outside of order processing, you need to select the *PO box* field manually.

Apt/suite

Alphanumeric, 32 positions; required.

The apartment number or suite number associated with the customer's delivery address.

Follow these steps to enter an apartment or suite address:

- Type APT to indicate an apartment or STE to indicate a suite.
- Insert a space and type the number of the apartment or suite, for example: APT 4 or STE 116.

Addresses must conform to United States Parcel Service (USPS) address formatting field description standards. For example, always precede the apartment or suite number with the appropriate abbreviation (for example, APT or STE).

Alphanumeric, 10 positions; optional.

Field	Description
Postal code	<p>The postal or zip code for this customer. This code represents a delivery area.</p> <p>If a postal code is required for the country, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <div data-bbox="938 457 1458 688" style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>The system fills in the City and State fields appropriately if you set up the Postal Code/City/State table and you enter a valid postal code.</p> </div>
City	<p><i>Alphanumeric, 10 positions; required or optional based on country.</i></p> <p>The city where the customer lives or receives mail or shipments.</p> <p><i>Alphanumeric, 25 positions; required.</i></p>
St (State)	<p>The state or province where the customer lives or receives mail or shipments. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Required only if the <i>Require state?</i> flag is selected for the country.</p> <p>The system validates that the state you enter is assigned to the SCF for the postal code.</p> <p><i>Alphanumeric, 2 positions; required or optional based on country.</i></p>
Ctry	<p>The code for the customer's country. Country codes are defined in and validated against the Country table.</p> <p>The Default Country for Customer Address (B17), if any, from the System Control table defaults here when you create a new customer; however, you can override the default.</p> <p><i>Alphanumeric, 3 positions; required.</i></p>

Field	Description
Delivery	<p>Identifies a business (commercial) or residential address. Used to calculate shipping charges for shippers that use rate tables (such as U.P.S.).</p> <p>The Default Delivery Code for New Order Entry Customers (D13) system control value defaults here; however, you can override this default.</p> <p>Valid values:</p> <ul style="list-style-type: none">• Business = Business rate table determines shipping charges.• Residential = Residential rate table determines shipping charges.• No distinction = No distinction between business and residence.

 **Note:**

Only Business and Residential are valid values for U.P.S. The system defines the shipper on an order as U.P.S. if the *Type* field in the Ship Via table = U; see [Working with Ship Via Codes \(WVIA\)](#).

Required.

Field	Description
Class	<p>A code that categorizes customers at a high level for reporting purposes. You can use customer class codes to:</p> <ul style="list-style-type: none"> • send offers to a limited group of customers • restrict item sales to a group of customers • bypass normal item reservation (If the customer is assigned to a class flagged to bypass reservation, then the bypass setting applies even if the <i>Bypass reservation</i> setting for the customer is unselected) • determine whether to prompt for user-defined fields in order entry <p>You can define a Default Customer Class in Order Entry (D63) to assign to all customers you create through order entry.</p> <p>Required? The Require Customer Class in OE, WCAT, and WCST (H85) system control value defines whether this field is required.</p> <p>Secured? The Maintenance of Customer Class Field (B07) secured feature defines whether you can enter or maintain the customer class field at this screen.</p>
Mail flag	<div data-bbox="938 873 1458 1245" style="border: 1px solid #0070C0; padding: 10px; margin-bottom: 10px;"> <p> Note:</p> <p>If the Require Customer Class in OE, WCAT, and WCST (H85) is selected and the customer does not have a customer class code assigned, a user who does not have authority based on the Maintenance of Customer Class Field (B07) secured feature cannot update a customer.</p> </div> <p>See Setting Up the Customer Class Table (WCCL) on working with customer classes.</p> <p><i>Alphanumeric, 2 positions; optional.</i></p> <p>Controls whether the customer receives future catalogs. Not to be confused with the three-position, alphanumeric Mail code field described above. This field is selected or N for new customers (added through order entry or a catalog request), depending on the value in the Default Mail Name (D10) system control value. Also defaults into the mail code on the first Create Customer Sold To screen, although you can override it.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • selected = Mail catalogs to the customer • unselected = Do not mail catalogs to the customer

Field	Description
Rent flag	<p>Controls whether to include the customer's name in lists you sell to other companies for their own catalog mailings.</p> <p>This field is selected or N for new customers (added through order entry or a catalog request), depending on the value in the Default Rent Name (D11) system control value.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> selected = You can sell the customer's name to another company unselected = Do not sell the customer's name to another company
Opt in/Opt out	<p>Indicates the preferred method of correspondence for the primary email address.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> O1 (Email) = Email is the preferred method of correspondence. O2 (Order-only email) = Use email for order-related correspondence only; generate a document for other correspondence. O3 (No email) = Do not use email for any correspondence; generate a document instead. O4 (Do not ask the customer) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>For a new customer, this value defaults from the Default Opt In/Opt Out Flag (G97) system control value, but you can override the default.</p>

 **Note:**

The above values use the letter O, not the number 0 (zero).

Email notifications: See [When Does the System Generate an Email Notification?](#) for an overview.

Outbound email API: The opt in/opt out settings controls the generation of the *Outbound Email XML Message (CWEmailOut)* using the same logic as the generation of outbound emails. See *Outbound Email API* for an overview.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Updating from an external system: See [Receiving Customer Email Status Updates From an External System](#) for an overview and the required setup.

Alphanumeric, 2 positions; required.

Field	Description
Mail code	<p>This code specifies how often, and under what conditions, you send mail to the customer. You can use this code to indicate the customer's mail preferences with more precision than the <i>Mail</i> flag, discussed below, permits.</p> <p>Mail codes are defined in and validated against the Mail/Call Code table. See Working with Mail/Call Codes (WMCC).</p> <p>After you create a sold-to customer at this screen, the value in the <i>Mail</i> flag defaults into the mail code field if you have not entered a mail code. You must define this value (either Y or N) in the Mail/Call Code table or the screen displays an error message.</p> <p><i>Alphanumeric, 3 positions; optional.</i></p>
Call code	<p>This code specifies how often, and under what conditions, you call the customer.</p> <p>Call codes are defined in and validated against the Mail/Call Code table. See Working with Mail/Call Codes (WMCC).</p> <p><i>Alphanumeric, 3 positions; optional.</i></p>
Telephone	<p>The phone numbers and extensions for the sold-to customer. The Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mobile</i> number.</p> <p><i>Phone number: alphanumeric, 14 positions each field; display-only.</i></p> <p><i>Extension: alphanumeric, 4 positions; display-only.</i></p>

Field	Description
Pop Up Messages	<p>Four optional message lines.</p> <p>Where do these messages display? These messages display on the:</p> <ul style="list-style-type: none"> • Customer Selection Screen as one 80-position field. <div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>The system does not add or remove any spaces when displaying these messages as one 80-position field; enter the text as you wish it to display. For example: If a word ends at the end of a message, put a space at the beginning of the next message so that the next word is separated from the previous word. If a word splits between the end of one message and the beginning of the next message, do not add a space at the end of the first message or the beginning of the next message.</p> </div> <ul style="list-style-type: none"> • Display Pop Up Msgs For Window in order entry for this customer unless the customer advanced to the order from the Customer Selection Screen. <p>Secured feature: The Access to Customer Pop-up Messages (A79) secured feature controls whether you can create or change a customer message. If this secured feature is set to *ALLOW, you can create or change a customer message. If this secured feature is set to *EXCLUDE, the message fields are display-only.</p> <p><i>Alphanumeric, 20 positions each field; optional.</i></p>
Email address	<p>The customer's primary email address. This address, like any other email addresses for the customer, is stored in the Customer Sold To Email table; in addition, the primary email address is also stored in the Customer Sold To table. The primary email address defaults in order entry.</p> <p>See Working with Customer Email Addresses for an overview.</p> <p><i>Alphanumeric, 50 positions; display-only.</i></p>

Screen Option	Procedure
Work with customer notes	Select Customer Notes to advance to the Edit Customer Notes Screen .

Creating a New Customer

Purpose: Select Create at the [Select Customer Sold To For Order Screen](#) to enter a new order and add a new customer to the system at the same time. You can add a new customer at the [Work with Order screen](#) using the fields below. Notice that the customer name and address fields are blank on the order entry screen so that you can enter a new order, enter customer information, and create a customer record on the system at the same time.

If you had previously searched for a customer by scanning on postal code, company name, or customer name, this information defaults into the appropriate fields when you create a new customer. See [Entering Orders](#) for complete descriptions of each customer-related field.

Customer price group: If you do not assign a customer price group to a new customer, the system assigns the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value to the customer.

Customer Order History Window

Purpose: This window identifies a customer who should be given preferential treatment because of the dollar value of purchases made since the first order.

Pops up when? This window opens only for customers who have made purchases greater than the value in the \$ *Value* field defined for the *Customer LTD purchase dollars* threshold in the Threshold table.

You can verify this threshold through the Work with Thresholds function (fast path = WTHR). The *Customer LTD purchase dollars* record is identified by the threshold code of LP.

This threshold option is delivered with the system; you may set this value at any dollar amount.

This window opens when:

- You enter a customer number in the *Customer* field on the [Select Customer Sold To For Order Screen](#), or
- You *select* a customer record on a Customer Scan screen, and
- The total customer purchases are greater than the amount in the \$ *value* field for the *Customer LTD purchase dollars* threshold.

Field	Description
Customer# (Sold-to customer number)	A number assigned by the system to identify the customer who is placing the order. A record exists in the Customer Sold-to table under this number. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
\$ orders LTD	The cumulative value of orders placed by this customer since the customer first placed an order on the system. This information accumulates in the Sold-to Customer History table. The system updates this value each time the customer places an order.

Note:

This field does not include the dollar value associated with pre-order quotes; see [Entering Pre-Order Quotes](#) for an overview.

Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.

Completing this screen: You have selected the customer for order entry through the customer number, a customer scan, or by selecting Create. Now you are ready to enter the order. Continue with [Entering Orders](#) for more information.

Customer Selection Screen

Purpose: Use this screen to review a customer's address information and order history before entering or maintaining an order, or to advance to:

- standard order inquiry
- customer maintenance
- reviewing item availability
- catalog requests
- customer notes
- operator statistics inquiry
- call log entry or inquiry

Actual CTI interface not necessary: It is not necessary to use actual computer telephony integration (CTI) to use this screen. You can simply use the screen as an alternative to the [Select Customer Sold To For Order Screen](#). See Use Computer Telephony Integration (F26) for more information on setting up telephony integration.

Customer Workflow Management window: The [Customer Workflow Management Window](#) automatically opens when you select a customer if open or in use ticklers exist for the sold to customer. Select Ticklers at this window to advance to the [Work with Ticklers Screen \(sold to customer view\)](#) where you can review and work with ticklers associated with the sold to customer.

How to display this screen: This screen opens automatically when you complete the [Default Values for Orders screen](#) if:

- the Use Computer Telephony Integration (F26) system control value is selected for any company on your system
- the *CTI user* field in Work with Users is selected
- the *CTI default screen* field in Work with Users is set to Always display CTI screen

Customer and order information: The top half of the screen displays information about the customer. All fields are display-only. If you need to change customer information, select Cust Maint to advance to the [Change Cust Sold to Name & Address Screen](#).

The bottom half of the screen displays information about the customer's past orders. You can maintain or inquire on a specific order by selecting Change or Display, respectively, for the selected order; or, you can advance to the order maintenance selection screen by selecting Order Maint.

How to display a customer: You can display customer and order information by:

- entering a valid customer number in the *Sold to* field, or scanning for the customer by prompting on the field
- entering a valid order number for a customer in the *Order #* field

See the field descriptions below for more information.

Field	Description
Customer information:	
Sold to	The number to identify the sold-to customer who is calling. To scan: You can enter the customer number in this field, or you can scan by clicking on the arrow. The Select Customer Sold To pop-up window opens. See the description of the Select Customer Sold To For Order Screen for complete field descriptions and instructions. <i>Numeric, 9 positions; optional.</i>
Name	The customer's name, consisting of: Prefix A title (such as “Mrs.” or “Dr.”) that precedes the customer's name. <i>Alphanumeric, 3 positions; display-only.</i> First Name The Sold-to customer's first name. <i>Alphanumeric, 15 positions; display-only.</i> Initial The initial of the customer's middle name. <i>Alphanumeric, 1 position; display-only.</i> Last Name The customer's last name. <i>Alphanumeric, 25 positions; display-only.</i> Suffix An addition to the customer's full name (such as “M.D.,” “Fr.,” or “III”). <i>Alphanumeric, 3 positions; display-only.</i>
Company	The name of the company associated with the customer. <i>Alphanumeric, 30 positions; display-only.</i>
Street	The customer's street address. This is the primary delivery address. <i>Alphanumeric, 32 positions; display-only.</i>
Apt./suite	The apartment number or suite number associated with the customer's delivery address. <i>Alphanumeric, 10 positions; display-only.</i>
City	The city where the customer lives or receives mail or shipments. <i>Alphanumeric, 25 positions; display-only.</i>
St (State)	The state or province where the customer lives or receives mail or shipments. <i>Alphanumeric, 2 positions; display-only.</i>
Postal code	The postal or zip code for this customer. <i>Alphanumeric, 10 positions; display-only.</i>
Country	The code for the customer's country. <i>Alphanumeric, 3 positions; display-only.</i>

Field	Description
Email	<p>The customer's primary email address. This address, like any other email addresses for the customer, is stored in the Customer Sold To Email table; in addition, the primary email address is also stored in the Customer Sold To table. The primary email address defaults in order entry.</p> <p>See Working with Customer Email Addresses for an overview.</p> <p><i>Alphanumeric, 50 positions; display-only.</i></p>
Opt In	<p>Indicates the preferred method of correspondence.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • O1 (All) = Email is the preferred method for all correspondence. • O2 (Order) = Use email for order-related correspondence only; generate a document for other correspondence. • O3 (None) = Do not use email for any correspondence; generate a document instead. • O4 (Don't Ask) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The above values use the letter O, not the number 0 (zero).</p> </div>
Phone	<p>Email notifications: See When Does the System Generate an Email Notification? for an overview.</p> <p><i>Display-only.</i></p> <p>The phone numbers and extensions for the sold-to customer. The fields here are based on the following system control values:</p> <ul style="list-style-type: none"> • The Phone Numbers (D15) system control value determines whether the third phone number (fax or mobile) or the evening phone number is listed after the daytime phone number. The possible settings for this system control value are <i>DAY/EVE</i> and <i>DAY/FAX</i>. • If the Phone Numbers (D15) system control value is set to <i>DAY/FAX</i>, the Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mobile</i> number. <p>See the Phone Numbers (D15) and Third Phone Number Type (L53) system control values for more information.</p> <p><i>Phone number: alphanumeric, 14 positions each field; display-only.</i></p> <p><i>Extension: alphanumeric, 4 positions; display-only.</i></p>

Field	Description
Customer Price Group	<p>The code and the first 15 positions of the description of the customer price group assigned to the sold to customer. See Working with Customer Price Groups (WCPG).</p> <p>If you do not assign a customer price group to a customer, the system assigns the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value to the customer.</p> <p><i>Customer price group code: Alphanumeric 4 positions; display-only.</i></p> <p><i>Customer price group description: Alphanumeric, 15 positions; display-only.</i></p>
Msg	<p>One 80-position field that displays the text entered for the four 20-position Pop up window messages 1-4 fields defined for the sold to customer.</p> <p>Example: If the following pop-up window messages are defined for the sold to customer:</p> <ul style="list-style-type: none">• THIS SOLD TO CUSTOME• R HAS AN OUTSTANDING• BALANCE THAT MUST B• E REVIEWED ASAP. <p>Then the <i>Msg</i> field displays as: THIS SOLD TO CUSTOMER HAS AN OUTSTANDING BALANCE THAT MUST BE REVIEWED ASAP.</p> <p>These messages display on the Display Pop Up Msgs For Window in order entry for this customer; however if you view these messages on the Customer Selection screen before advancing to an order, the pop up window does not display during order entry.</p> <p><i>Alphanumeric, 80 positions; display-only.</i></p>
Active since	<p>The date of the customer's first order, from the <i>Active since date</i> in the Customer Sold To Order History table.</p> <p><i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i></p>

Field	Description
LTD \$	<p>The total merchandise value of the orders placed by the customer, including any backordered or soldout items. This total does not reflect returns created through order entry and does not include the merchandise value associated with quotes.</p> <p>Updates: If the Update Demand for Order Maintenance Transactions (C72) system control value is selected, this field updates when you add a detail line(s) to an order in Order Maintenance. When you enter an exchange, the price of the exchange (replacement) item is added.</p> <p>If the Update Demand for Order Maintenance Transactions (C72) system control value is unselected, this field does not update when you add a detail line(s) to an order in Order Maintenance, including an exchange item.</p> <p>Cancellations: This total reduces when you cancel an order only if you enter a cancel reason set to update demand; otherwise, the orders amount remains the same and the Cancels amount increases.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only.</i></p>
LTD Orders	<p>The gross number of orders placed by this customer.</p> <p>Updates: If the Update Demand for Order Maintenance Transactions (C72) system control value is selected, this field increases when you add a detail line(s) to an order in Order Maintenance.</p> <p>If the Update Demand for Order Maintenance Transactions (C72) system control value is unselected, this field does not update when you add a detail line(s) to an order in Order Maintenance.</p> <p>Cancellations: This total reduces when you cancel an order only if you enter a cancel reason set to update demand; otherwise, the orders quantity remains the same and the Cancels quantity total increases.</p> <p>The total does not increase when you enter a return through order entry or enter an exchange item on an order that is already open or held.</p> <p><i>Numeric, 5 positions; display-only.</i></p>
Return %	<p>The total percentage of items returned by this customer, calculated as:</p> $\frac{(\text{Return } \$ \text{ amount} + \text{Exchange } \$ \text{ amount})}{\text{Sales } \$ \text{ amount}} * 100$ <p>Example: If the total value of returned and exchanged items is \$100, and the customer's total sales to date is \$500, the return percentage is 20, or $(\\$100 / \\$500) * 100$.</p> <p>See the Display Customer Order History Screen for information on how the Sales amount and the Returns amount are calculated.</p> <p><i>Numeric, 3 positions with a 2-place decimal; display-only.</i></p>

Field	Description
Item class	<p>The three item classes from which the customer has ordered the greatest dollar value, in descending order; the three item classes on the Display Customer Item Class Screen with the highest <i>LTD totals</i>. The item class description is truncated to 15 positions.</p> <p><i>Item class code: alphanumeric, 3 positions; display-only.</i></p> <p><i>Item class description: alphanumeric, 15 positions; display-only.</i></p>
Customer Class	<p>A code used to group customers. See Setting Up the Customer Class Table (WCCL) for a discussion. The first 15 positions of the description of the customer class is to the right.</p> <p><i>Customer class code: alphanumeric, 3 positions; display-only.</i></p> <p><i>Customer class description: alphanumeric, 15 positions; display-only.</i></p>
Loyalty card#	<p>The loyalty card number assigned to the sold to customer through the Customer Engagement Loyalty Integration.</p> <p>If Oracle Retail Customer Engagement finds more than one loyalty card assigned to the customer, the system displays the first card assigned to the customer.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This field displays only if the Use ORCE Loyalty (M06) system control value is selected; the loyalty card number is from Oracle Retail Customer Engagement and is not stored in the Order Administration database.</p> </div>
Points	<p>The total current earned points balance for the loyalty card assigned to the sold to customer through the Customer Engagement Loyalty Integration.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This field displays only if the Use ORCE Loyalty (M06) system control value is selected; the loyalty points is from Oracle Retail Customer Engagement and is not stored in the Order Administration database.</p> </div>

Field	Description
Awards	<p>The total current awards balance for the loyalty card assigned to the sold to customer through the Customer Engagement Loyalty Integration.</p> <div style="border: 1px solid #0070c0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>This field displays only if the Use ORCE Loyalty (M06) system control value is selected; the awards balance is from Oracle Retail Customer Engagement and is not stored in the Order Administration database.</p> </div>
Order information:	
Order#	<p>A number representing an order the customer has placed with your company. You can display customer information by entering a valid order number in this field. If the order is associated with a different sold-to customer, the screen displays the information on the newly-selected customer. However, if you then scan on a customer using the Sold to field at the top of the screen, the screen clears the previous customer's information and displays the information for the newly-selected customer.</p> <p><i>Numeric, 8 positions; optional.</i></p>
Status (Order status)	<p>The current status of the order.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • blank (all orders, including open) • Cancelled • Error • Held • Purged • Quote • Suspended • Closed <p>Select a status code to display orders that match your entry.</p> <p><i>Optional.</i></p>
Type	<p>A code representing the type of order. Order type codes identify how you received the order, such as by phone, mail or fax, and control attributes such as screen formats, and messaging.</p> <p><i>Alphanumeric, 1 position; display-only.</i></p>
Rcp (Number of recipients)	<p>The number of recipients on the order.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Date	<p>The date you entered the order.</p> <p><i>Numeric, 6 positions (in user date format): optional.</i></p>

Field	Description
Order total	The total value of the order, including merchandise, tax, freight, and all other charges. <i>Numeric, 20 positions with a 2-place decimal; display-only.</i>
Activity	These fields indicate whether any item on the order has been returned or exchanged, and whether the order includes any backordered items. The return indicator (RT) is provided in column 1, the exchange indicator (EX) in column 2, and the backorder indicator (BO) in column 3. Quotes: The system does not update this field for backordered items on quotes; see Entering Pre-Order Quotes for an overview. <i>Alphanumeric, three 2-position fields; display-only.</i>
R/E date	The date of the most recent return or exchange. If an order has both a return and an exchange, the return date is provided. <i>Numeric, 6 positions (in user date format); display-only.</i>

Screen Option	Procedure
Maintain an order	Select Maintenance for an order to advance to the Work with Order screen. See Performing Order Maintenance . Require Order Maintenance Reason: If the Require Reason in CTI (G98) system control value is selected and you do not have authority to the Bypass CTI Reason Code (B24) secured feature, the system advances you to the Order Inquiry Reason Codes Window when you return to the Customer Selection screen after maintaining an order.
Review an order	Select Inquiry for an order to advance to the Order Inquiry screen. See Order Inquiry . Require Order Inquiry Reason: If the Require Reason in CTI (G98) system control value is selected and you do not have authority to the Bypass CTI Reason Code (B24) secured feature, the system advances you to the Order Inquiry Reason Codes Window when you return to the Customer Selection screen after reviewing an order.
Enter a new order or quote	Select Create Order. See Entering Orders for standard order entry or Entering Pre-Order Quotes for quote entry.

 **Note:**

If the customer is a ghost customer, identified by the *Ghost* flag, the system opens the [Ghost Customer Number Warning Window](#).

Change the order entry defaults	Select Change Defaults to display the Change Defaults window.
Select an order or quote for maintenance	Select Order Maint to advance to the order maintenance selection screen. See Selecting an Order for Maintenance .

Screen Option	Procedure
Change the customer's name or address	Select Customer Maint to advance to the Change Cust Sold to Name & Address Screen .
Review item availability, preselect items to add to an order, or enter lost sales	Select Item Availability to advance to the Display Item Availability Screen .
Request a catalog	Select Catalog Requests to advance to the Create Catalog Request screen. See Entering Catalog Requests (WCAT) .
Review or work with customer notes	Select Customer Notes to advance to the Edit Customer Notes Screen .
Work with ticklers associated with the sold to customer	Select Work with Ticklers to advance to the Work with Ticklers Screen (sold to customer view) .
Work with customer call log entries	Select Call Log to advance to the Work with Customer Call Log Screen (WCLL) .
Display the Call Options pop-up window	Select Call Options to advance to the Call Options Window in order to disconnect a call or create a call log entry.
Review items that a customer has previously ordered	Select Cust Item History to advance to the Customer Order Item History Screen .
Perform a stored value card balance inquiry	Select Balance Inquiry to advance to the Stored Value Card Balance Inquiry Screen (MSVB) .

 **Note:**

The system returns you to the Customer Selection screen after you complete the balance inquiry.

Screen Option	Procedure
Review loyalty account information for a customer that is registered in the Oracle Retail Customer Engagement Loyalty program	<p>Select Loyalty. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement.</p> <ul style="list-style-type: none"> • If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the Display Loyalty Account Screen. If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer. • If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the Customer Loyalty Registration Window, where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program. • If a <i>Relate ID</i> is not defined for the customer in the Customer Sold To table, the system displays an error message similar to the following: This customer does not have a Relate ID. • If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.

 **Note:**

This option is available only if the Use ORCE Loyalty (M06) system control value is selected.

See [Customer Engagement Loyalty Integration](#) for processing details.

Review the customer's purchase history from Oracle Retail Customer Engagement

Select Purchase History. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement and advances you to the [Display Purchase History Screen](#) where you can review the completed sales and returns transactions from Oracle Retail Customer Engagement.

If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.

 **Note:**

This option displays only if the ORCE Customer Integration (L37) system control value is set to INTERACT; see [Customer Engagement Purchase History Integration](#).

Call Options Window

Purpose: Use this window to disconnect a CTI call or advance to the Log Telephone Call Screen (Entering or Changing a Call).

Note:

Transferring a call and creating a conference call are not currently implemented.

How to display this screen: Select Call Options at the [Customer Selection Screen](#).

Field	Description
CTI session (unlabeled field)	<p>This field indicates whether your current session is being monitored for CTI call handling.</p> <ul style="list-style-type: none"> If you are in a monitored CTI session, a background job is currently running to monitor call activity for your session. For monitored CTI sessions, the first 23 positions of the <i>Company phone number description</i> are at the top of this screen, allowing you to identify the DNIS number the customer called and indicating which call center script the customer service representative should use when answering the call. If you are in an unmonitored CTI session, CTI call handling is not currently active. For unmonitored CTI sessions, the word UNMONITORED displays at the top of the screen. <p><i>Alphanumeric, 23 positions; display-only.</i></p>
Customer	<p>The number and name, or company name, of the currently selected customer.</p> <p><i>Customer number: numeric, 9 positions; display-only.</i> <i>Customer name: alphanumeric, 41 positions; display-only.</i></p>
Transfer/Conference extension	<p>The extension to which you would like to transfer the call, or with which you would like to create a conference call.</p>
Monitored workstation	<p>This field is not currently implemented.</p>

Note:

Transferring a call or creating a conference call are not currently implemented.

Screen Option	Procedure
Transfer a call	Select Xfer. This option is not currently implemented.
Create a conference call	Select Conf. This option is not currently implemented.

Screen Option	Procedure
Disconnect a call	Select Disconnect. The call is ended, and you advance to the Log Telephone Call Screen (Entering or Changing a Call) .
Create a call log entry	Select Create Log to advance to the Log Telephone Call Screen (Entering or Changing a Call) .

Customer Scan Screen

Purpose: Use this screen to select a customer:

- for an order, in order entry
- for maintenance, in customer maintenance
- when creating a catalog request
- for a customer membership through the [Working with Customer Memberships \(WWCM\)](#) option

Used when? You advance to this screen if the [ORCE Customer Integration \(L37\)](#) system control value is set to INTERACT. Otherwise, you advance to:

- the [Select Customer Sold To For Order Screen](#) in order entry
- the [Select Customer Sold To Screen](#) in customer maintenance
- the [Select Customer for Catalog Request Screen](#) when you are creating a catalog request
- the Select Customer Sold To pop-up window when you are creating a customer membership through the [Working with Customer Memberships \(WWCM\)](#) option

Searching in Oracle Retail Customer Engagement: When you use this screen, the system first calls Oracle Retail Customer Engagement when searching for customers, and checks the Order Administration Customer Sold To table only if Oracle Retail Customer Engagement does not return any records that match your search criteria.

If any records found in Oracle Retail Customer Engagement: If there is at least one customer record in Oracle Retail Customer Engagement that matches your search criteria, the screen displays the results from Oracle Retail Customer Engagement only and does not display any matching records from the Order Administration Customer Sold To table.

In this topic:

- [Search](#)
- [Results](#)
- [Order entry: available options](#)
- [Customer maintenance: available options](#)
- [Creating a catalog request: available options](#)
- [Creating a customer membership: available options](#)

For more information: See the [Customer Engagement Customer Integration](#) for an overview and background on the integration.

How to display this screen: If the [ORCE Customer Integration \(L37\)](#) system control value is set to INTERACT:

- order entry:
 - select OK at the [Default Values for Orders screen](#) if you do not use the [Customer Selection Screen](#), or
 - prompt on the *Sold To* field at the [Customer Selection Screen](#)
 - prompt for a recipient sold to customer at the [Work with Order Screen](#).
- customer maintenance: enter WCST in the *Fast path* field at the top of any menu or select Work with Customers from a menu
- creating a catalog request: at the Create Catalog Request Screen, select Select Customer
- creating a customer membership: prompt on the *Customer#* field at the [Create Customer Membership Window](#)

Search

All of the fields in the Search at the top of the screen, with the exception of the *Batch #* available in order entry, are optional; however, you need to enter at least one criterion to search.

Combining search criteria: If you enter more than one search criterion, the [Results](#) displays customer records only if they match all entered criteria. You can combine any search criteria except for the [Customer#](#) and the [Alternate customer number](#).

Field	Description
Batch #	The number identifying the batch you are currently working with. Available only if you are in order entry and you selected the <i>Error order batches</i> option at the Default Values for Orders screen . <i>Numeric, 5 positions; display-only.</i>
Postal code	A postal delivery area, such as a zip code. Enter a full or partial code to scan for customers whose postal codes match your entry.

Note:

The [Postal Code Scan Length \(F61\)](#) system control value does not control how to search for or sort customer records based on postal code. For example, if you normally use a postal code scan length of 5 for searching, and some customers have the full ZIP+4 postal code, customers with the full ZIP+4 are listed after customers whose postal codes are just 5 positions long.

See [Setting Up the Zip/City/State \(Postal Code\) Table \(WZIP\)](#).
Alphanumeric, 10 positions.

Field	Description
Last name	<p>The sold-to customer's last name. Enter a full or partial last name to scan for customers whose last names match your entry.</p> <p><i>Alphanumeric, 25 positions.</i></p>
First name	<p>The sold-to customer's first name. Enter a full or partial first name to scan for customers whose first names match your entry.</p> <p><i>Alphanumeric, 25 positions.</i></p>
Phone#	<p>Any of the sold-to customer's phone numbers. Enter a full or partial phone number to display customers with phone numbers that start with your entry. When you search based on phone number, the Phone # displayed on the Results is the one matching your entry.</p> <p>Formatting not required: When you search using phone number against the Oracle Retail Customer Engagement database, it is not necessary to enter any formatting for the phone number; for example, an entry of 5085550100 matches a phone number formatted as (508) 555-0100.</p> <p>Deleted phone numbers: Even if you delete the phone number from Oracle Retail Customer Engagement and the number is no longer visible on Oracle Retail Customer Engagement screens, Oracle Retail Customer Engagement still stores the phone number for the customer in the database, and returns the customer in search results when you search based on the deleted phone number.</p> <p>Changed phone number: Similarly, if you change the phone number in Oracle Retail Customer Engagement, Oracle Retail Customer Engagement still stores the original phone number in its database and returns the customer in search results when you searched based on the original phone number.</p> <p>Deleted or changed phone number not displayed in results: If your search is based on a deleted or changed phone number for the customer, the Phone # field is blank at the Results, even if the customer has a current primary phone number.</p> <p>Searching based on phone number in Order Administration: Enter a full, valid phone number to display customers who have a phone number that matches your entry exactly, including formatting. The screen displays results from Order Administration only if no customer records in Oracle Retail Customer Engagement match your entry.</p> <p>You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY).</p> <p><i>Alphanumeric, 14 positions.</i></p>

Field	Description
Email	<p>Any of the customer's email addresses.</p> <p>Searching based on email address: Enter a full or partial email address to display customers with email addresses that start with your entry. The email address that matches your entry is displayed in the Email field at the Results, even if it is not the customer's primary email address in Oracle Retail Customer Engagement or in Order Administration.</p> <p>Deleted email addresses: Even if you delete the email address from Oracle Retail Customer Engagement and the email is no longer visible on Oracle Retail Customer Engagement screens, Oracle Retail Customer Engagement still stores the email address for the customer in the database, and returns the customer in search results when you search based on the deleted email address.</p> <p>Changed email address: Similarly, if you change the email address in Oracle Retail Customer Engagement, Oracle Retail Customer Engagement still stores the original email address in its database and returns the customer in search results when you searched based on the original email address.</p> <p>Deleted or changed email address not displayed in results: If your search is based on a deleted or changed email address for the customer, the Email field is blank at the Results, even if the customer has any current email addresses.</p> <p><i>Alphanumeric, 50 positions.</i></p>
Customer#	<p>A number assigned by the system to identify the customer in Order Administration. Saved in Oracle Retail Customer Engagement as an alternate key. Enter a valid customer number to advance immediately to:</p> <ul style="list-style-type: none"> the Customer Selection Screen in order entry the Change Customer (1 of 2) screen in customer maintenance the Create Catalog Request screen when creating a catalog request <p>You cannot enter any additional search criteria when you enter a customer number.</p> <p><i>Numeric, 9 positions.</i></p>
Loyalty Card#	<p>The loyalty card number assigned to the customer through the Customer Engagement Loyalty Integration.</p> <p>Enter a valid loyalty card number display customers whose loyalty card number matches your entry.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This field is available only if the Use ORCE Loyalty (M06) system control value is selected.</p> </div> <p><i>Numeric, 16 positions.</i></p>

Results

System Providing Customer Information: The Results section of the screen indicates whether the results displayed are from Oracle Retail Customer Engagement or Order Administration. If there is at least one record found in Oracle Retail Customer Engagement that matches your search criteria, the results from Oracle Retail Customer Engagement are displayed instead of any results from Order Administration.

Maximum search results exceeded: The Results display the error message `Maximum search results exceeded, please refine your search` if the number of matching records exceeds the *Customer Lookup Limit* setting in Customer Engagement. In this situation, you need to make your search criteria more specific to make sure that you can find the customer record you are looking for.

Column sort: You can sort on any column in the Result section of the screen by clicking the column name. An arrow pointing up displays next to the field when the values for the field display in ascending sequence; an arrow pointing down displays next to the field when the values for the field display in descending sequence.

Field	Description
System Providing Customer Information	<p>The name of the system where the customer results were found. When you use this screen, the system first calls Oracle Retail Customer Engagement when searching for customers, and checks the Order Administration Customer Sold To table only if Oracle Retail Customer Engagement does not return any records that match your search criteria.</p> <p>If there is at least one customer record in Oracle Retail Customer Engagement that matches your search criteria, the screen displays the results from Oracle Retail Customer Engagement only and does not display any matching records from the Order Administration Customer Sold To table.</p>
Name	<p>The customer's name, consisting of the last name, middle initial, and first name.</p> <p>If results are from Oracle Retail Customer Engagement: The company name is not displayed; and if the customer has a company name only, but no first and last name, then no name is displayed.</p> <p>Enter a full or partial name to display customers whose name contains your entry.</p> <p><i>Last name: alphanumeric, 25 positions.</i></p> <p><i>Middle initial: alphanumeric, 1 positions.</i></p> <p><i>First name: alphanumeric, 15 positions.</i></p> <p><i>Company name (from Order Administration only): alphanumeric, 30 positions.</i></p>
Address	<p>The customer's address, consisting of the first address line, city, and state.</p> <p>Enter a full or partial address to display customers whose address contains your entry.</p> <p><i>Street: alphanumeric, 32 positions.</i></p> <p><i>City: alphanumeric, 25 positions.</i></p> <p><i>State: alphanumeric, 2 positions.</i></p>
Postal code	<p>The customer's postal code.</p> <p>Enter a full or partial postal code to display customers whose postal code contains your entry.</p> <p><i>Alphanumeric, 10 positions.</i></p>

Field	Description
Phone #	<p>If results are from Oracle Retail Customer Engagement: The customer's primary phone number, unless:</p> <ul style="list-style-type: none"> • an alternate phone number was one of the search criteria; in this case, the alternate phone number is displayed. • there is no primary phone number, and a phone number was not a search criterion; in this case, no phone number is displayed.
	<div style="border-left: 2px solid #0070C0; padding-left: 10px;"> <p> Note:</p> <p>The phone number is displayed using the formatting, if any, from Oracle Retail Customer Engagement.</p> </div>
	<p>If results are from Order Administration: The customer's:</p> <ul style="list-style-type: none"> • daytime phone number, if any, unless a different phone number was a search criterion; otherwise, • the phone number entered as a search criterion, if any; otherwise, • the customer's evening number, if any; otherwise, • the customer's fax or mobile number, if any; otherwise, • this field is blank. <p>Enter a full or partial phone number to display customers whose phone number contains your entry. <i>Alphanumeric, 14 positions.</i></p>
Email	<p>If results are from Oracle Retail Customer Engagement: The customer's primary email address, unless:</p> <ul style="list-style-type: none"> • An alternate email address was one of the search criteria; in this case, the alternate email address is displayed. • An email address was one of the search criteria, but the customer does not have a primary email address in Oracle Retail Customer Engagement; in this case, the email address matching the search criterion is displayed. • An email address was one of the search criteria, and the customer once had this email address in Oracle Retail Customer Engagement, but the email address has been deleted or changed; in this case, the email address field is blank. • Email address was not one of the search criteria, and the customer does not have a primary email address in Oracle Retail Customer Engagement; in this case, no email address is displayed, even if the customer has one or more email addresses in Oracle Retail Customer Engagement. <p>Ordinarily, the customer's email address is the same in both Order Administration and Oracle Retail Customer Engagement.</p> <p>If results are from Order Administration: The customer's primary email address, unless an alternate email address was a search criterion.</p> <p>Enter a full or partial email address to display customers whose email address contains your entry. <i>Alphanumeric, 50 positions.</i></p>

Order entry: available options

Screen Option	Procedure
Enter an order or quote for a new customer	Select Create. See Entering Orders for standard order entry or Entering Pre-Order Quotes for quote entry.
Select a customer for order entry	Click the customer's name, or select Select from the <i>Action</i> drop-down menu. See Entering Orders for standard order entry or Entering Pre-Order Quotes for quote entry.
Change a customer	Select Change for a customer from the <i>Action</i> drop-down menu to advance to the Change Cust Sold to Name & Address Screen .
Display a customer	Select Display for a customer from the <i>Action</i> drop-down menu to advance to the Display Customer Sold To screen. See the First Create Sold To Customer Screen for field descriptions.
Review loyalty account information from Oracle Retail Customer Engagement for a customer	<p>Select Loyalty from the <i>Action</i> drop-down menu for a customer. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement.</p> <ul style="list-style-type: none"> • If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the Display Loyalty Account Screen. If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer. • If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the Customer Loyalty Registration Window, where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program. • If a <i>Relate ID</i> is not defined for the customer in the Customer Sold To table, the system displays an error message similar to the following: Loyalty cannot be displayed, there is no Relate ID. • If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.

 **Note:**

This option is available only if the Use ORCE Loyalty (M06) system control value is selected.

See Customer Engagement Loyalty Integration for processing details.

Screen Option	Procedure
Review the customer's purchase history from Oracle Retail Customer Engagement	<p>Select Purch Hist. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement and advances you to the Display Purchase History Screen where you can review the completed sales and returns transactions from Oracle Retail Customer Engagement.</p> <p>If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option displays only if the ORCE Customer Integration (L37) system control value is set to INTERACT; see Customer Engagement Purchase History Integration.</p> </div>
Exit the screen and return to the main menu	<p>Select Exit.</p> <p>If the Capture Order/Call Disposition (K03) system control value is set to ALL, and you advanced to this screen from a call received from an external order call center, the system displays the Confirm Order/Call Disposition Window where you must enter the reason for exiting this screen instead of creating an order. In addition, the system creates a record in the Order Disposition Table; see Tracking Order/Call Disposition Activity.</p>

Customer maintenance: available options

Screen Option	Procedure
Create a new customer	Select Create. See the First Create Sold To Customer Screen .
Change information about the customer	Select Change from the <i>Action</i> drop-down menu for a customer. See Changing Sold To Customers .
Display information about the customer	Select Display from the <i>Action</i> drop-down menu for a customer. You advance to the first Display Customer screen. You cannot change any information on this screen. See the First Create Sold To Customer Screen for field descriptions.
Work with actions for a customer	Select Actions from the <i>Action</i> drop-down menu for a customer to advance to the Edit Customer Actions Window .

Screen Option	Procedure
Work with bill-to customers	<p>Select Bill To from the <i>Action</i> drop-down menu for a customer. If the customer:</p> <ul style="list-style-type: none">• already has a bill-to customer, you advance to the Display Customer Bill To screen. See the Create Bill-to Customer Screen for field descriptions.• does not already have a bill-to customer, you advance to the Work with Bill To Customers Screen.
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px;"><p> Note:</p><p>If you do not have authority to the Work with Customer Bill To menu option, the Bill To option is not available in the <i>Action</i> drop-down menu.</p></div>
Work with contract pricing for a customer	Select Contract Price from the <i>Action</i> drop-down menu for a customer to advance to the Work with Contract Price Screen .
Review item ordering history for a customer	Select Item Hist from the <i>Action</i> drop-down menu for a customer to advance to the Customer Sold To Item History Screen . See Reviewing Customer History for an overview of customer history.

Screen Option	Procedure
Review loyalty account information from Oracle Retail Customer Engagement for a customer	<p>Select <i>Loyalty</i> from the <i>Action</i> drop-down menu for a customer. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement.</p> <ul style="list-style-type: none"> If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the <i>Display Loyalty Account Screen</i>. If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer. If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the <i>Customer Loyalty Registration Window</i>, where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program. If a <i>Relate ID</i> is not defined for the customer in the <i>Customer Sold To</i> table, the system displays an error message similar to the following: <i>Loyalty cannot be displayed, there is no Relate ID.</i> If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: <i>Unable to connect to ORCE.</i>
	<p>See <i>Customer Engagement Loyalty Integration</i> for processing details.</p>
Review mail history for a customer	Select <i>Mail Hist</i> from the <i>Action</i> drop-down menu for a customer to advance to the Display Customer Mail History Screen . See Reviewing Customer History for an overview of customer history.
Work with notes about a customer	Select <i>Notes</i> from the <i>Action</i> drop-down menu for a customer to advance to the Edit Customer Notes Screen .
Display customer order history	Select <i>Ord Hist</i> from the <i>Action</i> drop-down menu for a customer to advance to the Display Customer Order History Screen . See Reviewing Customer History for an overview of customer history.
Exclude pay types for a customer	Select <i>P/T Excl</i> from the <i>Action</i> drop-down menu for a customer to advance to the Exclude Pay Types By Customer Screen .
Review address changes for a customer	Select <i>Prev Addr</i> from the <i>Action</i> drop-down menu for a customer to advance to the Display Address Changes Screen . See Reviewing Customer Address Changes for an overview.

 **Note:**

This option is available only if the Use ORCE Loyalty (M06) system control value is selected.

Screen Option	Procedure
Work with the profile for a customer	Select Profile from the <i>Action</i> drop-down menu for a customer to advance to the Work with Customer Profile Screen .
Review the customer's purchase history from Oracle Retail Customer Engagement	<p>Select Purch Hist. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement and advances you to the Display Purchase History Screen where you can review the completed sales and returns transactions from Oracle Retail Customer Engagement.</p> <p>If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.</p>
<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option displays only if the ORCE Customer Integration (L37) system control value is set to <i>INTERACT</i>; see Customer Engagement Purchase History Integration.</p> </div>	
Work with ship-to customers	Select Ship To from the <i>Action</i> drop-down menu for a customer to advance to the Work with Customer Ship Tos Screen .
Work with subscriptions for a customer	Select Subscription from the <i>Action</i> drop-down menu for a customer to advance to the Work with Subscriptions Screen .
Work with state-specific tax exemptions for a customer	Select Tax from the <i>Action</i> drop-down menu for a customer to advance to the Work with Customer Tax Screen . See Working with Customer Tax Status for an overview.
Enter information in the user-defined fields for a customer	Select User Fields from the <i>Action</i> drop-down menu for a customer to advance to the Work with User Fields Screen .
Work with warranty information for a customer	Select Warranty from the <i>Action</i> drop-down menu for a customer to advance to the Work with Customer Warranty Information Screen .

Creating a catalog request: available options

Option	Procedure
Create a catalog request for a new customer	Select Create to return to the Create Catalog Request Screen without selecting an existing customer.
Select a customer for a catalog request	Select Select from the <i>Action</i> drop-down menu for a customer to return to the Create Catalog Request Screen with that customer's name and address defaulted.
Change a customer's name and address information	Select Change from the <i>Action</i> drop-down menu for a customer to advance to the Change Cust Sold to Name & Address Screen .

Option	Procedure
Display a customer's name and address information	Select Display from the <i>Action</i> drop-down menu for a customer to advance to the Display Customer Sold To screen. See the First Create Sold To Customer Screen for field descriptions.
Review loyalty account information from Oracle Retail Customer Engagement for a customer	<p>Select Loyalty from the <i>Action</i> drop-down menu for a customer. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement.</p> <ul style="list-style-type: none"> • If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the Display Loyalty Account Screen. If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer. • If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the Customer Loyalty Registration Window, where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program. • If a <i>Relate ID</i> is not defined for the customer in the Customer Sold To table, the system displays an error message similar to the following: <i>Loyalty cannot be displayed, there is no Relate ID.</i> • If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: <i>Unable to connect to ORCE.</i>

 **Note:**

This option is available only if the Use ORCE Loyalty (M06) system control value is selected.

See [Customer Engagement Loyalty Integration](#) for processing details.

Review the customer's purchase history from Oracle Retail Customer Engagement

Select Purch Hist. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement and advances you to the [Display Purchase History Screen](#) where you can review the completed sales and returns transactions from Oracle Retail Customer Engagement. If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: *Unable to connect to ORCE.*

 **Note:**

This option displays only if the ORCE Customer Integration (L37) system control value is set to INTERACT; see [Customer Engagement Purchase History Integration](#).

Creating a customer membership: available options

Option	Procedure
Select a customer for a customer membership	Select Select from the <i>Action</i> drop-down menu for a customer to advance to the Customer Membership Screen (Change Mode) with that customer's name and address defaulted.
Change a customer's name and address information	Select Change from the <i>Action</i> drop-down menu for a customer to advance to the Change Cust Sold to Name & Address Screen .
Display a customer's name and address information	Select Display from the <i>Action</i> drop-down menu for a customer to advance to the Display Customer Sold To screen. See the First Create Sold To Customer Screen for field descriptions.
Create a catalog request for a new customer	Select Create to return to the Create Catalog Request Screen without selecting an existing customer.
Review loyalty account information from Oracle Retail Customer Engagement for a customer	<p>Select Loyalty from the <i>Action</i> drop-down menu for a customer. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement.</p> <ul style="list-style-type: none"> • If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the Display Loyalty Account Screen. If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer. • If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the Customer Loyalty Registration Window, where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program. • If a <i>Relate ID</i> is not defined for the customer in the Customer Sold To table, the system displays an error message similar to the following: <code>Loyalty cannot be displayed, there is no Relate ID.</code> • If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: <code>Unable to connect to ORCE.</code>

 **Note:**

This option is available only if the Use ORCE Loyalty (M06) system control value is selected.

See [Customer Engagement Loyalty Integration](#) for processing details.

Option	Procedure
Review the customer's purchase history from Oracle Retail Customer Engagement	<p>Select Purch Hist. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement and advances you to the Display Purchase History Screen where you can review the completed sales and returns transactions from Oracle Retail Customer Engagement.</p> <p>If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.</p>

 **Note:**

This option displays only if the ORCE Customer Integration (L37) system control value is set to INTERACT; see [Customer Engagement Purchase History Integration](#).

Entering Orders

Purpose: This topic describes how you enter orders:

- You enter or verify customer and order information on the [Work with Order Screen](#).
- You add items to the order on the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Additionally, this topic describes how to attach payment information to the order and how to end the order. When you finish this topic, you will know how to enter a complete order on the system, including:

- Who is placing the order?
- What items are being ordered?
- What is the method of payment?
- What happens when you complete the order?

Once you use the steps outlined in this topic, you will have an order on the system; you can enhance the order in several different ways by selecting any of the functions listed at the bottom of the screen.

Entering quotes: See [Entering Pre-Order Quotes](#) for more information on creating a pre-order quote for a customer listing the items the customer wishes to order and the order totals should the customer agree to place the order.

Entering a ship-for-pickup order: Use the Store option, available at the [Create One Time Ship To Address Screen](#), to select the store location where the customer wants to pick up the order. See [Ship-for-Pickup Orders](#) for an overview.

In this topic:

Who is placing the order?

- [Work with Order Screen](#)

- Defining Order Controls
- Adding Customer/Address Information
- Adding Order Information
- Reviewing Order Totals
- Display Duplicate Sold To Window
- When a Window Opens

What items are being ordered?

- Work with Order Lines Screen (Adding Items to the Order)
 - Order Information Fields
 - Item Image
 - Order Totals
 - Item Entry Fields
 - Order Lines Fields
- Screen Differences to Note When Using SKUs
 - SKU Scan Screen
- Adding Different Types of Items to the Order
 - Entering a Subscription Item
 - Entering a Warranty Item
 - Entering a Stored Value Card Item
 - Entering Set Items
 - Entering Multiple Ship-Along Units on a Ship-for-Pickup Order
- Select Variable Set Items Screen
- Miscellaneous Messages and Windows at Item Entry
 - Discount Calculation Messages
 - Maximum Order Line Quantity/Value
 - Work with Item/SKU Comments Window
 - Enter Add Reason Window
 - Item Coordinate Message
 - Ship Via Overrides for Item Window
 - Item Status Message Window
 - Duplicate Item for Customer Window
- Displaying the Detail Line Options

Work with Order Screen

Purpose: This screen is the first screen that opens when you are entering an order.

How to display this screen: Set or accept Order Entry defaults at the [Default Values for Orders screen](#) and select the customer for Order Entry at the [Select Customer Sold To For Order Screen](#) or the [Customer Selection Screen](#).

Instructions:

1. Complete the necessary customer, address, and order information.
2. Select OK so the system can validate this information.
3. Press Enter again to advance to the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Note:

This topic describes simple Order Entry, which assumes that you complete the first screen and continue on to complete the second screen. You can, however, select any function listed at the bottom of the screen instead of adding items to the order immediately.

Defining Order Controls

The information you enter in the Order Control fields on the [Work with Order Screen](#) determines the format of the [Work with Order Lines Screen \(Adding Items to the Order\)](#) and controls whether freight is charged for the order.

Note:

Reservation occurs unconditionally for all orders (including Held orders) when you are using [Immediate Reservation \(A64\)](#), as defined in the System Control table.

The Order Controls fields are:

- [Order#](#)
- [Ship-to number \(unlabeled field\)](#)
- [Recip sts \(Recipient status\)](#)
- [Sold-to \(Sold-to customer number\)](#)
- [Type \(Order type\)](#)
- [Order date](#)
- [Calc freight \(Calculate freight\)](#)

System values: The system assigns values to several of the Order Control fields, including:

- order#
- ship-to number
- order date
- sold-to customer #
- recipient status
- hold reason
- calculate freight

Defaults: These fields in the Order Control part of the screen default, but can be overridden:

- *Order date* defaults to today's date.
- *Calc freight* defaults to selected.
- *Order type* defaults from the entry on the [Default Values for Orders screen](#).

Field	Description
Order#	<p>A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. This number is used throughout the system to access the order.</p> <p>The starting order number and last order number assigned are defined in the Number Assignment table. See Setting Up the Number Assignment Table (WNUM).</p> <p><i>Numeric, 9 positions; display-only, assigned by the system.</i></p>
Ship-to number (unlabeled field)	<p>A hyphen (-) separates this field from the <i>Order#</i> field.</p> <p>Indicates the number of shipping addresses for the order. The system assigns a ship-to suffix of 1 to a single recipient order.</p> <p><i>Numeric, 3 positions; display-only, assigned by the system.</i></p>
Recip sts (Recipient status)	<p>The status of the recipient (ship-to) order on the system.</p> <p>New orders</p> <p>The system assigns a suspended status to all new orders during Order Entry. You can review or maintain the orders from the Display Order Summary Screen.</p> <p>When you accept an order</p> <p>Once you accept the entire order, the system changes the status to open or held; however, when you batch orders, the individual orders in a batch remain in a suspended status until you accept the entire batch.</p> <p>Other status codes are:</p> <ul style="list-style-type: none"> • Canceled, if all lines are canceled before you accept the order. • Closed, if all lines are sold out before you accept the order. <p>See Using the Order Inquiry Scan Screens (OIOM) for more information about these order status codes.</p> <p><i>Alphanumeric, 9 positions; display-only, assigned by the system.</i></p>

Field	Description
Sold-to (Sold-to customer number)	<p>A number assigned by the system to identify the customer who is placing the order.</p> <p>The starting sold-to number and the last sold-to number are stored in the Number Assignment table.</p> <p><i>Numeric, 9 positions; display-only, assigned by the system.</i></p>
Type (Order type)	<p>A code that indicates how the order was received.</p> <p>Order types are defined in and validated against the Order Type table. Common order types include phone, fax, mail, retail or other. You use order type to group orders on the system, monitor employee performance and accuracy, and control the sort of several reports. See Establishing Order Types (WOTY).</p>
	<div style="border: 1px solid #0070c0; padding: 10px; background-color: #e6f2ff;"> <p> Note:</p> <p>You can select a default order type in the System Control table or at the Default Values for Orders screen.</p> </div>
	<p>Reserving Against a Non-Allocatable Warehouse</p> <p>If the Reserve from Non-Allocatable Warehouse (J25) system control value is selected, the system allows you to reserve inventory against a non-allocatable warehouse. You can define a non-allocatable warehouse in the <i>Retail warehouse</i> field for the order type; any orders entered for this order type reserve against the non-allocatable warehouse. If the item is not in stock, the system backorders the item against the non-allocatable warehouse. See Non-Allocatable Warehouse Reservation Processing During Order Entry for more information.</p> <p><i>Alphanumeric, 1 position; required.</i></p>
Order date	<p>The processing date for the order. Defaults to the current date, but you can override it to date-stamp orders you received on an earlier date but did not enter. However, if you change the order date to a date which falls within a closed accounting period, the following error message indicates:</p> <p>Order date falls within the closed accounting period.</p> <p>The order date determines which orders the system reserves first, if using Batch Reservation or running the Evaluate Backorders program.</p> <p><i>Numeric, 6 positions (in user date format); required.</i></p>
Calc freight (Calculate freight)	<p>Determines whether the system calculates and adds freight charges and any service charges by ship via to the order.</p> <ul style="list-style-type: none"> • selected = (Default): The system calculates freight based on the freight method defined for the source code. You can also define a freight override for the order ship to at the Work with Order Ship to Properties Screen. • unselected = The system does not calculate freight.

Adding Customer/Address Information

Use the customer and address information fields on the [Work with Order Screen](#) to enter or verify the name and address of the customer who is placing the order. The customer/address information fields are:

- [Name](#)
- [Cmp \(Company\)](#)
- [Attn \(Attention\)](#)
- [Street](#)
- [Apt](#)
- [M/F \(Male/female\)](#)
- [Postal](#)
- [City](#)
- [State](#)
- [Cnty \(Country\)](#)
- [Email](#)
- [OptIn](#)
- [Phone numbers](#)
- [Delivery](#)
- [Class \(customer class\)](#)
- [Rent](#)
- [Mail](#)
- [Currency](#)
- [Associate \(Associate customer\)](#)

For an existing customer: The system places the cursor in the [Source](#) field when you select an existing customer for Order Entry. The source code may default, based on your system control values and the source code information retained in the Sold-to Customer table; you can also use the [Source Code Auto Retrieval Value \(H82\)](#) to retrieve the correct source code based on the most recent mailing to the customer, or to default a source code if the actual code is unknown. Information from the customer appears in the customer name and address information fields. This information is kept on file for the Sold-to customer and is called each time you select this customer.

Verify that the customer information is still accurate. If it did not already default, enter a source code in the Source field, and enter other required order information.

Instructions: To update the customer and address information:

1. Position the cursor at the first customer field that needs to be updated.
2. Enter over the information in the field.
3. Enter the required information.

The system updates the Sold-to Customer *automatically* when you change any customer information on the Order Entry screen.

 **Note:**

The [Display/Update Bill to Screen](#) opens in Order Entry, Order Maintenance and in Work with Customers when you change the name or address of a Sold-to customer who is linked to a permanent Bill-to customer. The screen enables you to apply the changes made to the Sold-to address to the Bill-to address.

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you create or update a customer during order entry, Order Administration sends the current customer information to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the [Customer Engagement Customer Integration](#) for more information.

For a new customer: The system places the cursor in the [Name](#) field when you select Create on the [Select Customer Sold To For Order Screen](#) to enter an order for a new customer. The customer name and address fields are blank. The system assigns the next available Sold-to customer number to this new customer and files the customer's name and address information under this number in the Sold-to Customer table.

Search information: If you searched on postal code, name, company, or any combination of these fields before selecting Create to create a new customer, your most recent entry(ies) default into the appropriate fields. Additionally, if your search included the postal code, the related city, state, and country also default.

What to complete?

- [Name](#) or [Cmp \(Company\)](#)
- [Street](#)
- [Postal](#)
- [City](#)
- [State](#)
- [Cnty \(Country\)](#)

Making changes: If you change any of the shipping address information on the order after you have begun to enter additional information, including any items, the order might need to be repriced and the tax recalculated. This situation might occur if you use tax-inclusive pricing and VAT, because a change in address may change whether the order is subject to VAT. In tax-inclusive pricing, you do not accumulate tax in the [Tax](#) bucket on the order, instead, you charge a higher price for the item and add VAT as a hidden tax on the order detail line.

If the customer has a tax exemption at the state level, you also need to clear the tax-related fields in order to prompt the system to recalculate the tax on the order based on the new shipping address. See [Working with Customer Tax Status](#) for an overview.

Field	Description
Name	<p>5 fields are available for you to enter the customer's full name:</p> <p>Prefix A title that belongs before the customer's name, such as "Mrs." or "Dr." <i>Alphanumeric, 3 positions; optional.</i></p> <p>First Name The customer's first name. <i>Alphanumeric, 15 positions; optional.</i></p> <p>Initial The initial of the customer's middle name. <i>Alphanumeric, 1 position; optional.</i></p> <p>Last Name The customer's last name. If you entered a customer last name at a scan screen before selecting Create to create a new customer, this information defaults; but you can override it. <i>Alphanumeric, 25 positions; required if Company has not been entered.</i></p> <p>Suffix An addition to the customer's full name, such as "M.D.", "Fr.", or "III." <i>Alphanumeric, 3 positions; optional.</i></p>
Cmp (Company)	<p>The name of the company placing the order. If you entered a company name at a scan screen before selecting Create to create a new customer, this information defaults; but you can override it. <i>Alphanumeric, 30 positions; required if Last name is not entered.</i></p>
Attn (Attention)	<p>The name of the person who should receive this order at the shipping destination. <i>Alphanumeric, 30 positions; optional.</i></p>

Field	Description
Street	<p>The customer's street address. This is the primary delivery address.</p> <p>Shipping to a Post Office Box</p> <p>To ship to a Post Office Box, enter POST OFFICE BOX, POST BOX, or any variation of PO BOX (with or without spaces or non-alphabet characters, such as P.O. BOX), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table).</p> <p>Example: Enter P.O. Box 9999 in the <i>Street</i> field to indicate delivery to a post office box instead of a home or company address.</p>

 **Note:**

If you type POST OFFICE BOX, POST BOX, or any variation of PO BOX in the customer's street address during order entry or through the Order API, the system automatically selects the *PO box* field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the *PO box* flag.

Expanded Address

A plus sign (+) appears next to the word *Street* if there is additional information in the third or fourth address lines for the customer (however, the plus sign does not appear if there is an additional second address line only). Use the [Expand Name/Address Screen](#) to complete 3 additional address fields; for example, to enter international addresses.

Alphanumeric, 32 positions; required.

Apt	<p>The customer's apartment, suite, rural route or floor number. Use this field to identify the address further. This information prints next to the primary street address on labels.</p> <p>To enter an apartment or suite address:</p> <ol style="list-style-type: none"> 1. Enter APT to indicate an apartment or STE to indicate a suite. 2. Insert a space. 3. Enter the number of the apartment or suite, such as: APT 4 or STE 1164A. <p><i>Alphanumeric, 10 positions; optional.</i></p>
-----	--

Field	Description
M/F	<p>This code indicates the customer's gender. Gender codes are defined in the Profile Data table, which you use to define other demographic information as well.</p> <p><i>Alphanumeric, 1 position; optional.</i></p>
Postal	<p>The postal or zip code for this customer. If you entered a postal at a scan screen before selecting Create to create a new customer, this information defaults, but you can override it.</p> <p>Required? A postal code is required only if the <i>Require postal code?</i> flag for the country is selected; see Setting Up the Country Table (WCTY).</p> <p>Default city and state? If the system control value Use Zip/City/State Defaulting? (B13) is selected, you can enter just the postal code to have the system default the associated city and state.</p> <p>Postal code validation: If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <p>Tax rates: The Postal Code table includes valid postal code/city/state combinations, and may also contain tax rates. You can purchase a listing of the valid combinations from your post office or you can enter each postal code/city/state combination manually.</p> <p>SCF/ship via validation: If you enter a postal code and the <i>Perform ship via edit?</i> flag for the country is selected, the system validates the SCF/ship via combination against the SCF Ship Via table when you complete the order; see Working with SCF/Ship Via Values (WSHV).</p> <p><i>Alphanumeric, 10 positions; required or optional based on country.</i></p>
City	<p>The city where the customer lives or receives mail or shipments. If you entered a postal code at a scan screen before selecting Create to create a new customer, the related city defaults; but you can override it.</p> <p><i>Alphanumeric, 25 positions; required.</i></p>
State	<p>The state or province where the customer resides or receives mail or shipments. If you entered a postal code at a scan screen before selecting Create to create a new customer, the related state defaults; but you can override it.</p> <p>Defined where? State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY).</p> <p>Required? A state is required only if the <i>Require state?</i> flag for country is selected. See Setting Up the Country Table (WCTY).</p> <p>SCF validation: If the <i>Require postal?</i> flag for the country is selected, the system validates that the state you enter is assigned to the SCF associated with the postal code. See Working with SCF Codes (WSCF) for background.</p> <p><i>Alphanumeric, 2 positions; required or optional based on country.</i></p>

Field	Description
Cnty (Country)	<p>The code for the customer's country. Country codes are defined in and validated against the Country table.</p> <p>You can define a Default Country for Customer Address (B17) in the System Control table or specify one at the Default Values for Orders screen screen. If you entered a postal code at a scan screen before selecting Create to create a new customer, the related country defaults; but you can override it.</p> <p><i>Alphanumeric, 3 positions; required.</i></p>
Email	<p>The email address for this order.</p> <p>Order-level email address: The email address defaults from the customer's primary email address. A plus sign (+) indicates that there are additional email addresses on record for the customer. When you press Enter, the system adds the order-level email address to the Customer Sold To Email Address table, if it is not already there. See Working with an Order-Level Email Address for more information.</p> <p>Recipient or gift order: The email address is associated with the customer placing the order. To work with the email address for the order recipient, you must advance to the Expand Name/Address Screen.</p> <p>Email format validation: See Email Address Validation for information on how the system verifies that your entry is formatted correctly.</p> <p>Email notifications: This field must contain an email address for the system to send the customer automatic email notifications, such as backorder or soldout notifications. See When Does the System Generate an Email Notification?</p> <p>Fraud checking: The order goes on EO hold if this email address matches an email address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF).</p> <p><i>Alphanumeric, 50 positions; optional.</i></p>

Field	Description
OptIn	<p>Indicates the preferred method of correspondence.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • O1 (All) = Email is the preferred method of correspondence. • O2 (Order) = Use email for order-related correspondence only; generate a document for other correspondence. • O3 (None) = Do not use email for any correspondence; generate a document instead. • O4 (Don't Ask) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>Defaults:</p> <ul style="list-style-type: none"> • If the email address defaults from the sold-to customer, the opt-in/out setting also defaults from the customer. Normally, the opt-in/out setting for the customer and the setting for the matching record in the Customer Sold To Email table are the same, but if they are not, the opt-in/out setting defaults from the Customer Sold To Email table. • If no email address defaults, or if this is a new customer, this value defaults from the Default Opt In/Opt Out Flag (G97) system control value. <p>You can override the default.</p>

 **Note:**

The above values use the letter O, not the number 0 (zero).

The system updates this field when you change the setting of the *Opt in/Opt out* value at any other screen, such as customer maintenance, order maintenance, or catalog requests.

When you update this setting: The opt-in/out setting is not stored on the order itself. When you change the opt-in/out setting here, the system updates the opt-in/out setting for the email address used on the order in the Customer Sold To Email Address table. If the order-level email address is also the customer's primary email address, the system also updates the customer's default opt-in/out setting. See [Email Address Updates through Interactive Order Entry](#) for more information.

Recipient or gift order: The opt-in/out setting is associated with the customer placing the order. To work with the opt-in/out setting for the order recipient, you must advance to the [Expand Name/Address Screen](#).

Email notifications: See [When Does the System Generate an Email Notification?](#) for an overview.

Outbound email API: The opt in/opt out settings controls the generation of the *Outbound Email XML Message*

Field	Description
Phone numbers	<p data-bbox="678 275 1377 422"><i>(CWEmailOut)</i> using the same logic as the generation of outbound emails. See <i>Outbound Email API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). <i>Required.</i></p> <p data-bbox="678 436 1377 527">There are 2 different sets of fields for the customer's daytime and evening or third (fax or mobile) phone numbers. These fields are based on the following system control values:</p> <ul data-bbox="678 533 1377 768" style="list-style-type: none"> <li data-bbox="678 533 1377 646">• The Phone Numbers (D15) system control value determines whether the third phone number (fax or mobile) or the evening phone number is listed after the day phone number. <li data-bbox="678 653 1377 768">• If the Phone Numbers (D15) system control value is set to DAY/FAX, the Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mobile</i> number. <p data-bbox="678 774 1377 831">See the Phone Numbers (D15) and Third Phone Number Type (L53) system control values for more information.</p> <p data-bbox="678 840 1377 930">One, but not both, of these fields is a required field if you set the system control value Require Phone Number in Order Entry/Order Maintenance (H01) to Y.</p> <p data-bbox="678 938 1377 1339">Phone number format: You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and is displayed as it was entered by the operator.</p> <p data-bbox="678 1348 1125 1375">Example: Telephone Number Format</p> <p data-bbox="678 1383 1377 1440">An operator enters a phone number containing 10 numbers: 5085550100</p> <p data-bbox="678 1449 1377 1766">The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100. When an operator enters a phone number containing 10 numbers (as in the example), the phone number is displayed so that the first 3 positions are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100 and no format exists for 6 numbers, the phone number would display as it was entered (5550100). See <i>Setting Up the Country Table (WCTY)</i>.</p> <p data-bbox="678 1774 1377 1883"><i>Alphanumeric, one 14-position (phone number) and one 4-position (phone extension); one of the two fields is required if system control value Require Phone Number in Order Entry/Order Maintenance is selected; otherwise, optional.</i></p>

Field	Description
Delivery	<p data-bbox="665 262 1383 357">Identifies a business (commercial) or residential address. Carriers that use different business or consumer rate tables (such as UPS) use this value.</p> <p data-bbox="665 357 1383 388">Valid values are:</p> <ul data-bbox="665 388 1383 577" style="list-style-type: none"><li data-bbox="665 388 1383 451">• Business = Business rate table determines shipping charges.<li data-bbox="665 451 1383 514">• Residential = Residential rate table determines shipping charges.<li data-bbox="665 514 1383 577">• No Distinction = This is not a valid value for UPS shippers. <p data-bbox="665 577 1383 640">The system uses this logic to default a delivery code to a customer address on an order:</p> <ul data-bbox="665 640 1383 913" style="list-style-type: none"><li data-bbox="665 640 1383 703">• The system defaults the delivery code defined for the postal code on the address.<li data-bbox="665 703 1383 787">• If a delivery code has not been defined for the postal code on the address, the system defaults the delivery code defined in the Customer table.<li data-bbox="665 787 1383 913">• If a delivery code has not been defined in the Customer table, the system defaults the delivery code defined in the Default Delivery Code for New Order Entry Customers (D13) system control value. <p data-bbox="665 913 1383 955"><i>Required.</i></p>

Field	Description
Class (customer class)	<p>A code that categorizes customers at a high level for reporting purposes. You can use customer class codes to:</p> <ul style="list-style-type: none"> • send offers to a limited group of customers • restrict item sales to a group of customers • bypass normal item reservation • determine whether to prompt for user-defined fields in order entry <p>You can define a Default Customer Class in Order Entry (D63) to assign to all customers you create through order entry.</p> <p>Required? The Require Customer Class in OE, WCAT, and WCST (H85) system control value defines whether this field is required.</p> <p>Secured? The Maintenance of Customer Class Field (B07) secured feature defines whether you can enter or maintain the customer class field at this screen.</p> <div data-bbox="878 787 1380 1165" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>If the Require Customer Class in OE, WCAT, and WCST (H85) is selected and the customer does not have a customer class code assigned, a user who does not have authority based on the Maintenance of Customer Class Field (B07) secured feature will not be able to enter an order.</p> </div> <p>See Setting Up the Customer Class Table (WCCL) on working with customer classes.</p> <p><i>Numeric, 2 positions; optional or required depending on system control value.</i></p>
Rent	<p>Indicates whether to rent this customer's name to other companies.</p> <ul style="list-style-type: none"> • selected = Rent this name. • unselected = Do not rent this name.
Mail	<p>Indicates whether to send the customer mailings from your company. You can define a default value in the System Control table.</p> <ul style="list-style-type: none"> • selected = Send mail to this customer. • unselected = Do not send mail to this customer.

Field	Description
Currency	<p>The currency defined for the offer associated with the source code. The currency is included on the screen after you enter a source code on the order header.</p> <div style="border: 1px solid #0070c0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Displayed only if you have the Multi Currency by Offer (E03) field in the System Control table selected.</p> </div>
Associate (Associate customer)	<p><i>Alphanumeric, 3 positions; display-only.</i></p> <p>Indicates whether the customer is eligible for associate pricing. The associate price is a discounted price for an item, as defined in the <i>Associate price</i> field for the Item/Offer or SKU/Offer.</p> <p>Defaults to selected if the customer is identified as an associate customer.</p> <p>The system updates the customer automatically if you change this setting.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> selected = The customer receives the associate price for each item ordered. unselected (Default) = The customer is not an associate customer and receives the regular item price for each item ordered. <p>Secured Feature</p> <p>The <i>Change Associate Customer Flag (B10)</i> secured feature controls whether you can change this setting; if you prohibit access to this feature, an error message indicates if you try to change the value: Not authorized to change Associate Customer.</p>

Adding Order Information

Use the Order Information fields on the [Work with Order Screen](#) to define or verify how you received the order, to identify how the order will be delivered, and to specify whether the customer is eligible for any discounts or tax exemptions. The Order Information fields are located in the lower portion of the screen underneath the dashed line. The order information fields are:

- [Source](#)
- [Via](#)
- [Disc %](#)
- [Salesrep](#)
- [Pty \(Priority\)](#)
- [Hld Rsn](#)
- [Arrival date](#)

- [Cancel date](#)
- [Canc B/O \(Automatically cancel backorders\)](#)
- [Gift](#)
- [PO#](#)
- [Tax code](#)
- [Tax identification](#)
- [Whs \(Warehouse\)](#)
- [Est frt \(Estimated freight charge\)](#)

Defaults: Defaults may be loaded to various fields, based on values established in the System Control table or defaults entered at the [Default Values for Orders screen](#). You can override these values if needed.

What to complete?

- [Source](#)
- [Via](#)

Field	Description
Source	<p>A code that identifies a segment of your customer base or a rented list to whom you mail a catalog. The source code helps you to track the origin of the customer's order. The source code typically prints on the catalog mailing label (if your company includes this information when you print labels).</p> <p>Each order must include a valid source code during Order Entry, either one that the customer provides (a “known” source code from a catalog mailing) or a generic source code when you cannot trace the origin of the order from a specific catalog (an “unknown” source code).</p> <p>The source code controls how shipping is calculated and items are priced, and whether the order is eligible for any discounts.</p> <p>Defaulting</p> <ul style="list-style-type: none"> The source code may default from the <i>Current source</i> field or from mail history for the Sold To Customer depending on the settings of the Use Default Current Source Code (C46) and Load Source from Mailing History (D20) system control values. You can use the Source Code Auto Retrieval Value (H82) to automatically retrieve the correct source code based on the most recent mailing to the customer, or to default a source code if the actual code is unknown. If you enter a source code at the Select Customer Sold To For Order Screen, the system defaults this source code to the order. <p>Default Unknown Source Code</p> <p>If the order header source code matches the source code in the Default Unknown Source Code (I58) system control value, the system updates the source code on the order header to the source code associated with the offer on the first order detail line; see Default Unknown Source Code Logic.</p> <p>Prompting for a source code</p> <p>You can prompt on this field to obtain a list of current source codes. Only source codes with a <i>Y</i> in the <i>Display in O/E</i> field in the Source Code table are listed.</p> <p>You can also use the Source Code Auto Retrieval Value (H82) to retrieve the correct source code based on the most recent mailing to the customer, or to default a source code if the actual code is unknown.</p> <p>Currency of source code</p> <p>If you take orders in multiple currencies (the Multi Currency by Offer (E03) system control value is selected), the currency defined for the offer associated with the source code will display in the <i>Currency</i> field after you enter the source code.</p> <p>Restricted source codes</p> <p>During Order Entry, you must use unrestricted source codes, which means that the <i>Restricted</i> field in the Source Code is unselected.</p> <p>A source code might be flagged as “restricted” when:</p> <ul style="list-style-type: none"> The source code is obsolete; no new orders can use the source code.

Field	Description
	<ul style="list-style-type: none">The source code includes errors or was created by mistake. <p>Initially, all new source codes have an unrestricted status. During Offer Initialization, however, you might restrict all source codes associated with a particular offer.</p> <p>Capturing the Source Code</p> <p>The system writes the source code used by a new customer to the <i>Original source</i> field for the customer.</p> <p>If the Update Original Source Code for Recipient Customers (F90) system control value is selected, the system writes the source code defined for the sold to customer to the Original source code field for a recipient customer.</p> <p>The system may also update the source code to the Current source code field for a new or existing customer, depending on the setting of the Update of Current Source Code in Customer File (D08) field in the System Control table.</p> <p>Bypass Credit Checking</p> <p>If the <i>Bypass credit check</i> field for the source code is selected, the system does not perform credit checking for this order and writes a message to order transaction history indicating credit checking was bypassed.</p> <p>Entering Customer Warranty Information</p> <p>If the <i>Warranty required</i> field for the source code is selected, the system automatically advances you to the Customer Warranty Information screen where you can enter warranty information for a warranty product on the order. See Displaying More Options in OIOM.</p> <p>Entity History</p> <p>The system captures entity-level history based on the source code on the order header if the Track Customer History at Entity Level (F89) system control value is selected.</p> <p>More information on source codes: Source codes are defined in and validated against the Source Code table. See Working with Source Codes (WSRC).</p> <p><i>Alphanumeric, 9 positions; required.</i></p>

Field	Description
Via	<p>A code for the shipper to deliver this order to the customer. Ship via codes are defined in and validated against the Ship Via table; see Working with Ship Via Codes (WVIA). Additionally, ship via codes are validated against the SCF/Ship Via table, which ties together shippers and geographic locations. You need to set up valid carriers for each SCF prior to Order Entry. See Working with SCF/Ship Via Values (WSHV).</p> <p>Ship Via Defaults</p> <p>A default value is loaded in this field if you entered a default on the Default Values for Orders screen or in the Default Ship Via (A77) system control value. In addition, there are several ways the system can override the shipper specified on the order with another shipper; see Ship Via Override Hierarchy for a complete list and the hierarchy in which the ship via overrides take precedence.</p> <p>Reviewing eligible ship vias and optionally selecting an override</p> <p>You can prompt on this field to advance to the Valid Ship Vias for Window, where you can review valid ship vias for the order, including their overall shipping charges and expected delivery dates; optionally, you can select an override ship via.</p> <p>Prompting and validation for countries where postal code is optional:</p> <ul style="list-style-type: none"> • If the customer's address does not include a postal code (possible if the country's <i>Require postal code?</i> flag is unselected), the Valid Ship Vias for Window displays all valid SCF/ship via combinations based on the default SCF of #. Setting up SCF/ship via records using the default of # enables you to specify valid ship vias for an address without a postal code. • If the country's <i>Perform ship via edit?</i> flag is selected, then the system validates the ship via against the SCF/ship via table. To perform this validation for an address that does not include a postal code, the system uses the default SCF of #. <p>See Setting Up the Country Table (WCTY).</p> <p>Item Ship Via Overrides</p> <p>If ship via overrides exist in the Item Ship Via Override table for an item on the order, the system evaluates the ship via on the order header to determine if the ship via is eligible to ship the item.</p> <p>If the ship via on the order header is not defined in the Item Ship Via Override table for the item on the order, you advance to the Ship Via Overrides for Item Window, requesting you to select an eligible shipper to assign to the item on the order line. See Working with Item Ship Via Overrides for more information on defining eligible shippers for an item.</p> <p>Express Bill Ship Vias</p> <p>You can use an express bill shipper for orders in which an item has already been taken from the warehouse without first entering an order. An express ship via is designated by an Express Bill in the <i>Billing code</i> field for the shipper.</p>

Field	Description
	<p>When you enter an express billed order, the Enter Location pop-up window opens after you enter the item. Here, you must identify the warehouse and location from which the item was removed. The system defaults the warehouse and primary location defined in the Item table, however, if the Retail Order Defaults (F59) system control value is selected, the system defaults the warehouse from the Retail warehouse field in the Order Type table and defaults the location from the <i>Auto restock location</i> field for the warehouse that defaulted.</p> <p>When you express-bill an order:</p> <ul style="list-style-type: none"> • The system performs an inventory transaction to reduce the quantity on-hand in the location. • The system does not create a pre-generated pick for the item so that you do not reduce inventory twice. • No shipments occur. • If you enter a credit card payment method, you must manually authorize the card (enter an authorization number and authorization date for the payment method) or the order must be eligible for online authorization; see Performing Online Credit Card Authorizations. If the order is not eligible for online authorization and you do not enter an authorization number and authorization date, the screen displays an error message when you try to accept the order: Auth # & Date required for credit card on express order. Click on pay methods tab & enter.

 **Note:**

It is possible to exceed the entire available quantity of an item when you express-bill an order if you enter more than one order line for the same item. To avoid this situation, enter only one order line for each item on an express-billed order.

Since you cannot enter the Authorization Request ID at this screen, Oracle recommends that you instead use the Add Authorization option from the Order Summary page in Modern View to apply a manual authorization.

You can change an item on an order to express bill by entering an express bill code in the *Ship via* field on the [Work with Order Lines Screen \(Adding Items to the Order\)](#). When you express bill an item, the system does not create a pre-generated pick and no shipments occur.

An error message indicates if you try to change an item on an express bill order to a regular ship via:

Ship Via must be an Express Bill.

Numeric, 2 positions; required.

Field	Description
Disc %	<p>A flat discount percentage applied to discountable merchandise only (the Discountable field for the item is selected). A discount percentage defaults here if there is one specified for the source code or a standard or loyalty customer membership.</p> <p>The discount entered here applies only to the current shipping address on the order. You must reenter the discount for each recipient on the order.</p> <p>The system checks the user's feature authority in the <i>Discount percentage access</i> field in the Secured Features table and issues a message if the user is not authorized to take discounts on orders: You are not authorized to use discount %.</p> <p>The system also checks the Order Discount Percentage Limit (D16) system control value when you enter a discount here and issues a message if the discount exceeds this value: Discount % (xxx.xx) is greater than allowable limit.</p> <p><i>Numeric, 5 positions with a 2-place decimal; optional.</i></p>

Field	Description
Salesrep	<p>The person who is credited for making the sale. This is the person who is responsible for obtaining the customer's order; this may not be the same person who enters the order on the system.</p> <p>The salesrep# is used for sales and commission reporting. Sales representatives are defined in and validated against the Salesman table. See Working with Sales Representatives (WSLS). The system validates that the <i>Active</i> flag for the salesman on the order is selected; otherwise, an error message displays: <i>Salesman is not active</i>.</p> <p>The salesrep number defaults from:</p> <ul style="list-style-type: none">the customer table, if you have entered a valid value in the Salesrep # (Sales representative number) field in the customer table, or, if no Salesrep# is associated with the customer,the Default Values for Orders screen, if the <i>Salesrep #</i> field on the screen is populated (See Setting a Default Salesrep Number); this value on the Default Values for Orders screen may default from system control value Default Salesrep Number (E86). <p>If you prompt on this field, the system displays the Select Salesrep window where you can review and select a valid salesrep. The window indicates whether the salesrep is active and if a home store has been assigned to the salesrep.</p>

 **Note:**

- If you override the Salesrep number on the Work with Order screen, and then update customer information, the salesrep number associated with the customer, if the customer has an associated salesrep number, will again default.
- If a *Home Store* is defined for the salesrep number, the system does NOT default this store to the *Sales Rep Store* field on the [Work with Order Ship to Properties Screen](#).

Numeric, 7 positions; optional.

Field	Description
Pty (Priority)	<p>Used by the Evaluate Backorders program to match items to backorders. A value defaults to this field if a priority was entered in the B/O priority (Backorder priority) field for the source code; and the header-level value, in turn, defaults to the Priority field on the order detail line.</p> <p>The Auto Update Order Priority (G45) system control value controls whether the system automatically updates the priority of the order to 9 (highest priority) when you enter an override to the default Arrival date in order entry or order maintenance. If this system control value is selected, the system automatically updates the priority to 9 when you enter an override to the <i>Arrival date</i> on the order header or order detail screen. If this system control value is unselected, the system does not update the priority of the order when you enter an override to the <i>Arrival date</i>.</p> <p>Immediate Reservation</p> <p>If you use Immediate Reservation, this value determines the sequence in which orders with backordered items receive inventory. The Evaluate Backorders program uses the priority to determine which backorders receive stock first.</p> <p><i>Numeric, 1 position; optional.</i></p>
Hld Rsn	<p>A code to place an order on hold for any user-defined reason. Hold reason codes are defined in and validated against the Hold Reason table. See Establishing Order Hold Reason Codes (WOHR).</p> <p>The system reserves inventory for orders with a hold reason code; however, the order is not eligible for pick slip preparation.</p> <p>You must release orders on any type of hold through Releasing Held Orders.</p> <p><i>Alphanumeric, 2 positions; optional.</i></p>

Field	Description
Arrival date	The date when the customer wants to receive this order. Initially, the arrival date is set to the current date; however, you can enter some future date to ship the order at a later date. Alternatively, you can leave this field blank and enter an arrival date for selected items.

 **Note:**

This screen prevents you from entering an arrival date earlier than the order date; however, the system does not prevent you from setting the arrival date earlier than the order date when you create the order through the order API or submit the order to the batch edit. Also, the system does not prevent you from entering an arrival date for an order line that is earlier than the order date.

The Auto Update Order Priority (G45) system control value controls whether entering an override to the *Arrival date* in order entry or order maintenance updates the priority of the order to 9 (highest priority).

- If this system control value is selected, the system automatically updates the priority to 9 when you enter an override to the *Arrival date* on the order header or order detail screen.
- If this system control value is unselected, the system does not update the priority of the order when you enter an override to the *Arrival date*.

The arrival date controls:

- Inventory reservation.
- Pick slip preparation; see [Selecting Order Lines for Pick Slip Preparation](#).

Influence on Reservation

The arrival date on the order controls whether inventory is reserved for each order detail line. The system uses this calculation:

$$\text{arrival date} - \text{reservation lead days (B27)} = \text{reservation date}$$

The system will not reserve inventory if the system-calculated date is greater than today's date. This is considered a future order. The system identifies each item on the order as a future order and assigns a backorder status to each item.

You can run the [Evaluate Future Orders](#) periodic function each evening to evaluate each item marked as a "future order." The system reruns the arrival date calculation. The system reserves the required inventory based on the order date if

Field	Description
	<p>the system-calculated date is less than or equal to today's date.</p> <p>Influence on Pre-Generated Picks</p> <p>The arrival date on the order controls whether the system creates pre-generated picks for the order. The system uses this calculation:</p> <p>Arrival Date from Order Line (or Order Ship To) - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date</p> <p>The system creates a pre-generated pick for the order line if this system-calculated date is less than or equal to today's date; otherwise, the system does not create a pre-generated pick for the order line until the date is within the allotted time frame. See Selecting Order Lines for Pick Slip Preparation.</p> <p><i>Numeric, 6 positions; required.</i></p>
Cancel date	<p>The last date on which the customer will accept receipt of this order. Leave this field blank if there is no "deadline" for delivery.</p> <p>The system uses this calculation:</p> <p>Cancel date</p> <ul style="list-style-type: none"> - Lead days (System Control table) - Transfer days (Warehouse/Drop Point table) - Lead days (SCF/Ship Via table) - Date to stop reserving stock <p>Order Cancellation List</p> <p>Any items that have not shipped before the cancellation date are printed on the Order Cancellation List along with the customer's name and phone number.</p> <p>Customer Service uses this list to contact each customer to see if the deadline can be extended. If not, Customer Service must use Order Maintenance to cancel the order.</p> <p>Influence on Pre-Generated Picks</p> <p>The cancel date on the order controls whether the system creates pre-generated picks for the order. The system uses this calculation:</p> <p>Cancel Date > Today's Date + Pick Processing Days (B37) + Ship Via Lead Days in WSHV</p> <p>The system creates a pre-generated pick for the order line if the cancel date is greater than this system-calculated date; otherwise, the system does not create a pre-generated pick for the order line. See Selecting Order Lines for Pick Slip Preparation.</p> <p><i>Numeric, 6 positions; optional.</i></p>

Field	Description
Canc B/O (Automatically cancel backorders)	<p>Indicates whether the system will cancel any backordered lines automatically after the first shipment on the order. Unshipped lines are canceled during Confirmation.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• selected = Items cannot be backordered.• unselected (Default) = Items can be backordered. <p>If this field is selected, any open line on an order will be canceled during billing using the Auto Soldout Cancel Reason (C20), provided this system control value specifies a valid cancel reason code.</p>
Gift	<p>Indicates whether the order is a gift order.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• selected = The order is a gift order.• unselected = The order is not a gift order. <p>If the order is a gift order:</p> <ul style="list-style-type: none">• You can select Sold To/Recipient to enter the recipient's shipping address; see Adding a Recipient Order in Order Entry.• No pricing information prints on the pick slip.• The buyer receives a gift acknowledgment card to confirm delivery of the gift. <p>May default to Y or N depending on the value in the Default "Gift Order" Flag (D14) system control value. If this field is set to default to Y, the sold-to customer information is cleared after you enter the source code for the order. Also, you can select Accept/Add Recip to enter a recipient order, the <i>Gift</i> field will be selected automatically for each recipient (but can be overridden).</p>
PO#	<p>The customer's purchase order number.</p> <p><i>Alphanumeric, 15 positions; optional.</i></p>

Field	Description
Tax code	This code determines whether the customer's purchases are taxed, and if so, how to calculate the tax. Defaults to the tax status previously defined for an existing customer and defaults to N for a new customer. When you enter the customer's name and address, the system changes the tax code to T if the customer is subject to tax.

 **Note:**

The system ignores the tax code if you use an external tax system to calculate tax.

The system uses these sources to calculate tax on an order:

- [Tax Included in Price \(E70\)](#) system control value and other system control values
- Country table (see [Setting Up the Country Table \(WCTY\)](#))
- SCF table (see [Working with SCF/Ship Via Values \(WSHV\)](#))
- Postal Code table (see [Setting Up the Zip/City/State \(Postal Code\) Table \(WZIP\)](#))
- Customer Sold To table and Customer Tax table (see [Working with Customer Tax Status](#))
- Item and SKU tables; Item Tax Exemption table and GST Tax Exemption Status table (see [Working with Item Tax Exemptions \(WITX\)](#) and [Working with GST Tax Exemption Status \(MGTX\)](#))
- Additional Charge Code table (see [Establishing Additional Charge Codes \(WADC\)](#))

The information that the system gathers for tax calculation purposes includes tax rates, calculation methods for the Canadian GST and PST taxes, and whether to tax freight and/or handling.

You can set up a tax exemption as a default for a customer, or exemptions in particular states or provinces.

If you change the shipping address: Whenever you make any change to the shipping address on the order, you should clear the *Tax code* field and the *Resale/Exempt#* field.

Clearing these fields allows the correct information to default into these fields based on the new destination address. See [Working with Customer Tax Status](#) for a discussion of how a customer's tax information defaults in order entry.

Valid values are:

- Taxable = Indicates that the customer is subject to all regular taxes. If the customer resides in Canada, the customer is subject to both GST and PST.
- Non-Taxable = The system determines the customer's tax status in order entry based on whether you enter a *Resale/Exempt #* and on the shipping address. See [Working with Customer Tax Status](#) for an overview.
- Resale = Indicates that the customer is a reseller. A reseller is a person or company who purchases goods to

Field	Description
Tax identification	<p>sell to someone else. A reseller certificate number is required in the <i>Tax identification</i> field. The system does not calculate standard tax (in the <i>Tax</i> bucket) or VAT, if applicable, on the order.</p> <ul style="list-style-type: none"> • Exempt = Indicates that the customer is considered tax-exempt. A tax-exempt certificate number is required in the <i>Tax identification</i> field. The system does not calculate standard tax (in the <i>Tax</i> bucket) or VAT, if applicable, on the order. • GST Only = Indicates that the customer is a Canadian customer who is subject to the Goods and Services tax (GST) on purchases only. GST is a federal tax. The System Control table defines the default GST rate; however, an override GST rate might exist for the postal code or SCF. • PST Only = Indicates that the customer is a Canadian customer who is subject to the Provincial Services tax (PST) on purchases only. <p>The <i>Tax identification</i> is required for a tax code of Resale or Exempt. <i>Required.</i></p> <p>The customer's tax identification code, typically the resale or exempt certificate number assigned to a customer who is identified as tax exempt (E) or as a reseller (R); otherwise, the tax identification number does not control taxability. Any combination of letters, numbers, or special characters is accepted.</p> <p>The tax identification code entered here is saved on the order, but does not update the customer record.</p> <p>If a customer has a VAT exemption number, the tax code will default to Exempt and the words VAT EXEMPT will default in this field for any order subject to VAT. You cannot override a VAT exemption and make the order taxable. See Working with Customer Tax Status for a discussion of how tax information defaults in order entry.</p> <p><i>Alphanumeric, 30 positions; required if customer is defined as tax exempt or as a reseller; otherwise, optional.</i></p>

Field	Description
Whs (Warehouse)	<p>The warehouse used to ship the order. Leave this field blank if you want the system to determine which warehouse to use; otherwise, enter a warehouse code.</p> <p>The warehouse code you enter here overrides all warehouse codes except those entered for an individual order line, using the Add Line option.</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Warehouse Defaults</p> <p>The system uses the following hierarchy to default a warehouse to the order header.</p> <ol style="list-style-type: none"> 1. Default the <i>Reserve warehouse</i> defined for the shipping address on the order. <ul style="list-style-type: none"> • This is the <i>Reserve warehouse</i> defined for the permanent ship to customer on the order. • If a permanent ship to customer does not exist on the order, this is the <i>Reserve warehouse</i> defined for the recipient sold to customer on the order. • If a recipient sold to customer does not exist on the order, this is the <i>Reserve warehouse</i> defined for the sold to customer on the order. 2. If the Reserve from Non-Allocatable Warehouse (J25) system control value is <i>selected</i>, default the non-allocatable warehouse defined for the order type on the order. See Non-Allocatable Warehouse Reservation Processing During Order Entry for an overview.

 **Note:**

If you change the order type on the order, the system defaults the non-allocatable warehouse defined for the new order type. If a non-allocatable warehouse is not defined for the new order type, the system removes the warehouse from the order header.

3. If the [Reserve from Non-Allocatable Warehouse \(J25\)](#) system control value is unselected or a non-allocatable warehouse is not defined for the order type on the order, leave the *Warehouse* field on the order header blank.

 **Note:**

If you change the order type on the order, the system defaults the non-allocatable warehouse

Field	Description
-------	-------------

defined for the new order type. If a non-allocatable warehouse is not defined for the new order type, the system retains the warehouse default that currently exists on the order header.

Warehouse Reservation Hierarchy

The system uses the following hierarchy to determine the warehouse where an order will ship from.

1. Warehouse Defined on Order Line: If you have defined a warehouse code for an individual order line, the system reserves the item from this warehouse.
2. Warehouse Defined on Order Header: If you have defined a warehouse code on the order header, the system reserves the items on the order from this warehouse, unless a different warehouse is defined for an individual order line.
3. Warehouse List: If you have not entered a warehouse code for an individual order line or a warehouse code on the order header, the system will look for a warehouse list for the SCF of the order ship to address, if the Ship Complete from 1 Warehouse (B16) system control value is selected.
4. Item's Primary Warehouse: If no reserve warehouse can be assigned based on individual order lines, a warehouse code entered on the order header, or a warehouse list, the system will reserve the item in the warehouse defined for the item in the Item table.

Updating the Warehouse Defined for the Order

If you update the warehouse defined on the order header, the system:

- Removes any existing inventory reservations for the order lines on the order.
- Attempts to reserve the items on the order in the new warehouse specified. If the item is not available in the warehouse specified, the system assigns this warehouse as the backorder warehouse for the unreserved quantity of the item on the order line.

Reserving Against a Non-Allocatable Warehouse

If the Reserve from Non-Allocatable Warehouse (J25) system control value is selected, the system allows you to reserve inventory against a non-allocatable warehouse. You can define a non-allocatable warehouse in the *Reserve warehouse* field for the order type; any orders entered for this order type default the non-allocatable warehouse to the *Warehouse* field on the order and reserves against the non-allocatable warehouse. If the item is not in stock, the system backorders the item against the non-allocatable warehouse. See [Non-Allocatable Warehouse Reservation Processing During Order Entry](#) for more information.

Numeric, 3 positions; optional.

Field	Description
Est frt (Estimated freight charge)	<p>Your “best guess” of the freight charges on the order. Only enter a value here if using the actual freight method.</p> <p>You can tell the customer what the estimated freight charge for the order is; however, the true freight charge will be based on the actual weight of items on the order.</p> <p>Actual (billing amount) freight method</p> <p>You can enter an estimated freight charge when using the actual freight method (as designated by an Actual Bill Amt in the Freight method field of the source code).</p> <p>This is an order-level freight method that uses the total weight of all the items on the order to determine what the shipping charges will be on the order.</p> <p>The freight method being used on the order is transparent to your Order Entry operators; you must train your operators to enter estimated freight charges only for specific source codes.</p> <p>The actual freight charge is determined during Confirmation or Billing by one of these methods:</p> <ul style="list-style-type: none"> • Weighing the package and using the system- calculated the freight charge • Entering the freight charge manually <p>The estimated freight charge is not included in the order totals, so the <i>Frt</i> (freight) field will be blank (unless there is a freight override) until you determine the actual freight charge.</p>

 **Note:**

You can enter an estimated freight charge up to 99999.99. You must type the decimal point when entering the estimated freight.

Numeric, 13 positions with a 2-place decimal; optional.

Reviewing Order Totals

The system accumulates the current charges on the order in the Order Totals fields at the bottom of the [Work with Order Screen](#):

- [Merch \(Merchandise\)](#)
- [Frt \(Freight\)](#)
- [Frt+ \(Additional freight charges\)](#)
- [Tax](#)
- [Hnd \(Handling charge\)](#)
- [Chg \(Additional charges\)](#)
- [Total \(Order total\)](#)

The individual charges on the order are summarized in the *Total* field, enabling you to determine quickly what the customer is charged for items ordered, tax, freight, and additional charges, either by charge type or as a grand total.

Initially, the Order Totals fields are blank; however, the system updates the Order Totals fields as you add items to the order or as you attach additional charges.

You cannot enter information in these fields.

How do Order Totals relate to the current order? The Order Totals at the bottom of the screen relate to the current order only. This means that, although the customer may have placed several orders at the same time that will ship to different addresses, the Order Totals shown relate just to one order.

Select Summary to review the Order Totals across all recipient orders related to this order. These totals represent a summary of all charges for all shipping addresses; this is the amount that the customer owes for the initial order and all additional recipient orders. A recipient order is an order that is placed by and paid by a customer, but will ship to another address.

Field	Description
Merch (Merchandise)	<p>The total value of merchandise on this order. This does not include freight, additional charges, tax (except for hidden tax; see the Tax field), duty, handling, or sold out items. The value in the <i>Merch</i> field is the grand total of the item price on the line multiplied by the quantity ordered.</p> <p>Order-level discounts</p> <p>Select Reprice when you finish entering the order to calculate any end-of-order pricing discounts, including promotional pricing.</p> <p>Line-level discounts</p> <p>The system calculates any line-level discounts (such as the Disc %) line-by-line, as you enter each item.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Field	Description
Frt (Freight)	<p>The total charge for shipping this order. The system performs this calculation based on the freight method defined for the source code on the order. This total may depend on the quantity or weight of items ordered or on the dollar value of the order as a whole. If the system calculates freight as a percentage of the merchandise charges, there might be a penny variation in total freight amount due to rounding differences.</p> <p>You can also define a freight override for the order ship to on the Work with Order Ship to Properties Screen.</p> <p>Freight Methods</p> <p>Working with Source Codes (WSRC) discusses each freight method and freight calculation.</p> <p>Additional Charges</p> <p>Does not include any additional charges associated with shipping this item (see the Frt+ (Additional freight charges) field for these totals).</p> <p>Service and Weight Charges by Ship Via</p> <p>Includes any service charges by ship via or order weight charges by ship via. See Working with Ship Via Codes (WVIA).</p> <p>When the Freight Field is Blank</p> <ul style="list-style-type: none"> The <i>Frt</i> field is blank if the Calc freight (Calculate freight) field is unselected to indicate that freight will not be calculated for this order. The system calculates freight by order weight during repricing, the initial and final order accept, and when you select to change the last line on the order if you do not change its order quantity. The <i>Freight</i> field on the order does not include order weight freight charges as you add lines to the order; however, the system does display ship via service charges and ship via weight charges immediately. When the system calculates freight by order weight, the system updates the <i>Freight</i> field for the order with the complete freight amount. See Freight by Order Weight Calculation Logic and Examples. <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Frt+ (Additional freight charges)	<p>The total dollar amount for additional freight charges on the order, above regular shipping charges.</p> <p>The value in the <i>Frt+</i> field includes the additional freight charges defined for the shipper(s) on the order. For example, the shipper may charge a premium (additional shipping charges) for overnight shipments or Federal Express deliveries.</p> <p>Depending on how the shipper is defined, the customer may be charged additional shipping charges (in the <i>Frt+</i> field) and system-calculated shipping charges (in the <i>Frt</i> field) or just the additional shipping charges. The Add'l freight charge field for the Ship Via defines the additional freight charge.</p> <p>The system adds the additional shipping charge to an order only when the merchandise amount is less than or equal to the value in the <i>\$Limit</i> field for the shipper.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Field	Description
Tax	Tax Included in Price (E70)
Hnd (Handling charge)	<p>The total charge for special handling, gift wrapping or duty. The handling total in the <i>Hnd</i> field is the grand total of the handling charges for each item on the order multiplied by the quantity ordered.</p> <p>Also includes any duty charges on the order. You can review the duty charge for an individual item by selecting Change for an item on the Work with Order Lines Screen (Adding Items to the Order). See Special Handling Overview for more information.</p> <p>Can any item be gift wrapped?</p> <p>The Gift wrap and G/W price (Gift wrap price) fields for the Item/Offer or SKU/Offer control whether an item may be gift wrapped and defines the gift wrapping charge if gift wrapping is allowed. The system adds the special handling charge to the handling totals <i>for each gift wrapped item</i>.</p> <p>Blank if none of the items on the order are personalized or gift wrapped.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Field	Description
Chg (Additional charges)	<p>The total extra charges added to the current order.</p> <p>Types of Additional Charges</p> <p>The value in the <i>Chg</i> field is the sum of the additional charges on the order, namely:</p> <ul style="list-style-type: none"> • An additional service charge defined for the source code, based on the dollar value of merchandise on the order. • An additional service charge defined for the offer, based on the dollar value of merchandise on the order. • An additional shipping charge defined for the Shipper/Item. • A guaranteed service charge defined in the offer. • An additional charge entered manually through Charges. <p>Source code additional charges</p> <p>The system adds an additional charge to the order automatically when service charges exist for the source code. The amount of the additional charge is based on the total merchandise dollar value. See Working with Dollar Chart by Source Code (WDCS).</p> <p>Offer additional charges</p> <p>The system adds an additional charge to the order when service charges exist for the offer, but not for the source code. The amount of the additional charge is based on the total merchandise dollar value. See Working with Dollar Chart by Offer (WDCO).</p> <p>Shipper/item additional charges</p> <p>An additional charge may be defined for an item, depending on the shipper you select to deliver the item.</p> <p>Example: You might set up a special shipper/item for a desk when it will be delivered by Sample Shippers. Usually, Sample Shippers charges \$8.50 to deliver most items, but, because the desk is oversized and heavy, the customer will be charged an extra \$25.00 for delivery.</p> <p>The \$25.00 additional shipping charge will be added to the order automatically in the <i>Chg</i> field when the customer orders the desk and requests delivery through Sample Shippers.</p> <p>See Working with Ship Via Codes (WVIA).</p> <p>Guaranteed service charge</p> <p>A guaranteed service charge will be added automatically to the order when a value exists in the Guaranteed order charge field in the offer and the Excl serv chg (Exclude service charges) field for the source code is unselected. This is a charge required to guarantee that, if the order does not arrive, a replacement order will be shipped immediately while your company investigates the whereabouts of the original shipment.</p> <p>Manually-entered additional charges</p> <p>You can add any type of additional charge to the order by selecting Charges. The Enter Additional Charges Window opens for you to select an additional charge code and specify the additional charge. This allows you to add additional charges to an order at any time.</p> <p>The system displays the additional charge on this window using the value from the applicable <i>Additional charge code</i> field for the Offer.</p> <p>Additional charges and credits are defined in and validated against the Additional Charges table. You can define additional charge or credit codes for any reason, such as a charge for store-</p>

Field	Description
	<p>restocking or import duties or a credit for long-distance telephone charges or postage, etc. See Establishing Additional Charge Codes (WADC).</p> <p>You can limit the total amount of negative additional charges applied to an order by entering a dollar value in the Negative Additional Charge Limit (E49) system control value. You cannot override this dollar limit unless you have authority.</p> <p>Select Charges to review the additional charges on the order.</p> <p>Blank if no additional charges or credits are applied to the order.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Total (Order total)	<p>The sum of all charges on the order, including: merchandise, freight, additional freight, tax, handling, duty, and additional charges.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

When you complete this screen: Select OK when you complete the [Work with Order Screen](#). The system validates your entries and highlights any fields with errors. You must correct any errors before you can continue entering the order. So far, you have identified the person who is placing the order. Several different things can happen when you select OK and all your information is valid:

- The [Enter User Fields Screen](#) opens for you to capture information for the new customer.
- The [Work with Customer Warranty Information Screen](#) opens if the Warranty required field for the source code on the order header is selected. You can use this screen to enter warranty information for a product on the order.
- You advance to a pop-up window. See [When a Window Opens](#).
- The system places the cursor in the *Name* field; this allows you to:
 - Select any of the function keys listed at the bottom of the screen, *or*
 - Select OK again to advance to the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Display Duplicate Sold To Window

Duplicate addresses: A window opens if you enter a customer's name and address that matches another customer already on the system. The system determines this by assembling a match code for each customer address on the system. A match code is made up of parts of the customers name, address, and postal code. The match code is a user-defined code defined in the Match Code table; see [Setting Up Match Codes \(MMCH\)](#).

Note:

If you do not set up a match code in the Match Code table, the system displays the first sold to customer, based on sold to customer number, as a duplicate each time you enter a new address.

This window displays the new customer's name and address and the matching customer on the system. You can:

- Select Display for the matching customer to review additional name and address information to determine whether you should use the existing customer or create a new customer, *or*
- Select an existing address and select Select Exist to select an existing customer for the new order, *or*
- Select Accept Dup to use the new address and create a new Sold To Customer

Display Pop Up Msgs For Window

A window opens if text has been defined for the [Pop up window messages 1-4](#) fields for the sold to customer on the order and the customer did not advance to the order from the [Customer Selection Screen](#).

When a Window Opens

The system might also display a default payment type, customer actions or promotional pricing pop-up window at the [Work with Order Screen](#) that you must complete before you can select other functions or advance to the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Default payment type: The [Default Paytype Pop-up Windows](#) opens if you define a default payment type on the [Default Values for Orders screen](#) for cash/checks or credit cards. You can provide some basic payment information on the pop-up payment window before you continue entering the order. See [Default Paytype Pop-up Windows](#).

Customer actions: A window opens automatically on the Work with Order screen if the customer has an unresolved customer action issue. This may be something that you need to speak with the customer about or it may be an open issue that needs to be resolved. See [Displaying More Options in OIOM](#).

Promotion message: A window opens automatically if there is a message associated with the promotion code defined for the source code on the order header. See [Working with Source Codes \(WSRC\)](#) for more information on setting up promotions and source codes.

Screen Option	Procedure
Accept, validate, and process the order.	Select Accept Order; see Accepting or Rejecting the Order .
Reject (cancel) the order	Select Reject Order; see Accepting or Rejecting the Order .

Screen Option	Procedure
Enter a recipient order	Select Add Recipient; see Adding a Recipient Order in Order Entry .
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <ul style="list-style-type: none"> You will first advance to the Work with Order/Recap Screen if the Display Order Recap (A75) system control value is selected. This option is not available for a store pickup order; see Store Pickup Orders for an overview. </div>
Add additional charges to the order	Select Additional Charges; see Adding Miscellaneous Charges or Credits in Order Entry .
Enter or confirm the shipping address (permanent record).	Select Address Book; see Using a Permanent Shipping Address in Order Entry .
Enter or confirm the billing address for this order only.	Select Bill To; see Assigning a Billing Address in Order Entry .
Identify the items being ordered.	Select Detail; see Work with Order Lines Screen (Adding Items to the Order) .
Enter or verify additional address information	Select Expanded Address or click the plus sign (+) next to the <i>Street</i> ; see Expanding the Address in Order Entry .
Enter or verify order messages	Select Messages; see Adding Order Messages .
Display additional options	Select More Options; see Displaying More Options in Order Entry .
Enter or confirm the shipping address (this order only) or select a store location for a ship-for-pickup order	Select One Time Ship To; see Assigning an Order Shipping Address .
Add payment information to the order.	Select Pay Methods; see Enter Payment Method Screen .
Work with additional order properties	Select Properties; see Defining Order Properties .
Enter the address of the gift recipient.	Select Sold To/Recipient; see Adding a Recipient Order in Order Entry .
Work with the order summary information for each recipient on the order	Select Summary; see Working with Order Summary Information .

Work with Order Lines Screen (Adding Items to the Order)

Purpose: Use this screen to identify the items being ordered.

The screen is divided into 5 parts:

- The top of the screen displays order and customer information that is updated by the system.
- The center of the screen displays the item entry fields where you enter the necessary information to add an item to the order.
- The upper right displays running order totals that change dynamically as items are added to or deleted from the order.
- The center of the screen also displays several options that allow you to work with the individual lines on an order.
- The bottom portion of the screen displays the last three items you have added to the order with a second line of information for each item. If you have added more than three items to the order, you can select Next or Prev to review additional order lines that you have entered.

Order Information Fields

The Order Information fields on the [Work with Order Lines Screen \(Adding Items to the Order\)](#) contain several system-updated fields unique to the current order. The order information fields are:

- [Order#](#)
- [Recipients \(Recipient status\)](#)
- Sold To customer
- Ship to customer

This information appears in the *Sold-to* fields:

- The [Cmp \(Company\)](#) followed by the customer's [Last Name](#), [First Name](#), and [Initial](#).
- The customer's [Last Name](#), [First Name](#), and [Initial](#) if no company is specified.

The system inserts ATTN: between the company name and the customer name; this screen does not display the value from the [Attn \(Attention\)](#) field on the [Work with Order Screen](#).

Item Image

If you have specified an image of the item most recently added to the order, the screen displays this image between the [Order Information Fields](#) and the [Order Totals](#).

If you click on the actual image and you have set up item images on an external image hosting application, the system opens a web browser to the URL specified in the [Information Link](#) field for the item/SKU on the [Item Image/Info Link Screen](#).

For more information: See [Item Image/Info Link Screen](#) for more information on setting up item images on an external image hosting application to display in order entry, order maintenance, and at the Work with Items screen.

Order Totals

The system accumulates the current charges on the order in the Order Totals fields on the [Work with Order Lines Screen \(Adding Items to the Order\)](#):

- [Merch \(Merchandise\)](#)
- Freight: see [Frt \(Freight\)](#) for more information
- Freight +: see [Frt+ \(Additional freight charges\)](#) for more information
- [Tax](#)
- Handling: see [Hnd \(Handling charge\)](#) for more information
- Charges: see [Chg \(Additional charges\)](#) for more information
- [Total \(Order total\)](#)

The individual charges on the order are summarized in the *Total* field, enabling you to determine quickly what the customer is charged for items ordered, tax, freight, and additional charges, either by charge type or as a grand total.

Initially, the Order Totals fields are blank; however, the system updates the Order Totals fields as you add items to the order or as you attach additional charges.

You cannot enter information in these fields.

Item Entry Fields

Use the item entry fields to add items to the order. The item entry fields are:

- [Ofr \(Offer\)](#)
- [Item](#)
- [SKU](#)
- [Qty \(Quantity ordered\)](#)
- [Price](#)
- [No charge \(indicator\)](#)
- [Ovr \(Price override reason code\)](#)
- [S/H \(Special handling code\)](#)

Entering items: The item entry fields, located in the center of the screen, are described below.

Field	Description
Ofr (Offer)	<p>A code for the catalog, space or television advertisement from which you accept orders.</p> <p>Default offer</p> <p>Normally, the offer associated with the source code on the order header defaults here when you are using the line-format entry screen (see the description of the Position Cursor on Offer Field in OE/OM (F91) system control value). You can override this offer.</p> <p>Position Cursor on Offer Field in OE/OM (F91)</p> <p>The <i>Ofr</i> field will be blank if this system control value is selected; also, the cursor positions to this field. You might select this system control value to require order entry operators to verify and enter the offer for each item. If this system control value is unselected, the offer from the source code on the order header defaults, but you can override it; also, the cursor positions in the <i>Item</i> field.</p> <p>Linked Offer</p> <p>You can link a main offer to a sub-offer in Work with Offers. If you enter an item that is not found in the offer defined on the order detail line, the system uses the price defined for the item in the sub-offer linked to the offer. If a sub-offer has not been defined for the offer, or a price has not been defined for the item in the sub-offer, the system uses the most current active offer to determine the item's price.</p> <p>See Working with Offers (WOFR).</p> <p><i>Alphanumeric, 3 positions.</i></p>

Field	Description
Item	<p>A code for an existing unit of inventory. Item codes are defined in and validated against the Item table.</p> <p>Alias</p> <p>You can enter an alias for the item if the alias is defined for this item in the selected offer. Aliases are alternate names for items that you might use to track how presentation within an offer affects the item's sales performance. The alias you enter will display once you have entered the order detail line if the Display Item Alias (D56) system control value is selected.</p> <p>Cross Reference Code</p> <p>You can enter a code that represents another system's item and SKU in this field, provided the code does not exceed 12 positions. When an operator enters a cross reference code in the <i>Item</i> field, the system searches the SKU Cross Reference table alphanumerically for a Order Administration item that is associated with the cross reference code. If an Order Administration item is associated with the cross reference code, the system defaults the Order Administration item to the detail line. If a Order Administration item is not associated with the cross reference code, the system displays an error message. See Maintaining SKU Cross Reference Codes (MSKR).</p> <p>It is possible to set up a SKU cross reference code that exceeds 12 positions for integration with another system, such as ChannelAdvisor; however, you cannot enter these longer cross reference codes in order entry. See ChannelAdvisor Integration Overview for background.</p> <p>Membership item</p> <p>If you enter a membership item, you advance to the Enter Membership ID Window (Selecting a Membership Program).</p> <p>Restricted item</p> <p>If you enter an item which is restricted from being shipped to the address of the ship to customer, the item is highlighted and a message indicates: Item (XXXXXX) cannot be shipped to (COUNTRY/STATE).</p> <p>You cannot enter an item on an order if it is restricted for the ship to address. See Entering Additional Item Information for an explanation of country/state restrictions for an item.</p> <p>Zone Reservation Coded item</p> <p>If you enter a zone reservation coded (weather-sensitive) item, and you have set up the required supporting tables for zone reservation processing, you might advance to the Display Zone Reservation Dates Window or the Select Order Line Option Window, depending on the date of the order and the zone reservation dates you have specified for this item. Under zone reservation processing, an item is not reserved in order entry; instead, you can reserve the item during pick slip generation.</p>

 **Note:**

If you have not set up the required supporting tables, a

Field	Description
SKU	<div data-bbox="878 304 1377 611" style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px; margin-bottom: 10px;"> <p>zone reservation item is reserved under normal order entry processing except that if it is backordered, you cannot reserve the item through the Evaluate Backorders Periodic function; you can reserve it using the Interactive Reservations menu option. See Working with Interactive Reservation (MIRV).</p> </div> <p>See Shipping Zone Reservation Overview for a complete discussion of zone reservation rules.</p> <p>Scanning for Items</p> <p>When you prompt on this field, you advance to:</p> <ul style="list-style-type: none"> the Item Selection screen if the Auto-Generate Item Keywords from Description (F79) system control value is unselected. Note: Items whose status match the Item Status for Suppressing Item During Item Selection (L21) are not listed at this screen. the Keyword Selection Screen (Scanning for Items Using Item Keywords) if the Auto-Generate Item Keywords from Description (F79) system control value is selected. <p><i>Alphanumeric, 12 positions; required.</i></p> <p>A code that further defines an item's color, size, width, or any other type of user-defined attribute.</p> <p>If you are unsure of the SKUs available for an item, you can enter the item code, press Enter, review the contents of the SKU Scan Screen, and select the desired SKU from the scan.</p> <p>Inventory levels on the system and in the warehouse are maintained at the SKU level if the item has SKUs.</p> <p>The SKU portion of the item number consists of three 4-position fields. For example, SIZE represents SKU element 1, CLR (color) represents SKU element 2, and STYL (style) represents SKU element 3. Note, however, that these are user-defined fields in the System Control table. These labels are for demonstration only.</p> <p>The first 14 positions of the SKU description from Work with Item/SKUs is indicated in place of the SKU elements of a SKUed item if the Display SKU Description in place of SKU Element (F25) system control value is selected.</p> <p>SKUs are defined in and validated against the SKU table.</p> <p><i>Alphanumeric, three 4-position fields; required if the item has SKUs.</i></p>

Field	Description
Qty (Quantity ordered)	<p>The number of units of the item being ordered. May default from the Default Order Quantity (B30) system control value, but you can override it. The quantity ordered does not increase to reflect any sold out units.</p> <p>You can order up to 99,999 units of a single item on one order line.</p> <p>The Maximum Order Quantity (C60) system control value controls the maximum value you can enter in the <i>Quantity</i> field; additionally, the Allow Maximum Order Quantity Override (A70) secured feature controls whether individual users can exceed this maximum. See Maximum Order Line Quantity/Value.</p>

 **Note:**

If you enter a negative number, the system will process the transaction as a return of this number of units. See [Posting a Return or Exchange Through Order Entry](#).

Numeric, 5 positions; required.

F (Recalculate freight)
 **Note:**

This field is available in Order Maintenance only.

Controls whether the system recalculates freight for the item based on changes to its quantity or price in order maintenance.

- Selected = The system recalculates freight for the item based on changes to its quantity or price in order maintenance.
- Unselected = The system does not recalculate freight for the item based on changes to its quantity or price in order maintenance.

The [Recalculate Freight Default \(F62\)](#) system control value controls the default setting of this field, but you can override this default.

Field	Description
Price	<p>The system price of a single unit of the item. The price is assigned by the system when you press Enter, but you can override it.</p> <p>Price Overrides</p> <p>If you have the authority, you can override the price of an item. You must specify a price override reason code in the Ovr (Price override reason code) field.</p> <p>You can use the Price Override Limit Percent (E55) system control value to define a maximum override percentage for operators. The system uses the price defined in the item/offer to determine whether the price override exceeds the percentage. The override limit applies only to prices that are lower than the item/offer price. This check may be helpful in reducing fraud.</p> <p>Price Override Example</p> <p>The system uses this calculation to determine the percentage of the price override: (offer price - price override entered)/offer price * 100 = price override percentage</p> <p>Example:</p> <pre>price override percentage = 10% offer price = \$40.00 price override = \$35.00 (40.00 - 35.00) = 5.00 5.00/40.00 = .125 .125 * 100 = 12.50 (12.50 exceeds the 10% price override</pre> <p>The system displays a message if you enter a price that is lower than the minimum: Entered price exceeds the override limit.</p> <p>The Override Price Override Limit (A64) secured feature controls the ability to override the percentage defined in the Price Override Limit Percent (E55) system control value.</p> <p>Pricing Hierarchy</p> <p>The system calculates the price of an item by taking into account any price breaks and source or order discounts, and uses the pricing routine (pricing hierarchy) in the Pricing Values (B31) system control value to determine the price of the item on the order line. However, if a customer price group is defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value, the system always uses Customer Price Group Pricing.</p> <p>Entity-level override</p> <p>You can set up separate pricing hierarchies for each entity in your company to override the default pricing hierarchy defined in the Pricing Values (B31) system control value. See Working with Entities (WENT).</p> <p>Reviewing the Order Line Price Method</p> <p>When you finish entering a line, you select Change for the line to advance to the Work with Order Line Screen (Changing/</p>

Field	Description
	<p>Adding an Item) to determine how the system priced the line. The pricing method used by the system appears in the upper right of the screen under the <i>Price</i> field. For example, *Offer Price may appear if the price was defined in the offer through which the item was ordered. This information is also available through standard Order Inquiry.</p> <p>VAT</p> <p>If you make any changes to the order that will result in changing whether the order is subject to VAT, the system will reprice each item accordingly and recalculate tax as well. However, this update does not take place for any line with a price override, whether the override was made by a user or by the system (for instance, for a price table premium). You must delete the line and reenter it to correct the price and tax information.</p> <p>Override Price Table Maximum</p> <p>You can use the Price Table Level Override Code (E05) to apply the best possible price table pricing to an order line, even if it is beyond the maximum specified in the price table; however, to apply this pricing, you need to:</p> <ol style="list-style-type: none"> 1. Enter the requested quantity of the item using the default pricing 2. Select Change for the item to advance to the Work with Order Line Screen (Changing/Adding an Item) 3. Complete this screen by entering the Price Table Level Override Code (E05), but no price for the item <p>When you select Reprice or Accept, the system applies the best possible price table pricing. See Working with Price Tables (WPTB) and the Price Table Level Override Code (E05) system control value for more information.</p> <p>Manual Price Override Code</p> <p>You cannot use the Price Table Level Override Code (E05), Price Override Reason for Price Matrix Customer Specials (K42), or Price Override Reason for Promotions (K45) as a regular price override reason code when you manually enter a price override.</p> <p>Negative Prices</p> <p>The Allow Negative Prices in Order Entry (E97) system control value controls whether you can enter a negative item price. If you enter a positive item quantity, a negative price produces a credit; with a negative quantity, a negative price produces an invoice.</p> <p>Maximum Value</p> <p>The Maximum Order Line Value (E98) system control value controls the maximum dollar value of a line you can enter; additionally, the Allow Maximum Order Line Value Override (A69) secured feature controls whether individual users can exceed this maximum. See Maximum Order Line Quantity/Value. Numeric, 13 positions with a 2-place decimal; required, calculated by the system.</p>

Field	Description
No charge (indicator)	<p>Determines whether the customer will be charged for this item on the order.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • No Charge = Item is sold at no charge to the customer. • Priced = (Default): Customer will be charged a price for the item. <p>If set to No Charge, the system does not:</p> <ul style="list-style-type: none"> • add the price of the item to the order totals • print a charge on the pick slip for this item • charge the customer for this item <p>Also, the system requires you to define a price override reason code in the Ovr (Price override reason code) field.</p> <p>If this field is unselected, the system calculates the price for the line and adds this charge to the order totals.</p> <p>Tax?</p> <p>The system does not calculate tax on the merchandise value of the item sold at “no charge”; however, the system may tax freight or special handling.</p> <p>Freight?</p> <p>The system calculates freight (shipping) charges for the order regardless of whether the item is sold at no charge.</p> <p>You can, however, prevent the system from calculating freight for the entire order by selecting the <i>Calc freight</i> field on the previous screen. The system does not calculate freight for any other lines on the order, even those for which the customer will be charged.</p> <p>You cannot suppress freight charges at the line level.</p> <p>Duty?</p> <p>The system adds duty for each unit of the item based on whether the harmonize code defined for the item or SKU matches a duty rate defined for the country where the order is shipping. If the item is entered for no charge, the system bases the duty on the item's offer price. See Working with Items on the Order for more information on duty.</p> <p>Special handling charge?</p> <p>The system adds the special handling charge for item personalization (such as monogramming, engraving, altering, etc.), if any, to the order totals, even if the item is sold at “no charge.”</p> <p>Gift wrapping charge?</p> <p>The system adds the gift wrapping charge, if any, to the item, even if the item is sold at no charge.</p>

Field	Description
Ovr (Price override reason code)	<p data-bbox="678 275 1373 386">A code that represents the reason for overriding the item price or selling the item no charge. The system uses this code as an audit trail that links the operator who performed the price override or who sold the item at no charge.</p> <p data-bbox="678 396 1373 480">Price override reason codes are defined in and validated against the Price Override Reason table. See Establishing Price Override Reason Codes (WPOR).</p> <p data-bbox="678 495 873 520">Secured feature</p> <p data-bbox="678 531 1344 585">User and user class security control access to this field. See Setting Up Secured Features.</p> <p data-bbox="678 600 906 625">Price Table Pricing</p> <p data-bbox="678 636 1341 747">If you use price table pricing, you can define a Price Table Level Override Code (E05). Use this code to override the maximum price break you have defined for an item in the price table.</p> <p data-bbox="678 762 1292 787">Customer Price Group Price Override Reason Code</p> <p data-bbox="678 798 1341 909">If you assign the price override reason code defined in the Price Override Reason Code for CPG Pricing (L59) system control value, the order line cannot be further discounted except by order-level coupons.</p> <p data-bbox="678 924 1162 949">Quantity Price Matrix Customer Special</p> <p data-bbox="678 959 1373 1182">If the order line is priced using a Quantity Price Matrix Customer Special, the system assigns the Price Override Reason for Price Matrix Customer Specials (K42) to the order line during repricing. When this price override reason code is defined for an order line, the system cannot apply any additional discounts, such as promotions, to the order line. However, the system can still apply a source % discount to the order line.</p> <p data-bbox="678 1192 1373 1310">In addition, the system prevents you from manually entering this price override reason code on an order line: Price override reason reserved and cannot be manually entered.</p> <p data-bbox="678 1325 1373 1444">See Order Repricing, Premiums, Discounts, and Promotions for more information about repricing and Working with Quantity Price Matrix (WQPM) for an overview on quantity price matrix pricing.</p> <p data-bbox="678 1459 857 1484">Warranty Item</p> <p data-bbox="678 1495 1360 1606">If the Default Price Override Reason for Warranty Items (G01) system control value is set to a price override code, the system defaults the code to this field when an operator adds a warranty item to the order.</p> <p data-bbox="678 1621 1097 1646">Item Category or BOGO Promotion</p> <p data-bbox="678 1656 1373 1879">If the order line is discounted through an Item Category or BOGO (Buy One/Get One) promotion, or priced at “no charge” through a BOGO promotion, the system uses the Price Override Reason for Promotions (K45). This system control value prevents further discounting from applying to the order line. If this system control value is blank, the system uses the Default Price Override Reason (B35) for the “no charge” lines; however, the other lines discounted through</p>

Field	Description
	<p>these promotions will be subject to further discounting. See Working with Promotions (WPRO) for more information.</p> <p>You cannot manually enter the Price Override Reason for Promotions (K45) on an order detail line.</p> <p><i>Numeric, 1 position; required if performing a price override or selling item at no charge; otherwise, optional.</i></p>
S/H (Special handling code)	<p>A code that represents the type of personalization to be performed, such as monogramming, alterations, engraving, etc.</p> <p>Some items require special handling; this code may default from the S/H code (Special handling code) field for the Item/Offer or SKU/Offer.</p> <p>Special handling is optional for other items. When you prompt on this field, only the additional charge codes identified as special handling codes (by a value in the <i>S/H fmt</i> field for the Additional Charge) are listed. Special handling codes are defined in and validated against the Additional Charges table. See Establishing Additional Charge Codes (WADC).</p> <p>Special handling validation</p> <p>If you enter a special handling code, the system verifies that special handling has been defined for the item in the item/offer or SKU/offer and displays a message if special handling has not been defined: Special handling is not valid for this item in this offer.</p> <p>The special handling instructions and special handling charge print on the pick slip.</p> <p>See Special Handling Overview.</p> <p><i>Alphanumeric, 2 positions; optional.</i></p>

Order Lines Fields

The fields in the lower portion of the [Work with Order Lines Screen \(Adding Items to the Order\)](#) display the items you have already added to the order.

The system displays two lines of information for each item. Up to three items appear on the screen at once.

A Next>> button on the lower right of the screen indicates that there are additional item detail lines on the order beyond those currently displayed. Use this button to review or work with these items.

1st line of information: The first line of information for each item includes:

- [Ofr \(Offer\)](#)
- [Item](#)
- [SKU](#) (if any)
- [Qty \(Quantity ordered\)](#)
- [Price](#) (if any)
- [No charge \(indicator\)](#) (if any)

- [Ovr \(Price override reason code\)](#) (if any)
- [S/H \(Special handling code\)](#) (if any)
- [Extension](#) (Unlabeled field to the right of the S/H field)

2nd line of information: The second line of information for each item includes:

- [Line number](#) (first unlabeled field, line 2)
- [Item description](#) (2nd unlabeled field, line 2)
- [Rsv \(Quantity reserved\)](#) (appears only if quantity actually reserved)
- [Avl \(Quantity available\)](#)
- [Sts \(Status\)](#)
- [Exp \(Expected receipt date\)](#)

Field	Description
Item	The code for an item.

 **Note:**

An item alias is indicated if the customer ordered using an alias and the *Display Alias Item (D56)* system control value is selected.

SKU	<p><i>Alphanumeric, 12 positions; display-only.</i></p> <p>The specific style of the item, such as its color and size. The SKU description of a SKUed item is provided in place of the SKU elements if the Display SKU Description in place of SKU Element (F25) system control value is selected.</p> <p><i>Alphanumeric, three 4-position fields; display-only.</i></p>
Qty	<p>The number of units of the item being ordered.</p> <p><i>Numeric, 5 positions; display-only.</i></p>
Price	<p>The price for a single unit of the item. The price will be highlighted if it is less than the regular offer price for the item, the Display Order Line Discount Messages (F01) system control value is selected, and you do not specify a price override reason code whose Override item offer price field is selected. The system displays a message at the bottom of the screen describing the discount; for example: Line 2: Offer = 10.00 Actual = 9.00 Discount = 1.00: 10.00%</p> <p>See Discount Calculation Messages.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only, updated by the system.</i></p>
N/C	<p>Determines whether the customer will be charged for the item.</p> <ul style="list-style-type: none"> • selected = Item is sold at no charge to the customer. • unselected (default) = Customer will be charged a price for the item.

Field	Description
Ovr	A reason code for overriding the item price or selling the item at “no charge.” <i>Numeric, 1 position; display-only.</i>
C/G (Coordinate Group)	A code you assigned to two or more items to guarantee that they ship together. <i>Numeric, 3 positions; display-only.</i>
S/H (Special handling code)	A code that indicates the type of personalization to be performed, such as monogramming, alterations, engraving, etc. See Special Handling Overview for more information. <i>Alphanumeric, 2 positions; display-only.</i>
Extension	The price at which the item is sold multiplied by the quantity ordered, minus any quantities returned or canceled on the same line. The total of the extended prices for each item detail line equals the value in the <i>Merch</i> (merchandise dollars) field. Does not include any other types of item charges, such as freight, tax, gift wrap, special handling, etc. <i>Numeric, 20 positions with a 2-place decimal; display-only, calculated by the system.</i>
Line number	The number of the item detail line. The item detail lines appear in descending line number sequence, so the most recent item added to the order appears underneath the item entry fields. The line numbers are resequenced if you delete any items from the order; the deleted item detail lines are removed entirely and the line number is reused. This sample shows the screen before and after you delete an item from the order: Screen before you delete item: SHIRT 16 WHITE OX 33.00 1 N 007 LONG SLEEVE BUTTON DOWN Avl: 0 Sts: S SHIRT 15 WHITE OX 1 33.00 1 N 33.00 006 LONG SLEEVE BUTTON DOWN Rsv: 1 Avl: 23 SHIRT 14 WHITE OX 1 33.00 1 N 33.00 005 LONG SLEEVE BUTTON DOWN Rsv: 1 Avl: 232 + Screen after you delete the item: SHIRT 16 WHITE OX 33.00 1 N 006 LONG SLEEVE BUTTON DOWN Avl: 0 Sts: S SHIRT 15 WHITE OX 1 33.00 1 N 33.00 005 LONG SLEEVE BUTTON DOWN Rsv: 1 Avl: 23 +

Field	Description
	<p>Example: Line number 001 is for item #1390, line number 002 is for item #0519, and line number 003 is for item #0503.</p> <p>If, however, you delete line 001 (item #1390) by selecting Delete, notice that the line numbers are resequenced and the deleted line is removed entirely. The before- and after-images in the sample screen show how the system renumbers the lines.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Item description	<p>The description associated with the item.</p> <p><i>Alphanumeric, 120 positions; display-only.</i></p>

Field	Description
Rsv (Quantity reserved)	<p>The quantity reserved on the system for this order detail line. The system may reserve inventory from a single warehouse or over multiple warehouses, depending on whether a warehouse code is defined for the order line or order header and the values in the Ship Complete from 1 Warehouse (B16) system control value.</p> <p>Influences on Reservation</p> <p>Reservation occurs only if:</p> <ul style="list-style-type: none"> • The Immediate Reservation (A64) system control value is selected. • The Use OROB for Fulfillment Assignment (M31) system control value is unselected. • The order is not a future order -- the system-calculated date is less than or equal to today's date (see the Arrival date field). • The order is not a zone reservation order -- zone reservation is used for weather-sensitive items, which are not reserved until pick generation (see Shipping Zone Reservation Overview). • Both the customer and customer class are not flagged for <i>Bypass reservation</i>. • The quantity ordered of the item is not greater than or equal to the SKU <i>Reserve quantity</i> for the Item. • The Reservation freeze field for the Item/warehouse is not selected. • Reservation can be performed against the warehouse, meaning the warehouse is flagged as <i>Allocatable</i>. However, if the Reserve from Non-Allocatable Warehouse (J25) system control value is selected, the system allows you to reserve against a non-allocatable warehouse. • Inventory is available. <p>When the Item Cannot be Reserved</p> <p>If no quantity is available of the item, the <i>Rsv</i> field does not appear for the item detail line. The <i>Avl</i> field is updated by the quantity ordered; this value appears as a negative number. The system backorders the requested order quantity and updates the detail line with a backorder reason of No allocate and updates the backorder warehouse on the order detail line.</p> <p>When the Item is Partially Reserved</p> <p>If the entire quantity ordered is not available for the item, the quantity available is reserved (and is provided in the <i>Rsv</i> field) and the quantity unavailable is backordered (and is a negative number in the <i>Avl</i> field). The system updates the detail line with a backorder reason of Not enough avail in whse.</p> <p>Using Interactive Reservation</p> <p>If you use Working with Interactive Reservation (MIRV), no inventory is reserved until you run the Interactive Reservation program to disperse inventory manually to preferred customers or customers who buy in high volume. Interactive Reservation can be used to reserve inventory for an item if the quantity ordered exceeds the Reserve qty (Reserve quantity limit) defined in the Item table.</p> <p>Display of this field: The Display Reserved and Exp Date in OEM (J02) secured feature controls whether this screen displays the reserved quantity.</p> <p><i>Numeric, 5 positions; display-only.</i></p>

Field	Description
Avl (Quantity available)	<p>The quantity of the item that is available to sell across all shippable warehouses.</p> <p>Represents the quantity of the item available in the system that is not set aside for other orders or backorders.</p> <p>The system reduces the quantity available and updates the quantity open by the quantity ordered each time you enter an item. Availability is reduced regardless of the type of reservation used (immediate or interactive).</p> <p>Immediate Reservation</p> <p>The system uses this calculation to determine item availability in a single warehouse (Item/Warehouse level) when using Immediate Reservation: $\text{On hand} - \text{Protected} - \text{Reserved} - \text{Reserve Transfer} - \text{Backordered} = \text{Quantity Available}$</p> <p>With Immediate Reservation, inventory is reserved dynamically for items as they are entered. The Immediate Reservation (A64) and FIFO Flag (A03) system control values are selected.</p> <p>Fields Used in the Availability Calculations</p> <ul style="list-style-type: none"> • On hand: The quantity of this item currently in the warehouse. • Protected: The quantity of this item that the system cannot reserve for immediate reservation, as defined for the item. This inventory is reserved only during Interactive Reservation (used to disburse inventory manually to customers who bypass reservation because they buy in high volume). • Reserved: The quantity of this item already set aside for other orders. • Reserve transfer: The quantity of this item set to be transferred to another warehouse. • Backorder: The quantity of this item unavailable for existing orders that must be fulfilled through PO receipts. • Projected return: The quantity of this item you expect to receive in customer returns and have available to fulfill backorders. You can set the Projected returns for each item. The system checks the projected return field only if the item has a soldout control status of 2 (include on-order quantity on purchase orders); see Working with Soldout Controls (WSLD). <p>Positive Quantity Available</p> <p>If the quantity available is a positive number, the system increments the quantity reserved (in the <i>Rsv</i> field) immediately (when using Immediate Reservation), so that the item is reserved for the current order and not for another person's order.</p> <p>Negative Quantity Available</p> <p>If the quantity available is a negative number, the system:</p> <ul style="list-style-type: none"> • Does not reserve the item in any warehouse (because there is none to reserve) • Displays a negative number in the <i>Avl</i> field equal to the quantity ordered (if the entire order quantity is backordered). Also, if the entire order quantity is sold out, no <i>Qty</i> is provided, and the order totals do not increase. <p>Partial Quantity Available</p> <p>If the system finds a portion of the order quantity available in the warehouse, it will reserve what it can and backorder or sell out</p>

Field	Description
	<p>the rest. The <i>Rsv</i> field displays the quantity reserved and the <i>Avl</i> field displays the quantity backordered as a negative number. Any quantity sold out does not appear in the <i>Qty</i> field and does not increase the order totals.</p> <p>The quantity available for each of these fields represents the quantity at the Item/Warehouse level, which may be:</p> <ul style="list-style-type: none">• The warehouse list for the item, which is structured so that inventory will be reserved from the warehouse closest to the shipping destination.• Or, the warehouse defined at the item detail line level (this is an override to the warehouse defined for the order).• Or, the warehouse defined for the order.• Or, several different warehouses (if the quantity ordered of the item is not completely available in a single warehouse and you can ship from multiple warehouses, as defined in the Split Line Over Multi Whse (B19) system control value),• Or, a single warehouse (based on the value in the Split Line Over Multi Whse (B19) system control value). <p>Display of this field: The Hide Item Availability in Order Entry (J66) system control value controls whether this screen displays the available quantity.</p> <p><i>Numeric, 7 positions; display-only, updated by the system.</i></p>

Field	Description
Sts (Status)	<p>The current status of the order detail line. The status field is blank (Open) or is set to an S (soldout) during Order Entry:</p> <p>Open Status An item is assigned an open status when it is added to an order and it is currently “active” in your inventory.</p> <p>Sold Out Status The system changes the status of the item to S (Sold Out), based on one of these values in the <i>S/O control</i> field for the item:</p> <ul style="list-style-type: none"> • 1 = Sell out item immediately, <i>or</i> • 2 = Sell out item when the quantity available plus the quantity on-order on purchase orders is exhausted, <i>or</i> • 3 = Sell out item when the quantity available is exhausted. <p>The system prints a Soldout Notification Card for mail order customers if a discontinued item is ordered; phone order customers are notified of the discontinued status while placing the order. These customers do not receive soldout notifications.</p> <p>If a partial quantity of the item is sold out on the order line, the order line status is still open. The order line and order totals reflect the line quantity that is reserved or backordered, but do not reflect the soldout quantity. You can select Change for the item to review the quantity of the order line that is reserved or sold out.</p> <p>Soldout Controls for Non-Allocatable Warehouses If the Disregard Soldout Controls for Non-Allocatable Warehouses (J27) system control value is selected, the system disregards soldout control rules for inventory reserved against a non-allocatable warehouse. If the item cannot be reserved, the system backorders the item in the non-allocatable warehouse. You can reserve against a non-allocatable warehouse if the Reserve from Non-Allocatable Warehouse (J25) system control value is selected.</p> <p>Other Status Codes There are several other order detail line status codes that are assigned by the system at other points during the life of an order detail line, including:</p> <ul style="list-style-type: none"> • C = Canceled • X = Closed (item was shipped to customer) • E = Error (the item ordered through a phone service included data errors that you must correct) • B = Express bill (no pick slip produced for item, because item already removed from inventory; order moves directly to billing status) • H = Held • SP = The item is flagged for store pickup. See Store Pickup Orders for background. <p><i>Alphanumeric, 1 position; display-only.</i></p>

Field	Description
Exp (Expected receipt date)	<p>The date on which a purchase order that can fulfill this order detail line is expected. The expected date is provided only if:</p> <ul style="list-style-type: none"> • there are open (unreceived) purchase orders that can fulfill this item detail line. The expected receipt date is cleared once the purchase order is received through Purchase Order Receiving. • inventory that can fulfill this item detail line is located in a pending putaway warehouse. The expected receipt date is cleared once the inventory in the pending putaway warehouse is moved to the “final destination” warehouse. See Pending Putaway Overview. <p>Drop ships: This date is included for drop ship items only if the Assign Drop Ship Expected Ship Date (I59) system control value is selected. See that system control value for more information.</p> <p>Display of this field: The Display Reserved and Exp Date in OEOM (J02) secured feature controls whether this screen displays the expected receipt date.</p> <p><i>Numeric, 6 positions; display-only.</i></p>

 **Note:**

If you receive an error such as `Error occurred on call to program ILX0023` when adding an item to an order, it is possible that a flag has been set incorrectly in the IL Outbound Trigger Rules table. To prevent this message, query the IL Outbound Trigger Rules table in the database and confirm that there is not a trigger rule option with its flag set to Y even though you are not actually using that trigger rule for an integration layer process. See [Defining Outbound Interface Trigger Rules](#) for background on setting trigger rules.

Screen Differences to Note When Using SKUs

Purpose: Your screen may look different, depending on whether items have SKUs, how each SKU field was labeled and sequenced, and whether you use regular item entry or Page/Letter entry.

Using SKUs? One of the primary business decisions made by your company is whether items have SKUs.

SKUs are codes that further define items by virtue of color, size, width, or any other type of user-defined attribute. Usually, you define SKUs when the majority of your items have 2 or more identifying characteristics.

Inventory levels on the system and in the warehouse are maintained at the SKU level if you use SKUs.

Labeling the SKU elements: You can use three fields for entering item styles. These three fields are known as “SKU elements.” In the System Control table your System Administrator defines:

- Each SKU element (such as color, size, and width)

- The primary SKU element, the element for which you can define groups of characteristics (such as size: petite, small, medium, large, 5, 7, 9, 12, etc.). The primary SKU element is used in the SKU generator.
- The column headings for each SKU element; these are the labels that appear over each SKU field, such as COL, SZE, WTH.

Sequencing the SKU elements: Additionally, your System Administrator defines the sequence in which the SKU elements appear in Order Entry, such as SZE, COL, WTH. The sequence usually depends on how items are ordered, usually driven by the format of your order forms.

There may be a different sequence of the SKU fields for Inventory applications, depending on how the people who manage the inventory or how your merchandising staff would like to work with the product.

SKU Scan Screen

Purpose: Use this screen to select a style of the item to add to the order and, optionally, to specify the quantity being ordered. This screen also provides options for you to:

- Check on inventory availability
- Review any special pricing promotions
- Review the purchase order delivery schedule to determine when the SKU will be available for sale
- Obtain additional information about the item

System control value which affects this screen: If system control value [Restrict SKU Scan by Offer \(H34\)](#) is selected, the screen lists only SKUs included in the offer associated with the order line. If this value is unselected, this screen lists every SKU defined for the item in the SKU table. If you have not defined offers for the SKUs of an item at the SKU level, the system defaults the offer defined at the item level for each SKU.

Advantages: There are several advantages to the SKU Scan screen:

- The screen displays the range of styles available for the item
- You can cross-sell the customer to another, comparable style if the requested style is not immediately available for sale (out of stock)

Note:

Restricted SKUs, identified by a selected *Restrict* field in the SKU table, do not appear on the SKU Scan screen.

Screen sort: SKUs sort on this screen alphanumerically by the SKU sort sequence number assigned to each SKU. SKUs that are not assigned a SKU sort sequence number display at the top of the list and are sorted alphanumerically by SKU code. See [SKU Sort Sequence Numbers](#) for an overview.

How to display this screen:

- At the [Work with Order Lines Screen \(Adding Items to the Order\)](#) enter a code for an item that has SKUs but do not fully specify the SKU information before you select OK
- Prompt (click on the arrow in) the SKU field(s)

- Select an item with SKUs at the [Select Incentive Item Screen](#) or the [Select Incentive Group Window](#)

Field	Description
Item (Item code)	<p>The code of the item being ordered. Item codes are defined in and validated against the Item table. This is the base item code.</p> <p>The item alias is provided here if the customer ordered using an alias and the Display Item Alias (D56) field in the System Control table is selected.</p> <p><i>Alphanumeric, 12 positions; display-only.</i></p>
Order qty (Quantity ordered)	<p>The number of units being ordered. Brought forward from the previous screen if:</p> <ul style="list-style-type: none"> • you entered a value in the Qty field • the value defaulted from the Default Order Quantity (B30) system control value <p>No Order quantity is displayed if you:</p> <ul style="list-style-type: none"> • advanced from the Select Incentive Group Window by selecting Incentive price for the item • did not enter a quantity on the Work with Order Lines screen <p>In this situation, you can complete the Qty field, below.</p> <p><i>Numeric, 5 positions; display-only.</i></p>
Item description (Unlabeled field below Item field)	<p>The description associated with the item.</p> <p><i>Alphanumeric, 120 positions; display-only.</i></p>
SKU	<p>The specific style of the item, in terms of color, size, width, or some other identifying attribute that makes this item unique. Every SKU defined for the item appears in the SKU Scan window.</p> <p>SKUs sort on this screen alphanumerically by the SKU sort sequence number assigned to each SKU. SKUs that are not assigned a SKU sort sequence number display at the top of the list alphanumerically by SKU code. See SKU Sort Sequence Numbers for an overview.</p> <p><i>Alphanumeric, three 4-position fields; display-only.</i></p>
SKU description (Unlabeled field to the right of the SKU)	<p>The description associated with the SKU code, as defined in the SKU table.</p> <p><i>Alphanumeric, 25 positions; display-only.</i></p>

Field	Description
Sts (Status)	<p>A code that identifies the status of the SKU in your inventory. Set to selected if the item is flagged as a discontinued.</p> <ul style="list-style-type: none"> Selected = SKU is discontinued. Unselected = SKU is not discontinued; it is an active unit of inventory. <p>The system allows you to enter orders for discontinued items. The value in the <i>S/O control</i> field for the item, if any, determines whether the system changes the status of the discontinued item to “sold out”:</p> <ul style="list-style-type: none"> Immediately, <i>or</i> When the quantity available is exhausted, <i>or</i> When the quantity available plus the quantity on-order on purchase orders is exhausted. <p>The system prints a Soldout Notification Card for mail order customers if a discontinued item is ordered; phone order customers are notified of the discontinued status while placing the order. These customers do not receive soldout notifications.</p>
Avail (Quantity available)	<p>This is the quantity of this item that is available to sell across all shippable warehouses. A negative quantity indicates that the SKU is unavailable in your inventory and is backordered.</p> <p><i>Numeric, 7 positions; display-only, updated by the system.</i></p>
Qty	<p>The number of units of this SKU being ordered. Available only if you did not specify a quantity on the previous screen. Maximum quantity entry:</p> <ul style="list-style-type: none"> If you advanced from the Select Incentive Group Window by selecting Incentive price for the item, the system does not let you enter a quantity greater than the <i>Qty limit</i> specified for the promotional pricing. See Upselling with Promotional Pricing for an overview. The Maximum Order Quantity (C60) system control value and the Allow Maximum Order Quantity Override (A70) secured feature control your ability to exceed a given order line quantity, while the Maximum Order Line Value (E98) system control value and Allow Maximum Order Line Value Override (A69) secured feature control your ability to exceed a given order line value. <p><i>Numeric, 5 positions; optional or display-only.</i></p>
Expected date	<p>The date on which the next purchase order for this SKU is due. The expected date is cleared once the purchase order is received through Purchase Order Receiving.</p> <p>Pending Putaway Warehouse</p> <p>An expected date also is provided for inventory located in a pending putaway warehouse. This date represents the date the inventory will be moved to its “final destination” warehouse. See Pending Putaway Overview.</p> <p>Drop ships: This date is included for drop ship items only if the Assign Drop Ship Expected Ship Date (I59) system control value is selected. See that system control value for more information.</p> <p><i>Numeric, 6 positions, in user date format; display-only.</i></p>

Field	Description
Expected qty	The number of units of the SKU ordered on the purchase order.
	Pending Putaway Warehouse
	The number of units of the SKU located in a pending putaway warehouse. See Pending Putaway Overview .
	<i>Numeric, 7 positions; display-only.</i>

Completing this screen:

- Select the desired SKU, *or*
- Use the *Select* checkbox to select more than one SKU.

 **Note:**

You can only select SKUs that display on the current screen; if you select SKUs on the first screen and then click Next to select additional SKUs, the system only creates order detail lines for the SKUs that you selected on the second screen.

- Use the *Qty* field to enter the quantity desired of each SKU. You can only enter a quantity in the *Qty* field if no quantity was specified on the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

 **Note:**

The system creates an order detail line for each SKU for which you enter a quantity, even if you need to click Next to select additional SKUs.

Item status message: You advance to the [Item Status Message Window](#) if an item status message is defined for the status code associated with the item or SKU. Select OK on this window to continue.

 **Note:**

See [Upselling with Promotional Pricing](#) for more information on completing this screen if you advanced from the [Select Incentive Group Window](#).

Select OK to create an order detail line for the SKU(s). The system creates one order detail line for each SKU you select.

Screen Option	Procedure
Review on-hand availability statistics for the SKU across all shippable warehouses	Select Availability for a SKU to advance to the Item Availability Screen .

Screen Option	Procedure
Review any special pricing promotions for the SKU in the SKU/Offer table	Select Prices for a SKU to display the Quantity Pricing pop-up window. See Upselling the Customer in Order Entry .
Review the PO delivery schedule for the SKU	Select POs for an SKU to display the Display Open Purchase Orders Screen .
Search for the item across warehouses and stores in external systems	Select Merch Locator for an item to advance to the Merchandise Locator Search Window (Searching for an Item) . You cannot perform a merchandise locator search for an item/SKU if: <ul style="list-style-type: none"> • the Use Merchandise Locator (I38) system control value is unselected. Otherwise, the system displays an error message: Merchandise Locator is not enabled. • you have already entered an <i>Ord qty</i> to add to the order. • the item is: <ul style="list-style-type: none"> – soldout, canceled or closed – included on a printed pick slip (however, if the pick slips have been voided, you can use the merchandise locator option) – a component of a set – a membership item – a subscription item – not flagged as <i>OROB eligible</i> See Merchandise Locator API .
Review the original offer price and the incentive price for the SKU	Select Incentive price for the SKU to advance to the Incentive Price Window . This option is available only if you advanced to the SKU Scan screen from the Select Incentive Group Window .

 **Note:**

If you advanced to the SKU Scan screen by selecting Incentive price for the item at the [Select Incentive Group Window](#), you will need to select Options on/off before this option is available.

Adding Different Types of Items to the Order

Purpose: You can add different types of items to the order at the [Work with Order Lines Screen \(Adding Items to the Order\)](#). The following are described below:

- [Entering a Subscription Item](#)
- [Entering a Warranty Item](#)
- [Entering a Stored Value Card Item](#)
- [Entering Set Items](#)
- [Entering Multiple Ship-Alone Units on a Ship-for-Pickup Order](#)

For various other types of items, you advance to a pop-up window or to a different screen upon item entry. See:

- [Select Variable Set Items Screen](#)
- [Entering Customer Memberships in Order Entry](#)
- [Upselling with Promotional Pricing](#)

Entering a Subscription Item

If the customer orders a subscription item, the system express bills the order detail line when you generate pick slips and:

- bills the customer for the entire amount of the subscription item
- closes the order detail line
- changes the status of the line automatically to X (shipped)
- does not reduce inventory
- creates a Customer Subscription record in the Sold To or Ship To (if recipient) Customer table (which defines the unique characteristics of the subscription)
- logs a message to Order History for the express-billed subscription item and each issue of the subscription; Order History is viewable from Order Maintenance and standard or streamlined Order Inquiry

For more information: See [Working with Item Subscriptions \(WISB\)](#).

Entering a Warranty Item

If the customer orders a warranty item, the system:

- updates the *Warranty item* field on the order detail line to selected.
- updates the *No charge* field on the order detail line to selected.
- applies the Default Price Override Reason for Warranty Items (G01); otherwise, if this system control value is blank, the operator must enter a price override reason code.
- If you want to track the reason why the warranty item was added to the order, you can require the operator to enter an add reason code for the item. See [Enter Add Reason Window](#).
- if the operator enters a price for the warranty item, the system displays an error message: `Warranty item - price not allowed.`

For more information: See [Working with Customer Warranty Information \(WCST\)](#).

Entering a Stored Value Card Item

If the customer orders a virtual stored value card item (the *SVC type* field for the item is V), the system requires you to define an email address in order to send a [Stored Value Card Notification Email](#) to the recipient of the virtual stored value card. An email address is required because the email notification is the only way the recipient of the virtual stored value card will receive the stored value card number associated with the order. If you order a virtual stored value card item and the customer is not assigned an email address or the opt in/out value is invalid, the screen displays an error indicating you cannot accept the order: `Invalid e-mail address/opt in for order containing virtual SVC item.`

For more information: See [Stored Value Card Email Hierarchy](#) for more information on the hierarchy the system uses to send a Stored Value Card Notification to the recipient of the stored value card.

Entering Set Items

Set items are groups of one or more items that you sell together as a unit. The items that make up a set are referred to as component items. The components can also be sold individually.

Set items are designated by an S in the [Kit type](#) field in the Item table. The individual components associated with the set are defined in the Set table. Each set component must exist in the Item table.

When you place an order for a set item, a detail line is created for the main set item along with each component item. The price of the set is located at the main set item level. Any changes you make to the main set item, for example, changing the order quantity or selling out the set, are also reflected in the component items. Notice that the system underlines the main set item.

Secured feature: The [Set Component Maintenance \(J01\)](#) secured feature controls the ability to change, delete, or sell out a set component in order entry. See that secured feature for more information.

Soldouts:

- Component items(s):
 - If the [Sell Out Set if Component is Sold Out \(I05\)](#) system control value is selected: When any of the component items on a set are sold out based on the assigned soldout control code and the current inventory situation, the main set item and each of the component items are added to the order in a soldout status (S). For example, if the set includes five items, and one of the items is assigned a soldout control code indicating to sell the item out immediately, the main set item and all of the component items will be added to the order in a soldout status.
 - If this system control value is unselected: In the example described above, just the sold out component item is added to the order in a soldout status.
- Main set item: If the main set item itself is assigned *any* soldout control code, the main set item and each of the component items are added to the order in a soldout status (S).

See [Working with Soldout Controls \(WSLD\)](#) for a discussion on how soldout controls indicate when an item is sold out.

For more information:

- creating a set item: [Performing Initial Item Entry \(MITM\)](#)
- adding components to a set item: [Entering Set Information \(WSET\)](#)

Entering Multiple Ship-Along Units on a Ship-for-Pickup Order

When you enter a ship-for-pickup order, you cannot enter an order line with a quantity greater than one for an item that is flagged to ship alone. If the customer wants more than one unit of the item, you need to enter each unit as a separate order line.

See [Ship-for-Pickup Orders](#) for a discussion.

Select Variable Set Items Screen

Purpose: Use this screen for the customer to select a pre-defined number of items from each group to make up the set they want to purchase. A variable set, for example, may be a special promotion such as, "...Choose any 2 slacks, 1 jacket, and 1 belt from this page for only \$200.00."

Variable sets consist of several items that the customer can select to make up the desired set.

A variable set item is designated by a V in the [Kit type](#) field in the Item table. The individual components associated with the variable set item are defined in the Variable Sets table. Each variable set component item must exist in the Item table.

Each component item of a variable set is aligned to a group. For example, you may define a variable set group for slacks, another for jackets, and a third for belts. You then may define the component items for each variable set group and include a wide variety of colors and sizes for each group.

The customer must select the specific item(s) desired from each group at the [Select Variable Set Items Screen](#) to satisfy the requirements of the variable set (such as, 2 slacks, 1 jacket, and 1 belt). The system ensures that the customer orders the correct quantity from each variable set group by maintaining a counter of the number of items allowed as compared to the number of items ordered.

Detail lines will be added to the order for each variable set component item selected.

For more information:

- creating variable set items: [Performing Initial Item Entry \(MITM\)](#)
- adding components to a variable set item: [Entering Variable Set Information \(WVST\)](#)

How to display this screen: The customer orders a variable set item at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Field	Description
Variable set (Variable set item description)	Displays the description of the variable set, brought forward from the Description field in the Item table. <i>Alphanumeric, 120 positions; display-only.</i>
Order #	Displays the number assigned by the system to identify this order. This information is brought forward to this screen from the previous screen. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Group	Displays the number and description of the group of variable set component items, as defined in the Variable Set Groups table. See Entering Variable Set Information (WVST) . <i>Group number: Numeric, 3 positions; display-only.</i> <i>Group description: Alphanumeric, 30 positions; display-only.</i>
# of items allowed	Displays the required quantity of this variable set component item, as defined in the # of items field in the Variable Set Groups table. The system validates that the customer orders this number of items from the variable set group. The value in the # <i>selected</i> field must equal this value. <i>Numeric, 6 positions; display-only.</i>

Field	Description
# selected	<p>The quantity of the variable set component item ordered from the variable set group. The system updates this value as variable set component items are added to the order.</p> <p>The system validates that the customer selects the required number of component items from each group, as defined in the <i># of items allowed</i> field. The system does not allow you to accept your entries unless the # selected value equal the <i># of items allowed</i> value.</p> <p><i>Numeric, 6 positions; display-only.</i></p>
Qty	<p>The number of units of this variable set component item. This is the amount of the item being ordered.</p> <p><i>Numeric, 5 positions; display-only.</i></p>
Item	<p>The code for a variable set component item number, as defined in the Item table and assigned to the variable set in the Variable Set Components table.</p> <p><i>Alphanumeric, 12 positions; display-only.</i></p>
SKU	<p>The specific style of the item, in terms of color, size, width, or some other identifying attribute that makes this item unique.</p> <p><i>Alphanumeric, three 4-position fields; display-only.</i></p>
Description	<p>The description associated with the item.</p> <p><i>Alphanumeric, 25 positions; display-only.</i></p>
Selected	<p>The quantity of this variable set component item currently selected for the order.</p> <p>The system updates this number as this item is added to the order.</p> <p><i>Numeric, 7 positions; display-only, updated by the system.</i></p>
Offer price	<p>The price defined for this variable set component item. If selected, this item will be added to the order at the offer price.</p> <p><i>Numeric, 8 positions; display-only, updated by the system.</i></p>

Instructions:

1. Select the desired variable set component item(s) in each group, making sure that the number you select is the number allowed.
2. Select OK.
3. Select Change Qtys to change the quantity selected for a variable set component item (you can enter over the value that appears in the Qty field), *or*
4. Select Unselect All to change the quantity selected of all variable set component items to zero (erase all your selections), *or*
5. Select Accept Order to accept your entries and create detail lines on the order for these variable set component items, *and*
6. Return to the item entry screen; notice that the variable set component items have been added to the order in the specified quantity, at the offer price.

Screen Option	Procedure
Select a variable set component item	Select an item.
Remove a variable set component item from the order	Select Unselect for an item.

Miscellaneous Messages and Windows at Item Entry

Purpose: Depending on the type of item, how it is flagged, or the setting of various system control values, the system might display the following messages when you enter an item, or a window might open:

- [Discount Calculation Messages](#)
- [Maximum Order Line Quantity/Value](#)
- [Work with Item/SKU Comments Window](#)
- [Enter Add Reason Window](#)
- [Item Coordinate Message](#)
- [Ship Via Overrides for Item Window](#)
- [Item Status Message Window](#)

Each is described below.

Discount Calculation Messages

If the [Display Order Line Discount Messages \(F01\)](#) system control value is selected, each time you add an item to the order at a discounted price from the regular offer price for the item, the system:

- highlights the item price in a reverse color
- displays a message describing the amount and percentage discount represented by the item price.

Any price that is lower than the regular offer price for the item will be highlighted, and the discount calculation message will display. For example, if you override the price manually or use a pricing method such as price tables, quantity price matrix, or promotional pricing, the item is considered discounted.

```
BU001 CHOC LRGE 1 2.51 A 0 N 2.51
```

```
005 CHOCOLATE EASTER BUNNY Rsv: 1 Avl: 26
```

Discount calculation: A message displays for each discounted item: Line 1: Offer = 10.00 Actual = 9.00 Discount = 1.00: 10.00%

This message includes:

- the order line number of the discounted item
- the offer price
- the actual price (the discounted price the customer is paying)
- the dollar amount of the discount
- the discount percentage

When the message is not displayed: The system does not display the message or highlight price when you override the price on the order line, and:

- no item/SKU offer price exists, or
- the price override reason code's [Override item offer price](#) is selected.

See [Overriding the Item/SKU Offer Price](#) for an overview.

Message displayed when? The discount calculation message is displayed when you first add the item to the order. In the case of price table repricing, the calculation message is displayed when you reprice the order.

To review messages for other items: A plus sign (+) in the message area of the order detail screen indicates that there are discount calculation messages related to additional items on the order; you can review these messages by positioning your cursor on the same line as the plus sign and pressing Page down. To cycle back up through the calculation messages for the items on the order, press Page up. You can review the calculation messages only for the items that are currently displaying on the order detail screen. Press Page down or Page up to display earlier or subsequent items on the order and/or their related discount calculation messages.

If you delete a discounted item, the plus sign may remain on the screen until you select refresh to refresh.

Maximum Order Line Quantity/Value

You can define a maximum quantity or dollar total for individual order lines using these system control values:

- Maximum Order Quantity (C60)
- Maximum Order Line Value (E98)

For example, if you set the Maximum Order Quantity (C60) to 10, the system would validate that you do not enter a single order line with a greater quantity. This might help prevent inaccurate orders due to user error, such as entering 100 instead of 10.

If you set either of these values to 0, the system does not validate whether order lines exceed the maximum.

Secured features: These secured features control the ability to exceed these limits:

- Allow Maximum Order Line Value Override (A69)
- Allow Maximum Order Quantity Override (A70)

Pop-up window: If you have the proper authority, the Confirm Quantity/Line Value window opens when you exceed the maximum. Select Accept at this window to confirm the quantity and add the line to the order. If you cancel, an error message indicates an excess quantity:
`Order Qty of 50 exceeds the maximum allowed in SCV C60.`

An error message indicates an excess order line total dollar value: `Order line value of 1000.00 exceeds maximum allowed in SCV E98.`

If you do not have the proper authority, the window does not display. Only the error message is displayed, and you will not be able to override the maximum.

Work with Item/SKU Comments Window

This window opens after you add an item to the order if there are any item comments associated with the item or SKU. Comments must have the *Print code* set to Window for the window to open.

See [Entering Additional Item Information](#) on setting up item or SKU comments.

About this window: The window displays any comments entered at the SKU level for a SKUed item; if there are no SKU-level comments, the window displays item-level comments. If this is a SKUed item, the SKU is displayed only if the comments are associated with the SKU rather than the base item.

The window displays up to 10 lines. A plus sign (+) indicates that there are additional lines.

Enter Add Reason Window

You advance to this window after an operator adds an item to the order if the [Required reason code](#) field for the item offer or SKU offer is selected. Enter the add reason code that describes your reason for adding this line to the order. The add reason code is a 5-position, alphanumeric field, defined in the Add Reason table, that defines the reason for adding an item to an order in order entry or order maintenance.

For more information: See [Establishing Add Reason Codes \(WADR\)](#).

Item Coordinate Message

When you enter an order for an item that is associated with any item coordinates:

- If the [Automatically Display Coordinate Items in Order Entry \(I53\)](#) system control value is selected and the Promo flag for the order type is set to Promo Price, the [Display Coordinate Items Window](#) opens automatically advance to the Display Coordinate Items window when you add an item associated with coordinate items to an order.
- Otherwise, the screen displays a message `Coordinate items exist for base item entered`. You must Select Coordinates for the item to advance to the [Display Coordinate Items Window](#) if this system control value is not selected and/or the *Promo* flag is set to None.

The system will cross-sell coordinates even if the primary item is soldout, on backorder, is a drop ship item, non-inventory item, or main set item. Additionally, the system will cross-sell coordinates that are a drop ship item, non-inventory item, or main set item.

When the system does not cross-sell coordinates: See the [Automatically Display Coordinate Items in Order Entry \(I53\)](#) system control value for a discussion of when the system prompts you to select coordinates for an item.

You can still select Coordinates for the primary item to advance to the [Display Coordinate Items Window](#); however, if all of the coordinates are on backorder or soldout or are not included in the same offer as the primary item, there are no coordinates available to select.

Ship Via Overrides for Item Window

Item ship via overrides indicate the shippers the system can use to deliver a particular item to its destination. When you add an item to an order, the system looks at the Item Ship Via Override table to see if the ship via on the order header is an eligible shipper for the item.

The system first checks the order detail line to see if a ship via code is assigned at this level; otherwise, it checks the ship via for the order ship-to. Normally, the ship via field on the order line is blank unless there is an override.

- If the ship via on the order line (if one is assigned) or the order header is an eligible shipper for the item, the system uses that shipper to ship the item to its destination.
- If the ship via on the order line (if one is assigned) or the order header is not an eligible shipper for the item, you advance to the Ship Via Overrides for Item window, requesting you to select an eligible shipper for the item on the order line.

 **Note:**

If there are no records in the Item Ship Via Override table for an item, *all* shippers are eligible to ship the item and the Ship Via Overrides for Item window does not open when you add the item to an order.

This window opens if the ship via on the order line (if one is defined) or the ship via on the order header is not eligible to ship the item, and you:

- select OK to add the item to the order.
- select OK to accept any changes you made to the order line at the Work with Order Line screen.
- select Accept or Add Recipient to accept the order if the order is eligible for other ship via overrides or you have changed the ship via on the order header since adding the item to the order.

To complete this window: Select the shipper you wish to use to ship the item to its destination and select OK. The system assigns the selected shipper to the *Ship via* field on the order line; however, the system does not override the existing shipper on the order header.

For more information: See [Working with Item Ship Via Overrides](#).

Item Status Message Window

This window displays after you add an item to the order if an item status message is defined for the status code associated with the item or SKU.

The item status message defined for the item status at the SKU level overrides the item status message defined for the item status at the item level.

To create an item status code: Use the [Working with Item Status \(WIST\)](#) menu option to create an item status. The text you enter in the *O/E message 1* and *O/E message 2* fields displays in the Item Status Message window.

To assign an item status code to an item/SKU:

- Use the *Status* field on the first [Create Item Screen](#) or Change Item screen to assign a status code to an item.
- Use the *Status* field on the [Create SKU 2 of 2 \(With Overrides\) Screen](#) or Change SKU 2 of 2 (With Overrides) screen to assign a status code to a SKU.

About this window: The window displays any item status messages entered at the SKU level; if there are no SKU-level item status messages, the window displays item-level

messages. If this is a SKUed item, the SKU is displayed only if the comments are associated with the SKU rather than the base item.

After you have reviewed the item status message lines, select OK to add the item to the order.

Future order item status: You can default a future ship arrival date to an item defined with a future ship status on an order by entering the status code in the [Future Orders Item Status \(E52\)](#) system control value. The future arrival date that defaults for this item is taken from the date defined in the [Default Future Orders Arrival Date \(E53\)](#) system control value. In this situation, you might use the *Item status message* fields as a reminder to your operators when an item with this status is ordered, that it is a future ship item.

Duplicate Item for Customer Window

If the [Duplicate Item Check \(C09\)](#) system control value is selected, this window opens when you enter an item that has already been included on an order for the customer within the specified [Duplicate Item Days \(C58\)](#). This window lists:

- the item you just entered
- the number of days specified in the Duplicate Item Days (C58) system control value

To add the item to the order, click OK or press Enter.

To cancel entry of the item, click Exit or press F12.

Set items: This window opens when you enter a set item if the main set item or any of its components has been included on an order for the customer within the Duplicate Item Days (C58). Similarly, this window opens if you enter an item that is a component of a set and the set has been included on an order within the Duplicate Item Days (C58).

Example: Set item SET123 includes items COMP123, COMP456, and COMP789. If you have previously entered an order for SET123 and you enter an order for COMP123 within the Duplicate Item Days (C58), the Duplicate Item for Customer window opens. Similarly, if you have previously entered an order for COMP123 and you enter an order for SET123 within the Duplicate Item Days (C58), the Duplicate Item for Customer window opens.

For more information: See Duplicate Item Days (C58) and Duplicate Item Days (C58).

Displaying the Detail Line Options

The detail line options are available for you to work with items you have already added to the order.

Screen Option	Procedure
Update any information for the item, review how the system priced the item, and review the quantity and date the inventory was reserved by the system	<p>Select Change for the item to advance to the Work with Order Line Screen (Changing/Adding an Item).</p> <div data-bbox="902 369 1458 732" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option is controlled by the Set Component Maintenance (J01) secured feature for set component items. If you do not have the required authority, the system displays an error message: Not authorized to change, delete, cancel, or sell out a set component.</p> </div>
Remove the item from the order <i>immediately</i>	<p>Select Delete for the item to delete it. The lines are resequenced, reusing the line number of the deleted line.</p> <div data-bbox="902 871 1458 1234" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option is controlled by the Set Component Maintenance (J01) secured feature for set component items. If you do not have the required authority, the system displays an error message: Not authorized to change, delete, cancel, or sell out a set component.</p> </div>
Review the pending deliveries of this item on purchase orders placed with your suppliers	Select POs for the item to advance to the Display Open Purchase Orders Screen .
Review the availability of an item across all shippable warehouses	Select Availability for the item to advance to the Item Availability Screen .
Review additional items coordinated with the item for cross-selling purposes	Select Coordinates for the item to advance to the Display Coordinate Items Window if any coordinates are linked with the ordered item.
Enter a coupon to apply to the order or item	Select Coupons for the item to advance to the Coupon Discount Window .

Screen Option	Procedure
<p>Search for the item across warehouses and stores in external systems</p>	<p>Select Merchandise Locator for an item to advance to the Merchandise Locator Search Window (Searching for an Item). You cannot perform a merchandise locator search for an item/SKU if:</p> <ul style="list-style-type: none"> • the Use Merchandise Locator (I38) system control value is unselected. Otherwise, the system displays an error message: <code>Merchandise Locator is not enabled.</code> • you have already entered an <i>Ord qty</i> to add to the order. • the item is: <ul style="list-style-type: none"> – soldout, canceled or closed – included on a printed pick slip (however, if the pick slips have been voided, you can use the merchandise locator option) – a component of a set – a membership item – a subscription item – not flagged as <i>OROB eligible</i> <p>See Merchandise Locator API.</p>
<p>Attach messages behind the item detail line that optionally print on the pick slip and/or invoice or are used for internal reference</p>	<p>Select Messages for the item to advance to the Work with Order Line Messages Screen.</p>
<p>Review the quantity break prices for the item (as defined for the Item/Offer) to upsell the customer</p>	<p>Select Prices for the item to review the Display Quantity Pricing pop-up window. See Upselling the Customer in Order Entry.</p>
<p>Sell out an item</p>	<p>Select Sell Out to put the order line in sold out status and recalculate tax.</p>

 **Note:**

This option is controlled by the Set Component Maintenance (J01) secured feature for set component items. If you do not have the required authority, the system displays an error message: `Not authorized to change, delete, cancel, or sell out a set component.`

Screen Option	Procedure
Modify the special handling instructions and charges (for engraving, monogramming, altering, etc.) of an item eligible for special handling, as defined for the Item/Offer	Select Special Handling for the item to advance to Work with Special Handling Screen or Work with Custom Special Handling Screen .
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option is not available if the additional charge code used for the special handling format applied to the item is suppressed; see Special Handling Overview for a discussion.</p> </div>
Review additional order detail lines on the order	Select the Next or Prev button; this button displays on the lower right of the screen if additional order detail lines exist on the order beyond those currently displayed. Use this button to review or work with these items.

Completing the Work with Order Lines Screen

Purpose: Now you are at the point where you have successfully entered all the items being ordered on the [Work with Order Lines Screen \(Adding Items to the Order\)](#). Before you can accept the order on the system, you must provide some payment information on the:

- [Default Paytype Pop-up Windows](#)
- [Enter Payment Method Screen](#)
- [Work with Order/Recap Screen](#)

Screen Option	Procedure
Accept, validate, and process the order.	Select Accept Order; see Accepting or Rejecting the Order .
Reject (cancel) the order	Select Reject Order; see Accepting or Rejecting the Order .
Enter a recipient order	Select Add Recipient; see Adding a Recipient Order in Order Entry . <ul style="list-style-type: none"> • You will first advance to the Work with Order/Recap Screen if the Display Order Recap (A75) system control value is selected. • This option is not available for a store pickup order; see Store Pickup Orders for an overview.
Add an item to the order while defining line overrides at any level, such as offer, source code, warehouse, etc.	Select Add Line to advance to the Work with Order Line Screen (Changing/Adding an Item) .
Add additional charges to the order	Select Additional Charges to advance to the Enter Additional Charges Window .
Enter or verify order messages.	Select Messages to advance to the Work with Order Messages Screen .
Display additional options	Select More Options to advance to the Display More Options Screen .

Screen Option	Procedure
Return to the Work with Order screen	Select Order Header.
Add payment information to the order.	Select Pay Methods; see Enter Payment Method Screen .
Obtain information about compatible items.	Select Relationships to advance to the Select Item Relationships Window .
Apply or review order-level coupons, apply any order-level discounts to the order totals or review any promotions that currently apply to the order	Select Reprice. See Order Repricing, Premiums, Discounts, and Promotions .
Work with order information for each recipient order.	Select Summary to advance to the Display Order Summary Screen .
Review items on the order.	Select Scan Order Lines to advance to the Scan Order Lines Screen .
Find a store location where the items are available so the customer can pick up the order at the store	Select Store Pickup to advance to the Merchandise Locator Search Window (Store Pickup) .

 **Note:**

- This option is available only if the Use Merchandise Locator (I38) system control value is selected and the [Store Pickup Order Type \(L33\)](#) system control value specifies an order type. Also, this option is available in order entry only, and not in order maintenance.
- You cannot select the Store Pickup option if the order includes any items that:
 - are not flagged [OROB eligible](#)
 - have special handling instructions or have the Gift wrap flag selected
 - are held

Also, the order must:

- not include more than one ship-to
- include at least one item that is not sold out
- not be a ship-for-pickup order

See [Store Pickup Orders](#) for an overview and more background.

Order Repricing, Premiums, Discounts, and Promotions

Purpose: Repricing allows the system to reprice the order based on any discounts, premiums, and promotions that are applied to the order.

- [Types of Discounts and Promotions Applied During Repricing](#)
- [When Repricing Occurs](#)
- [Applying Order Audit Discounts during Repricing](#)
 - [Order Audit Discounts during Repricing Process Flow](#)
- [Repricing Screen Flow](#)
 - [Coupon Discount Window](#)
 - [Price Table Repricing](#)
 - [Display Premiums Screen \(Price Table Premiums\)](#)
 - [Enter Promotion Code Screen](#)
 - [Enter Coupon Discount Amount Window](#)
 - [Applying Free Gifts](#)

Types of Discounts and Promotions Applied During Repricing

The system allows you to:

- Perform [Customer Price Group Price Code Pricing](#) if a customer price group is defined in the [Customer Price Group Code for CPG Pricing Only \(L58\)](#) system control value and the Price Codes (D93) system control value is selected.
- Apply discounts such as free gifts based on the offer or source code, additional charge dollar discounts based on the offer or source code, or package inserts.
- Enter a coupon promotion, as defined in [Working with Coupon Promotions \(WCPR\)](#).
- Review any price table premiums that may apply to the order, adding or deleting them if desired, as defined in [Working with Price Tables \(WPTB\)](#).
- Apply a promotion to the order, if the Allow Manual Entry of Promotion Code (I63) system control value is selected.
- Review any promotions set up through [Working with Promotions \(WPRO\)](#) that currently apply to the order, if the Allow Manual Entry of Promotion Code (I63) system control value is unselected.
- Enter a coupon discount amount, if the [Prorate Dollar Discounts and Coupons \(D90\)](#) system control value is selected.
- Perform End of Order Quantity Price Matrix Pricing if the [Quantity Price Matrix Pricing \(K41\)](#) system control value is selected.
- Enter a Oracle Retail Customer Engagement award amount on the [Enter Loyalty Award Discount Window](#) to apply as a pro-rated merchandise discount to the order lines on the order if the [Use ORCE Loyalty \(M06\)](#) and Prorate Dollar Discounts and Coupons (D90) system control values are selected; see [Applying and Redeeming Customer Engagement Awards during Order Processing](#).
- Calculate freight if the freight method is Freight by Order Weight; see Freight by Order Weight Calculation Logic and Examples.

When Repricing Occurs

The system reprices an order when the *Price method* for the source code on the order header is set to Reg Plus Reprice and you:

- Select Reprice at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

- Select Accept or Exit at the [Coupon Discount Window](#) if the Automatically Reprice Coupon (K02) system control value is selected.
- Select Accept Order on the Work with Order Lines screen if you are using the Work with Order Recap screen (the Display Order Recap (A75) system control value is selected).
- Select Pay Methods on the Work with Order Lines screen to advance to the [Enter Payment Method Screen](#).
- Select Accept Order or Add Recip to perform the final order accept.
- Accept the order by selecting Accept.

Final reprice: The system will reprice the items after you accept the order. For example, you might delete or cancel an item on the order, reducing the merchandise total below the minimum required for the coupon. However, the changes in price after you accept the order will not be visible and you will not be able to inform the customer of the repricing unless the Display Order Recap (A75) system control value is selected; in this case, you can review the repriced order totals at the Order Recap screen.

If you do not use repricing: If you do not use promotions set up through the Working with Promotions (WPRO) menu option, you can set the *Price method* for your source codes in the Working with Source Codes (WSRC) menu option to Regular Hierarchy so that the system does not reprice the order. An error message indicates that repricing is not available if you select Reprice: `Repricing is not valid with current source price method`. By setting the *Price method* to Regular Hierarchy, you can eliminate repricing processing during order entry and improve order entry performance.

Applying Order Audit Discounts during Repricing

The system applies discounts that are not related to payment method during repricing and the initial order accept in addition to the final order accept. Applying discounts to the order at repricing and the initial order accept enables you to:

- provide an accurate order total to the customer before order payment has been processed.
- ensure the correct discounts have been applied to the order. The discounts are applied after the order has passed all edits, including payment, and can no longer be interactively changed.

Each time you reprice the order, the system adds the available discounts to the [Order Discount Audit Table \(OEODIS\)](#) in order to keep track of which discounts have been applied.

Order Audit Discounts

The following order audit discounts are eligible to apply to an order during repricing, the initial order accept, and the final order accept.

- These types of discounts are associated with Working with Promotions (WPRO):
 - ship via override on freight (order audit discount type FV)
 - ship via override on additional freight (order audit discount type AV)
 - ship via override on order promotion (order audit discount type OV)
 - free freight (order audit discount type FF)

- freight override (order audit discount type FO)
- additional charge discount for additional freight promotion (order audit discount type AA)
- additional charge discount for freight promotion (order audit discount type FA)
- additional charge discount for order promotion (order audit discount type OA)

 **Note:**

If you specify an additional charge code for the promotion, the discount will appear on the order as a credit additional charge and will be included in the Order Discount Audit table. If you do not specify an additional charge code for the promotion, the discount amount is prorated against the items on the order and will not be included in the Order Discount Audit table.

- additional charge discount for tiered promotion (order audit discount type TA)
- free gift for tiered promotion (order audit discount type TG)
- free gift added for BOGO (Buy One/Get One Free) promotion (order audit discount type FB)

 **Note:**

No record is created for an order line that discounted or changed to “no charge” through a BOGO promotion, but not added automatically through the promotion.

- Price table premiums (order audit discount type PT) are associated with Working with Price Tables (WPTB).
- Free gifts by source or offer (order audit discount type FG) are associated with Working with Source Codes (WSRC) or Working with Offers (WOFR).

 **Note:**

Free gifts set up for the source code override free gifts set up for the offer. If an order would qualify for both the offer and source code free gifts, only the source code's free gift is added to the order.

- Additional charge discounts based on offer (order audit discount type RA) are associated with Working with Offers (WOFR).
- Additional charge discount based on source (order audit discount type SA) are associated with Working with Source Codes (WSRC).

 **Note:**

If the Prorate Dollar Discounts and Coupons (D90) system control value is unselected, the system adds these discounts to the order as a negative additional charge, or credit. However, if this system control value is selected, the dollar discount is applied on a pro-rata basis to each item on the order and is reflected in the selling price.

- Package inserts (order audit discount type PI) are associated with [Package Insert Processing \(WPIP\)](#).

 **Note:**

The system adds package insert items to the order only if the [Evaluate Promotional Items/Inserts in Order Entry/Maintenance \(E48\)](#) system control value is selected.

 **Note:**

The order discount audit discounts do not change the price of an existing order line.

Order Audit Discounts during Repricing Process Flow

During repricing and the initial order accept, the system performs the following steps.

1. Uses the [Order Discount Audit Table \(OEODIS\)](#) to remove any discounts that have previously been applied to the order.
2. Clears the records in the [Order Discount Audit Table \(OEODIS\)](#) that are associated with the ship to order.
3. Reprices the order.
4. Processes discounts that apply to the order that do not use a pay type as the qualifier.
5. Creates a record in the [Order Discount Audit Table \(OEODIS\)](#) for the discounts that have been applied to the order during repricing.

During the final order accept, the system:

1. Uses the [Order Discount Audit Table \(OEODIS\)](#) to remove any discounts that were applied to the order during repricing.
2. Clears the records in the [Order Discount Audit Table \(OEODIS\)](#) that are associated with the ship to order.
3. Applies any discounts and promotions, including discounts that use a pay type qualifier, to the order.
4. Creates a record in the [Order Discount Audit Table \(OEODIS\)](#) for the discounts that have been applied to the order during the final order accept.
5. Clears the records in the [Order Discount Audit Table \(OEODIS\)](#) that are associated with the order once the order has been accepted.

Order Discount Audit Table (OEODIS)

When the system adds discounts to an order during repricing and the initial order accept, the system creates a record in the Order Discount Audit table (OEODIS) in order to keep track on which discounts have been assigned to the order. Once the order is accepted, the system removes the records associated with the order from this table. For an order batch, the system removes the records associated with the orders in the batch once the order batch is accepted.

 **Note:**

The system does not store all discounts that apply to the order in the Order Discount Audit table. This table keeps track of the end-of-order type discounts that apply to the order so that they can be removed and reapplied if the order changes before the final order accept.

Field	Description
Company	The company where the order is located. <i>Numeric, 3 positions.</i>
Order #	The order number associated with the discounts. <i>Numeric, 8 positions.</i>
Ship to #	The ship to number associated with the discounts. <i>Numeric, 3 positions.</i>
Seq #	The sequence in which the discounts have been applied to the order. <i>Numeric, 5 positions.</i>
Type	The type of order audit discount. Valid values: <ul style="list-style-type: none"> • AA = additional charge discount for additional freight promotion • AV = ship via override on additional freight • FA = additional charge discount for freight promotion • FB = free gift added for BOGO (Buy One/Get One Free) promotion • FF = free freight • FG = free gift by source or offer • FO = freight override • FV = ship via override on freight • OA = additional charge discount for order promotion • OV = ship via override on order promotion • PI = package inserts • PT = price table premiums • RA = additional charge discount based on offer • SA = additional charge discount based on source (discount type) • TA = additional charge discount for tiered promotion • TG = free gift for tiered promotion See Order Audit Discounts for more information. <i>Alphanumeric, 2 positions.</i>

Field	Description
Original freight amt	The amount of freight applied to the order before the discount was applied to the order. <i>Numeric, 13 positions with a 2-place decimal.</i>
Promotion freight amt	The amount of freight applied to the order after the discount was applied to the order. <i>Numeric, 13 positions with a 2-place decimal.</i>
Additional chg seq #	The sequence in which the additional charge code associated with the discount was applied to the order. <i>Numeric, 2 positions.</i>
Additional chg amt	The amount defined for the additional charge code that was applied to the order. This amount represents the discount amount. <i>Numeric, 13 positions with a 2-place decimal.</i>
Original ship via	The ship via assigned to the order before the discount was applied to the order. <i>Numeric, 2 positions.</i>
Promotion ship via	The ship via assigned to the order after the discount was applied to the order. <i>Numeric, 2 positions.</i>
ODT seq #	The order detail line sequence number associated with the discount, if any, including a free gift added through a BOGO (Buy One/Get One Free) promotion. See Sequence of Order Line Numbers in the Order Discount Audit for more information. <i>Numeric, 5 positions.</i>

Sequence of Order Line Numbers in the Order Discount Audit

Each time discounts are evaluated (during repricing, initial order accept, and final order accept), the system first removes the discounts that previously applied to the order and then applies the discounts that currently apply to the order. Because the system first removes the discounts that previously applied to the order, gaps may exist in the order line sequence number associated with each order line on the order, based on which discounts and promotions currently qualify for the order.

Example: You add item AB10 to an order for \$28.00 and then reprice the order. The system adds the following to the order.

Line #	Seq #	Item	Price	Comments
1	1	AB10	28.00	Original order line on the order.
2	2	BC10	0.00	Free gift for source code because the merchandise total is greater than \$25.00. (discount type FG)

Before accepting the order, you add item CD10 to the order for \$20.00, bringing the merchandise total to \$45.00.

Line #	Seq #	Item	Price	Comments
1	1	AB10	28.00	Original order line on the order.

Line #	Seq #	Item	Price	Comments
2	2	BC10	0.00	Free gift for source code because the merchandise total is greater than \$25.00. (discount type FG)
3	3	CD10	20.00	Last item added to the order.

When you perform the initial order accept, the system reevaluates the order audit discounts that apply to the order.

Line #	Seq #	Item	Price	Comments
1	1	AB10	28.00	Original order line on the order.
2	3	CD10	20.00	Last item added to the order.
3	4	BC10	0.00	Free gift for source code because the merchandise total is greater than \$25.00. (discount type FG)
4	5	EF	0.00	Package insert item added for item CD10. (discount type PI)

Notice the order line sequence number assigned to each order line.

- order line 1 = order line sequence number 1
- order line 2 = order line sequence number 3
- order line 3 = order line sequence number 4
- order line 4 = order line sequence number 5

This is because each time the system reevaluates the order for order audit discounts, the system first removes the order audit discounts that previously applied to the order (in this example, the free gift on line 2) and then applies the order audit discounts that currently apply to the order.

Canceling free gifts, premiums, and package inserts: If you delete a free gift, premium item, or package insert that was added to the order, the system reapplies the item to the order during repricing, initial order accept, or the final order accept as long as the order still qualifies for the item. In order to remove the item from the order, you need to cancel the item in order maintenance.

Premiums offered at a discounted price: The system automatically adds premium items that are offered as a free item to the order. However, if the premium item is offered at a discounted price, instead of offered as a free item, the system does not automatically add the premium item to the order. Instead, you must select Add to Order for the premium item at the [Display Premiums Screen \(Price Table Premiums\)](#) in order to add the premium item to the order.

Free gift for tiered promotion: If the order qualifies for a free gift for tiered promotion (order audit discount type TG), but also qualifies for other promotions which bring the merchandise total below the amount required for the free gift, the system still applies the free gift to the order.

Free gift by source or offer: If the order qualifies for a free gift by source or offer (order audit discount type FG), but also qualifies for other promotions which bring the merchandise total below the amount required for the free gift, the system removes the free gift from the order.

Special handling: If a package insert item or free gift contains special handling, the special handling window opens during repricing, initial order accept, and the final order accept. You need to reenter any special handling that you may have defined earlier. The system redisplay the special handling window because the system reevaluates the order to see if it still qualifies for the item, and if it does, the system adds the item back to the order.

Repricing Screen Flow

There are several different windows and screens that might open when you reprice an order in order entry, depending on the system control value settings and other values in your company:

	Screen or Window	Opens If:
1.	Coupon Discount Window	You have set up any coupon promotions in Working with Promotions (WPRO)
2.	Display Premiums Screen (Price Table Premiums)	You use Working with Price Tables (WPTB) to apply price tables, and the order qualifies for a premium item.
3.	Enter Promotion Code Screen	The Allow Manual Entry of Promotion Code (I63) and the Prorate Dollar Discounts and Coupons (D90) system control value are selected.
4.	Enter Coupon Discount Amount Window	The Prorate Dollar Discounts and Coupons (D90) system control value is selected and the Automatically Reprice Coupon (K02) system control value is unselected.
5.	Enter Loyalty Award Discount Window	The Use ORCE Loyalty (M06) and Prorate Dollar Discounts and Coupons (D90) system control values are selected, the sold to customer on the order is assigned to a loyalty card in Oracle Retail Customer Engagement, and there are current awards associated with the customer's loyalty account that are available for redemption.

Price Table Repricing

The system applies any repricing to the order based on price tables when you select Reprice or Accept Order. This repricing occurs regardless of whether the order qualifies for price table premium items.

If you use price table pricing, items on the order may qualify for reduced pricing based on the quantity of a particular item, the quantity of a group of items, or the merchandise total of a group of items. The order might also qualify for one or more premium items, as described below. See *Working with Price Tables (WPTB)* for complete information on setting up price table pricing and examples.

Also, if you use price table pricing, the order will be eligible for repricing in both Order Entry and Order Maintenance. Other pricing methods apply in Order Entry only.

You can override the maximum price break set up for an item by using the price override reason code defined in the system control table for price table level override.

By entering this code, you “unlock” any additional price breaks defined for the item but not ordinarily offered.

Display Premiums Screen (Price Table Premiums)

Use this window if you use price table pricing to review, accept, or reject premium items that the customer can earn through orders of certain items or groups of items. You use Working with Price Tables (WPTB) to set up price tables and price table premiums.

How to display this screen: If the order qualifies for one or more premium items, this screen opens automatically when you:

- select Accept Order or Reprice at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).
- Select Accept or Exit at the [Coupon Discount Window](#) if the Automatically Reprice Coupon (K02) system control value is selected.

See [Repricing Screen Flow](#).

Field	Description
Item	The premium item, specified in the price table, that the order qualifies for. Eligibility for premium items can be based on unit quantity or total dollars of a particular item or a group of items, or both. See Working with Price Tables (WPTB) for information on working with premium items and price tables. Item codes are defined in and validated against the Item table. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	The premium item's unique characteristics, such as its color and size. <i>Alphanumeric, three 4-position fields; display-only.</i>
Description	The description associated with the premium item. <i>Alphanumeric, 20 positions; display-only.</i>
Quantity	The quantity of the premium item earned by the order. The quantity may be a flat amount for each qualifying order, or a multiple of each qualifying amount. For example, if the customer earns a single premium item for each \$50.00 merchandise total for a group of items, and the premium item is set up as a multiple, the customer would earn a quantity of 2 premium items for a \$100.00 merchandise total. <i>Numeric, 5 positions; display-only.</i>
Price	The dollar amount to charge for the premium items. <i>Numeric, 13 positions with a 2-place decimal; display-only.</i>
Add	Indicates whether to add the premium item to the order. Valid values are: <ul style="list-style-type: none"> • Y = Add the premium item to the order. If the premium item is a “no charge” item (the <i>Price</i> displayed is .00), this flag defaults to Y. • N = Do not add the premium item to the order. If there is a charge associated with the premium item, this flag defaults to N.

Instructions:

1. Select Add to Order for any premium item whose *Add* flag is currently N to add this premium item to the order.

2. Select Remove from Order for any premium item whose *Add* flag is currently Y to omit this premium item from the order.
3. If each premium item has the *Add* flag set correctly, select Exit to exit the screen. The system adds the premium items indicated to the order after you accept it.

Enter Promotion Code Screen

Use this screen to specify one or more promotion codes to apply to the order ship-to.

How to display this screen: This screen opens automatically when you select Reprice at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) or select Accept or Exit at the [Coupon Discount Window](#) or [Display Premiums Screen \(Price Table Premiums\)](#) if the Prorate Dollar Discounts and Coupons (D90) system control value is selected.

See [Repricing Screen Flow](#).

In order to have a promotion whose *Required entry* flag is selected apply to the order, you must enter it at this screen. The system automatically applies promotions whose *Required entry* flag is unselected if the order qualifies. An order can qualify for multiple BOGO and Item category promotion; however, only one promotion of each additional type (order or tiered, freight, or additional freight) can apply to an order. See the discussion of [Promotion Logic and Processing](#) for more information.

 **Note:**

If the Allow Manual Entry of Promotion Code (I63) system control value is unselected, this screen does not open. The system automatically applies eligible promotions whose *Required entry* flag is unselected if the order qualifies.

Specifying promotion codes: Enter a promotion code to apply that promotion to the order. You can prompt on the *Promotion code* field to advance to the Select Promotion window. The setting of the Search Promotions by Start Date in Order Entry (M27) system control value defines how promotions sort on the Select Promotion window:

- If selected, the Select Promotion window sorts active promotions in ascending start date sequence. You can use the *Start Date*, *Promotion*, *Description*, and *Type* fields to search for a specific promotion.
- If unselected, the Select Promotion window sorts active promotions in ascending promotion code sequence. You can use the *Promotion* and *Description* fields to search for a specific promotion.

You can select multiple promotion codes of each type, and the system determines which promotion(s) to apply to the order based on your setup. See [Working with Promotions \(WPRO\)](#) for setup information and an overview on promotions.

Verifying that the order qualifies for entered promotions: The system verifies that each entry represents a valid promotion code and that the promotion is active. Additionally, the system verifies that the order is currently eligible for the promotion based on certain basic criteria at the time of entry, although the order might not ultimately be eligible for each promotion entered.

One-time-use promotions: When the promotion's [Use once](#) flag is selected and the promotion has already been applied to an order for the customer:

- If you have authority under the [Override One Time Use Promotion \(J08\)](#) secured feature, a window opens for you to confirm whether to apply the promotion to the current order.
- If you do not have authority under the [Override One Time Use Promotion \(J08\)](#) secured feature, you cannot apply the promotion to the order.

See [Cautions for One-Time-Use Promotions](#) for more information.

Free freight? If the customer is eligible for free freight through a loyalty program, you cannot apply a promotion that includes free freight. See [Loyalty Memberships](#) for background.

What if the order's eligibility for the promotion changes? If you make changes to the order, such as removing an item, adding a payment method, or changing the ship via, the order may no longer be eligible for an entered promotion, or may be eligible for additional promotions.

When does the system apply the promotion discount? The system updates the order with eligible promotions immediately. The promotions applied might be ones you have entered at this screen, or assigned by the system. In addition, the system reevaluates the order for eligible promotions when you accept the order.

If the order does not qualify for the promotion at order acceptance, the system does not apply the promotion discount and does not display an error message.

For more information: See [Working with Promotions \(WPRO\)](#) for an overview on promotions, including types of promotions, how an order qualifies for each, and setup instructions.

Field	Description
Promotion code	<p>Enter a promotion code to apply that promotion to the order. You can prompt on the <i>Promotion code</i> field to advance to the Select Promotion window. The setting of the Search Promotions by Start Date in Order Entry (M27) system control value defines how promotions sort on the Select Promotion window:</p> <ul style="list-style-type: none"> • If selected, the Select Promotion window sorts active promotions in ascending start date sequence. You can use the <i>Start Date</i>, <i>Promotion</i>, <i>Description</i>, and <i>Type</i> fields to search for a specific promotion. • If unselected, the Select Promotion window sorts active promotions in ascending promotion code sequence. You can use the <i>Promotion</i> and <i>Description</i> fields to search for a specific promotion. <p>Promotion codes are defined in and validated against the Promotion table. You can enter multiple promotion codes of each type, and the system determines which promotion(s) to apply to the order based on your setup.</p> <p>See Working with Promotions (WPRO) for setup information and an overview on promotions.</p> <p><i>Alphanumeric, 7 positions; Optional.</i></p> <p>For each promotion selected for the order:</p> <p>The system verifies that each entry represents a valid promotion code and that the promotion is active. Additionally, the system verifies that the order is currently eligible for the promotion based on certain basic criteria at the time of entry, although the order might not ultimately be eligible for each promotion entered.</p>

Field	Description
Promotion	The promotion code selected for the order. <i>Alphanumeric, 7 positions; display-only.</i>
Description	A description of the promotion. <i>Alphanumeric, 30 positions; display-only.</i>
Start Date	The date when the promotion first becomes effective. <i>Numeric, 6 positions; display-only.</i>
End Date	The last date when the promotion is effective. <i>Numeric, 6 positions; display-only.</i>
Type	The type of promotion. Valid values are: <ul style="list-style-type: none"> • Additional freight • BOGO • Freight • Item Category • Order • Tiered discount • blank = Messaging or reporting promotion <i>Alphanumeric, 30 positions; display-only.</i>

Enter Coupon Discount Amount Window

Use this window to specify a coupon amount to prorate against the items on the order.

How to display this screen: This window opens automatically when you select Reprice at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) or select Accept or Exit at the [Coupon Discount Window, Display Premiums Screen \(Price Table Premiums\)](#), or [Enter Promotion Code Screen](#) if the Prorate Dollar Discounts and Coupons (D90) system control value is selected and the Automatically Reprice Coupon (K02) system control value is unselected.

See [Repricing Screen Flow](#).

Only one coupon amount can apply to an order. If you select Reprice more than once while entering an order, the window opens again with the coupon amount you previously entered defaulted in the *Coupon amount* field. You can select OK to retain the coupon amount, enter a new amount, or remove the coupon amount from the order.

If you do not select Reprice at the order detail screen in Order Entry, the system still prorates any source code or offer dollar discount to the order; however, you do not have the opportunity to enter a coupon amount.

Field	Description
Coupon amount	The amount of the coupon the system applies to the order. The system applies any coupon amount you enter across all items on the order on a pro-rata basis. If any dollar discounts by source code or offer apply, the system applies them as well, along with any other end-of-order repricing or discounting you have defined. <i>Numeric, 13 positions with a 2-place decimal; optional.</i>

Field	Description
G/M (Gross profit margin)	<p>The unit amount of the order's merchandise that exceeds the cost of all of the item's on the order. You can use gross margin to determine the profit of an order based on each item's selling price. See Determining Gross Profit for more information on the calculations the system performs to determine gross margin and gross margin percentage.</p> <p>The Display Gross Margin (A65) secured feature controls whether this field is provided in order entry, maintenance, inquiry and item availability.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>
G/M% (Gross profit margin percent)	<p>The percentage of the order's merchandise that exceeds the cost of all of the items on the order. You can use gross margin to determine the profit of an order based on each item's selling price. See Determining Gross Profit for the calculations the system performs to determine gross margin and gross margin percentage.</p> <p>The Display Gross Margin (A65) secured feature controls whether this field is provided in order entry, maintenance, inquiry and item availability.</p> <p><i>Numeric, 7 positions with a 2-place decimal; optional.</i></p>

Applying Free Gifts

After you select the Reprice option and complete any pop-up windows, the system adds free gifts to the order based on the source code and total merchandise dollars on the order. This window lists the items that will be added to the order and provides you with an opportunity to tell the customer that the order qualified for free gifts.

Setting up free gifts: You set up free gifts for a source code at the Work with Source Free Gifts Screen, or for an offer at the Work with Offer Free Gifts Screen. You need to specify the required merchandise dollar value for an order to qualify for a gift, the quantity of the free gift item to add, and whether an order can qualify for multiple free gifts.

Things to note: The following factors influence how the system adds free gifts to the order:

- Offer price or selling price? To evaluate whether an order qualifies for a free gift, the system compares the total merchandise dollar value after applying any discounts or repricing (that is, the extended selling price of all items) with the *\$ required* specified for the free gift.
- **Multiple gifts?**
 - If the *Allow multiple gifts* flag is selected, the system adds the free gift defined for each dollar threshold met by the order total. For example, if a free gift is defined for an order total of \$10.00, \$15.00, and \$20.00 and the customer orders \$30.00 worth of merchandise, the system will add the free gifts for a \$10.00, \$15.00, and \$20.00 order.
 - If the *Allow multiple gifts* flag is unselected, the system adds the free gift defined for the highest dollar threshold met by the order total. For example, if a free gift is defined for an order total of \$10.00, \$15.00, and \$20.00 and the customer orders \$17.50 worth of merchandise, the system will add the free gift defined for a \$20.00 order, because this is the highest level for which the order qualifies.

- Source vs. offer free gifts: Free gifts set up for the source code override free gifts set up for the offer. If an order would qualify for both the offer and source code free gifts, only the source code's free gift is added to the order.

Determining Gross Profit

Purpose: When you add an item to an order at the [Work with Order Lines Screen \(Adding Items to the Order\)](#), you can determine the item's gross profit based on the item's extended selling price and extended cost.

Gross profit margin is used to determine the profit of an item on an order based on the item's selling price, or to determine the profit of an entire order. This calculation is helpful if your operators are allowed to negotiate prices and work on a commission basis.

Estimated freight? You can also include the estimated freight charges for a class of items when you determine the gross profit in order entry, item availability, and when [Printing the Order Demand/Sales Reports \(PSSR\)](#). Including estimated freight charges is helpful if you sell merchandise before the actual freight charges are known. See Working with Item Classes (WICL) for more information on how to set up estimated freight charges for a class of items.

Note:

The estimated freight is not included in the calculation for the *G/M* and *G/M %* at the [Display Invoice Header Screen](#) screen in order inquiry or the *Gross profit* listed on the sales journal reports.

Where are gross profit margin and gross profit margin percentage displayed?

The gross profit margin and gross profit margin percentages for individual orders or order lines are listed on the screens and reports below.

- **Screens:**
 - [Work with Order Line Screen \(Changing/Adding an Item\)](#) in order entry and order maintenance
 - [Work with Order/Recap Screen](#) in order entry
 - [Display Invoice Header Screen](#) in order inquiry
 - Display Item/Offer Prices Screen, available from the Display Item Availability Screen
- **Reports:**
 - [Standard Sales Journal](#)
 - [Sales Journal by Division](#)
 - [Salesman Demand Report](#)
 - [Source Shipped Report](#)

Note:

The following reports list gross profit totals across multiple orders:

- [Sales Journal Summary by Period](#)
- [Sales Journal Summary by Offer](#)
- [Sales Journal Summary by Descending Dollars](#)
- [Sales Journal Summary by Invoice Date](#)
- [Sales Journal Summary by Entity/Offer](#)

The Display Gross Margin (A65) secured feature controls the display of the gross profit margin and gross profit margin percentage fields on screens.

 **Note:**

If you are using multi-currency by offer (the DMulti Currency by Offer (E03) system control value is selected), the system converts the item's price to your local currency before calculating the gross profit.

Variations in calculation: The gross profit margin or gross profit margin percentage indicated for shipments might differ from those displayed in order entry if the item cost changes. Also, a rounding discrepancy of a cent is possible between the calculations on different screens and reports.

Calculating Gross Profit Margin and Gross Profit Percentage

The calculation of gross profit margin is described below.

 **Note:**

Estimated freight is included in the gross profit margin calculation only in order entry, item availability, and when [Printing the Sales Tax Report by State \(PSTX\)](#).

(item(s) selling price) - (item(s) cost + total estimated freight for the item class) = gross profit margin

Example:

Item A:

cost = 10.00

extended selling price = 20.00

Item B:

cost = 14.00

estimated freight = 5.00

extended selling price = 27.00

For each item:

$20.00 - 10.00 = 10.00$ (g/m for item A)

$27.00 - (14.00 + 5.00) = 8.00$ (g/m for item B)

For the entire order:

$$(20.00 + 27.00) - [(10.00 + 14.00) + 5.00]$$

$$47.00 - (24.00 + 5.00)$$

$$47.00 - 29.00 = 18.00 \text{ (g/m for entire order)}$$

The calculation of gross profit margin percentage:

(extended selling prices) - (item(s) cost + total estimated freight for item item)/(item(s) price x 100 = gross profit margin percentage

Example:

Item A:

$$\text{cost} = 10.00$$

$$\text{extended selling price} = 20.00$$

Item B:

$$\text{cost} = 14.00$$

$$\text{estimated freight} = 5.00$$

$$\text{extended price} = 27.00$$

For each item:

$$20.00 - 10.00 / 20.00 \times 100$$

$$10.00 / 20.00 = .5$$

$$.5 \times 100 = 50\% \text{ (g/m\% for item A)}$$

$$27.00 - (14.00 + 5.00) / 27.00 \times 100$$

$$8.00/27.00 = .2962$$

$$.2962 \times 100 = 29.62\% \text{ (g/m\% for item B)}$$

For the entire order:

$$(20.00 + 27.00) - [(10.00 + 14.00) + 5.00] / (20.00 + 27.00) \times 100$$

$$47.00 - (24.00 + 5.00) / 47.00 \times 100$$

$$47.00 - 29.00 = 18.00$$

$$18.00 / 47.00 = .3829$$

$$.3829 \times 100 = 38.29 \text{ (g/m\% for entire order)}$$

Calculating Gross Profit Margin and Percentage using Tax Inclusive Pricing (VAT)

In calculating gross profit margin and gross profit margin percentage on all screens and reports except for order entry, the system subtracts the hidden tax from the extended selling price on orders to countries that are subject to Value Added Tax (VAT). On orders subject to VAT, tax does not accumulate in the *Tax* field; instead, the customer pays a tax-inclusive price for each item and the tax is “hidden” on the order detail line in the [Hidden tax](#) field.

Order entry does not include hidden tax when calculating gross profit margin or gross profit margin percentage. See [Calculating Gross Profit Margin and Gross Profit Percentage](#) for the standard calculations used in order entry and on all other screens and reports for orders that are not subject to VAT.

The calculation of gross profit margin using tax-inclusive pricing on all screens and reports except for order entry:

$$(\text{extended item(s) selling price} - \text{hidden tax}) - (\text{extended item(s) cost} + \text{total estimated freight}) = \text{gross profit margin}$$

The calculation of gross profit margin percentage using tax-inclusive pricing except for order entry:

$$(\text{extended item(s) selling price} - \text{hidden tax}) - (\text{extended item(s) cost} + \text{total estimated freight}) / (\text{extended item(s) selling price} - \text{hidden tax}) \times 100 = \text{gross profit margin percentage}$$
 **Note:**

Estimated freight is included in the gross profit margin calculation only in order entry, item availability, and when Printing the Order Demand/Sales Reports (PSSR).

Work with Customer Profile

You advance to the [Work with Customer Profile Screen](#) when you select Accept Order or Accept/Add Rcp if you need to collect demographic information for the customer in a category flagged as mandatory.

 **Note:**

If the [Alternate ID Required for Displaying Customer Profile \(K87\)](#) system control value is selected, you advance automatically to the Work with Customer Profile screen only when the sold-to customer has an *Alternate customer number*.

Applying Payment to the Order

Default Paytype Pop-up Windows

Purpose: Use these windows to enter the payment information.

Why opens? These windows open when you select Accept Order or Accept/Add Rcp at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) only if you defined a default payment method on the [Default Values for Orders screen](#).

Enter Cash Control For Window (Cash/Check Payment Type)

This window opens only for a default cash/check payment type:

Field	Description
Pay type	<p>A user-defined code that represents the method of payment on the order.</p> <p>Valid pay types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>The pay type that appears at the top of this pop-up window represents a cash/check pay type.</p> <p><i>Numeric, 2 positions; display-only, updated by the system.</i></p>
Description (unlabeled field below the Pay type field)	<p>A description associated with this payment method. For example, this field may contain the description CASH/CHECK when using a cash/check payment type to prepay the order.</p> <p><i>Alphanumeric, 30 positions; display-only, updated by the system.</i></p>
Amount	<p>The total dollar value of the cash or check paytype.</p> <p><i>Numeric, 13 positions with a 2-place decimal; required.</i></p>
Routing #	<p>Informational. Enterable only for cash/check pay types.</p> <p><i>Alphanumeric, 9 positions; optional.</i></p>
Account # (Checking account number)	<p>Informational. Enterable only for cash/check pay types.</p> <p><i>Alphanumeric, 20 positions; optional.</i></p>
Check #	<p>Informational. Enterable only for cash/check pay types.</p> <p><i>Numeric, 6 positions; optional.</i></p>
Charge sequence	<p>The order in which the system should charge each pay type when the customer uses several payment types. Defaults to 1. See Enter Payment Method Screen.</p> <p><i>Numeric, 2 positions; required.</i></p>

Instructions:

1. Enter the amount in the *Amount* field and optionally, complete any of the other fields.
2. Select OK to validate your entries and to add this payment information to the order.

Enter Credit Card For Window (Credit Card Payment Type)

You can define a default credit card pay type by entering it at the [Default Values for Orders screen](#).

You can also display this window by selecting Change for a credit card payment method at the [Enter Payment Method Screen](#), or by entering a debit card payment method at the [Work with Order/Recap Screen](#).

Field	Description
Pay type	<p>A user-defined code that represents the method of payment on the order. If the credit card number has been replaced with a token, this field is display-only.</p> <p>Valid pay types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>Selecting a Different Pay Type: The pay type listed on this window is a credit card pay type, such as:</p> <ul style="list-style-type: none"> • regular credit card, such as Mastercard or VISA • stored value card • debit card <p>Each of these examples represents a Card type. You can change the pay type code to another card, if needed. For example, you can use this window to switch from a VISA card to American Express, since they are both regular credit cards; however, you should not use this window to switch from a VISA card to stored value card, or vice versa, as each card type has different entry requirements.</p> <p>To Change the Pay Type to a Different Card Type: To change the pay type to a different Card type, you should select Exit and enter the new payment method at the Enter Payment Method Screen or the Work with Order/Recap Screen.</p> <p>See Types of Credit Cards for more information.</p> <p><i>Numeric, 2 positions; display-only, updated by the system.</i></p>
Description (unlabeled field)	<p>A description associated with this payment method. For example, this field may contain the description CREDIT CARD when using a credit card payment type to charge the order.</p> <p><i>Alphanumeric, 30 positions; display-only, updated by the system.</i></p>
Card Number	<p>The number of the credit card payment method used on the order. Display-only.</p> <p>All cards must be authorized, either manually or by a credit card authorization service.</p> <p>Display-only? This field is display-only (for a credit card) or blank (for other credit card types).</p> <p>Last four: The system stores the last four digits of the actual credit card number in the <i>CC Last 4</i> field in the Order Payment Method table in order to verify the card with the customer.</p> <p>Changing: If you change the credit card number in order maintenance or through Manage Rejected Deposits in Modern View, the system writes an order payment history record indicating that the credit card number has been changed. See the Display Order Payment History Screen for more information.</p> <p><i>Alphanumeric, 20 positions; required.</i></p>
Expiration date	<p>The date (in MMY format) up until which the credit card is valid. For example, enter 1206 if the credit card expires in December of 2006.</p> <p>The Require expiration date flag for the pay type controls whether this field is a required entry.</p> <p><i>Numeric, 4 positions; required or optional, based on the Require expiration date flag for the pay type.</i></p>

Field	Description
SVC ID #	<p>The ID number for the stored value card payment. Define an ID number only if your stored value card processor supports it. Order Administration stores the ID number in the <i>OPM SVC ID Storage</i> field in the Order Payment Method table and includes it in the authorization request and deposit request sent for the stored value card payment.</p> <p><i>Numeric, 9 positions; optional.</i></p>
Amount	<p>The total dollar value to charge to this paytype.</p> <p>Leave this field blank if:</p> <ul style="list-style-type: none">the customer is using just this card to pay for the order; the system charges this card the total amount due on the order; or,this is the “catch-all” payment method; the system uses this card to charge the total balance remaining on the order after any other payment method has been charged. <p>The system issues a message for you to delete this amount if:</p> <ul style="list-style-type: none">The customer is using only this card to pay for the orderYou accept the order by selecting Accept or Accept/Add RcpThe dollar amount you specified is insufficient to cover the order. <p>After you delete the amount, the system charges the card the entire amount of the order and you avoid a balance-due situation. See Enter Payment Method Screen for more information about multi-pay type orders.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>

Field	Description
Authorization #	<p>A code that indicates that the amount to charge for this card has been authorized manually or through an authorization service. You can pre-authorize a credit card by entering an authorization number in the <i>Authorization #</i> field; however, you must also enter a value in the <i>Amount</i> field.</p> <p>Enter a code in this field to pre-authorize the credit card when you do not use an authorization service to evaluate and approve your credit card orders. You can enter an authorization number in upper and lower case.</p> <p>Since you cannot enter the Authorization Request ID at this screen, Oracle recommends that you instead use the Add Authorization option from the Order Summary page in Modern View to apply a manual authorization.</p>

 **Note:**

If you manually authorize a credit card, the credit card will not go out for online or batch authorization.

	<p>Secured feature: The ability of a user or user class to enter an authorization code manually for an order is controlled by the secured feature C/C Authorization Field Access (A25).</p> <p>If you use an authorization service, the system updates this field when an authorization is received.</p> <p><i>Alphanumeric, 16 positions; optional.</i></p>
Authorization date	<p>The date when this payment method was authorized manually or by an authorization service.</p> <p>You must enter an authorization date if you entered an authorization number in the <i>Authorization#</i> field.</p> <p>If you use an authorization service, the system updates this field when an authorization is received.</p> <p><i>Numeric, 6 positions (in user date format); optional.</i></p>

Field	Description
Issue #	<p>An incremental issue number which some banks assign when they replace a card, such as a debit card, because it is lost or stolen. It is important to enter the issue number exactly as it appears on the card. For example, an issue number of 0 is different from an issue number of 00, and an issue number of 1 is different from an issue number of 01.</p> <p>Required? An issue number may be required, based on the setting of the Require issue # field for the pay type. If it is required and you do not enter an issue number, the system displays an error message:</p> <pre>Credit card issue# () is not valid.</pre>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>An entry of 00 (two zeros) is not considered a valid issue number.</p> </div>
Start date	<p><i>Alphanumeric, 2 positions; required or optional based on the Require issue # flag for the pay type.</i></p> <p>The month and year when the card becomes effective.</p> <p>Required? The Require start date flag for the pay type controls whether the start date is required for the pay type. If the start date is required but not entered, the system displays an error message:</p> <pre>Credit card start date (0) is not valid.</pre> <p>Even if you require a start date for a pay type, the system does not validate that the start date is on or before the current date. Typically, if your authorization service requires a start date for this pay type, the service would validate that the start date has passed.</p> <p><i>Numeric, 4 positions (MMYY format); required or optional based on the Require start date flag for the pay type.</i></p>
Charge sequence	<p>The order in which the system should charge each pay type when the customer uses more than one payment method. Defaults to 2 for a stored value card, or 3 for any other type of credit card. See Determining the Charge Sequence for more information.</p> <p><i>Numeric, 2 positions; required.</i></p>
Pay plan (Deferred or installment payment plan)	<p>A code representing a deferred or installment payment plan. Only credit cards whose Card type is Credit card are eligible for payment plans.</p> <p>If the operator does not have authority to the Override Deferred and Installment Billing Options (A81) secured feature, this field is display-only.</p> <p>See Assigning a Payment Plan to the Order for more information on how the system determines the payment plan to assign to an order.</p> <p>Payment plans are defined in and validated against the Flexible Payment Option table. See Working with Flexible Payment Options (WFPO).</p> <p><i>Alphanumeric, 5 positions; optional.</i></p>

Instructions:

1. Enter the credit card number in the *Card Number* field.

 **Note:**

To change the pay type to a different Card type, you should select Exit and enter the new payment method at the [Enter Payment Method Screen](#) or the [Work with Order/Recap Screen](#). See Types of Credit Cards for more information.

2. Enter the date the credit card expires in the *Expiration date* field, using MMY format.
3. Leave the *Amount* field blank if the credit card is the only payment method on the order or if the credit card will serve as the “catch-all” pay type on a multi-pay type order.
4. Optionally, enter an authorization code in the *Authorization #* field to preauthorize (manually authorize) the credit card. You must enter an associated dollar amount to authorize in the *Amount* field. The system updates this field if you use an authorization service to authorize this credit card. You can enter an authorization number in upper and lower case.
5. If you entered an authorization number, enter the date on which you authorized the credit card manually. The system updates this field if you use an authorization service to authorize this credit card.

Since you cannot enter the Authorization Request ID at this screen, Oracle recommends that you instead use the Add Authorization option from the Order Summary page in Modern View to apply a manual authorization.

6. Optionally, enter the CID number defined for the credit card and the CID indicator if you wish to use credit card identification verification.
7. Select OK to attach this payment information to the order.

Screen Option	Procedure
Perform an interactive balance inquiry against a stored value card payment method	<p>Select Balance Inquiry.</p> <p>The system interactively performs a stored value card balance inquiry; see Stored Value Card Balance Inquiry (MSVB).</p> <p>An error message indicates if you have not yet created the stored value card payment method on the order: Must create pay method before Balance Inquiry.</p> <p>An error message indicates if you select this option for a payment method other than stored value card: Pay type not eligible for balance inquiry.</p>

Enter Payment Method Screen

Purpose: Use this screen at any time to enter the payment information.

Screen structure:

- The top of the screen displays the order number, the name of the customer who is placing the order, the accumulated order total across all recipient orders, and the write-off amount overpaid on previous orders. You can apply this amount to the current order.

- The center of the screen displays fields for you to specify payment information for any type of payment method.
- The bottom half of the screen displays the payment methods already attached on the order (either from entries to this screen or from entries to a default payment type pop-up window). You can change or delete any existing payment information on this screen.

How to display this screen: Select Pay Methods on the [Work with Order Screen](#) or the [Work with Order Lines Screen \(Adding Items to the Order\)](#), or the [Work with Order/Recap Screen](#)

Field	Description
WO\$ (Write-off dollars)	<p>The accumulated amount of write-offs (overpayments minus underpayments) for this customer that can be used as payment on the current order when you select Conv w/o \$ to pmt.</p> <p>Indicates whether the customer's write-off balance is positive or negative.</p> <p>The system issues a message if you select Conv w/o \$ to pmt when the write-off balance is 0 or negative:</p> <p>Cannot use as payment; write-off amount is zero or negative.</p> <p>Applying Write-off Dollars as an Order Payment: If the resulting refund/balance due write-off value is positive, the WO\$ field is provided on this screen and displays a value that the customer can use as payment on the order.</p> <p>Select Conv w/o \$ to pmt for the system to apply the <i>entire amount</i> of the refund/balance due write-off as payment on the order. The system adds an order payment method on the Payment Method screen using the payment type defined in the Default Cash Pay Type (C07) field in the System Control table.</p> <p>The system issues a refund check for the customer if the addition of the write-off dollars to the order results in an overpayment.</p> <p>Applying Write-off Dollars as Additional Charges: If the resulting refund/balance due write-off value is negative, the WO\$ field is provided on this screen and displays a value that you can apply to the order as an additional charge.</p> <p>Select Conv w/o \$ to chrg for the system to apply the entire amount of the refund/balance due write-off as an additional charge on the order. The system will use the additional charge code from the Default Additional Charge Code (C45) field in the System Control table. This amount will be added to the amount the customer owes for the current order. The system will add an additional charge to the Enter Additional Charges Window; the system will convert the negative balance due amount to a positive charge on the order.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Field	Description
Pay type	<p>A user-defined code for a method of payment on the order. Valid payment types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>All payment methods including PayPal and wallets are shown. As PayPal orders are created via the CWOOrderIn API and not directly through the user interface, hence these pay types should not be selected here. Order Administration does not support authorization integration with PayPal.</p> <p>The pay type code and description display on the lower portion of the screen for payment methods that you have already entered.</p> <p>Assigning a Customer Bill To: The system creates a bill-to automatically for the order and uses the customer's name and address as the billing address when a billing account does not exist for the customer.</p> <p>The bill-to created by the system is <i>attached to the current order only</i>.</p> <p>Restricted payment method: You cannot apply the Order Broker Payment Type (K98) to an order; instead, the screen displays an error, such as <code>Pay type (06-BROKER PAY TYPE) is restricted</code>.</p> <p><i>Numeric, 2 positions; display-only, required.</i></p>
Card Number	<p>The number of the credit card or stored value card used on the order. The Scan Credit Card Accounts Screen displays if you prompt on this field and you have defined the credit card pay type associated with the data loaded from GECC in the <i>Pay type</i> field. This screen allows you to scan for the credit card number of the customer placing the order.</p> <p>All cards must be authorized, either manually or by a credit card authorization service.</p> <p>The credit card number is indicated on the bottom half of the screen for credit card payment types that have already been added to the order.</p> <p>Last four: The system stores the last four digits of the actual credit card number in the <i>CC Last 4</i> field in the Order Payment Method table in order to verify the card with the customer.</p> <p><i>Alphanumeric, 20 positions; required.</i></p>
Exp date	<p>The date (in MMY format) up until which a credit card is valid. For example, enter 1206 if the credit card expires in December of 2006.</p> <p>The Require expiration date flag for the pay type controls whether this field is a required entry.</p> <p>The expiration date is on the bottom half of the screen for credit card payment types that have already been added to the order.</p> <p><i>Numeric, 4 positions; required or optional, based on the Require expiration date flag for the pay type.</i></p>

Field	Description
Issue #	<p>An incremental issue number which some banks assign when they replace a credit card, such as a debit card, because it is lost or stolen. It is important to enter the issue number exactly as it appears on the card. For example, an issue number of 0 is different from an issue number of 00, and an issue number of 1 is different from an issue number of 01.</p> <p>Required? An issue number may be required for a credit card or debit card, based on the setting of the Require issue # field for the pay type. If it is required and you do not enter an issue number, the system displays an error message: Credit card issue# () is not valid.</p> <div data-bbox="878 667 1378 842" style="border: 1px solid #0070C0; padding: 10px;"><p> Note:</p><p>An entry of 00 (two zeros) is not considered a valid issue number.</p></div> <p>The issue number is a valid entry only for a credit card payment method, such as a debit card. <i>Alphanumeric, 2 positions; required or optional based on the Require issue # flag for the pay type.</i></p>
Start date	<p>The month and year when a credit or debit card becomes effective.</p> <p>Required? The Require start date flag for the pay type controls whether the start date is required for a credit card pay type. If the start date is required but not entered, the system displays an error message: Credit card start date (0) is not valid.</p> <p>The start date is a valid entry only for a credit card payment method, such as a debit card.</p> <p>Even if you require a start date for a pay type, the system does not validate that the start date is on or before the current date. Typically, if your authorization service requires a start date for this pay type, the service would validate that the start date has passed.</p> <p><i>Numeric, 4 positions (MMYY format); required or optional based on the Require start date flag for the pay type.</i></p>

Field	Description
Plan (Deferred or installment payment plan code)	<p>A code that represents the deferred or installment payment plan you wish to assign to this order. An order is eligible for a payment plan only if it uses a credit card whose <i>Card type</i> is Credit Card) rather than, for example, a stored value card. See Types of Credit Cards for more information.</p> <p>Included only if the Deferred and Installment Billing (F51) system control value is selected.</p> <p>Display-only.</p> <p>An error message indicates if an operator enters a payment plan code and the order is not eligible.</p> <p>See Assigning a Payment Plan to the Order on how the system determines the payment plan to assign to the order.</p> <p>Payment plans are defined in and validated against the Flexible Payment Option table. See Working with Flexible Payment Options (WFPO).</p> <p><i>Alphanumeric, 5 positions; optional.</i></p>
Auth #	<p>A code that indicates that the amount to charge for this credit card payment type has been authorized manually or through a credit card authorization service.</p> <p>You can preauthorize a credit card by entering an authorization number in the <i>Authorization #</i> field; however, you must also enter a value in the <i>Amount</i> field.</p> <p>Enter a code in this field to preauthorize the credit card when you do not use an authorization service to evaluate and approve your credit card orders. You can enter an authorization number in upper and lower case.</p> <p>Secured feature: The ability of a user or user class to enter an authorization code manually for an order is controlled by the secured feature C/C Authorization Field Access (A25).</p> <p>If you use an authorization service, the system updates this field when an authorization is received.</p> <p><i>Alphanumeric, 16 positions; optional.</i></p>
Authorization date	<p>The date when this payment method received an authorization manually or by an authorization service.</p> <p>You must enter an authorization date if you entered an authorization number in the <i>Authorization#</i> field.</p> <p>If you use an authorization service, the system updates this field when an authorization is received.</p> <p><i>Numeric, 6 positions (in user date format); optional.</i></p>
Ord total	<p>The sum of all charges on the order, including: merchandise, freight, additional freight, tax, handling and additional charges.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Auth amt	<p>The amount you wish to manually authorize for this credit card.</p> <p>Since you cannot enter the Authorization Request ID at this screen, Oracle recommends that you instead use the Add Authorization option from the Order Summary page in Modern View to apply a manual authorization.</p> <p><i>Numeric, 13 positions with a 2-place decimal; required.</i></p>

Field	Description
Amount	<p>The total dollar value of this payment type.</p> <p>When to enter an amount? Enter an amount for cash/check payment types. If the amount you enter is less than the order total, the system displays the following message: Order total not equal to paid amount.</p> <p>Enter an amount if using a credit card that is not the only form of payment on the order and another payment type is used as the “catch- all” payment type. See Pay Type Editing for more information.</p> <p>When to leave this field blank? Leave this field blank:</p> <ul style="list-style-type: none"> • when entering a check interface payment type. • when the customer is using only this credit card to pay for the order (the system charges this credit card the total amount due on the order). • for one credit card payment type if the customer is using multiple payment methods on the order (the system charges the credit card the outstanding balance that is not charged to other payment types). <p>The system issues a message for you to delete this amount if:</p> <ul style="list-style-type: none"> • The customer is using only this credit card to pay for the order, <i>and</i> • You accept the order, <i>and</i> • The dollar amount is insufficient to cover the order. <p>Catch-all payment types: A catch-all payment type is a payment type that will be charged the outstanding balance on an order when the customer is using several payment methods on the order. You can identify a payment type as the catch-all payment type by leaving the <i>Amount</i> field blank.</p> <p>You can only use a credit card (including other card types) as the catch-all payment type.</p> <p>You can identify only one payment type on the order as the catch-all payment type.</p> <p>You cannot identify a cash/check payment type as the “catch-all” payment type, because the customer drafts the check for a specific amount. A “catch-all” payment type, however, will be charged whatever amount is not charged to other payment types on the order. This is an open- ended payment type that will “catch” the customer underpayment, charge the balance, and avoid a balance due situation.</p> <p><i>Numeric, 13 positions with a 2-place decimal; entry requirements depend on payment type.</i></p>
Charge sequence	<p>The order in which the system should charge each pay type when the customer uses several payment types. Indicates when each payment type will be billed by the system as merchandise is shipped. See Determining the Charge Sequence for more information.</p> <p>The charge sequence is provided for each entered payment method on the lower portion of the screen, and is enterable.</p> <p><i>Numeric, 2 positions; optional.</i></p>

Field	Description
SVC ID #	<p>The ID number for the stored value card payment. Define an ID number only if your stored value card processor supports it. Order Administration stores the ID number in the <i>OPM SVC ID Storage</i> field in the Order Payment Method table and includes it in the authorization request and deposit request sent for the stored value card payment.</p> <p><i>Numeric, 9 positions; optional.</i></p>
Pay bal (Payment balance)	<p>The amount remaining to charge on an order. The system uses this calculation to determine the payment balance: $\text{order total} - \text{total order payments} = \text{payment balance}$</p> <p>Represents the amount charged to the catch all pay type on a multi-pay type order.</p> <p>Example:</p> <p>The order total = 100.00 Pay type 1 = 45.00 Pay type 2 = 15.00 Pay type 3 (catch all) = 0.00 $100.00 - 60.00 = 40.00$ (this is the amount charged to the catch all pay type).</p> <p>This amount is a negative value if the customer overpays or a return or exchange is performed.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only.</i></p>
Routing	<p>Informational. Enterable only for cash/check pay types.</p> <p>An error message indicates if you enter a routing number for a pay type that does not represent pay category Cash/Check: A routing number cannot be entered for this pay type.</p> <p><i>Alphanumeric, 9 positions; optional.</i></p>
Acct (Account #)	<p>Informational. Enterable only for cash/check pay types.</p> <p>An error message indicates if you enter a routing number for a pay type that does not represent pay category Cash/Check: A routing number cannot be entered for this pay type.</p> <p><i>Alphanumeric, 20 positions; optional.</i></p>
Check #	<p>Informational. Enterable only for cash/check pay types.</p> <p>An error message indicates if you enter a check number for a pay type that does not represent pay category Cash/Check: A check number cannot be entered for this pay type.</p> <p><i>Numeric, 6 positions; optional.</i></p>

Field	Description
Ord discount (Order discount)	<p>The total discount applied to the order across all ship to customers. The total discount is calculated by comparing the selling price with the item/SKU offer price. If you use a price override on any of the order lines, or if it defaults from the Default Price Override Reason (B35) system control value:</p> <ul style="list-style-type: none"> • If the price override reason code's Override item offer price field is selected, the <i>Ord discount</i> includes any discounts that reduce the selling price from the price override amount you entered for the order line; however, it does not include the amount of the price override itself. For example, if an accompanying item normally priced at \$2.00 is added to the order at no charge, the \$2.00 is not included in the order discount amount. • If the price override reason code's Override item offer price field is unselected, and: <ul style="list-style-type: none"> – you override an existing item/SKU offer price for the item: the <i>Ord discount</i> includes the difference between the original item/SKU offer price and the final selling price, including the price override and any other discounts. – there is no item/SKU offer price for the item: the order detail line does not affect the <i>Ord discount</i> total.
	<div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p> Note:</p> <p>Provided only if the Display Discount on Order Recap Screen (D38) system control value is selected.</p> </div>
CC Last 4	<p><i>Numeric, 20 positions with a 2-place decimal; display-only.</i></p> <p>The last four positions of the credit card number. Updates the <i>CC Last 4</i> field in the Order Payment Method table.</p> <p>If you use credit card encryption, the system does not encrypt the value in this field.</p> <p><i>Alphanumeric, 4 positions; display-only.</i></p>

When you complete this screen: When you complete the [Enter Payment Method Screen](#), you have identified how the customer will pay for the order, either by using a single payment type or by using a valid combination of payment types. To accept each payment and to display it at the bottom half of the screen, select OK.

At this point, you can:

- Select Exit to return to the previous screen to review the order or add additional item, customer or order information, or
- Select Accept Order, or Acpt/Add Recipient to accept the order and add a recipient order if you have added all items to the order
- Select Reject to reject the order; see [Accepting or Rejecting the Order](#).

Screen Option	Procedure
Change a payment method.	Select Change for the payment method to change it. See Rules for Pay Type Combinations .
Delete a payment method.	Select Delete for the payment method to delete it. See Rules for Pay Type Combinations .
Perform online credit card authorization against a credit card payment method.	<i>This option is not available in order entry.</i> An error message indicates: Option is valid only in Order Maintenance See Accepting or Rejecting the Order for more information on performing online credit card authorization during order entry.
Perform an interactive balance inquiry against a stored value card payment method	Select Balance Inquiry for a stored value card payment method. The system interactively performs a stored value card balance inquiry; see Stored Value Card Balance Inquiry (MSVB) . An error message indicates if you enter this option for a payment method other than stored value card: Pay type not eligible for balance inquiry.
Deactivate a payment method.	Select Deactivate for the payment method to deactivate it. See Rules for Pay Type Combinations .
Review order payment history for this order.	Select History for a payment method to advance to the Display Order Payment History Screen .
Review the payment plan assigned to the order.	Select Plan Summary a payment method to advance to the Display Payment Plan Summary Screen .
Accept, validate, and process the order.	Select Accept Order; see Accepting or Rejecting the Order .
Reject (cancel) the order.	Select Reject Order; see Accepting or Rejecting the Order .
Apply the positive write-off balance in the WO\$ field as payment to the order, using the value in the Default Cash Pay Type (C07) field in the System Control table.	Select Convert W/O To Payment.
Apply the negative write-off balance in the WO\$ field as an additional charge on the order, using the value in the Default Additional Charge Code (C45) field in the System Control table.	Select Convert W/O To Charge.
Enter a recipient order.	Select Add Recipient; see Adding a Recipient Order in Order Entry .

 **Note:**

You will first advance to the [Work with Order/Recap Screen](#) if the [Display Order Recap \(A75\)](#) system control value is selected.

Screen Option	Procedure
Work with Rewards certificates	Not implemented.

Scan Credit Card Accounts Screen

Purpose: Use this screen to scan for the credit card account the customer wishes to use as payment for the order. This screen displays credit card information for customers with a specific pay type credit card account, such as a house charge account. This screen is helpful if a customer wishes to use the credit card to pay for the order but does not know the credit card number.

In order to view credit card accounts on this screen, you must first:

- Import the data provided by GECC containing the credit card accounts onto your system
- Associate a credit card pay type with the Credit Card Account table.

How to display this screen: Enter the pay type associated with the Credit Card Account table in the *Pay type* field and click on the arrow in the *Credit card number* field on the:

- [Work with Order/Recap Screen](#)
- [Enter Payment Method Screen](#)

An error message indicates if you click on the arrow in the *Credit card number* field and a pay type associated with the house charge has not been defined in the *Pay type* field:

Prompt not valid for this field

Field	Description
Postal code	The postal code or zip code for a customer with this credit card account. Credit card accounts for customers living in foreign countries have a postal code of 00000. Enter a 5-digit postal code to display credit card accounts whose postal codes match your entry. <i>Alphanumeric, 10 positions; optional.</i>
Name	The first 4 positions of the customer's last name. Enter a full or partial last name to display credit card accounts whose last names start with your entry. <i>Alphanumeric, 4 positions; optional.</i>
Address	The first 6 positions of the customer's street address. Enter a full or partial street address to display credit card accounts that match your entry. <i>Alphanumeric, 6 positions; optional.</i>
CC account no. (Credit card account number)	The credit card number of a customer's account. Information will be provided by Oracle at a later date. <i>Numeric, 20 positions; display-only.</i>

Screen Option	Procedure
Select a credit card account	Select a credit card account.
Display a credit card account	Select Display for a credit card account to display it.

Assigning a Payment Plan to the Order

Purpose: A payment plan allows you to pay for the order at a later date.

There are 2 types of payment plans:

- deferred
- installment

Deferred payment plans are payment plans that allow a customer to pay at a later date, for example, *Payment due on January 1st* or can be a rolling date, for example, *Payment due in 30 days*.

Installment payment plans are payment plans that allow a customer to pay a specific amount of the payment each month. The date of the payment is due can be a fixed day of the month, for example, *Installments due on the 25th of each month*, or based on a specific interval, for example, *Installments due in 30-day intervals*.

Determining eligible orders: The system determines whether an order is eligible for a deferred or installment payment plan based on this information:

- The [Deferred and Installment Billing \(F51\)](#) system control value is selected.
- The order date is within the starting date and ending date defined for the payment plan. For example, if the starting date for the payment plan is 09/01/06 and the ending date is 09/30/06, the order date must be within the month of September.
- The order does not contain an item that is excluded from deferred and installment payment plans (the [Exclude FPO \(Exclude flexible payment option\)](#) field for the item is selected). For example, if the *Exclude FPO* field for the item BX984 is selected, and the order includes this item, the entire order is excluded from deferred and installment payment plans.
- The source code on the order header is excluded from deferred and installment payment plans (the *Excl FPO (Exclude flexible payment option)* field for the source code is selected). For example, if the *Exclude FPO* field for the source code A102 is selected, and this source code is defined on the order header, the entire order is excluded from deferred and installment payment plans.
- The order meets the minimum dollar amount requirement defined for the payment plan. For example, if the *Minimum amount* field for the payment plan is set to \$50.00, the order total must be equal to or greater than \$50.00 in order to be eligible for this payment plan.
- The order meets the pay type requirement defined for the payment plan. For example, if the *Pay type* field for the payment plan is set to 04 (VISA), the method of payment on the order must be a VISA credit card in order to be eligible for this payment plan.

 **Note:**

Only credit cards whose *Type* is Credit card are eligible for payment plans. For example, you cannot apply a payment plan to a stored value card pay type.

Setting up a payment plan: These fields in the Flexible Payment Option table determine how an eligible payment plan is assigned to an order.

- Is the payment plan automatically applied to the order? If the *Auto apply* field for the payment plan is set to:
 - (auto apply), the system automatically applies the most eligible payment plan to the order.
 - (no auto apply), the system does not automatically apply a payment plan to the order. You can apply a payment plan to the order by selecting the *Pay plan* field on the [Work with Order/Recap Screen](#), entering a payment plan code in the *Pay plan* field on the Enter Payment Method screen, or by selecting a payment plan from the Select Payment Plan pop-up window.
 - (prompt), the system advances you to the [Select Payment Plan Window](#) where you can select a payment plan to apply to the order.

 **Note:**

In order to make payment plan selection easier, each payment plan should have the same *Auto apply* setting.

- Is the payment plan viewable in order entry and order maintenance? If the *View in oe/om* field for the payment plan is selected and the order is eligible for the payment plan, the plan is indicated in the [Select Payment Plan Window](#). If this field is unselected, the plan does not display in the Select Payment Plan pop-up window; however, you can still apply this plan to the order by entering the code in the *Pay plan* field. The system also displays the primary payment plan in this window regardless of the setting of this field.
- Do you advance to the Display Payment Plan Summary screen? If the *Display summary* field for the payment plan is selected, the system advances you to the [Display Payment Plan Summary Screen](#) when a payment plan is assigned to the order. If this field is unselected, the system does not advance you to the [Display Payment Plan Summary Screen](#), but you can display this screen upon request by using option Pay Plan Summary on the [Enter Payment Method Screen](#).

For more information: See [Deferred/Installment Billing Overview](#) for an overview on deferred and installment payment plans and how to set up payment plans.

Payment plan processing:

Determining the Primary Payment Plan

Once the system determines which payment plans are eligible to assign to the order, the system must then determine the primary payment plan for the order. The primary payment plan is the plan that is the most appropriate for the order based on the information defined for the payment plan and the information defined for the order.

The system uses this hierarchy to determine the primary payment plan for the order:

- The payment plan is set to automatically apply to the order. The system automatically applies a payment plan to the order if the *Auto apply* field in the Flexible Payment Option table is set to 1 (Automatically apply). If more than one payment plan is set to automatically apply or no payment plans are set to automatically apply, the system uses this hierarchy to determine the primary payment plan.
- The payment plan is assigned to a source code. A payment plan is defined in the *Flexible payment code* field for the source code defined on the order.
- An item on the order is defined for the payment plan and the order meets the dollar amount required. An item is defined in the Item field in the Flexible Payment Option table and the order meets the minimum dollar amount defined in the Minimum amount field in the Flexible Payment Option table.
- An item on the order is defined for the payment plan. An item is defined in the Item field in the Flexible Payment Option table.
- The offer on the order is defined for the payment plan and the order meets the dollar amount required. The offer associated with the source code on the order header is

defined in the *Offer* field in the Flexible Payment Option table and the order meets the minimum dollar amount defined in the *Minimum amount* field in the Flexible Payment Option table.

- The offer on the order is defined for the payment plan. The offer associated with the source code on the order is defined in the *Offer* field in the Flexible Payment Option table.
- The pay type on the order is defined for the payment plan and the order meets the dollar amount required? The pay type defined on the order is defined in the *Pay type* field in the Flexible Payment Option table and the order meets the minimum dollar amount defined in the *Minimum amount* field in the Flexible Payment Option table.
- The pay type on the order is defined for the payment plan. The pay type defined on the order is defined in the *Pay type* field in the Flexible Payment Option table.
- The dollar amount on the order meets the minimum dollar amount required. The total dollar amount on the order is equal to or greater than the dollar amount defined in the *Minimum amount* field in the Flexible Payment Option table.

If the more than one payment plan meets the same qualifications, the system then determines which payment plan is the primary plan based on:

- The payment plan is the first eligible plan in descending starting date sequence.
- The payment plan is the first alphanumerically.

Selecting the primary plan: Click the plan code to apply the payment plan to the order.

For more information: See Working with Flexible Payment Options (WFPO).

Select Payment Plan Window

Purpose: Use this window to assign a payment plan to the order. This window lists all payment plans that are eligible for this order and are set up to:

- Prompt in order entry (the *Auto apply* field in the Flexible Payment Option table is set to 3) and as viewable in order entry (the *View in oe/om* field in the Flexible Payment Option table is selected).
- Not automatically apply in order entry (the *Auto apply* field in the Flexible Payment Option table is set to 2) and as viewable in order entry (the *View in oe/om* field in the Flexible Payment Option table is selected).

Note:

The primary payment plan is indicated in the Select Payment Plan window regardless of the value defined in the *View in oe/om* field.

For more information: See Working with Flexible Payment Options (WFPO).

How to display this window:

- Enter a credit card payment type for the order on the [Enter Payment Method Screen](#) or [Work with Order/Recap Screen](#) if the *Auto apply* field for the payment plan is set to prompt.

- Click on the arrow in the *Pay plan* field on the [Enter Payment Method Screen](#) or [Work with Order/Recap Screen](#).

Field	Description
Plan (Payment plan)	The code for a payment plan that is eligible for this order. Payment plans are defined in and validated against the Flexible Payment Option table. <i>Alphanumeric, 5 positions; display-only.</i>
Description	The description of the payment plan. <i>Alphanumeric, 40 positions; display-only.</i>
D/I (Deferred or installment payment plan)	A code that indicates whether this payment plan is a deferred payment plan or an installment payment plan. Valid values are: D = This is a deferred payment plan. I = This is an installment payment plan. <i>Alphanumeric, 1 position; display-only.</i>
Primary plan	The most appropriate payment plan for this order. The system determines the primary payment plan based on this hierarchy: <ul style="list-style-type: none"> payment plan is set to automatically apply source code item and dollar amount item offer offer and dollar amount offer pay type and dollar amount pay type dollar amount descending starting date sequence alphanumerically by payment plan code See Assigning a Payment Plan to the Order on how the system determines which payment plan is the most appropriate for the order. <i>Primary payment plan code: Alphanumeric, 5 positions; display-only.</i> <i>Primary payment plan description: Alphanumeric, 40 positions; display-only.</i>
Other qualifying plans	The payment plans that are eligible for this order, but are not the primary payment plan. The system lists the other qualifying payment plans in alphanumeric order. An error message indicates is you select a payment plan other than the primary payment plan and you are not authorized to the Override Deferred and Installment Billing Options (A81) secured feature: Not authorized to override payment plan. <i>Qualifying payment plan code: Alphanumeric, 5 positions; display-only.</i> <i>Qualifying payment plan description: Alphanumeric, 40 positions; display-only.</i>

Display Payment Plan Summary Screen

Purpose: Use this screen to review information related to the payment schedule, such as the billing date if the plan is deferred or the amount due at each installment if the plan is an installment, for the payment plan assigned to the order.

How to display this screen:

- the payment plan assigned to the order is set up as *Display summary* = Selected.
- the operator selects Pay Plan Summary for a payment method on the [Enter Payment Method Screen](#). An error message indicates if you select Pay Plan Summary for a payment method and a payment plan has not been assigned to the order: Pay method is not associated with any payment plan.

Field	Description
Order #	The order number associated with this payment plan. <i>Numeric, 8 positions; display-only.</i>
Pay type	The pay type code and description associated with the payment plan and order. You can only assign a payment plan to an order containing a credit card as the method of payment. See Assigning a Payment Plan to the Order . Pay types are defined in and validated against the Pay Type table. <i>Pay type code: Numeric, 2 positions; display-only.</i> <i>Pay type description: Alphanumeric, 30 positions; display-only.</i>
Payment plan	The payment plan code and description assigned to this order. Payment plan codes are defined in and validated against the Flexible Payment Option table. See Working with Flexible Payment Options (WFPO). <i>Payment plan code: Alphanumeric, 5 position; display-only.</i> <i>Payment plan description: Alphanumeric, 40 positions; display-only.</i>
Sold to	The last, first and middle initial of the sold to customer associated with this order. <i>Last name: Alphanumeric, 25 positions; display-only.</i> <i>First name: Alphanumeric, 15 positions; display-only.</i> <i>Middle initial: Alphanumeric, 1 position; display-only.</i>
Fields associated with a deferred payment plan:	
# of days for deferral	The number of days the customer can defer paying this order. Example: payment due in 30 days. <i>Numeric, 3 positions; display-only.</i>
Deferred bill date	The billing date when the payment for this order is due. The system uses this calculation to determine the deferred bill date: order date + # of days for deferral = deferred bill date <i>Numeric, 6 positions (in user date format); display-only.</i>
Fix date for deferral	The fixed billing date when the payment for this order is due. Example: payment due on January 1st. <i>Numeric, 6 positions (in user date format); display-only.</i>

Field	Description
Order total	The sum of all charges on the order, including merchandise, freight, additional freight, tax, handling, and additional charges across all recipients on this order. <i>Numeric, 20 positions with a 2-place decimal; display-only.</i>
Fields associated with an installment payment plan:	
Installment amount	The amount due at each installment. The system uses this calculation to determine the amount due at each installment: $(\text{order total} - \text{prepaid amount}) / \# \text{ of intervals} = \text{installment amount}$ Example: order total = 45.00 prepaid amount = 15.00 number of installments = 3 $(45.00 - 15.00) / 3 = 10.00$ (installment amount) <i>Numeric, 20 positions with a 2-place decimal; display-only.</i>
# of installments	The total number of installments assigned to this payment plan. This is the number of times the customer must pay an installment amount. Example: If the order total is 30.00 and the number of installments is 3, the customer would pay 10.00 at each installment date. <i>Numeric, 2 positions; display-only.</i>
Installment interval	The number of days between each installment deposit date. This number cannot be less than 30 since the billing cycle for a credit card is 30 days. Example: order total = 30.00 installment amount = 10.00 number of installments = 3 installment interval = 30 In this situation, the customer must pay an installment amount of 10.00 during 3 separate times in 30 day intervals (a payment of 10.00 is due each month). <i>Numeric, 3 positions; display-only.</i>

Field	Description
Installment dates	<p>The dates when each installment amount is due.</p> <p>Installment based on fixed date:</p> <ul style="list-style-type: none"> If the current date is less than the fixed day, the system uses this month for the first installment. <p>Example:</p> <pre>fixed installment day = 25th current day = 9/10 first installment date = 9/25</pre> <ul style="list-style-type: none"> If the current date is equal to or greater than the fixed day, the system uses the next month for the first installment. <p>Example:</p> <pre>fixed installment day = 25th current day = 9/28 first installment date = 10/25</pre> <p>Installment based on specific interval:</p> <p>To calculate the first installment date: <code>order date = first installment date</code></p> <p>To calculate the second installment date: <code>order date + installment interval = second installment date</code></p> <p>To calculate additional installment dates: <code>previous installment date + installment interval = additional installment date</code></p> <p>Example:</p> <pre>order date = 08/04/06 installment interval = 30 number of installments = 3 First installment date: 08/04/06 Second installment date: 08/04/06 + 30 = 09/03/06 Third installment date: 09/03/06 + 30 = 10/03/06</pre>

 **Note:**

The system calculates the installment dates assuming the order ships on the current date.

Fixed installment day	<p><i>Numeric, 6 positions (in user date format); display-only.</i></p> <p>The day of the month when each installment amount is due.</p> <p>Example: payments due on the 1st of the month.</p> <p><i>Numeric, 2 positions; display-only.</i></p>
------------------------------	--

Field	Description
Expiration date	The date when this payment plan will no longer apply to new invoices. For deferred payment plans, the Number of days for deferral is added to the invoice date. <i>Numeric, 6 positions (in user date format); display-only.</i>

Pay Type Editing

Pay type entry requirements and options: This table lists each payment method and identifies the required (R), optional (O), defaulted value (D) and invalid (I) entry fields.

Field	credit card	cash/ check	stored value card	debit card	direct bank disburse
amount	O	R	O	O	O
charge seq	D	D	D	D	D
Card Number	R	I	R	R	D
Exp date	R	I	O	R	I
Issue #	O	I	I	O	I
Start date	O	I	I	O	I
Auth #/ date	O	I	O	O	I
Pay plan	O	I	I	I	I
routing #/ account #	I	O	I	I	R
check #	I	O	I	I	I

Note:

See [Enter Payment Method Screen](#) for more on how the system validates your pay type entries.

Rules for Pay Type Combinations

The system allows only these payment type combinations:

- Enter a value in the *Amount* field for a credit card payment type (including other card types) only if you use more than one credit card on the order, and the other card is the “catch-all” payment.
- Leave the *Amount* field for the credit card (including other card types) blank if you use a single credit card on an order with a cash/check payment type; otherwise, the system does not allow you to accept the order and displays a message: At least one 'catch-all' payment method must be defined.

To change: Select Change for a payment type at the [Enter Payment Method Screen](#) or [Work with Order/Recap Screen](#) to change existing payment information. A window opens automatically for the selected payment type; you can change any information on this window.

To delete: Select Delete for the payment type you want to remove from the order.

To deactivate: Select Deactivate for an authorized or billed credit card payment type that you want to disable from further billing only. This allows you to stop any further billing against a stolen credit card.

You receive a message if you attempt to deactivate a credit card that has not been authorized or billed: `Pay method has no activity -- delete instead.`

If the credit card is eligible for deactivation, a window opens on the [Enter Payment Method Screen](#) when you select OK.

Confirm Deactivation

Press Enter to confirm deactivate.

When you select OK, the system:

- updates the *Chg seq* (charge sequence) field with a value of 99; you cannot change or reactivate the deactivated payment type.
- displays a message if you deactivate the payment type on a single paytype order. The only pay method on the order has been deactivated.
- instructs you to define an alternate method of payment. You must also update another payment type if you are deactivating the “catch-all” payment type on the order.
- creates an authorization reversal if the payment is a stored value card and an open, unused authorization amount exists against the payment; see [Stored Value Card Authorization Reversal](#).

Note:

You cannot deactivate a credit card with a refund due; instead, you must use the Work With Refunds option to cancel the refund for the order or change the refund type. See Working with [Refunds, Writeoffs and Balances Due \(WREF\)](#).

Determining the Charge Sequence

Purpose: You can use the charge sequence field to indicate the order in which the system should charge payment methods on an order with multiple pay types. A lower charge sequence indicates to charge that payment method first. For example, you enter an order with a stored value card and a credit card: the stored value card has a charge sequence of 2, indicating to charge it first, and then the credit card. The payment method with the highest charge sequence must be the “catch-all,” as described above under [Pay Type Editing](#).

The system automatically assigns charge sequences to different payment categories as follows:

Payment Method	Pay Category	Default Charge Sequence
Cash or check	Cash/Check	1
Stored value card	Credit Card	2

Payment Method	Pay Category	Default Charge Sequence
Credit card (any Card type besides a stored value card)	Credit Card	3

Reassigning charge sequences: You can assign a different charge sequence to a payment method in order entry. If the payment method is not the “catch-all,” the system then reassigns the charge sequence for the “catch-all” so that it is higher. For example, if you change the charge sequence for a stored value card to 10, the system automatically changes the charge sequence for the credit card on the order to 11 (provided the credit card is the “catch-all”).

In the above example, if you changed the charge sequence of the stored value card to 98, you would not be able to accept the order. Instead, the system displays the following error message: `At least one 'catch-all' pay method must be defined.`

The reason the system displays this message is that a charge sequence of 99 indicates to deactivate the payment method, and you cannot deactivate the “catch-all.” Instead, use the [Enter Payment Method Screen](#) to reassign the charge sequences so that the “catch-all” has the highest charge sequence, but it is lower than 99.

Completing Order Entry

Alternate Shipping Charges by Via Window

Purpose: Use this window to review additional ship via choices with the customer, and allow the customer to select a different ship via based on total freight charges or delivery date.

Ship via overrides: There are several ways the system can override the shipper specified on the order with another shipper. See [Ship Via Override Hierarchy](#) for a list of ways the system can override the shipper specified on the order with another shipper and the hierarchy in which the ship via overrides take precedence.

How to display this window: This window opens automatically if:

- there are any ship vias for the shipper identified with a *Type* of O in the Best Way Ship Via table
- there is at least one reserved item on the order
- the [Best Way Ship Via for Auto-Assignment \(J67\)](#) system control value is blank

See [Working with Best Way Ship Vias](#) for an overview and setup instructions.

This window also opens automatically in order maintenance if:

- the [Display Alternate Shipping Charges by Via Window in OM \(I02\)](#) system control value is selected
- no items on the order are printed or shipped
- the [Best Way Ship Via for Auto-Assignment \(J67\)](#) system control value is blank

Auto-assignment? This window does not open if the [Best Way Ship Via for Auto-Assignment \(J67\)](#) system control value is set to a valid ship via code; in this situation, the system automatically assigns the best way ship via with the lowest overall shipping charges to the order. See the [Best Way Ship Via for Auto-Assignment \(J67\)](#) system control value for an overview.

Field	Description
Ship via	<p>The shipper to deliver the order. The current ship via on the order is indicated at the top of the window, with each of the possible alternate shippers below.</p> <p><i>Code: numeric, 3 positions; display-only.</i> <i>Description: alphanumeric, 30 positions; display-only.</i></p>
Charges	<p>The total freight charges on the order for this ship via, including:</p> <ul style="list-style-type: none"> • Add'l freight charge • shipper/item charges (see Work with Ship Via/Item Screen) • service charges (see Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges)) • weight charges (see Work with Weight Charges by Ship Via Screen) <p>The charges also include any special handling charges on the order if the system control value Include Special Handling in Alternate Shipping Charges by Via (I03) system control value is selected.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only.</i></p>
Ship lead days	<p>The total number of days to add to the current date to determine expected delivery date.</p> <p>Calculated how? Calculated by adding the Shipping lead days for the SCF/ship via + the number of days specified in the Pick Processing Days (B37) system control value.</p> <p>Additional factors for shipping lead days: Two additional factors, either separately or combined, can increase the shipping lead days: the system adds 1 day if the current time is later than the Warehouse Cutoff Time (K39), or adds 2 days if the total lead days based on the previous factors results in an expected delivery date after Friday of the current week and the Use Business Days When Calculating Expected Delivery Date (K38) system control value is selected, indicating that shipments do not occur on Saturday or Sunday.</p> <p>Future arrival dates: Even if the Arrival date on the order is later than the result of the expected delivery date calculation, the shipping lead days still indicate the total number of days required to process the order.</p> <p>If the expected delivery date is blank: If there are no reserved lines on the order, then the expected delivery dates for all displayed ship vias are blank.</p> <p>See the description of the <i>Expected delivery date</i>, below, for a discussion and an example.</p> <p><i>Numeric, 3 positions; display-only.</i></p>

Field	Description
Expected delivery date	<p>The date when the customer can expect to receive the shipment using this ship via, calculated by adding the order date to:</p> <ul style="list-style-type: none"> the Shipping lead days for the SCF/ship via number of days specified in the Pick Processing Days (B37) system control value 1 (if the current time is later than the Warehouse Cutoff Time (K39)) 2 (if the total lead days based on the previous factors results in an expected delivery date after Friday of the current week and the Use Business Days When Calculating Expected Delivery Date (K38) system control value is selected, indicating that shipments do not occur on Saturday or Sunday) <p>Example: Order date = 6/4 (Monday) Shipping lead days = 4 Pick processing days = 1 Current time = 4:00 p.m., and warehouse cutoff = 15:00 (3:00 p.m.) Use Business Days When Calculating Expected Delivery Date = selected</p> <p>The system adds 8 days to 6/4 (4 shipping lead days + 1 pick processing day + 1 day for warehouse cutoff + 2 days for weekend, so the expected delivery date is Tuesday, 6/12.</p> <p>Future arrival dates: If the Arrival date on the order is later than the <i>Order date</i>, then the expected delivery date displayed is never sooner than the <i>Arrival date</i>, regardless of the result of the above calculation. For example, if the result of the above calculation is 6/12, but the arrival date is 6/30, then the displayed expected delivery date is 6/30.</p> <p>If the expected delivery date is blank: If there are no reserved lines on the order, then the expected delivery dates for all displayed ship vias are blank.</p> <p><i>Numeric, 6 positions (in user date format); display-only.</i></p>

Completing this window: Select a ship via to replace the current ship via on the order, or click Exit to retain the current shipper.

Work with Order/Recap Screen

Purpose: Use this screen to enter the payment method(s) for an order and review important information.

Screen structure:

- The center of the screen displays customer and address information for the customer who is placing the order (sold-to customer) and the customer who is receiving the order (recipient customer or “ship-to” customer). Also, this part of the screen displays several order-related fields that you can update before ending the order.

This information is repeated on this screen so that you can reiterate this information to the customer. This allows you one last chance to change this information before you accept the order.

- The bottom of the screen displays fields for you to specify payment information for any type of payment method, namely:
 - Cash/check
 - Credit card (including other card types)
- The right-hand portion of the screen displays the value of the order in the *Total* field; the individual charges on the order display in these fields:
 - Merchandise
 - Freight
 - Additional freight
 - Tax
 - Handling and duty
 - Additional charges

This screen includes entry fields for credit card and cash/check payment types because this is targeted to customers who pay for their orders this way.

Additionally, this screen includes any payment information that you entered in a default payment type pop-up window or on the [Enter Payment Method Screen](#).

You can enter up to 4 payment types on this screen.

 **Note:**

This screen does not provide a means to delete a payment type from the order, change the charge sequence, or enter an issue number or start date for any payment method that is not a debit card. You must select Payments to access the [Enter Payment Method Screen](#) and select Delete for the payment type you wish to remove.

Adding an alternate pay type: Use the alternate pay type field at the bottom of the Pay Type area of this screen to add any additional payment method to the order. A pop-up window opens for the specified payment type which you must complete to add the payment method to the order. See the field descriptions for the [Enter Payment Method Screen](#) for further details.

When opens?

- Select Accept Order at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) and
- The system control value, [Display Order Recap \(A75\)](#), is selected.

Field	Description
Hold (Hold reason)	<p>A code to place an order on hold for any reason. See the description of the hold reason field on the Work with Order Screen for a complete description.</p> <p>If you have already entered a hold reason, it will display here; however, you can also enter or change a hold reason code on the recap screen.</p> <p><i>Alphanumeric, 2 positions; optional.</i></p>

Field	Description
Sold-to # (Sold-to customer number)	The number assigned by the system to identify the customer who is placing the order. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Sold-to name (Sold-to customer name and address)	The name, or company name, and address of the customer placing the order. A plus sign (+) indicates that there is additional address information in lines 3 or 4 of the address; see Expanding the Address in Order Entry . <i>Alphanumeric, 30 positions.</i>
Delivery	The type of delivery address. Valid values are: <ul style="list-style-type: none"> • Business = Business rate table determines shipping charges. • Residential = Residential rate table determines shipping charges. • No Distinction = This is not a valid value for UPS shippers.
	<div data-bbox="883 835 1378 1096" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The system defines the shipper on an order as U.P.S. if the <i>Type</i> field in the Ship Via table = U; see Working with Ship Via Codes (WVIA).</p> </div>
Ship-to	<i>Display-only.</i> The name, or company name, and address of the customer to receive the order. If there is extended ship-to customer address information that does not display, this is indicated by a plus sign: (+). <i>Alphanumeric, 30 positions.</i>
Wgt (weight)	The total Sell wgt. (Selling weight) of the items on the order. <i>Numeric, 7 positions with a 3-place decimal.</i>
Via	A code for the shipper to deliver this order to the customer. The system may have changed the ship via based on a ship via override that applied to this order; see Ship Via Override Hierarchy . Reviewing eligible ship vias and optionally selecting an override: You can prompt on this field to advance to the Valid Ship Vias for Window , where you can review valid ship vias for the order, including their overall shipping charges and expected delivery dates; optionally, you can select an override ship via. <i>Numeric, 2 positions; required.</i>

Field	Description
Priority (Reservation priority)	<p>A number in the range of 0-9 that designates the priority for backorder or order fulfillment, where</p> <ul style="list-style-type: none"> • 0 = Lowest priority • 9 = Highest priority <p>A value defaults to this field if a priority was entered in the B/O priority (Backorder priority) field for the source code; and the header-level value, in turn, defaults to the Priority field on the order detail line.</p> <p><i>Numeric, 1 position; optional.</i></p>
Arrival date	<p>The date when the customer wants to receive this order. The default value is the current date. If you enter an override to the arrival date, the system automatically updates the order <i>Priority</i> to 9 (Highest priority) if the Auto Update Order Priority (G45) system control value is selected.</p> <p><i>Numeric, 6 positions (in user date format); required.</i></p>
Source	<p>A code that:</p> <ul style="list-style-type: none"> • Traces the origin of the customer's order • Determines the freight and pricing methods and discounts available on the order. <p><i>Alphanumeric, 9 positions; display-only.</i></p>
PO#	<p>The customer's purchase order number.</p> <p><i>Alphanumeric, 15 positions; optional.</i></p>
Credit Card payment type (Unlabeled entry field before the card number)	<p>Enter a user-defined code for a credit card payment type. If you attempt to enter a non-credit card payment method in the first payment type field, the screen displays an error message: <i>Pay type must be credit card.</i></p> <p>Pay types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>Issue number and/or start date: If the payment method you enter is a debit card (a credit card pay type with the Card type set to D), you advance automatically to the Enter Credit Card For Window (Credit Card Payment Type), where you can enter the issue number and/or start date. However, you will not be able to enter the issue number or start date for any other payment method from this screen, regardless of the settings of the Require start date or Require issue # for the pay type; you will need to use the Enter Payment Method Screen instead.</p> <p><i>Numeric, 2 positions; display-only.</i></p>
Card Number	<p>The number of the credit card used on the order. Information will be provided by Oracle at a later date.</p> <p><i>Alphanumeric, 20 positions; required.</i></p>
Expire Date	<p>The date (in MMY format) up until which a credit card is valid. For example, enter 1206 if the credit card expires in December of 2006.</p> <p>The Require expiration date flag for the pay type controls whether this field is a required entry.</p> <p><i>Numeric, 4 positions; required or optional, based on the Require expiration date flag for the pay type.</i></p>

Field	Description
Pay plan (Deferred or installment payment plan code)	<p>A code that represents the deferred or installment payment plan you wish to assign to this order. Only credit cards whose Card type is C are eligible for payment plans.</p> <p>Included only if the Deferred and Installment Billing (F51) system control value is selected.</p> <p>If an operator does not have authority to the Override Deferred and Installment Billing Options (A81) secured feature, this field is display-only.</p> <p>An error message indicates if an operator enters Y in this field and the order is not eligible.</p> <p>See Assigning a Payment Plan to the Order on how the system determines the payment plan to assign to the order.</p> <p>Payment plans are defined in and validated against the Flexible Payment Option table. See Working with Flexible Payment Options (WFPO).</p> <p><i>Alphanumeric, 5 positions; optional.</i></p>
Auth# (Authorization number)	<p>A code that indicates that the amount to charge for this credit card payment type has been authorized manually or through a credit card authorization service.</p> <p>You can pre-authorize a credit card by entering an authorization number in the <i>Authorization #</i> field; however, you must also enter a value in the <i>Amount</i> field.</p> <p>Enter a code in this field to pre-authorize the credit card when you do not use an authorization service to evaluate and approve your credit card orders. You can enter an authorization number in upper and lower case.</p> <p>Secured feature: The ability of a user or user class to enter an authorization code manually for an order is controlled by the secured feature C/C Authorization Field Access (A25).</p> <p>If you use an authorization service, the system updates this field when an authorization is received.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Only the first 7 positions of the authorization number display on the Work with Order/Recap screen.</p> </div>
SVC ID #	<p><i>Alphanumeric, 16 positions; optional.</i></p> <p>The ID number for the stored value card payment. Define an ID number only if your stored value card processor supports it. Order Administration stores the ID number in the <i>OPM SVC ID Storage</i> field in the Order Payment Method table and includes it in the authorization request and deposit request sent for the stored value card payment.</p> <p><i>Numeric, 9 positions; optional.</i></p>

Field	Description
Alternate payment type (Unlabeled entry field below the Credit Card payment type)	Enter a user-defined code for a cash/check payment type. Valid pay types are defined in and validated against the Pay Type table. <i>Numeric, 2 positions; display-only.</i>
Description (Unlabeled field)	The description associated with this payment method, as defined in the Pay Type table. <i>Alphanumeric, 30 positions; display-only, updated by the system.</i>
Amount	The total dollar value of the alternate payment type, as defined on the pop-up window. <i>Numeric, 13 positions with a 2-place decimal; entry requirements depend on payment type.</i>
Merch (Merchandise)	The total value of merchandise on this order. This does not include freight, additional charges, tax (except for hidden tax; see the Tax field), duty, handling, or sold out items. The value in the <i>Merch</i> field is the grand total of the item price on the line multiplied by the quantity ordered. Order-level discounts: Select Reprice when you finish entering the order to calculate any end-of-order pricing discounts, including promotional pricing. Line-level discounts: The system calculates any line-level discounts (such as the Disc %) line-by-line, as you enter each item. <i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i>

Field	Description
Frt (Freight)	<p>The total charge for shipping this order. The system performs this calculation based on the freight method defined for the source code on the order. This total may depend on the quantity or weight of items ordered or on the dollar value of the order as a whole. If the system calculates freight as a percentage of the merchandise charges, there might be a penny variation in total freight amount due to rounding differences.</p> <p>You can also define a freight override for the order ship to on the Work with Order Ship to Properties Screen.</p> <p>Freight Methods: Working with Source Codes (WSRC) discusses each freight method and freight calculation.</p> <p>Additional Charges: Does not include any additional charges associated with shipping this item (see the Frt+ (Additional freight charges) field for these totals).</p> <p>Service and Weight Charges by Ship Via: Includes any service charges by ship via or order weight charges by ship via. See Working with Ship Via Codes (WVIA).</p> <p>When the Freight Field is Blank:</p> <ul style="list-style-type: none">• The <i>Frt</i> field is blank if the Calc freight (Calculate freight) field is unselected to indicate that freight will not be calculated for this order.• The system calculates freight by order weight during repricing, the initial and final order accept, and when you select to change the last line on the order if you do not change its order quantity. The <i>Freight</i> field on the order does not include order weight freight charges as you add lines to the order; however, the system does display ship via service charges and ship via weight charges immediately. When the system calculates freight by order weight, the system updates the <i>Freight</i> field for the order with the complete freight amount. See Freight by Order Weight Calculation Logic and Examples. <p><i>Numeric, 7 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Field	Description
Frt+ (Additional freight charges)	<p>The total dollar amount for additional freight charges on the order, above regular shipping charges.</p> <p>The value in the <i>Frt+</i> field includes the additional freight charges defined for the shipper(s) on the order. For example, the shipper may charge a premium (additional shipping charges) for overnight shipments or Federal Express deliveries.</p> <p>Depending on how the shipper is defined, the customer may be charged additional shipping charges (in the <i>Frt+</i> field) and system-calculated shipping charges (in the <i>Frt</i> field) or just the additional shipping charges. The Add'l freight charge field for the Ship Via defines the additional freight charge.</p> <p>The system adds the additional shipping charge to an order only when the merchandise amount is less than or equal to the value in the <i>\$Limit</i> field for the shipper.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p> <p>Note: See the field description under Reviewing Order Totals for more information on the Tax, Hnd, Chg, and Total fields.</p>
Tax	<p>The total sales tax on the current order.</p> <p>The value in the <i>Tax</i> field is based on the value of merchandise on the order plus any taxable freight and special handling charges. Tax does not accumulate in this field on orders subject to VAT.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Hnd (Handling charge)	<p>The total charge for special handling or gift wrapping. Also includes any duty charges on the order.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Chg (Additional charges)	<p>The total extra charges added to the current order.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Total (Order total)	<p>The sum of all charges on the order, including: merchandise, freight, additional freight, tax, handling, and additional charges.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Field	Description
Discount	<p>The total discount applied to the order across all ship to customers. The total discount is calculated by comparing the selling price with the item/SKU offer price. If you use a price override on any of the order lines, or if it defaults from the Default Price Override Reason (B35) system control value:</p> <ul style="list-style-type: none"> • If the price override reason code's Override item offer price field is selected, the <i>Ord discount</i> includes any discounts that reduce the selling price from the price override amount you entered for the order line; however, it does not include the amount of the price override itself. For example, if an accompanying item normally priced at \$2.00 is added to the order at no charge, the \$2.00 is not included in the order discount amount. • If the price override reason code's Override item offer price field is unselected, and: <ul style="list-style-type: none"> – you override an existing item/SKU offer price for the item: the <i>Ord discount</i> includes the difference between the original item/SKU offer price and the final selling price, including the price override and any other discounts. – there is no item/SKU offer price for the item: the order detail line does not affect the <i>Ord discount</i> total.

 **Note:**

Included only if the [Display Discount on Order Recap Screen \(D38\)](#) system control value is selected.

G/M (Gross profit margin)

Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.

The unit amount of the order's merchandise that exceeds the cost of all of the item's on the order. You can use gross margin to determine the profit of an order based on each item's selling price. See [Determining Gross Profit](#) for more information on the calculations the system performs to determine gross margin and gross margin percentage.

The [Display Gross Margin \(A65\)](#) secured feature controls whether this field is included in order entry, maintenance, inquiry and item availability.

Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
G/M% (Gross profit margin percent)	<p>The percentage of the order's merchandise that exceeds the cost of all of the item's on the order. You can use gross margin to determine the profit of an order based on each item's selling price. See Determining Gross Profit for more information on the calculations the system performs to determine gross margin and gross margin percentage.</p> <p>The Display Gross Margin (A65) secured feature controls whether this field is included in order entry, maintenance, inquiry and item availability.</p> <p><i>Numeric, 7 positions with a 2-place decimal; optional.</i></p>

When you complete this screen: When you complete this screen, you have identified how the customer will pay for the order, either by using a combination of credit card, cash/check, or stored value card payment types or any alternate payment type.

You have also identified who is placing the order and the items being bought. This is the only information required to add an order to the system.

At this point, you can:

- Select any of the function keys listed at the bottom of the screen, *or*
- Select Accept Order to accept the order (see [Accepting or Rejecting the Order](#)), *or*
- Select Reject Order to reject the order (see [Accepting or Rejecting the Order](#)).

Screen Option	Procedure
Accept the order	Select Accept Order. See Accepting or Rejecting the Order .
Reject the order	Select Reject Order. See Accepting or Rejecting the Order .
Add a recipient	Select Add Recipient.

 **Note:**

You will first advance to the [Work with Order/Recap Screen](#) if the [Display Order Recap \(A75\)](#) system control value is selected.

Work with additional charges on the order	Select Additional Charges to advance to the Enter Additional Charges Window .
Work with customer ship-to information	Select Address Book to advance to the Select Ship To Window .
Work with customer bill-to information	Select Bill To to advance to the Change Customer Bill To Screen (Selecting, Changing, or Excluding a Billing Account) .
Return to the Work with Order Lines screen	Select Detail to advance to the Work with Order Lines Screen (Adding Items to the Order) .

Screen Option	Procedure
Work with the extended address for the sold-to customer	Select Expand Address to advance to the Expand Name/Address Screen .
Work with order messages	Select Messages to advance to the Work with Order Messages Screen .
Display more options	Select More Options to advance to the Display More Options Screen .
Work with order ship-to information	Select One Time Ship To to advance to the Create One Time Ship To Address Screen .
Advance to the Order Header screen	Select Order Header to advance to the Work with Order Screen .
Advance to the Enter Payment Method screen	Select Pay Methods to advance to the Enter Payment Method Screen .
Advance to the Work with Order Ship To Properties screen	Select Properties to advance to the Work with Order Ship to Properties Screen .
Advance to the Display Order Summary screen	Select Summary to advance to the Display Order Summary Screen .

Accepting or Rejecting the Order

- [Rejecting the Order](#)
 - [Confirm Order/Call Disposition Window](#)
 - [Confirm Reject Window](#)
- [Accepting the Order](#)
 - [Performing Online Credit Card Authorizations](#)
 - [Confirm Invalid Expiration Date Screen](#)

Rejecting the Order

When you select Reject Order, the system looks at the setting of the [Capture Order/Call Disposition \(K03\)](#) system control value to determine how to proceed.

- If this system control value is set to ORDER or ALL, the system advances you to the [Confirm Order/Call Disposition Window](#) where you must enter a reject reason code explaining why you are rejecting the order. In addition, the system creates a record in the [Order Disposition Table](#) so that you can track order/call disposition activity; see [Tracking Order/Call Disposition Activity](#).
- If this system control value is set to NONE or blank, the system advances you to the [Confirm Reject Window](#) where you must select OK in order to proceed with the order rejection.

Confirm Order/Call Disposition Window

Use this window to enter the reason why you reject an order in interactive Order Entry or end a call received from an external order call center.

How to display this screen: The setting of the Capture Order/Call Disposition (K03) system control value controls when this window displays.

- If this system control value is set to ORDER, this window displays when you reject an order during interactive Order Entry.
- If this system control value is set to ALL, this window displays when you:
 - reject an order during interactive Order Entry.
 - end a call received from an external order call center or select Exit at the [Select Customer Sold To For Order Screen](#) if a *Universal call ID* has been captured for the call in the Order Disposition table.

Field	Description
Reject reason	<p>A code for the reason you are rejecting an order or ending a call from an external order call center.</p> <p>You can prompt on this field to advance to the Select Reject Reason screen, where you can select a valid order/call disposition reject reason code; additionally, if you have authority to the Work with Reject Reason Codes (WWRR) menu option, you can create a new reject reason.</p>

 **Note:**

If you prompt on this field and select a reject reason code at the Select Reject Reason screen, the system immediately rejects the order or ends the call and does not return you to the Confirm Order/Call Disposition window.

Order/call disposition reject reason codes are defined in and validated against the Reject Reason table; see [Working with Order/Call Disposition Reject Reason Codes \(WWRR\)](#).

Alphanumeric, 2 positions; required.

Screen Option	Procedure
Reject the order or end the call from an external order call center	<p>Select Reject. The system:</p> <ul style="list-style-type: none"> • captures the reject reason you enter at this window in the Order Disposition Table. • returns you to the screen where you were located before entering the order or taking the call from the external order call center.

Screen Option	Procedure
Return to the order	Select Exit. The system returns you to the order.

 **Note:**

This option only displays when you reject an order; this option does not display when you exit a call from an external order call center.

Confirm Reject Window

Use this window to confirm that you wish to reject the order.

How to display this screen: This window displays when you:

- reject an order during interactive Order Entry if the Capture Order/Call Disposition (K03) system control value is set to NONE or blank.
- reject an order during Batch Order Entry.
- reject an order batch at the [Work with Error Orders Batches Screen](#).
- reject a business to business order.

Screen Option	Procedure
Reject the order	Select Reject. The system returns you to the screen where you were located before entering the order.
Return to the order	Select Exit. The system returns you to the order.

Accepting the Order

When you select Accept Order:

1. The system verifies the accuracy of all order information and ensures that you have defined some method of payment.
2. The system adds the new order immediately to the Order tables; it becomes available for Order Maintenance or Order Inquiry.
3. The system sends the credit card payment method on the order to the authorization service if you are set up to perform online credit card authorizations; see [Performing Online Credit Card Authorizations](#).
4. A scrolling message similar to the following displays at the bottom of the screen:
Finalizing order, Finalizing order.
5. Several updates occur; see [Order Entry Updates](#).
6. You return to the Select Customer Sold To screen to enter another order or to end the Order Entry function.

Payment plan error message: An error message indicates if you select Accept Order for an order associated with a payment plan and the order includes more than one credit card:
Multiple credit cards not allowed with payment plan.

See [Working with Flexible Payment Options \(WFPO\)](#) for more information on deferred and installment payment plans.

Store pickup error messages: If the order is flagged for store pickup, the system confirms that all items have been flagged and that there are no non-credit card payment methods on the order. See [Troubleshooting Creation of Store Pickup Orders and Things to Note](#) for more information.

Ship-for-pickup error message: If the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value is selected and this is a ship-for-pickup order that does not match the [Order Type for Special Orders \(L15\)](#), the system confirms that any payment methods on the order are credit cards whose *Card type* fields are set to Credit. If not, an error message indicates: `Invalid pay type for ship for pickup order`. You need to change the payment methods before you can accept the order. See [Payment at POS for Ship for Pickup Orders \(L60\)](#) [Payment at POS for Ship for Pickup Orders \(L60\)](#) [Payment at POS for Ship for Pickup Orders \(L60\)](#) [Payment at POS for Ship for Pickup Orders \(L60\)](#) [Payment at POS for Ship for Pickup Orders \(L60\)](#) for more information.

Performing Online Credit Card Authorizations

Online credit card authorization allows you to send and receive electronically the information required to authorize a credit card at the time the order is placed instead of at the time the pick slip is generated for the order.

The system performs online authorization when you select Accept Order after determining if the order should go on hold. Note that online authorization still takes place, even if the order is on hold, provided that the order is eligible for online authorization.

If the order is eligible to receive a credit card authorization during order entry, the system sends the amount requiring authorization to the authorization service and waits for a response.

There are 3 types of responses you can receive from the authorization service.

- R = an authorization response was received, such as declined or approved.
- T = the program timed out before an authorization response was received.
- U = an undefined response was received.

Additionally, the authorization service sends back an response code, authorization code, AVS response code (if you are performing AVS verification), CID response code (if you are performing credit card identification verification), and date.

If you have defined a pop up window message for the vendor response received, you advance to the [Select Authorization Response Option Window](#). Also, if you have specified vendor response, the system places the order on hold.

Note:

The Select Authorization Response Option window opens once for each authorization transaction; if you receive an authorization response, AVS response, and CID response from the authorization service, an authorization pop up window displays the first response (in the order listed).

Credit cards requiring authorizations less than \$1.00: If the credit card amount to authorize is less than \$1.00 and the [Authorization Number for Authorizations Under \\$1.00 \(I08\)](#) system control value specifies an authorization number, the system does not send the credit card to the service bureau for authorization; instead, it assigns the authorization number from the system control value. If the system control value is blank, the system sends the credit card to the service bureau for authorization, regardless of the amount that requires authorization.

Performing Online Verification Only: If the [Online Auth Verification Only \(I96\)](#) system control value is selected, the system processes online authorizations for \$1.00 for the purpose of validating the card. During batch authorizations, the system authorizes the card for the shippable dollar amount and voids the online authorization for \$1.00.

Oracle Retail Customer Engagement stored value cards: When using the [Customer Engagement Stored Value Card Integration](#), if the Oracle Retail Customer Engagement stored value card is the only payment on the order and the amount authorized for the card is less than the order total, Order Administration updates the amount for the card with the amount authorized and displays the message `Insufficient balance on card - please add another payment`. In order to accept the order, you must add another payment to the order to cover the amount of the order that is not covered by the Oracle Retail Customer Engagement stored value card. Example: If the order total is 500.00 and the amount authorized for the Oracle Retail Customer Engagement stored value card is 236.20, the system updates the amount for the card to 236.20 and requires another form of payment to cover the remaining 289.55 balance on the order.

For more information: See [Performing Online Credit Card Authorizations](#) for an overview of the online credit card authorization process and the required setup.

Confirm Invalid Expiration Date Screen

This screen opens if the expiration date for the credit card expires before the credit card payment method assigned to the order has been paid in full, for example, the credit card expiration date is 10/06 and an installment payment plan is assigned to the credit card payment method with installment dates of 9/8/06, 10/8/06 and 11/8/06.

Field	Description
Correct expiration/Start date	Indicates whether you wish to change the expiration date for the credit card or change the payment method assigned to the order. Valid values are: <ul style="list-style-type: none"> • Yes = Correct the expiration date or change the payment method assigned to the order. • No = Do not correct the expiration date or change the payment method assigned to the order.

Instructions:

To correct the credit card expiration date or start date.

1. Select Yes from the *Correct expiration/start date* field if you wish to change the credit card expiration date or the credit card payment method assigned to the order, or
2. Select OK.
3. The system returns you to Order Maintenance, where you can correct the payment method.

 **Note:**

If you selected Yes from the *Correct expiration/start date* field, you must change the expiration date or payment method assigned to the order or the system will advance you to this screen again when you select Accept Order.

Order Entry Updates

Purpose: The system performs updates to a number of tables to reflect the addition of a new order to the system. The updates occur:

- Immediately (interactively), as you enter an order; see [Immediate Updates](#)
- When you select Accept Order; see [Updates at Accept](#)
- When the Order ASYNC job receives an order processing data queue record; see [Updates During Background Processing](#) for more information about which fields are updated in each table.

Immediate Updates

The system updates the SKU and Item/Warehouse tables immediately (interactively) as you enter a new order.

Process	Table	Field
Update the Item/Warehouse for each item ordered	Item/ Warehouse	On-hand quantity (if express-billed order) Item/warehouse backorder quantity Reserve quantity Special handling reserve quantity Item/warehouse on-order quantity
Update the SKU for each item ordered	SKU	Orders availability pick generation Open quantity On-hold quantity

Additionally, the system updates these tables as you enter a new order:

- Alternate Customer # Cross Reference (if you are creating a new customer, and the [Assign Alternate Customer # \(I88\)](#) system control value is selected)
- Customer Sold To
- Customer Sold To Extended Address
- Customer Sold To Phone #
- Customer Bill To
- Customer Bill To Extended Address
- Customer Bill To Phone #
- Customer Ship To

- Customer Ship To Extended
- Customer Ship To Phone #
- Customer Action Notes
- Order Additional Charges
- Order Batch
- Order Coupon Discount
- Order Detail
- Order Detail Coupon
- Order Detail Data Queue
- Order Free Gift
- Order Header
- Order I/T Lines
- Order Information
- Order Line History
- Order Line Message
- Order Message
- Order Payment Method
- Order Pending Checks
- Order Selected Item
- Order Ship To
- Order Ship To Address
- Order Ship To Data Queue
- Order Special Format
- Order Special Handling
- Order Transaction History
- Reserved Order Lines

Updates at Accept

The system performs these table updates when you select Accept Order. See [Performing the Release](#) and [Introducing Order Hold Reason Codes](#) for more information about the credit check process that evaluates customers, orders, and payment types and performs record updates if any condition on the order fails a credit check.

Process	Table	Field
Reprice order if the Price method field for the Source Code is set to D (Regular Item Pricing + Repricing)	Order Detail	Order detail price
Evaluate free gift eligibility, based on the source code or offer; create order detail records for free gift, if applicable	Order Detail	All fields

Process	Table	Field
Calculate the \$ Discount, based on Source or Offer; add a record to the Order Additional Charges table	Order Additional Charges	All fields

Updates During Background Processing

The system performs the balance of the field and table updates during a background processing job (Order ASYNC) that runs after you accept the order. The ORDR_ASYNC job updates system tables with order and demand information as orders are entered and maintained. As you enter or maintain orders, the system sends the records to the Order Processing data queue for processing. As soon as the Order Processing Data queue receives a record to process, the record is processed immediately, regardless of the status of the Order Processing ASYNC (ORDR_ASYNC) job. The ORDR_ASYNC job processes multiple orders simultaneously. While the Order Async job does not need to be active to process records, you should set the Order Async job to active to handle reorganization and cleanup of any transactions that did not process correctly. See [Updates During Background Processing](#) for a detailed listing.

Tax-inclusive pricing: Each of the updates made for an item sold at the tax-inclusive price (in which VAT is added to the [Hidden tax](#) field on the order detail line, rather than accumulating tax in the *Tax* bucket on the order) are made using the tax-inclusive price minus

the hidden tax. For example, if you sell an item at a tax-inclusive price of \$10.00, but hidden tax of \$1.50 was included on the order detail line, each of the dollar updates will be in the amount of \$8.50.

Working with Items on the Order

Purpose: This topic discusses the options available on the [Work with Order Lines Screen \(Adding Items to the Order\)](#) to work with items you have added to the order by changing, reviewing or enhancing item information.

Use the item detail options in the center of the item entry screen to:

- Change information for an item on the order
- Review additional information for an item, such as:
 - Pending deliveries of the item on purchase orders
 - Availability in shippable warehouses
 - Special item pricing promotions
 - Customer Service notices
 - Specials
 - Relationships to other items you sell
 - Hidden tax
 - Gross profit margin and gross profit margin percent
- Attach information to a specific item, for:
 - Special handling instructions
 - Messages
- Review coordinating items and add them to the order

In this topic:

- [Work with Order Line Screen \(Changing/Adding an Item\)](#)
- [Display Open Purchase Orders Screen](#)
- [Item Availability Screen](#)
- [Display Quantity Pricing Window](#)
- [Work with Special Handling Screen](#)
- [Work with Custom Special Handling Screen](#)
- [Display Coordinate Items Window](#)
- [Select Coordinate Items Window](#)
- [Work with Order Line Messages Screen](#)
- [Select Item Relationships Window](#)
- [Display Item Relationship Screen](#)

Work with Order Lines Screen Options

Screen Option	Procedure
Change any information for an item or add an item, perform overrides at the item detail line level, review how the system priced the item, and review the quantity and date the inventory was reserved by the system	<p>Select Change for the item or select Add Line on the Work with Order Lines Screen (Adding Items to the Order) to advance to the Work with Order Line Screen (Changing/Adding an Item).</p> <p>NOTE: Selecting Change for a set component item is controlled by the Set Component Maintenance (J01) secured feature. If you do not have the required authority, an error message indicates: Not authorized to change, delete, cancel, or sell out a set component.</p>
Remove the item from the order	<p>Select Delete for the item to delete the item.</p> <p>The system does not issue a warning message before deleting the item from the Order Entry screen. Also, the remaining items are renumbered in place of the deleted item.</p> <p>NOTE:</p> <ul style="list-style-type: none"> Selecting Delete for a set component item is controlled by the Set Component Maintenance (J01) secured feature. If you do not have the required authority, an error message indicates: Not authorized to change, delete, cancel, or sell out a set component. Make sure that you are deleting the correct item when you use this option. The system deletes the item immediately from the order without prompting you to confirm the deletion.
Review the pending deliveries of this item on purchase orders	Select POs for an item to advance to the Display Open Purchase Orders Screen .
Review the availability of the item across all shippable warehouses	Select Availability for an item to advance to the Item Availability Screen .
Review the quantity break prices for the item offer	Select Pricing for an item to advance to the Display Quantity Pricing Window .
Enter or change the special handling instructions for an item that will be personalized	<p>Select Special Handling for the item to advance to the Work with Special Handling Screen or the Work with Custom Special Handling Screen.</p> <p>NOTE: This option is not available if the additional charge code used for the special handling format is suppressed; see Special Handling Overview for a discussion.</p>
Place an item on hold	<p>Select Hold for the item to place the item on hold. Only open lines are eligible to be held. The item is not eligible for pick slip preparation until you release the line; if you generate a pick slip for the other items on the order, the pick slip lists this item as backordered.</p> <p>You can also put order lines in held status automatically through a special handling format. See Putting a Line on Hold through a Special Handling Format for a discussion.</p>
Release a held item	<p>Select Release for an item to release it from hold. Only held items (status = H) are eligible to be released. The line status changes to open (blank) and the item is now eligible for pick slip preparation.</p> <p>If the hold status was applied automatically through a special handling format, you can release the line by removing the special handling. See Putting a Line on Hold through a Special Handling Format for a discussion.</p>

Screen Option	Procedure
Display coordinating items you can add to the order	Select Coordinates for the item to advance to the Display Coordinate Items Window .
Search for the item across warehouses and stores in external systems	Select Merchandise Locator for an item to advance to the Merchandise Locator Search Window (Searching for an Item) . See Merchandise Locator Process Overview for more information.
Enter a message about the item	Select Messages for the item to display the Work with Order Line Messages Screen .
Review other items that are compatible with this item	Select Relationships to display the Select Item Relationships Window .
Sell out a backordered item	Select Sell Out to change the order line status to soldout and recalculate tax.

 **Note:**

You cannot perform a merchandise locator search for an item/SKU if:

- the [Use Merchandise Locator \(I38\)](#) system control value is unselected. Otherwise, an error message indicates: Merchandise Locator is not enabled.
- you have already entered an *Ord qty* to add to the order. See the [Display Selected Items Window](#) for a workaround.
- the item is:
 - soldout, canceled or closed
 - included on a printed pick slip (however, if the pick slips have been voided, you can use the merchandise locator option)
 - a component of a set
 - a membership item
 - a subscription item

 **Note:**

Selecting Sell Out for a set component item is controlled by the Set Component Maintenance (J01) secured feature. If you do not have the required authority, an error message indicates: Not authorized to change, delete, cancel, or sell out a set component.

Work with Order Line Screen (Changing/Adding an Item)

Purpose: Use this screen to override order defaults or review reservation information for an item.

How to display this screen:

- Select Change for an item at the [Work with Order Lines Screen \(Adding Items to the Order\)](#)
- Select Create at the [Work with Order Lines Screen \(Adding Items to the Order\)](#)

Note:

- The **Item** and **SKU** fields are blank if you selected Create.
- Selecting Change for a set component item is controlled by the Set Component Maintenance (J01) secured feature. If you do not have the required authority, an error message indicates: Not authorized to change, delete, cancel, or sell out a set component.
- See [Adding Different Types of Items to the Order](#) for more information on the processing the system performs for different types of items.

Field	Description
Order#	A unique number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Ship To #	Unlabeled field to the right of the order number. The number assigned to the shipping address on the current order. The system assigns a sequential ship-to number to every order, even if the shipping address and the sold-to address are the same. The first ship-to address is assigned the number 1. <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Ln# (Line number)	The number assigned to this item on the order. <i>Numeric, 3 positions; display-only.</i>
Sts (Status)	The current status of the item detail line. The status field is Open or Soldout during Order Entry: Open Status An item is assigned an open status when it is added to an order and it is currently “active” in your inventory. If a partial quantity of the item is sold out on the order line, the order line status is still open. The order line and order totals reflect the line quantity that is reserved or backordered, but do not reflect the soldout quantity. Other Statuses There are several other item detail line status codes that are assigned by the system at other points during the life of an order detail line, including: <ul style="list-style-type: none"> • Soldout • Canceled • Closed (item was shipped to customer) • Error (the item ordered through a phone service included data errors that you must correct) • Express bill (no pick slip produced for item, because item already removed from inventory; order moves directly to billing status). <i>Alphanumeric, 9 positions; display-only, assigned by the system.</i>

Field	Description
B/O (Backorder reason)	<p>The reason why this item was backordered, as determined by the system.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Future order • Item not in warehouse • No warehouse specified • Not enough (inventory) available in warehouse • Reservation bypassed; if the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system uses this reason for each item sent to Order Administration for fulfillment assignment; see Brokered Backorders. • SKU reserve limit exceeded <p>The system assigns a backorder status to items that could not be fulfilled (no on-hand inventory available for the item).</p> <p>NOTE: Not displayed if the item was available and could be reserved.</p> <p><i>Display-only, updated by the system.</i></p>
Ofr (Offer code)	<p>A code for the catalog, space or television advertisement from which you accept orders.</p> <p>The offer defined for the order controls how shipping is calculated and items are priced. However, if you override the offer for an item (if the customer is ordering from more than 1 catalog, for example), demand for the item will be attributed to the offer associated with the item rather than the order. Demand represents the number and dollar value of orders placed against an offer.</p> <p>Related System Control Values</p> <ul style="list-style-type: none"> • The system automatically overrides the offer for an item if Override Offer on Order Detail Line (D49) system control value is selected and the item is not sold in the offer used on the order. • The system automatically overrides the offer for an item if the Override Offer/Page/Alias on Order Detail (E72) system control value is selected and the item does not contain a page/alias in the offer used on the order. • The cursor positions to the offer field, which is blank, if the Position Cursor on Offer Field in OE/OM (F91) field is selected. <p><i>Alphanumeric, 3 positions; required.</i></p>
Item	<p>The code for a unit of inventory. Items are defined in and validated against the Item table.</p>

 **Note:**

An item alias is displayed if the customer ordered using an alias and the [Display Item Alias \(D56\)](#) field in the System Control table is selected.

Alphanumeric, 12 positions; display-only.

Field	Description
SKU	A code that identifies the style of the item, such as its color or size. <i>Alphanumeric, three 4-position fields; display-only.</i>
Qty (Quantity ordered)	<p>The number of units of this item being ordered, excluding any units sold out. You can change the quantity ordered, but you cannot change a positive to a negative or vice versa or a message indicates:</p> <p>Order qty may not be changed between (+) / (-).</p> <p>Instead, you must delete and reenter the item. If you change the quantity of a set item, the change is also reflected in the component items.</p> <p>The Maximum Order Quantity (C60) field in the System Control value controls the maximum value you can enter in the <i>Quantity</i> field; additionally, the Allow Maximum Order Quantity Override (A70) secured feature controls whether individual users can exceed this maximum.</p> <p><i>Numeric, 5 positions; required.</i></p>

Field	Description
Price	<p>The actual selling price of a single unit of the item, either calculated by the system or entered on the line as a price override.</p> <p>Secured Feature</p> <p>The Price Overrides (A23) secured feature controls whether you can update the price for the order line; if you do not have authority to this secured feature, the <i>Price</i> field is display-only.</p> <p>Price Overrides</p> <p>If you enter a price override, you must also enter a price override reason code in the Ovr (Price override reason code) field.</p> <p>You can define a maximum percentage operators can discount an item by entering a percentage in the Price Override Limit Percent (E55) system control value. The system uses the price from the item/offer to determine whether the price override exceeds the percentage. The override limit applies only to prices that are lower than the item/offer price. This is helpful in reducing the possibility of fraud by order entry operators.</p> <p>Price Override Example</p> <p>The system uses this calculation to determine the percentage of the price override:</p> $\frac{(\text{offer price} - \text{price override entered})}{\text{offer price}} * 100 = \text{price override percentage}$ <p>Example:</p> <pre>price override percentage = 10% offer price = \$40.00 price override = \$35.00 (40.00 - 35.00) = 5.00 5.00/40.00 = .125 .125 * 100 = 12.50 (12.50 exceeds the 10% price override)</pre> <p>A message indicates if an operator enters a price that is less than the percentage allowed:</p> <pre>Entered price exceeds override limit.</pre> <p>The Override Price Override Limit (A64) secured feature controls whether operators can override the Price Override Limit Percent (E55)</p> <p>Override Price Table Maximum</p> <p>You can use the Price Table Level Override Code (E05) to apply the best possible price table pricing to an order line, even if it is beyond the maximum specified in the price table; however, to apply this pricing, you need to:</p> <ol style="list-style-type: none"> 1. Enter the requested quantity of the item at the Work with Order Lines Screen (Adding Items to the Order) using the default pricing 2. Select Change for the item to advance to the Work with Order Line Screen (Changing/Adding an Item) 3. Complete this screen by entering the Price Table Level Override Code (E05), but no price for the item <p>When you select Reprice or Accept, the system applies the best possible price table pricing. See Working with Price Tables (WPTB)</p>

Field	Description
	<p>and the Price Table Level Override Code (E05) system control value for more information.</p> <p>Manual Price Override Code</p> <p>You cannot use the Price Table Level Override Code (E05), Price Override Reason for Price Matrix Customer Specials (K42), or Price Override Reason for Promotions (K45) as a regular price override reason code when you manually enter a price override.</p> <p>Negative Prices</p> <p>The Allow Negative Prices in Order Entry (E97) system control value controls whether you can enter a negative item price. If you enter a positive item quantity, a negative price produces a credit; with a negative quantity, a negative price produces an invoice.</p> <p>Maximum Value</p> <p>The Maximum Order Line Value (E98) field in the System Control value controls the maximum dollar value of a line you can enter; additionally, the Allow Maximum Order Line Value Override (A69) secured feature controls whether individual users can exceed this maximum.</p> <p><i>Numeric, 13 positions with a 2-place decimal; required, calculated by the system.</i></p>
N/C (“No charge” flag)	<p>Controls whether to charge the customer for the item.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected =Item is given to the customer at no charge. • Unselected =The customer pays for the item. <p>If you select this field, the order totals are not increased, no charge prints for the item on the pick slip, and the customer will not be invoiced for the item. Also, you must enter a price override reason code in the Ovr (Price override reason code) field.</p> <p>The Price Overrides (A23) secured feature controls whether you can update the no charge flag for the order line; if you do not have authority to this secured feature, the <i>No charge</i> field is display-only.</p>

Field	Description
Ovr (Price override reason code)	<p>A code that represents the reason for overriding the item price or giving the item at no charge.</p> <p>Price override reason codes are defined in and validated against the Price Override Reason table. See Establishing Price Override Reason Codes (WPOR).</p> <p>Secured Feature</p> <p>The Price Overrides (A23) secured feature controls whether you can override the item price; if you do not have authority to this secured feature, the <i>Price override reason code</i> field is display-only.</p> <p>Price Table Pricing</p> <p>If you use price table pricing, you can define a Price Table Level Override Code (E05). Use this code to override the maximum price break you have defined for an item in the price table.</p> <p>Customer Price Group Price Override Reason Code</p> <p>If you assign the price override reason code defined in the Price Override Reason Code for CPG Pricing (L59) system control value, the order line cannot be further discounted except by order-level coupons.</p> <p>VAT</p> <p>If you make any changes to the order that will result in changing whether the order is subject to VAT, the system will reprice each item accordingly and recalculate tax as well. However, this update does not take place for any line with a price override, whether the override was made by a user or by the system (for instance, for a price table premium). You must delete the line and reenter it to correct the price and tax information.</p> <p>Quantity Price Matrix Customer Special</p> <p>If the order line is priced using a Quantity Price Matrix Customer Special, the system assigns the Price Override Reason for Price Matrix Customer Specials (K42) to the order line during repricing. When this price override reason code is defined for an order line, the system cannot apply any additional discounts, such as promotions, to the order line. However, the system can still apply a source % discount to the order line.</p> <p>In addition, the system prevents you from manually entering this price override reason code on an order line: Price override reason reserved and cannot be manually entered.</p> <p>See Order Repricing, Premiums, Discounts, and Promotions for more information about repricing and Working with Quantity Price Matrix (WQPM) for an overview on quantity price matrix pricing.</p> <p>Warranty Item</p> <p>If the Default Price Override Reason for Warranty Items (G01) system control value contains a price override code, the system defaults this price override code to this field when an operator enters a warranty item.</p> <p>Item Category or BOGO Promotion</p> <p>If the order line is discounted through an Item Category or BOGO (Buy One/Get One) promotion, or priced at “no charge” through a BOGO promotion, the system uses the Price Override Reason for Promotions (K45). This system control value prevents further discounting from applying to the order line. If this system control value is blank, the system uses the Default Price Override Reason</p>

Field	Description
Cpn (Coupon)	<p>(B35) for the “no charge” lines; however, the other lines discounted through these promotions will be subject to further discounting. See Working with Promotions (WPRO) for more information.</p> <p>You cannot manually enter the Price Override Reason for Promotions (K45) on an order detail line.</p> <p><i>Alphanumeric, 1 position; required if overriding a price or selling item at no charge.</i></p> <p>Indicates whether a coupon is being redeemed for this item.</p> <ul style="list-style-type: none"> • Selected = The customer is using a coupon for this item. • Unselected (default) = The customer is not using a coupon towards the purchase of this item. <p>You can enter a coupon for an item during Order Entry, for example, if you include a coupon in your catalog that the customer can use towards a purchase.</p> <p>If you select this field, you must also enter the amount of the coupon in the <i>Coupon amt</i> field. The dollar amount of the coupon will be subtracted from the price of the item and *Coupon Item Price will display on this screen as the pricing method.</p>
Coupon amt (Coupon amount)	<p>The value of the coupon being applied against this item. The system subtracts this amount from the item's price.</p> <p>You must select the <i>Cpn (Coupon)</i> field if applying a coupon against an item.</p> <p><i>Numeric, 13 positions with a 2-place decimal; required if using a coupon.</i></p>
Description (Unlabeled field below Item field)	<p>The description of the item.</p> <p><i>Alphanumeric, 25 positions; display-only.</i></p>

 **Note:**

For a coupon to be applied to an item, the [Pricing Values \(B31\)](#) in the System Control table must use the COUPON/ITEM pricing method (or it should be near the top of the pricing hierarchy) or you should use [Best Way Pricing \(A78\)](#) so that the system can give the item to the customer at the lowest available price.

Field	Description
Pricing method	<p>The method used to calculate the price for the item, controlled by:</p> <ul style="list-style-type: none"> • The pricing hierarchy defined in the Pricing Values (B31) system control value. • The pricing method associated with the source code used on the order or entered for the item. • A price override on the item. <p>Pricing Methods</p> <ul style="list-style-type: none"> • 1 Coupon item price • 2 Customer discount% • 3 Contract price • 4 Special source price • 5 Column price • 6 Quantity break price • 7 Offer price • A Repriced-prorated discount • B Quantity Price Matrix Customer Override • C Use item cost • E Price code • F Customer Price Group • G BOGO • I Repriced-qty break/item • J Repriced Customer Price Group Best Price • K Price table default • L Price Table Level Ovr • N No charge (with cost tracking; source code definition) • O No charge/no cost (source code definition) • R Price override (includes entering as no charge in Order Entry) • T Price table premium • U Upsell Item • V Repriced-volume discount • Y Price table • X Qty Price Matrix • Z Repriced-item category promotion <p><i>Alphanumeric, 25 positions; display-only, updated by the system.</i></p>
Offer price	<p>The price of the item in the catalog, before applying any additional discounts or repricing. If the order was subject to VAT and tax-inclusive pricing, in which any tax is included in the <i>Hidden tax</i> field rather than the <i>Tax</i> bucket on the order, the offer price presented here is the tax-inclusive offer price.</p> <p>The Price Overrides (A23) secured feature controls whether you can update the offer price for the order line; if you do not have authority to this secured feature, the <i>Offer price</i> field is display-only.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>

Field	Description
Pre-disc. price (Pre-discount price)	<p>The item price before applying any coupons or dollar discounts by source or offer, if the Prorate Dollar Discounts and Coupons (D90) field in the System Control table is selected, but after applying other discounts and repricing.</p> <p>The system does not update this field if you change the customer's tax status at any point after entering the item. If you use tax-inclusive pricing, there may be cases where the system reprices items due to changes in a customer's tax exemption status, changing the shipping address to a VAT-exempt state, etc. In these cases, the pre-discount price may not correspond to the way the way the actual price was derived.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>
Duty	<p>The amount of duty on the item. Duty is a tax based on the item and the country where you are shipping the item. On other screens in Order Entry and Maintenance, the duty is generally included with the special handling total on the order.</p> <p>The system determines whether to add duty by comparing the item's harmonize code with the harmonize code defined for the country's duty rates. The system calculates duty, if it finds a match, based on the percentage or per-unit amount defined for the duty rate. See Setting Up the Country Table (WCTY) for a complete discussion of defining and using duty charges for a country.</p> <p>When the system adds duty to the order for an item, it also writes an order line message.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>

Field	Description
Ship via	<p>The shipper that will deliver <i>this item</i> to the customer. Leave this field blank if you want to use the shipper defined on the order header.</p> <p>Enter a different ship via code here only if you want to ship this particular item by another shipper.</p> <p>Ship via codes are defined in and validated against the Ship Via table; see Working with Ship Via Codes (WVIA). Also, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <p>If you enter a ship via code and the <i>Perform ship via edit?</i> flag for the country is selected, the system validates the SCF/ship via combination against the SCF Ship Via table when you complete the order; see Working with SCF/Ship Via Values (WSHV).</p> <p>Item Ship Via Overrides</p> <p>Item ship via overrides define the shippers eligible to ship the item to its destination. If ship via overrides exist in the Item Ship Via Override table for an item on the order, the system evaluates the ship via you define for the order line to determine if the ship via is eligible to ship the item. Additionally, if you prompt on the <i>Ship via</i> field, you advance to the Work with Item Ship Via Overrides screen containing only those ship vias eligible to ship the item.</p> <p>If the ship via you enter is not found in the Item Ship Via Override table for the item on the order, you advance to the Ship Via Overrides for Item Window, requesting you to select an eligible shipper to assign to the item on the order line. Additionally, if you do not define a ship via on the order line, the system evaluates the ship via on the order header to determine if it is eligible to ship the item.</p> <p>If item ship via overrides do not exist for the item, you can define any valid ship via code in this field. See Working with Item Ship Via Overrides for more information on defining eligible shippers for an item.</p> <p>Express Bill Ship Via</p> <p>You can change an item on an order to express bill by entering an express bill code. When you express bill an item, a pick slip does not print and no shipments occur for the item.</p> <p>An error message indicates if you change an item on an express order to ship non-express: Ship Via must be an Express Bill.</p> <p><i>Numeric, 2 positions; optional.</i></p>
Extension	<p>The actual selling price of the item multiplied by the quantity ordered, excluding any sold out units.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, calculated by the system.</i></p>

Field	Description
Arrival date	<p>The date when the customer wants to receive this item. The arrival date entered here overrides the arrival date defined for the order.</p> <p>The arrival date is initially set to the current date for each item; however, you can enter some future date on this screen to delay shipment of the item.</p> <p>The system defaults a future ship arrival date to an item with a future ship status if the item's status code matches the Future Orders Item Status (E52). The future arrival date that defaults for this item comes from the Default Future Orders Arrival Date (E53).</p>

 **Note:**

The system does not prevent you from setting the arrival date for the order line to be earlier than the current date or the order date.

The arrival date controls:

- Whether the item is reserved
- Whether to create a pre-generated pick for the item; see [Selecting Order Lines for Pick Slip Preparation](#).

Influence on Reservation

The arrival date for the item controls whether to reserve inventory as follows:

Arrival date - [Reservation Lead Days \(B27\)](#) = Date

The system does not reserve inventory if the result is a future date. In this case, the item is flagged as a future order and assigned a backorder status.

When you run the Evaluate Future Orders process (typically, every evening) it evaluates each item flagged as a future order and reruns the arrival date calculation. When the result is no longer in the future, the process reserves the inventory. See [Scheduling Jobs](#) for more information.

Influence on Pick Slip Preparation

The item's arrival date also controls whether the system creates a pre-generated pick for the item.

The system uses this calculation:

Arrival Date from Order Line (or Order Ship To) - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date

The system creates a pre-generated pick for the order line if this system-calculated date is less than or equal to today's date; otherwise, the system does not create a pre-generated pick for the order line until the date is within the allotted time frame. See [Selecting Order Lines for Pick Slip Preparation](#).

Zone reservation rules: For items subject to zone reservation, this date is:

- the zone start date if the item was ordered prior to the zone season start date.

Field	Description
	<ul style="list-style-type: none">• the order date if the item was ordered between the zone season start date and zone end date, provided that:<ul style="list-style-type: none">– if you use Standard Zone Reservation Rules, the item was available or you took the order before the zone's deferred cutoff date– if you use Alternate Zone Reservation Rules, the item was available or had an open PO quantity• otherwise, this date is the next season's zone start date from the zone reservation dates. <p>See Shipping Zone Reservation Overview for a complete discussion.</p> <p>You can use the order ship to's <i>Arrival date</i> as a selection criterion in pick slip generation; the system does not look at the order line arrival date during pick slip generation. See Streamlined Pick Slip Generation (WSPS).</p> <p><i>Numeric, 6 positions (in user date format); required.</i></p>

Field	Description
Source	<p>A code used to identify a segment of your customer base or a rented list to whom you mail a catalog. The source code prints on the catalog mailing labels next to the customer's name.</p> <p>A source code entered here overrides the source code entered on the order header screen. The source code on the order header determines shipping and item pricing; the source code on the order detail line is used to track demand.</p> <p>Prompting for a source code</p> <p>Click on the arrow at this field to obtain a list of current source codes. Only the source codes whose Display on O/E (Display in Order Entry) fields are selected appear.</p> <p>Restricted source codes</p> <p>During Order Entry, you must use only unrestricted source codes (Restricted = Unselected in the Source Code table). A source code may be identified as “restricted” when:</p> <ul style="list-style-type: none"> • The source code is obsolete; no new orders can use this source code. • The source code includes errors • The source code was created by mistake. <p>Initially, all new source codes are unrestricted. When Initializing an Offer (MOFI), however, you can restrict all source codes associated with a particular offer until the offer is in effect.</p> <p>Capturing the Source Code</p> <p>The system writes the source code used by a new customer to the Original source code field in the Customer record.</p> <p>If the Update Original Source Code for Recipient Customers (F90) system control value is selected, the system writes the source code defined for the sold to customer to the <i>Original source</i> field for a recipient customer.</p> <p>The system also writes the source code to the Current source code field in the Customer record for new and existing customers. The system updates this field each time the customer places a new order from a different source code.</p> <p>Capturing Demand</p> <p>If you override the source code for an item, the system updates demand for the new source code for this order line. Demand represents the dollar amount and number of orders.</p> <p>A source code may default to this field automatically, depending on how you have set the Load Source from Mailing History (D20) and Use Source Code from Order Header When Creating Order Lines (D73) system control values.</p> <p>The system defaults the source code defined for the offer on the order detail line if the offer on the detail line is not associated with the source code defined on the order header and the Default Offer Source Code to Order Detail Line (G28) system control value is selected.</p> <p>Source codes are defined in and validated against the Source Code table. See <i>Working with Source Codes (WSRC)</i>.</p> <p><i>Alphanumeric, 9 positions; required.</i></p>

Field	Description
Exp ship date (Expected shipment date)	<p>The date when you expect receipt of a purchase order that can be used to fulfill this order.</p> <p>This date takes into account P.O. layering, in which items already backordered are filled first. This means that the date displayed here might not be when the next purchase order is due.</p> <p>The system updates this field using information from Purchase Order Receipts and the Evaluate Backorders programs.</p> <p>No date is indicated here if the item has been reserved or if there are no outstanding purchase orders for this item.</p> <p>The expected shipment date is cleared once the purchase order is received through Purchase Order Receiving.</p> <p>Drop ships: This date is included for drop ship items only if the Assign Drop Ship Expected Ship Date (I59) system control value is selected. See that system control value for more information.</p> <p><i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i></p>
C/G (Coordinate group code)	<p>A number that you can enter to force two or more items to ship together. The system does not create a pre-generated pick for these items until they are all available; see Selecting Order Lines for Pick Slip Preparation. You must use the same ship via for all items assigned to the same coordinate group.</p> <p><i>Numeric, 3 positions; optional.</i></p>

Field	Description
Freight	<p>The shipping charge for this item. You can enter a freight override only if the current source code uses one of these line-level freight methods:</p> <ul style="list-style-type: none"> • Flat rate by item (Flat Rt/Item) freight • Flat rate by quantity (Flat Rt/Qty) freight • Flat rate by item source (Flat Rt/Itm Src) freight • Item (By Item) freight • Weight freight <p>This freight charge overrides the system- calculated freight charge for this item.</p> <p>Freight Method Validation</p> <p>If you enter a freight override here, the system checks the freight method for the Source and displays a message if you are not using a line-level freight method: Freight charge (xx.xx) cannot be overridden - order level freight method.</p> <p>In response to this message, you must remove the freight override or change the source code on the order to one that uses a line-level freight method.</p> <p>Source Code Override at Line Level</p> <p>If you override the source code at the item level, make sure you update the offer code appropriately. Demand (the number and dollar amount of orders for this item) will be attributed to the source code/offer at the item level, if you perform an override.</p> <p>This source code override is used only for historical updates and has no effect on how freight and prices are calculated.</p> <p>Freight Exempt Items</p> <p>The system checks the Working with Freight Exempt Items (WFEI) menu option for freight exempt items when the Use Item Freight Exemption File (E73) system control value is selected. See Freight Exempt Items Setup for additional information.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>
G/W (Gift wrap flag)	<p>Indicates whether this item will be gift wrapped.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = Gift wrap item • Unselected (default) = Do not gift wrap item <p>The Gift wrap field in the Item/Offer record determines whether the item is eligible for gift wrapping. If so, the G/W price (Gift wrap price) field includes the charge for gift wrapping, if any.</p> <p>Items marked for gift wrapping are identified on the pick slip with the literal Gift Wrap, along with the gift wrapping charge.</p>

Field	Description
S/H code (Special handling code)	<p>A code that represents some type of work that will be performed on the item, such as monogramming, alterations, engraving, etc. A value defaults here if a special handling code is specified for the item/SKU offer, or if you have already specified special handling for the item.</p> <p>You can mark the item for special handling only if the item is eligible for it (Special handling = selected in the Item/Offer or SKU/Offer table).</p> <p>If you click on the arrow here, only special handling codes are listed on the prompt screen. Special handling codes are defined in and validated against the Additional Charges table. See Establishing Additional Charge Codes (WADC).</p> <p>The special handling instructions screen opens if the item is marked for special handling. At this screen, you can enter notes about how to work on the item. Also, you can enter or override a charge for this work. See Work with Special Handling Screen or the Work with Custom Special Handling Screen.</p>

 **Note:**

You do not advance to a special handling screen if the special handling code is flagged to suppress the display of the screen, based on the setting of the [Suppress S/H window](#) field; however, any related handling charges will be added to the order.

The special handling instructions and special handling charge may print on the pick slip, depending on which pick slip print program you use.

Special handling validation

If you enter a special handling code, the system verifies that special handling has been defined for the item in the item/offer or SKU/offer and displays a message if special handling has not been defined: Special handling is not valid for this item in this offer.

Alphanumeric, 2 positions; optional.

Field	Description
S/H charge	<p>The charge to perform extra work on the item, such as alterations, engraving, or monogramming.</p> <p>A charge defaults here if the item is set up for special handling in the item offer or SKU offer, and if a price has been defined for it. You can specify a price for special handling at:</p> <ul style="list-style-type: none">the item offer or SKU offer (standard or custom special handling)the special handling format (custom special handling only) <p>If a price is specified at both the item/SKU offer and the special handling format, the price specified for the offer is used. You can also enter a handling price here if you have the required authority. See the Enter or Override Personalization Charge (A40) and Enter or Override S/H Price (B12) secured features, or see Special Handling Overview for a general discussion.</p> <p>This charge is added to the <i>Handling</i> total on the order.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional or display-only.</i></p>
Future order	<p>Indicates whether the system will reserve inventory for this item, based on the arrival date entered for the item. No items are reserved for “future orders” until a later date.</p> <p>Valid values are:</p> <ul style="list-style-type: none">Selected = Item is a “future order” and inventory will not be reserved.Unselected = Item is a “current order” and inventory will be reserved. <p>Identifying Future Orders</p> <p>The system subtracts the Reservation Lead Days (B27) from the arrival date entered on the order or for an item. If this date is greater than today's date, the system will not reserve inventory for the order or item, because it is too soon.</p> <p>Reserving for Current Orders</p> <p>The Evaluate Future Orders program runs daily to determine whether future orders are eligible for reservation, based on the arrival date calculation. If so, the item detail line is identified as a “current order” and inventory will be reserved.</p> <p>See the Arrival date field for more information about how the arrival date controls reservation and creating pre-generated picks.</p> <p>The system updates the <i>Future order</i> field automatically.</p>

Field	Description
Warehouse	<p>The warehouse used to ship this item.</p> <p>The warehouse you enter in this field overrides:</p> <ul style="list-style-type: none"> the warehouse from the order header the warehouse from a warehouse list; see Working with Warehouse Lists (WWHL). the warehouse defined for the item in the Item table <p>If the Reserve from Non-Allocatable Warehouse (J25) system control value is blank, the warehouse you enter must be an allocatable warehouse (the <i>Allocatable flag</i> for the warehouse is selected).</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Updating the Warehouse for an Order Line</p> <p>If you update the warehouse defined for an order line, the system:</p> <ul style="list-style-type: none"> Removes any existing inventory reservations for the order line. Attempts to reserve the item on the order line in the new warehouse specified. If the item is not available in the warehouse specified, the system assigns this warehouse as the backorder warehouse for the unreserved quantity of the item on the order line. <p>Example: You add item A123 to an order for a quantity of 3 and it reserves against warehouse 1. You change the warehouse for the order line from warehouse 1 to warehouse 2. The system unreserves the quantity of 3 from warehouse 1 and reserves the quantity against warehouse 2. However, warehouse 2 can only reserve 2 units of the item; the remaining 1 unit is backordered against warehouse 2.</p> <p>Reserving Against a Non-Allocatable Warehouse</p> <p>If the Reserve from Non-Allocatable Warehouse (J25) system control value is selected, the system allows you to reserve inventory against a non-allocatable warehouse. You can define a non-allocatable warehouse in the <i>Retail warehouse</i> field for the order type; any orders entered for this order type will default the non-allocatable warehouse to the <i>Warehouse</i> field on the order/order line to reserve against the non-allocatable warehouse. If the item is not in stock, the system will backorder the item against the non-allocatable warehouse.</p>

 **Note:**

The *Reserve warehouse* defined for the shipping address on the order takes precedence over the non-allocatable warehouse defined for the order type on the order; see [Order Header Warehouse Default Hierarchy](#).

Soldout Processing for Non-Allocatable Warehouse

Field	Description
	<p>If the isregard Soldout Controls for Non-Allocatable Warehouses (J27) system control value is selected, the system evaluates the warehouse assigned to the order line, if any.</p> <ul style="list-style-type: none">• If the warehouse assigned to the order line is a non-allocatable warehouse, the system reserves the item against the non-allocatable warehouse, regardless of the soldout control code defined for the item. If the item cannot be reserved, the system backorders the item in the non-allocatable warehouse.• If the warehouse assigned to the order line is an allocatable warehouse, or the <i>Warehouse</i> field for the order line is blank, the system follows regular soldout control rules to determine whether to sell out the item. See Working with Soldout Controls (WSLD) for more information on how the system determines when to sell out an item. <p><i>Numeric, 3 positions; optional.</i></p>
Cancel date	<p>The date the customer wants to cancel this item if it has not been shipped.</p> <p>The system uses this calculation:</p> <p>Cancel date</p> <ul style="list-style-type: none">-Lead days (System Control table)-Transfer days (Warehouse/Drop Point table)-Lead days (SCF/Ship Via table) <p>Date to stop reserving stock</p> <p>Any items that have not shipped before this date are included on the Order Cancellation List along with the customer's name and telephone number. Customer Service uses this report to contact each customer to see if they still want the item; otherwise, the item should be canceled.</p> <p><i>Numeric, 6 positions (in user date format) optional.</i></p>

Field	Description
Affect inv (Affect inventory?)	<p data-bbox="699 275 1349 331">Indicates whether the quantity available to sell (on-hand quantity) of the item is reduced during order entry.</p> <p data-bbox="699 338 889 365">Valid values are:</p> <ul data-bbox="699 373 1455 638" style="list-style-type: none"><li data-bbox="699 373 1455 575">• Selected (default for a regular item) = Inventory levels are affected during order entry and when you ship the order. During order entry, reserved and open inventory increase and available inventory is decreased; when you ship the order, on-hand inventory, pickable inventory, open inventory, reserved inventory and total inventory across all warehouses decreases.<li data-bbox="699 581 1455 638">• Unselected (default for a Non/inv (Non inventory) item) = Inventory levels are not affected. <p data-bbox="699 644 1446 873">The system creates a pre-generated pick for the non-inventory item, even if all other items on the order are not eligible for pick slip preparation; however, the system will not create a pre-generated pick for a non-inventory item if all other items on the order are backordered; when one or more backordered items are available, the system creates a pre-generated pick for the non-inventory item as well as for the available item(s). See Selecting Order Lines for Pick Slip Preparation.</p> <p data-bbox="699 882 1419 972">You cannot change the <i>Affect inventory</i> flag to N for a drop ship item: Affect Inventory flag must be Y for Drop Ship Items.</p>

Field	Description
Drop ship	<p>Indicates whether this item is a drop ship item, which is an item that you do not sell from your own inventory. Instead, drop ship items are ordered from and shipped from a vendor.</p> <p>About drop ship items: Drop ship items are not usually available for reservation. Instead, you generate drop ship pick slips or purchase orders for these items, and the vendor ships the items to your customers. The drop ship items bill when you receive notification of shipment from the vendor.</p> <p>Even if an item is flagged as Drop ship, the system reserves it if it is available in the warehouse.</p> <p>Overriding the setting: The setting defaults from the Drop ship field in the Item table. Optionally, when you enter a new item, you can override a regular item to a drop ship item by selecting the Drop Ship setting, or you can override a drop ship item to a reserve or backorder from the warehouse by selecting the Override D/S setting. No other selections update the order line.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Drop Ship = The Drop ship is selected for the item, indicating that the vendor ships the item. Optionally, select this setting for a non-drop ship item to prevent it from being reserved, backordered, or submitted to the Order Orchestration as a brokered backorder. • Reg. Item = The Drop ship is not selected for the item, indicating that you ship the item from the warehouse. • Override D/S = Optionally, select this setting for a drop ship item to have the item backordered in the warehouse. This option is available only for items flagged as Drop ship.

 **Note:**

This field is enterable only if you advance to the Work with Order Line screen by selecting Add Line on the [Work with Order Lines Screen \(Adding Items to the Order\)](#). When you advance to this screen for an existing order line, this field is display-only.

Optional or display-only.

Priority	<p>Used by the Evaluate Backorders program to match items to backorders. A value defaults to this field if a priority was entered or defaulted into the Pty (Priority) on the order header; and this field, in turn, defaults from the B/O priority (Backorder priority) field for the source code.</p> <p>Immediate Reservation</p> <p>If you use Immediate Reservation, this value determines the sequence in which orders with backordered items receive inventory. The Evaluate Backorders program uses the priority to determine which backordered items receive stock first.</p> <p>See Reviewing Reservation Types.</p> <p><i>Numeric, 1 position; optional.</i></p>
-----------------	--

Field	Description
Bypass rsv (Bypass reservation)	<p>Indicates whether to reserve this item during Order Entry if inventory is available.</p> <ul style="list-style-type: none"> If the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system selects this flag for each order line sent to Order Orchestration for fulfillment assignment. See Brokered Backorders. If the Use OROB for Fulfillment Assignment (M31) Use OROB for Fulfillment Assignment (M31) Interactive Reservation. See Working with Interactive Reservation (MIRV). You can define an item to bypass reservation in the Item table. <p>Valid values are:</p> <ul style="list-style-type: none"> Unselected (default) = Do not bypass reservation. Selected = Bypass reservation. <p>This setting may default from the Item table if the item is set up to bypass reservation, because it is available in a limited quantity or it is a limited edition.</p>
Page/letter	<p>Indicates the page number and letter used to identify the item in the catalog, if using page/letter assignments in your catalogs instead of item numbers.</p> <p>Page/letter codes are defined for an item in the Item/Offer table. See Assigning Items/SKUs to Offers.</p> <p><i>Alphanumeric, 6 positions; display-only.</i></p>
Cost override	<p>An override to the base cost of the item, as defined in the SKU table. You can override the cost of an item when you place a special order from your vendor for the customer. The cost override ensures that your gross margin is accurate.</p> <p><i>Numeric, 13 positions with a 4-place decimal; optional.</i></p>
G/W \$ (Gift wrap charge)	<p>The cost to gift wrap the item, if any. May default from the G/W price (Gift wrap price) field in the Item/Offer table.</p> <p>A charge appears here only if the item is being gift wrapped (G/W = Selected).</p> <p>This is the per unit charge to gift wrap the item. This charge is multiplied by the quantity ordered. Added to the handling charge total on the order.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Add'l frt (Additional freight)	<p>The additional charge to ship this item, if one was defined for the shipper.</p> <p>If, in the Ship Via table, the shipper is set up to use additional charges only, the charge entered here will be used. Otherwise, the additional charges will be added to the regular shipping charges, up to the maximum charge from the <i>\$Limit</i> for the Ship Via.</p> <p>For example, you may be charged an additional amount for overnight or express shipping. See Working with Ship Via Codes (WVIA).</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>

Field	Description
Tax	<p>Sales tax charged for the item, as calculated by the system. This is the extended tax amount; that is, the total tax for the entire quantity.</p> <p>The total in the <i>Tax</i> bucket on the order may not equal the totals for each item if, for example the order is subject to tax on handling and/or freight, or due to rounding up or down to the nearest penny.</p> <p>On orders subject to VAT and tax-inclusive pricing, any tax appears in the <i>Hidden tax</i> field. This amount is not included in the <i>Tax</i> bucket on the order totals.</p> <p><i>Numeric, 13 positions with a 5-place decimal; display-only.</i></p>
Hidden tax	<p>The amount of any hidden tax attributed to the item. Displayed only if the Tax Included in Price (E70) system control value is selected, and a hidden tax amount appears only for orders and items subject to VAT and tax-inclusive pricing.</p> <p>On orders using tax-inclusive pricing, you charge a different, higher price for an item than an orders subject to conventional tax. Also, any tax amount is not calculated in the standard way and included in the <i>Tax</i> bucket on the order; instead, a hidden tax amount is calculated based on the information you have defined for the customer's country or the item itself, and this amount is "hidden" on the order detail line; this tax is not visible to the customer. Unlike the item tax indicated in the <i>Tax</i> field, the hidden tax is a unit amount, not an extended amount; you must multiply the hidden tax amount by the item quantity to arrive at the extended hidden tax amount for the order line.</p> <p>In tracking sales figures, such as in the Order Billing History table and on marketing reports, the system subtracts the hidden tax amount from the item price to determine sales dollars. For example, if the customer pays \$10.00 for an item, but the hidden tax amount is \$1.50, the system posts the sale as \$8.50.</p> <p>It is possible for the hidden tax for an item to exceed the price you charge the customer if you have defined hidden tax for the item as an amount rather than a percentage of the item price.</p> <p>An item may be exempt from tax, hidden tax, or both based on exemptions defined for the order, customer, state, or item. See Working with Customer Tax Status for more information on tax exemptions. See Setting Up the Country Table (WCTY) for more information on how the system determines how to apply tax or hidden tax to an order.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>
G/M (Gross profit margin)	<p>The amount of the item's price that exceeds the cost of the item. You can use gross margin to determine the profit of an item on an order based on the item's selling price, or to determine the profit of an entire order. See Determining Gross Profit for a discussion.</p> <p>The Display Gross Margin (A65) secured feature controls whether this field is indicated in order entry, maintenance, inquiry and item availability.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>

Field	Description
G/M% (Gross profit margin percentage)	<p>The percentage of the item's price that exceeds the cost of the item. You can use gross margin to determine the profit of an item on the order based on the item's selling price, or to determine the profit of an entire order. See Determining Gross Profit for a discussion.</p> <p>The Display Gross Margin (A65) secured feature controls whether this field is indicated in order entry, maintenance, inquiry and item availability.</p> <p><i>Numeric, 5 positions with a 2-place decimal; display-only.</i></p>

Field	Description
Quantity reserved	<p>The number of units of the item reserved.</p> <p>The system may reserve inventory from a single warehouse or over multiple warehouses, depending on whether a warehouse is defined for the order and the values in the Ship Complete from 1 Warehouse (B16) and Split Line Over Multi Whse (B19) system control values.</p> <p>Using Immediate Reservation</p> <p>If using Immediate Reservation (A64), inventory is reserved on a first-come, first-served basis (FIFO) in the specified warehouse (at the order detail line level, the order level, or from the warehouse list for the item) as you add the item to the order.</p> <p>Using Interactive Reservation</p> <p>If using Interactive Reservation, no inventory is reserved until you run the Interactive Reservation program to selectively reserve inventory; see Working with Interactive Reservation (MIRV).</p> <p>Influences on Reservation</p> <p>Reservation occurs only if:</p> <ul style="list-style-type: none"> • The Use OROB for Fulfillment Assignment (M31) system control value is unselected, or if selected, the item is not eligible for fulfillment assignment. See Brokered Backorders. • The order is not a future order – the system- calculated date is less than or equal to today's date (see the Arrival date field). • The Customer is not flagged to bypass reservation based on the <i>Bypass res</i> flag for the customer or the <i>Bypass reservation</i> flag for the customer class. • The quantity ordered of the item is not greater than or equal to the value in the Reserve qty (Reserve quantity limit) field for the item • The item is not frozen (Reservation freeze = Unselected in Item Warehouse table) • Reservations can be performed against the warehouse (Allocatable flag = Selected for the warehouse) <p>When the item is reserved...</p> <p>If the item is available in the specified quantity, the system reserves the inventory so that no other order can take it and increases the reserve quantity in the Item/Warehouse record in the designated warehouse.</p> <p>When the item cannot be reserved...</p> <p>If no quantity is available of the item, the screen does not initially display the <i>Rsv</i> field for the item. The quantity ordered is in the <i>Avl</i> field as a negative number. The system backorders the item and updates the detail line with a backorder reason of No allocate.</p> <p>When the item is partially reserved...</p> <p>If the entire quantity ordered is not available for the item, the quantity that is available is reserved (and indicated in the <i>Rsv</i> field) and the quantity unavailable is backordered (and is a negative number in the <i>Avl</i> field). The system updates the detail line with a backorder reason of Not enough avail in whse.</p> <p>The system updates the <i>B/O</i> field on the Select Item Relationships Window if there is not enough inventory available to reserve the</p>

Field	Description
	entire quantity ordered on the order detail line and the <i>Avl</i> value is negative. <i>Numeric, 5 positions; display-only, updated by the system.</i>
Quantity printed	The quantity of this item printed on pick slips. Blank during Order Entry, but updated after Pick Slip Generation. You can review the quantity printed through Order Maintenance or Order Inquiry. <i>Numeric, 5 positions; display-only, updated by the system.</i>
Quantity shipped	The number of units of this item that have been shipped. An item on an order is identified as “shipped” through the Confirmation program. Only items for which pick slips have been generated are eligible to be shipped. Blank during Order Entry. You can review the quantity shipped through Order Maintenance or Order Inquiry. <i>Numeric, 5 positions; display-only, updated by the system.</i>
Quantity returned	The number of units of this item on this order that have been returned. Only items that have been shipped can be returned. Blank during Order Entry. You can review the quantity returned through Order Maintenance or Order Inquiry. <i>Numeric, 5 positions; display-only, updated by the system.</i>
Quantity canceled	The number of units of this item that have been canceled from this order through Order Maintenance. Blank during Order Entry. You can review the quantity canceled through Order Maintenance or Order Inquiry. <i>Numeric, 5 positions; display-only, updated by the system.</i>

Field	Description
Quantity sold out	<p>The number of units of this item on this order that have been identified as sold out.</p> <p>Sell Out in Order Entry</p> <p>You can identify an item as sold out during Order Entry if the item is unavailable and the customer wants to cancel the item from the order. Instead of simply deleting the item from the order and losing true demand, select Sell Out for the item to have an accurate count of the number of orders for this item. Based on this figure, you might increase the quantity ordered from your vendor.</p> <p>You cannot sell out an item that has been reserved.</p> <p>Sell Out Item Automatically</p> <p>In the Item table, you can mark an item as a sold out item by entering a value in the <i>S/O control</i> field. Some items will sell out:</p> <ul style="list-style-type: none"> • Immediately • Immediately, when the item is no longer available in the warehouse (on-hand = 0) • Immediately, when the item is no longer available in the warehouse and you no longer have outstanding purchase orders for this item from your vendors (on-hand = 0 and on-order = 0). <p>You can specify the quantity of the item that you expect to receive in returns, and that you will use to fulfill backorders. The system checks the projected return field only if the item has a soldout control status of 2 (include on-order quantity on purchase orders); see Working with Soldout Controls (WSLD).</p> <p>Updated during Order Entry if the item is sold out immediately; otherwise, the system updates this field when you use Processing Auto Soldout Cancellations (MASO).</p> <p><i>Numeric, 5 positions; display-only, updated by the system.</i></p>
Reserved date	<p>The date when the system reserved the item on this order.</p> <p><i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i></p>
Printed date	<p>The date when the system printed pick slips for this item on this order.</p> <p>Blank during Order Entry and is updated after Pick Slip Generation.</p> <p>You can review this date through Order Maintenance or Order Inquiry.</p> <p><i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i></p>
Shipped date	<p>The date when the item was confirmed for shipment.</p> <p>Blank during Order Entry.</p> <p>You can review this date through Order Maintenance or Order Inquiry.</p> <p><i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i></p>

Field	Description
Returned date	The date when a return was entered for the item on this order. Blank during Order Entry. You can review this date through Order Maintenance or Order Inquiry. <i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i>
Canceled date	The date when a quantity ordered of this item was canceled through Order Maintenance. Blank during Order Entry. You can review this date through Order Maintenance or Order Inquiry. <i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i>
Sold out date	The date when the item was sold out on this order, either during Order Entry or automatically by the system. The date can reflect the item entry date (if the item was sold out immediately during Order Entry) or a later date (if the item was sold out through Processing Auto Soldout Cancellations (MASO)). <i>Numeric, 6 positions (in user date format); display-only, updated by the system.</i>

Screen Option	Procedure
Enter notes about how to perform extra work on the item, such as alterations, engraving, monogramming, etc.	Select Special Handling to advance to the Work with Special Handling Screen . This option is not available if the additional charge code used for the special handling format is suppressed; see v for a discussion.
Review the quantities available to sell of this item in all shippable warehouses	Select Availability to advance to the Item Availability Screen .
Review any special pricing promotions for the item in this offer	Select Pricing to display the Display Quantity Pricing Window .
Enter messages about this item	Select Messages to advance to the Work with Order Line Messages Screen .

Display Open Purchase Orders Screen

Purpose: Use this screen to review expected deliveries of this item from open purchase orders placed with your vendors.

This screen shows you the warehouse where the items will be stored and the quantity expected in each delivery.

This information can help you predict when you will receive this item if it is not currently available (on-hand) in your warehouses. Information is obtained from [Maintaining Purchase Orders \(MPOE\)](#) and [Purchase Order Receipts](#).

Held purchase orders are not listed on this screen.

How to display this screen: Select Open POs for the item at the [Work with Order Lines Screen \(Adding Items to the Order\)](#)

Field	Description
Item	The code for a unit of inventory that you sell. Item codes are defined in and validated against the Item table. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	The style associated with the item, such as its color or size. <i>Alphanumeric, three 4-position fields; display-only.</i>
Description (Unlabeled field to the right of the Item/SKU fields)	The description of the item. <i>Alphanumeric, 25 positions; display-only.</i>
Whs (Warehouse code)	The warehouse into which this item will be received. Warehouses are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS) . <i>Numeric, 3 positions; optional.</i>
PO #	The purchase order on which this item was ordered. Held purchase orders are not listed. <i>Numeric, 7 positions; display-only.</i>
Ln #	The line number on the purchase order on which this item was ordered. <i>Numeric, 3 positions; display-only.</i>
Vendor#	The code for the supplier from whom you purchase products or services. Vendors are defined in and validated against the Vendor table; see Working with Vendors (WVEN) . <i>Numeric, 7 positions; display-only.</i>
Name	The vendor's name. Blank if the Vendor Name Display (D41) field in the System Control table is unselected. <i>Alphanumeric, 30 positions; display-only.</i>
Qty due	The number of units of this item ordered that are not already used by backorders. Updated through the P.O. Layering program. See Purchase Order Layering and Backorder Notifications . <i>Numeric, 7 positions; display-only.</i>
Date (Expected delivery date)	The date on which the item is due to be received from the vendor. The expected delivery date is cleared once you receive the purchase order in Purchase Order Receiving. No date is indicated here if the item has been reserved or if there are no outstanding purchase orders for this item. <i>Numeric, 6 positions (in user date format); display-only.</i>

Item Availability Screen

Purpose: Use this screen to determine how many units of this item you have available to sell in your shippable warehouses only. These numbers do not include quantities in warehouses where you store defective items, items being returned to the vendor, purchase orders that were docked but not yet received, or items in any warehouse set up to be non-viewable in Order Entry.

 **Note:**

This screen displays items in warehouses set up to be Viewable in O/E (Viewable in Order Entry). The Display Item Availability Screen displays items in warehouses for which the Allocatable flag is selected.

This information is useful because you can determine quickly where the item is available in the desired order quantity. The available quantity is the quantity of this item that is not reserved on other orders or backorders.

Each time an item is reserved, the system reduces the quantity available and updates the quantity open by the quantity ordered.

 **Note:**

See [Merchandise Locator Process Overview](#) for information on searching for an item's availability across warehouses and stores through integration with Order Orchestration.

How to display this screen: Select Availability for the item at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Field	Description
Item	The code for a unit of inventory that you sell. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	The style of the item, such as its color or size. <i>Alphanumeric, three 4-position fields; display-only.</i>
Total avail	The quantity of this item that is available to sell in your shippable warehouses. <i>Numeric, 7 positions; display-only, updated by the system.</i>
Whs	The warehouse in which the item is currently available to be sold. Warehouse codes are defined in and validated against the Warehouse table. <i>Numeric, 3 positions; display-only.</i>
Description	The description of the warehouse. <i>Alphanumeric, 30 positions; display-only.</i>
Avail (Available)	The quantity of this item currently available to be sold in the warehouse. <i>Numeric, 7 positions; display-only, updated by the system.</i>
B/O (Backorder quantity)	The quantity of this item currently backordered in the warehouse. This means that the item was ordered on previous orders, but was not available for sale. Usually purchase orders are placed with your vendors for these backordered items. A negative sign indicates that the item is backordered. <i>Numeric, 7 positions; display-only, updated by the system.</i>

Field	Description
Open PO	The total quantity of this item in this particular warehouse that is due to be received on unreceived or partially received purchase orders. Enables you to estimate when the item will be received. <i>Numeric, 7 positions; display-only, updated by the system.</i>

Display Quantity Pricing Window

Purpose: Use this window to review any special pricing promotions for the item/offer.

Definition: You can establish quantity price breaks for the item, so that the customer can purchase the item for a lower price if ordering a sufficient quantity. Additionally, you can define a pricing column for a price break. Customers with this pricing column receive the special price automatically.

Setup: Quantity pricing specials are defined through Item/Offer; see [Assigning Items/SKUs to Offers](#). When you use this option, the system checks for a quantity pricing record in the table for the current offer. A message indicates if there is no quantity price break defined for the item in this offer:

Item Offer not found.

In response, you can change the offer code for the item to one that is running a quantity price break special. Select Change for the item to display the Quantity Pricing window.

You can assign a customer to a pricing column by entering a number in the [Price column](#) field in the Customer table. The customer automatically receives the price break for an item and pricing column, regardless of the quantity ordered.

For example, if the customer belongs to pricing column 02 and the price break record requires the customer to order a quantity of 10, the customer receives the discounted price *when ordering any quantity of the item*.

Receiving a quantity price break: This window lists each price break for an item. If the customer wants to increase the quantity ordered to receive the price break, select OK the item, select OK, then change the number in the Qty field. The system automatically reprices the item to reflect the quantity break price.

How to display this screen: Select Pricing for an item at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Field	Description
Item	The code for a unit of inventory. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	The style of the item, such as its color or size. <i>Alphanumeric, three 4-position fields.</i>
Description (Unlabeled field below the Item/SKU fields)	The description of the item. <i>Alphanumeric, 25 positions; display-only.</i>

Field	Description
Offer	<p>The code for the catalog, newspaper, or space advertisement from which you accept orders.</p> <p>Offers are defined in and validated against the Offer table. Use the Item/Offer table to identify which items are carried in the offer. Also, use the Item Prices table to define price breaks for the item in the offer.</p> <p><i>Alphanumeric, 3 positions; display-only.</i></p>
Description	<p>The description of the offer.</p> <p><i>Alphanumeric, 30 positions; display-only.</i></p>
Effective (Effective date)	<p>The starting date for the item price break in this offer.</p> <p>This item quantity discount is available until the next effective date, if any.</p> <p>From the Effective date in the Item Prices table.</p> <p><i>Numeric, 6 positions (in user date format); display-only.</i></p>
Qty (Quantity)	<p>The quantity of the item that must be purchased to receive the price break. Any SKU ordered for this item is counted towards this quantity.</p> <p>This number is from the Quantity in the Item Prices table.</p> <p>If the quantity is 1, you are offering your customers an automatic discount if they purchase this item. If the quantity is greater than 1, your customers must purchase several units of the item (such as in different colors) to receive the price break.</p> <p>Customers assigned to the pricing column defined here receive the quantity break price automatically regardless of the quantity ordered.</p> <p><i>Numeric, 7 positions; display-only.</i></p>
Price	<p>The selling price of the item for your regular customers who order the required quantity of the item or who belong to the appropriate pricing column.</p> <p>Items eligible for the price break are repriced automatically and the system updates the pricing method field with *Quantity Break Price.</p> <p><i>Numeric, 13 positions with a 2-place decimal; required, calculated by the system.</i></p>
Assoc	<p>The selling price of the item for your associate customers (Associate = Selected in the Customer table) who order the required quantity of the item or who belong to the appropriate pricing column.</p> <p>Items eligible for the price break are repriced automatically and the system updates the pricing method field with *Quantity Break Price.</p> <p><i>Numeric, 13 positions with a 2-place decimal; required, calculated by the system.</i></p>
Col (Column number)	<p>The pricing column eligible for this price break.</p> <p>Customers belonging to this pricing column receive the quantity price break automatically, regardless of the quantity ordered.</p> <p><i>Numeric, 2 positions; display-only.</i></p>

Work with Special Handling Screen

Purpose: Use this screen to define how to perform some type of extra work on an item by engraving, monogramming, altering it, etc. The item must be eligible for special handling ([Special handling](#) = Selected for the item offer or SKU offer).

The special handling instructions and the charge for this work print on the pick slip if your pick slip printing program supports it.

How to display this screen: See [Bypassing or Suppressing the Special Handling Screens](#) for a discussion of when you advance to this screen automatically, and when you can display it on demand.

Standard or custom screen? There are two different screens available where you can enter special handling information.

Standard special handling is a set of free-form instructions or notes about how to work on an item, including the charge for the special handling work. Standard special handling is entered on a free-format screen where you can enter any information necessary to explain what needs to be done to the item.

 **Note:**

Drop ship orders display standard special handling instructions only if you process the orders using drop ship pick slips; drop ship purchase orders, including drop ship purchase orders created through the Order Orchestration Drop Ship interface, display only custom special handling instructions, not standard special handling instructions.

Custom special handling is a set of pre-formatted notes about how to work on an item, including charges for the custom special handling work. Custom special handling is entered on a screen which includes various fields that you need to complete to explain how to work on the item. Each activity is listed along with the valid responses.

You can work with the customer to define exactly what needs to be done to the item, using this screen as a guide to obtain complete and accurate information.

Special handling codes and formats: Special handling codes are defined in and validated against the Additional Charges table. In this table, you identify a code as a special handling code by entering S (standard format) or C (custom format) in the [S/H type \(Special handling type\)](#) field. If the code calls for a custom format, you must enter a custom format code in the S/H format (Special handling format) field. Custom special handling formats are defined in and validated against the Special Handling Format table; see [Establishing Custom Special Handling Formats \(WSHF\)](#).

When you set up a special handling code in the Additional Charges table, you also specify whether to advance to a special handling screen automatically, on-demand, or not at all in order entry when entering an item flagged for special handling in the item offer or SKU offer.

Special handling restrictions: You can restrict the type of special handling an item can receive based on item class. For example, you might want to restrict personalizing a t-shirt with an emblem if the process used to attach the emblem damages the t-shirt. A message indicates when you enter an additional charge code assigned to a restricted item class:

```
Additional charge code (EM) cannot be used with this item class (RST).
```

See [Working with Item Classes \(WICL\)](#) for more information on how to restrict special handling by item class.

For more information: See Special Handling Overview for information on how the system applies special handling charges based on your setup.

Field	Description
Available qty	<p>The quantity of the item currently available to sell after accounting for the current order line. Item availability is calculated as follows:</p> <p>On hand - Protected - Reserved - Reserve Transfer - Backordered = Available quantity</p> <p>This field is included only if the Hide Item Availability in Order Entry (J66) system control value is unselected.</p> <div data-bbox="878 604 1378 947" style="border: 1px solid #0070c0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>If the <i>Available Qty</i> shown is 0 or more, the system has already reserved the quantity on the current order. If the <i>Available Qty</i> shown is a negative amount, there is not enough inventory and the customer should be informed.</p> </div> <p>See Display Inventory Warehouses Screen for more information.</p> <p><i>Numeric, 7 positions; display-only.</i></p>
Order #	<p>A number to identify an order.</p> <p><i>Numeric, 8 positions; display-only, assigned by the system.</i></p>
Ship-to # (unlabeled field to the right of the order number)	<p>A number to identify the shipping address on this order. The system assigns a sequential ship-to number to every order, even if the shipping address and the sold-to address are the same. The first ship-to address is assigned the number 1.</p> <p><i>Numeric, 3 positions; display-only, assigned by the system.</i></p>
Line #	<p>The line number of the item on the order.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Sold To (Sold-to customer name)	<p>The customer's last name, first name and initial, or the name of the company placing the order.</p> <p><i>Alphanumeric, 41 positions; display-only.</i></p>
Ship To (Ship-to customer name)	<p>The last name, first name and initial of the customer you are shipping the order to.</p> <p><i>Alphanumeric, 41 positions; display-only.</i></p>
Item	<p>The code for the item.</p> <p><i>Alphanumeric, 12 positions; display-only.</i></p>
SKU (Unlabeled field to the right of the item number)	<p>The style of the item, such as its color or size.</p> <p><i>Alphanumeric, three 4-position fields; display-only.</i></p>

Field	Description
Special handling	The special handling code that identifies the type of work to be performed on the item. Special handling codes are defined in and validated against the Additional Charges table. See Special Handling Overview for more information. <i>Alphanumeric, 2 positions; display-only.</i>
Description (Unlabeled field to the right of the special handling code)	The description of the special handling code. <i>Alphanumeric, 30 positions; display-only.</i>
Item description (unlabeled field below Special handling field)	The description of the item. <i>Alphanumeric, 120 positions; display-only.</i>
Charge	The charge for performing the extra work on the item. This charge is added to the <i>Hnd</i> (Handling) totals on the order. Your entry here overrides the <i>S/H charge</i> defined for the item/SKU offer, if any. Leave this field blank if you are not charging the customer for this work.

 **Note:**

If the [Evaluate Special Handling Charges by Order Line \(D67\)](#) system control value is selected, the special handling charge will be added to the order once per line no matter what the unit quantity. If this system control value is unselected, the charge will be multiplied by the unit quantity.

Handling information	<i>Numeric, 13 positions with a 2-place decimal; optional.</i> Use this area of the screen to enter notes about how to work on the item. This information prints on the pick slip. You can use as much room as necessary to enter special handling instructions, but remember that this information prints on the pick slip so space is limited there. If you click OK at this screen without entering any information, the system still applies the special handling charge to the order. <i>Alphanumeric, 30 positions each line; optional.</i>
-----------------------------	---

Screen Option	Procedure
Update the special handling instructions	Select Add/Change.
Remove the special handling from the item	Select Delete S/H then select OK at the delete-confirmation prompt.

Screen Option	Procedure
Accept your entries, and add/retain the special handling charge	Click OK.

Work with Custom Special Handling Screen

How to display this screen: See Bypassing or Suppressing the Special Handling Screens for a discussion of when you advance to this screen automatically, and when you can display it on demand.

Example:

The customer is ordering a company emblem to be placed on a jacket.

During Order Entry, the custom special handling format screen opens:

- automatically if the item is set up with a custom special handling code (in the SKU/Offer or Item/Offer table), or
- if you enter a custom special handling code for the item during Order Entry.

You can use the custom special handling screen to help the customer define exactly how the item will be handled. The screen presents you with the options that can be performed on the item; in this case, emblem personalization. Each option is labeled and provides an input field where you enter the details the customer requests. Details for an input field can be defined as:

- a list of valid responses
- default text
- free-form style

You can use all three forms for a single item.

Valid responses: Valid responses are used when you want to limit the choices a customer can make on an item. You can display a list of the valid responses for an input field by clicking on the arrow. The Select Special Format Response screen opens. This screen lists each valid response along with the response description. Response descriptions display only if the [Display Special Format Response Descriptions in Order Entry \(E90\)](#) system control value is selected. Response descriptions are helpful if you use codes to identify each valid response. However, if you do not select a value at the Select Special Format Response screen, the system clears the previous entry in the *Input* field.

For example, the valid responses and response descriptions for the label *Size* are:

- 4786 (small)
- 4981 (medium)
- 5012 (large)

The customer must choose from this list; an invalid response produces the error:

Value entered is not a valid response.

Not all valid response fields have a default; default responses are used when one response is especially popular. To override the size, enter the valid size the customer requests.

Default text: Default text is text selected from the Customer Sold To table that defaults onto an input field when you enter the [Work with Custom Special Handling Screen](#). On the custom screen the default text *Company* was used.

You can confirm the default text with the customer and override it if necessary. For example, the default text for the customer's name is the first name, middle initial and last name. If the customer requests you use his or her full middle name, you can override the middle initial and enter the full name.

Free-form: You use the free-form style when no valid responses or default text have been defined for the input field. The free-form style is often used for more creative detail.

Maximum characters: In some instances, an input field has been defined with a maximum amount of characters that can be used. For example, on the custom screen, the label *Text* displays the number 10. This stands for the maximum number of characters that can be used for any other information you wish to print on the emblem, for example, first name.

The [Include Spaces in Special Handling Edit for Maximum Characters \(F80\)](#) system control value controls whether the system includes spaces in the number of characters of text used. For example, if this system control value is selected, and the operator enters *Julie Marie* in the *Text* field, the system considers this name to be 11 characters. If this system control value is unselected, the system considers the name *Julie Marie* to be 10 characters.

If more characters are entered than are allowed, a message indicates:

```
Exceeds Maximum Characters Allowed.
```

A ruler above the input fields helps you count the number of spaces used in an input field when there are length restrictions.

Special handling rules: Optionally, you can define rules for a complex special handling format to help prevent the entry of special handling instructions that are inconsistent or that cannot be completed. If the special handling instructions entered at this screen violate a rule, the screen displays an error, such as: `MGM LOCATION - center pocket response is not valid for POCKET - no pocket`. You need to fix the error before accepting the special handling for the item. If there are multiple errors, the screen displays each error individually, and you need to fix each error before accepting.

See the [Work with Special Format Rules Screen](#) for more information on special handling rules.

Optional charges: In some instances, a charge is associated with an option. For example, on the custom screen, the option *Text* has a charge of \$2.00. If the customer requests additional text to print on the emblem, he or she will be charged \$2.00 in addition to the regular cost of the special handling. The system charges the customer for any feature options in which you have entered a valid value. Leave a feature option field blank to avoid adding the optional charge to the order.

Holding an order line based on special handling format: You can flag a special handling format to automatically put an order line on hold when it uses that format. See [Putting a Line on Hold through a Special Handling Format](#) for a discussion.

Completing the screen: To complete this screen, ask the customer what he or she would like for each detail line. If valid responses have been defined for an input field, list the options the customer can choose from. Confirm with the customer any text that defaults automatically in an input field and change it if necessary. Make sure the customer is aware of any optional charges that are associated with an option he or she requests.

Field	Description
Available qty	<p>The quantity of the item currently available to sell after accounting for the current order line. Item availability is calculated as follows:</p> <p>On hand - Protected - Reserved - Reserve Transfer - Backordered = Available quantity</p> <p>This field is included only if the Hide Item Availability in Order Entry (J66) system control value is unselected.</p> <div data-bbox="883 535 1377 850" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>If the <i>Available Qty</i> shown is 0 or more, the system has already reserved the quantity of the current order. If the <i>Available Qty</i> shown is a negative amount, there is not enough inventory for the order.</p> </div>
Order #	<p>See Display Inventory Warehouses Screen for more information.</p> <p><i>Numeric, 7 positions; display-only.</i></p> <p>The number used to identify an order.</p> <p><i>Numeric, 8 positions; display-only.</i></p>
Ship to # (Unlabeled field to the right of the order number)	<p>The number used to identify the shipping address on the order.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Line #	<p>The line number of the item on the order.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Item	<p>The code to identify a unit of inventory that you sell.</p> <p><i>Alphanumeric, 12 positions; display-only.</i></p>
Description (Unlabeled field below Item code)	<p>The item description.</p> <p><i>Alphanumeric, 120 positions; display-only.</i></p>
SKU	<p>A code to identify the style of the item, such as its color or size.</p> <p><i>Alphanumeric, three 4-position fields; display-only.</i></p>
Special handling	<p>The special handling code. See Special Handling Overview for more information.</p> <p><i>Alphanumeric, 2 positions; display-only.</i></p>
Description	<p>The description of the special handling code.</p> <p><i>Alphanumeric, 25 positions; display-only.</i></p>

Field	Description
S/H price	<p>The price you are charging the customer for the special handling. Included only if you have specified a S/H price (Special handling price) for the item/SKU offer; otherwise, the Charge, which defaults from the special handling format, is indicated instead.</p> <p>The default price specified for the item/SKU offer defaults, but you can override it if you have authority based on the Enter or Override S/H Price (B12) secured feature; otherwise, it is display-only.</p> <p>If the Evaluate Special Handling Charges by Order Line (D67) field in the System Control table is unselected, the charge for the special handling will be multiplied by the number of units ordered; otherwise, it will be added just once for each order line associated with custom special handling.</p> <p>The charge is added to the <i>Hnd</i> (Handling) bucket of the order totals.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional or display-only.</i></p>
Space guide	<p>A ruler displayed to assist operators in counting the number of spaces used on a detail line when there are line length restrictions. For example, you might limit engraving initials to three characters. The maximum number of characters you can allow on a detail line is 45.</p> <p><i>Numeric, 45 positions; display-only.</i></p>
Label	<p>The description of a special handling option defined for this custom special handling format.</p> <p><i>Alphanumeric, 15 positions; display-only.</i></p>

Field	Description
Input	<p>An entry field for you to enter the response to each special handling option available in the custom special handling format.</p> <p>You can click on the arrow at the <i>Input</i> field to display a list of valid responses and response descriptions; however, if you do not select a response from the subsequent screen, it clears the previous entry from the <i>Input</i> field and you will need to re-enter it. When you are using default text, the text defaults automatically from the customer sold-to table, allowing you to skip over those detail lines. If you need to, you can change the information displayed in the default text detail lines.</p> <p>A message indicates if you do not enter a value in a required field: Required field - a valid value must be entered.</p> <p>A message indicates if you have defined valid values for a field in the Special Handling Format table and you enter an invalid response: Value entered is not a valid response.</p>
Charge	<p><i>Alphanumeric, 45 positions; may be required.</i></p> <p>The charge associated with an option in the custom special handling format. Only fields defined as feature options can carry a separate charge. Included only if you have not specified a S/H price (Special handling price) for the item/SKU offer; otherwise, the special handling price for the offer is in the S/H price field instead.</p> <p>The charge defaults from the custom special handling format; however, you can add or remove a charge only if you have authority based on the Enter or Override Personalization Charge (A40) secured feature.</p> <p>If the Evaluate Special Handling Charges by Order Line (D67) field in the System Control table is unselected, the charge for the special handling will be multiplied by the number of units ordered; otherwise, it will be added just once for each order line associated with custom special handling.</p> <p>The charge is added to the <i>Hnd</i> (Handling) bucket of the order totals.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>

 **Note:**

You can enter upper and lower case text in an input field if the Enter Custom Special Handling in Upper and Lower Case (D65) field in the System Control table is selected.

Screen Option	Procedure
Accept the special handling information for the item being ordered	Select Accept.
Remove the special handling information associated with the item being ordered	Select Reject.

Display Coordinate Items Window

Purpose: Use this window to review the coordinate items associated with a primary item on the order for cross-selling purposes.

- [Display Sequence](#)
- [Assigning Coordinates to an Item](#)
- [To Cross-Sell Coordinates](#)
- [When There are No Coordinates in the Display Coordinate Items Window](#)
- [To Add Coordinates to the Order](#)
- [Display Coordinate Items Window](#)
- [Select Coordinate Items Window](#)

Display Sequence

This window displays item coordinates in coordinate sequence number order (lowest to highest).

- Coordinate items that are not assigned a sequence number are first.
- If more than one coordinate type has the same sequence number, item coordinates are listed alphanumerically by coordinate type.
- If more than one item coordinate is assigned to a coordinate type, item coordinates are listed alphanumerically by item number.

Assigning Coordinates to an Item

You can assign coordinate items to an item:

- at the [Work with Item Coordinates Screen](#) in the Work with Item/SKUs (MITM) menu option.
- at the Work with Item Coordinates Screen in the Work with Coordinates by Offer (WCIO) menu option.

See [Working with Item Coordinates \(WCIO\)](#) for an overview and additional setup.

To Cross-Sell Coordinates

When you enter an order for an item that is associated with any item coordinates:

- If the [Automatically Display Coordinate Items in Order Entry \(I53\)](#) system control value is selected and the Promo flag for the order type is set to Promo Price, the [Display Coordinate Items Window](#) opens automatically advance to the Display Coordinate Items window when you add an item associated with coordinate items to an order.

- Otherwise, the screen displays a message `Coordinate items exist for base item entered`. You must Select Coordinates for the item to advance to the [Display Coordinate Items Window](#) if this system control value is not selected and/or the *Promo* flag is set to None.

The system will cross-sell coordinates even if the primary item is soldout, on backorder, is a drop ship item, non-inventory item, or main set item. Additionally, the system will cross-sell coordinates that are a drop ship item, non-inventory item, or main set item.

When the system does not cross-sell coordinates: See the Automatically Display Coordinate Items in Order Entry (I53) system control value for a discussion of when the system prompts you to select coordinates for an item.

You can still select Coordinates for the primary item to advance to the [Display Coordinate Items Window](#); however, if all of the coordinates are on backorder or soldout or are not included in the same offer as the primary item, there are no coordinates available to select.

When There are No Coordinates in the Display Coordinate Items Window

You can still advance to the Display Coordinate Items window, but there will not be any coordinates if:

- they are all currently backordered, and the Display Backordered Coordinate Sale Items (F41) system control value is unselected, or
- none of the coordinates are in the same offer as the primary item (that is, the offer indicated on the order detail line for the item).

To Add Coordinates to the Order

To add a SKUed coordinate:

- At the [Display Coordinate Items Window](#), select a SKUed coordinate and select Display SKUs to advance to the [Select Coordinate Items Window](#).
- At the Select Coordinate Items window, enter the quantity of the SKUed coordinate that you wish to add to the order in the *Quantity* field. If you wish to add more than one coordinate to the order, enter a quantity for each coordinate, using the Next and Prev options to position to the coordinates that you wish to add.
- Once you have entered a quantity for each SKUed coordinate that you wish to add to the order, select OK. You return to the Display Coordinate Items window and a message indicates the coordinates have been added to the order: `Item has been added to current recipient`.

At this point you can:

- also add a non-SKUed coordinate to the order; see below.
- select OK or Exit to return to the Work with Order Lines screen.

To add a non-SKUed coordinate: At the [Display Coordinate Items Window](#):

- Enter the quantity of the non-SKUed coordinate that you wish to add to the order in the *Qty (Quantity)* field. If you wish to add more than one non-SKUed coordinate to the order, enter a quantity for each coordinate, using the Next and Prev options to position to the coordinates that you wish to add.
- Once you have entered a quantity for each non-SKUed coordinate that you wish to add to the order:

- select OK. You return to the Work with Order Lines screen and a message indicates the coordinate has been added to the order: `Item has been added to current recipient.`
- select Display SKUs to also add SKUed coordinates to the order. You advance to the [Select Coordinate Items Window](#) and a message indicates the non-SKUed coordinate has been added to the order: `Item has been added to current recipient.`

Note:

- If you enter a quantity for a coordinate, and then select another option, such as Information, for another coordinate, the system immediately adds the coordinate to the order as soon as you advance to the other screen. To verify that the coordinate has been added to the order, look for the message indicating that a coordinate is added to the order: `Item has been added to current recipient.`
- If you enter a quantity for a coordinate, and then select another option, such as Information, for that same coordinate, the system advances you to the other screen, but does not add the coordinate to the order. You will need to reenter the quantity for the coordinate and select OK to add the coordinate to the order.
- When you select OK at the [Display Coordinate Items Window](#) to add a coordinate to the order, the system returns you to the Work with Order Lines screen. If you want to add additional coordinates to the order, you will need to select Coordinates for the primary item to return to the Display Coordinate Items window.
- If you select Exit at the [Display Coordinate Items Window](#) and you have defined a quantity for a coordinate, the system returns you to the Work with Order Lines screen, but does not add the coordinate to the order.
- If you use the *Coordinate* scan field to position to a specific coordinate:
 - the system removes the Next and Prev options from the window. You will need to use the scan field again to position to another coordinate.
 - you will not be able to add multiple coordinates to the order using the scan field. If you enter a quantity for a coordinate, and then use the scan field to position to a coordinate, the system clears the quantity you have defined.

Display Coordinate Items Window

Use this window to review the coordinate items associated with a primary item on the order for cross-selling purposes.

How to display this screen:

- Select Coordinates for the primary item at the [Work with Order Lines Screen \(Adding Items to the Order\)](#). If the item you select is not linked to any coordinate items, a message indicates: `Coordinate items do not exist for base item.`
- Select the Automatically Display Coordinate Items in Order Entry (I53) system control value and add an item associated with coordinate items to the order, provided the Promo flag for the order type is set to Promo Price; the system automatically opens this window.

Field	Description
Primary item	<p>The primary item to which the coordinate items are linked. If the Display Item Alias (D56) system control value is selected, the alias is indicated here instead of the actual item code.</p> <p>Item codes are defined in and validated against the Item table.</p> <p>The description of the item is to the right.</p> <p><i>Item code: alphanumeric, 12 positions; display-only.</i></p> <p><i>Description: alphanumeric, 120 positions; display-only.</i></p>
Offer	<p>The offer associated with the primary item. Only coordinate items that are included in this offer display.</p> <p>Offer codes are defined in and validated against the Offer table.</p> <p><i>Alphanumeric, 3 positions; display-only.</i></p>
Qty (Quantity)	<p>Enter the quantity of the coordinate item to add to the order. When you select OK, the system returns you to the Work with Order Lines screen, adding the selected coordinate item to the order.</p> <p>Enterable only if the item does not have SKUs. To add a SKUED coordinate to the order, select Display SKUs for the item to advance to the Select Coordinate Items Window.</p> <p>See To Add Coordinates to the Order for instructions on adding a coordinate to the order.</p> <p><i>Numeric, 5 positions; optional (non-SKUED items only).</i></p>
Coordinate	<p>The item that is linked to the primary item for cross-selling purposes.</p> <p>To scan, enter a full or partial item code to display coordinates in alphanumeric order beginning with your entry.</p> <p>Which coordinates display?</p> <ul style="list-style-type: none"> • Base items only: This window displays only non-SKUED items and base items of SKUED items. To review SKUs, select the base item and select Display SKUs; you advance to the Select Coordinate Items Window. • Backordered items: The window displays backordered items only if the Display Backordered Coordinate Sale Items (F41) system control value is selected; also, it always displays soldout items if there is stock on-hand but they were sold out with a soldout control value of <i>Sellout immediately</i>. • Same offer: Only coordinate items that are in the same offer as the primary item display. • Non-inventory: Non-inventory items always display. <p>Alias</p> <p>The alias is indicated if the Display Item Alias (D56) system control value is selected; however, scanning is by actual item code only.</p> <p><i>Alphanumeric, 12 positions; optional.</i></p>
Description	<p>The first 25 positions of the description of the coordinate item.</p> <p><i>Alphanumeric, 25 positions; display-only.</i></p>

Field	Description
Price	The unit price of the coordinate item. The system determines pricing for the coordinate item in the same way as other items. <i>Numeric, 13 positions with a 2-place decimal; display-only.</i>
Avail (Available)	The quantity of the coordinate item available for sale. A negative number indicates that the item is backordered. Blank for SKUed items. <i>Numeric, 7 positions; display-only.</i>
Page#	The page number of the offer where the coordinate item appears; from the Item Offer record. <i>Numeric, 5 positions; display-only.</i>
Ty (type)	A code representing a type of item coordinate, such as mandatory or optional. The type also controls the sequence in which to display coordinate items in this window. For example, coordinate items assigned to type S (strongly recommended) are before coordinate items assigned to type O (optional accessory). Coordinate type codes are defined in and validated against the Item Coordinate Type table; see Working with Item Coordinate Types (WICT) . <i>Alphanumeric, 2 positions; optional.</i>
Message (Unlabeled field below the coordinate)	A persuasive or descriptive message about the item coordinate. <i>Alphanumeric, 70 positions; display-only.</i>

Screen Option	Procedure
Add a coordinate to the order	Enter the desired quantity in the <i>Quantity</i> field next to the coordinate and select OK. The system returns you to the Work with Order Lines screen. A message indicates that the coordinate has been added to the order. See To Add Coordinates to the Order for step-by-step instructions.
Exit the window without adding any coordinates to the order	Select Exit. The system returns you to the Work with Order Lines screen and does not add any coordinates to the order, even if you have defined a quantity for a coordinate.
Display or select SKUs for a SKUed item	Select Display SKUs for the coordinate to advance to the Select Coordinate Items Window . If you entered a quantity for a non-SKUed coordinate, the system adds the coordinate to the order at this time.
Review item availability information	Select Availability for a non-SKUed coordinate to advance to the Item Availability Screen . You can review item availability for a SKUed coordinate from the Select Coordinate Items Window .
Review pricing information	Select Pricing for a coordinate to advance to the Display Quantity Pricing Window . You can also review pricing for a SKUed coordinate from the Select Coordinate Items Window .

Screen Option	Procedure
Review pending purchase orders	Select POs for a non-SKUed item to advance to the Display Open Purchase Orders Screen . You can review pending purchase orders for a SKUed coordinate from the Select Coordinate Items Window .

Select Coordinate Items Window

Purpose: Use this window to review information on the SKUs of a coordinate item, or to add one or more SKUs to the current order.

See [To Add Coordinates to the Order](#) for step-by-step instructions on how to add a coordinate to the order.

About SKU filtering: The [SKU Element for Order Entry Filtering \(F40\)](#) system control value controls which SKUs display initially at this pop-up window.

Normally, you would set this system control value to restrict the SKUs displayed when you initially advance to this window to the ones you think the customer will be most interested in purchasing. For example, if the customer orders a blazer in size 10, you might wish to filter the display to size 10 SKUs of the pants and skirt only. If you use SKU element 2 for size, you would then set the system control value to 2.

You can toggle back and forth between filtering SKUs and displaying all SKUs by selecting [Toggle All SKUs/Order Line Match Only](#). On the right of the screen next to the options, a message indicates whether SKU filtering is currently on or off.

How to display this screen: Select [Display SKUs for a SKUed coordinate at the Display Coordinate Items Window](#).

Field	Description
SKU	The item's unique characteristics, such as its color and size. If the Display SKU Description in place of SKU Element (F25) system control value is selected, the SKU description is displayed here instead. Scanning on the SKU is not currently implemented. <i>Alphanumeric, three 4-position fields; optional.</i>
Exp dt (Expected delivery date)	The date when the SKU is due to be received from the vendor. No date is included here if there are no outstanding purchase orders for this SKU. This date is included for drop ship items only if the Assign Drop Ship Expected Ship Date (I59) system control value is selected. See that system control value for more information. <i>Numeric, 6 positions (in user date format); display-only.</i>
Exp qty (Next expected qty)	The quantity of this SKU expected on the next purchase order that can fulfill the current order, taking into account SKUs already promised to backorders on earlier purchase orders. <i>Numeric, 7 positions; display-only.</i>

Screen Option	Procedure
Add a coordinate SKU to the order	Enter the desired quantity in the <i>Quantity</i> field next to the coordinate SKU and select OK. You return to the Display Coordinate Items Window , where a message indicates that the coordinate has been added to the order. See To Add Coordinates to the Order for step-by-step instructions on how to add a coordinate to the order.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>There is only one message, regardless of how many coordinate items you add to the order.</p> </div>
Review item availability information	Select Avail for the SKU to advance to the Item Availability Screen .
Review pricing information	Select Pricing for the SKU to advance to the Display Quantity Pricing Window .
Review pending purchase orders	Select POs for the SKU to advance to the Display Open Purchase Orders Screen .
Switch between SKU filtering or displaying all SKUs	Select Toggle All SKUs/Order Line Match Only.

Work with Order Line Messages Screen

Purpose: Use this screen to enter a note about the item. This message may be informational only, or you can print it on the pick slip and/or invoice if your print program supports it.

Things to note:

- The messages you enter on this screen are for the current item only. See the [Work with Order Messages Screen](#) for messages you enter at the order level.
- There are an unlimited amount of fields for you to enter messages about the item on the order, but remember that space is limited if you are printing these messages on the pick slip or invoice.
- Each message line provides an option to print the message. Select Nowhere for the *Print* field if the message is informational only.
- In addition to entering messages in order entry, you can also receive them through the order API as part of a new order.
- The [Modify Existing Messages \(A30\)](#) secured feature controls the ability to change or delete an existing order line message.

Default messages: Default messages are standard order or gift messages that you enter on orders on a regular basis. Instead of requiring users to retype a standard message on each eligible order, you can have the user select the message from a list of standard messages to default to the order, allowing you to avoid typographical errors that can occur when the message is manually added to the order. When a user selects a default message to add to an order, the message text defined for the default message defaults to the *Message* field and the print code defined for the default message defaults to the *Print* field; however, the user can still override the default message text and the print code or add to the default message text.

For example, if a user selects to default `Happy Birthday`, the user may wish to modify the message line to read `Happy Birthday, Mom! Love, Alex and Beth`.

To add a default message: Use the following steps to add a default message to the Work with Order Line Messages screen.

1. At the Work with Order Line Messages screen, select the prompt arrow next to a blank *Message* field to advance to the [Select Default Message Screen](#).
2. At the Select Default Message Screen, review and select a default message. When you select a default message, the system returns you to the Work with Order Line Messages screen and:
 - Defaults the value in the Message (Default text) field for the default message to the *Messages* field.
 - Defaults the value in the Print Code field for the default message to the *Print* field.
3. Optionally, modify the *Messages* field and *Print* field for the message line.

See [Working with Default Messages \(WMSG\)](#) for more information on default messages.

Duty charge message: The system writes an order message line if there is a duty charge for the item: `001.00% - Duty Used`. See [Setting Up the Country Table \(WCTY\)](#) for more information on how the system calculates duty for the ship-to customer's country.

Selecting this option: Select Messages for an item at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) or from the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#).

Field	Description
Order #	A number to identify the order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Sold To (Sold-to customer name)	The last name, first name and initial of the customer or the name of the company that is placing the order. <i>Alphanumeric, 41 positions; display-only.</i>
Ship To (Ship-to customer name)	The last name, first name and initial of the customer or the name of the company that you are shipping the order to. <i>Alphanumeric, 41 positions; display-only.</i>
Item	The code for a unit of inventory that you sell. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	The style of the item, such as its color or size. <i>Alphanumeric, three 4-position fields; display-only.</i>

Field	Description
Messages	<p>Use this area of the screen to enter notes about the item.</p> <p>You can print any of these messages by entering a print code in the <i>Print</i> field. You can also enter informational messages that do not print anywhere.</p> <p>Each message line is treated as a separate message on the system. Therefore, you can select different printing options for each message line.</p> <p>Default Message</p> <p>Select the prompt arrow next to a blank <i>Messages</i> field to advance to the Select Default Message Screen, where you can review and select a default message to default its message text and print code to the <i>Messages</i> and <i>Print</i> fields. Default messages are defined in and validated against the Default Message table.</p> <p><i>Alphanumeric, 60 positions each line.</i></p>
Print	<p>A code that controls whether the message prints.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Both = Print on invoice and pick slip • Invoices = Print on invoice only • Picks = Print on pick slip only • Nowhere = The message is informational and does not need to be printed. <p><i>Optional.</i></p>
Date	<p>The date on which the message was entered.</p> <p><i>Numeric, 6 positions (in user date format); display-only.</i></p>
User	<p>The user ID of the person who entered the message.</p> <p><i>Alphanumeric, 6 positions; display-only, updated by the system.</i></p>

Screen Option	Procedure
Change a message or print option	<p>Select Add/Change.</p> <p>To change: Position your cursor in the message line and edit it as needed. You can also change the setting of the <i>Print</i> flag. Click OK when you are done.</p> <p>To delete: Double-click a message line to select it and then delete the text. You also need to clear the <i>Print</i> flag and click OK to delete the message.</p>

 **Note:**

This option is not available if you do not have authority under the Modify Existing Messages (A30) secured feature.

Select Item Relationships Window

Purpose: Use this screen to find all items that belong to the same category of items (such as computers) and are compatible with each other (such as IBM products). Also, you can narrow down your search further by entering a price range. Only those items that meet these requirements are listed on the Item Relationship screen.

Once the Item Relationship screen opens, you can review the item's current availability, special item pricing promotions, and expected deliveries. Also, you can obtain additional information about the item.

You would use this option primarily if the customer is interested in finding out more about other items that you sell that may be compatible to or substituted for an item the customer is buying. From here, you can select items from this screen and add them directly to the order.

You can assign an item category and compatibility code to an item in the SKU table. Item categories are defined in and validated against the Item Categories table. You can enter any code in the *Compatibility* field.

For example, you might assign an item category code of HD (“Computer Hardware”) and a compatibility code of 01 (“IBM-compatible”) to these items: a CPU, a monitor, a modem, and a printer. In this way, item categories provide an easy way to find similar items or a different item that the customer can buy if the original item is not available.

How to display this screen: Select Relationships at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).

Field	Description
Category	<p>A high-level classification code for a group of items. This may represent a product group or merchandise class, such as “Computer Hardware.”</p> <p>Item category codes are defined in and validated against the Item Categories table.</p> <p>Enter an item category code in the <i>Itm category</i> field in the SKU table to assign an item to a category.</p> <p>You can run inventory reports based on item category.</p> <p><i>Alphanumeric, 4 positions; required.</i></p>
Compatibility	<p>A user-defined code to further classify items within an item category. Compatible items should be assigned the same compatibility code, such as, “IBM-Compatible.”</p> <p>Enter a code in the <i>Compatibility</i> field of the SKU table to assign a compatibility code to the item; the system does not validate this value.</p> <p><i>Alphanumeric, 3 positions; optional</i></p>
Price range	<p>The price range of the compatible items. Only items that are priced in this range and belong to the specified category and compatibility are listed.</p> <p>Leave the <i>Price range</i> fields blank to obtain a list of all compatible items, regardless of selling price.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>

Instructions: Enter an item category code and optionally, a compatibility code and price range and select OK to advance to the [Display Item Relationship Screen](#).

Display Item Relationship Screen

How to display this screen: Enter an item category code, a compatibility code, and optionally, a price range at the [Select Item Relationships Window](#). This screen lists all the items that match your entries.

Field	Description
Category	A high-level classification code for a group of items. This may represent a product group or merchandise class, such as “Computer Hardware.” <i>Alphanumeric, 4 positions; required.</i>
Compatibility	A user-defined code to further classify items within an item category. <i>Alphanumeric, 3 positions; required.</i>
Qty	Enter the number of units of this item the customer wants to order. The system will add a detail line to the order for this item. <i>Numeric, 5 positions; required when selecting the item.</i>
Item	The code for a unit of inventory that you sell. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	A code for the style of the item, such as its color or size. <i>Alphanumeric, three 4-position fields; display-only.</i>
Availability (Quantity available)	The number of units of the item available to sell. <i>Numeric, 7 positions; display-only, updated by the system.</i>
Action	Displays Added to order when you select an item from this screen for the order. <i>Alphanumeric, 14 positions; display-only.</i>
Description (unlabeled field below Item field)	The description of the item. <i>Alphanumeric, 25 positions; display-only.</i>

Screen Option	Procedure
Select an item for the order	Select the item, enter the quantity to order for the item, and then select Select. Added to order displays in the <i>Action</i> field indicating the item has been selected for the order.
Display the quantity available to sell of an item	Select Availability for an item to advance to the Item Availability Screen .
Display any special price breaks for an item	Select Pricing for an item to display the Display Quantity Pricing Window .
Review the expected deliveries of this item from your vendors	Select Open POs for an item to advance to the Display Open Purchase Orders Screen .

Upselling the Customer in Order Entry

Purpose: Several features are available in the system to upsell customers.

These are specials by which the customer can purchase items at a discounted price or receive them for free. When you upsell the customer, you offer the customer the chance to purchase unsolicited items in exchange for some type of incentive item.

Promotional pricing windows may open automatically during Order Entry when the customer's order points to an offer, source code, customer class, state, payment type, item class, or day of the week for which a promotion has been defined.

In this topic:

- [Upselling with Promotional Pricing](#)
 - [Select Incentive Item Screen](#)
 - [Select Incentive Group Window](#)
 - [Incentive Price Window](#)
- [Upselling with Special Source Prices](#)
- [Upselling with Price Breaks](#)
- [Upselling with Accompanying Items](#)

Cross-selling: You can also cross-sell the customer by suggesting items related to an item the customer is buying. For example, if the customer orders a blazer, you can suggest a coordinating skirt or blouse. A message indicates when the customer orders an item associated with coordinate items; you can then select Coordinates for the item to display and select coordinates. See [Working with Items on the Order](#).

Restrictions: The system may suppress a promotional pricing window if there is an item restriction or there is no available inventory for the items on special.

The order type controls whether promotional pricing windows open. No promotional pricing windows open during Order Maintenance.

Capturing history: The system tracks the demand (number of orders) and sale (number shipped) of upsell items separately from all other items. This allows you to analyze the number and dollar value of items that are sold as part of an upsell promotion.

Free gifts: The system applies free gifts to the order after you select the Reprice option and complete any pop-up windows. See [Applying Free Gifts](#) for more information.

Upselling with Promotional Pricing

Purpose: Promotional pricing specials enable the customer to receive incentive items free of charge or at reduced prices, based on the items or dollar amount on the order.

Incentive eligibility: A promotional pricing window opens only when:

- The customer places an order from a source code/offer in which a promotion has been defined, *and*
- The customer orders:
 - a specific quantity from a pre-defined group, *or*
 - a specific quantity of an item, *or*
 - a certain dollar value of merchandise, *and*
- The [Promo pricing \(Promotional pricing\)](#) field in the Source record (WSRC) is selected, *and*
- The *Promo windows* field in the Order Type record (WOTY) is set to a Promo (promotional pricing), *and*

- Item/SKU offer prices exist for the items/SKUs on the order in the offer associated with the promotion (either the offer is specified for the promotion or is associated with the source code specified for the promotion)

Examples of incentives:

- Buy any two different items from group 100, receive 50% off the third
- Spend over \$50.00 and receive item AB100 at no charge
- Buy item BB100, receive an item from group 200 for \$5.00
- Buy item CC100, receive \$10.00 off another unit of item CC100

Types of Promotional Pricing Windows and Screens

The system displays the [Select Incentive Group Window](#) or the [Select Incentive Item Screen](#) during Order Entry if the order meets the requirement for the promotional pricing. The logic that the system uses to determine which screen or window to display is described below.

If there is a single incentive item: If the promotional pricing specifies any quantity of a single incentive item, the system displays the [Select Incentive Item Screen](#), regardless of whether the item is offered at no charge, with an incentive price, or with a dollar or percentage discount. For example, the promotional pricing might specify one unit at no charge, or up to five units at a reduced price. You can either:

- Add the item to the order up to the maximum allowable quantity by completing the *Quantity* field. You have this option for non-SKUed items, or for SKUed items when it is the individual SKU that is listed on the screen.
- If the item has SKUs and only the base item is listed on the screen, advance to the [SKU Scan Screen](#) by completing the *Quantity* field. At the SKU Scan screen, you can add the selected quantity of a SKU to the order by selecting Select for a SKU.
- Exit the screen without adding the item.

Incentive group at no charge or an incentive price: If the promotional pricing specifies any quantity of items within a specified group at either no charge or at a specific incentive price, the system displays the [Select Incentive Group Window](#). You can:

- Add an item to the order by completing the *Quantity* field. You have this option for non-SKUed items, or for SKUed items when it is the individual SKU that is listed on the screen. Press the Tab key three times to advance to the *Qty* field.
- If the item has SKUs and only the base item is listed in the window, advance to the [SKU Scan Screen](#) by completing the *Quantity* field. At the SKU Scan screen, you can add the selected quantity of a SKU to the order by selecting Select for a SKU.
- Changing a selected item, SKU or quantity: Once you have completed the *Quantity* field, you cannot change your selection to a different item or SKU without rejecting and then re-entering the order. To select two different SKUs of the same item, you should first enter the desired quantity of the first SKU and then select it at the SKU scan screen; then, when you return to the [Select Incentive Group Window](#), enter the desired quantity of the next SKU so that you can select that SKU at the SKU Scan screen. (**Note:** If you select multiple items or SKUs using these steps, you will need to exit the window once you have selected all desired incentives; the window will not close automatically.)
- Exit the window without adding an item to the order.

Incentive group at dollar or percentage discount: If the promotional pricing specifies any quantity of items within a specified group with either a dollar or percentage discount, the system displays the [Select Incentive Group Window](#). In this situation, you have the added option to review the discounted price of any item in the group by selecting Incentive price for

the item. For example, if the promotional pricing includes a 20% discount, you can see what the selling price of a given item will be after applying this discount to the regular price. You can:

- Add an item to the order by completing the *Quantity* field. You have this option for non-SKUed items, or for SKUed items when it is the individual SKU that is listed on the screen. Press the Tab key three times to advance to the *Qty* field.
- Review the discounted incentive price of the item by selecting Incentive price for the item. You have this option for non-SKUed items, or for SKUed items when it is the individual SKU that is listed on the screen.
- If the item has SKUs and only the base item is listed in the window, your selection at the window advances you to the [SKU Scan Screen](#). At this screen:
 - If you completed the *Quantity* field at the [Select Incentive Group Window](#), you can add the selected quantity of a SKU to the order by selecting Select for a SKU.
 - If you selected Incentive price for the item at the Select Incentive Group window, you can select Options on/off and then select Incentive price for the SKU to review the incentive price. You can also complete the *Quantity* field at the SKU Scan screen to select the quantity of the SKU.

 **Note:**

If you select multiple items or SKUs using these steps, you will need to exit the window once you have selected all desired incentives; the window will not close automatically.

- Exit the window without adding an item to the order.

What if the order qualifies for more than one type of promotional pricing? If you enter an item that qualifies the order for more than one type of promotional pricing, the system displays the promotional pricing records in alphanumeric order based on Promotion ID.

Select Incentive Item Screen

Purpose: The system displays this window when the items on an order meet the qualifications for promotional pricing, as set up through [Work with Promotional Pricing \(WPRP\)](#).

 **Note:**

If you enter an item that qualifies the order for more than one type of promotional pricing, the system displays the promotional pricing records in alphanumeric order based on Promotion ID.

Field	Description
Customer qualifies...	<p>The maximum quantity of the incentive item that the customer can select when ordering a specific quantity of an item. The system ensures that the customer adds only this quantity of the incentive item to the order.</p> <p>Taken from the <i>Qty limit</i> field in the Promotion Pricing record.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Although the system does not allow you to exceed this quantity at the Select Incentive Item Screen, the Select Incentive Group Window, or the SKU Scan Screen, it is still possible to change the order line to a higher quantity afterward, for example at the Work with Order Lines Screen (Adding Items to the Order) or in order maintenance.</p> </div>
At... (Promotional price of the item)	<p><i>Numeric, 5 positions; display-only.</i></p> <p>The price for which the customer can purchase the incentive item. If price is .00, the system adds the item to the order at no charge. The system calculates or derives the price from your entries at the Promotion Pricing Screen (Add Mode). On orders subject to VAT, the <i>Incentive tax price</i> is indicated.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>
Item (Item code)	<p>The code for the incentive item, as defined in the Promotion Pricing record, if the incentive is a specific item or in the Promotion Pricing Group record, if the incentive item belongs to a predefined group.</p> <p>All items are defined in the Item table.</p> <p><i>Alphanumeric, 12 positions; display-only.</i></p>
Description	<p>The description associated with the incentive item, taken from the <i>Description</i> field in the Item record.</p> <p><i>Alphanumeric, 30 positions; display-only.</i></p>
Order qty (Quantity)	<p>The quantity of the incentive item that will be added to the order; the system validates that this value is not greater than the value in the <i>Qty limit</i> field in the Promotion Pricing record (which is at the top of the Promotional Pricing pop-up window).</p> <p><i>Numeric, 5 positions; required.</i></p>

Completing this screen: To add the item to the order, enter a quantity not greater than the maximum. If the item has SKUs and only the base item is listed on the screen, you advance to the [SKU Scan Screen](#) when you enter a *Quantity*. At the SKU Scan screen, you can add the selected quantity of a SKU to the order by selecting [Select for a SKU](#).

Optionally, you can also exit the screen without adding the item.

Select Incentive Group Window

Purpose: The system displays this window when the items on the order qualify for a group promotion. See [Upselling with Promotional Pricing](#) for an overview.

 **Note:**

If you enter an item that qualifies the order for more than one type of promotional pricing, the system displays the promotional pricing records in alphanumeric order based on Promotion ID.

Field	Description
Select up to...	<p>The maximum number of incentive items that can be added to the order, based on the items ordered from a pre-defined promotional pricing group. The system ensures that the customer adds only this quantity of the incentive item to the order.</p> <p>Taken from the <i>Qty limit</i> field in the Promotion Pricing record.</p>
	<p> Note:</p> <p>Although the system does not allow you to exceed this quantity at the Select Incentive Item Screen, the Select Incentive Group Window, or the SKU Scan Screen, it is still possible to change the order line to a higher quantity afterward, for example at the Work with Order Lines Screen (Adding Items to the Order) or in order maintenance.</p>
Special price	<p><i>Numeric, 5 positions; display-only.</i></p> <p>The price for which the customer may purchase the incentive item. The window displays a <i>Special price</i> if an Incentive price is specified for the promotion price record. If the No charge flag is set, the special price displayed is .00, and the system adds the item to the order at no charge.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>
Additional discount of...%	<p>The discount percentage that the system subtracts from the unit selling price of each selected incentive item. The window displays this discount percentage only if an Incentive disc % is specified for the promotion price record. You can select Incentive price for an item to advance to the Incentive Price Window, which displays the unit selling price after subtracting the discount percentage.</p> <p><i>Numeric, 3 positions with a 2-place decimal; display-only.</i></p>

Field	Description
Additional discount of...\$	<p>The discount amount that the system subtracts from the unit selling price of each selected incentive item. The window displays this discount amount only if an Incentive disc \$ is specified for the promotion price record.</p> <p>You can select Incentive price for an item to advance to the Incentive Price Window, which displays the unit selling price after subtracting the dollar discount.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>
Qty (Quantity)	<p>The quantity of the incentive item that will be added to the order. The system validates that this value is not greater than the value in the <i>Qty limit</i> field in the Promotion Pricing record (which is at the top of the Promotional Pricing pop-up window). If you select multiple items or SKUs, the system validates that the total quantity selected does not exceed the <i>Qty limit</i>.</p> <p>Numeric, 5 positions; required.</p>
Item (Item number)	<p>The code for the incentive item, as defined in the Promotion Pricing record (if the incentive is a specific item) or in the Promotion Pricing Group record (if the incentive item belongs to a predefined group).</p> <p>All items are defined in the Item table.</p> <p><i>Alphanumeric, 12 positions; display-only.</i></p>
Description	<p>The description associated with the incentive item, taken from the <i>Description</i> field in the Item table.</p> <p><i>Alphanumeric, 30 positions; display-only.</i></p>

Completing this window: Your options at this window are:

Adding an item to the order: Complete the *Quantity* field. Depending on whether the item has SKUs:

- If the item you select does not have SKUs, or if it is a specific SKU of a SKUed item, entering the quantity adds the item to the order. Press the Tab key three times to advance to the *Qty* field.
- If the item has SKUs and only the base item is listed in the window, when you enter a quantity as described above you advance to the [SKU Scan Screen](#). At this screen, you can add the selected quantity of a SKU to the order by selecting Select for a SKU.

Reviewing the discounted incentive price for an item: Select Incentive price for the item:

- If the item you select does not have SKUs, or if it is a specific SKU of a SKUed item, you advance to the [Incentive Price Window](#).
- If the item has SKUs and only the base item is listed in the window, you advance to the [SKU Scan Screen](#). At this screen, you can select Options on/off and then select Incentive price for the SKU to review the original offer price and the incentive price. You can also complete the *Quantity* field at the SKU Scan screen to select the quantity of the SKU.

Changing your selections: Once you have added an incentive item to the order by completing the *Quantity* field at this window, you cannot delete it and substitute another incentive item or SKU in its place. Also, once you have exited this window, you cannot redisplay it for the current order. However, you can always delete an incentive item from the order as you would any other item.

Exiting the window: Optionally, you can exit the window without adding an incentive item to the order.

Incentive Price Window

Purpose: Use this window to review the regular offer price and the discounted incentive price for an item displayed at the [Select Incentive Group Window](#).

How to display this screen: Select Incentive price for an item at the [Select Incentive Group Window](#).

Field	Description
Item	The item you selected for review at the Select Incentive Group Window . The description is below the item. <i>Item: alphanumeric, 12 positions; display-only.</i>
Incentive price	The unit price of the item after applying the <i>Incentive discount %</i> or the <i>Incentive discount \$</i> specified at the Promotion Pricing Screen (Add Mode). <i>Numeric, 13 positions with a 2-place decimal; display-only.</i>
Offer price	The regular unit price of the item based on the offer, using the regular pricing logic. <i>Numeric, 13 positions with a 2-place decimal; display-only.</i>

Upselling with Special Source Prices

Purpose: The system calculates an item discount automatically when the customer orders an item in a specific quantity using a source code for which a special source price promotion exists.

Definition: Use the Item/Source Prices record to define the source code, required order quantity, discounted price for regular customers, and discounted price for associate customers.

The system determines that the item will be discounted if the order points to a source code with a special source price record, and the customer orders at least the number in the Qty field. This is a form of quantity break pricing because, usually, the price of the item is reduced as the customer orders a greater quantity.

No pop-up window opens to inform the customer of this discount; however, the system updates the order detail line with *Special Source Price as the pricing method.

Upselling with Price Breaks

Purpose: You can offer the customer the chance to purchase a specific quantity of an item at a reduced price, based on the offer used on the order. Additionally, offer price breaks can be defined for pricing columns so that, when a customer assigned to a pricing column places an order, the customer is eligible for the price breaks regardless of the quantity ordered.

See [Display Quantity Pricing Window](#).

Upselling with Accompanying Items

Accompanying items are added to the order automatically at no charge or for a set price when the customer orders the originating item, or "trigger item," in a specific quantity and for a specific offer. This activity is automated so that the order entry operator does not have to remember to add this item to the order. No pop-up window

opens to notify the operator that the system is adding an accompanying item to the order. In addition, certain updates to the originating item in order entry also update the accompanying item.

The system also adds accompanying items to an order in order maintenance if the [Add Accompanying Items in Order Maintenance \(H28\)](#) system control value is selected. When you ship the order, the system ensures that the originating item and accompanying item ship together.

Examples: These examples illustrate two different situations in which the system adds an accompanying item to an order:

Product information pamphlet: You can define a product information pamphlet as the accompanying item. The pamphlet is added to the order at no charge. Each time the customer orders the originating item in the required quantity from the offer, the system adds one product information pamphlet to the order.

Cleaning solution: You can set up a bottle of cleaning solution as the accompanying item each time the customer orders a set of pans. The cleaning solution is automatically added to the order at its regular price.

For more information:

- [Defining Accompanying Items](#)
- [Adding an Accompanying Item in Order Entry](#)
- [Updating the Originating Item in Order Entry](#)
- [Updating the Accompanying Item in Order Entry](#)
- [Accompanying Items in Order Maintenance](#)

Defining Accompanying Items

Use the [Work with Accompanying Item Screen](#) to define accompanying items for a specified item/SKU and offer.

For each accompanying item that you define, you must indicate:

- the required order quantity of the originating item in order to add the accompanying item to the order; for example, you must order 2 of the originating item to add the accompanying item to the order
- the accompanying item/SKU to add to the order
- the quantity of the accompanying item to add to the order (either a specific quantity or the same quantity as the originating item)
- whether there is a charge for the accompanying item (accompanying items are added at no charge, or at the regular price according to your pricing hierarchy)

Accompanying item hierarchy: If you define an accompanying item at the SKU Offer and Item Offer level, the system:

1. If the item you order qualifies for the accompanying item at the SKU Offer level, adds the accompanying item defined at the SKU Offer level to the order.
2. If the item you order does not qualify for the accompanying item at the SKU Offer level, but does qualify for the accompanying item at the Item Offer level, adds the accompanying item defined at the Item Offer level to the order.

Adding an Accompanying Item in Order Entry

The system evaluates whether to add an accompanying item automatically to the order when:

- you add the originating item to the order.
- you change the originating item on the order and an accompanying item is not yet defined for the originating item.

If the order quantity of the originating item meets the [Required qty \(Originating item required quantity\)](#) defined for the accompanying item, the system adds the accompanying item automatically to the order.

Example: The following accompanying item is set up for item A.

Required qty	Item
3	B

- If the customer orders item A for a quantity of 1, the system does not add the accompanying item to the order since the originating item's order quantity does not meet the *Required quantity* for the accompanying item.
- If the customer changes the order quantity for item A to 2, the system does not add the accompanying item to the order since the originating item's order quantity does not meet the *Required quantity* for the accompanying item.
- If the customer changes the order quantity to 3, the system adds accompanying item B to the order since the originating item's order quantity now meets the *Required quantity* for the accompanying item.
- If the customer changes the order quantity to 4, the system does not evaluate whether to add an accompanying item to the order since an accompanying item is already defined for the originating item.

Order quantity of accompanying item: The [Use order qty \(Use originating item order quantity\)](#) field for the accompanying item determines the quantity of the accompanying item that is added to the order.

- If the *Use order quantity* is No, the system adds the accompanying item to the order for the quantity specified in the [Acc qty \(Accompanying item quantity\)](#) field.

Example: If the *Accompanying item quantity* is 1, when the customer orders 3 of the originating item, the system adds 1 accompanying item automatically to the order.

- If the *Use order quantity* is Yes, the system adds the same quantity of the accompanying item to the order as the quantity of the originating item.

Example: When the customer orders 3 of the originating item, the system adds 3 accompanying items automatically to the order.

Price of accompanying item: The [Free?](#) field for the accompanying item defines whether there is a charge for the accompanying item that is added to the order.

- If the *Free?* field is Yes, the system adds the accompanying item to the order free of charge (the *NC* (no charge) field for the order line is Y).
- If the *Free?* field is No, the system adds the regular price of the accompanying item to the order totals.

If more than one accompanying item is defined for an originating item: If you have more than one accompanying item defined for an originating item, the system

uses the [Required qty \(Originating item required quantity\)](#) for the accompanying item to determine which accompanying item to add to the order.

Example: The following accompanying items are set up for item A.

Required qty	Item
1	B
2	C
4	D

- If a customer orders item A for a quantity of 1, the system adds accompanying item B to the order.
- If a customer orders item A for a quantity of 2, the system adds accompanying item C to the order.
- If a customer orders item A for a quantity of 3, the system adds accompanying item C to the order. The system adds accompanying item C to the order because the *Required quantity* for this accompanying item is closest to, but not greater than, the order quantity of the originating item.
- If a customer orders item A for a quantity of 4, the system adds accompanying item D to the order.

Identifying the originating and accompanying item: When the system adds the accompanying item to the order, the system:

- updates the *Accompanying item indicator* field in the Order Detail table for the originating item with T to indicate that the order line contains the originating item, or trigger item, associated with the accompanying item.
- updates the *Accompanying item indicator* field in the Order Detail table for the accompanying item with A to indicate that the order line contains the accompanying item. In addition, the system updates the *Accompanying item trigger line* field in the Order Detail table with the order line sequence number for the order line that contains the associated originating item.

If you have multiple accompanying items on the order, the system uses the *Accompanying item indicator* field and *Accompanying item trigger line* field in the Order Detail table to determine which accompanying item is associated with which originating item. In addition, the system uses these fields to determine which accompanying item to update when you update the originating item on the order; see [Updating the Originating Item in Order Entry](#).

Cannot add accompanying item with set: The system does not add an accompanying item to the order if it is associated with a set item.

Updating the Originating Item in Order Entry

When you perform the following updates to the originating item in order entry, the system determines if the accompanying item should also be updated:

- [Deleting the Originating Item](#)
- [Increasing the Order Quantity of the Originating Item](#)
- [Decreasing the Order Quantity of the Originating Item](#)
- [Selling Out the Originating Item](#)

Deleting the Originating Item

When you delete the originating item from the order, the system also deletes the accompanying item from the order.

If the accompanying item is a set item, the system deletes the accompanying item and its component items from the order.

Increasing the Order Quantity of the Originating Item

When you increase the order quantity of the originating item on the order, the system looks at the setting of the *Use Order Quantity* field for the accompanying item to determine if the order quantity of the accompanying item should also increase.

- If the *Use Order Quantity* field for the accompanying item is set to No, the system does not increase the order quantity for the accompanying item when the order quantity for the originating item increases.

Example: The following accompanying item is set up for item A:

Required qty	Item	Accompanying Qty	Use Order Qty
2	B	1	No

A customer orders item A for a quantity of 2. Because the *Required quantity* is reached and *Use order quantity* is No, the system adds item B to the order for a quantity of 1. The customer then decides to increase the order quantity for item A to 3. Because *Use order quantity* is No, the system does not update the order quantity for item B and instead, retains the order quantity of 1.

- If the *Use Order Quantity* field for the accompanying item is set to Yes, the system increases the order quantity for the accompanying item to match the quantity of the originating item.

Example: The following accompanying item is set up for item A:

Required qty	Item	Accompanying Qty	Use Order Qty
2	B	1	Yes

A customer orders item A for a quantity of 2. Because the *Required quantity* is reached and *Use order quantity* is Yes, the system adds item B to the order for a quantity of 2. The customer then decides to increase the order quantity for item A to 3. Because *Use Order Quantity* is Yes, the system updates the order quantity for item B to 3 as well.

If the originating item now qualifies for the accompanying item: If the original order quantity of the originating item did not meet the *Required quantity* for the accompanying item, but you increase the order quantity of the originating item and it now meets the *Required quantity* for the accompanying item, the system adds the accompanying item to the order.

Example: The following accompanying item is set up for item A:

Required qty	Item
3	B

A customer orders item A for a quantity of 1. Because the *Required quantity* is not reached, the system does not add item B to the order. The customer then decides to

increase the order quantity for item A to 3. Because the *Required quantity* is now reached, the system adds item B to the order.

If the originating item now qualifies for a different accompanying item: If the system has already added an accompanying item to the order for the originating item, and you increase the order quantity of the originating item so that the originating item now meets the *Required quantity* for another accompanying item, the system does not add this accompanying item to the order, but instead keeps the original accompanying item that was added to the order.

Example: The following accompanying items are set up for item A:

Required qty	Item
1	B
2	C
4	D

A customer orders item A for a quantity of 1. Because the *Required quantity* is reached, the system adds item B to the order. The customer then decides to increase the order quantity for item A to 2. Even though the *Required quantity* is reached for a different accompanying item (item C), because an accompanying item has already been added to the order for the originating item, the system does not add item C to the order and instead retains accompanying item B.

To apply a different accompanying item to an originating item: In order to update the order with the accompanying item that is closest to, but not greater than, the order quantity of the originating item, you should:

- delete the originating item from the order and reenter the originating item for the updated order quantity. In the example above, when you delete originating item A from the order, the system also deletes accompanying item B from the order. When you reenter originating item A on the order for an order quantity of 2, the system adds accompanying item C to the order.
- delete the accompanying item from the order and then select Change for the originating item on the order so that the system reevaluates the accompanying items defined for the originating item. In the example above, when you delete accompanying item B from the order and then select Change for the originating item to update the order quantity to 2, the system adds accompanying item C to the order.

Decreasing the Order Quantity of the Originating Item

When you decrease the order quantity of the originating item on the order, the system looks at the setting of the *Use Order Quantity* field for the accompanying item to determine if the order quantity of the accompanying item should also decrease.

- If the *Use Order Quantity* field is set to No, the system does not decrease the order quantity of the accompanying item when you decrease the order quantity of the originating item.

Example: The following accompanying item is set up for item A:

Required qty	Item	Accompanying Qty	Use Order Qty
3	B	2	No

A customer orders item A for a quantity of 4. Because the *Required quantity* is reached and *Use order quantity* is No, the system adds item B to the order for an order quantity of 2. The

customer then decides to decrease the order quantity for item A to 3. Because *Use order quantity* is No, the system does not update the order quantity for item B and instead, retains the order quantity of 2.

- If the *Use Order Quantity* field is set to Yes, the system decreases the order quantity for the accompanying item to match the quantity of the originating item.

Example: The following accompanying item is set up for item A:

Required qty	Item	Accompanying Qty	Use Order Qty
3	B	2	Yes

A customer orders item A for a quantity of 4. Because the *Required quantity* is reached and *Use order quantity* is Yes, the system adds item B to the order for an order quantity of 4. The customer then decides to decrease the order quantity for item A to 3. Because *Use order quantity* is Yes, the system updates the order quantity for item B to 3 as well.

If the originating item no longer qualifies for the accompanying item: If by decreasing the order quantity of the originating item on the order means the *Required quantity* for the accompanying item is no longer reached, the system removes the accompanying item from the order.

Example: The following accompanying item is set up for item A:

Required qty	Item
3	B

A customer orders item A for a quantity of 3. Because the *Required quantity* is reached, the system adds item B to the order. The customer then decides to decrease the order quantity for item A to 2. Because the *Required quantity* is no longer reached, the system deletes item B from the order.

If the originating item now qualifies for a different accompanying item: If the system has already added an accompanying item to the order for the originating item, and you decrease the order quantity of the originating item so that the originating item now meets the *Required quantity* for another accompanying item, the system does not add this accompanying item to the order. In addition, because the originating item no longer meets the *Required quantity* for the accompanying item that was originally added to the order, the system deletes the accompanying item from the order.

Example: The following accompanying items are set up for item A:

Required qty	Item
1	B
2	C
4	D

A customer orders item A for a quantity of 4. Because the *Required quantity* is reached, the system adds item D to the order. The customer then decides to decrease the order quantity for item A to 2. Even though the *Required quantity* is reached for a different accompanying item (item C), because an accompanying item has already been added to the order for the originating item, the system does not add item C to the

order. In addition, because the *Required quantity* for accompanying item D is no longer reached, the system deletes accompanying item D from the order.

 **Note:**

After the system deletes the accompanying item from the order, if you select Change for the originating item, the system reevaluates the accompanying items defined for the originating item, and if the *Required quantity* for one of the accompanying items is reached, the system adds this accompanying item to the order. In the example above, if you select Change for originating item A, the system adds accompanying item C to the order since the originating item's order quantity is 2.

Selling Out the Originating Item

If you manually sell out the originating item, the system also sells out the accompanying item.

If the system automatically sells out the originating item, the system adds the accompanying item to the order and immediately sells out the order line.

If the accompanying item is a set item, the system sells out the accompanying item and its component items on the order.

Updating the Accompanying Item in Order Entry

Once the accompanying item is added to the order in order entry, you can perform regular order entry updates to the order line. However, you cannot manually increase the order quantity of the accompanying item; if you try to increase the order quantity, you receive an error message: `This is an accompanying item, the qty cannot be increased.`

Deleting the Accompanying Item and then Updating the Originating Item

If you delete the accompanying item from the order, and then update the originating item, the system reevaluates the accompanying items defined for the originating item and if the order quantity of the originating item qualifies for an accompanying item, the system adds the accompanying item to the order.

Example: The following accompanying item is set up for item A:

Required qty	Item
3	B

A customer orders item A for a quantity of 3. Because the *Required quantity* is reached, the system adds accompanying item B to the order. You then delete item B from the order. The customer then decides to increase the order quantity for originating item A to 4. Because the system reevaluates accompanying items when you update the originating item on the order, the system adds accompanying item B to the order.

Updating the Accompanying Item and then Updating the Originating Item

If you update an accompanying item whose [Use order qty \(Use originating item order quantity\)](#) is set to Yes, and then update the originating item, the system overrides the update you made to the accompanying item in the following scenarios:

If you increase the order quantity of the originating item: If you decrease the order quantity of the accompanying item, but then increase the order quantity of the originating

item, the system also updates the order quantity of the accompanying item to match the order quantity of the originating item.

Example: The following accompanying item is set up for item A:

Required qty	Item	Accompanying Qty	Use Order Qty
3	B	1	Yes

A customer orders item A for a quantity of 3. Because the *Required quantity* is reached and *Use order quantity* is Yes, the system adds accompanying item B to the order for an order quantity of 3. You then decrease the order quantity for item B to 1. The customer then decides to increase the order quantity for originating item A to 4. Because *Use order quantity* is Yes, the system also updates the order quantity for item B to 4.

If you decrease the order quantity of the originating item: If you decrease the order quantity of the accompanying item, but then decrease the order quantity of the originating item, the system also updates the order quantity of the accompanying item to match the order quantity of the originating item.

Example: The following accompanying item is set up for item A:

Required qty	Item	Accompanying Qty	Use Order Qty
3	B	1	Yes

A customer orders item A for a quantity of 4. Because the *Required quantity* is reached and *Use order quantity* is Yes, the system adds accompanying item B to the order for an order quantity of 4. You then decrease the order quantity for item B to 1. The customer then decides to decrease the order quantity for originating item A to 3. Because *Use order quantity* is Yes, the system also updates the order quantity for item B to 3.

If the required quantity for the accompanying item is no longer reached: If you decrease the order quantity of the accompanying item, but then decrease the order quantity of the originating item to a quantity that no longer meets the *Required quantity* for the accompanying item, the system removes the accompanying item from the order.

Example: The following accompanying item is set up for item A:

Required qty	Item	Accompanying Qty	Use Order Qty
3	B	1	Yes

A customer orders item A for a quantity of 3. Because the *Required quantity* is reached and *Use order quantity* is Yes, the system adds accompanying item B to the order for an order quantity of 3. You then decrease the order quantity for item B to 1. The customer then decides to decrease the order quantity for originating item A to 2. Because the *Required quantity* for accompanying item B is no longer reached, the system deletes item B from the order.

Accompanying Items in Order Maintenance

The Add Accompanying Items in Order Maintenance (H28) system control value controls whether the system adds accompanying items in both order entry and order maintenance, or in order entry only.

If you select this system control value, the system adds an accompanying item to the order automatically when you add an item designated for accompanying items to the order in order maintenance. The accompanying item will also be added to the order if you select the designated item as the exchange (replacement) item in order maintenance or Work with Return Authorizations.

 **Note:**

When you update the originating item in order maintenance, the system does not update the accompanying item. For example, if you sell out the originating item in order maintenance, the system does not also sell out the accompanying item.

Expanding the Address in Order Entry

Purpose: Use the [Expand Name/Address Screen](#) to enter or verify additional customer address information that does not appear on the initial order entry screen, such as:

- Additional address lines
- Additional (third) telephone number

Why complete this screen? It is useful to complete this screen when you need to enter an international or business address, or when the customer provides additional address information, so that the customer record is as accurate as possible.

 **Important:**

Your entries to this screen update the Sold-to customer record automatically.

You can complete the Expanded Address screen at any time during order entry or Customer Maintenance.

Any customer name and address information entered on the initial order entry screen defaults to the Expanded Address screen. You can change any of this information or add to it by completing any of the remaining fields.

How can you tell if a customer has information? If a sold-to or ship-to customer record includes a third or fourth address line, a plus sign (+) appears by the customer's name or address in order entry, order maintenance, and standard order inquiry. If the extended address information includes other fields -- such as the second address line or a third phone number -- but not the third or fourth address line, the plus sign does not appear.

Streamlined order inquiry always displays the entire address for the customer.

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you update customer information in order entry, Order Administration sends the customer information to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the [Customer Engagement Customer Integration](#) for more information.

Expand Name/Address Screen

How to display this screen: Select Expanded Address at the [Work with Order Screen](#).

Field	Description
Sold-to (Sold-to customer number)	A number assigned by the system to identify the customer. The system assigns a Sold-to number to every customer placing an order. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Order#	A unique number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Ship-to number (unlabeled field separated by the Order # field by a hyphen)	Indicates the number of shipping addresses on the order. The system assigns a sequential ship-to number to every order, even if the shipping address and the sold-to address are the same. The first ship-to address is assigned the number 1. <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Order date	The processing date for the order. The order date defaults to the current date, but you can override it. <i>Numeric, 6 positions (in user date format); display-only).</i>
Attention	The person who should receive the order. <i>Alphanumeric, 30 positions; optional.</i>
Name	5 fields are available for you to enter the customer's full name: Prefix A title that belongs before the customer's name, such as "Mrs." or "Dr." <i>Alphanumeric, 3 positions; optional.</i> First Name The customer's first name. <i>Alphanumeric, 15 positions; optional.</i> Initial The initial of the customer's middle name. <i>Alphanumeric, 1 position; optional.</i> Last Name The customer's last name. <i>Alphanumeric, 25 positions; required if Company has not been entered.</i> Suffix An addition to the customer's full name, such as "M.D.", "Fr.", or "III." <i>Alphanumeric, 3 positions; optional.</i>
Company	The name of the company placing the order. <i>Alphanumeric, 30 positions; required if Last name has not been entered.</i>

Field	Description
Address	<p>Four address fields are available for you to enter a complete and specific customer address.</p> <p>Address line #1 The customer's street address. This is the primary delivery address.</p> <p>Shipping to a Post Office Box To ship to a Post Office Box, enter POST OFFICE BOX, POST BOX, or any variation of PO BOX (with or without spaces or non-alphabet characters, such as P.O. BOX), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table). Example: Enter P.O. Box 9999 in the <i>Street</i> field to indicate delivery to a post office box instead of a home or company address.</p>

 **Note:**

If you type POST OFFICE BOX, POST BOX, or any variation of PO BOX in the customer's street address during order entry or through the Order API, the system automatically selects the *PO box* field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the *PO box* flag.

 **Note:**

When you create a customer outside of order processing, you need to select the *PO box* field manually. Selecting the *PO box* field manually only applies in Work with Customers (WCST).

Alphanumeric, 32 positions; required.

Address lines #2-#4

(unlabeled fields under initial *Address* field) Additional address fields for international or business addresses. Although the primary delivery address (address line #1) is required, you may add additional address lines when necessary to pinpoint a customer's address.

Alphanumeric, three 32-position lines; optional.

Field	Description
Apt/Suite (Apartment/Suite)	<p>The customer's apartment, suite, rural route or floor number.</p> <p>You can enter any type of information in this field to further identify the address. This information prints next to the primary street address on labels.</p> <p>To enter an apartment or suite address:</p> <ol style="list-style-type: none"> 1. Enter APT to indicate an apartment or STE to indicate a suite. 2. Insert a space. 3. Enter the number of the apartment or suite, such as: APT 4 or STE 1164A. <p><i>Alphanumeric, 10 positions; optional.</i></p>
Postal code	<p>The postal or zip code for this customer.</p> <p>Required? A postal code is required only if the <i>Require postal code?</i> flag for the country is selected; see Setting Up the Country Table (WCTY).</p> <p>Default city and state? If the system control value Use Zip/City/State Defaulting? (B13) is selected, you can enter the postal code to have the system default the associated city and state.</p> <p>Postal code validation: If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <p>Tax rates: The Postal Code table includes valid postal code/city/state combinations, and may also contain tax rates. You can purchase a listing of the valid combinations from your post office or you can enter each postal code/city/state combination manually.</p> <p>SCF/ship via validation: If you enter a postal code and the <i>Perform ship via edit?</i> flag for the country is selected, the system validates the SCF/ship via combination against the SCF Ship Via table when you complete the order; see Working with SCF/Ship Via Values (WSHV).</p> <p><i>Alphanumeric, 10 positions; required or optional based on country.</i></p>
City	<p>The city where the customer lives or receives mail or shipments.</p> <p><i>Alphanumeric, 25 positions; required.</i></p>

Field	Description
St (State)	<p>The state or province where the customer resides or receives mail or shipments. If you entered a postal code at a scan screen before selecting Create to create a new customer, the related state defaults; but you can override it.</p> <p>Defined where? State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY).</p> <p>Required? A state is required only if the <i>Require state?</i> flag for country is selected. See Setting Up the Country Table (WCTY).</p> <p>SCF validation: If the <i>Require postal?</i> flag for the country is selected, the system validates that the state you enter is assigned to the SCF associated with the postal code. See Working with SCF Codes (WSCF) for background.</p> <p><i>Alphanumeric, 2 positions; required or optional based on country.</i></p>
Ctry (Country)	<p>The code for the customer's country. Country codes are defined in and validated against the Country table.</p> <p><i>Alphanumeric, 3 positions; required.</i></p>
Delivery	<p>Identifies a business (commercial) or residential address. Used when you ship an order by a carrier that uses business or consumer rate tables (such as UPS).</p> <ul style="list-style-type: none">• Business = Business rate table used to determine shipping charges.• Residence = Residential rate table used to determine shipping charges.• No Distinction = No distinction between business and residential (not valid for UPS). <p><i>Required.</i></p>

Field	Description
Cust class (Customer class code)	<p>A code that categorizes the consumer environment at a high level for reporting purposes. You can use a customer class code to:</p> <ul style="list-style-type: none">• direct offerings to a limited customer group• restrict item sales to a group of customers, for example, restricting the sale of guns to minors• set a default for bypassing item reservation for a group of customers• generate a list of customers for reporting purposes, or segment reports by class code <p>If the customer is a new customer, the system uses the Default Customer Class in Order Entry (D63).</p> <p>If the customer is an existing customer, the assigned customer class code defaults.</p> <p>If you enter a new customer class code in this field, the system updates the Customer Sold To table with the code you entered.</p> <p>Required? The Require Customer Class in OE, WCAT, and WCST (H85) system control value defines whether this field is required.</p> <p>Secured? The Maintenance of Customer Class Field (B07) secured feature defines whether you can enter or maintain the customer class field at this screen.</p> <p>See Setting Up the Customer Class Table (WCCL) on working with customer classes.</p> <p><i>Numeric, 2 positions; optional.</i></p>
Mail	<p>Identifies whether to send mail to the customer.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• selected= Send mail to the customer.• unselected = Do not send mail to the customer. <p>The setting of the Default Mail Name (D10) system control value, if any, defaults here.</p>
Rent	<p>Identifies whether to include the customer's name in lists that you rent. Valid values are:</p> <ul style="list-style-type: none">• selected = Rent the customer's name.• unselected = Do not rent the customer's name. <p>The setting of the Default Rent Name (D11) system control value, if any, defaults here.</p>

Field	Description
OptIn	<p>Indicates the preferred method of correspondence. Valid values are:</p> <ul style="list-style-type: none"> • O1 (All) = Email is the preferred method of correspondence. • O2 (Order) = Use email for order-related correspondence only; generate a document for other correspondence. • O3 (None) = Do not use email for any correspondence; generate a document instead. • O4 (Don't Ask) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified.

 **Note:**

The above values use the letter O, not the number 0 (zero).

The system updates this field when you change the setting of the *Opt in/Opt out* value at any other screen, such as customer maintenance, order maintenance, or catalog requests.

When you update this setting: The opt-in/out setting is not stored on the order itself. When you change the opt-in/out setting here, the system updates the opt-in/out setting for the email address used on the order in the Customer Sold To Email Address table. If the order-level email address is also the customer's primary email address, the system also updates the customer's default opt-in/out setting. See [Email Address Updates through Interactive Order Entry](#) for more information.

Email notifications: See [When Does the System Generate an Email Notification?](#) for an overview.

Required.

Mail code Indicates when, and under what circumstances, to send mail to the customer. Enables you to define the customer's mail preferences with more precision than the *Mail* flag. Mail codes are defined in and validated against the Mail/Call Code table; see [Working with Mail/Call Codes \(WMCC\)](#).

If you leave this field blank, the value from the *Mail* flag defaults.

Alphanumeric, 3 positions; optional.

Call code This code specifies how often, and under what conditions, you will call the customer.
Call codes are defined in and validated against the Mail/Call Code table. See [Working with Mail/Call Codes \(WMCC\)](#).

Alphanumeric, 3 positions; optional.

Field	Description
Telephone	<p>The customer's day, evening and third (fax or mobile) phone numbers. The Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mbl</i> (mobile) number.</p> <p>Phone number format: You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator.</p> <p>Example:</p> <p>An operator enters a phone number containing 10 numbers: 5085550100</p> <p>The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100</p> <p>When an operator enters a phone number containing 10 numbers (as in the example), the phone number displays so that the first 3 numbers are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100 and no format exists for 6 numbers, the phone number would display as it was entered (5550100). See Setting Up the Country Table (WCTY).</p> <p><i>Alphanumeric, 14 positions; optional.</i></p>
Ext (Extension)	<p>The extension of the customer's telephone numbers.</p> <p><i>Alphanumeric, 4 positions; optional.</i></p>

Field	Description
Email address	<p>The email address for this order.</p> <p>Order-level email address: The email address defaults from the customer's primary email address. A plus sign (+) indicates that there are additional email addresses on record for the customer. When you click OK, the system adds the order-level email address to the Customer Sold To Email Address table, if it is not already there. See Working with an Order-Level Email Address for more information.</p> <p>Email format validation: See Email Address Validation for information on how the system verifies that your entry is formatted correctly.</p> <p>Email notifications: This field must contain an email address for the system to send the customer automatic email notifications, such as backorder or soldout notifications. See When Does the System Generate an Email Notification?</p> <p>Fraud checking: The order goes on EO hold if this email address matches an email address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF).</p> <p><i>Alphanumeric, 50 positions; optional.</i></p>

When you complete this screen: When you select OK, the system updates the Sold-to customer record automatically from your entries to this screen.

Note:

The [Display/Update Bill to Screen](#) opens in order entry, order maintenance and in Work with Customers when you change the name or address of a Sold-to customer who is linked to a permanent Bill-to customer. The screen enables you to apply the changes you have made to the Sold-to address to the Bill-to address.

Screen Option	Procedure
Exclude the recipient	Select Exclude Recipient. This option is not implemented on the Expand Name/Address Screen .

Using a Permanent Shipping Address in Order Entry

Purpose: Use this function to select a shipping address on file for the customer, or to enter a new shipping address for the order that will be linked permanently to the customer and kept on file.

In this topic:

- Histories:
 - [Mail History](#)
 - [Item History](#)
 - [Order History](#)
- [Select Ship To Window](#)

- [Change Customer Ship To Screen \(Using, Changing, or Excluding a Shipping Address\)](#)
- [Select Customer Ship To Window \(Scanning for a Shipping Address\)](#)
 - [Alphabetic Scan](#)
 - [Numeric Scan](#)
- [Create Customer Ship To Screen](#)

Permanent shipping addresses are address that are kept on file for the sold-to customer. An example of a ship-to address would be the customer's work address. The system adds a separate record to the Ship-to Customer table for this shipping address under the customer number. You can define up to 999 permanent shipping addresses for one customer.

One advantage of linking a permanent shipping address to the customer is that you can search for the address on file instead of reentering the address. This is a useful feature for business-to-business customers or customers who repeatedly ship to an alternate address.

Oracle Retail Customer Engagement customer integration: A customer's permanent shipping addresses are not included in the information that Order Administration sends to Oracle Retail Customer Engagement when you use the Oracle Retail Customer Engagement customer integration. See the [Customer Engagement Customer Integration](#) for more information.

Capturing history: You control what type of mail, order, and item history the system displays by the numeric value you enter in the *Track item history* field for the sold-to customer. These values are available:

Value	Type of Tracking
1	No item history tracking
2	Sold-to level only
3	Sold-to and ship-to

The system assigns a value of 2 to all customers that you create through Order Entry. You can change the item history tracking level through the Work with Customers function. If at any point you change the value from 2 to 3 for a sold-to customer, you will be able to review all item history for the related ship-to customers. See [Reviewing Customer History](#).

If this value is set to 3, you can review mail, order, and item history information for the ship-to customer from the sold-to customer record. This is useful if you want to target future catalog mailings to ship-to customers.

Mail History

The system captures this offer mailing history automatically for each customer ship-to address:

- Source code
- Source description
- Mail date

Item History

The system captures this item history automatically for each customer ship-to address:

- Item number
- SKU
- Date ordered
- Quantity ordered
- Order total

Order History

The system captures this order history automatically for each customer ship-to address:

- \$ on order
- Active since
- Life-to-date totals
- orders
- sales
- returns
- cancels
- exchanges
- sold outs
- Last credit card number and expiration date
- Last order type
- Last pay type
- Last source
- Last mail date

Additionally, the system captures order and sales history details for the quantity and amount ordered and posted to sales (product actually shipped).

Select Ship To Window

This window displays the shipping addresses already on file for the customer. At this point, you can:

- select the appropriate shipping address to ship the order to this address, or
- select Next to view additional addresses (if needed), or
- select Create/Scan to advance to the [Select Customer Ship To Window \(Scanning for a Shipping Address\)](#), where you can refine your search for a ship-to customer. You can also advance to the [Create Customer Ship To Screen](#). At this screen, you can enter an additional shipping address if the desired address is not on file for the customer.

Shipping restrictions: If one or more items on the order is restricted from being shipped to the state or country of the ship to address you have selected, a message indicates:

One or more items on the order line are restricted to new Shipping country/
state.

See [Entering Additional Item Information](#), for information on item/state restrictions.

Tax calculation: If the customer has a tax exemption at the state level, you need to clear the tax-related fields in order to prompt the system to recalculate the tax on the order based on the new shipping address. See [Working with Customer Tax Status](#) for an overview.

How to display this window: Select Address Book at the [Work with Order Screen](#) if there are ship-to customers associated with the sold-to customer. If not, you advance directly to the [Select Customer Ship To Window \(Scanning for a Shipping Address\)](#).

Field	Description
Cust (Customer number)	A number assigned by the system to identify the customer who is placing the order or requesting a catalog. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Ship To (Ship To customer number)	A number that identifies this customer's shipping address. The system adds the shipping address to the Customer Ship To table under the customer number (Sold To Customer number) and a suffix (Ship To Customer number). For example, a customer places an order and requests that you ship the order to his business address. If the customer's customer number is 13248, the customer's office address (shipping address) would be filed under number 13248-001. The customer calls back and places another order, but asks you to ship the order to his beach house. You can select Cust Ship To to scan for this address. Only the customer's office address is listed in the pop-up window. Once again, you can add the new shipping address by selecting Create. The system will file the shipping address under number 13248-002. <i>Numeric, 3 positions; optional.</i>
Name/Address	The address where you are shipping this order. The address includes this information: Company name The name of the company to receive the order, if available. The shipping address must contain either the company name or customer name. <i>Alphanumeric, 51 positions; display-only.</i> Customer name The name of the customer to receive the order. The name consists of the prefix (such as "Mr.", "Mrs.", "Dr.", etc.), first name, last name, and suffix (such as "Jr.", "M.D.", etc.). <i>Alphanumeric, 51 positions; display-only.</i> Address The delivery address, which is made up of the street, city, state, and postal code <i>Alphanumeric, 50 positions; display-only.</i>

Change Customer Ship To Screen (Using, Changing, or Excluding a Shipping Address)

How to display this screen: Select a shipping address at the [Select Ship To Window](#). If there is already a ship-to selected for the order, you can also display this screen by selecting Ship To at the:

- [Work with Order Screen in Order Maintenance](#)

- [Work with Order Lines Screen](#)
- [Enter Payment Methods Screen in Order Maintenance](#)
- [Create Customer Bill To Screen](#)
- [Change Customer Bill To Screen \(Selecting, Changing, or Excluding a Billing Account\)](#)
- [Work with Order Messages Screen](#)

To use: Select OK at this screen to use this address as the shipping address on the current order.

To change: Enter over any information you want to update. The current order will ship to the new shipping address, if you changed address information. Also, the system saves the new shipping information for the customer.

Each of the fields on this screen are described under [Create Customer Ship To Screen](#).

Shipping restrictions: If one or more items on the order is restricted from being shipped to the state or country of the ship to address you have selected, a message indicates:

One or more items on the order line are restricted to new Shipping country/
state.

See [Entering Additional Item Information](#), for information on item/state restrictions.

To exclude: Select Exclude from order to remove this shipping address from the current order.

Removing the shipping address is necessary if you select the address, then decide to ship the order to another address. The system attaches the shipping address automatically to the order when you select a shipping address. After you select Exclude from order, you can select another address or use the customer's home address (billing address) as the order shipping address.

Select Customer Ship To Window (Scanning for a Shipping Address)

To scan: Enter information in any of the scan fields on this window to locate the desired shipping address for the order.

How to display this screen: Select Address Book at the [Work with Order Screen](#) if there are currently no ship-to customers associated with the sold-to customers. Otherwise, you advance to this window by selecting Create/Scan at the [Select Ship To Window](#).

Scan fields: Enter information in the scan fields. You advance to a scan screen that lists the shipping addresses that closely match the information you entered. You can search using the customer's match code, postal code and last name, postal code and company name, last name only, company name or telephone number.

You can enter partial or full information into any of the scan fields. For example, you can enter J or JONES in the *Last name* field to locate the shipping address for Howard Jones.

We recommend that you be as specific as possible when you enter scan information to narrow down the number of shipping addresses that match your entries.

The scan screen that opens includes the shipping addresses that closely match the information you entered. The shipping addresses are listed alphabetically or numerically, starting with the first address that matches the scan information.

Alphabetic Scan

For example, the scan screen lists these names if you enter J in the *Last name* field:

JACOBSON
JAMESBURY
JONES (etc.)

However, the scan screen lists these names if you enter JONES in the *Last name* field:

JONES
JONESBURY
JONESTON (etc.)

Numeric Scan

The scan screen lists these postal codes if you enter 0 in the *Postal code* field:

01519
01527
01560 (etc.)

However, the scan screen lists these postal codes if you enter 02062 in the *Postal code* field:

02062
02069
02074

If you find the shipping address, select it. The current order will be shipped to this address.

If you are not sure that the address is the one you want to ship to, select Display for it. This allows you to verify the address before you attach it to the current order. If the address is the right one, select it to ship the current order to this address.

If you do not find the desired address, you can continue your search by selecting Next to display additional shipping addresses on file for the customer or you can select Create to add a new shipping address.

Create Customer Ship To Screen

Purpose: Use this screen to enter a permanent shipping address for the customer.

The system uses this address for the current order and files the address under the customer number in the Customer Ship To table. Also, this address is in the window the next time you enter a new order for the customer and select Address Book to use a permanent shipping address.

Shipping restrictions: If one or more items on the order is restricted from being shipped to the state or country of the ship to address you have selected, a message indicates:

One or more items on the order line are restricted to new Shipping country/state.

See [Entering Additional Item Information](#), for information on item/state restrictions.

How to display this screen: Select Create/Scan at the [Select Ship To Window](#).

Field	Description
Order#	A number to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Ship-to number (unlabeled field to the right of the Order#)	A number to identify the shipping address. <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Sold-to (Sold-to customer number)	A number to identify the customer who places the order or requests a catalog. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Customer name	The full name of the person to whom you are shipping the order, which may include: Prefix The customer's title, such as "Mr.", "Mrs.", "Dr.", etc. <i>Alphanumeric, 3 positions; optional.</i> First name The customer's first name. <i>Alphanumeric, 15 positions; optional.</i> Initial The initial of the customer's middle name. <i>Alphanumeric, 1 position; optional.</i> Last name The customer's last name. <i>Alphanumeric, 25 positions; required if you do not enter a Company.</i> Suffix The suffix to the customer's name, such as "Jr.", "III", "M.D.", etc. <i>Alphanumeric, 3 positions; optional.</i>
Company	The name of the company to which you are shipping the order. <i>Alphanumeric, 30 positions; required if you do not enter a customer name.</i>

Field	Description
Address	<p>The full address to which you are shipping the order.</p> <p>Address line #1</p> <p>The street address. This is the primary delivery address.</p> <p>Shipping to a Post Office Box</p> <p>To ship to a Post Office Box, enter <code>POST OFFICE BOX</code>, <code>POST BOX</code>, or any variation of <code>PO BOX</code> (with or without spaces or non-alphabet characters, such as <code>P.O. BOX</code>), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table).</p> <p>Example: Enter <code>P.O. Box 9999</code> in the <i>Street</i> field to indicate delivery to a post office box instead of a home or company address.</p>

 **Note:**

If you type `POST OFFICE BOX`, `POST BOX`, or any variation of `PO BOX` in the customer's street address during order entry or through the Order API, the system automatically selects the *PO box* field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the *PO box* flag.

 **Note:**

When you create a customer outside of order processing, you need to select the *PO box* field manually. Selecting the *PO box* field manually only applies in Work with Customers (WCST).

Alphanumeric, 32 positions; required.

Address lines #2-#4

(unlabeled fields under the *Address* field): Additional lines for you to enter address information.

Alphanumeric, 32 positions each line; optional.

Field	Description
Apt/Suite (Apartment/Suite)	<p>The apartment, suite, rural route or floor number for this address, if any.</p> <p>This information prints next to the primary street address on labels.</p> <p>To enter an apartment or suite address</p> <ol style="list-style-type: none"> 1. Enter APT for an apartment or STE for a suite. 2. Press the space bar once. 3. Enter the number. <p><i>Alphanumeric, 10 positions; optional.</i></p>
Postal code	<p>The postal or zip code for the shipping address.</p> <p>Required? A postal code is required only if the <i>Require postal code?</i> flag for the country is selected; see Setting Up the Country Table (WCTY).</p> <p>Default city and state? If the system control value Use Zip/City/State Defaulting? (B13) is selected, you can enter just the postal code to have the system default the associated city and state.</p> <p>Postal code validation: If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <p>Tax rates: The Postal Code table includes valid postal code/city/state combinations, and may also contain tax rates. You can purchase a listing of the valid combinations from your post office or you can enter each postal code/city/state combination manually.</p> <p>SCF/ship via validation: If you enter a postal code and the <i>Perform ship via edit?</i> flag for the country is selected, the system validates the SCF/ship via combination against the SCF Ship Via table when you complete the order; see Working with SCF/Ship Via Values (WSHV).</p> <p><i>Alphanumeric, 10 positions; required or optional based on country.</i></p>
City	<p>The city to which you are shipping the order.</p> <p><i>Alphanumeric, 25 positions; required.</i></p>
St (State)	<p>The state or province where you are shipping the order.</p> <p>Defined where? State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY).</p> <p>Required? A state is required only if the <i>Require state?</i> flag for country is selected. See Setting Up the Country Table (WCTY).</p> <p>SCF validation: If the <i>Require postal?</i> flag for the country is selected, the system validates that the state you enter is assigned to the SCF associated with the postal code. See Working with SCF Codes (WSCF) for background.</p> <p><i>Alphanumeric, 2 positions; required or optional based on country.</i></p>
Ctry (Country)	<p>The code for the country where the order is shipping. Country codes are defined in and validated against the Country table.</p> <p>The Default Country for Customer Address (B17) system control value, if any, defaults here; but you can override this value.</p> <p><i>Alphanumeric, 3 positions; required.</i></p>

Field	Description
Delivery	<p>A code to identify an address as a business or residence. This code is used to calculate shipping charges for shippers that use rate tables, such as UPS.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• Business• Residence• No distinction between business and residence (not a valid delivery code for a UPS shipper) <p>The system uses this logic to default a delivery code to a customer address on an order:</p> <ul style="list-style-type: none">• The system defaults the delivery code from the postal code on the address.• If there is no delivery code for the postal code on the address, the system defaults the delivery code from the Customer table.• If there is no delivery code in the Customer table, the system uses the Default Delivery Code for New Order Entry Customers (D13). <p><i>Required.</i></p>
Rent	<p>Indicates whether to include the customer's name in lists that you rent. Valid values are:</p> <ul style="list-style-type: none">• selected = You can rent this customer's name.• unselected = You cannot rent this customer's name. <p>The Default Rent Name (D11) setting defaults here, but you can override it.</p>
	<div data-bbox="906 1108 1458 1276"><p> Note:</p><p>Not on the Change or Display Customer Ship-to screens.</p></div>
Mail code	<p>This code indicates when, and under what circumstances, you can send mail to this customer. Mail codes are defined in and validated against the Mail/Call Code table; see Working with Mail/Call Codes (WMCC) Not to be confused with the <i>Mail</i> flag.</p> <p>If you do not enter a mail code at the Create Customer Ship To screen, the system will default in the value from the Default Mail Name (D10) system control value.</p>
	<div data-bbox="906 1579 1458 1747"><p> Note:</p><p>Not on the Change or Display Customer Ship-to screens.</p></div>

Alphanumeric, 3 positions; optional.

Field	Description
Call code	This code indicates when, and under what circumstances, you can call the customer. Call codes are defined in and validated against the Mail/Call Code table; see Working with Mail/Call Codes (WMCC).

 **Note:**

Not on the Change or Display Customer Ship-to screens.

Country code	<p><i>Alphanumeric, 3 positions; optional.</i></p> <p>The international telephone code associated with this country. For example, the country code for France is 33. You must enter this code plus the city code before the telephone number to place an international telephone call.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
---------------------	--

Field	Description
Telephone numbers	<p>The daytime, evening and third (fax or mobile) telephone numbers associated with this shipping address.</p> <div data-bbox="906 365 1459 598" style="border: 1px solid #0070C0; padding: 10px;"><p> Note:</p><p>The Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mobile</i> number.</p></div> <p>Phone number format: You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a telephone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator.</p> <p>Example:</p> <p>An operator enters a phone number containing 10 numbers: 5085550100.</p> <p>The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100.</p> <p>When an operator enters a phone number containing 10 numbers (as in the example), the phone number displays so that the first 3 positions are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100 and no format exists for 6 numbers, the phone number would display as it was entered. (5550100). See Setting Up the Country Table (WCTY).</p> <p><i>Alphanumeric, 14 positions each field; optional.</i></p>
E-mail address	<p>The customer's email address. See Email Address Validation for an overview of how the system verifies that your entry is formatted correctly.</p> <p><i>Alphanumeric, 50 positions; optional.</i></p>

Screen Option	Procedure
Default Sold-To Customer information on the Create Customer Ship To screen	<p>Select Default Sold To if you want the system to default sold-to customer information in the fields on this screen.</p> <p>Selecting this option defaults the following fields from the order header:</p> <ul style="list-style-type: none"> • Name • Company • First line of address information • Apartment number • Postal code • City • State • Country • Delivery code (Business or Residence) • Rent flag • Day phone and extension • Evening phone and extension • Third (fax or mobile) phone and extension <p>You can override this information.</p>

Assigning an Order Shipping Address

Purpose: Use the Create Order Ship to Address Screen to specify a shipping address for the order that will be linked to the current order only; no secondary customer record is filed with this address to use on future orders.

Order ship-to addresses are addresses that are attached to orders you are entering, but which are not saved as permanent mailing addresses for customers.

Example: Here is an example of when you would define an order ship-to address for an order:

```
Customer: "...please ship the package to my hotel room, because I am on vacation...."
```

No history captured: When you enter an order ship-to address, the system does not capture mail, order, or item history because the recipient is not a good target for future mailings.

When you create an order ship-to address, the system:

- Attaches this address automatically to the current order only
- Ships the order to the new shipping address

Shipping restrictions: If you have already entered the order, and one or more items on the order are restricted from being shipped to the state or country of the ship-to address you have selected, you cannot attach the new address to the order; instead, a message indicates:

```
One or more items on the order line are restricted to new shipping country/ state.
```

For more information: See [Entering Additional Item Information](#) for information on item/state restrictions.

Tax calculation: If the customer has a tax exemption at the state level, you need to clear the tax-related fields in order to prompt the system to recalculate the tax on the order based on the new shipping address. See [Working with Customer Tax Status](#) for an overview.

Ship-for-pickup order: If you use the [Order Orchestration Integration](#), you can use the Create One Time Ship To Address screen to create a ship-for-pickup order (an order you ship to a designated store location, where the customer picks it up). See [Ship-for-Pickup Orders](#) for an overview.

Oracle Retail Customer Engagement customer integration: An one-time shipping address is not included in the information that Order Administration sends to Oracle Retail Customer Engagement when you use the Oracle Retail Customer Engagement customer integration. See the [Customer Engagement Customer Integration](#) for more information.

In this topic:

- [Create One Time Ship To Address Screen](#)
- [Store Location Screen](#)

Create One Time Ship To Address Screen

How to display this screen: Select One Time Ship To at the [Work with Order Screen](#) or the [Work with Order/Recap Screen](#). You advance to the Change One Time Ship To Address screen instead if there is already an order ship-to address for the order; this screen includes all the same fields as the Create screen, and the attributes of each field are the same.

About this screen: The first fields at the top of this screen include information pertaining to the current order. Notice that no customer number is assigned to the order ship-to address record. This limitation is in place because the only purpose of this address is to direct the order to the correct destination.

The [Country](#) might default from the System Control table. Otherwise, the fields on this screen are blank, so you can enter the shipping address for the order.

Creating a ship-for-pickup order: If the [Name in OROB for Point of Sale \(L09\)](#) system control value specifies a system name, then the Store option is available at this screen. Select this option to advance to the [Store Location Screen](#), where you can select the store where the customer wants to pick up a ship-for-pickup order. The store description and address then default to the Create One Time Ship To Address screen.

Note:

The Store option is not available in order maintenance.

Field	Description
Order#	A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. This number is used in Order Inquiry to review information for the order. This number is also used throughout the system to access information on an order. You cannot update this number. <i>Numeric, 8 positions; display-only, assigned by the system.</i>

Field	Description
Ship-to number (unlabeled field)	<p>A hyphen (-) separates this field from the <i>Order#</i> field. The system assigns a sequential ship-to number to every shipping address on an order, even if the shipping address and the sold-to address are the same. The first ship-to address is assigned the number 1.</p> <p>You cannot update this number.</p> <p><i>Numeric, 3 positions; display-only, assigned by the system.</i></p>
Sold-to name	<p>The name or company name of the customer placing the order.</p> <p><i>Alphanumeric, 41 positions; display-only.</i></p>
Store#	<p>The store number and description of the store location selected for a ship-for-pickup order, if selected at the Store Location Screen. In this case, the description also defaults to the <i>Company</i> field. If the store description exceeds 35 positions, it is truncated.</p> <p><i>Store number: alphanumeric, 10 positions; display-only.</i></p> <p><i>Store description: alphanumeric, 35 positions; display-only.</i></p>
Name	<p>Five fields are available for you to enter the customer's full name:</p> <p>Prefix</p> <p>A title that belongs before the customer's name, such as "Mrs." or "Dr."</p> <p><i>Alphanumeric, 3 positions; optional.</i></p> <p>First Name</p> <p>The customer's first name.</p> <p><i>Alphanumeric, 15 positions; optional.</i></p> <p>Initial</p> <p>The initial of the customer's middle name.</p> <p><i>Alphanumeric, 1 position; optional.</i></p> <p>Last Name</p> <p>The customer's last name.</p> <p><i>Alphanumeric, 25 positions; required if Company has not been entered.</i></p> <p>Suffix</p> <p>An addition to the customer's full name, such as "M.D.", "Fr.", or "III."</p> <p><i>Alphanumeric, 3 positions; optional.</i></p>
Company	<p>The name of the company to receive the shipment.</p> <p><i>Alphanumeric, 30 positions; required if Last name has not been entered.</i></p>

Field	Description
Address	<p>Four address fields are available:</p> <p>Address line #1 The customer's street address. Enter P.O. Box and the box number if the customer's shipping address is a post office box. For example, enter P.O. Box 9999 in the <i>Street</i> field to indicate delivery to a post office box instead of a home or company address. <i>Alphanumeric, 32 positions; required.</i></p> <p>Address lines #2-#4 (unlabeled fields under initial <i>Address</i> field): Additional address fields for international or business addresses. <i>Alphanumeric, 32 positions; optional.</i></p>
Apt/Suite (Apartment/Suite)	<p>The customer's apartment, suite, rural route, or floor number. <i>Alphanumeric, 10 positions; optional.</i></p>
Postal code	<p>The postal or zip code for the shipping address. Required? A postal code is required only if the <i>Require postal code?</i> flag for the country is selected; see Setting Up the Country Table (WCTY). Default city and state? If the system control value Use Zip/City/State Defaulting? (B13) is selected, you can enter just the postal code to have the system default the associated city and state. Postal code validation: If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP). Tax rates: The Postal Code table includes valid postal code/city/state combinations, and may also contain tax rates. You can purchase a listing of the valid combinations from your post office or you can enter each postal code/city/state combination manually. SCF/ship via validation: If you enter a postal code and the <i>Perform ship via edit?</i> flag for the country is selected, the system validates the SCF/ship via combination against the SCF Ship Via table when you complete the order; see Working with SCF/Ship Via Values (WSHV). <i>Alphanumeric, 10 positions; required or optional based on country.</i></p>
City	<p>The city where the customer receives mail the shipment. <i>Alphanumeric, 25 positions; required.</i></p>

Field	Description
State	<p>The state or province where you are shipping the order. Defined where? State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY).</p> <p>Required? A state is required only if the <i>Require state?</i> flag for country is selected. See Setting Up the Country Table (WCTY).</p> <p>SCF validation: If the <i>Require postal?</i> flag for the country is selected, the system validates that the state you enter is assigned to the SCF associated with the postal code. See Working with SCF Codes (WSCF) for background.</p> <p><i>Alphanumeric, 2 positions; required or optional based on country.</i></p>
Country	<p>The code for the customer's country. Country codes are defined in and validated against the Country table. The country defaults from the Default Country for Customer Address (B17) or from your entry at the Default Values for Orders screen.</p> <p><i>Alphanumeric, 3 positions; required.</i></p>
Delivery	<p>Identifies a business (commercial) or residential address. Used when you ship an order by a carrier that uses business or consumer rate tables (such as UPS).</p> <ul style="list-style-type: none"> • B =Business rate table will be used to determine shipping charges. • R =Residential rate table will be used to determine shipping charges. <p><i>Alphanumeric, 1 position; optional.</i></p>
Email address	<p>The email address associated with the ship-to mailing address. The email address is upper and lower case.</p> <p>Fraud checking: The order goes on ES hold if this email address matches an email address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF).</p> <p><i>Alphanumeric, 50 positions; optional.</i></p>
Phone	<p>The phone number for the one-time shipping address.</p> <p>Telephone number format: You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator. See Work with Telephone Number Format Screen for more information.</p> <p><i>Alphanumeric, 14 positions; optional.</i></p>

Screen Option	Procedure
Select the store where the customer wants to pick up a ship-for-pickup order	Select Store to advance to the Store Location Screen . This option is available only if the Name in OROB for Point of Sale (L09) system control value specifies a system name. When you select a store on the Store Location Screen , the system defaults the store description and address to the Create One Time Ship To Address screen.

 **Note:**

The Store option is not available in order maintenance.

Store Location Screen

Purpose: Use this screen to select the store location where the customer wants to pick up a ship-for-pickup order. Only store locations set up through [Work with Store Cross Reference \(WSCR\)](#) and flagged as *Ship for pickup* are available at this screen. See [Ship-for-Pickup Orders](#) for an overview.

How to display this screen: Select the Store option at the [Create One Time Ship To Address Screen](#). The Store option is available if the Name in OROB for Point of Sale (L09) system control value specifies a system name.

 **Note:**

The Store option is not available if there is an Order Orchestration record associated with the order (indicating that the order is a delivery or retail pickup order received from Order Orchestration, or a brokered backorder sent to Order Orchestration). See the [Order Orchestration Integration](#) for an overview.

Field	Description
Store code	The store code from the Store Cross Reference record. <i>Alphanumeric, 10 positions; display-only.</i>
Postal code	The postal code where the store is located. <i>Alphanumeric, 10 positions; display-only.</i>
City	The city where the store is located. If the city exceeds 35 positions, it is truncated. <i>Alphanumeric, 35 positions; display-only.</i>
State	The state or province where the store is located. <i>Alphanumeric, 2 positions; display-only.</i>
Store name	The description of the store. If the description exceeds 30 positions, it is truncated. <i>Alphanumeric, 30 positions; display-only.</i>

Selecting a store location: When you select a store location, the following information from the Store Cross Reference record defaults to the [Create One Time Ship To Address Screen](#):

- Store #: assigned to the Order Ship To for the order
- Description: Company name field (truncated to 30 positions)
- Address lines 1-4, city, state, postal code, and country: corresponding fields for the one-time shipping address

 **Note:**

In order to create a ship-for-pickup order to send to Order Orchestration, you need to select the store at this screen. If you simply enter the name and address of the store at the [Create One Time Ship To Address Screen](#), the system does not treat the order as a ship-for-pickup order or send the order information to Order Orchestration.

Changing to or from a store location for a ship-for-pickup order:

- *Changing the information from the Store Cross Reference record:* Once you have selected a store location for a ship-for-pickup order, it is important not to change the name and address to one that differs from the store location's shipping address.
- *Selecting a store after entering a name and address:* If you select a store location after initially entering a one-time ship-to address for the order, the system flags the order as a ship-for-pickup order and defaults the available address fields from the Store Cross Reference record; however, if you previously entered a name or apartment/suite that did not default from the Store Cross Reference record, this information remains. Things to note:
 - The fields you cannot define for the Store Cross Reference record are the name fields (prefix, first name, middle initial, last name, suffix); the apartment or suite; and the email address.
 - If you leave any of the address lines blank for the Store Cross Reference record, the information you entered previously is not replaced when you select the store.
- *Changing to a different store:* After selecting a store location, you can change the order to ship to a different store location by selecting the Store option again. The description and address of the new store location replaces the existing shipping address.
- *Removing a store:* You can select Delete on the [Create One Time Ship To Address Screen](#) during order entry to remove the store location from the order. In this situation, the system no longer considers the order a ship-for-pickup order and changes the ship-to address on the order to the sold to address.

For more information: See [Ship-for-Pickup Orders](#) for background.

Adding a Recipient Order in Order Entry

Purpose: Use this screen to send all or part of the order to another address.

In this topic:

- [About Gift Orders](#)
 - [Alternating Display of Sold-to/Recipient Addresses](#)

- [Recipient Entry Methods](#)
- [Select Customer Sold To Pop-up Window](#)
- [Scan Types](#)
 - [Alphabetic Scan](#)
 - [Numeric Scan](#)
 - [E-mail Address Scan](#)
- [Using the Scan Screen](#)
- [Copying the Sold To Customer Address](#)

Recipient orders are secondary orders that you add to an order to ship to different customers or addresses. For example, you can place an order for yourself and a friend in a single phone call, on a single order.

The system assigns the first order an order number, you enter name, address, and item information, and then select Add Recipient to accept the current order and enter the next order.

Adding a ship-to suffix to the order number: When you enter the second order, the system views this as a recipient order, related to the initial order. The system assigns this order (and any subsequent recipient order) the same order number, but increments the shipping suffix by 1 for every additional recipient address on the order.

Adding a sold-to record: The system also assigns a sold to customer number to the person or company receiving each recipient order and creates a separate record for each recipient address in the Sold To Customer table. The system updates the recipient customer record with an R in the *Original mail type* field to indicate that the customer was added to the Customer Sold To table as a recipient. This code is used for historical purposes to trace how the customer was added to the system.

If the [Update Original Source Code for Recipient Customers \(F90\)](#) system control value is selected, the system writes the source code defined for the sold to customer to the *Original source* field for a recipient customer.

Recipient orders as separate orders: Although the buyer on the order (sold-to customer) and the order number are the same for a multi-recipient order, each recipient order is considered a separate order on the system. You must define name, address and item information for each order recipient, but define payment information only once.

Select Options to review the order totals across all recipients on the order. The Order Totals pop-up window summarizes the individual charges on each recipient order and displays balances for what the customer has purchased, paid and owes. See [Displaying More Options in Order Entry](#).

The system does not capture sales history for any of the recipients.

Switching from one recipient to another: As you work with the order, you can switch from one recipient to another through the Display Order Summary screen. At the Display Order Summary screen, you can change recipient order information, such as item information, before you process the order.

You can advance to the [Display Order Summary Screen](#) by selecting Summary on the [Work with Order Screen](#), [Work with Order Lines Screen \(Adding Items to the Order\)](#) or [Work with Order/Recap Screen](#). At the Order Summary screen you can:

- Review all of the items ordered for the current order plus any recipient orders. The Order Summary screen lists each item ordered for each shipping address so you can verify the items ordered.
- Accept the order information for the recipient you are currently working with and switch to another recipient so you can work with the order information for that recipient.
- Copy an item from a recipient to the recipient you are currently working with. When you copy an item, the system adds an order line to the current order ship to for each item copied.
- Review the order totals in the customer's currency.

Email address and opt-in/out setting: The email address and opt-in/out setting are associated with the customer who places the order. When you enter a new email address, the system adds an email address for the customer placing the order; similarly, if you display the [Select Customer Email Address Screen](#) by prompting on the email address, the screen displays email address information for the customer placing the order. To review or work with the recipient's email address or opt-in/out setting, you must advance to the [Expand Name/Address Screen](#).

**Note:**

This option is not available for a store pickup order; see [Store Pickup Orders](#) for an overview.

Tax calculation: If the customer has a tax exemption at the state level, you need to clear the tax-related fields in order to prompt the system to recalculate the tax on the order based on the new shipping address. See [Working with Customer Tax Status](#) for an overview.

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you create a recipient customer in order entry, Order Administration sends the information about the recipient customer to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the [Customer Engagement Customer Integration](#) for more information.

About Gift Orders

Another type of recipient order is a gift order. You identify an order as a gift order by selecting the *Gift* field. You can then select Sold To/Recip to enter the address where the gift will be shipped. The gift recipient's address is entered on the same screen you use to enter the address for a recipient order.

If the gift recipient is not already a customer of your company, the system assigns a sold-to customer number to the recipient of the gift order, creates a separate sold-to customer record under this number and updates the original mail type field with an R (recipient) to track how the order was received on the system. This makes the gift recipient eligible for future mailings because the customer is already familiar with your product.

A gift order differs from a recipient order because:

- pricing information may not print on the pick slip, depending on your pick slip printing program
- a gift acknowledgment card prints for the customer who placed the order (sold-to customer) to confirm that the gift has been shipped

The system performs the same updates as with recipient orders.

The system does not capture sales history for the gift recipient.

Alternating Display of Sold-to/Recipient Addresses

Select Sold To/Recip at the [Work with Order Screen](#) to review or enter the buyers (sold-to) address or recipient's address. Notice that the addresses of the customer who placed the order (sold to customer) and the customer who will receive the order alternate each time you select Sold To/Recip.

Recipient Entry Methods

Purpose: You can enter a recipient order in two ways:

- Select Accept/Add Rcp on the [Work with Order Screen](#), [Work with Order/Recap Screen](#) or [Select Order Recipient Screen](#).
- Select Sold To/Recip on the [Work with Order Screen](#) if the recipient is a gift order.

Confirm Missing Recipient Window

This window opens if you select Accept/Add Rcp or Sold To/Recip to add a recipient and then select Accept/Add Rcp or Sold To/Recip again without entering a recipient address:

The system is looking for a recipient address. Select OK to override this message and use the sold to address or select Exit to enter a recipient address.

When you select Accept/Add Rcp or Sold To/Recip to add a recipient to the order, the system advances you to the [Work with Order Screen](#). On this screen, the customer address lines default in blank. Here you can:

- Enter in the recipient's address information. The system advances you to the Display Duplicate Sold To window if the system finds a match to the address you entered; otherwise the system creates a new sold to customer record for the address.
- Click on the arrow in the name or company name fields to advance to the [Select Customer Sold To Pop-up Window](#) where you can scan for an existing customer.
- Select Cancel to default the sold to customer's name and address information in the recipient's address lines. You would use this option if you are shipping to the same address but to a different person. For example, a daughter is ordering a gift for her mother and they live in the same house.

Select Customer Sold To Pop-up Window

Purpose: Use this window to scan for an existing customer to update the recipient address lines.

A message indicates when you select an existing customer address to default into the recipient address fields on the [Work with Order Screen](#):

```
Customer (46) has been updated with changes!
```

This message indicates that the order has been updated with the recipient address.

Oracle Retail Customer Engagement customer integration: If the [ORCE Customer Integration \(L37\)](#) system control value is set to INTERACT, you advance instead to the [Customer Scan Screen](#). See the [Customer Engagement Customer Integration](#) for an overview.

How to display this screen: Prompt on the *First name*, *Middle initial*, *Last name* or *Company* fields of the recipient address on the [Work with Order Screen](#).

Field	Description
Match code	<p>A code the system assembles in the format you define through the Match Code function. The match code contains elements of the customer's name and address. The system assigns a match code to every customer on the system to identify duplicate customers and to detect fraudulent addresses.</p> <p>Enter a full or partial match code to advance to the Scan Customer by Match Code screen.</p> <p><i>Alphanumeric, 15 positions; optional.</i></p>
Postal code	<p>A postal delivery area. See Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <p>Enter a full or partial code to advance to the Scan Sold To by Postal Code/Company screen. This screen lists all customers by postal code in ascending (lowest to highest) numeric sequence, beginning with the code you entered.</p> <p>If you enter a postal code, last name, and first name, you advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered.</p> <p><i>Alphanumeric, 10 positions; optional.</i></p>
Last name	<p>The sold to customer's last name.</p> <p>Enter a full or partial name to advance to a Scan Cust Sold To By Last Name screen, which lists all customers alphabetically beginning with the name you entered. You can also include a full or partial first name along with a full (not partial) last name to restrict the scan further.</p> <p><i>Numeric, 25 positions; optional.</i></p>
First name	<p>The sold-to customer's first name.</p> <p>Enter the last name, first name, and postal code to advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered. You can also enter just the full (not partial) last name and full or partial first name to advance to the Scan Cust Sold To By Last Name screen.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p><i>First name</i> must be used in conjunction with <i>Postal code</i>, <i>Last name</i> or with just <i>Last name</i> for scanning. You cannot scan on first name alone. See Scan Types.</p> </div>
Company	<p><i>Alphanumeric, 25 positions; optional.</i></p> <p>The sold to customer's company name.</p> <p>Enter a full or partial company name to advance to the Scan Customer by Company Name screen.</p> <p><i>Alphanumeric, 30 positions; optional.</i></p>

Field	Description
Telephone #	<p>The daytime, evening or third (fax or mobile) telephone number of the sold to customer.</p> <p>The Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mobile</i> number.</p> <p>You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY).</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Your entry should include any formatting specified by the telephone number format for the country; for example, if the telephone number format for the United States is (111) 111-111, your entry should include the parentheses and hyphen.</p> </div>
Alt cust # (Alternate customer number)	<p>Enter a full or partial phone number to advance to the Scan Customer by Phone Number screen.</p> <p><i>Alphanumeric, 14 positions; optional.</i></p> <p>An additional number to identify the sold to customer on the system. This can be a customer number from another system.</p> <p>Enter a full or partial alternate customer number to advance to the Scan Customer by Alternate Customer Number screen.</p> <p>Alternate Customer Number Label Description</p> <p>The field label name that is on this screen is based on the name you enter in the Alternate Customer Number Label Description (H95) system control value; if you do not enter a name in this system control value, the field label is <i>Alt cust</i>.</p> <p>Example: If you enter the field label name MEMBER# in the system control value, the field label name that is on this screen is <i>MEMBER#</i> instead of <i>Alt cust #</i>.</p> <p><i>Alphanumeric, 15 positions; optional.</i></p>
E-mail Address	<p>The customer's email address. Not case sensitive; an email address of abc@EXAMPLE.com matches an entry of ABC@EXAMPLE.COM, and vice versa.</p> <p><i>Alphanumeric, 30 positions; optional.</i></p>
Customer (Sold to customer number)	<p>A number assigned by the system to identify the customer.</p> <p>Enter a valid customer number in this field to default the address information to the recipient address fields on the Work with Order Screen.</p> <p><i>Alphanumeric, 9 positions; optional.</i></p>

Scan Types

Purpose: Enter any combination of customer information in the scan fields. You advance to a scan screen that lists the customers who closely match the information

you entered. Each scan screen (except the Scan Customer by Phone Number screen) includes the customer number, street address, city, state and postal code.

The types of scans that are available from the Select Customer Sold To pop-up window are:

- Match Code
- Postal Code/Last Name
- Postal Code/Last Name/First Name
- Postal Code/Company Name
- Last Name
- Company Name
- Phone Number
- Alternate Customer Number
- E-mail Address

How to scan? You can enter partial or full information into any of the scan fields. For example, you can enter M or Mae in the *Last name* field to located Mary Mae.

When you select OK on the [Select Customer Sold To Pop-up Window](#), the system advances you to a scan screen that lists customers who closely match the information you entered. The customers are listed alphabetically or numerically from the first record that matches the scan information until the end of the table.

Alphabetic Scan

Example: You receive this type of scan if you enter M in the *Last name* field:

MAE

MALLEY

MAX

Example: However, you receive this type of scan if you enter MAX in the *Last name* field:

MAX

MAXFIELD

MAXWELL

Numeric Scan

Example: You receive this type of scan if you enter a 0 in the *Postal code* field:

01007

01040

01128

Example: However, you receive this type of scan if you enter 017 in the *Postal code* field:

01701

01742

01746

E-mail Address Scan

This scan is not case sensitive; an email address of abc@example.com matches an entry of ABC@EXAMPLE.COM, and vice versa.

Using the Scan Screen

Purpose: There are several ways to select a customer for a recipient address from the scan screen, depending on whether the customer is listed.

If the customer is listed: Select the customer number to select the customer for the recipient address.

If you are not sure if this is the correct customer: Select Display for a customer number to review more information about the customer, such as telephone number. If the customer is correct, select OK the customer number.

If the customer is not listed: Continue your search by scrolling through customer records by selecting Next. More customer records are available if a + sign is indicated in the lower right of the screen. If you still cannot find the customer, return to the recipient address on the Work with Order screen and enter a new customer.

Note:

If you scan on the *Postal code*, *Last name* or *Company* fields on this screen and then select Create to create a new customer as an order recipient, the scan information you had entered defaults onto the related fields on the order. If your scan included a postal code, the related city, state and country also default.

Copying the Sold To Customer Address

Purpose: Select Copy Sold to default the sold to customer's address into the recipient address fields.

Copying the sold to customer address into the recipient address fields is helpful if the recipient customer has an address similar to the sold to customer's address. For example, if a daughter is ordering a gift for her mother and they live at the same address, you can select Copy Sold to default the sold to address into the recipient address fields and then override the *Name* field to enter the recipient's name.

If you scan for an existing customer by clicking on the arrow in the *First name*, *Middle name*, *Last name* or *Company name* fields, select a customer to default to the recipient address fields and then select Copy Sold to copy the sold to customer address, an error message indicates:

WARNING: Customer 26 is about to be changed.

If you then select OK, the system overrides the address for the customer you selected from the Select Customer Scan screens with the address of the sold to customer. If you do not want the system to override the selected customer with the sold to customer address, you must select Exit.

The system overrides this address information when you select an existing customer for the recipient address and then select Copy Sold to default the sold to customer in the recipient address fields:

- first name, middle initial and last name
- company name
- street address
- apartment/suite number
- address lines 1, 2 and 3
- postal code
- city
- state
- country
- day/business phone number
- evening/home phone number
- third (fax or mobile) phone number

Entering a Recipient Customer: You can enter the recipient's address information in the address fields on the [Work with Order Screen](#) for the recipient order.

You advance to the [Work with Order Screen](#) for a recipient order by:

- Selecting Sold To/Recip to enter the gift recipient's address, *or*
- Selecting Accept/Add Rcp to enter a recipient order shipping to a different address

How to complete this screen: To complete the recipient address information at the [Work with Order Screen](#), you have several options. You can:

- Enter the recipient's information in the address fields.
- If the recipient customer has an address similar to the sold-to customer's address (for example, a daughter is ordering a gift for her mother and they live at the same address), you can select Copy Sold to default the sold-to customer's address into the recipient address fields. See [Copying the Sold To Customer Address](#).
- If the recipient customer is an existing customer, you can click on the arrow in the recipient address fields to select the customer from one of the [Select Customer Sold To Pop-up Window](#).

Select OK after you enter the recipient's address information.

The system validates your entries and highlights any fields you need to correct. Correct any fields and select OK again.

The system verifies that the ship via (carrier) used on the previous order is still valid for the recipient address.

You can change any order information for a recipient order. For example, you can select a different shipping service. Any other recipient orders are not updated.

For a multi-recipient order (entering an order for the customer and a friend), the updates you make affect only the current recipient order. Additionally, you update the recipient customer when you update any of the customer-specific fields on the recipient screen.

 **Note:**

If you have already entered the order, and one or more items on the order are restricted from being shipped to the state or country of the ship to address you have selected, you cannot attach the new address to the order and a message will display when you select OK:

One or more items on the order line are restricted to the new Shipping country/state.

See [Entering Additional Item Information](#), for information on item/state restrictions.

Screen Option	Procedure
Display the address of the buyer (Sold To Customer) or the recipient (Ship To Customer)	Select Sold To/Recipient.
Select an existing customer to default to the recipient address fields.	Click on the arrow in the recipient address field. See Select Customer Sold To Pop-up Window .
Enter or confirm the billing address	Select Bill To. See Assigning a Billing Address in Order Entry .
Enter or confirm the shipping address kept on file for the customer	Select Customer Ship To. See Using a Permanent Shipping Address in Order Entry .
	<p> Note:</p> <p>You cannot select Customer Ship To and select a permanent shipping address for the order if you entered an address for a gift recipient (with Sold To/Recipient) or you are sending part of the order to another recipient address (with Add Recipient); otherwise, the system issues a message:</p> <p>A permanent ship to cannot be assigned - recipient present.</p>
Enter the items for the order	Select Work w/detail. See Entering Orders .
Accept, validate and process the new order	Select Accept Order. See Entering Orders .
Reject (cancel) the new order	Select Reject Order. See Entering Orders .
Enter payment information for the order	Select Payments. See Entering Orders .

Screen Option	Procedure
Enter a credit or add a miscellaneous charge to the order	Select Charges. See Adding Miscellaneous Charges or Credits in Order Entry .
Review the totals for the current order plus any other related (recipient) orders	Select Summary. See Displaying More Options in Order Entry .
Enter or verify the complete address	Select Expand Address. See Expanding the Address in Order Entry .
Enter a recipient address	Select Add Recipient.
Copy the sold to customer's information to the recipient address lines.	Select Copy Sold. See Copying the Sold To Customer Address .
Enter or change additional order information regarding shipping and delivery	Select Properties. See Defining Order Properties .
Enter messages for the order, such as a birthday message or delivery instructions	Select Messages. See Adding Order Messages .

Assigning a Billing Address in Order Entry

Purpose: Use this option to enter or select a billing address for the current order being paid on-account.

Here are some examples where you might use a billing account:

- when the customer is placing an order for a company and wants to bill the corporate headquarters for the order, or
- when the customer is placing an order and charging it to his/her parent's credit card, or
- when the customer wants to pay on-account.

Note:

The value in the [Create/Assign Bill To Customers in Order Entry \(A76\)](#) system control value controls whether you can set up a billing account for a customer during Order Entry or only through the Customer table.

In this topic:

- [Related System Control Values](#)
- [Select Customer Bill To Window](#)
- [Create Customer Bill To Screen](#)
- [Scan Customer Bill to By Match Code Screen \(Using an Existing Billing Account\)](#)

- [Display Customer Bill To Screen](#)
- [Change Customer Bill To Screen \(Selecting, Changing, or Excluding a Billing Account\)](#)

Billing addresses are addresses where you send the invoice for an order.

A customer can have only one billing account; however, more than one customer can use the same billing account.

You can set up a billing account for a customer by entering the account number in the *Bill to* field in the Customer table. This is useful if you want your customers to fill out an application for an account and select a credit limit for the customer instead of opening a billing account for the customer during Order Entry. This helps you control your credit risk.

Related System Control Values

These system control values control how the system creates new bill-to customers:

- [Create/Assign Bill To Customers in Order Entry \(A76\)](#) controls whether the system allows you to assign a bill-to customer to a sold-to customer in Order Entry. In this case, the system uses the sold-to customer information for the new bill-to customer.
- [Allow Order for New Bill-to Without Order Hold \(D84\)](#) controls whether orders associated with a new bill-to customer, created automatically by the system in Order Entry, goes on UB (unreferenced bill-to) hold.

Select Customer Bill To Window

How to display this window: Select Bill To at the [Work with Order Screen](#) when entering an order for a customer who is not already assigned to a bill-to.

At this window, you can enter the number of the billing account for this customer or enter information in any of the scan fields to locate the desired account. Otherwise, you can select Create here to set up a new billing account for the customer.

Field	Description
Order#	A unique number to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Customer name (Unlabeled field to the right of the Order# field)	The customer last name, first name, and initial or the name of the company placing the order. <i>Alphanumeric, 41 positions; display-only.</i>
Account# (Billing account number)	A number to identify the billing account. Enter a billing account number here to attach an existing billing address to the current order. <i>Numeric, 7 positions; display-only, assigned by the system.</i>
Match code	A code, made up of parts of the customer's name and address, which is used to identify duplicate customers. See Setting Up Match Codes (MMCH) . <i>Alphanumeric, 15 positions; optional.</i>

Field	Description
Postal code	A code for a postal delivery area. You can enter a postal code and last name or a postal code and company name to narrow down your search for a billing account. <i>Alphanumeric, 10 positions; optional.</i>
Last name	The last name used on the billing account. <i>Alphanumeric, 25 positions; optional.</i>
Company name	The company name used on the billing account. <i>Alphanumeric, 30 positions; optional.</i>
Telephone #	The daytime, evening or third (fax or mobile) phone number for the billing account. <i>Phone #: Alphanumeric, 14 positions; optional.</i> <i>Type: Alphanumeric, 1 position; optional.</i>

Screen Option	Procedure
Create a new billing account to use for this order	Select Create to advance to the Create Customer Bill To Screen .

Create Customer Bill To Screen

Purpose: Use this screen to create a billing account for the current order. Any invoices for this order will be sent to this address.

How to display this screen: Select Create at the [Select Customer Bill To Window](#).

Field	Description
Order#	A number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Customer name (unlabeled field to the right of the Order# field)	The last name, first name and initial or the company name of the buyer (customer who is placing the order). <i>Alphanumeric, 41 positions; display-only.</i>
Account# (Billing account number)	A number assigned by the system to identify a billing account. The system assigns a billing account number to every customer placing an order on credit. <i>Numeric, 7 positions; display-only, assigned by the system.</i>
Name	The full name of the customer on the billing account. This may include a prefix (such as Mr. or Dr.), first name, initial, last name, and suffix (such as Jr. or III). <i>Alphanumeric, 47 positions; name or company name are required.</i>
Company	The company name on the billing account. <i>Alphanumeric, 30 positions; name or company name are required.</i>

Field	Description
Address	<p>The full address for the billing account.</p> <p>The first address line is for the street address. This is the primary delivery address. Enter P.O. Box and the box number here if the address represents a post office box.</p> <p>Address lines 2-4 are for additional address information or international addresses.</p> <p><i>Alphanumeric, 32 positions each line; address line #1 is required, address lines 2-4 are optional.</i></p>
Apt/Suite (Apartment/Suite)	<p>The apartment, suite, rural route or floor number for this billing address.</p> <p>To enter an apartment or suite address:</p> <ol style="list-style-type: none"> 1. Enter APT to indicate an apartment or STE to indicate a suite. 2. Insert a space. 3. Enter the number of the apartment or suite, such as: APT 4 or STE 1164A. <p><i>Alphanumeric, 10 positions; optional.</i></p>
Postal code	<p>The postal or zip code for the billing address.</p> <p>Required? A postal code is required only if the <i>Require postal code?</i> flag for the country is selected; see Setting Up the Country Table (WCTY).</p> <p>Postal code validation: If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <p><i>Alphanumeric, 10 positions; required or optional based on country.</i></p>
City	<p>The city associated with this billing address.</p> <p><i>Alphanumeric, 25 positions; required.</i></p>
St (State)	<p>The state or province of the billing address.</p> <p>Defined where? State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY).</p> <p>Required? A state is required only if the <i>Require state?</i> flag for country is selected. See Setting Up the Country Table (WCTY).</p> <p>SCF validation: If the <i>Require postal?</i> flag for the country is selected, the system validates that the state you enter is assigned to the SCF associated with the postal code. See Working with SCF Codes (WSCF) for background.</p> <p><i>Alphanumeric, 2 positions; required or optional based on country.</i></p>
Ctry (Country)	<p>The code for the country associated with this billing address.</p> <p>Country codes are defined in and validated against the Country table.</p> <p>A country code may default here from the Default Values for Orders screen or the System Control table; however, you can override this code.</p> <p><i>Alphanumeric, 3 positions; required.</i></p>

Field	Description
Delivery	<p>A code to identify this address as a commercial or residential address.</p> <p>This code is used for calculating shipping charges for shippers who use different shipping rate tables when shipping to a business or home.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Business • Residential • No Distinction (This is not a valid value for a UPS shipper). <p><i>Required.</i></p>
Email address	<p>The bill-to customer's email address. See Email Address Validation for information on how the system verifies that your entry is formatted correctly.</p> <p><i>Alphanumeric, 50 positions; optional.</i></p>
OptIn	<p>Indicates the preferred method of correspondence for the bill-to email address.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • All E-Mail = Email is the preferred method of correspondence. • Order E-Mail Only = Use email for order-related correspondence only; generate a document for other correspondence. • No E-Mail = Do not use email for any correspondence; generate a document instead. • Do Not Ask = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>Defaults from the Default Opt In/Opt Out Flag (G97) system control value, but you can override it.</p> <div data-bbox="906 1272 1458 1444" style="border: 1px solid #0070c0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>The above value uses the letter O, not the number 0 (zero).</p> </div> <p><i>Required.</i></p>
Telephone country code	<p>A code that determines how telephone numbers display for this country. The system reformats the telephone number for the screen based on this code.</p> <p>The telephone country code is important because the format for telephone numbers differs between countries.</p> <p>The country code may also be referred to as the country prefix. For example, the country code for France is 33. You must enter the country code (and, optionally, the city code) before the local number to make an international call.</p> <p><i>Numeric, 3 positions; display-only.</i></p>

Field	Description
Telephone numbers	<p>Three different fields are available for you to enter the daytime (business), evening, and third (fax or mobile) phone numbers for this billing address.</p> <p>NOTE: The Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mbl</i> (mobile) number.</p> <p>Phone number format: You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator.</p> <p>Example:</p> <p>An operator enters a phone number containing 10 numbers: 5085550100. The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100</p> <p>When an operator enters a phone number containing 10 numbers (as in the example), the phone number displays so that the first 3 positions are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100 and no format exists for 6 numbers, the phone number would display as it was entered (5550100). See Setting Up the Country Table (WCTY).</p> <p><i>Alphanumeric, 14 positions each telephone number; optional.</i></p>

Screen Option	Procedure
Use the name and address of the buyer as the billing address	Select Default Sold To, then select OK.

Scan Customer Bill to By Match Code Screen (Using an Existing Billing Account)

Purpose: This window displays fields for you to enter the number of the billing account you want to use on the order or for you to search for a billing account by using any of the scan fields.

Scan types: You can locate an existing billing account by using the scan fields. Simply enter information in any of the scan fields to display a scan screen that lists billing accounts that match your entries.

Several scans are available, such as scan by...

- Match code

- Postal code only
- Postal code and last name
- Postal code and company name
- Last name only
- Company name only
- Telephone number

Scanning instructions: You can enter all or some information into any of the scan fields. For example, you can enter J or JONES in the *Last name* field to locate the billing account set up for Jones Plumbing Supply.

When you enter information in the scan fields, you advance to a scan screen that lists the billing accounts that closely match the information entered. The billing accounts are listed alphabetically or numerically from the first record that matches your entries until the end of the table.

How to display this screen: Enter information in the *Match code* field.

Screen Option	Procedure
Select a billing account to use for this order	Select a billing account. See Change Customer Bill To Screen (Selecting, Changing, or Excluding a Billing Account) .
Review the name and address on the billing account to verify it's the account you want to use	Select Display for a billing account to advance to the Display Customer Bill To Screen .
Create a billing account for this order	Select Create to advance to the Create Customer Bill To Screen .

Display Customer Bill To Screen

Purpose: Use this screen to verify the name and address on a billing account before you select the billing account for the current order.

How to display this screen: Select Display for a billing account listed on a scan screen.

Field	Description
Account # (Billing account number)	A number to identify the billing account. <i>Numeric, 7 positions; display-only, assigned by the system.fff</i>
Name	The prefix, first name, initial, and last name of the person set up on the billing account. <i>Alphanumeric, 41 positions; display-only.</i>
Company	The name of the company associated with the billing account. <i>Alphanumeric, 30 positions; display-only.</i>
Address	The full address for the billing account. The first address line is for the street address. This is the primary delivery address or where P.O. box information displays. Address lines 2-4 are for additional address information or international addresses. <i>Alphanumeric, 32 positions each line; display-only.</i>

Field	Description
Apt/Suite (Apartment/Suite)	The apartment, suite, rural route or floor number for this billing address. <i>Alphanumeric, 10 positions; display-only.</i>
Postal code	The postal code or zip code for this billing address. This code represents a delivery area. <i>Alphanumeric, 10 positions; display-only.</i>
City	The city associated with this billing address. <i>Alphanumeric, 25 positions; display-only.</i>
St (State)	The code for the state or province associated with this billing address. <i>Alphanumeric, 2 positions; display-only.</i>
Ctry (Country)	The code for the country associated with this billing address. Country codes are defined in and validated against the Country table. <i>Alphanumeric, 3 positions; display-only.</i>
Delivery	A code to identify this address as a commercial or residential address. This code is used for calculating shipping charges for shippers who use different shipping rate tables when shipping to a business or home. Valid values are: <ul style="list-style-type: none"> • Business • Residential • No distinction (not valid for UPS shippers). <i>Display-only.</i>
Email address	The bill-to customer's email address. See Email Address Validation for information on how the system verifies that your entry is formatted correctly. <i>Alphanumeric, 50 positions; display-only.</i>
OptIn	Indicates the preferred method of correspondence for the bill-to email address. Valid values are: <ul style="list-style-type: none"> • O1 (All) = Email is the preferred method of correspondence. • O2 (Order) = Use email for order-related correspondence only; generate a document for other correspondence. • O3 (None) = Do not use email for any correspondence; generate a document instead. • O4 (Don't Ask) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <i>Display-only.</i>

Field	Description
Telephone (Telephone country code)	<p>A code that determines how telephone numbers display for this country. The system reformats the telephone number for the screen so you can easily contact the customer.</p> <p>The telephone country code is important because the format for telephone numbers differs between countries.</p> <p>The country code may also be referred to as the country prefix. For example, the country code for France is 33. You must enter the country code (and, optionally, the city code) before the local number to make an international call.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Telephone numbers	<p>The day, evening and third (fax or mobile) phone numbers defined for this customer.</p> <p>NOTE: The Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the <i>Fax</i> or <i>Mobile</i> number.</p> <p>You can define a telephone number format to map to the phone numbers operators enter into the system.</p> <p><i>Alphanumeric, 14 positions each telephone number; display-only.</i></p>

Change Customer Bill To Screen (Selecting, Changing, or Excluding a Billing Account)

Purpose: Use this option to:

- select a billing account for the current order, or
- update billing information, or
- remove the billing account from the current order

How to display this screen: Enter a billing account number in the *Account#* field on the [Select Customer Bill To Window](#) or select a billing account from a scan screen.

To select: Select OK at this screen to use this billing account for the current order. The billing account is used automatically for the order.

If it is not the correct account or if the current order will not be purchased on-account, you must use the option to exclude the billing account.

To change: You can update the billing address as needed by entering over any information on the [Change Customer Bill To Screen \(Selecting, Changing, or Excluding a Billing Account\)](#). The system updates the Bill To table automatically with these changes.

To exclude: Select Excl. from order at the [Change Customer Bill To Screen \(Selecting, Changing, or Excluding a Billing Account\)](#) to remove the billing account from the current order only. You may do so if the account is not the account you want to use or if the customer normally pays on-account, but will not do so on the current order.

Screen Option	Procedure
Remove the billing account from the current order	Select Exc. from order.

Defining Order Properties

Purpose: Use this screen to further define the current order or to advance to additional fields that are unavailable on the initial Order Entry screen.

The Order Ship-to Properties screen displays order-level defaults that you can override at the item level, if necessary. However, the values on this screen are used if you do not enter overrides at the item level.

The information you enter on this screen affects only the current order; you can set different order properties for any secondary orders (order ship-to's), except where noted in the field descriptions. Additionally, your entries on this screen do not update the customer record.

Work with Order Ship to Properties Screen

How to display this screen: Select Properties on the [Work with Order Screen](#).

Field	Description
Order #	A unique number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Ship-to number (Unlabeled field to the right of the order number)	A hyphen (-) separates this field from the <i>Order#</i> field. Indicates the number of shipping addresses for the order. The system assigns a sequential ship-to number to every order, even if the shipping address and the sold-to address are the same. The first ship-to address is assigned the number 1. <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Alt Ord	The order number, if any, that was passed through the <i>Generic Order Interface (Order API)</i> and used to identify the order in an external system. In the case of a retail pickup or delivery order assigned through the Order Orchestration Integration , this is the order number in the system originating the order. The system assigns an Order Administration order number at the time it creates the order. <i>Alphanumeric, 35 positions; display-only.</i> For more information see the Order Administration Web Services Guide on https://support.oracle.com (ID 2953017.1).
Weight (Order ship to weight)	The total weight of the items (based on the value in the <i>Sell weight</i> field in the Item table). <i>Numeric, 7 positions with a 2-place decimal; display-only.</i>
Arrival date	The date when the customer wants to receive the order. The current date defaults, but you can override it and enter a future date. <i>Numeric, 6 positions (in user date format); optional.</i>

Field	Description
B/O priority (Backorder priority for reservation)	<p>Determines the sequence in which orders with backordered items reserve first, where:</p> <ul style="list-style-type: none">• 0 =Lowest priority• 9 =Highest priority <p>A value defaults to this field if a priority was entered in the B/O priority (Backorder priority) field for the source code; and the header-level value, in turn, defaults to the Priority field on the order detail line.</p> <p>Priority for Immediate Reservation</p> <p>Immediate Reservation runs during Order Entry and reserves inventory for orders as they are entered. The Evaluate Backorders program uses the backorder priority to determine which backordered items receive stock first.</p> <p><i>Numeric, 1 position; optional.</i></p>
Quote Origin	<p>Indicates whether the order originated from a pre-order quote.</p> <ul style="list-style-type: none">• Selected = The order originated from a pre-order quote.• Unselected = The order did not originate from a pre-order quote. <p>See Entering Pre-Order Quotes for an overview and the required setup.</p> <p><i>Display-only.</i></p>
Calculate freight	<p>Indicates whether the system will calculate and add freight charges to the order.</p> <ul style="list-style-type: none">• Selected = Freight will be calculated.• Unselected = Freight will not be calculated; the freight method for the source is ignored. <p>To change this setting for the order, use the <i>Calculate freight</i> field at the Work with Order Screen.</p> <p><i>Display-only.</i></p>
Gift	<p>Indicates whether this order is a gift order that will be shipped to a second party. If so, no pricing information prints on the pick slip and the buyer receives a gift acknowledgment card to confirm delivery of the gift.</p> <ul style="list-style-type: none">• Selected = The order is a gift order.• Unselected = The order is not a gift order.

Field	Description
Ship complete	<p>Indicates whether all items on the order must ship together.</p> <p>When an order must be shipped complete</p> <p>The system:</p> <ol style="list-style-type: none"> 1. Reserves available inventory for the order (reserving a partial quantity for an item whenever possible). 2. Backorders the remaining inventory for the order; the item's <i>Reserved</i> field is set to 0. 3. Reserves the remaining inventory as it is received on purchase orders; the system ensures that backordered items receive inventory before new orders. 4. Creates pre-generated picks for the order <i>when all items are available</i>; the warehouse can now pick and ship the order. 5. Holds any reserved items until all items can be fulfilled. <p>When an order does not have to be shipped complete</p> <p>The system:</p> <ol style="list-style-type: none"> 1. Reserves available inventory for the order (reserving a partial quantity for an item whenever possible). 2. Creates pre-generated picks for qualifying items; the warehouse can pick and ship these items; see Selecting Order Lines for Pick Slip Preparation. 3. Backorders the remaining inventory for the order; the item's <i>Reserved</i> field is set to 0. 4. Reserves the remaining inventory as it is received on purchase orders; the system ensures that backordered lines receive inventory before new orders. 5. Prints pick slips for the remaining items; the warehouse can now pick and ship these items; see Performing Pick Slip Generation. <p>The system repeats Steps 4-5 for each backordered item until the order has been completely shipped.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = Order must ship complete; available items will be held until each item is available and the entire order can ship together. • Unselected = Items can be shipped as they become available, or backordered and shipped at a later date. <p>Defaults to selected if you have the Default Ship Complete Flag (E09) system control value selected; otherwise, this field will default to unselected.</p>
Auto can B/O (Automatically cancel backorders)	<p>Indicates whether the system will cancel any backordered items automatically for the first shipment on the order (during Confirmation, in which items are confirmed for shipment).</p> <ul style="list-style-type: none"> • Selected = Items cannot be backordered • Unselected = Items can be backordered

Field	Description
Cancel date	<p>The date when the order will be canceled if all lines have not shipped.</p> <p>The system will not reserve inventory one day prior to the order cancellation date, because the order would not reach the customer in time.</p> <p>Order Cancellation List</p> <p>Any items that have not shipped one day prior to the cancellation date appear on the Order Cancellation List.</p> <p>Customer Service uses this list of pending order cancellations to contact each customer and request more time. If this is not possible, Customer Service must cancel the order manually through Order Maintenance.</p> <p><i>Numeric, 6 positions (in user date format); optional.</i></p>
Freight override	<p>A flat freight fee for the order ship to. This fee will be used as the shipping charge on the current order, regardless of any system-calculated freight charges.</p> <p>If you change the freight override amount and a freight tax override amount exists, the system recalculates the Freight tax override amount on freight for the order ship to using the tax rate for the freight defined in the <i>OST Freight tax rate</i> field in the Order Ship To table.</p>

 **Note:**

If a freight override exists, the system does not apply any additional freight, item charges, weight charges, or service charges to the order.

Numeric, 13 positions with a 2-place decimal; optional.

Field	Description
Freight tax override	The tax override amount on freight for the order ship to. Used only if a freight override amount is defined. If defined, the system does not calculate tax on freight.

 **Note:**

- You can define a tax override amount on freight only on orders received through the *Generic Order Interface (Order API)*; see the *freight_tax_amount* attribute in the *Inbound Order XML Message (CWORDERIN)*. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- If you change the **Freight override** amount in order maintenance, the system uses the tax rate for the freight defined in the *OST Freight tax rate* field in the Order Ship To table to recalculate the freight tax override amount. The system does not update the freight tax rate based on the updated freight tax override amount.

The system stores the tax rate for the freight in the *OST Freight tax rate* field in the Order Ship To table; the system uses the freight tax rate during return and cancellation processing to determine the amount of tax on freight that should be returned or deducted during cancellation.

Numeric, 13 positions with a 2-place decimal; display-only.

Field	Description
Estimated freight	<p>Your “best guess” of the freight charges on the current order. The true freight charge will be based on the actual weight of items on the order.</p> <p>Actual (billing amount) freight method</p> <p>You can enter an estimated freight charge when using the actual freight method (as designated by selecting Actual in the Freight method field of the source code). A freight method is a means of calculating shipping charges for an order. This is an order-level freight method that uses the total weight of all the items on the order to determine what the shipping charges will be.</p> <p>The actual freight charge is determined during Confirmation or Billing by one of these methods:</p> <ul style="list-style-type: none">• Weighing the package and using the system-calculated the freight charge• Entering the freight charge manually <p>The estimated freight charge is not included in the order totals, so the <i>Fr</i>t (freight) field will be blank (unless there is a freight override) until you determine the actual freight charge.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>

Field	Description
Tax code	<p>This code determines whether the customer's purchases are taxed, and if so, how to calculate the tax. Defaults to the tax status from the Sold To Customer record for an existing customer, and defaults to unselected for a new customer. When you enter the customer's name and address, the system changes to the tax code to T if the customer is subject to tax.</p> <p>The system ignores the tax code if you use the an external tax system to calculate tax.</p> <p>The system uses these values to calculate tax on an order:</p> <ul style="list-style-type: none"> • Tax Included in Price (E70) system control value and other system control values • Country table (see Setting Up the Country Table (WCTY)) • SCF table (see Working with SCF Codes (WSCF)) • Postal Code table (see Setting Up the Zip/City/State (Postal Code) Table (WZIP)) • Customer Sold To table and Customer Tax table (see Working with Customer Tax Status) • Item and SKU tables; Item Tax Exemption table and GST Tax Exemption Status table (see Working with GST Tax Exemption Status (MGTX) and Working with Item Tax Exemptions (WITX)) • Additional Charge Code table (see Establishing Additional Charge Codes (WADC)) <p>The information that the system gathers for tax calculation purposes includes tax rates, calculation methods for the Canadian GST and PST taxes, and whether to tax freight and/or handling.</p> <p>You can set up a tax exemption as an default for a customer, or exemptions in particular states or provinces. Whenever you make any change to the shipping address on the order, you should clear the <i>Tax code</i> field and the <i>Tax identification</i> field. Clearing these fields allows the correct information to default into these fields based on the new destination address. See Working with Customer Tax Status for a discussion of how a customer's tax information defaults in order entry.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Standard Tax = Indicates that the customer is subject to all regular taxes. If the customer resides in Canada, the customer is subject to both GST and PST. • Non Taxable = Indicates that the customer's purchases are not taxed. The system will reset the field to T when you select OK. • Resale = Indicates that the customer is a reseller. A reseller is a person or company who purchases goods to sell to someone else. A reseller certificate number is required in the <i>Tax identification</i> field. The system will not calculate standard tax (in the <i>Tax</i> bucket) or VAT, if applicable, on the order. • Exempt = Indicates that the customer is considered tax-exempt. A tax-exempt certificate number is required in the <i>Tax identification</i> field. The system will not calculate standard tax (in the <i>Tax</i> bucket) or VAT, if applicable, on the order.

Field	Description
<p>Tax identification (Reseller/Exempt certificate number)</p>	<ul style="list-style-type: none"> • GST Only (Goods and Services Tax) = Indicates that the customer is a Canadian customer who is subject to the Goods and Services tax (GST) on purchases only. GST is a federal tax. <p>The System Control table defines the default GST Rate (A90); however, an override GST rate may exist for the postal code or SCF.</p> <ul style="list-style-type: none"> • PST Only (Provincial Services Tax) = Indicates that the customer is a Canadian customer who is subject to the Provincial Services tax (PST) on purchases only. <p>Tax Codes and their meaning</p> <p>Consult this table for a quick reference of each tax code, its tax status, and whether merchandise will be taxed on the order:</p> <p>Status Tax? Certificate #?</p> <p>Standard Tax yes no Non Taxable no no Resale no yes Exempt no yes GST yes no</p> <p><i>Required.</i></p> <p>The customer's tax identification number, typically the resale or exempt certificate number assigned to a customer who is identified as tax exempt (E) or as a reseller (R); otherwise, the tax identification number does not control taxability. Any combination of letters, numbers, or special characters is accepted.</p> <p>If a customer has a VAT exemption number, the tax code will default to Exempt and the words VAT EXEMPT will default in this field for any order subject to VAT. You cannot override a VAT exemption and make the order taxable. See Working with Customer Tax Status for a discussion of how tax information defaults in order entry.</p> <p><i>Alphanumeric, 30 positions; required if customer is defined as tax exempt or as a reseller; otherwise, optional.</i></p>
<p>Carrier #</p>	<p>The customer's carrier account number that will be billed when the order ships by the carrier. The customer will not receive a bill directly for the order shipping charges; the carrier delivery service will be billed for the shipment (and, in turn, bill your account).</p> <p><i>Alphanumeric, 10 positions; optional.</i></p>

Field	Description
PO#	<p>The customer's own purchase order number.</p> <p>For example, several departments within a company are requisitioning supplies. Each departmental manager creates a purchase order for these supplies, has it approved, and gives the purchase order to the office manager. The office manager places one order, with different ship-to addresses for each purchase order.</p> <p>Each purchase order represents a ship-to customer on the system, because, although the sold-to customer is the company placing the order, the recipient of each order differs by department (and purchase order number).</p> <p>The department manager may inquire into the status of his or her order by the purchase order number.</p> <p><i>Alphanumeric, 15 positions; optional.</i></p>
Broker delivery type	<p>Indicates whether the order is being fulfilled through the Order Orchestration Integration. Possible settings are:</p> <ul style="list-style-type: none">• Retail pickup = The order originated in an external system and Order Administration ships the order to the originating retail store location, where the customer picks it up• Delivery = The order originated in an external system, and Order Administration ships the order directly to the customer• Ship for pickup = The order originated in Order Administration, and Order Administration ships the order to a designated retail store location, where the customer picks it up

 **Note:**

An additional delivery type in which Order Administration assigns backordered items to Order Orchestration for fulfillment (brokered backorder) is not indicated here.

See the [Order Orchestration Integration](#) for an overview.
Display-only.

Field	Description
Sales Rep Store	The store number assigned to the order. Store numbers are defined in and validated against the Store Cross Reference table; see Work with Store Cross Reference (WSCR) . The system validates that the <i>Active</i> flag for the store on the order is selected; otherwise, an error message displays: Store is not active.

 **Note:**

The store number defined here does not have to be associated with the salesrep from the Order Header.

The [Maintain Originating Store # During Order Maintenance \(B23\)](#) secured feature controls whether you can update the *Sales Rep Store* field on the Work with Order Ship To Properties screen in Order Maintenance. If you do not have authority to this secured feature, the *Sales Rep Store* field is display-only.

Included in CWEmailOut: If the order is not fulfilled through Order Orchestration integration, the *OriginatingStore* element in the *Outbound Email XML Message (CWEmailOut)* specifies the sales rep store and the description and address information from its Store Cross Reference record. See the *OriginatingStore* element for more information.

For more information see the Order Administration Web Services Guide on <https://support.oracle.com> My Oracle Support (ID 2953017.1).

Alphanumeric, 10 positions; optional.

When you complete this screen: Select OK when you finish entering order properties. These values are associated with the current order only (except for the *Freight override/all ship-to's* field, which affects the primary order and all secondary orders) and does not update the customer record. You return to the initial Order Entry screen.

Adding Order Messages

Purpose: Use the [Work with Order Messages Screen](#) to add messages to the order for inquiry only or that optionally print on the customer's:

- Invoice
- Pick slip(s)
- Invoice and pick slip(s)
- Refund check
- Gift acknowledgments
- Custom pick slip or master pick slip
- Order Orchestration packing slip for drop ship orders

- Quotes

The messages you enter on this screen are used for the current order only. It is attached to the order you are entering, but not to any other order for the customer.

Order-level messages: These messages do not apply to specific items on the order. For item-level messages, see the [Work with Order Line Messages Screen](#).

 **Note:**

In addition to entering messages in order entry, you can also receive them through the order API as part of a new order. Also, the BROKER process writes messages when it creates a new retail pickup or delivery order; see [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#).

In this topic:

- [Print Restrictions](#)
- [More Print Flag Information](#)
- [Work with Order Messages Screen](#)

Print Restrictions

Enter as many lines as necessary for the order message, but keep in mind that, if you print the message, your messages are limited to the space available on the documents.

Your messages print only if the print program you use supports them. The Order Administration base pick slip, invoice, and refund check print programs support printing customer messages; however, your unique print programs may not. These print programs are specified in the System Control table. The related system control value names, codes, and base programs are:

SCV Description	Application Area	Base Program	Menu Option to Print	Comments
Pick Printing Program (C37)	Fulfillment	PICK G	Streamlined Pick Slip Generation (WSPS)	Prints up to four message lines flagged to print on Both or print on Picks. Messages print on any pick slips for the order.

SCV Description	Application Area	Base Program	Menu Option to Print	Comments
Refund Check Print Program (D23)	Customer Service	REFC HECK	Processing Refunds (MREF) and Reprint Refunds Screen (MREP) .	Prints up to three message lines flagged as Check Cust in the in the check stub area of the first refund check you print. Lines flagged as Check Int do not print on the base refund check. After printing, the system changes Check Cust flags to Chk Cst Msg Print and Check Int flags to Chk Int Msg Print. Change the flags back to include the messages on a subsequent refund check. When you reprint refunds, the messages from the original refund check print.
Gift Order Acknowledgment Print Program (B90)	Customer Service	GIFT ACKG	Streamlined Pick Slip Generation (WSPS)	Prints up to four message lines flagged as print on Both, print on Picks, or print as Gift Msg. NOTE: Message lines flagged as print as Gift Msg only print on gift orders.
Quote Printing Program (K73)	Order Entry	QUOT E or QUOT EG	Print/Email Quote Window in order entry/maintenance	Prints up to four message lines flagged as print on Quote. See Quote Form .

More Print Flag Information

Changing print flags/deleting message lines: The system does not prevent you from changing the print flag on an existing message line, or deleting message lines at any point; however, simply changing the flag or deleting the line may not produce the result you expect. The reason for this is that the system sometimes determines which message information to print by the position of the message line. For example, if you delete any message lines and then reprint a refund check, the correct messages do not print on the refund check because the system does not find the refund message lines in the expected positions.

To avoid errors, you should use a new line for each new message.

Reprinting refunds/additional refunds: A group of message lines remain associated with the refund check where they first print, so that if you need to reprint a refund check the correct messages appear. If there are additional transactions against the order and you print one or more new refund checks after the first check, each group of message lines is associated with the check where they first appear.

For example, you enter a prepaid order with an overpayment, and print a refund check with a message explaining the reason. Subsequently, the customer returns an item, and you generate a new refund check with a message related to the return. If at any point you need to reprint the first refund check, the system includes the original message on the reprint.

Reprinting/additional pick slips and invoices: Any eligible message lines do print each time you print or reprint a pick slip or invoice. These message lines are not associated with any particular shipments against an order.

Reprinting quotes: Any eligible message lines print each time you print or reprint a quote. See [Quote Form](#).

Maximum lines for printing: If you enter more message lines than can print on the refund check, the flags on the unprinted lines still change to a printed status after you print the check. For example, if you enter five lines with a Chk Cust flag and use the base refund check print program, only three lines print on the check, yet all five lines are flagged as printed.

Work with Order Messages Screen

How to use this screen: Select Next to enter or review additional messages, when necessary.

The option to print is available for each line of order messages. For example, if you want each line to print on the invoice and pick slips, you must enter this print code for each order message line. Alternatively, some order messages you enter may be for use by Customer Service; in this case, enter the code that specifies that the message should not print at all.

Enter the order message(s). Notice that these order messages now appear in inquiry mode, meaning that you cannot update them. You must select Add/Change to update existing order messages.

View order messages in FIFO or LIFO sequence? The word FIFO or LIFO is in the top right corner of the screen indicating if you are viewing:

- order messages in FIFO (first in, first out; meaning oldest to newest messages) sequence, *or*
- order messages in LIFO (last in, last out; meaning newest to oldest messages) sequence

Select View by FIFO/LIFO to toggle between viewing order messages in FIFO sequence or LIFO sequence; when you first advance to the screen, order messages display in FIFO sequence.

The system looks at the *Date* for the order message to determine the FIFO and LIFO sequence. Within each date, the system displays the order messages in sequence.

Example: When you view the order messages in FIFO sequence the messages are listed as:

Sequence number	Date
order message sequence 1	11/25/06
order message sequence 2	11/25/06
order message sequence 3	11/26/06
order message sequence 4	11/27/06

When you view the order messages in LIFO sequence, the messages display as:

Sequence number	Date
order message sequence 4	11/27/06
order message sequence 3	11/26/06
order message sequence 1	11/25/06
order message sequence 2	11/25/06

Default messages: Default messages are standard order or gift messages that you enter on orders on a regular basis. Instead of having to retype a standard message, the user can select from the correct message from a list. This option saves time and helps avoid typographical errors. When a user selects a default message to add to an order, the message text defaults to the *Message* field, and the print code defaults to the *Print* field; however, the user can still override the default message text and the print code or add to the default message text. For example, after selecting *Happy Birthday*, the user can modify the message line to read *Happy Birthday, Mom! Love, Alex and Beth*.

To add a default message: Use the following steps to add a default message to the Work with Order Messages screen.

1. At the Work with Order Messages screen, select the prompt arrow next to a blank *Message* field to advance to the Select Default Message Screen.
2. At the [Select Default Message Screen](#), review and select a default message. When you select a default message, the system returns you to the Work with Order Messages screen and:
 - Defaults the [Message \(Default text\)](#) to the *Messages* field.
 - Defaults the [Print Code](#) for the default message to the *Print* field.
3. Optionally, modify the *Messages* field and *Print* field for the message line.

See [Working with Default Messages \(WMSG\)](#) for more background.

Change or delete existing messages? The [Modify Existing Messages \(A30\)](#) secured feature controls the ability to change or delete an existing order message.

How to display this screen: Select Messages at the [Work with Order Screen](#) or in standard or streamlined order inquiry.

If you [Use Workflow Management \(H96\)](#):

- select Notes for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#) (tickler supervisor)
- select OK at the [Create Tickler Screen](#)
- select Notes at the [Change Tickler Screen](#) or Display Tickler Screen.

Field	Description
Order #	A unique number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Sold to (Sold-to customer number)	A number assigned by the system to identify the customer placing an order. <i>Numeric, 9 positions; display-only, assigned by the system.</i>

Field	Description
Customer name (Unlabeled field to the right of the customer #)	<p>The last, first and middle initial of the sold-to customer (the customer who is placing the order). If there is a company name, this information appears first, followed by the word ATTN: and the customer contact name.</p> <p>Last name The customer's last name. <i>Alphanumeric, 25 positions; display-only.</i></p> <p>First name The customer's first name. <i>Alphanumeric, 15 positions; display-only.</i></p> <p>Initial The initial of the customer's middle name. <i>Alphanumeric, 1 position; display-only.</i></p> <p>Company name The company name. <i>Alphanumeric, 30 positions; display-only.</i></p>
Ship to (Ship-to number)	<p>The sold-to number of the customer to receive shipment of the order, if it is different from the sold-to customer. This number is blank if the order is shipped to the sold-to customer. <i>Numeric, 9 positions; display-only, updated by the system.</i></p>
Customer name (Unlabeled field to the right of the Ship-to)	<p>The last, first and middle initial of the ship-to customer (the customer who receives the order). If there is a company name, only this information appears.</p> <p>Last name The customer's last name. <i>Alphanumeric, 25 positions; display-only.</i></p> <p>First name The customer's first name. <i>Alphanumeric, 15 positions; display-only.</i></p> <p>Initial The initial of the customer's middle name. <i>Alphanumeric, 1 position; display-only.</i></p> <p>Company name The company name. <i>Alphanumeric, 30 positions; display-only.</i></p>

Field	Description
Messages	<p>Use these fields to enter message lines for this order. These messages are attached to the current order only, and do not update the customer record.</p> <p>You can flag a message to print by entering a code in the Print field; however, you can also enter non-printing order messages for inquiry only. The customer does not see these messages.</p> <p>The system treats each order message line as a separate message, so you can specify a different printing option for each order message line.</p> <p>Default Message</p> <p>Select the prompt arrow next to a blank <i>Messages</i> field to advance to the Select Default Message Screen, where you can review and select a default message to default its message text and print code to the <i>Messages</i> and <i>Print</i> fields. Default messages are defined in and validated against the Default Message table.</p> <p><i>Alphanumeric, 60 positions each line.</i></p>
Print	<p>The code you enter in this field determines whether the order message line prints or is available for internal use only.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Both = Print on both invoice and pick slip • Check Cust = Print on refund check only • Gift Msg = Gift message • Invoices = Print on invoice only • Nowhere or blank = Do not print • Picks = Print on pick slip only • Quote = Print on the Quote Form • Check Int = Print on detachable area of refund check not visible to the customer • User = Print on the document defined by the user, such as a custom pick slip. If there is no user-defined document, the message does not print anywhere in Order Administration. <p>You must enter a print flag for each order message line to define how the system handles the message, whether it prints it, and where it prints it.</p> <p>See Print Restrictions.</p> <p><i>Optional.</i></p>
Date	<p>The date when the message was created.</p> <p><i>Numeric, 6 positions (in user date format); display-only.</i></p>
User	<p>The user ID of the person who entered the message. If the order was generated through the Generating Membership Orders (EGMO) option, the user ID identifies the person who submitted the membership generation job.</p> <p><i>Alphanumeric, 10 positions; display-only.</i></p>

When you complete this screen: Select OK when you finish entering, reviewing or deleting order messages. These order messages are attached to the current order only.

Screen Option	Procedure
Toggle between displaying order messages in FIFO (first in, first out; meaning oldest to newest message) or LIFO (last in, first out; meaning newest to oldest message)	Select View by FIFO/LIFO. The word FIFO or LIFO is in the top right corner of the screen, depending on which message order you are viewing.
Switch between having previously entered messages enterable or display-only	Select Add/Change. To change: Position your cursor in the message line and edit it as needed. You can also change the setting of the <i>Print</i> flag. Click OK when you are done. To delete: Double-click a message line to select it and then delete the text. You also need to clear the <i>Print</i> flag and click OK to delete the message.

 **Note:**

This option is not available if you do not have authority under the [Modify Existing Messages \(A30\)](#) secured feature.

Adding Miscellaneous Charges or Credits in Order Entry

Purpose: Use the [Enter Additional Charges Window](#) to add a miscellaneous charge or credit to an order.

In this topic:

- [About Default Charges](#)
- [Error Messages](#)
- [Change Additional Charges Screen](#)

Additional charges are user-defined types of charges that you can add to an order for any reason. You might establish standard additional charge codes for freight fees, special handling charges or rush shipment fees. You might also establish standard credit types of additional charge codes to reimburse the customer for long-distance telephone calls or postage fees.

The additional charges you enter on the [Enter Additional Charges Window](#) are order-level additional charges, and are not associated with any particular item. The additional charges you enter for an item (for special handling, gift wrapping, etc.) do not appear at this window.

Additional charge codes are defined in the Additional Charges table. See [Establishing Additional Charge Codes \(WADC\)](#).

Secured feature: Access to the [Enter Additional Charges Window](#) is controlled by the [Additional Charges Access \(A24\)](#) secured feature.

Entering a S/H additional charge: In these situations, you might add a special handling additional charge code on the [Enter Additional Charges Window](#):

- The item is ineligible for special handling normally, but you are making an exception,
- You are offsetting a special handling charge with a credit so that the special handling performed on an item is provided at no charge or at a reduced charge,
- The item requires special handling and carries a predefined charge; however, you are adding an additional charge for extra work performed on the item.

When you add a special handling additional charge code to the order at the [Enter Additional Charges Window](#), the [Work with Special Handling Screen](#) or [Work with Custom Special Handling Screen](#) does not open for you to define how you want to personalize the item. These screens open only when you enter a special handling additional charge code in the S/H field for the line (or when the SKU/Offer record is set to a special handling code that require a specific type of special handling).

Additionally, when you add a special handling additional charge code on the [Enter Additional Charges Window](#), the special handling code is not associated with a particular order detail line and no special handling instructions print on the pick slip for the item.

Bills when? An additional charge does not bill until the order goes through billing for some reason. If the order is already closed, you might force the additional charge to bill by adding an express-billed item to the order.

Order totals: Additional charges or discounts are added to or subtracted from the order total, but are broken out from the order totals in the *Chg* field.

Charge or credit? When an additional charge represents a credit use Field Minus or - when you enter the dollar value in the *Amount* field to identify the additional charge as a credit and back this amount out of the order total.

Entering a Credit: For example, you are crediting a customer for long-distance telephone charges because there was a problem with a previous order.

Use these steps:

1. Enter the appropriate additional charge code.
2. Enter the amount in the *Amount* field.
3. Press - to make this a negative value.
4. Select OK.

Entering a Charge: For example, you are charging a customer to special handle an item that is not typically personalized.

Use these steps:

1. Enter the appropriate additional charge code.
2. Enter the amount in the *Amount* field.
3. Select OK.

About Default Charges

You can use the [Restrict Additional Charge Amount if Default Charge \(F43\)](#) system control value and the [Enter Amount for Order Additional Charge Code \(A80\)](#) secured feature to control which operators can add additional charges to an order.

These fields affect only:

- the [Enter Additional Charges Window](#), available by selecting Additional Charges in order entry, order maintenance, and the streamlined version of Work with Return Authorizations (see [Introducing Return Authorizations \(WRTA\)](#)); and,
- the [Change Additional Charges Screen](#), available by selecting Change for an additional charge code at the [Enter Additional Charges Window](#).

These two values work in combination:

	Restrict Additional Charge Amount if Default Charge (F43) SCV is selected	Restrict Additional Charge Amount if Default Charge (F43) SCV is unselected
Enter Amount for Order Additional Charge Code (A80) authority is set to *ALLOW	The <i>Amount</i> field at the Enter Additional Charges Window is enterable only if there is not a <i>Default charge amount</i> for the additional charge code. If the additional charge code has a default amount specified, this amount defaults and you must use the Change Additional Charges Screen to override it. The <i>Amount</i> field at the Change Additional Charges screen is always enterable.	The <i>Amount</i> field is always enterable at the Enter Additional Charges Window or at the Change Additional Charges Screen . If you enter just the additional charge code for a code that has a default amount specified, this amount defaults. However, if you enter the additional charge code but enter an override amount, the override amount is added to the order.
Enter Amount for Order Additional Charge Code (A80) authority is set to *EXCLUDE	The <i>Amount</i> field is never enterable at the Enter Additional Charges Window or at the Change Additional Charges Screen .	

Error Messages

This table describes the error messages the screen might display when you enter an additional charge, and their reasons:

Error Message	Displayed when?	Description/More Information
Not authorized to access additional charges.	you select Charges to display the Enter Additional Charges Window	You do not have authority to work with additional charges. The Additional Charges Access (A24) secured feature controls this authority.

Error Message	Displayed when?	Description/More Information
Negative additional charge exceeds the limit for this order.	you enter a negative additional charge	You have attempted to add a negative additional charge that would bring the total negative additional charges on the order over the limit specified in the Negative Additional Charge Limit (E49) system control value, and if you do not have authority to exceed this limit. This authority is controlled by the Override Negative Additional Charge Limit (A60) secured feature, and applies to miscellaneous additional charges only.

Error Message	Displayed when?	Description/More Information
---------------	-----------------	------------------------------

cluded in the negative additional national charge total; also, the total is not decreased by positive additional national charges.

Error Message	Displayed when?	Description/More Information
Charge amt is restricted because there is a default defined.	you enter a charge code and an amount	This message displays if: the Restrict Additional Charge Amount if Default Charge (F43) system control value is selected, and you have authority to enter an amount under the Enter Amount for Order Additional Charge Code (A80) secured feature (otherwise the <i>Amount</i> field would not have been enterable; see About Default Charges)

Enter Additional Charges Window

How to display this screen: Select Additional Charges at the [Work with Order Screen](#), [Work with Order/Recap Screen](#), or [Work with Order Lines Screen \(Adding Items to the Order\)](#) in Order Entry.

Field	Description
Order #	A number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Ship-to number (Unlabeled field to the right of the order number)	A number to identify the shipping address on the order <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Sold-to (Sold-to customer number)	A number to identify the customer. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Customer name (Unlabeled field to the right of the sold-to number)	The customer's last name, first name, and initial. <i>Alphanumeric, 41 positions; display-only.</i>

Field	Description
Add'l chg code (Additional charge code)	<p>A code for a type of charge or credit applied to the order. Additional charge codes are defined in and validated against the Additional Charge table. See Establishing Additional Charge Codes (WADC).</p> <p>Special Handling Additional Charge Codes You can further define additional charge codes as special handling codes by entering a value in the <i>S/H fmt</i> field when you are setting up the additional charge code. Special handling refers to any type of item personalization you offer, such as engraving, monogramming, alterations, etc.</p> <p>Additional Charge Fees You can define additional charge codes for any reason, such as freight fees (such as shipments to Alaska and Hawaii), postage, guaranteed delivery (shipment guaranteed within 24 hours...), gift wrapping oversized items, and store restocking fees, for example.</p> <p>Additional Charge Credits You can define additional charge codes for any reason to credit the customer's order, such as long-distance telephone charges, no charge for freight, etc. You can enter a negative number in the <i>Amount</i> field to credit the customer. You can limit the total amount of negative additional charges applied to an order by entering a dollar value in the Negative Additional Charge Limit (E49) field in the System Control table. See Error Messages.</p> <p><i>Alphanumeric, 2 positions; required.</i></p>
Amount	<p>The amount of the charge or credit. Press - after the amount to enter the amount as a credit.</p> <p>Default charge amount If you have set up a default charge amount for the additional charge code, this amount will default.</p> <p>Is this field enterable? Not enterable if:</p> <ul style="list-style-type: none"> the Restrict Additional Charge Amount if Default Charge (F43) system control value is selected (regardless of your authority level) and there is a default charge specified for the code you entered, or you do not have the authority to enter an amount. <p>Do you have authority to enter an amount? Authority to enter a charge amount is based on the Enter Amount for Order Additional Charge Code (A80) secured feature. If selected: You can change the charge amount by selecting Change for the additional charge code once you have added it and entering a different amount at the Change Additional Charges Screen. If unselected: You will be able to enter additional charge codes only if they have default charge amounts defined. See About Default Charges. <i>Numeric, 13 positions with a 2-place decimal; required or display-only.</i></p>

Field	Description
Description	The description of the additional charge code. <i>Alphanumeric, 30 positions; display-only.</i>
Billed	Indicates whether the customer has been billed for the additional charge. Valid values are: Selected =Customer has been billed for the additional charge. Unselected =Customer has not been billed for the additional charge. If the charge has been billed, you cannot change or delete the additional charge.

Screen Option	Procedure
Enter an additional charge	Complete the additional charge code field and, depending on your settings and authority, the amount, and select OK.
Change an additional charge	Select Change for an additional charge. See Change Additional Charges Screen .
Delete an additional charge	Select Delete for an additional charge to display the confirm delete pop-up window.

 **Note:**

You can delete an additional charge only if it has not already been billed.

Freight by order weight freight method: During Order Entry, if you remove additional charges from the order when using the freight by order weight freight method, the system adds the additional charges back to the order when it calls repricing during the final order accept.

Change Additional Charges Screen

Purpose: Use this screen to change an additional charge code or the amount of the charge.

If the Restrict Additional Charge Amount if Default Charge (F43) system control value is selected, you will need to use this screen to override any default charge; however, you will be able to do so only if you have the proper authority based on the Enter Amount for Order Additional Charge Code (A80) secured feature. If you do not have the authority to change the amount, you will need to change the charge code itself, or delete the code and add a different one.

How to display this screen: Select Change for an additional code at the [Enter Additional Charges Window](#).

If the additional charge has already been billed, each field on this screen will be display-only.

Field	Description
Order#	A number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only, assigned by the system.</i>
Ship-to number (Unlabeled field to the right of the order number)	A number to identify the shipping address on the order <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Sold-to (Sold-to customer number)	A number to identify the customer. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Customer name (Unlabeled field to the right of the sold-to number)	The customer's last name, first name, and initial. <i>Alphanumeric, 41 positions; display-only.</i>
Add'l chg code (Additional charge code)	<p>The additional charge code you selected at the Enter Additional Charges Window. You can change the code only if you have the proper authority and if the charge has not been billed. To change, enter a new additional charge code.</p> <p>If the Restrict Additional Charge Amount if Default Charge (F43) system control value is selected, and if you do not have the proper authority based on the nter Amount for Order Additional Charge Code (A80) secured feature, you will not be able to enter an additional charge code that does not have a default amount specified; instead, a message will display:</p> <p>Must use an Additional charge with a default.</p> <p>Changing the additional charge code itself does not automatically change the charge amount.</p> <p><i>Alphanumeric, 2 positions; required, or display-only if the additional charge has already been billed.</i></p>
Description	The description of the additional charge code. <i>Alphanumeric, 30 positions; display-only.</i>

Field	Description
Amount	<p>The dollar amount of the charge or credit. Press - after the dollar amount to enter the amount as a credit.</p> <p>Default charge amount</p> <p>If you have set up a default charge amount for the additional charge code, this amount will default after you Tab through the <i>Amount</i> field and select OK.</p> <p>Is this field enterable?</p> <p>Not enterable if</p> <ul style="list-style-type: none"> • you do not have the authority to enter an amount, or • the additional charge has already been billed. <p>Do you have authority to enter an amount?</p> <p>Authority to enter a charge amount is based on the Enter Amount for Order Additional Charge Code (A80) secured feature.</p> <p>If selected: You can change the charge amount by typing the new amount and selecting OK.</p> <p>If unselected: At this screen, you will be able to change the additional charge code only, and only to an additional charge that has a default amount specified.</p> <p>See About Default Charges.</p> <p><i>Numeric, 13 positions with a 2-place decimal; required or display-only.</i></p>
Billed	<p>Indicates whether the customer has been billed for the additional charge.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected =Customer has been billed for the additional charge. • Unselected =Customer has not been billed for the additional charge. <p>If the charge has been billed, you cannot change the amount or delete the additional charge.</p>

Displaying More Options in Order Entry

Purpose: Select More Options on one of the following screens to display a screen that provides additional options related to order entry. These options are unavailable on the regular order entry screens.

Order entry:

- [Work with Order Screen](#)
- [Work with Order Lines Screen \(Adding Items to the Order\)](#)
- [Work with Order/Recap Screen](#)

Order maintenance:

- [Work with Order Screen in Order Maintenance](#)
- [Work with Order Lines Screen](#)

Display More Options Screen

**Note:**

Each field on this screen is display-only.

Field	Description
Order #	The number of the order and the order ship-to (shipping address) you are currently working with. <i>Order number: numeric, 8 positions.</i> <i>Ship-to number: numeric, 3 positions.</i>
Sold to	A unique number to identify the customer who placed the order, and the customer's name or company name. <i>Customer number: numeric, 9 positions.</i> <i>Name: alphanumeric, 41 positions.</i>
Bill to	The bill-to customer associated with the customer who placed the order. <i>Numeric, 7 positions.</i>

Options on this screen:

- Ticklers: select this option to work with ticklers associated with the order. See [Work with Ticklers Screen](#). *This option is available only if the [Use Workflow Management \(H96\)](#) system control value is selected.*
- Customer action notes: select this option to enter, update, delete or resolve an action issue for a customer. A pop-up action window opens each time you select the customer until the issue is resolved. See [About Customer Action Notes](#).
- Email for order: select this option to advance to the [Work with Email by Order Number Screen](#), where you can review or work with emails sent to or received from the customer related to the current order.
- Customer profile: select this option to create a demographic profile for the current customer, which may describe the customer's gender, age, income, geographic location, or other types of demographic data. See the [Work with Customer Profile Screen](#).
- Email for customer sold to: select this option to advance to the [Work with Email by Customer Sold To Number Screen](#), where you can review or work with emails sent to or received from the sold-to, ship-to, or bill-to customer on the order.
- Customer ownership: information will be provided at a later date.
- Customer notes: select this option to record or view information about the current customer. See [Edit Customer Notes Screen](#).
- Email for customer ship to: select this option to advance to the [Work with Email by Customer Ship To Number Screen](#), where you can review or work with emails sent to or received from the sold-to customer on the order.
- Void/reprint picks (order entry/maintenance only): select this option to void or reprint a pick slip for a previous order for the customer, if, for example, the customer wants to use a different shipping service. See the [Reprint/Void Pick Slips by Order Screen](#) in [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#).

- Email for customer bill to: select this option to advance to the [Work with Email by Customer Bill To Number Screen](#), where you can review or work with emails sent to or received from the sold-to or bill-to customer on the order.
- Display picks: select this option to find out the status of picks printed for an order, such as when they were printed and/or confirmed. See the [Display Pick Tickets for Order Screen](#).
- Order totals: select this option to view accumulated totals across all shipping addresses (recipients) on an order. See [Display Order Totals Window](#).
- Customer email addresses: select this option to advance to the [Work with Customer Email Address Screen](#), where you can review and work with email addresses for a sold-to customer.
- Display invoices: select this option to advance to the [Display Invoices Screen](#) where you can review invoices associated with the order.
- Letter request: This option is not currently supported.
- Ticklers: select this option to work with ticklers associated with the order. See [Work with Ticklers Screen \(order view\)](#). *This option is available only if the [Use Workflow Management \(H96\)](#) system control value is selected.*
- Customer warranty information: select this option to review, create, change, and delete customer warranty information for a product on the order. See the [Work with Customer Warranty Information Screen](#).
- Customer memberships: select this option to review or work with membership programs you use to generate periodic orders for the customer. This screen displays each customer membership for the sold-to customer on the current order. This information appears only for the customer who purchased the membership, not the recipient (if any). If the membership was created through order entry rather than the Work with Customer Membership menu option, the order number appears on this screen. You cannot create a customer membership through this screen. See [Working with Customer Memberships \(WWCM\)](#).
- Display carton contents: select this option to review the contents of a carton that has shipped.
- Display batch OM transactions: select this option to review errors created when the customer attempted to maintain or cancel this order from the web storefront. See [Working with Batch Order Maintenance Transactions \(WBOM\)](#).
- Print/Email Quotes: Select this option to advance to the [Print/Email Quote Window](#), where you can select to print the Quote form or generate the Quote Confirmation email. See [Entering Pre-Order Quotes](#).

 **Note:**

This option is available only for orders whose order type has the *Quote* option selected. In addition, this option does not display if the [Quote Printing Program \(K73\)](#) and [Quote Confirmation Email Program \(K74\)](#) system control values do not contain a value or if all of the items on the quote are soldout and the *Exclude S/O on order confirmation* field for the order type on the quote is selected.

- Customer order item history: Select this option to display the [Customer Order Item History Screen](#)
- Rewards Points: Not implemented.

For more information: Each option available from this screen is described in [Displaying More Options in OIOM](#).

Entering User Fields

Purpose: Use the [Enter User Fields Screen](#) in Order Entry to capture any type of additional information about the customer.

For more information: On setting up user-defined fields, see [Setting Up User-Defined Fields \(WUDF\)](#)

Enter User Fields Screen

How to display this screen: At the [Work with Order Screen](#) enter a new or existing customer and, based on the settings of these system control values, the Enter User Field screen opens:

- [User-defined Field Prompting for Existing Customers \(D33\)](#)
- [Customer Class for User Defined Field Prompting \(G04\)](#)

These two system control values work together to determine if:

- The system prompts for new and/or existing customers, or both.
- Whether the prompt is restricted to a particular customer class.
- Whether the [Enter User Fields Screen](#) continues to prompt until the user-defined information is supplied.

You can enter user-defined fields for customers at this screen in Order Entry only if the user-defined *File Code* is CST for Customer Sold To.

Field	Description
Customer #	A unique number to identify the customer who placed the order. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
Customer name (Unlabeled field to the right of the customer number)	The name or company name associated with the customer number. <i>Alphanumeric, 41 positions; display-only.</i>
Fields	The label associated with the user-defined field. The corresponding entry field appears to the right of the field label. User fields are defined in the User Defined Field table. Only fields identified as “input” appear on the Enter User Fields screen in order entry. You can also work with user fields through an option in customer maintenance, where “output” fields are also available. The three types of user-defined fields are: Numeric = Appear on the left side of the screen. <i>Numeric, 16 positions; optional.</i> Text = Appear in the center of the screen. <i>Alphanumeric, 30 positions; optional.</i> Date = Appear on the right side of the screen. <i>Numeric, 6 positions (in user date format); optional.</i>

Working with Order Summary Information

Purpose: Use the [Display Order Summary Screen](#) to:

- Review all of the items ordered for the current order plus any recipient orders. The Order Summary screen lists each item ordered for each shipping address so you can verify the items ordered.
- Accept the order information for the recipient you are currently working with and switch to another recipient so you can work with the order information for that recipient. When you select another recipient, the system advances you to the order header screen for the recipient you selected.
- Copy an item from a recipient to the recipient you are currently working with. When you copy an item, the system adds an order line to the current order ship-to for each item copied.
- Review the order totals in the customer's currency.

Foreign currency view: The foreign currency view is not necessary or correct if you process orders in multiple currencies by offer (the [Multi Currency by Offer \(E03\)](#) system control value is selected). In this situation, the dollar values on the order are already in the customer's currency.

This screen is available from Order Entry only.

In this topic:

- [Display Order Summary Screen](#)
- [Switching to Another Recipient](#)
- [Copying Items from One Recipient to Another](#)
- [Display Selected Items Window](#)
- [Select Order Recipient Screen](#)
- [Displaying Order Totals in Foreign Currency](#)
 - [Important Information](#)

Display Order Summary Screen

Purpose: Use this screen to review the items ordered for each recipient on the order.

How to display this screen: Select Summary or Return/Summary at the [Work with Order Screen](#) or [Work with Order/Recap Screen](#).

Field	Description
Order #	The number of the order you are currently working with. <i>Numeric, 9 positions; display-only, assigned by the system.</i>
# Rcp (Number of recipients)	The number of recipients on this order. This is the number of shipping addresses on the order. <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Prepaid	The total dollar amount prepaid on this order using checks. <i>Numeric, 20 positions with a 2-place decimal; display-only, calculated by the system.</i>

Field	Description
Balance	<p>The balance due on the order, calculated by subtracting the order total (current order plus all recipient orders) from the prepaid amount.</p> <p>If the balance is 0, this means that the customer prepaid the entire order. If the balance is negative, there is a balance due that will be charged to the customer.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, calculated by the system.</i></p>
Current recip (Current recipient)	<p>The ship-to number indicating the recipient you are currently working with.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Merch (Merchandise)	<p>The total value of merchandise on this order, which is calculated by multiplying the quantity ordered by the item's price. This amount does not include charges for freight (shipping), sales tax, or handling.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Frt (Freight)	<p>The total charge for shipping the current order plus any recipient orders.</p> <p>Shipping charges are based on the freight method defined for the source code used on the order.</p> <p>This amount also includes any service charges by ship via and order weight charges by ship via. See Working with Ship Via Codes (WVIA).</p> <p>This amount does not include any additional charges associated with shipping this item (see the <i>Frt+</i> field for these totals).</p> <p>Blank if no freight is charged on the order (<i>Calc freight</i> = Unselected).</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Frt+ (Additional freight)	<p>The total additional freight charges on the current order plus any recipient orders.</p> <p>Additional freight charges can be defined for a shipper in the Ship Via table. For example, a shipper can charge a premium for overnight or Federal Express deliveries.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>
Chg (Additional charges)	<p>The total extra charges added to the current order and any recipient orders.</p> <p>This can be an additional service charge defined for the source code or offer used on the order, an additional shipping charge for an item on the order, a guaranteed service charge defined for the offer, or any type of miscellaneous charge or credit added to the order.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Field	Description
Tax	The total sales tax on the current order and any recipient orders, based on the merchandise dollar value of the order and, optionally, freight and special handling. Tax does not accumulate here for orders subject to VAT and tax-inclusive pricing. <i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i>
Hnd	The total charge, on the current order and any recipient orders, for special handling, gift wrapping, or duty. <i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i>
Total	The grand total of all charges on the current order and any recipient orders. This includes merchandise, freight, additional freight, additional charges, tax, and handling. <i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i>
Shp (Ship To number)	The number of the shipping address on the order. <i>Numeric, 3 positions; display-only, assigned by the system.</i>
Name	The initial and last name or company name of the customer the order is shipping to. The customer or company name is included next to the first detail line for each customer. <i>Alphanumeric, 10 positions; display-only.</i>
Ln#	The line number of this item on the order. <i>Numeric, 3 positions; display-only.</i>
Qty (Quantity)	The number of units ordered of the item. <i>Numeric, 5 positions; display-only.</i>
Item	A code for a unit of inventory that you sell. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	The style of the item, such as its color or size. <i>Alphanumeric, three 4-position fields; display-only.</i>
Via	A code for the carrier or service that will deliver the order. Ship via codes are defined in and validated against the Ship Via table. <i>Numeric, 2 positions; display-only.</i>
Price	The selling price of a single unit of this item. The system calculates the price by taking into account any price breaks, source or order discounts. The system calculates the price using the pricing hierarchy in the System Control table. <i>Numeric, 13 positions with a 2 place decimal; display-only, calculated by the system.</i>
Whs (Warehouse)	A code for the warehouse the item will ship from. Warehouse codes are defined in and validated against the Warehouse table. <i>Numeric, 3 positions; display-only.</i>

Field	Description
SA (Ship alone code)	<p>Identifies whether the item can ship with other items.</p> <p>Valid values include:</p> <p>S = Ship alone: item cannot be shipped with other items. A pick prints for each unit ordered.</p> <p>M = Multi-ship: item can ship with other items.</p> <p>L = Picks print in location code sequence.</p> <p>U = User-defined.</p> <p>This information is taken from the <i>Ship alone</i> field in the Item table.</p> <p><i>Alphanumeric, 1 position; display-only.</i></p>
Item description (Unlabeled field below the Shp field)	<p>The description of the item being ordered.</p> <p><i>Alphanumeric, 120 positions; display-only.</i></p>
SKU description (Unlabeled field below the SKU field)	<p>The description of the SKU for the item.</p> <p><i>Alphanumeric, 25 positions; display-only.</i></p>
Extended price (Unlabeled field below the Whs field)	<p>The total charge for this item, which is calculated by multiplying the price of the item by the quantity ordered.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i></p>

Screen Option	Procedure
Accept the order information for the recipient you are currently working with and switch to another recipient.	Select recipient and accept current for a recipient to advance to the order header screen where you can work with the order information for the selected recipient. See Switching to Another Recipient .
Copy an item to the recipient you are currently working with	Select Copy item to current recipient for a recipient's order line that includes the item you wish to copy. See Copying Items from One Recipient to Another .
Display the order totals at the top of the screen in the customer's currency or in the system currency (from the Local Currency Code (A55) system control value).	Select Foreign Curr Dsp. See Displaying Order Totals in Foreign Currency .
Review the items selected to copy	Select Dsp Item to Copy to advance to the Display Selected Items Window .
Accept the order information for the recipient you are currently working with and advance to the Select Order Recipient screen	Select Acpt/Switch Rcp to advance to the Select Order Recipient Screen .

Switching to Another Recipient

Purpose: Select recipient and accept current for a recipient at the [Display Order Summary Screen](#).

An error message indicates if you select recipient and accept current for the recipient you are currently working with:

```
Selected ship to (3) must be different than current ship to (3).
```

When you select recipient and accept current for a recipient, the system accepts the order information for the recipient you are currently working with and advances you to the [Work with Order Screen](#) for the recipient you selected.

Copying Items from One Recipient to Another

Purpose: From the [Display Order Summary Screen](#) you can copy items from other recipients on the order to the recipient you are currently working with.

Copying items to current recipient: Select Copy item to current recipient for an item defined for a recipient other than the recipient you are currently working with. A message indicates when you select an item to copy:

```
Item (S5Y) has been selected for copy to current recipient (3).
```

An error message indicates if the item you selected to copy is included in the order for the recipient you are currently work with:

```
Selected ship to (3) must be different than current ship to (3).
```

You can copy as many items from as many different recipients as you want. The system logs the items that you have selected and does not copy them to the current recipient until:

- you select recipient and accept current for a recipient to accept the current recipient's information and switch to another recipient
- you select Exit to exit the screen.
- you select Acpt/Switch Rcp to accept the current recipient's information and advance to the [Select Order Recipient Screen](#).

When you accept the current recipient's order information, the system advances you to the [Display Selected Items Window](#). This window lists each item that you have selected to copy to the current recipient. In order to continue with the order, you must confirm the items that you wish to copy or delete them from the copy list.

Item information copied: The system copies the item to the current customer including any changes you have made to the item or any special characteristics of the item. For example:

- if you changed the price of the item and then copied the item to the recipient you are currently work with, the system would copy the item with the price you defined.
- if the item is defined as a special handling item or custom special handling item, the system advances you to the [Work with Special Handling Screen](#) or [Work with Custom Special Handling Screen](#) where you can enter the handling charge and the handling information.
- if the item is defined as a main set item, the system copies the item and its components. If you copy a component item, the system copies the item with a price of zero and retains the no charge flag and price override code.
- if the item is an accompanying item, the system defaults the accompanying item to the current recipient's order.

The system also performs the normal edits for items selected to copy to the current recipient. For example, if the item selected to copy uses a ship via that is not valid with the current recipient's zip code, an error message indicates:

Ship via (2) is not valid with ship to zip code (011).

Display Selected Items Window

Purpose: Use this window to review the items that you have selected to copy to the recipient you are currently working with and:

- add the items to the current recipient's order
- delete selected items from the copy list
- remove all items in the copy list

How to display this screen: At the [Display Order Summary Screen](#),

- Select recipient and accept current for a recipient after you have previously selected items to copy.
- Select Exit after you have previously selected items to copy.
- Select Dsp Item to Copy.
- Select Acpt/Switch Rcp after you have previously selected items to copy.

Field	Description
Item	The code for the item you have selected to copy. <i>Alphanumeric, 12 positions; optional.</i>
SKU	The SKU of the item you have selected to copy. <i>Alphanumeric, three 4-position fields; optional.</i>
Qty (Quantity)	The number of units of the item you selected to copy. <i>Numeric, 5 positions; display-only.</i>

Screen Option	Procedure
Delete an item from the copy list	Select Delete for the item you wish to delete to delete it.
Add the items on the copy list to the current recipient's order	Select OK. The system adds the items on the copy list to the current recipient's order. You can work with the items added to the order on the Work with Order Line Screen (Changing/Adding an Item) .

Note:

You can only add the items to the current recipient's order if you advanced to the Display Selected Items pop-up window by selecting a recipient or selecting Exit or Acpt/Switch Rcp.

Screen Option	Procedure
Remove all items from the copy list	Select Delete All to remove all items from the copy list. The system advances you to the Clear Selected Items pop-up window. Select OK to confirm the delete of all items or select Exit to cancel

Select Order Recipient Screen

Purpose: Use this screen to select an existing recipient to work with or add a new recipient to the order.

How to display this screen: Select Acpt/Switch Rcp on the [Display Order Summary Screen](#).

Field	Description
Order #	The number of the order you are currently working with. <i>Numeric, 9 positions; display-only.</i>
Sold to	The number and name of the customer who placed the order. <i>Sold to customer number: Numeric, 9 positions; display-only.</i> <i>Sold to customer name: Alphanumeric, 40 positions; display-only.</i>
Rcp	The ship-to number of each recipient on this order. <i>Numeric, 3 positions; optional.</i>
Customer #	A unique number assigned to each recipient on the order. <i>Numeric, 9 positions; display-only.</i>
Name	The name of each recipient on this order. <i>Alphanumeric, 40 positions; display-only.</i>
Sts (Order status)	A code that indicates the current status of the order. Valid values are: <ul style="list-style-type: none"> • Suspended • Open • Held • Cancelled • Closed • Error • Purged The system places an order in a suspended status until the order is accepted (Acpt/Switch Rcp) and processed. Enter a status code to display status codes that match your entry. <i>Optional.</i>
Merch amt (Merchandise amount)	The total dollar value of merchandise on the order, which is calculated by multiplying the quantity ordered by the item's price. This amount does not include charges for freight (shipping), sales tax, or handling. <i>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</i>

Field	Description
Address (Customer address)	The address for each recipient on this order. The address consists of the street address, city, state and zip code. <i>Street address: Alphanumeric, 32 positions; display-only.</i> <i>City: Alphanumeric, 25 positions; display-only.</i> <i>State: Alphanumeric, 2 positions; display-only.</i> <i>Zip code: Numeric, 10 positions; display-only.</i>

Screen Option	Procedure
Select a recipient	Select a recipient to advance to the Work with Order Screen of the selected recipient.
Add a recipient to the order	Select Add Recipient to create a new recipient for the order. See Adding a Recipient Order in Order Entry .

Displaying Order Totals in Foreign Currency

Purpose: Use this function to convert, then display the order totals in the customer's currency.

Note:

The foreign currency view is not necessary or correct if you process orders in multiple currencies by offer (the Multi Currency by Offer (E03) system control value is selected). In this situation, the dollar values on the order are already in the customer's currency.

Using this feature: Select Foreign Curr Dsp at the [Display Order Summary Screen](#) to convert the order totals to the customer's currency.

About currency conversion: When you select Foreign Curr Dsp, the system gets the country code for the sold-to customer (which is the customer who placed the order), then checks the Currency table.

If a currency code has been defined for this country, the system multiplies each order total bucket by the conversion rate, and displays the order totals in the customer's own currency. This way, the order total is more meaningful to the customer.

Example: A customer calls from Italy to place an order. You enter the order, then select Summary to review the order totals. Next, you select Foreign Curr Dsp to display the totals expressed in the customer's own currency. The system performs the currency conversion immediately, using the current conversion rate from the Currency table, and updates the order totals appropriately.

Important Information

- The system issues a message if there is no currency record defined for the customer's country in the Currency table, and you will not be able to view the order totals in the customer's currency when you select Foreign Curr Dsp:

No currency match found for country XXX.

- The value in the *Total* field is the sum of all other order totals fields (*Merch*, *Frt*, *Frt+*, *Chg*, *Tax*, and *Hnd*); no conversion is performed on this field.
- Currency values extending beyond 2 decimal places are rounded up or down to the nearest dollar value.
- The country code and the currency code must be the same for order totals conversion.
- The order totals are converted using the current currency rate. This means that the order totals you see on this screen may be different from the order totals at shipping time.
- Selecting Foreign Curr Dsp toggles between displaying the order totals in the customer's (foreign) currency or in the system currency.

Posting a Return or Exchange Through Order Entry

Purpose: You can use Order Entry to enter a new order for an item being returned when:

- you have converted your orders and cannot post the return against the original order number
- you have purged the original order from the system
- a customer paid for the item with more than one payment type (such as a check and credit card), but wants you to credit the credit card the full amount of the return

In this topic:

- [Return Updates in Order Entry](#)
- [Returning an Item in Order Entry](#)
- [Enter Return/Exchange Reason Window](#)
- [Exchanging an Item in Order Entry](#)

Return Updates in Order Entry

These updates occur for returns entered through Order Entry:

- order is updated to X (closed) status if the entire order is a return
- order is open if an exchange item was entered; this item reserves and ships in the normal way
- the number and dollar amount for returns are updated by the quantity returned; however, the number and dollar amount of orders are not updated
- a refund, such as a credit card credit or a refund check, will be generated for this order when you process refunds

Refund check messages: You can use the [Work with Order Messages Screen](#) to enter messages that will print on the customer's refund check. The messages will print only if you use the base refund check print program (CSR0836), or if your unique refund check printing program supports messages.

Return Authority: In order to post a return or exchange through order entry, you must have authority to the following secured features:

- [Enter Return Authorization \(A28\)](#)
- [Receive Return Authorization \(A29\)](#)
- [Credit Return Authorization \(A34\)](#)

If you do not have authority to these secured features, the system displays an error message when you try to post a return or exchange in order entry: *User is not authorized to process a return.*

Return authorization download triggers: If the [Create Return Download Triggers \(K28\)](#) system control value is selected, the system creates a return authorization download (RAD) trigger when you post a return through order entry, based on the trigger rules defined for the Return Authorization Download (RETURN_OUT) integration layer job. The RETURN_OUT integration layer job monitors for return authorization download triggers and generates a *Return Authorization Outbound XML Message (CWReturnRAOut)* to send the return authorization information to a remote system.

Returning an Item in Order Entry

Use the following steps to return an item in order entry.

1. At the [Select Customer Sold To For Order Screen](#) in Order Entry, select the customer who is returning the item.
2. Complete the [Work with Order Screen](#).
3. Enter the code for the item being returned at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).
4. At the *Qty* field, enter the number of units of the item being returned. Make sure to enter this number as a negative number to process a return.
5. Optionally, at the *Price* field, enter the price the customer paid for the item. This is the amount you will credit to the customer, and can be different from the current price of the item.
6. At the *Ovr* field, enter the reason code for overriding the price of the item, if needed.
7. Select OK to advance to the [Enter Return/Exchange Reason Window](#).

Enter Return/Exchange Reason Window

At this window, you must tell the system how to process the return.

1. At the *Return reason* field, enter the reason code for the return.
2. At the *Return disposition* field, enter the return disposition code for the return. The system uses the [Default Disposition Code \(C18\)](#), but you can override it. An error message indicates if you do not have authority to the return disposition value: *User Does not have authority to return disposition code.*
3. Enter the code for the warehouse and location to which the item is being returned. These fields default from the Item or SKU table, or from the return disposition code, but you can override them.
4. Optionally, deselect the *Refund duty* field if you do not want to refund any duty for the item. This field defaults to selected.

 **Note:**

If the *Refund duty* field is selected and duty was not calculated for the item, the system automatically updates this flag to unselected when it creates the RA Detail record.

5. Select OK. The item is added to the new order with a negative quantity and a negative dollar amount. This means that you are posting a return and crediting the customer.

The system displays an informational pop-up window when you select OK if the item has no primary location (for example, the item has been liquidated and sold through a retail outlet), and if the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value is selected.

Exchanging an Item in Order Entry

Use these steps when the customer is returning an item and wants you to send a different item.

1. At the [Select Customer Sold To For Order Screen](#) in Order Entry, select the customer who is returning the item.
2. Complete the [Work with Order Screen](#).
3. Enter the code for the item being returned at the [Work with Order Lines Screen \(Adding Items to the Order\)](#).
4. At the *Qty* field, enter the number of units of the item being returned. Make sure to enter this number as a negative number to process a return.
5. Optionally, at the *Price* field, enter the price at which the item was sold to the customer. This is the amount you will credit to the customer. This can be different from the current price of the item.
6. At the *Ovr* field, enter the reason code for overriding the price of the item, if needed.
7. Select OK. The [Enter Return/Exchange Reason Window](#) opens. At this window, you must tell the system how to process the returned item and identify the reason for the item exchange.
8. At the *Exchange reason* field, enter the reason code for the exchange.
9. At the *Return disposition* field, enter the return disposition code for the return. The Default Disposition Code (C18) defaults here, but you can override it.
10. An error message indicates if you do not have authority to the return disposition value: *User Does not have authority to return disposition code.*
11. Enter the code for the warehouse and location to which the item is being returned. These fields default from the Item or SKU table, or from the return disposition code, but you can override them.
12. Optionally, deselect the *Refund duty* field if you do not want to refund any duty for the item. This field defaults to selected.
13. Select OK. The item is added to the new order with a negative quantity and a negative dollar amount. This means that you are posting a return and crediting the customer.
14. Enter the code for the item that the customer wants to order, using a positive quantity.
15. Optionally, select Payments to add a payment to the order if the new item is more expensive than the item being returned. If the new item is less expensive, the customer will be refunded the difference when you process refunds.

The system displays an informational pop-up window when you select OK if the item has no primary location (for example, the item has been liquidated and sold through a retail outlet), and if the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value is selected.

Refunding extra charges: To credit the customer for shipping, handling or other types of charges on the returned item.

1. Select Charges to display the [Enter Additional Charges Window](#).
2. At the *Add'l chg code* field, select the appropriate additional charge code.
3. Enter the dollar amount in the *Amount* field.
4. Select OK. The *Chg* field in the order totals is updated with these credits.

Changing payment information: If the purpose of entering the return is to credit the credit card for the full amount of the item.

1. Enter the return; see [Returning an Item in Order Entry](#).
2. Select Payments to display the [Enter Payment Method Screen](#).
3. Select the appropriate code for the credit card you want to credit.
4. Complete the payment information by typing the credit card number, expiration date, authorization number, and authorization date.
5. Select OK, then Accept to accept the order.

Entering Customer Memberships in Order Entry

Purpose: You can create a standard membership or a discount-only membership for a customer through order entry by adding an item flagged as a membership (the *Membership* field for the item = Selected) to an order.

Standard membership programs allow you to generate orders periodically. Each order can include the same item(s) or differing items; additionally, you can specify monthly shipments or a different interval. For example, you could set up a membership program that ships a pound of coffee each month, or a different food item each month for 12 months. Membership programs can also include a discount percentage, which applies to all orders placed by the customer. Alternatively, you can set up a membership that does not create orders and only applies the discount percentage to the customer's orders.

Quotes: You can also create a standard customer membership in quote entry. The system performs the same updates as it would when you create a customer membership in order entry; however, the system creates the customer membership in an inactive status and does not update the status to active until you convert the quote to an order. See [Entering Customer Memberships in Quote Entry](#) for more information.

Identifying the standard membership program: When you enter a membership item in order entry, a window opens for you to specify the membership program the customer wants.

Simplify membership entry: You can simplify adding a customer membership in order entry by using the same name for the membership item and the membership program ID. For example, you can name both the membership program and name the membership item MEMB01; when an operator enter the item MEMB01 in order entry, the membership ID MEMB01 defaults in the pop-up window.

Overriding membership defaults: When you add a standard customer membership in order entry, you can accept the default settings from the membership program or override them. For example, a membership program might specify monthly shipments, but you can override this setting to generate orders every other month.

You can override the information that defaults from the membership program only if the membership type permits it.

Soldout membership: If the membership item is soldout, the system updates the status of the order line to S (Soldout) and does not display the Membership window. If the membership item is sold out, the system does not generate a customer membership.

Order message: If the [Write Order Messages for Membership Rotation \(K04\)](#) system control value is selected, the system writes an order message indicating the description of the membership program and the first date when it is eligible for order generation. This order message is flagged to print on the pick slip. See the system control value for more information.

Loyalty memberships: You cannot create a loyalty customer membership in order entry; instead, the background jobs create or deactivate loyalty memberships based on order activity. See [Loyalty Memberships](#) for an overview.

In this topic:

- [Enter Membership ID Window \(Selecting a Membership Program\)](#)
- [Customer Membership Details Screen \(Overriding Customer Membership Defaults\)](#)
- [Information that Defaults from the Order to the Customer Membership](#)
- [Discount Applied Window \(Membership has a Discount Percentage\)](#)
- [Order Total Window \(Reviewing the First Order Total\)](#)
- [Specifying a Cash Amount for the Membership](#)
- [Additional Information on Memberships in Order Entry](#)

Enter Membership ID Window (Selecting a Membership Program)

Purpose: Use this window to select a standard membership program for the customer.

How to display this screen: Add a membership item to an order or quote at the [Work with Order Lines Screen \(Adding Items to the Order\)](#). A membership item is an item whose *Membership* field is selected. See [Performing Initial Item Entry \(MITM\)](#), for more information on setting up membership items.

Membership ID field: If the membership item you entered has the same name as a membership program ID, the matching membership ID defaults. Otherwise, you will need to enter or select a membership program ID. The membership ID is a 12-position, alphanumeric field; it is defined in and validated against the Membership Program table. See [Working with Membership Programs \(WWMP\)](#).

Instructions:

1. Enter the ID for the membership the customer is ordering, or override the default if desired.
2. Select OK. The system validates your entry and highlights the *Membership ID* field if you need to correct it. Correct the field if necessary and select OK again.

Note:

You cannot enter a membership ID for a loyalty membership program. See [Loyalty Memberships](#) for an overview.

3. To create a customer membership using all defaults from the membership program, select Accept. To override any of the defaults from the membership program, or to review the membership settings, select View/Edit. Otherwise, select Exit to cancel adding the membership to the order.

The particular information that you can override depends on the membership program type. If the membership type prohibits overrides, you will be able to change only the payment and shipment information.

If you accept without overrides: The system adds the membership item to the order and creates the customer membership.

To make any changes to the membership, including canceling it:

- in quote or order entry: select Options to advance to the Display More Options screen, and select Customer Memberships. See [Displaying More Options in OIOM](#).
- separate menu option: use the Work with Customer Memberships menu option. See [Working with Customer Memberships \(WWCM\)](#).

If you choose to override it: You advance to the [Customer Membership Details Screen \(Overriding Customer Membership Defaults\)](#). From this screen, you can:

- add or change items to include in the membership
- advance to the Customer Membership screen in Change mode, where you can work with shipment intervals, discounts, pay type information, shipping address, and other header-level settings.

The types of changes you can make are controlled by the membership program type. See [Customer Membership Details Screen \(Overriding Customer Membership Defaults\)](#).

If you select Exit: The system does not create the customer membership, and the membership item is not added to the order. You can select Delete for the membership item to delete it.

Customer Membership Details Screen (Overriding Customer Membership Defaults)

Purpose: Use this screen to change any items that have defaulted from the membership program to the customer membership, or to add items.

You can also advance from this screen to the Customer Membership screen in Change mode, where you can work with shipment intervals, discounts, pay type information, shipping address, and other header-level settings.

How to display this screen: Select View/Edit at the [Enter Membership ID Window \(Selecting a Membership Program\)](#).

You can change information on this screen only if the membership program's type allows changes; otherwise, each field is display-only. See [Working with Membership Programs \(WWMP\)](#).

About this screen: See [Working with Customer Memberships \(WWCM\)](#) for more information on this screen and on changing customer memberships.

Information that Defaults from the Order to the Customer Membership

Paytype: The paytype from the order defaults to the customer membership. This default occurs after you accept the order.

A cash or check pay type will default to the customer membership only if there is not a “catch-all” pay type on the order as well; in any other situation, the “catch-all” will always default to the membership.

If you enter paytype information for the customer membership, the paytype from the order does not override it.

If there is more than one membership on the order, the pay type information defaults to the first membership only. You will not be able to generate any orders for the second membership unless you update the membership directly.

Recipient: If you enter a recipient address by selecting Sold To/Recip or Accept/Add Rcp in order entry, the system defaults the recipient customer's number to the customer membership. However, if you also enter an alternate address for the customer membership, the system uses this address.

If you enter multiple recipients using Accept/Add Rcp, and order a membership item for each recipient, the system creates a separate customer membership for each. However, if you do not enter payment information before pressing Accept/Add Rcp to advance to the next recipient, the payment method will apply to the first membership you create only.

You cannot select a ship-to address for a recipient customer in order entry.

Alternate address, no default: If you enter an alternate address by selecting Order Ship To in order entry, this address does NOT default to the customer membership; this is an order-level address only. You need to enter any alternate address on the membership itself.

Customer ship-to: If you select Cust Ship To to select a ship-to customer in order entry, this ship-to number defaults to the customer membership. When you review the customer membership, you will see that the sold-to customer number appears in the *Recipient #* field, because the ship-to number on a customer membership refers to the recipient customer number (unlike order entry). The system ensures that the correct ship-to number is assigned to the customer membership by defaulting the sold-to customer number in the membership *Recipient #* field.

Even if there is a recipient for the membership, any discount defined for the membership applies to the customer who places the order.

Ship via: If there is no Ship via specified for the membership program at the [Membership Program Screen](#), the system defaults the current ship via on the order header to the customer membership. If you subsequently change the ship via on the order header, or if the system overrides the ship via for the order automatically, it does not automatically change the ship via on the customer membership. See [Ship Via Override Hierarchy](#) for more information on how the system might override the ship via on the order header.

See Working with Customer Memberships (WWCM).

Discount Applied Window (Membership has a Discount Percentage)

Purpose: If you enter a membership that includes a discount percentage, that percentage defaults to the order header whenever the customer places an order, including the current order in which you are entering the membership itself. As a result, the system displays a window immediately after you enter the membership:

If more than one membership discount: If you enter more than one membership that includes a discount on the same order, the discount percentage from the first membership you enter defaults to the order header and applies to the current order. The second (or subsequent) membership discount for the sold-to customer does not apply to the order on

which you enter it; however, on any subsequent orders, the system selects the highest membership discount percentage to default onto the order header.

Example: You enter an order for membership MEMB01, which includes a 10% discount, and membership MEMB02, which includes a 15% discount. Since you enter MEMB01 first, a 10% discount applies to the current order. However, when you enter any subsequent orders for the sold-to customer, a 15% discount defaults to the order header as long as the MEMB02 is active.

Additional repricing and discounts may also apply, depending on the pricing values and special offers you have set up in your company.

Applies to sold-to customer only: Any discount percentage applies only to the customer who places the order, not the recipient of the order and membership.

Order Total Window (Reviewing the First Order Total)

Purpose: Use this window to review the estimated dollar total of the first order you will generate for the membership.

How to display this screen: Select Accept to accept the order if the [Display First Membership Order Total \(G14\)](#) system control value is selected. If the order was prepaid, this window opens after you have entered a cash amount for the membership. For quotes, this window does not display until you convert the quote to an order and select Accept to accept the order.

Quotes: This window does not display until you convert a quote to an order and select Accept.

About this window: This window indicates the next rotation eligible for order generation. When you review this window in order entry, the rotation will always be 1.

Order total an estimate: The order total that appears in this window includes merchandise and tax. It also includes projected freight charges if the ship via on the order does not match the [Best Way Ship Via for Auto-Assignment \(J67\)](#). This order total is an estimate only. The actual order total when you generate the first order may vary, depending on changes to pricing, using various freight methods, including special charges, and so on.

Specifying a Cash Amount for the Membership

Purpose: When you create a customer membership by entering a prepaid order, you can specify the amount of the prepayment to apply to orders you will generate for the membership. Only cash or checks (payment category 1) can apply to memberships. See [Working with Pay Types \(WPAY\)](#).

When you first enter a prepayment amount that is greater than the current order total, the system displays a message:

```
Order total not equal to paid amount.
```

Select OK to confirm the prepayment amount.

Cash Amount for Membership Window

Allocate cash for membership: When you accept the order, the system displays this window for you to specify the amount of the prepayment to apply to orders you will generate for the customer membership, rather than the current order:

The amount of the prepayment defaults. Enter the amount that should apply toward orders generated for the membership; the remaining amount will be available to pay for the current order.

For example, the customer sent a check for \$50.00, and the current order total is \$20.00. You would enter \$30.00 in the window to apply \$30.00 to the membership, and leave \$20.00 to apply to the current order.

The system allows you to enter any amount, as long as it is not more than the payment method amount. However, when you generate the first order for the membership, it will go on hold because of a balance due if the cash amount is insufficient.

Amount remaining toward current order: Any amount you do not apply to the customer membership is applied to the current order. If this amount is less than the current order total (and if there is not another, sufficient payment method on the order) the order will go on hold. If this amount is more than the current order total, the system will generate a refund.

If more than one prepayment method: When entering more than one prepayment method on the order, you should enter the prepayment method that should apply to the membership first. If there is more than one prepayment method on the order, the amount of the first prepayment defaults in the window. You will not be able to enter an amount greater than this first prepayment method.

For example, a customer sends a check for \$10.00 and a check for \$60.00. The order total is \$20.00. When you are entering the payment information on the current order, you should enter the \$60.00 check first, so that the Cash Amount for Membership window defaults to \$60.00; this way, you can apply \$50.00 to the membership and leave \$20.00 for the current order. If you entered the \$10.00 check first, then \$10.00 would default in the window, and you would not be able to enter an amount greater than \$10.00; the system would create a refund for the remaining \$40.00 from the \$60.00 check as an overpayment.

Review payment in order inquiry: When you review payment information for the order in standard or streamlined order inquiry, the amount of the payment method will equal the difference between the original prepayment amount and the amount applied to the membership.

For example, if the customer sent a check for \$100.00, and you applied \$80.00 to the membership, the payment amount on the order appears in order inquiry as \$20.00.

You can review payment information in standard or streamlined order inquiry by selecting Payments. See [Reviewing Financial Information on an Order](#).

Order history message: The system writes a message to Order History when you apply a prepayment amount to a customer membership.

```
3/30/06 M Cash applied to membership(MEMB01) 10.00 EJOHNSON
```

The membership ID appears in parentheses.

You can review this message in standard order inquiry by selecting Order History and in streamlined order inquiry by selecting History. See [Display Order History Screen](#).

If more than one membership on the order: If you enter a prepaid order that includes more than one membership, the cash amount posts to the first membership on the order only.

Additional Information on Memberships in Order Entry

Please note these guidelines regarding creating customer memberships through order entry:

Deleting/rejecting the membership:

- Deleting the membership item from a quote also deletes the customer membership. When you select Delete for a membership item to delete it during quote entry, the system will not create the customer membership. When you select Delete for a membership item to delete it during quote maintenance, the system deletes the customer membership. See [Entering Customer Memberships in Quote Entry](#).
- Deleting the membership item from an order does not cancel the customer membership. If you select Delete for a membership item to delete it, the customer membership will still exist, and will generate orders to the customer. To delete or cancel the membership:
 - Use the Work with Customer Memberships menu option (fast path = WWCM), or
 - Select Options in order entry to advance to the Display More Options screen, and select Customer Membership.

To delete immediately: If you select View/Edit at the [Enter Membership ID Window \(Selecting a Membership Program\)](#), you can then select Header at the [Customer Membership Details Screen \(Overriding Customer Membership Defaults\)](#), and finally, select Reject at the Customer Membership screen to delete the membership. However, you can only follow these steps while you are first entering the membership item.

Rejecting the order deletes the customer membership. If you reject the entire order or quote, the system deletes the customer membership as well.

Entering multiple memberships: *When entering the membership item, do not use a quantity greater than one.* Each time you enter a membership item, you can create only one customer membership, regardless of the item quantity you enter. To create two memberships with different recipients or shipping addresses, enter the same membership item twice.

If you enter more than one membership on an order, the pay type from the order defaults to the first membership only. You must enter pay type information for the second membership.

Additional considerations:

- Changing a customer membership: *A membership can be assigned to a type that does not permit changes.* If a membership program's type prohibits changes, you will not be able to override any of the settings that default from the program for an individual customer membership. For example, you will not be able to add or change any items, or change the shipment intervals.
- Discount applied to membership item? *If the membership includes a discount, the price of the membership itself will be discounted unless you flag the item.* You should deselect the *Discountable* field for the item to prevent the price of the membership from being discounted.
- If the membership item is the only item on the order: *In this situation, the order will be closed the next time you generate pick slips (provided the credit card on the order, if any, passes authorization).*
- Working with a membership during order entry but after adding it to the order: *To work with the membership during order entry, but after you have selected Accept to add it, select Options to advance to the [Display More Options Screen](#). and select Customer Memberships.*

- “Best way” ship via override: If the ship via for the membership matches the [Best Way Ship Via for Auto-Assignment \(J67\)](#), the system automatically assigns the “best way” ship via with the lowest overall shipping charges when generating a membership order. See that system control value for more information.
- Order message: If the customer membership is not discount-only (that is, if there are items specified to include on generated orders) and if the Write Order Messages for Membership Rotation (K04) system control value is selected, the system writes an order message indicating the description of the membership program and the first date when it is eligible for order generation. This order message is flagged to print on the pick slip. See that system control value for more information.

Entering Coupon Promotions on an Order

Purpose: Use the [Coupon Discount Window](#) to work with coupon promotions that provide dollar or percentage discounts on an order or order detail line. Unlike the discount amounts that you can enter at the [Enter Coupon Discount Amount Window](#), coupon promotions can be restricted to particular source codes, offers, or qualifying items. There are two types of coupons:

- order-level (Coupon type = O): the discount applies to all eligible order detail lines.
- detail-level (Coupon type = D): the discount applies to the selected order detail line only.

You can use the Coupon Discount window to:

If you advance to the window by selecting Coupons for an order line:	If you advance to the window by selecting Reprice in order entry/maintenance:
<ul style="list-style-type: none"> • add an order-level coupon • add a detail-level coupon to the item on the order line • delete an order-level coupon • delete a detail-level coupon that was applied to the item on the order line • review order-level coupons • review detail-level coupons applied to the item on the order line • automatically reprice the order and apply order-level and detail-level coupon discounts if the Automatically Reprice Coupon (K02) system control value is selected 	<ul style="list-style-type: none"> • add an order-level coupon • delete an order-level coupon • review order-level coupons • apply order-level and detail-level coupon discounts to all eligible items <p>See Selecting Reprice (Working with Order-Level Coupons).</p>
<p>See Selecting an Item (Working with Order-Level and Detail-Level Coupons).</p>	

Restrictions and requirements for displaying this window:

- This window is available only when the Price method for the source code on the order header is set to D (regular plus reprice) and you have created one or more coupons through [Working with Coupon Promotions \(WCPR\)](#).
- In standard order inquiry, you can review coupons but not make any changes.
- You cannot make any changes to the coupons on an order if any of the order detail lines has a printed pick, or is in a closed (X) status.
- The system applies any changes you enter in order maintenance only if you have the [Price Tables \(E07\)](#) system control value at the [Pricing Values \(B31\)](#) screen selected.

For more information: See Working with Coupon Promotions (WCPR) for an overview on how coupon promotions work, and information on how to set up coupon promotions. Also, see [Order Repricing, Premiums, Discounts, and Promotions](#) for information on the windows and screens that open in order entry when you select the Reprice option.

In this topic:

- [Coupon Discount Window](#)
- [Selecting an Item \(Working with Order-Level and Detail-Level Coupons\)](#)
- [Selecting Reprice \(Working with Order-Level Coupons\)](#)
- [Understanding Coupon Error Messages in Order Entry](#)
- [Understanding Coupon Error Messages through the Order API](#)

Coupon Discount Window

How to display this window:

- Select Coupons for an item at the:
 - [Work with Order Lines Screen \(Adding Items to the Order\)](#) in order entry (header format) or the [Work with Order Lines Screen](#) in order maintenance
 - [Scan Order Lines Screen](#) in order entry or order maintenance
 - [Order Inquiry Detail Screen](#) (standard order inquiry)
- Select Reprice at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) if there are any order-level coupon promotions in your company. When you advance to the window by selecting Reprice, it displays only order-level coupons.

The methods of displaying the window in order entry differ in that:

Selecting Coupons for an Item	Selecting Reprice
You can enter and review both order-level coupons (which apply to each eligible item on the order) or detail-level coupons (which apply only to the selected item)	You can enter order-level coupons only
The system automatically reprices the order and applies coupon discounts at this time only if the Automatically Reprice Coupon (K02) system control value is selected.	The system applies coupon discounts at this time

Field	Description
Item	The item on the order detail line that the coupon applies to; displayed only when you advance to the window by selecting Coupons for an item. <i>Alphanumeric, 12 positions; display-only.</i>
SKU	The item's unique characteristics, such as its color or style; displayed only when you advance to the window by selecting Coupons for an item. <i>Alphanumeric, three 4-position fields; display-only.</i>

Field	Description
Description	The description of the item or SKU; displayed only when you advance to the window by selecting Coupons for an item. <i>Alphanumeric, 120 positions; display-only.</i>
Coupon code	The code that identifies the coupon applied to the order or order detail line. To add a coupon, enter the code here. You can also prompt to display a list of existing coupons in your company, and select a coupon from the list. <i>Alphanumeric, 6 positions; optional.</i>
Coupon description	The description of the coupon, truncated from 45 positions. <i>Alphanumeric, 30 positions; display-only.</i>
Ord Det (Order or Detail level coupon)	Indicates whether this is an order-level or detail-level coupon. Valid values are: <ul style="list-style-type: none"> • O = applies to all applicable items on the order • D = applies only to a specific item on the order <i>Display-only.</i>
Discount Type (Unlabeled field after <i>Ord Det</i>)	Indicates the type of the discount for the coupon; the amount of each discount displays in the <i>Discount</i> field: <ul style="list-style-type: none"> • D = Coupon applies the dollar discount indicated in the <i>Discount</i> field; if this is an order-level coupon, the total dollar discount applies to the eligible order detail line with the highest unit price; if this is a detail-level coupon, the total dollar discount applies to this order line. The total discount amount is prorated against the quantity of the order line. • % = Coupon applies the percentage discount indicated in the <i>Discount</i> field to the eligible items on the order (order-level coupons) or the order detail line (detail-level coupons) <i>Alphanumeric, 1 position; display-only.</i>
Discount	Indicates the amount of the discount. <ul style="list-style-type: none"> • If the <i>Discount type</i> is D, this is the dollar discount for the coupon; if this is an order-level coupon, the total dollar discount applies to the eligible order detail line with the highest unit price; if this is a detail-level coupon, the total dollar discount applies to this order line. The total discount amount is prorated against the quantity of the order line. • If the <i>Discount type</i> is %, this is the percentage discount for the coupon to apply to the eligible items on the order (order-level coupons) or the order detail line (detail-level coupons) <i>Numeric, 13 positions with a 2-place decimal; display-only.</i>

Field	Description
Disc seq #	<p>Indicates the sequence in which to apply this coupon compared with other coupons for the same order or detail line. Coupons with lower sequence numbers apply first. The system uses all of the following information when determining the sequence in which to apply coupons:</p> <ul style="list-style-type: none"> • Detail-level coupons always apply before order-level coupons. • Next, the system checks this sequence number. The coupon with the lower sequence number applies first. • Finally, if two coupons have the same sequence number, the first coupon alphanumerically, based on the coupon code, applies first. <p><i>Numeric, 5 positions; required.</i></p>

Selecting an Item (Working with Order-Level and Detail-Level Coupons)

When you display the window by selecting Coupons for an item, you can review or work with order-level and detail-level coupons. See [Selecting Reprice \(Working with Order-Level Coupons\)](#) for an alternate method of displaying the window.

To apply a coupon to the order or order detail line: Enter the coupon code. You can also prompt to display a list of existing coupons in your company, and select a coupon from the list. When you add a coupon:

- If you enter a detail-level coupon, it applies to that order detail line only.
- If you enter an order-level coupon, it applies to any eligible line on the order.

See [How an Order or Item Qualifies for a Coupon](#).

If the order or detail line does not qualify for the selected coupon, or if there is any other problem, the system displays an error message; see [Understanding Coupon Error Messages in Order Entry](#) for more information. Otherwise, the coupon is added to the detail line or all eligible detail lines, as appropriate, and displayed in the window.

Reviewing coupons: When you use this method to display the window, it includes:

- all order-level coupons applied to the order
- all detail-level coupons applied to this order detail line

Deleting a coupon: Select Delete for a coupon to delete it from the order or detail line.

Note:

You cannot add or delete a coupon at this window if any item on the order has a printed pick slip or is in closed (X) status.

Click Accept or Exit to confirm your entries when you are done.

Canceling an item: Order-level dollar discount coupons apply the total dollar discount to the item on the order with the highest single-unit offer price. If you cancel this item, the system moves the discount to the item with the next highest single-unit price if the order is still eligible for the coupon.

When are the discounts applied? The setting of the Automatically Reprice Coupon (K02) system control value controls when the system applies the discounts to the order.

- If selected, the system applies order-level and detail-level coupon discounts and validates the order dollar minimum when you select Accept or Exit at the [Coupon Discount Window](#), select Reprice, and when you accept the order.
- If unselected, the system applies order-level and detail-level coupon discounts and validates the order dollar minimum when you select Reprice and when you accept the order.

For more information: See Working with Coupon Promotions (WCPR) for an overview on how coupon discounts work, including examples and setup instructions.

Selecting Reprice (Working with Order-Level Coupons)

When you display the window by selecting Reprice at the [Work with Order Lines Screen \(Adding Items to the Order\)](#), you can review or work with order-level coupons only. See [Selecting an Item \(Working with Order-Level and Detail-Level Coupons\)](#) for an alternate method of displaying the window.

Completing this window: You can add, review, or delete order-level coupons; see [Selecting an Item \(Working with Order-Level and Detail-Level Coupons\)](#) for instructions. Click Accept or Exit to confirm your entries when you are done. The system validates that the order meets any order dollar minimum requirement, and applies all eligible coupon discounts, including discounts for detail-level coupons.

To recalculate item prices and order totals:

- If the Automatically Reprice Coupon (K02) system control value is unselected, each time you add or delete a coupon by selecting an item on the order, you will need to select Reprice again and then click Accept or Exit at the window to see the effect of your entries.
- If the Automatically Reprice Coupon (K02) system control value is selected, each time you add or delete a coupon by selecting an item on the order and select Accept or Exit at the Coupon Discount window, the system automatically recalculates the item prices and order totals.

For more information:

- See Working with Coupon Promotions (WCPR) for an overview on how coupon discounts work, including examples and setup instructions.
- See [Order Repricing, Premiums, Discounts, and Promotions](#), particularly the [Repricing Screen Flow](#), for more information on the other windows that may display when you perform repricing.

Understanding Coupon Error Messages in Order Entry

The following error messages are possible during order entry if there is an error related to a coupon you are trying to apply to the order.

Error Message	Explanation
% discount not allowed.	You have tried to apply a detail-level percentage discount to an item that is restricted from percentage discounts, as specified through the Work with Coupon Item Restriction Screen ; or, you have tried to apply a percentage discount to an order, and all of the items on the order are restricted.

Error Message	Explanation
At least one item is restricted from this coupon.	You have applied an order-level percentage discount to an order that includes an item that is restricted from percentage discounts, as set up through the Work with Coupon Item Restriction Screen . This discount will not apply to the restricted item; however, the discount will apply to any other eligible items on the order.
Coupon cannot be used with existing offer.	The coupon has an offer restriction (the Offer requirement field is selected), and the offer associated with the source code on the order header is not specified through the Work with Coupon Offer Requirement Screen . You cannot apply the coupon to this order.
Coupon cannot be used with existing source.	The coupon has a source code restriction (the Source requirement field is selected), and the source code on the order is not specified through the Work with Coupon Source Requirement Screen . You cannot apply the coupon to this order.
Coupon code entered is invalid.	The coupon code you entered is not a valid coupon in your company. Check your spelling, or prompt to display a list of coupons.
Coupon is not currently active.	The current date is earlier than the Start date or later than the End date for the coupon. You cannot apply this coupon at this time.
Coupon item requirement(s) have not been met.	The coupon has an item requirement (indicated by the Item requirement field), and the item on the order detail line does not match an item specified through the Work with Coupon Item Requirement Screen ; or, if this is an order-level coupon with an item requirement, all of the required items are not on the order. <ul style="list-style-type: none"> For detail-level coupons: you cannot apply the coupon to this item. For order-level coupons: you cannot apply the coupon to this order without adding all required items.
Coupon may not be used with a conflicting coupon.	The coupon has a restriction against use with another coupon that is on the order (the Coupon restriction field is selected, and there is another coupon on the order that has a coupon restriction for this coupon as specified through the Work with Coupon Restriction Screen). You cannot apply both of these coupons on the same order.
Coupon may not be used with non-discountable item.	The item you have selected, or all items on the order, have the Discountable field in the Item table unselected. You cannot apply a coupon against this item (or order, if all items are non-discountable).
Coupon type must be 'O' or 'D'	The Coupon type is not set to Order Level or Detail Level. You cannot apply the coupon to an order until this field is set to one of the valid values.
Detail coupon must be entered for specific item.	You have displayed the Coupon Discount window by selecting Reprice at the Work with Order Lines Screen (Adding Items to the Order) , and then attempted to enter a detail-level coupon. Only order-level coupons are accessible when you display the window this way. You need to display the window by selecting Coupons for an item and applying the coupon to the selected item.
Detail coupon not allowed - item is sold out.	You have tried to enter a detail-level coupon against an item that is soldout.

Error Message	Explanation
Duplicate coupon not allowed.	You have tried to apply the same order-level coupon twice to a single order.
Item price is less than coupon requirement.	The coupon has an order detail line total requirement (indicated by the Minimum detail \$ amt field), and the regular offer price of the item is less than this minimum. You cannot apply the coupon to this item.
No coupon maintenance allowed. Order has picks.	Once you have printed a pick slip for any item you can no longer add or delete coupons for the order.
No coupon maintenance allowed. Order must have only open lines.	You cannot add or delete coupons if any item on the order has a status of closed (X).
Order Detail Coupon already exists.	You have tried to apply the same detail-level coupon twice on a single order detail line. It is possible to apply a coupon to more than one order detail line on an order if it is a detail-level coupon (the Coupon type is D). Also, the system applies an order-level coupon (the Coupon type is O) automatically to each eligible detail line on the order.
Order total is less than coupon requirement.	The coupon has an order total requirement (indicated by the Minimum order \$ amt field), and the merchandise total on the order is less than this minimum. You cannot apply the coupon to this order unless you add more merchandise. Non-discountable items (the Discountable field in the Item table is unselected) are not included in the merchandise dollar total for the purposes of meeting this minimum. See How an Order or Item Qualifies for a Coupon .

Understanding Coupon Error Messages through the Order API

The CWOrderOut response message might include coupon-related errors when the system receives an inbound order message (CWOrderIn) that includes a header-level or detail-level coupon and the *response_type* specified in the inbound message is E.

If it is possible to correct the error, the correction is indicated below. In all other cases, the customer cannot apply the coupon to the order, and the order remains in error status until you edit it in batch order entry.

Note:

The system does not put an order in message if the CWOrderIn message includes the same coupon code twice; instead, it just creates the order and applies the coupon once, assuming that the order qualifies. Also, the system does not put an order in error if the message includes an order-level percentage discount coupon and there are any restricted items on the order as specified through the Work with Coupon Item Restriction Screen, provided that there is at least one unrestricted item.

For more information: See *Generic Order Interface (Order API)*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Code	Error	Explanation
55	Invalid Cpn Code	The coupon code you entered is not a valid coupon in your company. The customer cannot apply this coupon to an order.
56	Cpn Not Active	The current date is earlier than the Start date or later than the End date for the coupon. The customer cannot apply this coupon at this time.
58	Offer Restricted	The coupon has an offer restriction (the Offer requirement field is selected), and the offer associated with the source code on the order header is not specified through the Work with Coupon Offer Requirement Screen . The customer cannot apply the coupon to this order.
59	Invalid Src Requirement	The coupon has a source code restriction (the Source requirement field is selected), and the source code on the order is not specified through the Work with Coupon Source Requirement Screen. The customer cannot apply the coupon to this order.
60	Cpn Restricted	The coupon has a restriction against use with another coupon that is on the order (the Coupon restriction field is selected, and there is another coupon on the order that has a coupon restriction for this coupon as specified through the Work with Coupon Restriction Screen). The customer cannot apply both of these coupons on the same order.
61	% discount not allowed	The customer has tried to apply a detail-level percentage discount to an item that is restricted from percentage discounts, as specified through the Work with Coupon Item Restriction Screen; or, the customer tried to apply a percentage discount to an order, and all of the items on the order are restricted.
62	Order Tot < Cpn Requires	The coupon has an order total requirement (indicated by the Minimum order \$ amt field), and the merchandise total on the order is less than this minimum. The customer cannot apply the coupon to this order without adding more merchandise. Non-discountable items (the Discountable field in the Item table is unselected) are not included in the merchandise dollar total for the purposes of meeting this minimum. See How an Order or Item Qualifies for a Coupon .

Code	Error	Explanation
63	Cpn Item Required	<p>The coupon has an item requirement (indicated by the Item requirement field), and the item on the order detail line does not match an item specified through the Work with Coupon Item Requirement Screen; or, if this is an order-level coupon with an item requirement, all of the required items are not on the order.</p> <ul style="list-style-type: none">• For detail-level coupons: the customer cannot apply the coupon to this item.• For order-level coupons: the customer cannot apply the coupon to this order without adding all required items.
64	Detail \$ < Required	<p>The coupon has an order detail line total requirement (indicated by the Minimum detail \$ amt field), and the regular offer price of the item is less than this minimum. The customer cannot apply the coupon to this item.</p>
65	Non-Disc Item	<p>The item that the customer selected has the <i>Discountable</i> field in the Item table unselected. The customer cannot apply a coupon against this item.</p>
77	No Discountable Items	<p>All items on the order have the <i>Discountable</i> field in the Item table unselected. The customer cannot apply a coupon against this order.</p>
78	Cpn Not Allowed-Item S/O	<p>The customer has tried to enter a detail-level coupon against an item that is soldout.</p>

 **Note:**

The response does not return this error if other conditions prevent the coupon from applying to the order (for example, if one item on the order is non-discountable and the other item is sold out).

Code	Error	Explanation
80	Dtl Cpn Passed at Ord Lvl	The message includes a detail coupon (<i>Type = D</i>) in the <i>coupon_code</i> attribute of the <i>Coupon</i> element, which should be used for header coupons (<i>Type = O</i>). To apply a detail coupon, the message should use the <i>coupon_detail_code</i> attribute of the <i>CouponDetail</i> element.

 **Note:**

There is no edit against passing an order-level coupon at the detail level; the system still applies the coupon discount to the order if the order qualifies.

Working with an Order-Level Email Address

Purpose: The system stores an email address for each order you create. The order-level email address is separate from the email addresses maintained for the customer sold to, permanent ship-to customer, or other email addresses in the system.

In this topic:

- [Email Address Updates through Interactive Order Entry](#)
- [Email Address Updates through the Generic Order Interface](#)
- [Email Address Updates through Order Maintenance](#)
- [Email Address Assignment through Membership Generation](#)
- [Email Address Updates Summary](#)

Email Address Updates through Interactive Order Entry

How the order-level email address defaults: The system uses the following hierarchy to default the order-level [Email](#) address in order entry:

- If the customer sold-to has a primary email address, use that email address; otherwise,
- No order-level email address defaults in order entry.

You can accept the default, enter a different email address, or clear the email address.

 **Note:**

If you clear the email address and the [Suppress Email Address Search \(J09\)](#) system control value is selected, the system does not generate order-related emails for the order. See that system control value for more information.

Accepting the order-level email address: When you click OK, the system:

- saves the [Email](#) address as the order-level email address
- if the customer sold-to does not already have a primary email address, saves the *Email address* as the primary email address; the *Opt-in/opt-out* value specified at the order entry screen defaults to the *Opt-in/opt-out* setting for the customer
- if the *Email address* is not already in the Customer Sold To Email Address table but the customer does have a primary email address, saves the new email address and the *Opt-in/opt-out* setting as an additional email address for the customer, but does not change the customer's primary email address

The system does not update the individual email address or opt-in/out setting based on your entry; instead, if the individual's email address defaulted, this email address is now added to the Customer Sold To Email Address table for the sold-to customer, along with the specified opt-in/out value. If you cleared the email address in order entry and the Suppress Email Address Search (J09) system control value is selected, the system does not update the Customer Sold To Email Address table or the sold-to customer; it simply does not store an email address at the order level.

Changing the primary email address: To change the sold-to customer's primary email address, place the cursor in the *Email address* field and click on the arrow to display the [Select Customer Email Address Screen](#). At this screen, you can flag an email address as the primary address or delete an outdated address. You can also advance to this screen by prompting on the *Email* field at the [Expand Name/Address Screen](#).

Updating the opt-in/out setting: Unlike the email address, the opt-in/out setting is not stored on the order. When you update the *OptIn* setting in order entry, the system updates the email address for the customer that matches the email address on the order as follows:

- If the order-level email address is the same as the customer's primary email address, or if there is no order-level email address, the system updates the [Opt in/Opt out](#) setting for the sold-to customer and the [Opt in/out](#) setting for the Customer Sold To Email Address record.
- Otherwise, the system updates just the [Opt in/out](#) setting for the matching Customer Sold To Email Address record.

Recipient or gift orders: The email address and opt-in/out setting are associated with the customer who places the order, not the recipient. When you enter a new email address, the system adds an email address for the customer placing the order; similarly, if you display the [Select Customer Email Address Screen](#) by prompting on the email address, the screen displays email address information for the customer placing the order. To review or work with the recipient's email address or opt-in/out setting, you must advance to the [Expand Name/Address Screen](#).

How to review? The order-level email address is available at the [Work with Order Screen](#) in order entry or maintenance.

Note:

The order-level email address, which is stored in the Order Header Extended table, is not available for review through order inquiry.

For more information: See [Working with Customer Email Addresses](#) for more information on the Customer Sold To Email Address table and primary email address.

Email Address Updates through the Generic Order Interface

Selecting the order-level email address: The system uses the following hierarchy in updating the order-level email address when creating orders through the *Generic Order Interface (Order API)*:

- If an *order_email* is specified in the Inbound Order Message, use that email address; otherwise,
- If there is an email address specified for the sold-to customer (either specified in the *sold_to_email* in the message, or the current primary email address for the customer), use that email address; otherwise,
- Leave the order-level email address blank.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Updating the customer's primary email address: The system updates the sold-to customer's primary email address and opt-in/out setting only if:

- existing customers: the *sold_to_email_update* is selected and a *sold_to_email* is specified in the message
- new customers: a *sold_to_email* is specified in the message

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

This update occurs regardless of whether the sold-to customer's email address is used as the order-level email address.

Updating the customer's opt-in/out setting: The system always updates the customer's opt-in/out setting if a *sold_to_opt_in* is specified in the message.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Email Address Updates through Order Maintenance

Adding an order-level email address: When you enter a new email address in order maintenance, this email address is used as the order-level email address and added to the Customer Sold To Email Address table. In addition, if the previous email address that was defined on the order does not exist in the Customer Sold To Email Address table, the new email address also becomes the new primary email address for the customer if there is not already a primary defined.

Clearing the order-level email address: Clearing the email address in order maintenance removes the order-level email address from the order; however, the address remains in the Customer Sold To Email Address table unless you delete it. You can use the [Work with Customer Email Address Screen](#) or the [Select Customer Email Address Screen](#).

Note:

If you clear the email address and the Suppress Email Address Search (J09) system control value is selected, the system does not generate additional order--related emails for the order. See that system control value for more information.

Changing the opt-in/out setting: When you change the opt-in/out flag in order maintenance, the system updates the [Opt in/out](#) in the Customer Sold To Email Address table for the email address that matches the order-level email address. If the order-level email address is the same as the customer's primary email address, the system also updates the [Opt in/Opt out](#) for the sold-to customer. If there is no order-level email address, the system updates the *Opt-in/out* setting for the customer's primary email address, and the matching address in the Customer Sold To Email table.

Recipient or gift orders: The email address and opt-in/out setting are associated with the customer who places the order. When you enter a new email address, the system creates a new email address for the customer placing the order; similarly, if you display the [Select Customer Email Address Screen](#) by prompting on the email address, the screen displays email address information for the customer placing the order. To review or work with the recipient's email address or opt-in/out setting, you must advance to the [Expand Name/Address Screen](#).

Email Address Assignment through Membership Generation

When you generate a membership order through [Generating Membership Orders \(EGMO\)](#), the customer's primary email address, if any, is used as the order-level email address. If the customer does not have a primary email address, then no order-level email address is assigned.

Email Address Updates Summary

The following table summarizes the various methods of specifying an email address for an order, and the related updates that take place. See the individual listings above for more detail.

Order Entry Method	Defaulting Hierarchy	Updates to:	
		Primary Email Address?	Customer Sold To Email Address table?
interactive	Customer sold-to primary email address	Uses order-level email address if the customer does not already have a primary email address	Adds order-level email address
generic order interface	<ul style="list-style-type: none"> <i>order_email</i> from message Customer sold-to primary email address For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Only if <i>sold_to_email</i> specified in message, and <i>sold_to_email_update</i> is selected For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Adds order-level email address, either <i>order_email</i> or <i>ind_email_address</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
order maintenance	existing order-level email	Only if the previous email address on the order does not exist in the Customer Sold To Email Address table and a primary is not defined	Adds new order-level email address

Order Entry Method	Defaulting Hierarchy	Updates to:	
		Primary Email Address?	Customer Sold To Email Address table?
membership generation	existing customer sold-to primary email address	No	N/A

Valid Ship Vias for Window

Purpose: Use this window to review the ship vias eligible to ship an order, including the projected overall shipping charges and the expected delivery date for each ship via. You can also use this window to select a different ship via for the order.

How are shipping charges calculated? The total *Charges* displayed at this window include:

- Freight charges, based on the *Freight method* for the source code on the order header
- [Add'l freight charge](#)
- shipper/item charges (see [Work with Ship Via/Item Screen](#))
- service charges (see [Work with Dollar Chart by Ship Via Screen \(Ship Via Service Charges\)](#))
- weight charges (see [Work with Weight Charges by Ship Via Screen](#))

The charges also include any special handling charges on the order if the [Include Special Handling in Alternate Shipping Charges by Via \(I03\)](#) system control value is selected.

How is the expected delivery date calculated?

- If the *Arrival date* on the order is later than the *Order date*, then the expected delivery date = the *Arrival date*; otherwise,
- the *Order date* + the [Shipping lead days](#) for the SCF/ship via + number of days specified in the [Pick Processing Days \(B37\)](#) system control value

Note:

The expected delivery date is blank if there are no reserved lines on the order.

Will the selected ship via be the one to actually deliver the order? Depending on your setup, the system can override the ship via on the order during the order acceptance process. See the [Ship Via Override Hierarchy](#) for more information on possible overrides.

Note:

- If the [Best Way Ship Via for Auto-Assignment \(J67\)](#) system control value specifies a ship via, this ship via is not listed at this window.

- If there is only one item on the order, and that item has an item/ship via override, then the override ship via (indicated on the order detail line; see the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#)) is used to ship the item, regardless of the ship via code on the order header.

How to display this window: Prompt on the *Ship via* field at the [Work with Order Screen](#) or [Work with Order/Recap Screen](#) in order entry, or the [Work with Order Screen in Order Maintenance](#).

Note:

If you advance to this window in order maintenance, the system displays the freight charges for all open lines on the order and does not look at the calculate freight setting for each order line.

Field	Description
Country	The three-letter code identifying the country for the SCF of the order shipping address, as specified in the SCF table. See Working with SCF Codes (WSCF) for information on setting up and working with SCF codes. <i>Alphanumeric, 3 positions; display-only.</i>
SCF	The SCF for the shipping address on the order. <i>Alphanumeric, 3 position; display-only.</i>
Valid states (two unlabeled fields to the right of the SCF)	The valid state(s) for the SCF, as specified in the SCF table. You can specify one or two valid states for each SCF. See Working with SCF Codes (WSCF) for information on setting up and working with SCF codes. <i>Alphanumeric, two 2-position fields; display-only.</i>
Via	A ship via that is eligible to ship the order, based on the existence of an SCF/ship via record. See Working with SCF/Ship Via Values (WSHV) for more information on setting up SCF/ship via records. Selecting a ship via: You can select a ship via at this window to use this ship via for delivery of the order. However, if the system subsequently overrides the ship via, or if there are no order lines without item/ship via overrides, then the ship via you select will not be used. See above for a discussion. If the Best Way Ship Via for Auto-Assignment (J67) system control value specifies a ship via, this ship via is not listed. <i>Numeric, 2 positions; optional.</i>
Description	The description of the ship via, from the Ship Via table. See Working with Ship Via Codes (WVIA) for information on setting up ship vias. <i>Alphanumeric, 30 positions; optional.</i>

Field	Description
Charges	<p>The total charges to ship the order with this ship via, including:</p> <ul style="list-style-type: none"> • Freight charges, based on the <i>Freight method</i> for the source code on the order header • Add'l freight charge • shipper/item charges (see Work with Ship Via/Item Screen) • service charges (see Work with Dollar Chart by Ship Via Screen (Ship Via Service Charges)) • weight charges (see Weight Charges by Ship Via Screen) <p>The charges also include any special handling charges on the order if the system control value Include Special Handling in Alternate Shipping Charges by Via (I03) system control value is selected.</p> <p><i>Numeric, 20 positions with a 2-place decimal; display-only.</i></p>
Exp Delivery Date	<p>The date when the customer can expect to receive the shipment using this ship via, calculated as follows:</p> <ul style="list-style-type: none"> • If the <i>Arrival date</i> on the order is later than the <i>Order date</i>, then the expected delivery date = the <i>Arrival date</i>; otherwise, • the <i>Order date</i> + the Shipping lead days for the SCF/ship via + number of days specified in the Pick Processing Days (B37) system control value <div data-bbox="906 953 1459 1184" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>If there are no reserved lines on the order, then the expected delivery dates for all displayed ship vias are blank.</p> </div> <p><i>Numeric, 6 positions (in user date format); display-only.</i></p>

Tracking Order/Call Disposition Activity

Order/Call Disposition Activity allows you to track the calls that come into Order Administration from an external order call center. In addition, you can track the reason why a call was terminated or an order was rejected. You can use the order/call disposition activity in Order Administration to match the calls taken in Order Administration against the call history in the external order call center.

When is order/call disposition activity tracked? The setting of the [Capture Order/Call Disposition \(K03\)](#) system control value controls when the system captures order/call disposition activity and whether a reject reason is required when you reject an order or terminate a call from an external order call center.

K03 Setting	Description
ORDER	<p>The system creates a record in the Order Disposition Table when you reject an order in interactive Order Entry; see Order Disposition Information Captured for a Rejected Order.</p> <p>In addition, the system requires you to enter an order/call disposition reject reason code at the Confirm Order/Call Disposition Window when you reject an order in interactive Order Entry.</p>

 **Note:**

Interactive order entry in this situation does not include web orders or membership orders.

Multiple Recipient Orders

If an order contains multiple ship to customers, the system creates one record in the [Order Disposition Table](#) for the order for the first ship to customer. If you reject a ship to customer, but not the order, the system displays the [Confirm Reject Window](#) to confirm that you wish to reject the ship to customer on the order; the system only displays the [Confirm Order/Call Disposition Window](#) if you reject the entire order.

K03 Setting	Description
ALL	<p>The system creates a record in the Order Disposition Table when:</p> <ul style="list-style-type: none">• you end a call received from an external order call center that does not result in placing an order; see Order Disposition Information Captured for a Terminated Call.• you accept an order in interactive Order Entry; see Order Disposition Information Captured for an Approved Order.• you reject an order in interactive Order Entry; see Order Disposition Information Captured for a Rejected Order. <p>In addition, the system requires you to enter an order/call disposition reject reason code at the Confirm Order/Call Disposition Window when:</p> <ul style="list-style-type: none">• you reject an order in interactive Order Entry.• you end a call received from an external order call center or select Exit at the Select Customer Sold To For Order Screen if a <i>Universal call ID</i> has been captured for the call in the Order Disposition table.

 **Note:**

Interactive order entry in this situation does not include web orders or membership orders.

Identifying a Call from an External Order Call Center

The system uses the presences of a *Universal call ID* defined in the Order Disposition table to determine if a call has been received from an external order call center.

 **Note:**

The system does not create a record in the Order Disposition table when you receive a call from an external order call center and immediately select Maintain at the [Select Customer Sold To For Order Screen](#).

Multiple Recipient Orders

If an order contains multiple ship to customers, the system creates one record in the [Order Disposition Table](#) for the order for the first ship to customer. If you reject a ship to customer, but not the order, the system displays the [Confirm Reject Window](#) to confirm that you wish to reject the ship to customer on the order; the system only displays the [Confirm Order/Call Disposition Window](#) if you reject the entire order.

K03 Setting	Description
NONE or blank	The system does not capture order/call disposition activity in the Order Disposition table. In addition, the system displays the Confirm Reject Window when you reject an order.

To view order/call disposition activity: You can review order/call disposition activity in the Order Disposition table.

The setting of the Capture Order/Call Disposition (K03) system control value controls when the system creates a record in this table.

Note:

You cannot view the information in the Order Disposition table from any Order Administration screen.

Order Disposition Table

Field	Description
Company	A code for the company where the order or call was placed. <i>Numeric, 3 positions.</i>
Order #	The order number associated with the order/call disposition. An order number displays when: <ul style="list-style-type: none"> you reject an order in interactive order entry if the Capture Order/Call Disposition (K03) system control value is set to ORDER or ALL. The <i>Reject reason code</i> indicates why the order was rejected. you accept an order in interactive order entry if the Capture Order/Call Disposition (K03) system control value is set to ALL. <i>Numeric, 8 positions.</i>

Field	Description
Order ship to #	<p>The order ship to associated with the order/call disposition. An order ship to number displays when:</p> <ul style="list-style-type: none"> you reject an order in interactive order entry if the Capture Order/Call Disposition (K03) system control value is set to ORDER or ALL. The <i>Reject reason code</i> indicates why the order was rejected. you accept an order in interactive order entry if the Capture Order/Call Disposition (K03) system control value is set to ALL.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If an order contains multiple ship to customers, the system creates one record in the Order Disposition Table for the order for the first ship to customer.</p> </div>
Universal call ID (UCID)	<p><i>Numeric, 3 positions.</i></p> <p>The UCID, or universal call identifier, associated with a call received into Order Administration from an external order call center. You can use this ID to track each individual call received from the order call center.</p> <p>This field remains blank if the order is not associated with a call received from an external order call center.</p> <p>If you end a call that does not result in placing an order, the order disposition record contains a UCID number without an order number or order ship to number.</p> <p><i>Alphanumeric, 50 positions.</i></p>
Source code	<p>A code for the source code associated with the order or call.</p> <p><i>Alphanumeric, 9 positions.</i></p>
Reject reason code	<p>A code for the order/call disposition reject reason code assigned to the order or call, indicating why the order was rejected or the call was ended before an order was placed.</p> <p>Reject reason codes are defined in and validated against the Reject Reason table; see Working with Order/Call Disposition Reject Reason Codes (WWRR).</p> <p><i>Alphanumeric, 2 positions.</i></p>
Entered by user	<p>The user ID associated with the order or call.</p> <p>For calls received from an external order call center, this is the user ID of the operator that took the call.</p> <p><i>Alphanumeric, 10 positions.</i></p>
Create date	<p>The date when the order or call was placed.</p> <p><i>Numeric, 8 positions (in user date format).</i></p>
Create time	<p>The time when the order or call was placed.</p> <p><i>Numeric, 6 positions (HHMMSS format).</i></p>

Order Disposition Information Captured for a Terminated Call

The system captures the following information in the [Order Disposition Table](#) when you end a call received from an external order call center if the Capture Order/Call Disposition (K03) system control value is set to ALL and a *Universal call ID* is defined for the call in the Order Disposition table:

- company
- universal call ID
- source code
- reject reason code
- entered by user
- create date
- create time

Order Disposition Information Captured for an Approved Order

The system captures the following information in the [Order Disposition Table](#) when you accept an order in interactive Order Entry if the Capture Order/Call Disposition (K03) system control value is set to ALL:

- company
- order #
- order ship to #
- universal call ID (if the order is associated with a call from an external order call center; otherwise, this field remains blank)
- source code
- entered by user
- create date
- create time

Order Disposition Information Captured for a Rejected Order

The system captures the following information in the [Order Disposition Table](#) when you reject an order in interactive Order Entry if the Capture Order/Call Disposition (K03) system control value is set to ALL or ORDER:

- company
- order #
- order ship to #
- universal call ID (if the order is associated with a call from an external order call center; otherwise, this field remains blank)
- source code
- reject reason code
- entered by user
- create date
- create time

Entering Pre-Order Quotes

Quoting allows you to create a pre-order for a customer listing the items the customer wishes to order and the estimated order totals should the customer agree to place the order. The system does not reserve inventory or perform background async updates for the quote until it is converted to an order. Optionally, the system assigns an expiration date to a quote, indicating how long the estimated quote is valid before it expires.

Why create quotes? You may wish to create quotes for high-priced items or items whose price is negotiable, such as furniture or recreational vehicles.

What's Required On a Quote?

To complete a quote you must define the customer requesting the quote, the merchandise included in the quote, and a delivery address for the merchandise.

Entering a quote is similar to entering a standard order:

- You enter and verify customer and quote information on the [Work with Order Screen](#).
- You add items to the quote on the [Work with Order Lines](#) screen. The system uses standard pricing logic to determine the price of each item on a quote and whether the quote is eligible for any discounts or promotions.
- You define a payment method for the quote on the [Enter Payment Method Screen](#). The *Pay method required* setting for the order type on the quote determines whether a payment method is required.
- When you accept the quote, you can select to email a Quote Confirmation and print a Quote form for the customer, listing the items on the quote and the estimated order totals.

In addition, you can receive quotes through the *Generic Order Interface (Order API)*; see *Creating a Quote through the Order API*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

How are Quotes Different from Orders?

Unlike standard orders:

- Because the system does not reserve items on quotes, adding an item to a quote does not guarantee that the item will be available when the customer is ready to order. When you convert a quote to an order, the system reserves inventory and displays the [Unavailable Quoted Order Lines Screen](#), listing the items on the quote that are not available because they are on backorder or are soldout.
- You can have only one ship to customer on a quote, and all of the items on a quote must ship to the same address.
- The price of each item on a quote is not guaranteed unless you enter a price override reason code in the [Price Override Reason for Quotes \(K75\)](#) system control value. The system assigns this price override reason code to each order line that does not already have a price override reason code defined when you accept the quote.

- The freight charges on a quote are not guaranteed unless you select the [Override Freight on Quote Conversion \(K76\)](#) system control value. The system applies the freight and additional freight charges on a quote as a freight override when you accept the quote.
- You cannot express bill any items on a quote.
- You cannot apply a pre-paid pay type to a quote.
- The system does not reduce inventory or update demand until you convert a quote to an order.
- The system does not perform any credit or fraud checking until you convert a quote to an order.

See [Quote Restrictions](#) for additional functionality that is not available on a pre-order quote.

- [Converting Quotes to Orders](#) for more information on the updates the system performs when you convert a quote to a standard order.

Pre-Order Quote Setup

Before you can enter a pre-order quote, you must complete the required setup.

- [Pre-Order Quote Order Type](#)
- [Quote Confirmation Email Template](#)

- [Price Override Reason for Quotes](#)
- [Cancel Reason for Quotes](#)
- [System Control Values](#)

Pre-Order Quote Order Type

Use the [Establishing Order Types \(WOTY\)](#) menu option to create an order type that represents pre-order quote orders. You can create one or more pre-order quote order types.

When you create a pre-order quote order type, you must indicate the following:

Field	Description
Quote	<p>Indicates whether orders for this order type represent a pre-order quote and not a regular order.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = Orders for this order type represent a pre-order quote. • Unselected = Orders for this order type represent a regular order. <p><i>Required for pre-order quote order types.</i></p>
Expiration days	<p>Indicates the number of days a pre-order quote is valid before it expires.</p> <p>When you accept a pre-order quote in order entry, the system updates the <i>Cancel date</i> for the quote based on the quotes arrival date and the expiration days. The system removes the cancel date when you convert the quote to an order.</p> <p>Example: If the arrival date for a quote is 10/29/09 and the expiration days defined for the quote order type is 30, the system updates the <i>Cancel date</i> for the quote to 11/28/09.</p>

Note:

If you change the order type for a quote to another order type whose *Quote* field is selected, the system recalculates the cancel date for the quote, based on the number defined in the *Expiration days* field for the new order type. If an *Expiration days* has not been defined for the new order type, the system removes the cancellation date from the quote.

Numeric, 3 positions; optional.

Field	Description
Pay method required	Indicates whether a pay method is required on a pre-order quote. Valid values are: <ul style="list-style-type: none">• Selected = A pay method is required on a pre-order quote. You cannot add a pre-paid pay method to a quote.• Unselected = A pay method is not required on a pre-order quote. The system does not require a pay method until the quote is converted to an order.

 **Note:**

If you change the order type for a quote to another order type whose *Quote* field is selected, the system requires a pay method for the quote based on the setting of the *Pay method required* field for the new order type.

Optional.

Field	Description
Exclude S/O on order confirmation	<p>Indicates if the system excludes soldout items on the quote confirmation email or the <i>Outbound Email XML Message (CWEmailOut)</i> and the Quote Form.</p> <p>For example, you may wish to exclude soldout items when generating quote confirmations and forms for quotes taken over the phone, but include soldout items when generating quote confirmations and forms for quotes you receive through the order API.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <ul style="list-style-type: none">Selected = Exclude soldout items on the quote confirmation email or the <i>Outbound Email XML Message (CWEmailOut)</i> and the Quote form. <div data-bbox="727 699 1378 961" style="border: 1px solid #0070C0; padding: 10px;"><p> Note:</p><p>If the soldout item is the only item on the quote and you exclude soldout items from printing, the system does not display the Print/Email Quote Window where you can select to generate a quote confirmation email or Quote form.</p></div> <ul style="list-style-type: none">Unselected = Include soldout items on the quote confirmation email or the <i>Outbound Email XML Message (CWEmailOut)</i> and the Quote form. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

 **Note:**

- The system excludes soldout items from the quote confirmation email only if the program in the [Quote Confirmation Email Program \(K74\)](#) system control value is based on the QUOCONF base program.
- The system excludes soldout items from the Quote form only if the program in the [Quote Printing Program \(K73\)](#) system control value is based on the QUOTE or QUOTE_G base program.

In addition:

Field	Description
Promotional pricing windows	If you select to display promotional pricing windows, the system will display promotional pricing windows when you enter a pre-order quote. See Upselling the Customer in Order Entry .
Soldout notifications	If this field is selected and the <i>Email notifications</i> field for the order type is also selected, the system generates a soldout notification for items on quotes that are soldout automatically by the Processing Auto Soldout Cancellations (MASO) menu option. The system does not generate a soldout notification for items that are soldout during quote entry or quote maintenance. See Soldout Processing on Quotes .
Immediate B/O notice	The system ignores this setting since backorder notices are not generated for pre-order quotes. The system generates a backorder notice when you convert a quote to a standard order. See Converting Quotes to Orders .
Email notification	If this field is selected and the <i>Soldout notifications</i> field for the order type is also selected, the system generates a soldout notification for items on quotes that are soldout automatically by the Processing Auto Soldout Cancellations (MASO) menu option. The system does not generate backorder notices or order confirmations for pre-order quotes. The system generates these email notifications when you convert a quote to a standard order. See Converting Quotes to Orders .
OnLine Authorization	The system performs online authorization for a pre-order quote based on this setting and if a credit card type payment method is added to the pre-order quote. See Performing Online Credit Card Authorizations .
Address standardization	The system performs address standardization for the customer address on the pre-order quote based on this setting. See Experian Data Quality (EDQ) Address Validate API .

Quote Confirmation Email Template

Use the [Working with E-Mail Notification Templates \(WEMT\)](#) menu option to create an email template that the system uses when generating a Quote Confirmation email. You can override the standard email template text for the order type or entity; see [Email Setup within Order Administration](#) for more information.

Outbound email API: Order Administration generates a generic outbound XML message, rather than an actual email, for quote confirmations if the *XML only?* flag for the quote confirmation template is selected and the [Quote Confirmation Email Program \(K74\)](#) system control value is not blank. The *Outbound Email XML Message (CWEmailOut)* includes additional information that is not included in the standard email notice. You might choose to generate the XML message so that you can use this information to produce a reformatted HTML that includes additional information. See [Outbound Email API](#) for an overview and message details.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Determining when to email a quote confirmation: See [Quote Confirmation Emails](#) for a discussion on the criteria required to generate the Quote Confirmation email. See [Quote Confirmation Email Sample and Contents](#) for a sample email.

Price Override Reason for Quotes

Use the [Establishing Price Override Reason Codes \(WPOR\)](#) menu option to create a price override reason to apply to items that are added to a pre-order quote. Applying this price override reason code prevents the system from applying a new price to the item when you maintain the quote or convert the quote to a regular order.

Once you have created the price override reason code, enter the code in the Price Override Reason for Quotes (K75) system control value.

Cancel Reason for Quotes

Optionally, use the [Establishing Cancel Reason Codes \(WCNR\)](#) menu option to create a cancel reason to apply to quotes that you cancel in order maintenance. See [Cancelling a Quote through Order Maintenance](#).

System Control Values

System Control Value	Description
Quote Printing Program (K73)	Defines the name of the program that prints the Quote form. The standard graphical quote printing program is QUOTEG. The standard non-graphical quote printing program is QUOTE.
Quote Confirmation Email Program (K74)	Defines the program to generate quote confirmations for pre-order quotes. The standard base program is QUOCONF, which generates a notification email in HTML format.
Price Override Reason for Quotes (K75)	Defines the price override reason code the system applies to each detail line on a pre-order quote when it is accepted so that the quoted price for each item is retained.
Override Freight on Quote Conversion (K76)	Defines whether the freight and additional freight charges on a pre-order quote are used as a freight override when the quote is converted to a regular order.

Note:

The Quote form is not currently implemented.

Advancing to Quote Entry

Use the Enter/Maintain Orders (OEOM) menu option to create and maintain a quote. The system uses the *Quote* field on the order type to identify the order as a standard order or a pre-order quote.

- If the *Quote* field for the order type is selected, the system identifies the order as a pre-order quote.
- If the *Quote* field for the order type is unselected, the system identifies the order as a standard order; see [Entering Orders](#).

Receiving a quote through the generic order interface: You can create a pre-order quote on the web storefront and send the quote information to Order Administration

using the *Generic Order Interface (Order API)*. See *Creating a Quote through the Order API*.

Maintaining quotes: You can use the standard Order Inquiry/Maintenance (OIOM) menu option to maintain and inquire on a quote. See [Maintaining Quotes in Order Maintenance](#).

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Types of Customers on a Quote

As in standard order entry, a quote can contain the following customers.

Customer	Description
Sold to customer	The person or business who requested the quote. If the sold to customer does not exist in Order Administration, the system creates the customer in the Work with Customers (WCST) menu option. See Selecting Customers in Order Entry .
Ship to customer	<p>The address where the merchandise will be delivered when the quote is converted to an order. A quote can contain a sold to address and one ship to address. If you don't define a ship to address, the system delivers the merchandise to the address defined for the sold to customer.</p> <p>You can add the following types of ship to customers to a quote.</p> <p>One time shipping address: A one time shipping address is an address that is attached to the quote you are entering, but which is not saved as a permanent mailing address for the sold to customer. To add a one time address to a quote, select One Time Ship To on the Order Header screen. See Assigning an Order Shipping Address.</p> <p>Permanent shipping address: Permanent shipping addresses are address that are kept on file for the sold to customer. Examples of permanent ship to addresses would be the customer's work address and home address. The system adds a separate record to the Customer Ship To table for this shipping address under the customer number. You can define up to 999 permanent shipping addresses for one customer. To add an address book customer to a quote, select Address Book on the Order Header screen. See Using a Permanent Shipping Address in Order Entry.</p> <p>Recipient/Gift quote: A recipient/gift quote allows you to ship the merchandise to another address or customer. You can flag the quote as a gift by selecting the <i>Gift</i> field on the Work with Order screen. You can then select Sold To/Recip to enter the address where the gift will be shipped. See About Gift Orders.</p>

Note:

If you enter a gift quote, the system prints pricing information on the [Quote Form](#) and Quote Confirmation.

Excluded from quotes: You cannot add a recipient ship to customer to a quote. If you select Accept/Add Rcp to accept the quote and add a recipient customer to the quote, the system displays an error message: *Add recipient not allowed with Quote*.

Customer	Description
Bill to customer	<p>The person that will be charged for the quote when it is converted to an order. Billing addresses are addresses where you send the invoice for an order.</p> <p>A sold to customer can have only one billing account; however, more than one customer can use the same billing account.</p> <p>See Assigning a Billing Address in Order Entry.</p>

Address standardization: If you have enabled address standardization for the order type on the quote, the system uses the EDQ Address Validate API to standardize the address on the quote; see [Experian Data Quality \(EDQ\) Address Validate API](#) for an overview and the required setup.

Entering Header Information on a Quote

Use the [Work with Order Screen](#) to enter or verify customer and header information, such as the source code and ship via on the quote.

Printing order header messages on the Quote form: You can flag an order header message to print on the [Quote Form](#) by selecting Quote in the *Print* field for the message on the [Work with Order Messages Screen](#). The first four order header messages whose *Print* flag is set to Quote print on the form.

Field descriptions and screen options: See [Work with Order Screen](#) for a complete description of the fields and options available on this screen.

The fields below describe information on the Work with Order screen that applies specifically to entering quotes in order entry.

Field	Description
Order #	The system uses the Order Header number assignment wheel to assign a unique number to the quote.
Recip Sts	The system assigns a Quote status to all new quotes. The quote retains this status until it is either canceled or converted to an order; see Cancelling a Quote through Order Maintenance and Converting Quotes to Orders .
Email	<p>The system sends the Quote Confirmation email to this email address. If an email address is not defined on the quote, the system sends the Quote Confirmation email to the email address defined for the sold to customer on the quote.</p> <p>See Quote Confirmation Emails and Quote Confirmation Email Sample and Contents.</p>
Via	Because the system does not reserve inventory until a quote is converted to an order, the system does not allow you to enter an express bill ship via on a quote (the <i>Billing</i> field for the ship via code is set to Express): Express bill not allowed with quote.
Salesrep	<p>The system includes the salesman on the Quote Confirmation email and Quote Form. In addition, you can review the quotes associated with a salesman on the Salesman Demand Report.</p> <p>See Quote Confirmation Email Sample and Contents for a sample of the Quote Confirmation.</p>

Field	Description
Type	<p>The order type assigned to the quote. For quotes, the Quote field for the order type is selected, indicating orders for this order type are pre-order quotes.</p> <ul style="list-style-type: none"> If you change the order type to another type whose <i>Quote</i> field is selected, the system uses the new order type's Expiration days and Pay method required settings to determine the cancel date on the quote and whether a pay type is required for the quote. See Assigning an Expiration Date to a Quote and Adding a Payment Method to a Quote. If you change the order type to a type whose <i>Quote</i> field is unselected during quote entry, the system performs standard order entry; see Entering Orders. If you change the order type to a type whose <i>Quote</i> field is unselected during quote maintenance, the system converts the quote to an order; see Converting Quotes to Orders. <div data-bbox="878 831 1378 974" style="border: 1px solid #0070c0; background-color: #e1eef6; padding: 10px; margin-top: 10px;"> <p> Note: During quote entry:</p> </div> <ul style="list-style-type: none"> You cannot change from a non-quote order type to a quote order type if reserved order lines already exist: Quote type not allowed - reserved order lines exist. If you change from a quote order type to a non-quote order type and order lines already exist, you will need to delete and reenter them in order to perform reservation.
Hold Reason	<p>If you enter a hold reason code, the system does not update the status of the quote to Held; the status remains Quote. The hold reason code is informational-only. You can remove the quote from hold in order maintenance; see Maintaining Quotes in Order Maintenance.</p> <p>If you convert the quote to an order, the system retains the hold reason and updates the status of the order to Held; see Converting Quotes to Orders.</p> <div data-bbox="878 1516 1378 1774" style="border: 1px solid #0070c0; background-color: #e1eef6; padding: 10px; margin-top: 10px;"> <p> Note: Held quotes are not included in the Release Held Orders (ERHO) menu option; you must use order maintenance to remove the hold reason from the quote.</p> </div>
Order date	<p>The date you entered the quote. Defaults to the current date, but you can override it.</p>

Field	Description
Arrival date	<p>Regardless of the arrival date, the system does not reserve inventory on quotes. The system reserves inventory when the quote is converted to an order; see Converting Quotes to Orders.</p> <p>Assigning an expiration date to a quote: If a number of days has been entered in the Expiration days field for the order type on the quote, the system assigns a cancel date to the quote and each line on the quote, indicating when the quote is no longer valid and should be cancelled.</p> <p>The system uses the following calculation to assign a cancel date to a quote:</p> $\text{Quote arrival date} + \text{Order type Expiration dates} = \text{Quote expiration date}$ <p>The system stores the quote expiration date in the <i>Cancel date</i> field in the Order Header table and Order Detail table.</p>
Cancel date	<p>If a number of days has been entered in the Expiration days field for the order type on the quote, the system assigns a cancel date to the quote and each line on the quote when you accept the quote. The cancel date indicates when the quote is no longer valid; see Assigning an Expiration Date to a Quote.</p> <p>The system uses the following calculation to assign a cancel date to a quote:</p> $\text{Quote arrival date} + \text{Order type Expiration dates} = \text{Quote expiration date}$ <p>If you manually enter a date in the <i>Cancel date</i> field on the Work with Order screen, the system overrides the date you entered with the calculated quote expiration date.</p>

 **Note:**

The cancel date cannot be earlier than the arrival date: Cancel date cannot be earlier than arrival date.

Order Cancellation List

Once the cancel date has been reached the quote prints on the [Order Cancellation List](#). Customer Service uses this list to contact each customer to see if the deadline can be extended. If not, Customer Service must use Order Maintenance to cancel the quote. See [Cancelling a Quote through Order Maintenance](#).

Adding Items to a Quote

Use the Work with Order Lines screen to add items to a quote.

Inventory reservation: The system does not reserve inventory for order lines on a quote. The system performs inventory reservation when the quote is converted to an order. See [Converting Quotes to Orders](#).

Messages and windows during quote entry: The system displays messages and windows related to items added to a quote as in standard order entry; see [Miscellaneous Messages and Windows at Item Entry](#).

Discounts and promotions: The system applies discounts and promotions to a quote as in standard order entry; see [Order Repricing, Premiums, Discounts, and Promotions](#).

Retaining the quoted price: When you accept a quote, the system assigns the price override reason code defined in the Price Override Reason for Quotes (K75) system control value to each detail line so that the price of each item is retained.

- You can select Reprice during quote entry and maintenance to reprice the quote and apply any qualifying discounts, premiums, and promotions to the quote; however, the system does not reprice any lines that contain a price override reason code. If you wish to reprice these lines, you must remove the price override reason code from the line.
- If a detail line already contains a price override reason code (for example, you manually entered a price override reason code), the system will not reprice the line and will not assign the price override reason code defined in the *Price Override Reason for Quotes (K75)* system control value to the line.
- If a price override reason code is not defined in the Price Override Reason for Quotes (K75) system control value, you can reprice the lines on a quote during quote maintenance and when you convert the quote to an order, using regular pricing logic.

Field descriptions: See [Work with Order Lines Screen \(Adding Items to the Order\)](#) for a complete description of the fields and options available on this screen.

The fields below describe information on the Work with Order Lines screen that applies specifically to entering Quotes in order entry.

Field	Description
Item	You can add different types of items to a quote as in standard order entry; see Adding Different Types of Items to the Order . Membership items: See Entering Customer Memberships in Quote Entry .
Qty	You cannot enter an item for a negative quantity on a quote: Negative quantity not allowed on quote.
Price	As in standard order entry, the system calculates the price of an item by taking into account any price breaks and source or order discounts, and uses the pricing routine (pricing hierarchy) in the Pricing Values (B31) system control value to determine the price of the item on the order line.

Field	Description
Ovr Price override reason code	<p>The price override reason code assigned to the order line. If you have the authority, you can override the price of an item and specify a price override reason code.</p> <p>When you accept a quote, the system assigns the price override reason code defined in the Price Override Reason for Quotes (K75) system control value to each detail line so that the quoted price for each item is retained.</p> <ul style="list-style-type: none"> You can select Reprice during quote entry and maintenance to reprice the quote and apply any qualifying discounts, premiums, and promotions to the quote; however, the system does not reprice any lines that contain a price override reason code. If you wish to reprice these lines, you must remove the price override reason code from the line. If a detail line already contains a price override reason code (for example, you manually entered a price override reason code), the system will not reprice the line and will not assign the price override reason code defined in the Price Override Reason for Quotes (K75) system control value to the line. If a price override reason code is not defined in the Price Override Reason for Quotes (K75) system control value, you can reprice the lines on a quote during quote maintenance and when you convert the quote to an order, using regular pricing logic.
Rsv Quantity reserved	<p>The system does not reserve inventory for order lines on a quote. The system performs inventory reservation when the quote is converted to an order. See Converting Quotes to Orders.</p>
Avl Quantity available	<p>The quantity of the item that is available to sell across all shippable warehouses. This is the quantity of the item available in the system that is not set aside for orders or backorders.</p> <p>When you add an item to a quote, the system does not reduce the quantity available and does not update the quantity open by the quantity ordered on a quote. You can use the quantity available for the item to inform the customer of low stock situations and whether the item is on backorder or soldout.</p> <p>Example: You add item ABC to a quote. The available quantity for item ABC is 20. You add item ABC to another quote. Since this item has not been added to a regular order since the first quote was created, the available quantity for item ABC is still 20. The system does not decrease the available quantity for an item when it is added to a quote.</p>

 **Note:**

The system does not generate a backorder notification for a pre-order quote. The system generates a backorder notification when the pre-order quote is converted to a regular order and it is accepted.

Field	Description
Sts Status	The current status of the detail line. The status field is blank (Open) or is set to S (soldout) during quote entry. Soldout status: See Soldout Processing on Quotes .
Exp Expected receipt date	This field does not display for items on a quote. In order to review availability, select Availability for an item to advance to the Item Availability screen. When you convert a quote to an order, the system displays the Unavailable Quoted Order Lines Screen , listing the items on the converted quote that are on backorder or soldout.

Entering Customer Memberships in Quote Entry

You can create a standard customer membership in quote entry. The system performs the same updates as it would when you create a customer membership in regular order entry; however, the system creates the customer membership in an inactive status. The customer membership will remain inactive until you convert the quote to an order.

If you enter a membership item on a quote:

- You advance to the [Enter Membership ID Window \(Selecting a Membership Program\)](#) as in standard order entry where you can select the membership to add to the quote.
- The system does not require a pay type and does not display the [Order Total Window \(Reviewing the First Order Total\)](#) until you convert the quote to an order.
- If you delete the membership item from the quote in quote entry, the system will not create the customer membership. If you delete the membership item from the quote in quote maintenance, the system will also delete the customer membership.
- If you accept the quote, you can review the customer membership in the [Working with Customer Memberships \(WWCM\)](#) menu option. The status of the customer membership is inactive. Because the membership status is inactive the system will not generate a membership order until you convert the quote to an order; see [Converting Quotes to Orders](#).
- If you cancel the quote, the system will also cancel the customer membership.
- Once you convert the quote to an order, the system updates the status of the customer membership to active and generates membership orders for the customer based on the customer membership's next release date.

For more information: See [Entering Customer Memberships in Order Entry](#) for more information on membership processing in order entry.

Soldout Processing on Quotes

If an item on a quote contains a soldout code, the system sells out the item on the quote using existing soldout processing.

Exclude soldouts on Quote Confirmation and Form? The *Exclude S/O on order confirmation* field for the order type on the quote indicates if the system excludes soldout items on the quote confirmation email or the *Outbound Email XML Message (CWEmailOut)* and the [Quote Form](#).

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- If this field is selected, the system excludes soldout items on the quote confirmation email or the *Outbound Email XML Message (CWEmailOut)* and the Quote form. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

 **Note:**

If the soldout item is the only item on the quote and you exclude soldout items from printing, the system does not display the [Print/Email Quote Window](#) where you can select to generate a quote confirmation email or Quote form.

- If this field is unselected, the system includes soldout items on the quote confirmation email or the *Outbound Email XML Message (CWEmailOut)* and the Quote form.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Automatic soldout processing: If you use [Processing Auto Soldout Cancellations \(MASO\)](#) to automatically cancel soldout items, the system includes soldout items on quotes. When you run process auto soldout cancellations, the system automatically cancels soldout items that were added to a quote before the item sold out. In addition, if the *Soldout notifications* field for the order type on the quote is selected, the system generates a soldout notification for the soldout items in order to notify the customer and prevent confusion when the quote is converted to an order. See [Generating Soldout Notifications \(MSON\)](#).

Evaluating soldout items during quote conversion: When you convert the quote to an order, the item remains soldout and displays on the [Unavailable Quoted Order Lines Screen](#); the system does not reevaluate soldout order lines based on current inventory status. In order to reevaluate soldout order lines during quote conversion, you will need to delete the existing soldout order line and add a new order line to the order for the item that is soldout.

Adding a Payment Method to a Quote

Use the [Enter Payment Method Screen](#) to add a pay type to the quote. In addition, you can use the [Work with Order/Recap Screen](#) to add a pay type to the quote.

Payment method required? The [Pay method required](#) field for the order type on the quote defines whether a pay type is required on a quote.

- If the *Pay method required* field is selected, the system requires you to enter a pay type on a quote before the quote can be accepted.
- If the *Pay method required* field is unselected, the system does not require a pay type on a quote. A pay type is not required until the quote is converted to an order.

The system performs the same pay type validation as in standard order entry; see [Pay Type Editing](#).

Cash/check pay type: You cannot enter a cash/check pay type on a quote. You can add a cash/check pay type when the quote is converted to a regular order.

Default pay type pop-up windows: The system displays a default pay type window when you select Accept Order at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) if you defined a default payment method on the [Default Values for Orders](#)

screen. However, if you defined a default cash/check pay type, the system will not display the [Enter Cash Control For Window \(Cash/Check Payment Type\)](#) since you cannot enter a cash/check pay type on a quote. See [Default Paytype Pop-up Windows](#).

Online authorization: If you add a credit card pay type to a quote and the order type on the quote allows online authorization, the system performs online authorization when you accept the quote. See [Performing Online Credit Card Authorizations](#).

Assigning a payment plan to a quote: You can assign a payment plan to a quote. When you convert the quote to an order, the system updates the deferred bill date or installment bill dates.

Deferred payment plan example: On 11/10/09, you enter a quote and apply a deferred payment plan to the credit card pay type on the quote. When you accept the quote, the system assigns a deferred bill date of 12/20/09 to the quote (based on a 30 day deferral). On 11/12/09, you convert the quote to an order. When you accept the converted order, the system updates the deferred bill date to 12/22/09.

Installment payment plan example: On 11/10/09, you enter a quote and apply an installment payment plan to the credit card pay type on the quote. When you accept the quote, the system assigns the following installment bill dates to the quote: 11/10/09 and 12/10/09. On 11/12/09, you convert the quote to an order. When you accept the converted order, the system updates the installment bill dates to 11/12/09 and 12/12/09.

See [Assigning a Payment Plan to the Order](#) for more information.

Completing a Quote

When you finish entering the quote, you can either:

- Accept the quote.
- Reject the quote.

Rejecting a Quote

When you select Reject Order, the system looks at the setting of the [Capture Order/Call Disposition \(K03\)](#) system control value to determine how to proceed.

- If this system control value is set to ORDER or ALL, the system advances you to the [Confirm Order/Call Disposition Window](#) where you must enter a reject reason code explaining why you are rejecting the quote. In addition, the system creates a record in the [Order Disposition Table](#) so that you can track order/call disposition activity; see [Tracking Order/Call Disposition Activity](#).
- If this system control value is set to NONE or blank, the system advances you to the [Confirm Reject Window](#) where you must select OK in order to proceed with the quote rejection.

Accepting a Quote

When you select Accept Order:

1. The system verifies the accuracy of all quote information and, if the *Pay method required* field for the order type is selected, ensures that you have defined some method of payment.
2. The system adds the new quote immediately to the Order tables; it becomes available for Order Maintenance and standard or streamlined Order Inquiry.

3. The system selects the *Quote Origin* field on the [Work with Order Ship to Properties Screen](#) to indicate the order originated as a pre-order quote. The system retains this setting when you convert the quote to an order.
4. If the [Override Freight on Quote Conversion \(K76\)](#) system control value is selected, the system applies the freight and additional freight charges on the quote as a freight override. You can review the freight and additional freight charges on the quote in the *Freight override* field on the [Work with Order Ship to Properties Screen](#).
5. The system assigns the price override reason code defined in the Price Override Reason for Quotes (K75) system control value to each detail line that does not already have a price override reason defined.
6. The system assigns an expiration date to the quote and each item on the quote if a number of days has been entered in the Expiration days field for the order type on the quote; see [Assigning an Expiration Date to a Quote](#).
7. The system sends the credit card payment method on the quote to the authorization service if you are set up to perform online credit card authorizations; see [Performing Online Credit Card Authorizations](#).
8. A scrolling message similar to the following displays at the bottom of the screen:
Finalizing order, Finalizing order.
9. The system advances you to the [Print/Email Quote Window](#), where you can select to print the [Quote Form](#) or generate the Quote Confirmation email.
10. Several updates occur; see [Quote Entry Updates](#).

Assigning an Expiration Date to a Quote

The Expiration days field for the order type on the quote indicates the number of days a pre-order quote is valid before it expires.

When you accept a pre-order quote in order entry or maintenance, the system updates the *Cancel date* for the quote based on the quotes arrival date and the expiration days. The system removes the cancel date when you convert the quote to an order.

The system uses the following calculation to assign a cancel date to a quote:

Quote arrival date + Order type Expiration days = Quote expiration date

The system stores the quote expiration date in the *Cancel date* field in the Order Header table and Order Detail table.

Example: If the arrival date for a quote is 10/29/09 and the expiration days defined for the quote order type is 30, the system updates the *Cancel date* for the quote to 11/28/09.

If you change the order type on a quote: If you change the order type on a quote to another order type whose *Quote* field is selected, the system recalculates the cancel date for the quote, based on the number defined in the *Expiration days* field for the new order type. If an *Expiration days* has not been defined for the new order type, the system removes the cancellation date from the quote.

Manually entering a cancel date: If you manually enter a date in the *Cancel date* field on the Work with Order screen or Work with Order Line screen, the system uses this date instead of the calculated quote expiration date.

Adding an item in order maintenance: If you add an item in order maintenance, the system assigns the cancel date defined on the order header to the new order line.

 **Note:**

If you change the Expiration days field for the order type, the system applies the new expiration days to new quotes entered and does not update the expiration date for existing quotes.

Expired quotes: Once the cancel date has been reached, the quote prints on the [Order Cancellation List](#). Customer Service uses this list to contact each customer to see if the deadline can be extended. If not, Customer Service must use Order Maintenance to cancel the quote. See [Cancelling a Quote through Order Maintenance](#).

Print/Email Quote Window

Use this window to print the Quote form or generate the Quote Confirmation email.

If you maintain a quote: If you maintain a quote after printing the Quote form or generating the Quote Confirmation email, and the estimated order totals for the quote change as a result of your changes, you should resend the Quote form or Quote Confirmation to the customer so that the customer has the most recent estimated totals for the quote.

Order history: When you generate the Quote Confirmation email, the system creates an order history message, indicating the email was sent; for example: 10/28/09 LETTER Quote Conf to kbrown@example.co

How to display this screen:

- Select Accept to perform the final accept for a pre-order quote during order entry or maintenance, or
- Select the Print/Email Quotes option on the [Display More Options Screen](#).

 **Note:**

This window does not open if:

- The Quote Printing Program (K73) and Quote Confirmation Email Program (K74) system control values do not contain a value, or
- All of the items on the quote are soldout and the *Exclude S/O on order confirmation* field for the order type on the quote is selected.

Field	Description
Print Quote	<p>Indicates whether you wish to print the Quote form for the pre-order quote.</p> <div data-bbox="878 365 1377 596" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The system prints the Quote form based on the quote totals at the time you select to print the Quote form.</p> </div> <ul style="list-style-type: none"> • Selected = Print the Quote form. • Unselected = Do not print the Quote form. <p>This field displays only if the Quote Printing Program (K73) system control value contains a value.</p> <p>See Quote Form for a sample of the form and a description of the contents on the quote form.</p>
Email Quote	<p>Indicates whether you wish to generate the Quote Confirmation email for the pre-order quote.</p> <div data-bbox="878 932 1377 1163" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The system generates the Quote Confirmation based on the quote totals at the time you select to email the Quote Confirmation.</p> </div> <ul style="list-style-type: none"> • Selected = Generate the Quote Confirmation email. See Quote Confirmation Emails and Quote Confirmation Email Sample and Contents. • Unselected = Do not generate the Quote Confirmation email. <p>Order Administration generates a generic outbound XML message, rather than an actual email, for quote confirmations if the <i>XML only?</i> flag for the quote confirmation template is selected. The <i>Outbound Email XML Message (CWEmailOut)</i> includes additional information that is not included in the standard email notice. See Outbound Email API for an overview and message details.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>This field displays only if an email address is defined for the order or sold to customer and the Quote Confirmation Email Program (K74) system control value contains a value.</p>

Screen Option	Procedure
Print the Quote form and generate the Quote Confirmation email, based on the fields selected	<p>Select OK. The system prints the Quote form and generates the Quote Confirmation email based on the fields you selected.</p> <p>See Quote Form for a sample Quote form and see Quote Confirmation Email Sample and Contents for a sample Quote Confirmation.</p> <p>The system returns you to the Select Customer Sold To screen or Customer Selection screen where you can enter another quote or standard order.</p>

Reviewing Quotes

Similar to standard orders, you can review quotes in standard or streamlined Order Inquiry; see [Order Inquiry](#). In addition, quotes are included in the following reports and activities.

Reviewing open orders by item: Items on quotes are included in the [Displaying Open Orders by Item \(DOOI\)](#) menu option.

Customer history API: You can use the *Generic Customer History API* to review a customer's quote and order history, or detailed information about a single quote or order.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Pending order summary: You can review the summary information for quotes in the [Reviewing Pending Orders \(DOSS\)](#) menu option.

Salesman reports: Quotes are included on the [Salesman Demand Report](#), which lists merchandise, tax, and freight totals for orders and quotes by salesman number. Q displays in the *Order Status* field for orders flagged as quotes. The *Quantity Returned*, *Quantity Reserved*, and *Quantity Shipped* totals are always 0 for quotes.

Quote Restrictions

The following functionality is not available on a pre-order quote.

Option	Restriction
Multiple Ship To Customers	The system does not allow you to have multiple ship to customers on a quote; see Types of Customers on a Quote .
Order Confirmations	The system does not generate an order confirmation for a quote until it is converted to an order and the order is accepted.
Backorder Notifications	The system does not generate a backorder notification for a quote until it is converted to an order and the order is accepted.
Item Substitution	Item substitution processing does not include quotes. See Processing Item Substitutions (PSUB) .
Drop Ship Processing	The Selecting Vendors for Drop Ship Processing (MDSP) menu option does not include drop ship items that are on quotes until the quote is converted to an order and the order is accepted. In addition, drop ship items on quotes are not included on the Display Unprocessed Drop Ship Items Screen.

Option	Restriction
Inventory Reservation	<p>Because the system does not reserve inventory for items on the quote, the following processes do not include quotes.</p> <ul style="list-style-type: none"> • Reset SKU Open Order Quantity (MRSO) • Reset Backorder Quantity (MRBO) • Evaluate Backorder Reasons without Backorder Warehouse periodic function • Reserve Backorders periodic function • Working with Interactive Reservation (MIRV) • Evaluate Future Orders periodic function • Generate Order Orchestration Requests periodic function
Order Orchestration and Merchandise Locator	<p>You cannot use Order Orchestration to send backordered lines on a quote to the Order Broker module in Order Orchestration for fulfillment. Also, you cannot use the merchandise locator integration to request current availability information about an item/SKU in retail stores within a geographic search area or in external warehouses. However, once the quote is converted to an order, the system will automatically send eligible backordered lines to the Order Broker module in Order Orchestration for fulfillment. Also, the merchandise locator option is available for eligible items on the order. See Order Orchestration Integration and Merchandise Locator API.</p>
Credit checking	<p>The system does not perform credit checking on a quote until it is converted to an order and the order is accepted.</p>
Background Async Processing	<p>Because the system does not perform background async processing on quotes, the following processes do not include quotes.</p> <ul style="list-style-type: none"> • Resetting the Order Billing History Table (ROBH) • The system does not update the Customer Sold To \$ On Order. Because of this, the Resetting Customer Sold To Amount On Order (RONO) process does not include quotes. • The Display Reason/Offer Screen (Cancel Reason History) does not include canceled quotes.
Backorder Reports	<p>The system does not include quotes that contain an item on backorder on the following backorder reports:</p> <ul style="list-style-type: none"> • Backorder Report by Item • Backorder Report by Item with SKU Details • Backorder Report by Warehouse • Backorder Report by Warehouse with SKU Details • Backorder Report by Vendor • Backorder Report by Vendor with SKU Details • Backorder Report by Vendor w/PO • Backorder Report by Vendor/SKU/PO • Backorder Report by Descending Dollars by Entity/Warehouse • Backorder Report by Descending Dollars by Division/Warehouse • Backorder Report by Descending Dollars by Offer/Warehouse • Backorder Report by Descending Dollars by Warehouse

Option	Restriction
Order Reports	Because a quote may never be converted to an order, does not represent a true order, and is not included in demand, the system does not include quotes on the following reports: <ul style="list-style-type: none"> • Order Shipment Analysis Report • Product Performance Report (Ordered Totals) • Product Performance Report (Shipped Totals) • Campaign Performance Report (PCPR) • Order Reconciliation Report • Reviewing Operations Control Summary (FLSH) • Held Order by Reason Code Report • Display Held Order Summary (DHOS)
Order Purge	Purging Orders (MPOR) does not include open quotes. Eligible cancelled quotes are included in the purge.
Workflow Activity	Quotes do not trigger any workflow activity.
Fraud Checking	The system does not check records in the Working with Miscellaneous Frauds (WMFF) or Working with Customer Fraud Tables (WCFD) until you convert a quote to an order; see Converting Quotes to Orders .

Quote Entry Updates

Purpose: The system performs updates to a number of tables to reflect the addition of a new quote to the system. The updates occur:

- Immediately (interactively), as you enter a quote; see [Immediate Quote Updates](#)
- When you select Accept Order; see [Quote Updates at Accept](#)
- The system does not perform any updates during background processing (Order Async) until the quote is converted to an order; see [Quote Conversion Updates During Background Processing](#).

Immediate Quote Updates

The system updates the following tables as you enter a new quote.

- Customer Sold To

Note:

The system does not update the customer's mail type to Buyer when you accept a quote. In addition, the system does not update the customer sold to's item history or order history until you convert a quote to an order; see [Converting Quotes to Orders](#).

- Customer Sold To Extended Address
- Customer Sold To Phone #
- Customer Bill To

 **Note:**

The system does not update the customer bill to's *On order* dollars until you convert a quote to an order; see [Converting Quotes to Orders](#).

- Customer Bill To Extended Address
- Customer Bill To Phone #
- Customer Ship To

 **Note:**

The system does not update the customer ship to's item history or order history until you convert a quote to an order; see [Converting Quotes to Orders](#).

- Customer Ship To Extended
- Customer Ship To Phone #
- Customer Action Notes
- Order Additional Charges
- Order Coupon Discount
- Order Detail
- Order Detail Coupon
- Order Free Gift
- Order Header
- Order Information
- Order Line Message
- Order Message
- Order Payment Method
- Order Ship To
- Order Ship To Address
- Order Special Format
- Order Special Handling

See [Quote Conversion Updates During Background Processing](#) for more information on the tables the system updates when you convert a quote to an order.

Quote Updates at Accept

The system performs these table updates when you select Accept Order to accept a quote.

Process	Table	Field
Reprice order if the Price method field for the Source Code is set to D (Regular Item Pricing + Repricing)	Order Detail	Order detail price
Evaluate free gift eligibility, based on the source code or offer; create order detail records for free gift, if applicable	Order Detail	All fields
Calculate the \$ Discount, based on Source or Offer; add a record to the Order Additional Charges table	Order Additional Charges	All fields
Capture order disposition activity if the Capture Order/Call Disposition (K03) system control value is set to ALL; see Tracking Order/Call Disposition Activity	Order Disposition	Company Order # Order ship to # Universal call ID (if the order is associated with a call from an external order call center) source code entered by user create date create time
Approved online credit card authorization: Create an online authorization record, authorization history record, and void authorization record if you performed online credit card authorization for a credit card payment method on the order	Online Authorization Authorization History Void Authorization	Online Authorization: company order # seq # auth amount vendor response 1 (auth response) vendor response 2 (card security response) auth # auth date status: *UPDT trans seq # card number terminal # AVS result Card security value ASV auth service Authorization History: All fields except Amount Deposited Void Authorization: All fields

Process	Table	Field
Declined online credit card authorization: Create an online authorization record and authorization history record if you performed online credit card authorization for a credit card payment method on the order	Online Authorization Authorization History	Online Authorization: company order # seq # auth amount vendor response status: *SENT trans seq # card number terminal # ASV auth service Authorization History: All fields except Amount Deposited, Auth Date, and Auth #
Undefined online credit card authorization response: Create an online authorization record and authorization history record if you performed online credit card authorization for a credit card payment method on the order	Online Authorization Authorization History	Online Authorization: company order # seq # auth amount vendor response auth # auth date status: *UPDT trans seq # card number terminal # ASV auth service Authorization History: All fields except Amount Deposited

Process	Table	Field
Online credit card authorization communication failure: Create an online authorization record and authorization history record if you performed online credit card authorization for a credit card payment method on the order	Online Authorization Authorization History	Online Authorization: company order # seq # auth amount auth # auth date status: *UPDT trans seq # card number terminal # ASV auth service Authorization History: All fields except Amount Deposited, Auth Date, Auth #, and Vendor Response

Customer Engagement Gift Registry and Customer Wish List Integration

Purpose: The Oracle Retail Customer Engagement Gift Registry and Wish List integration allows you to review a customer's gift registry or wish list across multiple channels, such as retail, call center, and e-commerce, using the Registries window in Modern View and Contact Center Order Entry. When you use these options, the system retrieves the sold to customer's registry or wish list information from Customer Engagement to display in Modern View.

How to create or update a registry for a customer: You need to use Customer Engagement to create or update a gift registry or wish list.

In this topic:

- [Customer Engagement Registry Setup](#)

Customer Engagement Registry Integration Setup

Before you can review a customer's gift registry or wish list from Customer Engagement in Order Administration Modern View, or create a registry order in Modern View, you must complete the required setup.

Required versions:

- Order Management System version 21.2 or higher, or Order Administration.
- Customer Engagement version 16.0 or higher.

In addition, retrieving a customer's gift registry or wish list from Customer Engagement uses version 3.1 of the Customer Engagement Registry Service API.

Setup is required in both Order Administration and Customer Engagement.

For more information: See:

- [Customer Engagement Batch Customer and Sales Integration](#) for more information on the setup required to use the [Customer Engagement Sales Feed](#) and [Customer Engagement Customer Integration](#).
- [Customer Engagement Loyalty Integration](#) for more information on the setup required to use the Customer Engagement loyalty program.
- [Customer Engagement Purchase History Integration](#) for more information on the setup required to retrieve a customer's purchase history from Customer Engagement.

Setup in Order Administration for Customer Engagement Customer Gift Registry and Wish List

- [System Control Values for Customer Engagement Gift Registry or Wish List](#)
- [Web Service Authentication for Customer Engagement](#)
- [Customer Engagement Property Settings for Customer Engagement Registry](#)

System Control Values for Customer Engagement Gift Registry or Wish List

System Control Value	Description
ORCE Customer Integration (L37)	Enter INTERACT to send information on new and updated customers to Customer Engagement interactively. Required to use the gift registry and wish list integration. See Customer Engagement Customer Integration for more information.
ORCE Integration Item ID (L38)	<p>Defines how Order Administration identifies items/SKUs returned from Customer Engagement in the registry API.</p> <p>ITEM = Order Administration uses the <i>Item code</i> and <i>SKU code</i>.</p> <p>XREF = Order Administration uses the <i>Retail reference number</i>.</p> <p>The system uses the item ID to determine the item and SKU. The ORCE Integration Item ID (L38) system control value controls whether to identify the item by item and SKU or by a cross reference. See that system control value for more information.</p> <p>If the item and SKU is not found in Order Administration, description displayed in Modern View is <i>Store only item</i>. In this case, you cannot add the item to an order.</p> <p>Note: Order Administration also uses the setting of this system control value when sending requests to Customer Engagement in order to update the items on the customer's gift registry or wish list.</p>
Use ORCE Registries (M26)	Select this system control value to use the Customer Engagement Registry integration.
Default Location for ORCE Integration (K69)	This system control value must specify a valid location in Customer Engagement to support creating registry orders in Modern View.

Web Service Authentication for Customer Engagement

Use the *ORCE Registry* entry in [Working with Web Service Authentication \(WWSA\)](#) to specify a valid client ID and client secret for authentication.

Note:

OAuth is required.

For more information: See Oracle Retail Omnichannel Web Service Authentication Configuration Guide on My Oracle Support (2728265.1) for configuration instructions.

Customer Engagement Property Settings for Customer Engagement Registry

[Working with Customer Properties \(PROP\)](#) contains settings required for integration with Customer Engagement required for the item registry and wish list integration.

Setting	Description	Setting
ORCE_CUSTO MER_SERVICE_ PREFIX	The system uses this property to build the URL for communication with Customer Engagement.	https://server:8447/ where: server = the name of your Customer Engagement server 8447 = the port to use on the Customer Engagement server
ORCE_CUSTO MER_SERVICE_ SUFFIX	The system uses this property, along with the <code>ORCE_CUSTOMER_SERVICE_PREFIX</code> and the value in the ORCE Organization Descriptor (L50) , to build the URL for communication with Customer Engagement using the Customer Services API.	/OrceWebServices/v2_3/ CustomerServicesApiService? wsdl where 2_3 is the version of the Customer Services API
ORCE_REGIST RY_SERVICE_S UFFIX	The system uses this property, along with the <code>ORCE_CUSTOMER_SERVICE_PREFIX</code> and the value in the ORCE Organization Descriptor (L50) to build the URL for communication with Customer Engagement using the Customer Engagement Registry Service API.	/v3_1/RegistryServices? wsdl where 3.1 is the version of the Registry Service API.
ORCE_SECURI TY_USER_ID	The Customer Engagement user ID with Security Group permission included in the Customer Engagement API messages.	Must be a valid user ID in Customer Engagement that has Security Group permission

Setup in Customer Engagement for Item Registry and Wish List

Order Administration Company > Customer Engagement Organization

An organization in Customer Engagement corresponds to a company in Order Administration. You associate a Customer Engagement organization with an Order Administration company through the [ORCE Organization Descriptor \(L50\)](#) system control value.

In Customer Engagement, define the *Organization Descriptor* for the organization that integrates with Order Administration, and that matches the ORCE Organization Descriptor (L50) system control value setting.

Selecting items for the registry in Customer Engagement:

- If there is not a record of the item in Order Administration, the item cannot be added to an order. In this case, the item description displayed is Store only item.
- Restricted items on a registry cannot be added to an order.
- Variable set items on a registry cannot be added to an order for the registry.
- If an item on the registry is assigned the status defined in the [Item Status for Suppressing Item During Item Selection \(L21\)](#) system control value, the item is not displayed in Contact Center Order Entry during registry order creation.

See the Customer Engagement **Implementation Guide** for more information on how to define configuration settings for Customer Engagement.

 **Note:**

Whenever you make changes to an organization's configuration settings, you must stop Customer Engagement, deploy the configuration settings to Customer Engagement, and restart Customer Engagement. See:

- **Shut Down Services** in the **Add New Organization** section of the Customer Engagement Implementation Guide (Installer Version) for more information on how to stop Customer Engagement.
- The Customer Engagement Configuration Guide for more information on deploying configuration settings Customer Engagement.
- **Restart Services** in the **Add New Organization** section of the Customer Engagement Implementation Guide (Installer Version) for more information on how to restart Customer Engagement.

Reviewing a Customer's Gift Registry or Wish List in Order Administration Modern View, and Creating a Registry Order

When customer integration with Customer Engagement is enabled, including gift registry and wish list integration, the Registries link is available in the Purchases tile at top of the Customer Order List page in Modern View.

The option is available regardless of whether the Orders, Items, Purchase History, or Loyalty tab is selected, and regardless of whether the customer currently has any existing registries.

When you select the Registries link, the Registries panel opens to the right. If the customer has more than one existing registry, the panel displays the list of registries, and you can select a registry to review. If the customer has a single registry, the panel displays the details of the registry, including the items on the registry. Any items that do not exist in Order Administration have a description of Store only item.

The Create Registry Order link is available when the Registries panel is displaying a registry, enabling you to use Contact Center Order Entry to enter an order for one or more of the items in the registry for the customer assigned to the registry in Customer Engagement. If the customer has any registries, the option to create a registry order is displayed within Contact Center Order Entry for a regular (non-registry) order.

When would you create a registry order? You might create a registry order if:

- A customer wants to purchase items on their own wish list. For example, a customer might create a wish list for items needed for the first semester at college.

- A customer wants to purchase items remaining on a registry after the event occurs. For example, after a baby shower, the customer might want to purchase any remaining items that were not given as gifts at the shower.

The options and information in Contact Center Order Entry differ somewhat from those available when you are entering a regular order. For example:

- The Add items to order step displays only the registry items when you have selected entry of a registry order.
- While the page displays registry items, the Quantity Desired and Quantity Purchased are displayed for these items.

When you are entering a registry order, you do have the option to search for all items. You can add non-registry items to a registry order, and vice versa. If the customer has more than one existing registry, you can add items from different registries to the order. The details of the currently selected registry are displayed at the top of the page.

When you submit the order, the *Quantity Purchased* is updated for each registry item on the order. Also, an Order Transaction History record indicates that an item was purchased for a registry, for example: Line 2 purchased from Sample Registry.

See *Order Entry* in the Modern View online help for more information.

Reviewing and Updating a Customer's Gift Registry or Wish List in Customer Engagement

You can view and update a customer's wish list on the **View Registry** screen for a customer, available from the Customer Dashboard in Customer Engagement Modern View. See **Registries** in the Customer Engagement **JET UI User Guide** for screen details.

The screenshot shows the 'View Registry for' screen. At the top, it says 'View Registry for (Customer ID)' and 'registry'. Below this, there are two main sections: 'Registry information' and 'Registry Owners'.

Registry information:

Field	Value
Registry ID	144
Registry Type	Wish List

There is also a 'Registry Comments' field which is currently empty.

Registry Owners:

Primary	Name	Nickname	Registry Phone	Registry Email	Registry Address
<input checked="" type="checkbox"/>			5085552372	@oracle.com	

Items in Registry:

Image	Item ID	Description	Desired Quantity	Purchased Quantity
	AB1003	CLOWN BRACELET	3	0

Customer Engagement Registry Service API v3.1

The Customer Engagement Registry Service API v3.1 is used to communicate with Customer Engagement to retrieve and update a customer's gift registry or wish list.

Order Administration calls the Customer Engagement Registry Services API version 3.1 to generate the following messages:

URL: The system uses the [ORCE_CUSTOMER_SERVICE_PREFIX](#) value, the [ORCE Organization Descriptor \(L50\)](#), and [ORCE_REGISTRY_SERVICE_SUFFIX](#) setting to build the URL for communication with Customer Engagement.

ORCE log: Order Administration logs the Customer Engagement transactions passed between Order Administration and Customer Engagement in the [Trace Log](#) if its [Logging Level](#) is set to **DEBUG**.

Web service authentication? If the web services used to process inbound messages to Customer Engagement require web service authentication, you must provide a valid web service authentication client ID and client secret for the ORCE Registry entry in [Working with Web Service Authentication \(WWSA\)](#). OAuth is required. See **Oracle Retail Omnichannel Web Service Authentication Configuration Guide** on My Oracle Support (2728265.1) for more information.

See the **Customer Engagement Batch Processing and Web Services Guide** for more information on the Customer Engagement API interface.

Working with Error Order Batches

Topics in this part:

- [Introducing Order Batches](#) describes the process of working with batched orders from a high-level point of view.
- [Working with an Order Batch](#) describes how to review, correct, and accept orders received from an external system that are in error.
- [Performing Batch Order Entry](#) describes how to work with the individual orders in the batch.
- [Accepting or Rejecting the Order Batch](#) describes how to release the individual orders in a batch on the system once the batch is in balance or how to reject the entire batch, if necessary.

Introducing Order Batches

You can work with the following types of order batches.

- [Batch Orders and Web Orders](#)
- [Batch Orders and Membership Orders](#)

Batch Orders and Web Orders

Web orders that fail the order edit: If an order received through the *Generic Order Interface (Order API)* does not pass the order edit, or if it does not include payment information, it is retained in the [Default Batch for E-Commerce Orders in Error \(G41\)](#). However:

- If the *order_channel* is P and the order is not part of a batch, the system places the order in the [Batch Number for Retail Channel Orders \(I78\)](#) if it has errors.
- If a retail pickup or delivery order does not pass the order edit, it is retained in the [Order Broker Error Batch Number \(K90\)](#). If this system control value is blank, retail pickup and delivery orders in error are assigned to the same batch as e-commerce orders in error. See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for background.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

To correct web orders in error: You can use batch orders to review, work with, and approve web orders that failed the order edit. Select Edit/Accept on the [Work with Error Orders Batches Screen](#) to edit the order batch. The system runs the same order edit that is performed when you receive orders through the *Generic Order Interface (Order API)*. When

an order passes the order edit, the system removes the batch number from the order, updates its status to open, performs pick slip preparation, and makes it available in regular order maintenance and inquiry. If an order fails the order edit, the system includes the order on the [Print Remote Order Errors Report](#) and retains the order in an error status in the order batch.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Batch Orders and Membership Orders

Membership orders that fail the order edit: If a membership order generated through [Generating Membership Orders \(EGMO\)](#) does not pass the order edit, the order remains in a suspended status and is placed in a generated order batch, using the next number in the *Order Batch (A01)* number assignment wheel.

To correct membership orders in error: You can use batch orders to review, work with, and approve membership orders that failed the order edit. Select Edit/Accept on the [Work with Error Orders Batches Screen](#) to edit the order batch. The system runs the same order edit that is performed when you receive orders through the *Generic Order Interface (Order API)*. When an order passes the order edit, the system removes the batch number from the order, updates its status to open, performs pick slip preparation, and makes it available in regular order maintenance and inquiry. If an order fails the order edit, the system includes the order on the [Print Remote Order Errors Report](#) and retains the order in an error status in the order batch.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Working with an Order Batch

Order batching allows you to review, correct, and accept orders received from an external system that are in error.

Web orders: If an order received through the *Generic Order Interface (Order API)* does not pass the order edit, or if it does not include payment information, the system places the order in an order batch; see [Batch Orders and Web Orders](#). Select Edit/Accept on the [Work with Error Orders Batches Screen](#) to edit and approve the batch. Even if the batch is error-free, you will still need to approve it manually.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

In this topic:

- [Default Values for Orders Screen \(Selecting Error Order Batches\)](#)
- [Work with Error Orders Batches Screen](#)
- [Work with Orders within a Batch Screen](#)

Default Values for Orders Screen (Selecting Error Order Batches)

Purpose: Use this screen to advance to the Work with Error Order Batches screen.

About this screen: Each field on this screen is described in [Setting Defaults in Order Entry](#); however, you must select the *Error order batches* field to select to work with orders in error. Entries to the other fields on this screen are optional.

Work with Error Orders Batches Screen

Purpose: This screen displays the order batches in the system that contain orders in error. The value in the *Assigned to user* field controls which batches display. If blank, this screen lists all the order batches in the system.

Threshold: The Suspended Batches threshold value controls the length of time in which a suspended order batch remains on the system. Any order batches beyond this threshold are deleted automatically during a periodic process.

User ID: This screen also displays the user ID of the person currently working with an order batch. Only one person can work on a batch.

Screen use: Use this screen to:

- Work with an order batch. Orders in the batch remain in a suspended status until you accept the batch. For each order batch, you can:
 - Edit and accept the orders in the order batch.
 - Reject an order batch.
 - Add, delete, or work with an order in the batch at the [Work with Orders within a Batch Screen](#).
- Review, work with, and edit orders received through the *Generic Order Interface (Order API)* that did not pass the order edit or do not include payment information; see [Batch Orders and Web Orders](#).
For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- You can select Edit/Accept to edit the order batch. The system runs the same order edit that is performed when you receive orders through the *Generic Order Interface (Order API)*.
For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

When an order passes the order edit, the system removes the batch number from the order, updates its status to open, performs pick slip preparation, and makes it available in regular order maintenance and inquiry. If an order fails the order edit, the system includes the order on the [Print Remote Order Errors Report](#) and retains the order in an error status in the order batch.

How to display this screen:

1. Select *Error order batches* on the [Default Values for Orders Screen \(Selecting Error Order Batches\)](#).
2. Select OK to display the Work with Error Order Batches screen.

Field	Description
Assigned to user	The user ID of the person who created the order batch. All order batches display if this field is blank. The system assigns your default user to orders received through the <i>Generic Order Interface (Order API)</i> that contain errors. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). <i>Alphanumeric, 10 positions; optional, assigned by the system.</i>

Field	Description
Batch suspended	<p>Indicates whether the screen lists only suspended batches or all batches. The system suspends a batch if the keyed cash and/or order controls do not match the actual cash and/or order controls.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> Selected = (default): Display only suspended (unbalanced) batches. Unselected = Display balanced and unbalanced batches. <p>The system default is to display only the unbalanced batches because these batches need to be worked on. You must enter (or continue to enter) orders for the batch, adjust the cash or order controls for the batch or correct the orders in the batch to bring the batch into balance. If you select this field, every batch currently on the system is listed.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>A threshold value controls the length of time in which an order batch remains on the system. After this period, the system deletes order batches automatically during a periodic process.</p> </div>
Batch #	<p>The number assigned by the system to a group of orders within an order batch.</p> <p>Web orders: If an order received through the <i>Generic Order Interface (Order API)</i> does not pass the order edit, or if it does not include payment information, it is retained in the Default Batch for E-Commerce Orders in Error (G41). However:</p> <ul style="list-style-type: none"> If the <i>order_channel</i> is P and the order is not part of a batch, the system places the order in the Batch Number for Retail Channel Orders (I78) if it has errors. If a retail pickup or delivery order does not pass the order edit, it is retained in the Order Broker Error Batch Number (K90). If this system control value is blank, retail pickup and delivery orders in error are assigned to the same batch as e-commerce orders in error. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for background. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). <i>Numeric, 5 positions; display-only, assigned by the system.</i></p>
Date	<p>The date on which the order batch was created.</p> <p><i>Numeric, 6 positions (in user date format); display-only, assigned by the system.</i></p>
# orders	<p>The number of individual orders assigned to the order batch, regardless of order status and including orders that have been processed and no longer display in the batch. The system includes all orders whose <i>Batch #</i> field in the Order Header table matches the order batch number.</p> <p><i>Numeric, 5 positions; display-only.</i></p>

Field	Description
\$ value	The total dollar amount of orders entered for this batch during Order Entry. The system updates this field as you enter and accept each order in the batch. <i>Numeric, 13 positions with a 2-place decimal.</i>
In use by	The user ID of the person currently working with the batch. Only one person at a time can access a batch. If the batch is locked by another user because, for example, the user's session ended unexpectedly, you can use Unlocking a Stranded Order or Batch (MULO) to unlock the batch. <i>Alphanumeric, 10 positions; display-only, updated by the system.</i>

Screen Option	Procedure
Review, delete or enter orders for the batch	Select Work with Orders for a batch to display the Work with Orders within a Batch Screen .
Reject and remove the entire batch	Select Reject for a batch to reject and delete the batch. Select OK at the Confirm Reject Window to perform this action. See Accepting or Rejecting the Order Batch .
Run the order edit batch program and print the Print Remote Order Errors report for an order batch	Select Edit/Accept for an order batch to run the order batch edit and print the Print Remote Order Errors Report . See Accepting or Rejecting the Order Batch for the updates that occur.

Work with Orders within a Batch Screen

Purpose: Use this option to:

- Review the orders assigned to the batch
- Delete an order from the batch
- Work with an order in the batch
- Review the order totals for an order in the batch
- Add an order to the batch

How to display this screen: Select Work with Orders for an order batch at the [Work with Error Orders Batches Screen](#).

Field	Description
Batch#	The number assigned by the system to a group of orders within an order batch. <i>Numeric, 5 positions; display-only, assigned by the system.</i>

Field	Description
Sts Order status	<p>The status of the order, as assigned by the system. Batched orders may have a Suspended, Open or Quote status.</p> <p>Suspended/Error Batched orders are suspended in an error status until the errors are corrected. When you correct the errors on an order, the status of the order in the batch changes to Open.</p> <p>Open Pick slips may be printed for orders in an open status. Additionally, these orders are available for maintenance and inquiry.</p> <p>Quote If the <i>Quote</i> field for the order type on the order is selected, the system considers the order a pre-order quote and not a standard order. Quotes in a batch are entered in a Quote status and remain in a Quote status until you convert the quote to an order in Quote Maintenance. See Entering Pre-Order Quotes for an overview. Other status codes are: Held, Cancelled or Closed. <i>Alphanumeric, display-only, updated by the system.</i></p>
Order #	A unique number assigned by the system to identify an order. <i>Numeric, 8 positions; display-only.</i>
Ord date	The date the order was created. <i>Numeric, 6 positions (in user date format); display-only.</i>
Sold to	The last name, first name and initial or the company name of the customer who placed the order. <i>Alphanumeric, 41 positions; display-only.</i>
#Rcp	<p>The number of recipients for this order, which indicates the number of different shipping addresses associated with the order number.</p> <p>The system assigns a sequential ship-to number to every order, even if the shipping address and the sold-to address are the same. <i>Numeric, 3 positions; display-only.</i></p>
Total paid	The dollar amount you received from the customer on all prepaid (cash/check payments) for the order. <i>Numeric, 20 positions with a 2-place decimal; display-only.</i>
Pmt	<p>Indicates whether a payment method exists on the order.</p> <ul style="list-style-type: none"> • Y = A payment method exists on the order. • N = A payment method does not exist on the order. <i>Alphanumeric, 1 position; display-only.</i>

Screen Option	Procedure
Delete an order from the batch	Select Delete for the order to delete it. The system writes a record in the Deleted Order Table for the order.
Go into an order in the batch to change or verify order information before you accept the entire batch	Select Ship To's for an order listed for the batch to advance to Order Entry (in "review" mode). You must accept or reject the order when you are through.

Screen Option	Procedure
Review the order totals for the order	Select Display order totals for the order to display the Display Order Totals Window .
Enter another order for the batch	Select Create. See Performing Batch Order Entry for more information about the batching process during Order Entry. See also Entering Orders for details on how to enter an order.

Performing Batch Order Entry

Purpose: This topic describes the differences you see during Order Entry when you work with an order in an order batch. This topic identifies the screen differences on each major Order Entry screen during Batch Order Entry. The screens display this way only if you select the *Error order batches* field at the [Default Values for Orders Screen \(Selecting Error Order Batches\)](#).

Only the fields and command keys that apply to Batch Order Entry are described in this topic.

Refer to [Entering Orders](#) for field-by-field descriptions and instructions for performing Order Entry. Whether entering batched or unbatched orders, this process remains the same.

When you complete the Batch Order Entry process, which means that you update and accept each order in the batch, you must accept the entire batch to release these orders on the system. See [Accepting or Rejecting the Order Batch](#) if you have completed the orders in the batch and wish to process or delete the batch.

In this topic:

- [Select Customer Sold To For Order Screen](#)
- [Work with Order Screen \(Batch Order Entry\)](#)
- [Completing Order Entry](#)

Select Customer Sold To For Order Screen

Purpose: Use this screen to specify the customer for the order in the order batch, by:

- Entering the customer number, if you know it, *or*
- Entering information in any of the scan fields to obtain a list of customers who closely match this information, *or*
- Selecting Create to enter an order for a new customer.

How to display this screen: Select Create at the [Work with Orders within a Batch Screen](#).

Note:

If the [ORCE Customer Integration \(L37\)](#) system control value is set to INTERACT, you advance instead to the [Customer Scan Screen](#).

About this screen: This screen is described fully in [Selecting Customers in Order Entry](#); however, in batch order entry the [Batch #](#) field is listed at the top of the screen to indicate that you are entering orders for a batch.

Field	Description
Batch #	The batch number for which you are entering the current order. The batch number is a number assigned by the system to a group of orders. <i>Numeric, 5 positions; display-only, assigned by the system.</i>

Screen Option	Procedure
Review or update defaults for several Order Entry fields	Select Change Defaults to display the Change Defaults pop-up window. See Setting Defaults in Order Entry .
Enter an order for a new customer	Select Create to advance to the Work with Order screen. See Entering Orders .
Review the orders already entered in the batch	Select Maintain to display the Work with Orders within a Batch Screen .

Work with Order Screen (Batch Order Entry)

Purpose: The following screens identify the differences in the Order Entry screens when batching orders. See [Entering Orders](#) for a complete discussion and a sample of these screens.

Field	Description
Batch#	The batch number for which you are entering the current order. The batch number is a number assigned by the system to a group of orders. <i>Numeric, 5 positions; display-only, assigned by the system.</i>

Completing Order Entry

Purpose: You return to the [Work with Orders within a Batch Screen](#) when you accept or reject each order in the batch.

Select one of the following options on the [Work with Error Orders Batches Screen](#) when you finish working with the orders in the batch:

- Select Edit/Accept to accept all the orders in the batch.
- Select Reject to reject and delete the entire batch.

See [Accepting or Rejecting the Order Batch](#) if you are through entering the entire batch.

Accepting or Rejecting the Order Batch

Purpose: This topic describes the processes that the system performs when you select Edit/Accept for a batch to accept the entire batch or you select Reject Batch for a batch to reject and delete the batch.

In this topic:

- [Rejecting the Batch](#)

- [Accepting the Batch](#)
- [Performing Online Credit Card Authorizations](#)
- [Accepting an Order in the Batch](#)
 - [Immediate Updates](#)
 - [Updates at Accept](#)
 - [Updates During Background Processing](#)
- [Accepting the Entire Batch](#)
 - [Updates at Accept](#)
 - [Updates During Background Processing](#)

When to accept or reject: You accept or reject a batch of orders when you finish entering the individual orders in a batch; see [Performing Batch Order Entry](#).

Rejecting the Batch

You may want to reject an order batch if the order batch contains orders that you wish to delete.

Select [Reject Batch](#) to reject and delete the batch. You advance to the [Confirm Reject Window](#). Select [OK](#) to reject the batch.

The system prints the [Rejected Batch Listing](#), deletes the orders from the system, and deletes the batch itself.

Deleted Order table: The system writes a record in the Deleted Order Table for each purged order.

If the batch includes a retail pickup or delivery order from Order Orchestration, the BROKER process sends a status update rejecting the order; also, it deletes the related Order Orchestration and Order Orchestration History records. See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview.

Accepting the Batch

Select [Edit/Accept](#) on the [Work with Error Orders Batches Screen](#) to edit the order batch. The system runs the same order edit that is performed when you receive orders through the Generic Order Interface (Order API) and includes any orders in error on the [Print Remote Order Errors Report](#).

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

When an order passes the order edit, the system removes the batch number from the order, updates its status to open, performs pick slip preparation, and makes it available in regular order maintenance and inquiry.

If an order fails the order edit, the system includes the order on the [Print Remote Order Errors Report](#) and retains the order in an error status in the order batch. Select [Work with Orders](#) for the order batch to advance to the [Work with Error Orders Batches Screen](#) where you can review and correct the errors on each order. When you have finished updating each order, select [Edit/Accept](#) again to edit and accept the remaining orders in the order batch.

Performing Online Credit Card Authorizations

Online credit card authorization allows you to send and receive electronically the information required to authorize a credit card at the time the order is placed instead of at the time the pick slip is generated for the order.

The system performs online authorization when you accept an order batch after determining if any order in the batch should go on hold.

If an order in the batch is eligible to receive a credit card authorization during batch order entry, the system sends the amount requiring authorization to the authorization service and waits for a response.

There are 3 types of responses you can receive from the authorization service.

- R = an authorization response was received, such as declined or approved.
- T = the program timed out before an authorization response was received.
- U = an undefined response was received.

Additionally, if an authorization response is received, the authorization service sends back an authorization response code, AVS response code (if performing address verification), card security response code (if performing credit card security identification), authorization code, and date.

If a hold reason code has been defined for the vendor response, AVS response, or CID response received, the system places the order on hold.

Credit cards requiring authorizations less than \$1.00: If the credit card amount to authorize is less than \$1.00 and you have defined an authorization number in the [Authorization Number for Authorizations Under \\$1.00 \(I08\)](#) system control value, the system does not send the credit card to the service bureau for authorization and instead assigns the authorization number from the system control value to the credit card. If an authorization number is not defined in this system control value, the system sends the credit card to the service bureau for authorization, regardless of the amount that requires authorization.

Performing Online Verification Only: If the [Online Auth Verification Only \(I96\)](#) system control value is selected, the system processes online authorizations for \$1.00 for the purpose of validating the card. During batch authorizations, the system authorizes the card for the shippable dollar amount and voids the online authorization for \$1.00.

For more information: See [Performing Online Credit Card Authorizations](#) for an overview of the online credit card authorization process and the required setup.

Accepting an Order in the Batch

Purpose: The system performs updates to a number of tables to reflect the addition of a new order to the batch. The updates occur:

- Immediately, as you enter an order to the batch.
- When you accept the order or accept the order and add a recipient order.
- During a background processing job (ORDR_ASYNC).

Immediate Updates

The system updates the SKU and Item/Warehouse tables immediately as you enter a new order to the batch.

Process	Table	Field
Update the Item/Warehouse record for each item ordered	Item/ Warehouse	On hand qty (if express-billed order) ITW B/O qty Reserve qty S/H reserve qty ITW On order qty
Update the SKU record	SKU	SKU Orders avail pick gen SKU Open qty SKU On hold qty

Additionally, the system updates the following tables as you enter a new order:

- Customer Sold To
- Customer Sold To Extended Address
- Customer Sold To Phone #
- Customer Bill To
- Customer Bill To Extended Address
- Customer Bill To Phone #
- Customer Ship To
- Customer Ship To Extended
- Customer Ship To Phone #
- Customer Action Notes
- Order Additional Charges
- Order Detail
- Order Detail Data Queue
- Order Free Gift
- Order Header
- Order I/T Lines
- Order Information
- Order Line History
- Order Line Messages
- Order Messages
- Order Payment Method
- Order Pending Checks
- Order Selected Item
- Order Ship To
- Order Ship To Address
- Order Ship To Data Queue

- Order Special Handling
- Order Transaction History
- Reserved Order Lines

Updates at Accept

The system performs these table updates when you accept each order in the batch.

Process	Table	Field
Reprice order if the <i>Pricing method</i> field in the Source Code record is set to a Reg Plus Reprice	Order Detail	ODT Price
Evaluate free gift eligibility, based on the source code or offer; create order detail records for free gift, if applicable	Order Detail	All fields
Calculate the \$ Discount, based on Source or Offer; add a record to the Order Additional Charges table	Order Additional Charges	All fields
Sends balance of updates to background processing job (O/P ASYNC)		

Order transaction history: When you accept an order that is part of an order batch, the system writes an order transaction history message with a *Type* of Maintenance indicating the user that accepted the order. The system writes an order transaction history message each time a user accepts the order so that you can track the users that changed the order in the batch prior to accepting the order batch. You can review order transaction history messages on the [Display Order History Screen](#).

An example of the order transaction history message the system creates when a user accepts an order that is part of an order batch is displayed below. The system includes an amount regardless of whether the change updated the order total.

Date	Type	Transaction Note	Amount	User
8/14/14	MAINT	Order changed while in unaccepted batch	45.00	SFLYE

 **Note:**

The system does not create an order transaction history message if a user rejects out of an order that is part of an order batch. If a user accepts an order in order maintenance that is no longer part of an order batch, the system writes an order transaction history message indicating: Order was maintained.

Additional updates when you accept the entire batch: The system performs these updates to the individual orders in the batch only when you accept the entire batch (see [Accepting the Entire Batch](#)):

- Perform the credit check processes
- Evaluate for refund eligibility
- Update the Flash Report
- Evaluate and update the order status based on the detail line status, if necessary
- Update the Online Authorization, Authorization History, and Void Authorization tables if you performed online credit card authorization
- Applies pick slip preparation to each eligible order; see [Applying Pick Slip Preparation to an Order](#)

Updates During Background Processing

The system performs the balance of the field and table updates during a background processing job (O/P ASYNC) that runs after you accept each order in the batch.

Process	Table	Field
Update the Price Override Reason table, based on price overrides at detail line level	Price Override Reason	POR # of overrides POR Total discount
Update the SKU record	SKU	Date of first order Date of last order
Update the SKU/Price History record	SKU Price History	SPH # orders SPH \$ orders

Accepting the Entire Batch

Purpose: The system updates several tables:

- When you accept the entire batch

- During a background processing job that runs automatically after you accept a batch or an order in the batch

See [Working with the ORDR_ASYNC Job](#) for more information on the background jobs.

Updates at Accept

The system performs these table updates when you accept the batch. See [Performing the Release](#) and [Introducing Order Hold Reason Codes](#) for more information about the credit check process that evaluates customers, orders, and payment types and performs record updates if any condition on the order fails a credit check.

Process	Table	Field

Generic Order Interface

Topic in this part: The following topic describes how to use the generic order interface:

- *Generic Order Interface (Order API)*: Provides an overview of the generic order interface, including the XML file layout and customer creation and matching. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- *Order Creation Errors*: Lists possible errors that might occur through the generic order interface.

Order Creation Errors

Purpose: The following table describes errors that can occur when you create orders through the order API. These errors might be included in the *Detailed Order XML Response (CWORDEROUT)* if the response_type in the *Inbound Order XML Message (CWORDERIN)* is E.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Note:

Special characters (such as < or >) are replaced in the outbound message.

For more information: See *Generic Order Interface (Order API)*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Code	Error	Explanation
01	Entered Price Exceeds Lim	The requested price of a new or existing item is below the maximum discount percentage, as specified in the Price Override Limit Percent (E55) system control value. For example, if this system control value specifies a limit of 10%, and the requested price of an item was 15% below the regular price, this would produce an error.
		<div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>This error based on the setting of the Override Price Override Limit (A64) secured feature:</p> <ul style="list-style-type: none"> • if there is a valid <i>entered_by_user</i> specified in the message, the system checks the secured feature authority of that user; • otherwise, if the <i>entered_by_user</i> is not a valid user ID in Order Administration, or if there is no <i>entered_by_user</i> specified in the message, the system checks the secured feature authority of your default user. </div>
A0	Invalid Promotion Code	The promotion code specified in the message does not actually exist. See the Allow Manual Entry of Promotion Code (I63) system control value for more information.
A1	Multiples error	The order line quantity is not evenly divisible by the <i>Sell quantity</i> for the item/SKU.
A4	Price is zero	No price was found for the item/offer, but the item is not eligible for a price override to zero.
A7	Item not valid for whs	The <i>line_warehouse</i> indicated for a return or express bill does not exist.
A8	Invalid line frt override	A line freight override is indicated, but the freight method on the order is not a line-level freight method.
A9	S/H code is invalid	The <i>S/H code (Special handling code)</i> specified for the item is invalid.
B1	Restricted item/SKU	The Restrict flag for an item on the order is selected.
B2	SKU does not exist	The short SKU specified in the message is not associated with a valid SKU.
B3	Base item does not exist	The system cannot identify the item/SKU for an order detail line based on the information provided in the message.
B4	Discount limit exceeded	The discount on the order ship to exceeds the Order Discount Percentage Limit (D16) system control value.
BZ	Invalid Additional Charge	The <i>additional_charge_code</i> is not a valid additional charge code in the Additional Charge table.
C0	Invalid offer	The item specified is associated with an invalid offer.
C1	Item/Cust cls restriction	The customer's class is restricted from shipment of items of this item class, as defined through the Item Class Restrictions by Customer Class Screen (Working with Restrictions) .

Code	Error	Explanation
C3	S/H code not allowed	Special handling is not allowed for the item, as defined at the Create Item Offer Screen or the Create SKU Offer Screen .
C4	Invalid/Missing Cust Cls	There is no valid customer class indicated in the message, the Default Customer Class in Order Entry (D63) system control value is blank, and the Require Customer Class in OE, WCAT, and WCST (H85) system control value is selected.
C5	Gift wrap not allowed	The <i>gift_wrap</i> field is selected and gift wrapping is not allowed for the offer.
C8	Invalid Ship Via	<ul style="list-style-type: none"> The <i>Require postal code?</i> flag is selected for the country and the ship via specified for the order does not exist, OR There is an invalid <i>line_shipping_method</i> specified for an item on the order, OR The order represents a pre-order quote (the <i>Quote</i> field for the order type is selected) and the ship via entered on the quote is an express bill ship via.
D3	Price does not exist for item source.	The source code uses special pricing by source, and special pricing is not defined for the item. See Working with Special Pricing by Source Code (WSP) for more information.
D4	Multiple CCs with \$0	There is more than one “catch-all” payment method. See Enter Payment Method Screen for more information.
D8	Missing Whse/ Loc-No IT Ln	The <i>line_warehouse</i> or <i>location</i> indicated for a return or express bill does not exist. You must delete the entire order and re-enter it.
E2	State not found	The state is not valid for the country, as defined through Setting Up the Country Table (WCTY) . If a state is specified, it must be a valid state for the country, regardless of the setting of the <i>Require state?</i> flag for the country.
E3	Order qty > max allowed	The item quantity exceeds the maximum specified in the Maximum Order Quantity (C60) system control value.

 **Note:**

This error based on the setting of the [Allow Maximum Order Quantity Override \(A70\)](#) secured feature:

- if there is a valid *entered_by_user* specified in the message, the system checks the secured feature authority of that user;
- otherwise, if the *entered_by_user* is not a valid user ID in Order Administration, or if there is no *entered_by_user* specified in the message, the system checks the secured feature authority of your default user

Code	Error	Explanation
E5	Line \$value > max allowed	The extended price of the order detail line exceeds the limit specified in the Maximum Order Line Value (E98) .
		<div style="border: 1px solid #0070c0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>This error based on the setting of the Allow Maximum Order Line Value Override (A69) secured feature:</p> <ul style="list-style-type: none"> if there is a valid <i>entered_by_user</i> specified in the message, the system checks the secured feature authority of that user; otherwise, if the <i>entered_by_user</i> is not a valid user ID in Order Administration, or if there is no <i>entered_by_user</i> specified in the message, the system checks the secured feature authority of your default user </div>
E6	Price can not be negative	<ul style="list-style-type: none"> The item has a price that is negative and the Allow Negative Prices in Order Entry (E97) system control value is not selected, OR The order represents a pre-order quote (the <i>Quote</i> field for the order type is selected) and the quantity for an item on the quote is a negative quantity.
E7	Multiple CC with pay plan	There is more than one credit card on an order that includes a flexible payment option. See Deferred/Installment Billing Overview for more information.
E8	CC Pmt Req w/ Store Ship	There is no credit card payment method specified for a store shipment request.
		<div style="border: 1px solid #0070c0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>Store fulfillment is not currently implemented.</p> </div>
E9	Email invalid	The email address is not properly formatted. See Email Address Validation for more information.
EM	Exceeds maximum char	<p>The personalization text exceeds the maximum specified for the custom special handling format. See the <i>personalization_line</i> element in the <i>Inbound Order XML Message (CWORDERIN)</i> for more information.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
F5	Inv qty for ShipToStore	There is a ship-alone item with a quantity greater than one on a ship-for-pickup order. See Ship-for-Pickup Orders for background.
F8	Item Ctry/St Restriction	The item is restricted from shipment to that country or state, as defined through the Work with Item Restriction by Country/ State Screen .

Code	Error	Explanation
F9	Ship Via invalid for Item	The shipper is not eligible to ship the item to its destination, based on the Item Ship Via Override table. See Working with Item Ship Via Overrides .
G5	Invalid Prefix Code	Not currently implemented.
GA	SH Resp fail defined rule	The custom special handling for the item does not conform to a rule set up for the custom special handling format. See Work with Special Format Rules Screen for background.
H2	Invalid Flexible Payment	There is an invalid flexible payment option specified for an order payment method. See Flexible Payment Options for more information.
I1	Duplicate item for cust	The Duplicate Item Check (C09) system control value is selected and an item is included on more than one order for the customer within the number of days specified in the Duplicate Item Days (C58) system control value.
<div style="border-left: 2px solid #0070C0; padding-left: 10px; margin-left: 20px;"> <p> Note:</p> <p>After you accept or edit the order batch that includes the order with the duplicate item, the error status of the order line(s) is cleared, and the system does not reevaluate the order for a duplicate item error.</p> </div>		
I2	Invalid Card Issue#	An issue number is required for the credit card pay type (based on the Require issue # flag), but an issue number was not provided. See Working with Pay Types (WPAY) for more information.
I3	Bill Me Later trans limit	Not currently implemented.
IM	Required Input missing	Required information is missing from the custom special handling instructions.
M1	Invalid email/opt in-SVC	There is a virtual stored value card on the order and a valid email address was not provided. The system requires an email address in order to send a Stored Value Card Notification email to the recipient of the stored value card. See Stored Value Card Email Hierarchy for more information.
NC	No catch all pay method	There is no payment method on the order with the <i>amt_to_charge</i> field blank.
OD	Invalid Order date	The accounting period associated with the date could not be found.
SA	Non-CC on Ship for Pickup	The Payment at POS for Ship for Pickup Orders (L60) system control value is selected, this is a ship-for-pickup order, the order type does not match the <i>Order Type for Special Orders (L15)</i> system control value, and the order includes a payment method that is not a credit card with a <i>Card type</i> of Credit.

Code	Error	Explanation
S1	Store Fulfillment Loc Msg	No store_code was passed for a store pickup order. See Store Pickup Orders for more information.
S4	Store Fulfillment Subscrip	You cannot generate a store pickup request for a subscription item. See Store Pickup Orders for background.
S5	Store Fulfillment Mbrship	You cannot generate a store pickup request for a membership item. See Store Pickup Orders for background.
S6	Store Fulfillment Neg Qty	You cannot generate a store pickup request for a negative quantity. See Store Pickup Orders for background.
S7	Invalid Store Code	The store_code passed to create a ship-for-pickup or store pickup order is not a valid code as set up through Work with Store Cross Reference (WSCR) See Ship-for-Pickup Orders or Store Pickup Orders for background.
S8	Invalid Delivery Type	The delivery_type was not set to P (store pickup) or S (ship-for-pickup).
S9	Ineligible for Store Pick	The message indicates to create a store pickup order, but the order is not eligible. See Store Pickup Orders for more information. Possible reasons include: <ul style="list-style-type: none"> • a payment method that is not a credit card. • items on the order that are not flagged as <i>OROB eligible</i> • items on the order that have gift wrap or special handling instructions. • multiple ship to addresses exist on the order with pickup information. • the store_code indicated is invalid. If the store_code is invalid, then there are additional errors related to the ship-to address on the order.
SE	Email Missing/ Ineligible	This is a store pickup order, and there is not an email address with an opt-in/out flag of O1 (all emails) or O2 (order-related emails) on the order. The email address and opt-in/out setting are required so that you can notify the customer when the order is ready for pickup at the selected store. See Store Pickup Notifications for more information.
SI	Sales Rep Inactive	The Active field for the sales_rep_number assigned to the order in the Salesman table is N. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
SJ	Sales Rep Store Inactive	The Active field for the sales_rep_store assigned to the order in the Store Cross Reference table is N. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
SK	Sales Rep Store Invalid	The sales_rep_store assigned to the order is not a valid store number in the Store Cross Reference table. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Code	Error	Explanation
VR	Input not valid response	The personalization text is not a valid entry for the custom special handling format. See the <i>personalization_line</i> element in the <i>Inbound Order XML Message (CWORDERIN)</i> for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
W3	City Blank	No city is specified for the shipping address.
W4	Country Not Found	The country code is invalid or no country was specified.
W7 W8	Invalid Cancel Date Invalid Cancel/Arrival DT	The cancel date specified in the message is earlier than the current date.
X0	Invalid date of birth	Not currently implemented.
X1	Invalid Order Hold Reason	The order hold reason code indicated does not exist in the Order Hold Reason table. See Establishing Order Hold Reason Codes (WOHR) for more information.
X2	Invalid Order Type	The order type indicated does not exist in the Order Type table. This error can also occur when the E-Commerce Order Type (G42) does not specify an order type and no order type was specified in the CWOOrderIn message. See Establishing Order Types (WOTY) for more information.
X3	Invalid Salesman Number	The Require Salesrep Number in Order Entry/Order Maintenance (E87) system control value is selected and the order does not have a valid sales rep.
X4	Invalid Ship Via for FEDX	There is a Federal Express tracking number indicated, but the ship via on the order does not have a <i>Type</i> of FX.
X5	Invalid Ship Via for POB	The ship via for the order does not deliver to P.O. boxes, as specified by the PO box delivery field for the ship via. This error can occur regardless of the setting of the <i>Perform ship via edit?</i> flag for the country.
X6	Invalid Ship Via for SCF	Either the SCF or the ship via/SCF combination is not valid. This error occurs only if the <i>Perform ship via edit?</i> flag is selected for the country.

Code	Error	Explanation
X7	Invalid Source Code	The source code specified on an order detail line is not valid.
<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Normally, even if the source code on the header is not specified or is invalid or restricted, the system selects a valid header-level source code from the customer's mail history, current source code, or a system control value default. See the <i>source_code</i> for a discussion.</p> </div>		
<p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>		
X9	Invalid State for Zip	The state is not valid for the postal code, as defined through Setting Up the Zip/City/State (Postal Code) Table (WZIP) .
Y0	Invalid social security #	Not currently implemented.
Y2	Last Name & Comp Blank	Both the last name and the company field for the sold-to customer are blank; at least one is required.
Y3	SCF not Found	The SCF is not valid for the country, as defined through Working with SCF Codes (WSCF) . This error occurs only if the <i>Require postal?</i> flag is selected for the country.
Y4	State Blank	No state is specified. This error occurs only if the <i>Require state?</i> flag is selected for the country.
Y5	Street Address Blank	No street address is specified.
Y8	Zip Code Blank	No postal code is specified. This error occurs only if the <i>Require postal code?</i> flag is selected for the country.
Z0	Direct Disbursement N/A	Not currently implemented.
Z1	No Detail lines	No items were specified for the order.
Z2	No Paytypes for Order	No payment methods have been provided.
Z4	CC Expiration/ Start Date	<p>If an expiration date is required for the credit card pay type (based on the <i>Require expiration date</i> flag):</p> <ul style="list-style-type: none"> • the credit card payment method did not include a valid expiration date; for example, the <i>cc_exp_month</i> or <i>cc_exp_year</i> exceeded two positions each, or the <i>cc_exp_month</i> is not a valid month (1 through 12) • the expiration date is in the past • the expiration date is more than 20 years in the future <p>if a start date is required for the credit card pay type (based on the <i>Require start date</i> flag), the credit card payment method did not include a start date. See Working with Pay Types (WPAY) for more information.</p>

Code	Error	Explanation
Z5	Invalid Credit Card	<ul style="list-style-type: none"> No credit card number was provided for a credit card pay type. The credit card number failed validation against the credit card length, leading digits, or bin number defined for the credit card pay type.
Z6	Invalid Pay Type	<ul style="list-style-type: none"> No payment method was passed, or the payment method passed was invalid, OR The order represents a pre-order quote (the <i>Quote</i> field for the order type is selected) and a cash/check pay type is defined on the quote.
Z7	Invalid Bill To Address	Some part or all of the bill-to information in the message is invalid. See Creating and Updating Bill-to Customers (WCBT) for more information.
Z8	Invalid Sold to Address	There is a problem with the sold-to customer's address. This error accompanies the error message indicating the specific problem.
Z9	Invalid Ship to Address	Any of the entries for the shipping address are invalid. This error appears with one or more other error messages describing the fields that are invalid.
ZZ	No Order I/T Line for Item	You attempted to send an express-billed order without specifying the warehouse and location where the item(s) were taken.

Order Entry Appendices

Purpose: The following topic provides reference information for use in sales tax calculation.

- *Generic Tax API* describes using the generic tax API (TAX_INT process) to calculate tax using an external tax interface. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- [Avalara AvaTax Interface](#) describes the bridge between Order Administration and the Avalara AvaTax system, which you use for sales tax calculation and reporting.
- [Vertex Interface](#) describes the bridge between Order Administration and the Vertex Sales Tax Compliance System, which you use for sales tax calculation and reporting.
- [Experian Data Quality \(EDQ\) Address Validate API](#) provides an overview and required setup to send Order Administration addresses to the EDQ Address Validate API for address cleansing and standardization.

Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration

Overview: Use the integration with Oracle Retail Merchandising Foundation Cloud Service (RMFCS) to import item information.

The import from RMFCS also supports importing pricing information from Oracle Retail Pricing Cloud Service (RPCS). This import is also described below.

Note:

This integration will be deprecated in a future release. [Importing Enterprise Foundation Data through Omnichannel Cloud Data Service \(OCDS\)](#) can be used instead to import items and pricing.

In this topic:

- [Data Flow from RMFCS and RPCS to Order Administration](#)
- [Configuration for RMFCS and RPCS Integrations](#)
 - [Configuration within Order Administration](#)
- [Additional Considerations for RMFCS Integration](#)
- [Mapping Item and Pricing Information into Order Administration](#)
 - [RMFCS to OACS Mapping](#)
 - [RPCS to OACS Mapping](#)

Data Flow from RMFCS and RPCS to Order Administration

If your company is configured for RMFCS integration for item creation and update, processing takes place as follows:

1.Import momzip file into file storage: Use the API to place the inbound momzip file from RMFCS in the FILE_STORAGE table. See [Working with File Imports](#) for background.

Note:

You cannot use [Work with File Uploads \(WUPL\)](#) to process the momzip file.

About the momzip file: The momzip file must contain one or more pipe-delimited text files, each with the DAT extension, created from RMFCS. The momzip file itself is a compressed file.

Item information: The `itemhdr` DAT file contains the item information to import from RMFCS into Order Administration. Note that not all fields in this file are mapped into Order Administration. See [RMFCS to OACS Mapping](#) and [RPCS to OACS Mapping](#) for details.

Pricing information: RPCS provides two DAT files:

- Regular price: The `REGPC` DAT file includes regular pricing information for items.
- Clearance price: The `CLRPC` DAT file includes clearance pricing for items.

Like the `Itemhdr` file, the two pricing files from RPCS are pipe-delimited text files. If either or both of these files are included in the momzip file, the file contents update the [RI Item Upload Table \(RIIUPP\)](#) and, ultimately, the Item Offer and Item Price tables. Because no offer information is mapped from RPCS, the offer code to use defaults from the [RMS Item Upload Periodic Function](#). See [RPCS to OACS Mapping](#) for mapping details.

File naming: The periodic function identifies DAT files containing item or pricing data by the file name. The file from RMFCS needs to begin with `itemhdr`, while the pricing files need to begin with `REGPC` or `CLRPC`. Each file needs to include the store ID assigned in RMFCS.

For example, a file might be named `itemhdr_20180702123456_1234_delta_50.dat`, where `201807123456` is the date and time stamp, `1234` is the store ID, `delta` indicates that the file includes only changed records, and `50` is the total number of records in the file. Including the text `delta` in the file name is informational; regardless of whether it is included, processing the records works the same way.

Similarly, a pricing file name might be `REGPC_20180702021616_1234.dat`.

Any other files included in the momzip file are not used.

Note:

File names and suffixes are not case-sensitive. For example, either momzip or MOMZIP are acceptable and will not result in an error.

2. Process records in momzip file and create RI Item Upload records: Once the momzip file is available in the FILE_STORAGE table, the RMSItem Upload periodic function can process the contents of the file and create records in the [RI Item Upload Table \(RIIUPP\)](#). The periodic function includes a parameter defining the store ID assigned in RMFCS, as well as specifying the *Company* number.

See [RMS Item Upload Periodic Function](#) for details on configuring the periodic function.

If there are multiple momzip files, the oldest file is processed.

When this step completes, an RIIUPP record is created for each eligible row in the DAT file, and displayed at the Work with File Upload Screen even though you cannot use this screen to upload import files from RMFCS or RPCS.

This preliminary step of creating the RI Item Upload records does not include all the field mapping that ultimately needs to take place when updating the target tables; instead, the mapping is completed during the next step in the process, when the target tables are updated.

3. Use RI Item Upload records to create or update items, offers, and prices: The [RI Item Upload Translation Program](#) and [RI Item Upload Edit Program](#) process the records in the RI Item Upload table, and use these records to create or update items, offers, and prices. You can begin these programs by selecting Process File at the [Work with Retail Item Upload Screen](#), or by submitting the [RIUPLD Function](#).

Configuration for RMFCS and RPCS Integrations

Configuration within Order Administration

The configuration required in Order Administration to support importing items from RMFCS and RPCS is described below.

System Control Values

The following system control values must be selected:

- [Use Retail Integration \(H26\)](#)

Important:

See [Retail Integration \(External System into Order Administration\) Overview and Setup](#) for background on the additional setup required to support retail item integration. If you do not complete this setup, the import will not be successful.

- [Require Long SKU Division with Long SKU Department \(E85\)](#)

The following system control values must be unselected:

- [Require Item Class in Work with Items \(F06\)](#)
- [Require Sort Sequence Number in the SKU File \(F23\)](#)
- [Require Entity in Item File \(G44\)](#)

Since this information is not provided by RMFCS, the import will not be successful if the information is required.

RMS Item Upload Periodic Function

Use [Working with Periodic Functions \(WPER\)](#) to set up the RMS Item Upload periodic function. If the function needs to run in more than one company, mapping from more than one store in RMFCS, you can name the function RMSZIPN, where N is a unique number. When setting up the function:

- Set the *Program name* to **PFRMS**.
- Set the *Parameter* to the store ID assigned in RMFCS, and the default offer code in Order Administration, separated by an underscore. For example, if the store ID is 1234 and the default offer is OFR, set the *Parameter* to 1234_OFR.

The offer code is required for the import of pricing information from RPCS. If you set the parameter to just the store ID, such as 1234, but do not include the offer code, such as 1234_OFR, the [Current Offer \(A33\)](#) applies.

- Select the *Company Parameter* flag.

RIUPLD Function

Use [Working with Periodic Functions \(WPER\)](#) to set up the RIUPLD periodic function, if it does not already exist. When setting up the function, set the *Program name* to PFR0084.

Periodic Process

Use [Working with Periodic Processes \(WPPR\)](#) to assign either or both of the periodic functions described above to a periodic process. The *Company* parameter is required to indicate the company where the records should be created or updated.

Additional Considerations for RMFCS Integration

Does not support SKUs: Since RMFCS does not support SKU's, all items imported from RMFCS are non-SKU'd items.

Using RMFCS Item Level and Tran Level to determine whether to create or update an item: RMFCS uses a different hierarchy than Order Administration for multi-level items. The RMFCS hierarchy supports:

- A level 1 item: For example, a picture frame that comes in only one finish and size.
- A level 2 item: For example, an item group that includes a novelty tee shirt in sizes small, medium, and large. Level 1 is the tee shirt, while level 2 includes the sizes.
- A level 3 item: For example, an item group that includes a polo shirt in red, blue, and yellow, and sizes small, medium, and large. Level 1 is the polo shirt, level 2 is the sizes, and level 3 is the colors.

The records in the `itemhdr` file that map to items in Order Administration are identifiable by the fact that the `ItemLevel` passed in the file is the same as the `TranLevel`. If the `ItemLevel` and the `TranLevel` are different, the record is not used to update the `RIIUPP` table in Order Administration.

Troubleshooting Information for the RMFCS Item and Pricing Import

If the process ends without populating the RIIUPP table, possible explanations include:

- The momzip file was not found.
- The number of columns in the DAT file was incorrect.
- The RIIUPP table already contained records that need to be cleared before the process could run again.

When there is an error with the import, it is listed on the Work with File Upload Screen with a *File Type* of RIIUPP and a status of Error, and you can view the error description by selecting Action > View Error.

If the momzip file did not contain a DAT file containing the itemhdr data, the upload remains at the Work with File Upload Screen in Submitted status. To correct this situation, you need to delete the momzip file from the FILE_STORAGE table.

Mapping Item and Pricing Information into Order Administration

RMFCS to OACS Mapping

The item information that updates the [RI Item Upload Table \(RIIUPP\)](#) and ultimately updates the target tables, including information mapped from RMFCS, is described in the following table. The process creates record type 01 (Item/SKU) records in the table based on the information from RMFCS. See [RI Item Upload Table \(RIIUPP\)](#) for more information on the updated fields.

The file from RMFCS contains no null fields. A blank is passed for an alphanumeric field with no data, and a 0 is passed for a numeric field.

****DFLT ITEM?** Certain fields default from the [**DFLT ITEM Item/SKU](#), if one is configured. These fields are indicated below. This information defaults when the RI Item Upload Translation Program and [RI Item Upload Edit Program](#) run, using the information in the RI Item Upload table to update the target tables.

****DFTCHG Item?** The [**DFTCHG Item/SKU](#) controls the update of existing items:

- Any fields that are populated for the [**DFTCHG item](#) are not changed for an existing item that is passed from RMFCS.
- And any fields that are not populated for the [**DFTCHG item](#) are eligible to be updated for an existing item that is passed from RMFCS.

See the [**DFTCHG Item/SKU](#) for more information.

See [RPCS to OACS Mapping](#) for information on how pricing information in the [RI Item Upload Table \(RIIUPP\)](#) is updated based on the data received from RTM.

Additional information from RMFCS: Additional information is included in the DAT files from RMFCS; however, only the fields that update the [RI Item Upload Table \(RIIUPP\)](#) are described in the following table.

Sample itemhdr row:

```
ITEMS|FULLHDR|1234|102900077||N|N|1|1|Y| || || || || || || || || || || |2CDQ|2222|5274|2222|5485|A|
Item 102900077||Item 102900077||Y|N|1000|EA| || |E|N|12.22|USD| |USD| ||N|N|N|N|N|
ITEM| || ||N| || ||N|N|Y|Y| ||N|N|N|N| || || ||N|N|
```

 **Note:**

About unmapped item/SKU fields: Any item/SKU in Order Administration fields not listed below are not mapped from RMFCS. They are left blank if alphanumeric, or set to 0 if numeric.

Target Field	Value Used	Description/ Comments
Item Updates		
Company	Company number from the periodic process	The periodic process set up for the RMS Item Upload periodic function should be set up to require the <i>Company Parameter</i> .
Record Created Date	Current date when record created	
Record Created Time	Current time when record created	
Record Type	01	Hard-coded.
Request Type	blank	Since RMFCS does not indicate whether the record is an Add or a Change, Order Administration updates the record for the item if it exists. If no matching item exists, it creates a new item.
Sequence #	Sequential assigned number	Assignment of sequence numbers starts at 1 and continues for the first 999 records in the upload file. After the first 999 records, the <i>Record Created Time</i> increases by 1 second, and sequential assignment begins again and again runs from 1 through 999. This pattern continues for all records in the upload file, so that each has a unique <i>Record Created Time/Sequence #</i> assignment.
Key Type	IT	Hard-coded.
Item	RMFCS item code	Rather than using item SKU fields in the same way as Order Administration, RMFCS uses a hierarchical system to identify the relationships between individual items. An item code in the import table creates or updates an item in Order Administration only if the item's <i>ItemLevel</i> and <i>TranLevel</i> in RMFCS are the same. See Additional Considerations for RMFCS Integration for a discussion.
SKU	Blank	Not used. See Additional Considerations for RMFCS Integration for a discussion.
Status	U	Unprocessed.
Processed Date	Blank	Populated through the RI Item Upload Process .
Processed Time	Blank	Populated through the RI Item Upload Process .
Allow SKUs	N	Hard-coded. SKUs are not supported through the integration.

Target Field	Value Used	Description/ Comments
Drop Ship	Blank	From the **DFLT ITEM Item/SKU ; otherwise, unselected.
Long SKU Style	ItemParent	If no ItemParent is passed, the item code is used as the <i>Long SKU Style</i> .
Retail Style #	Item	The item code from RMFCS is used as the <i>Retail Style #</i> .
Long SKU Vendor	Subclass	The Subclass from RMFCS is used as the <i>Long SKU Vendor</i> .
Non-Inventory	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Selling Qty	1	
Selling Weight	0	From the **DFLT ITEM Item/SKU ; otherwise, 0.
Serial # Tracking	N	Not implemented in Order Administration.
Ship Alone	From ShipAloneInd	When the <i>ShipAloneInd</i> from RMFCS is set to Y, the <i>Ship Alone</i> field is set to S; otherwise, the <i>Ship Alone</i> field is left blank.
Allow % Discount?	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Oversize	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Description	ItemDesc	From the ItemDesc in RMFCS.
Exclude From Flex Pay	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Royalty	N	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Membership	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Buyer	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
Item Class	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.

 **Note:**

Non-inventory items from RMFCS, indicated by a setting of N in the *MerchandiseInd* field, are not imported into Order Administration.

Target Field	Value Used	Description/ Comments
Location Class	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
Class (Long SKU Class)	Class	The Class from RMFCS is used as the <i>Long SKU Class</i> .
Department (Long SKU Department)	Department	The Department from RMFCS is used as the <i>Long SKU Department</i> .
UOM (Unit of Measure)	StandardUOM from RMFCS	Needs to be a valid unit of measure in Order Administration, set up through Working with Units of Measure (WUOM) .

 **Note:**

Units of measure set up in RMFCS should not exceed 3 positions, since this is the maximum field length supported in Order Administration.

Vendor #	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
Ship Via Code	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
Manufacturer Vendor	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
Entity Number	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
Season	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
Subscription	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Height Override	0	From the **DFLT ITEM Item/SKU ; otherwise, 0.
Length Override	0	From the **DFLT ITEM Item/SKU ; otherwise, 0.
SKU Gift Certificate	N	Hard-coded. Not supported in Order Administration.
Restrict Orders	Blank	From the **DFLT ITEM Item/SKU ; otherwise, blank.
VAT Exempt Flag	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.

Target Field	Value Used	Description/ Comments
Suppress B/O Card	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Returnable	Blank	From the **DFLT ITEM Item/SKU ; otherwise, not selected.
Whs (Warehouse)		From the **DFLT ITEM Item/SKU ; otherwise, from the Default Warehouse (A04) ; otherwise, set to 0.
Soldout Control Code	Blank	Defaults from the Default Soldout Control Code (D72) .
UOM Type	StandardUOM from RMFCS	Needs to match a unit of measure in Order Administration, set up through Working with Units of Measure (WUOM).
OROB Eligible		Selected.

RPCS to OACS Mapping

The offer and pricing information that updates the [RI Item Upload Table \(RIIUPP\)](#) and ultimately updates the target tables, including information mapped from RPCS, is described in the following table. The process creates record type 03 (Item Offer) and 05 (Item Price) records in the table based on the information from RPCS. See [RI Item Upload Table \(RIIUPP\)](#) for more information on the updated fields.

The file from RPCS contains no null fields. A blank is passed for an alphanumeric field with no data, and a 0 is passed for a numeric field.

See [RMFCS to OACS Mapping](#) for information on how item information in the Item table and related tables is updated based on the data received from RMFCS.

Additional information from RPCS: Additional information is included in the DAT files from RPCS. The files each include a header record (FHEAD) and a tail record (FTAIL), as well as a detail record (FDETL) for each item offer and price. However, only the fields that update the [RI Item Upload Table \(RIIUPP\)](#) are described in the following table.

Unmapped Item Offer fields: Any Item Offer or Item Price fields not listed in the following tables are not mapped from RMFCS. They are left blank if alphanumeric, or set to 0 if numeric.

Sample REGPC file contents:

```
FHEAD|1|REGPC|20180627021616|1234|S
FDETL|2|CRE|1001|101000122|20180404000000|1|16.75|EA|USD|0|||
FDETL|3|CRE|1002|101000132|20180405000000|1|16.75|EA|USD|0|||
FDETL|4|CRE|1003|101000123|20180627000000|1|16.75|EA|USD|0|||
FTAIL|5|3
```

Sample CLRPC file contents:

```
FHEAD|1|CLRPC|20180404021514|4241|S
FDETL|2|CRE|10002|101000126|20180404000000|6.85|EA|USD|
FDETL|3|CRE|10003|101000136|20180405000000|8.85|EA|USD|
```

FDETL|4|CRE|10004|101000135|20180404000000|7.85|EA|USD|

FTAIL|5|3

Item Offer Mapping from RPCS

Target Field	Value Used	Description/ Comments
Item Updates		
Company	Company number from the periodic process	The periodic process set up for the RMS Item Upload Periodic Function should be set up to require the <i>Company Parameter</i> .
Record Created Date	Current date when record created	
Record Created Time	Current time when record created	
Record Type	03	Indicates Item Offer. Hard-coded.
Request Type	blank	Since RPCS does not indicate whether the record is an Add or a Change, Order Administration updates the record for the item if it exists. If no matching item exists, it creates a new item.
Sequence #	Sequential assigned number	Assignment of sequence numbers starts at 1 and continues for the first 999 records in the upload file. After the first 999 records, the <i>Record Created Time</i> increases by 1 second, and sequential assignment begins again and again runs from 1 through 999. This pattern continues for all records in the upload file, so that each has a unique <i>Record Created Time/Sequence #</i> assignment.
Key Type	IT	Hard-coded.
Item	RMFCS item code	The item to be updated with the Item Offer information.
SKU	Blank	Not used. See Additional Considerations for RMFCS Integration for a discussion.
Status	U	Unprocessed.
Processed Date	Blank	Populated through the RI Item Upload Process.
Processed Time	Blank	Populated through the RI Item Upload Process.
Offer for Item Offer	Offer from periodic function	The offer code defaults from the Parameter defined for the RMS Item Upload Periodic Function . If no offer code is specified for the periodic function, the Current Offer (A33) applies.

Item Price Mapping from RPCS

The following mapping applies to both the REGPC (regular price) and CLRPC (clearance price) files from RPCS.

Target Field	Value Used	Description/ Comments
Item Updates		
Company	Company number from the periodic process	The periodic process set up for the RMS Item Upload Periodic Function should be set up to require the <i>Company Parameter</i> .
Record Created Date	Current date when record created	
Record Created Time	Current time when record created	
Record Type	05	Indicates Item Price. Hard-coded.
Request Type	blank	Since RPCS does not indicate whether the record is an Add or a Change, Order Administration updates the record for the item if it exists. If no matching item exists, it creates a new item.
Sequence #	Sequential assigned number	Assignment of sequence numbers starts at 1 and continues for the first 999 records in the upload file. After the first 999 records, the <i>Record Created Time</i> increases by 1 second, and sequential assignment begins again and again runs from 1 through 999. This pattern continues for all records in the upload file, so that each has a unique <i>Record Created Time/Sequence #</i> assignment.
Key Type	IT	Hard-coded.
Item	RMFCS item code	The item to be updated with the Item Offer information.
SKU	Blank	Not used. See Additional Considerations for RMFCS Integration for a discussion.
Status	U	Unprocessed.
Processed Date	Blank	Populated through the RI Item Upload Process.
Processed Time	Blank	Populated through the RI Item Upload Process.
Offer for Item Offer	Offer from periodic function	The offer code defaults from the Parameter defined for the RMS Item Upload Periodic Function . If no offer code is specified for the periodic function, the Current Offer (A33) applies.
Effective Date	RPCS Effective Date	The date when the price becomes effective.
Qty	RPCS: Multi-Units	The quantity required for the price break. In the case of the CLRPC file (clearance price), the quantity is hard-coded to 1.
Price	RPCS Multi-Unit Retail	The item price.

Operating Background Jobs

Topics in this part: The following topics describe the functions available to operate the background ASYNC jobs.

- [Using the ASYNC Jobs \(MBJC\)](#) describes the purpose of the background jobs, provides a brief overview of the each background ASYNC job, explains the steps to use to start and end the background ASYNC jobs, and shows you how to location the function.
- [Working with the CNTL_ASYNC Job](#) shows you how to start and end the background ASYNC jobs, how to reorganize the data queues associated with the background ASYNC jobs, and how to change the status of the background ASYNC jobs.
- [Working with the BILL_ASYNC Job](#) shows you how to display the Billing Header Data Queue, how to correct Billing ASYNC errors, how to change the status of the Billing ASYNC job, and describes the table updates that occur when records are processed by the BILL_ASYNC job.
- [Working with the EBO_ASYNC Job](#) shows you how to display the Evaluate B/O Data Queue, how to correct EBO_ASYNC errors, how to change the status of the EBO_ASYNC job, and describes the table updates that occur when records are processed by the EBO_ASYNC job.
- [Working with the ORDR_ASYNC Job](#) shows you how to display the Order Ship To Data Queue, how to correct ORDR_ASYNC errors, how to change the status of the ORDR_ASYNC job, and describes the table updates that occur when records are processed by the ORDR_ASYNC job.
- [Working with the OTHR_ASYNC Job](#) shows you how to display the PO Header Data Queue, how to correct OTHR_ASYNC errors, how to change the status of the OTHR_ASYNC job, and describes the table updates that occur when records are processed by the OTHR_ASYNC job.
- [Purging Active Procedures \(MACP\)](#) shows you how to display the Active Procedures for a user and how to delete stranded Active Procedure records for a user.
- [Working with Integration Layer Processes \(IJCT\)](#) shows you how to work with the integration layer processes used for transmitting data between Order Administration and an external system.

Using the ASYNC Jobs (MBJC)

ASYNC (background) jobs process the non-time sensitive table updates, such as analysis and reporting updates, associated with transactions that are processed throughout the day in the following modules: Order Entry, Order Maintenance, Purchase Order Maintenance, Purchase Order Receiving, and Billing.

ASYNC jobs are used to process these updates for the following reasons:

- System response time would be affected if all table updates associated with each system transaction were processed interactively.
- Table updates can occur more quickly by dynamically updating the tables throughout the day rather than running an end of day batch process.
- Analysis information can be viewed and reported more quickly.

Example: When new orders are entered onto the system, the order records are created interactively, and if desired, inventory can be reserved for the order. The order can be maintained, viewed, and is eligible for shipment as soon as it is entered.

The marketing information associated with the order is updated via the Order Processing ASYNC function. These table updates occur throughout the day as the

records are sent to the data queue associated with the Order Processing ASYNC function.

ASYNC processing allows you to quickly update the tables necessary to create and ship the order, and eliminates the need to run a batch process at the end of the day to update all of the system tables associated with recording the order.

The following ASYNC jobs are used:

ASYNC Job	Function
CNTL_ASYNC	Starts and ends all of the ASYNC jobs. See Starting the ASYNC Jobs and Ending the ASYNC Jobs .
BILL_ASYNC	Updates system tables as orders are billed.
EBO_ASYNC	Performs reservation for backordered items when inventory levels for an item change.
ORDR_ASYNC	Updates system tables as orders are entered and maintained.
OTHR_ASYNC	Updates system tables as purchase orders are entered, maintained, and received.

In this topic:

- [Running the ASYNC \(Background\) Jobs](#)
- [Starting the ASYNC Jobs](#)
- [Processing Transactions](#)
- [Ending the ASYNC Jobs](#)
- [ASYNC Job Status Codes](#)

Running the ASYNC (Background) Jobs

Purpose: The ASYNC jobs, or background jobs, are used to process system table updates throughout the day. These jobs run in the background and process transactions in sequence as they are sent to the data queues. These jobs are placed in a Wait (DEQW) status when there are no records to process.

Starting the ASYNC Jobs

The following ASYNC jobs must be running to process the records in the data queue tables. The controlling ASYNC job (CNTL_ASYNC) is used to start the ASYNC jobs.

- BILL_ASYNC
- EBO_ASYNC
- OTHR_ASYNC

 **Note:**

The ORDR_ASYNC job updates system tables with order and demand information as orders are entered and maintained. As you enter or maintain orders, the system sends the records to the Order Processing data queue for processing. As soon as the Order Processing Data queue receives a record to process, the record is processed immediately, regardless of the status of the Order Processing ASYNC (ORDR_ASYNC) job. The ORDR_ASYNC job processes multiple orders simultaneously. While the Order Async job does not need to be active to process records, you should set the Order Async job to active to handle reorganization and cleanup of any transactions that did not process correctly.

If you start the ASYNC jobs and the ASYNC subsystem is not running, the status of the CNTL_ASYNC job will be *JOBQ. The status will change to *ACTIVE as soon as the ASYNC subsystem is up.

Scheduling when the Async Jobs Start: You can create a schedule for a periodic process that contains the STRASYN periodic function to start asyncs.

Function	Description	Program	Summary
STRASYN	Start asyncs	MSSTRASYNC	<p>If the asyncs are currently Inactive, this periodic function calls the Controlling Data Queue (CNTL_ASYNC) in Background Job Control (MBCJ) and starts the background jobs.</p> <p>This periodic function performs the same updates as selecting Start for the CNTL_ASYNC to start the background jobs. See Starting the Background ASYNC Jobs.</p>

For more information:

- See Working with Periodic Processes (WPPR) for information on how to assign each function to a periodic process.
- See Executing Periodic Processes (EPRO) for more information on scheduling a periodic process to run at a specified time.

Processing Transactions

As transactions are processed on the system, records are sent to the data queues. The records are processed one-by-one in the sequence in which they were sent to the data queue. A separate data queue is used for each ASYNC job. The status of each data queue record can be viewed at any point by displaying the data queue associated with the ASYNC job.

Errors: If an error occurs as a record is being processed, the system stops processing the record at the error point, and moves on to the next record in sequence for processing.

The records in error remain on the system until the error is corrected and processing can be fully completed. The errors are listed on the error reports that print when the ASYNC jobs are ended. A separate error report is printed for each ASYNC job.

Processing errors occur when a table associated with the transaction cannot be updated. This usually occurs because the system is attempting to update a record that no longer exists.

Example: If the Source Code record associated with an order is deleted before the order is billed, an error will occur during BILL_ASYNC.

Status of async jobs: When the Async jobs are active, the system checks the status of each async job under Job Management (My Jobs). If the async job is active and the job status is not RUN, the next time the system checks the status of the async jobs, the system automatically updates the job status to RUN. For example, if the Order Async is Active and you change the ORDR_ASYNC job to END, the system will automatically change the status of the ORDR_ASYNC job back to RUN. To start or stop the Async jobs, you need to start or stop the Controlling Async job in the Background Job Control (MBCJ) menu option.

Ending the ASYNC Jobs

The ASYNC jobs must be ended to clear the completed records from the data queue tables and to print the error reports. The controlling ASYNC job (CNTL_ASYNC) is used to end all of the ASYNC jobs. You can use the **ENDASYN** periodic function to end them.

The ASYNC jobs should be ended once per day so that the data queues can be deleted and any errors can be corrected in a timely manner. If you do not bring these jobs down regularly:

- Completed records in the data queues will not be deleted and the data queue tables will become quite large.
- The 'shut down' process will take longer.
- Errors will be more difficult to correct.

For more information: See Troubleshooting the Async Jobs for more information.

Scheduling when the Async Jobs End: You can create a schedule for a periodic process that contains the ENDASYN periodic function to end asyncs.

Function	Description	Program	Summary
ENDASYN	End asyncs	MSENDASYN C	If the asyncs are currently Active, this periodic function calls the Controlling Data Queue (CNTL_ASYNC) in Background Job Control (MBCJ) and ends the background jobs. This periodic function performs the same updates as selecting End for the controlling data queue to end the background jobs; however, any records in the data queue will be processed when the background ASYNC jobs are restarted. See Ending the Background ASYNC Jobs for more information on the updates that are performed.

For more information:

- See Working with Periodic Processes (WPPR) for information on how to assign each function to a periodic process.
- See Executing Periodic Processes (EPRO) for more information on scheduling a periodic process to run at a specified time.

When the ASYNC jobs are ended:

- If you manually end asyncs, a terminator record is sent to each data queue to identify the last record to be processed. Records sent to the data queue before the terminator record

will be processed; records sent to the data queue after the terminator record was sent will be processed when the background ASYNC jobs are restarted.

- If you use the ENDASYN periodic function to end asyncs, any records in the data queue will be processed when the background ASYNC jobs are restarted.
- The data queue will be reorganized. All completed records will be deleted from the data queue tables.
- An error report listing all of the records that could not be processed, and the reason for the error, will be printed. A separate error report will print for each ASYNC job.
- The status of the ASYNC jobs will change to *INACTIVE.

If someone reboots the server: If someone restarts Order Management System while an asynchronous job is active, the system updates the job on the Job Management Screen (under My Jobs) to MSG status. In this situation, you will need to run the JOBCLN periodic function. See Running the JOBCLN Periodic Function to Correct the Async Jobs for more information.

ASYNC Job Status Codes

Status	Description
*ACTIVE	The ASYNC job is up and running.
*INACTIVE	The ASYNC job is not running.
*JOBQ	The ASYNC job has been submitted to the job queue for start-up. The ASYNC jobs are in a *JOBQ status only when the ASYNC subsystem has not been started.
*ENDPEND	The ASYNC job is in the process of ending.
*REORG	Completed records processed by the ASYNC job are being deleted from the tables.

Working With the CNTL_ASYNC Job

The controlling ASYNC job (CNTL_ASYNC) is used to start and end each of the background ASYNC jobs. When you start the CNTL_ASYNC job, all of the background ASYNC jobs start; when you end the CNTL_ASYNC job, all of the background ASYNC jobs end. You cannot start or end an individual background ASYNC job.

You should end the CNTL_ASYNC job each day, when your operations for the day are complete. When you end the CNTL_ASYNC job:

- Records that were processed successfully for each background ASYNC job are deleted from the data queue tables.
- An error list is produced for each background ASYNC job.

Ending the background ASYNC jobs allows you to delete unnecessary records from the system, and enables you to correct any processing errors in a timely manner.

Work with Background Jobs Screen

Purpose: This screen displays the current status of each background ASYNC job. This screen is used to start or end the ASYNC jobs, to display the records in the data queue associated with each job, or to reorganize the data queues.

All of the options on this screen can be used with the Controlling ASYNC (CNTL_ASYNC) job.

How to display this screen: Enter MBJC in the *Fast path* field at the top of any menu or select Background Job Control from a menu.

Field	Description
Job name	The name of the ASYNC job. The ASYNC jobs are: <ul style="list-style-type: none"> • BILL_ASYNC = Billing background job • CNTL_ASYNC = Controlling background job • EBO_ASYNC = Evaluate backorders background job • ORDR_ASYNC = Order processing background job • OTHR_ASYNC = Other background job purchase orders) <i>Alphanumeric, 10 positions; optional.</i>
Description	The description of the data queue associated with the ASYNC function. <i>Alphanumeric, 40 positions; optional.</i>
Status	The status of the ASYNC job. Valid status codes are: <ul style="list-style-type: none"> • *ACTIVE = the ASYNC function is running • *INACTIVE = the ASYNC function has ended • *JOBQ = the ASYNC function has been submitted to the job queue for startup • *Endpend = the ASYNC function is in the process of ending • *Reorg = the data queue associated with the ASYNC function is being reorganized <i>Alphanumeric, 10 positions; display-only.</i>

Field	Description
Control	<p>A code indicating whether the ASYNC function is a controlling function. The controlling function is used to start, end, and reorganize the data queues for the ASYNC functions it controls. Currently, the CNTL_ASYNC function is the only controlling function.</p> <p>Valid codes are:</p> <ul style="list-style-type: none"> • Y = the ASYNC function is a controlling function • N = the ASYNC function is not a controlling function.

Note:

In order to perform certain options at the Work with Background Jobs screen, you need to have the *Security administrator* flag for the user selected. See [User Configuration](#) in the Administration Guide for more information.

Screen Option	Procedure
Display the attributes of an ASYNC job	Select Display for an ASYNC job to advance to the Display Asynchronous Job Screen (Displaying the CNTL_ASYNC Job) .
Start the background ASYNC jobs	Select Start for the CNTL_ASYNC job to start all of the ASYNC jobs. See Starting the Background ASYNC Jobs .
End the background ASYNC jobs	Select End for the CNTL_ASYNC job to end all of the ASYNC jobs. See Ending the Background ASYNC Jobs .
Reorganize the data queue for a background ASYNC job	Select Reorganize queue for the CNTL_ASYNC job to reorganize the data queues associated with each ASYNC job. See Reorganizing the ASYNC Job Data Queues .
Display the data queue for an ASYNC job	Select Display Data queue for an ASYNC job. Display Data queue cannot be used with the CNTL_ASYNC.
Work with Drop Ship background jobs	Select Drop Ship Jobs to advance to the Work with Drop Ship Background Jobs Screen .
Work with integration layer jobs	Select Integration Layer to advance to the Work with Integration Layer Process Screen .

Display Asynchronous Job Screen (Displaying the CNTL_ASYNC Job)

Purpose: Use this screen to display descriptive information about an ASYNC job such as the CNTL_ASYNC job.

How to display this screen: Select Display for a job at the [Work with Background Jobs Screen](#).

Field	Description
Process name	<p>The name of the process for this ASYNC job. Listed as the Workstation for the ASYNC job at the screen in Purge Active Procedures Across Users (MACX).</p> <p>The data queues are:</p> <ul style="list-style-type: none"> • CNTL_ASYNC = CNTRLDATAQ • BILL_ASYNC = BILLDATAQ • EBO_ASYNC = EVLBODATAQ • ORDR_ASYNC = ORDERDATAQ • OTHR_ASYNC = OTHERDATAQ <p>Alphanumeric, 10 positions; display-only.</p>
Job name	<p>The name of the ASYNC job.</p> <p>The ASYNC jobs are:</p> <ul style="list-style-type: none"> • BILL_ASYNC = Billing background job • CNTL_ASYNC = Controlling background job • EBO_ASYNC = Evaluate backorders background job • ORDR_ASYNC = Order processing background job • OTHR_ASYNC = Other background job purchase orders) <p>Each ASYNC job is discussed separately in this part.</p> <p>Alphanumeric, 10 positions; optional.</p>
Description	<p>The description of the ASYNC job.</p> <p>Alphanumeric, 40 positions; display-only</p>
Start	<p>The date and time the ASYNC job was last started and the User ID of the person who started it.</p> <p>(Date): Numeric, 6 positions; display-only.</p> <p>(Time): Numeric, 6 positions; display-only.</p> <p>(User ID): Alphanumeric, 10 positions; display-only.</p>
End	<p>The date and time the ASYNC job was last ended and the User ID of the person who ended it.</p> <p>(Date): Numeric, 6 positions; display-only.</p> <p>(Time): Numeric, 6 positions; display-only.</p> <p>(User ID): Alphanumeric, 10 positions; display-only.</p>
Controlling job	<p>A flag indicating whether this function controls other ASYNC functions. The controlling ASYNC function starts and ends other ASYNC functions.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = This is a controlling ASYNC function. • Unselected = This is not a controlling ASYNC function. <p>The CNTL_ASYNC job is the only controlling ASYNC job.</p>
System Option	<p>A flag indicating whether this function is a system function that cannot be deleted by the user.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = This function cannot be deleted by the user. • Unselected = This function can be deleted by the user.

Field	Description
Status	The current status of the function. Valid status codes are: <ul style="list-style-type: none">• *ACTIVE• *INACTIVE• *ENDPEND• *JOBQ• *REORG Display-only.

Starting the Background ASYNC Jobs

Purpose: The CNTL_ASYNC job is used to start and end all of the other background ASYNC jobs.

The following background jobs must be active for the records in the data queues to be processed. If the background ASYNC job is not active, records will be held in the data queue until you start the background ASYNC jobs.

- BILL_ASYNC
- EBO_ASYNC
- OTHR_ASYNC

Note:

The ORDR_ASYNC job updates system tables with order and demand information as orders are entered and maintained. As you enter or maintain orders, the system sends the records to the Order Processing data queue for processing. As soon as the Order Processing Data queue receives a record to process, the record is processed immediately, regardless of the status of the Order Processing ASYNC (ORDR_ASYNC) job. The ORDR_ASYNC job processes multiple orders simultaneously. While the Order Async job does not need to be active to process records, you should set the Order Async job to active to handle reorganization and cleanup of any transactions that did not process correctly.

Starting the Background ASYNC jobs

You can start the background ASYNC jobs manually at the [Work with Background Jobs Screen](#), or create a periodic process to schedule the ASYNC jobs to start at a specified time.

When you start the background ASYNC jobs, the system removes any terminator records that may exist in the data queues. The system creates a terminator record in the data queues when you end the background async jobs to determine which records to process before the asyncs are brought down and which records to process when the asyncs are restarted. Multiple terminator records may exist in the data queues if you run the ENDASYN periodic function to end the asyncs when the asyncs are already inactive. Because you are now starting the background async jobs, the system no longer needs the terminator records to determine when to reprocess the records in the data queue and instead will process all records that may exist in the data queues.

Before you start the background ASYNC jobs: To start the background ASYNC jobs, the status of each job must be *INACTIVE and each job must not be running. You can use the [Display Active Batch Jobs Screen](#) menu option to verify that the jobs are not running.

To manually start the ASYNC jobs:

1. At the [Work with Background Jobs Screen](#), review the status of the background jobs. The jobs must be started if the status is *INACTIVE.
2. Select Start for the CNTL_ASYNC job.
3. The status of the ASYNC jobs should be *ACTIVE.

Unable to start? The system verifies that the job is not currently in active status and is not actually running on any server. If the job is already in active status, or is actually running on a server, the screen displays an error message.

To resolve issues with the job's status, use the [JOBCLN](#) periodic function.

To schedule the ASYNC jobs to start at a specified time:

Create a schedule for a periodic process that contains the STRASYN periodic function to start asyncs.

Function	Description	Program	Summary
STRASYN	Start asyncs	MSSTRASYNC	<p>If the asyncs are currently Inactive, this periodic function calls the Controlling Data Queue (CNTL_ASYNC) in Background Job Control (MBJC) and starts the background jobs.</p> <p>This periodic function performs the same updates as selecting Start for the CNTL_ASYNC to start the background jobs.</p>

For more information:

- See [Working with Periodic Processes \(WPPR\)](#) for information on how to assign each function to a periodic process.
- See [Executing Periodic Processes \(EPRO\)](#) for more information on scheduling a periodic process to run at a specified time.
- See [Using the JOBCLN Function to Resolve Job Status Across Servers](#) for more information on how to reset the async jobs when they are out of sync.

Ending the Background ASYNC Jobs

Purpose: You can end the background ASYNC jobs manually at the [Work with Background Jobs Screen](#), or create a periodic process to schedule the ASYNC jobs to end at a specified time.

Use the CNTL_ASYNC job to end all of the other background ASYNC jobs. You should bring down the background jobs at the end of your processing day.

When you bring down the background ASYNC jobs:

- If you manually end asyncs, a terminator record is sent to each data queue to identify the last record to be processed. Records sent to the data queue before the terminator record will be processed; records sent to the data queue after the terminator record was sent will be processed when the background ASYNC jobs are restarted.

- If you use the ENDASYN periodic function to end asyncs, any records in the data queue will be processed when the background ASYNC jobs are restarted.
- The data queues are reorganized. All completed records are deleted from the data queue tables. Records that have not been fully processed will be reloaded to the data queue when the background ASYNC jobs are restarted.
- An error list prints for each background ASYNC job, listing the records that could not be fully processed and the reason for the error.

When the jobs end: The status of each background job will change from *ACTIVE to *INACTIVE. (You may see *ENDPEND or *REORG before you see *INACTIVE, depending upon how long it takes to end each job.)

 **Note:**

You must end the background ASYNC jobs before the ASYNC subsystem is brought down. If you bring down the ASYNC subsystem while the background ASYNC jobs are running, the jobs will be ended but will remain in an *ACTIVE status. You will then need to run the JOBCLN periodic function to reset the status correctly. See [Using the JOBCLN Function to Resolve Job Status Across Servers](#).

To manually end the ASYNC jobs:

1. Select End for the CNTL_ASYNC job at the [Work with Background Jobs Screen](#).
2. The status of the ASYNC jobs changes to ENDING and then to INACTIVE.
3. When you end the ASYNC jobs, the Display Active Procedure window displays if there are any active procedures for the Order Entry/Maintenance, Purchase Order Maintenance, Receiving, or Confirmation functions. The system creates these records to prevent possible conflicts when users are engaged in these activities. See [Display Active Procedure Window](#).

Unable to end? The system verifies that the job is not currently in inactive status and is actually running server. If the job is already in inactive status, or is not actually running on a server, the screen displays an error message.

To resolve issues with the job's status, use the [JOBCLN](#) periodic function.

Display Active Procedure Window

This window opens when you end the ASYNC jobs if there are any active procedures for the Order Entry/Maintenance, Purchase Order Maintenance, Receiving, or Confirmation functions. The system creates these records to prevent possible conflicts when users are engaged in these activities.

If a user is active in a function:

- the user can exit the function before the ASYNC jobs end. Depending on the activity, the user might need to exit Order Administration and then reenter, if needed, to clear the active procedure record.
- you can select Delete next to each active procedure record to delete the active procedure, or select Delete all to delete them all. Deleting the active procedure does not force the user out of the activity; there is no signal of the deletion to the user and the user can continue entering updates to the record. However, this

allows more than one user to access the same record, such as an order or a customer and possibly overwrite each other's updates.

If neither of these steps clears the active procedure record, you will need to purge the Active Procedures table. See [Purging Active Procedures \(MACP\)](#).

Field	Description
Job #	The system job number assigned to the active procedure. Numeric, 6 positions; display-only
Program description	The description of the program associated with the Active Procedures record. Alphanumeric, 3 positions; display-only.
User	The User ID of the person engaged in the activity that created the Active Procedures record. Alphanumeric, 10 positions; display-only.
Workstation	The Workstation ID where the user is working. Alphanumeric, 10 positions, display-only.
Start date	The date when the Active Procedures record was created. This is the date the user entered the application. Numeric, 6 positions; display-only.
Time	The time when the Active Procedure record was created. This is the time the user entered the application. Numeric, 6 positions; display-only.

To remove active procedures:

1. Have each person whose name appears in the window exit the application so that you can end the ASYNC jobs. It may be necessary to exit Order Administration temporarily to delete the active procedure record, or
2. Select Delete next to each active procedure record to delete the active procedure. Deleting the active procedure does not force the user out of the activity; there is no signal of the deletion to the user and the user can continue entering updates to the record. However, this allows more than one user to access the same record, such as an order or a customer and possibly overwrite each other's updates.
3. Use Purging Active Procedures (MACP) to delete any stranded Active Procedure records, if necessary. You can also purge active procedures for interactive jobs that are older than a specified number of hours using the Delete Stranded Active Procedures (PFR0121) periodic function.
4. Select Refresh to refresh the Active Procedure Window to monitor whether the users have exited.
5. Select Exit to exit the window and return to the [Work with Background Jobs Screen](#).

Deleting active procedure records: You can delete the Active Procedure records at this window by selecting Delete for each record in the window. Deleting the active procedure does not force the user out of the activity, such as order entry; there is no signal of the deletion to the user and the user can continue entering updates to the record. However, it is not recommended to delete Active Procedure records in this way, because it removes the safeguard against two users potentially accessing the same record, such as an order or customer, at the same time.

To schedule the ASYNC jobs to end at a specified time:

Create a schedule for a periodic process that contains the ENDASYN periodic function to end asyncs.

Function	Description	Program	Summary
ENDASYN	End asyncs	MSENDASYN	<p>If the asyncs are currently Active, this periodic function calls the Controlling Data Queue (CNTL_ASYNC) in Background Job Control (MBJC) and ends the background jobs.</p> <p>This periodic function performs the same updates as selecting End for the controlling data queue to end the background jobs; however, any records in the data queue will be processed when the background ASYNC jobs are restarted.</p>

 **Note:**

When you end the ASYNC jobs using the job scheduler, the system does not look for active procedures, and instead, ends the asyncs immediately.

For more information:

- See Working with Periodic Processes (WPPR) for information on how to assign each function to a periodic process.
- See Executing Periodic Processes (EPRO) for more information on scheduling a periodic process to run at a specified time.

Reorganizing the ASYNC Job Data Queues

Purpose: The data queues associated with the ASYNC jobs are reorganized when the ASYNC jobs are ended. Use the Reorganize queue option as a recovery tool only when the ASYNC jobs end abnormally before the data queues have been reorganized. This option allows you to reorganize the data queues before the next ASYNC job end is processed.

To determine if the data queues were reorganized: Display the data queue for an ASYNC job. If the entry date for a record is earlier than the date you last ended the ASYNC jobs, or if records are in a *BLANK status, the data queues were not reorganized. If you do not use the Reorganize queue option, the data queues will be reorganized the next time you end the ASYNC jobs.

When you use the Reorganize queue option, the system deletes completed records from the data queue tables associated with the ASYNC jobs. Records that have not been fully processed will be reloaded to the data queues when the background ASYNC jobs are restarted.

The Reorganize queue option is available only with the CNTL_ASYNC job. All of the ASYNC jobs must be in a *INACTIVE status, and there can be no Active Procedures records for Order Entry, Order Maintenance, Purchase Order Maintenance, Receiving, and Confirmation functions.

Before you reorganize the data queues: Before you attempt to reorganize the data queues, you should make sure that the status of each ASYNC job is *INACTIVE.

How to reorganize the data queues: Select Reorganize queue for the CNTL_ASYNC job at the [Work with Background Jobs Screen](#).

Active procedures window: A pop-up window opens if there are any users in the Order Entry/Maintenance, Purchase Order Maintenance, Receiving, or Confirmation functions. The data queues cannot be reorganized if there are any users in these functions. See [Ending the Background ASYNC Jobs](#)

For more information: See [Troubleshooting the Async Jobs](#) for more information on the steps you should take if you suspect the async jobs are not running correctly.

Troubleshooting the Async Jobs

Use the following steps if you suspect that the async jobs are not running correctly.

- [Determining the Status of the Async Jobs](#)
- [Verifying the Status of the Async Jobs](#)
- [Running the JOBCLN Periodic Function to Correct the Async Jobs](#)
- [Reviewing the Async Job Log](#)

Determining the Status of the Async Jobs

Use the [Display Active Batch Jobs Screen](#) to determine if the async jobs are running across all Order Administration application servers.

- If the async job is listed on the [Display Active Batch Jobs Screen](#), the job is running. Review the My Jobs field for the async job to determine if the status of the async job on the [Job Management Screen](#) is accurate. See [Verifying the Status of the Async Jobs](#).
- If the async job is not listed on the Display Active Batch Jobs screen, the job is not running, regardless of the status of the job on the [Job Management Screen](#) or the status of each async job on the [Work with Background Jobs Screen](#). See [Running the JOBCLN Periodic Function to Correct the Async Jobs](#) for background on resetting the asyncs. Once the JOBCLN completes, you can restart the background async jobs; see [Starting the Background ASYNC Jobs](#).

Verifying the Status of the Async Jobs

The batch jobs displayed on the Display Active Batch Jobs Screen are the jobs that are currently running across all Order Administration application servers. The My Jobs field on this screen indicates if the status of the batch job on the [Job Management Screen](#) is accurate. The table below indicates the action to take, based on the status of the async job on the Display Active Batch Jobs screen.

Async Status in My Jobs Field:	Indicates:	Action to Take:
RUN	The async job is running and the status of the job on the Job Management Screen is accurate.	<p>Verify that the status of each of the async jobs that is running displays as *ACTIVE on the Work with Background Jobs Screen.</p> <p>What if the async job is active but no records are being processed? If this situation occurs, it is possible that the controlling async data queue table has been cleared. To correct, use the JOBCLN periodic function.</p>
MSG	The async job is running, but the status on the Job Management Screen is not accurate.	<p>When the Async jobs in the Background Job Control (MBC) menu option are active, the system checks the status of each async job on the Job Management screen. If the async job is active and the job status is not RUN, the next time the system checks the status of the async jobs, the system automatically updates the job status to RUN.</p>
ERR	The async job is running, but a user has manually ended the job on the Job Management Screen while its status was MSG.	<p>1. If an async job is listed on the Display Active Batch Jobs Screen and its My Jobs status is not RUN, wait a few minutes to see if the system will automatically update the status to RUN.</p>
END	The async job is running, but a user has manually ended the job on the Job Management Screen.	<p>2. Once the status updates to RUN, verify that the status of the async jobs displays as *ACTIVE on the Work with Background Jobs Screen.</p> <p>If the async job does not auto-update to a RUN status, you will need to determine if an error occurred. See Reviewing the Async Job Log.</p> <p>Use the JOBCLN periodic function to correct the async jobs. See Running the JOBCLN Periodic Function to Correct the Async Jobs for more information.</p>
RMV	The async job is running, but a user has removed the job from the Job Management Screen.	<p>Note: Never try to end an actively running async job by manually ending it on the Job Management Screen. This does not actually end the async job.</p> <p>End the CNTL_ASYNC that submitted the job. See Ending the Background ASYNC Jobs for instructions.</p> <p>Once you end the CNTL_ASYNC, the system ends the async job and removes the async job from the Display Active Batch Jobs Screen since it is no longer running. You will need to restart the CNTL_ASYNC in order to resubmit the job and run it again.</p> <p>Note: Never remove an actively running async job from the Job Management Screen. If you do this, the system removes all traces of the job from the system, even though the job is still actively running.</p>

Running the JOBCLN Periodic Function to Correct the Async Jobs

Running the JOBCLN Periodic Function to Correct the Async Jobs

The JOBCLN periodic function corrects the status of ASYNC jobs across all servers as follows.

Correcting the status of the BILL_ASYNC, EBO_ASYNC, OTHR_ASYNC, and ORDR_ASYNC:

- Currently running? If one of these ASYNC jobs is currently running, the JOBCLN function does the following:
 - If the status is INACTIVE, change the status to ACTIVE; otherwise, do not change the status. Also, for the BILL_ASYNC job, make sure that there is an active procedure if the job is running.
 - If there are multiple Ending records for an async job, delete all but one.
 - If the job is in END, FIN, or MSG at Job Management (My Jobs) screen, change the status to RUN and update Job History (Display Job History (DJHY)).
- Not currently running? Otherwise, if the ASYNC job is not currently running, the JOBCLN function does the following:
 - If the status is ACTIVE, change it to INACTIVE.
 - If there is an active procedure for the BILL_ASYNC job, delete it.
 - If the job is in RUN or MSG status, or any status except END at the Job Management screen, change the status to END and update Job History.

Correcting the status of the CNTL_ASYNC job:

- Currently running? If the job is running, the JOBCLN periodic function does the following:
 - If the status is INACTIVE, update it to ACTIVE; otherwise, do not change status.
 - If the status is not in ENDING or REORG status, delete any Ending records for each of the ASYNC jobs.
 - If the status is END, FIN, or MSG at the Job Management screen, update the status to RUN and update Job History.
 - If the EBO_ASYNC or ORDR_ASYNC jobs are INACTIVE, start them.
 - If the BILL_ASYNC or OTHR_ASYNC are INACTIVE, do not change the status because each will start up automatically when data arrives in its queue.
- Not currently running? If the CNTL_ASYNC is not currently running, the JOBCLN periodic function does the following:
 - If any other ASYNC job is ACTIVE, create an Ending record if one does not exist.
 - If any of the other ASYNC jobs are INACTIVE, delete any Ending records for those jobs.
 - If the CNTL_ASYNC status is ACTIVE or ENDING or JOBQ, change to INACTIVE.
 - If the status is REORG and the REORG Job is not currently running, change the status to INACTIVE.
 - If the status is RUN, FIN, MSG, or any other status at the Job Management screen, update the status to END and update Job History.

Reviewing the Async Job Log

If the async job remains in a MSG status without being auto-corrected by the system, you can also review the async job log to determine if an error occurred.

Async Job Log

To review the async job log: Click the logFile link for the async job on the Job Management Screen to advance to the Log file screen. Note: If the logFile is not a link, the async job was submitted from a different application server; you must log on to the other application server to review the async job log.

If an error occurred during async processing, the system writes an entry similar to the following in the async job log:

```
2009-04-18 22:09:10,161 ERROR [ JENASYS] execute(): status
change to [MSG]:334547java.lang.RuntimeException:
java.lang.RuntimeException:
com.microsoft.sqlserver.jdbc.SQLServerException: The result set
has no current row. (JenasysJob.java:297)
```

```
2009-04-18 22:09:10,177 ERROR [ JENASYS] run(): Job status
change to [MSG]. In 'invokeHandler' EXCEPTION ocured while
calling processServiceRequest. java.lang.RuntimeException:
com.microsoft.sqlserver.jdbc.SQLServerException: The result set
has no current row. (JenasysJob.java:701)
```

If an error exists in the async job log, copy the error and the log so that the problem can be researched if needed.

If an error occurred for one async job: Use the JOBCLN periodic function. See [Using the JOBCLN Function to Resolve Job Status Across Servers](#) for more information.

Working With the BILL_ASYNC Jobs

Purpose: The BILLING ASYNC job updates system tables with sales and shipment information as orders are billed.

As orders are confirmed, items returned, or records are uploaded from the PC Manifest system, the system sends records to the Billing data queue for processing. If the Billing ASYNC (BILL_ASYNC) job is active, it processes the records immediately. If the job is inactive when the records arrive, the BILL_ASYNC job processes them when it becomes active again. Records for virtual stored value cards are given priority for processing, and all other records are processed afterward in the sequence in which they arrive at the data queue.

If there are any errors, processing for that order stops at the error point. The system begins processing for the next order record in sequence. You should correct any errors that exist as soon as possible so that your system tables update properly. See [Working with BILL_ASYNC Status Messages](#).

You can review the status of each record in the data queue at any point at the [Display Billing Header Data Queue Screen](#)

To generate a shipment or return confirmation: Order Administration generates a shipment or return confirmation email or *Outbound Email XML Message (CWEmailOut)* when you:

- process a shipment or return through billing if the [Send Shipment Confirmation from Billing \(L98\)](#) system control value is selected.

- generate shipment confirmations or return confirmations using the Send Internet Order Ship Confirmations menu option; see [Sending Internet Order Ship Confirmation \(ESCF\)](#).
- execute the ECSHCNF periodic function; see [Working with Periodic Functions \(WPER\)](#).

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

For more information: See [Troubleshooting the Async Jobs](#) for more information on the steps you should take if you suspect the async jobs are not running correctly.

In this topic:

- [Related System Control Values](#)
- [Display Asynchronous Job Screen \(Displaying the Billing ASYNC Job\)](#)
- [Display Billing Header Data Queue Screen](#)
- [Working with BILL_ASYNC Status Messages](#)
- [Updates During Background Processing.](#)

Related System Control Values

The following system control values affect the function of the BILL_ASYNC job.

System Control Value	Description
Use Async Start Date for Billing Transactions (E95)	<p>If this system control value is selected, the Override Async Start Date pop-up window opens when you start the CNTL_ASYNC job.</p> <p>In this window you can specify a date other than the system date to update billing transaction records and ensure a clean cutoff for billing. You must confirm your entry after completing the pop-up window. See Working with the CNTL_ASYNC Job.</p> <p>If this system control value is unselected, the system date is used for all billing transactions. Because Order Administration can be set up with multiple companies each with different settings, if any company has the system control value selected, the pop-up window is displayed. The override date that you enter at the window is used only for those companies that have the system control value selected; the system date is used for any company where the system control value is unselected.</p>

System Control Value	Description
Number of Billing Async Jobs to Start (F08)	<p>This system control value indicates how many instances of the BILL_ASYNC job to run when you start the CNTL_ASYNC job. You can choose to run more than one BILL_ASYNC job to increase the rate at which you process billing transactions.</p> <p>Because the background jobs run for all companies in Order Administration, the system checks the setting for this system control value in all companies, and uses the highest value (up to 9). A setting of 0 or 1 will cause the system to run one BILL_ASYNC job only. See</p> <p>Note: For better system performance, if you run more than one Billing Async job, you should also select Delay Billing Updates (K85) to defer updates.</p> <p>Unique job names: If the <i>Number of Billing Async Jobs to Start (F08)</i> is set to more than 1 and <i>Delay Billing Updates (K85)</i> is selected, each submitted BILL_ASYNC job is assigned a unique name. The first is always named BILL_ASYNC, the second is named BILL_ASYNC_02, and so on.</p>
Delay Billing Updates (K85)	<p>If this system control value is selected, the Billing Async defers certain updates until you run the Delay Billing Update Process.</p> <p>If this system control value is unselected, the Billing Async completes all updates immediately. See Updates During Background Processing for more information on the billing updates that occur immediately and the updates that are processed by the Delay Billing Update Process.</p>

System Control Value	Description
Hold Invoices for Multi-Recipient Orders (G07)	<p>This system control value defines whether the system holds invoices for multi-recipient orders until all of the pick slips for the order are confirmed. If this system control value is selected, the system determines if the pick slip being confirmed is the last pick slip that needs to be confirmed for the multi-recipient order.</p> <p>If the pick slip is the last pick slip that needs to be confirmed for the order, the system:</p> <ul style="list-style-type: none"> • submits all of the pick slips associated with the order to the BILL_ASYNC • places the order in a closed status • creates an invoice for all of the pick slips associated with order <p>If the pick slip is not the last pick slip that needs to be confirmed for the order, the system:</p> <ul style="list-style-type: none"> • places the pick slip in a B (billing pending) status until all of the pick slips for the order have been confirmed • does not create an invoice • keeps the order in an open status • writes an order transaction history message indicating that the pick slip has been confirmed
Capture Addresses for Invoice (J24)	<p>If this system control value is selected, the system saves the billing and shipping addresses for each invoice during billing. The shipping address is used to calculate tax.</p>
Preload Deposits (L78)	<p>If selected, billing creates records in the CC Deposit Transaction table and CC Deposit History table immediately after creating records in the Invoice Payment Method table.</p>

Display Asynchronous Job Screen (Displaying the Billing ASYNC Job)

Purpose: Use this screen to display the job attributes for each background ASYNC job, including the Billing ASYNC job.

How to display this screen: Select Display for the BILL_ASYNC job at the [Work with Background Jobs Screen](#).

Field	Description
Process name	The name of the process for this ASYNC job. The name of the billing data queue is BILLDATAQ. Alphanumeric, 10 positions; display-only.
Job name	The name of the ASYNC job. Alphanumeric, 10 positions; display-only.
Description	The description of the ASYNC job. Alphanumeric, 40 positions; display-only.

Field	Description
Start	The date and time the ASYNC job was last started and the User ID of the person who started it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. (User ID): Alphanumeric, 10 positions; display-only.
End	The date and time the ASYNC job was last ended and the User ID of the person who ended it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. (User ID): Alphanumeric; 10 positions; display-only.
Controlling job?	A flag indicating whether this job controls other ASYNC functions. The controlling ASYNC job starts and ends other ASYNC functions. Valid values are: <ul style="list-style-type: none"> Selected = This is a controlling ASYNC job. Unselected = This is not a controlling ASYNC job. The CNTL_ASYNC job is the only controlling ASYNC job.
System Option?	A flag indicating whether this job is a system function that cannot be deleted by the user. Valid values are: <ul style="list-style-type: none"> Selected = This job cannot be deleted by the user. Unselected = This job can be deleted by the user.
Status	The current status of the job. Valid status codes are: <ul style="list-style-type: none"> *ACTIVE *INACTIVE *ENDPEND *JOBQ *REORG Display-only.

Display Billing Header Data Queue Screen

Purpose: This screen displays the records that were sent to the data queue for processing since the last time the ASYNC job was ended. Records are sent to the data queue when orders are confirmed or items are returned.

Records for virtual stored value cards are given priority for processing, and all other records are processed afterward in the sequence in which they arrive at the data queue.

The status of each record, indicating if the record was processed or if any errors exist, displays.

How to display this screen: Select Display Data Queue for the BILL_ASYNC job at the [Work with Background Jobs Screen](#).

Field	Description
Cmp (Company)	The number of the company for which the transaction was processed. If you are running operations for more than one company, transactions for all companies are submitted to the same data queue. Numeric, 3 positions; display-only.
Date	The date when the transaction was submitted to the data queue for processing. Numeric, 6 positions (in user date format); display-only.
Time	The time when the transaction was submitted to the data queue for processing. Note: The number of seconds might exceed 59 if the ASYNC job processed 60 or more records in a minute. Numeric, 6 position (HH:MM:SS format); display-only.
Job #	The job number assigned to the transaction when it was submitted to the data queue. Numeric, 6 positions; display-only.
B/A	A code indicating whether the record represents a before image or an after image for the transaction. After records are written for all transactions; before records are written for orders that have been maintained. Valid codes are: <ul style="list-style-type: none"> • B = The record represents the order information before the transaction was processed. • A = The record represents the order information after the transaction was processed. Alphanumeric, 1 position; display-only.
Processed	The status of the record. The record is either not processed, in process, in error, or processed. A status message displays for each step. Alphanumeric, 30 positions; display-only.
Ordr ship to	The order ship-to number for which the record is being processed. (Order #): Numeric, 8 positions; display-only. (Ship-to): Numeric, 3 positions; display-only.
Trans	A code identifying the function from which the transaction originated. Valid status codes are: <ul style="list-style-type: none"> • CF = Confirmation • DS = Drop Ship • EB = Evaluate Backorders • OE = Order Entry • OM = Order Maintenance • PM = Purchase Order Maintenance • PR = Receiving • RA = Return Authorization • US = Unspecified Alphanumeric, 2 positions, display-only.

Working with BILL_ASYNC Status Messages

Purpose: You can review the status of each data queue record by displaying the data queue. You must correct the error before the billing transaction can be fully processed.

BILL_ASYNC status messages: This table lists the status messages that you may see when displaying the Billing Header Data Queue

Message	Message ID	Error Reason/Action Required
Processing has begun	----	None.
All updates complete	----	None. The record was fully processed.
Cust Bill To Change	OA20931	A Bill To record does not exist for the customer in the Customer Bill To table. This error cannot be corrected by the user.
Cust Ship To Change	OA20937	A Ship To record does not exist for the customer in the Customer Ship To table. This error cannot be corrected by the user.
Cust Sold To Change	OA20939	A Sold To record does not exist for the customer in the Customer Sold To table. This error cannot be corrected by the user.
Division Change	OA22980	A Division record does not exist for the division under which the order was entered, and must be created. See Working with Divisions (WDIV) .
OHD in Use	OA21782	The order is currently being maintained (the Order Header record is in use). The system will process the record when the Order Header record is no longer in use.
OHD# Error	OA21153	The Order Header record does not exist. This error cannot be corrected by the user.
OST# Error	OA21170	The Order Ship To record does not exist. This error cannot be corrected by the user.
PCH in Use	OA22373	The Pick Control record is in use. The system will process the record when the Pick Control record is no longer in use.
Salesman Change	OA21795	A Salesman record does not exist for the sales representative assigned to the order, and must be created. See Working with Sales Representatives (WLS) .
Ship Via Change	OA21696	A Ship Via record does not exist for the carrier being used to ship the order, and must be created. See Working with Ship Via Codes (WVIA) .
Source Change	OA21695	A Division record does not exist for the division under which the order was entered, and must be created. See Working with Source Codes (WSRC) .

Updates During Background Processing

Purpose: The following tables list the field and table updates during the BILL_ASYNC procedure.

- [Immediate Billing Updates](#)
- [Batch Billing Updates](#)

Immediate Billing Updates

The following billing updates occur immediately during the BILL_ASYNC procedure.

Table	Updates
CC Deposit Transaction	Creates records if the Preload Deposits (L78) system control value is selected
CC Deposit History	Creates records if the Preload Deposits (L78) system control value is selected
IL Outbound Trigger (MSILOU)	Creates a record with a File/Key type of CAS for each shipment on an order whose order type matches the ChannelAdvisor Order Type (L90) . See ChannelAdvisor Integration Overview , especially Sending Shipment Confirmations to ChannelAdvisor .
Invoice Address (OEINAD)	Creates a record for the shipping and billing address for each invoice if the Capture Addresses for Invoice (J24) system control value was selected
Invoice Currency (MSINCU)	Creates/updates records if the Multi Currency by Offer (E03) system control value or Track Invoice Currency (D68) system control value is selected
Invoice Detail (OEINDT)	Creates/updates records Note: The system bypasses the creation of an Invoice Detail record for a drop ship line when the order line status is X Closed OR the quantity shipped is equal to or greater than the quantity ordered. If this situation occurs, the system writes a message similar to the following in the Application Log : Drop ship line skipped/already billed: 555/00039520/001/00001.
Invoice Detail Charge (INIDCP)	Creates/updates records
Invoice Detail Pay Method (CSINVP)	Creates/updates records
Invoice Header (OEINHHD)	Creates/updates records
Invoice Pay Method (CSINVP)	Creates/updates records
Invoice Ship To (OEINSH)	Creates/updates records
Item Location (INILOC)	Reduce quantity on-hand Reduce printed quantity
Item Transaction History	Creates/updates records
Item Warehouse (INIWRE)	Units sold, \$ Sold Units returned, \$ returned Reduce quantity on-hand
Item Warehouse History (INIWRH)	Units sold, \$ sold Units returned, \$ returned
Order Orchestration	Updates the Status to Complete. Note: The system also sends a status update with a status of Fulfilled for a delivery order, or In transit for a ship-for-pickup order. See Order Orchestration Integration for an overview.
Order Detail (OEORDT)	Updates status Adjusts quantities
Order Line History	Creates/updates records

Table	Updates
Order Payment Method (OEPAYM)	Updates amounts billed and credit For a retail pickup or delivery order from the Order Orchestration, deactivates the payment method
Order Ship To (OERST)	Updates order balance amounts
Order Shipment Details	Creates a record for a shipment if a tracking number is specified, and generates the order request message to Narvar if the Narvar Integration is enabled
Refunds (CSRFND)	Creates/updates records
Reserved Order Line (FLRSOL)	Updates/deletes records
Stored Value Card (OESVCD)	Create a record for each unit of a stored value card item billed on the order; see Billing a Stored Value Card
Tickler (MSTKLR)	Creates/updates records if the Use Workflow Management (H96) system control value is selected and billing activates a tickler rule

Batch Billing Updates

If the Delay Billing Updates (K85) system control value is selected, the system delays the following billing updates until you run the Delay Billing Update Process; otherwise, these updates also occur immediately.

Table	Updates
Carton Contents	Create carton contents records
Customer Bill To (CSCBIL)	# of invoices # of sales Sales LTD Sales YTD \$ on order # of Credits
Customer Membership (OECOMP)	Create or deactivate customer loyalty memberships based on total sales dollars or customer class. See Loyalty Memberships for an overview.
Customer Ship To Entity (OECHEP)	Units and \$ Sales LTD Units and \$ Exchanges LTD Units and \$ Returns LTD On Order \$
Customer Ship To Item Class Entity (OEICEP)	Units and \$ Sales LTD Units and \$ Exchanges LTD Units and \$ Returns LTD
Customer Ship To Order History (CSORH)	# Sales LTD, \$ Sales LTD # Exchanges LTD, \$ Exchanges LTD # Returns LTD, \$ Returns LTD On Order \$
Customer Shipment History (FLCSHP)	# of shipments, \$ value Last shipment date

Table	Updates
Customer Sold To Entity (OECSEP) 1	Units and \$ Sales LTD Units and \$ Exchanges LTD Units and \$ Returns LTD On Order \$
Customer Sold To Item Class (OECSIC)	Units and \$ Sales LTD Units and \$ Returns LTD Units and \$ Exchanges LTD
Customer Sold To Order History (CSTOOH)	# Sales LTD, \$ Sales LTD, incremented for each recipient # Exchanges LTD, \$ Exchanges LTD # Returns LTD, \$ Returns LTD On Order \$ \$ Warranty Shipped \$ Warranty Returned
Division (MSDIV)	# Sales Today, # Sales LTD, incremented for each recipient \$ Sales Today, \$ Sales LTD # Returns Today, # Returns LTD \$ Returns Today, \$ Returns LTD
Division History (ACDIVH)	# Sales, \$ Sales # Returns, \$ Returns
Exchange Reason/Offer (CSXROF)	# Exchange, \$ Exchange
Exchange Reason/Offer/Item (INEROI)	# Exchange, \$ Exchange
Flexible Payment Option (FLFPOP)	# of shipments, \$ shipped # of returns, and \$ returned
Order Control Summary (MSORSU)	# orders shipped, \$ orders shipped, quantity shipped # invoices credited, \$ invoices credited, quantity credited # orders exchanged, \$ orders exchanged, quantity exchanged Note: The Order Async updates the orders entered, orders canceled, and orders soldout fields in the Order Control Summary table. The batch order control job updates the operation and merchandising fields in the Order Control Summary table; see Reviewing Operations Control Summary (FLSH) .
Order/Billing History (OEBHST)	Qty Sold, \$ Sold Total, # Sales Qty Exchanged, \$ Exchanged Total, # Exchanged Qty Returned, \$ Returned Total, # Returns
Return Reason/Offer (CSRTNO)	# Returns, \$ Returns
Return Reason/Offer/Item (INRROI)	# Returns, \$ Returns

Table	Updates
Salesman (MSSLMN)	# Sales LTD, \$ Sales LTD, incremented for each recipient # Exchanges LTD, \$ Exchanges LTD # Returns LTD, \$ Returns LTD
Ship Via (MSSHPV)	# of Packages TD, # of Packages LTD Freight Collected TD, Freight Collected LTD
Ship Via History (VIAHST)	# of Packages, Freight Collected
SKU Price History (SKUPHT)	# Sales, \$ Sales
Source (MSSRC)	\$ Sales, # Sales, incremented for each shipment \$ Exchanges, # Exchanges \$ Returns, # Returns Requests mailed (if the order type on the order matches the order type in the Order Type to Process as Catalog Request/Item Samples (E08) system control value)
Tax Jurisdiction History (MSTXJH)	Amount charged Amount credited
User Define Exit Point	Execute any user defined exit points that are called during Billing

¹ Entity-level updates take place only if the [Track Customer History at Entity Level \(F89\)](#) system control value is selected.

Working With the EBO ASYNC Job

Purpose: The Evaluate Backorders ASYNC function updates the system tables with reservation and backorder information whenever the inventory level for a backordered item increases. Inventory levels for an item increase when you process inventory transactions, receive purchase orders, or transfer merchandise from suspense.

When the inventory transactions program runs, it sends records to the Evaluate Backorders data queue for processing if the inventory level for a backordered item is increased.

- If the Evaluate Backorders ASYNC (EBO_ASYNC) function is active, it processes the records immediately.
- If the EBO_ASYNC is not active when it receives the records, it processes them as soon as it becomes active again.

All records are processed in the sequence in which they arrive in the data queue.

Pick slip preparation: During the Evaluate Backorders process, the system performs pick slip preparation for each order updated:

1. The system REMOVES any pick slip preparation from the order.
2. Once the Evaluate Backorders async reserves stock for an order, the system EVALUATES the order to determine if it is eligible for pick slip preparation.
3. If the order is eligible for pick slip preparation after the changes to the order have been made, the system RE-APPLIES pick slip preparation to the order.

See [Preparing Orders for Pick Slip Generation](#) for processing details.

Errors: If any errors occur in processing a data queue record, the function stops processing at the error point and starts the next record in sequence. The records in error are listed on the Evaluate Backorders ASYNC Error Report, which prints when the ASYNC jobs end. EBO_ASYNC continues processing any record in error once the error is corrected.

You can view the status of each record in the data queue at the [Display Evaluate B/O Data Queue Screen](#).

For more information: See [Troubleshooting the Async Jobs](#) for more information on the steps you should take if you suspect the async jobs are not running correctly.

In this topic:

- [Display Asynchronous Job Screen \(Displaying the Evaluate Backorders ASYNC Job\)](#)
- [Display Evaluate B/O Data Queue Screen](#)
- [Evaluate B/O Background Job Error Listing](#)
- [Updates During Background Processing](#).

Display Asynchronous Job Screen (Displaying the Evaluate Backorders ASYNC Job)

Purpose: Use this screen to display the job attributes for each background ASYNC job. This screen displays descriptive information about the ASYNC job.

How to display this screen: Select Display for the EBO_ASYNC job at the [Work with Background Jobs Screen](#).

Field	Description
Process name	The name of the process for this ASYNC job. The name of the evaluate backorders data queue is EVLBODATAQ. Alphanumeric, 10 positions; display-only.
Job name	The name of the ASYNC job. Alphanumeric, 10 positions; display-only.
Description	The description of the ASYNC job. Alphanumeric, 40 positions; display-only.
Start	The date and time the ASYNC job was last started and the User ID of the person who started it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. User ID): Alphanumeric, 10 positions; display-only.
End	The date and time the ASYNC job was last ended and the User ID of the person who ended it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. (User ID): Alphanumeric, 10 positions; display-only.
Controlling job?	A flag indicating whether this function controls other ASYNC functions. The controlling ASYNC function starts and ends other ASYNC functions. Valid values are: Selected - This is a controlling ASYNC function. Unselected - This is not a controlling ASYNC function. The CNTL_ASYNC job is the only controlling ASYNC job.

Field	Description
System Option?	A flag indicating whether this function is a system function that cannot be deleted by the user. Valid values are: Selected - This function cannot be deleted by the user. Unselected - This function can be deleted by the user.
Status	The current status of the job. Valid status codes are: <ul style="list-style-type: none"> • *ACTIVE • *INACTIVE • *ENDPEND • *JOBQ • *REORG Display-only.

Display Evaluate B/O Data Queue Screen

Purpose: This screen displays the records that have been sent to the data queue for processing since the last time the ASYNC function was ended. Records are sent to the data queue when the inventory level for an item is increased. The status of each record indicates if the record has been processed or if any errors exist.

Note:

If the [Use Inventory Sharing Backorder Evaluation \(I80\)](#) system control value is selected, there is a data queue record only for the shared company (the company where you actually track the inventory). See [Inventory Sharing \(A69\)](#) for an overview.

How to display this screen: Select Display Data Queue for the EBO_ASYNC job on the [Work with Background Jobs Screen](#).

Field	Description
Cmp (Company)	The number of the company for which the transaction was processed. If you are running operations for more than one company, transactions for all companies are submitted to the same data queue. Note: If the Use Inventory Sharing Backorder Evaluation (I80) system control value is selected, there is a data queue record only for the shared company (the company where you actually track the inventory). See Inventory Sharing (A69) for an overview. Numeric, 3 positions; display-only.
Date	The date when the transaction was submitted to the data queue for processing. Numeric, 6 positions (in user date format); display-only.

Field	Description
Time	The time at which the transaction was submitted to the data queue for processing. Note: The number of seconds might exceed 59 if the ASYNC job processed 60 or more records in a minute. Numeric, 6 position (HH:MM:SS format); display-only.
Job #	The job number assigned to the transaction when it was submitted to the data queue. Numeric, 6 positions; display-only.
Processed	The status of the record. The record is either not processed, in process, in error, or processed. A status message displays for each step. Alphanumeric, 30 positions; display-only.
Item	The item number/SKU of the backordered item that can now be reserved. (Item#): Alphanumeric, 12 positions; display-only. (SKU): Alphanumeric, three 4-position fields; display-only.
Whs	The code of the warehouse where the backordered item can be reserved. Numeric, 3 positions; display-only.

Evaluate B/O Background Job Error Listing

Purpose: This listing prints when the background ASYNC jobs are ended. The report lists the records that could not be processed and the reason for the error. The record will be processed when the error is corrected.

- Order #: The order number for which the error occurred.
- Ship to: The ship-to suffix of the order for which the error occurred.
- Order date: The date when the order was entered.
- User: The User ID of the operator who entered the order.
- Update area: The message describing the reason for the error.
- Error ID: The ID number assigned to the error.

Updates During Background Processing

Updates: Evaluate Backorders:

- Updates backorder quantity, reserved quantity, and available quantity in item warehouse
- Creates reserved order lines

Pick slip preparation: During the Evaluate Backorders process, the system performs pick slip preparation for each order updated:

1. The system REMOVES any pick slip preparation from the order.
2. Once the Evaluate Backorders async reserves stock for an order, the system EVALUATES the order to determine if it is eligible for pick slip preparation.
3. If the order is eligible for pick slip preparation after the changes to the order have been made, the system RE-APPLIES pick slip preparation to the order.

See [Preparing Orders for Pick Slip Generation](#) for processing details.

Working With the ORDR_ASYNC Job

Purpose: The Order Processing ASYNC job updates system tables with order and demand information as orders are entered and maintained.

As you enter or maintain orders, the system sends the records to the Order Processing data queue for processing. As soon as the Order Processing Data queue receives a record to process, the record is processed immediately, regardless of the status of the Order Processing ASYNC (ORDR_ASYNC) job. The ORDR_ASYNC job processes multiple orders simultaneously.

If there are any records that the job cannot update, it skips that record and continues.

You can review the status of each record in the data queue at any point by displaying the [Display Order Ship To Data Queue Screen](#).

Quotes: The system does not send quotes to the Order Async until the quote is converted to an order; see [Entering Pre-Order Quotes](#) for an overview.

Related system control value: The [Update Demand for Order Maintenance Transactions \(C72\)](#) controls how this job processes updates.

Note:

While the Order Async job does not need to be active to process records, you should set the Order Async job to active to handle reorganization and cleanup of any transactions that did not process correctly.

For more information: See [Troubleshooting the Async Jobs](#) for more information on the steps you should take if you suspect the async jobs are not running correctly.

In this topic:

- [Display Asynchronous Job Screen \(Displaying the Order Processing ASYNC Job\)](#)
- [Display Order Ship To Data Queue Screen](#)
- [Updates During Background Processing](#)

Display Asynchronous Job Screen (Displaying the Order Processing ASYNC Job)

Purpose: Use this screen to display the job attributes for each background ASYNC job, including the Order Processing ASYNC job.

How to display this screen: Select Display for an ASYNC job at the [Work with Background Jobs Screen](#).

Field	Description
Process name	The name of the process for this ASYNC job. The name of the order data queue is ORDERDATAQ. Alphanumeric, 10 positions; display-only.
Job name	The name of the ASYNC job. Alphanumeric, 10 positions; display-only.

Field	Description
Description	The description of the ASYNC job. Alphanumeric, 40 positions; display-only.
Start	The date and time the ASYNC job was last started and the User ID of the person who started it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. (User ID): Alphanumeric; 10 positions; display-only.
End	The date and time the ASYNC job was last ended and the User ID of the person who ended it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. (User ID): Alphanumeric; 10 positions; display-only.
Controlling job	A flag indicating whether this job controls other ASYNC functions. The controlling ASYNC job starts and ends other ASYNC functions. Valid values are: <ul style="list-style-type: none"> Selected - This is a controlling ASYNC job. Unselected - This is not a controlling ASYNC job. The CNTL_ASYNC job is the only controlling ASYNC job.
System Option	A flag indicating whether this is a system job that cannot be deleted by the user. Valid values are: <ul style="list-style-type: none"> Selected - This job cannot be deleted by the user. Unselected - This job can be deleted by the user.
Status	The current status of the job. Valid status codes are: <ul style="list-style-type: none"> *ACTIVE *INACTIVE *ENDPEND *JOBQ *REORG Display-only.

Display Order Ship To Data Queue Screen

Purpose: Use this screen to review the records that have arrived in the data queue for processing since the last time you ended the ASYNC jobs. Records arrive in the data queue for new orders that are entered and for existing orders that are maintained. The status of each record, indicating if the record has been processed or if any errors exist, displays.

How to display this screen: Select Display Data Queue for the ORDR_ASYNC job at the [Work with Background Jobs Screen](#).

Field	Description
Cmp (Company)	The number of the company for which the transaction was processed. If you are running operations for more than one company, transactions for all companies are submitted to the same data queue. Numeric, 3 positions; display-only.

Field	Description
Date	The date when the transaction was submitted to the data queue for processing. Numeric, 6 positions (in user date format); display-only.
Time	The time when the transaction was submitted to the data queue for processing. Note: The number of seconds might exceed 59 if the ASYNC job processed 60 or more records in a minute. Numeric, 6 position (HH:MM:SS format); display-only.
User	The user ID of the user associated with the order transaction. Alphanumeric, 10 positions; display-only.
B/A	A code indicating whether the record represents a before image or an after image for the transaction. After records are written for all transactions; before records are written for orders that have been maintained. Valid codes are: <ul style="list-style-type: none"> • B = The record represents the order information before the transaction was processed. • A = The record represents the order information after the transaction was processed. Alphanumeric, 1 position; display-only.
Processed	The status of the record. The record is either not processed, in process, in error, or processed. A status message displays for each step. Alphanumeric, 30 positions; display-only.
Ordr #	The order number of the record. (Order #): Numeric, 8 positions; display-only.
Ordr ship to	The order ship-to number of the record. (Ship to): Numeric, 3 positions, display-only.
Trn	A code identifying the job from which the transaction originated. Valid status codes are: <ul style="list-style-type: none"> • CF = Confirmation • DS = Drop Ship • EB = Evaluate Backorders • OE = Order Entry • OM = Order Maintenance • PM = Purchase Order Maintenance • PR = Receiving • RA = Return Authorization • US = Unspecified Alphanumeric, 2 positions, display-only.

Updates During Background Processing

Purpose: The ORDR_ASYNC job updates system tables with order and demand information as orders are entered and maintained. As you enter or maintain orders, the system sends the records to the Order Processing data queue for processing. As soon as the Order Processing Data queue receives a record to process, the record is processed immediately, regardless of the status of the Order Processing ASYNC (ORDR_ASYNC) job. The ORDR_ASYNC job processes multiple orders

simultaneously. While the Order Async job does not need to be active to process records, you should set the Order Async job to active to handle reorganization and cleanup of any transactions that did not process correctly.

Related system control value: The Update Demand for Order Maintenance Transactions (C72) system control value controls whether totals update as a result of order maintenance as well as order entry.

Order count and demand updates for retail pickup and delivery orders: If the originating location on a retail pickup or delivery order is Order Administration, the system does not increase the order count that is displayed on the [About Application Screen](#) or perform any demand updates for the order.

 **Note:**

The system identifies the originating location as Order Administration if the request_system_cd in the fulfillment response message matches the system code in the [OROB System \(K50\)](#) system control value and the request_location_cd in the fulfillment response message matches the location in the [Originating Location to Pass to OROB \(M32\)](#) system control value. In this situation, the system prefaces the E-commerce order number in the Order Header Extended table with ORIG#: 9999-001, where ORIG#: indicates the order was created as a result of OROB fulfillment assignment, 9999 is the order number, and 001 is the ship to number. See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information.

Table	Updates
Cancel Reason/Offer (CNCNRO)	Date # canceled qty canceled units canceled Creates a record only if the cancel reason code is flagged not to reduce demand.
CC Authorization Backorder (CCATBO)	Create a record for authorization of a fully backordered order if the Preauthorize Backorders (D32) system control value is selected.
Correspondence History (MSCOHS)	Creates a record for each order confirmation email <i>Outbound Email XML Message (CWEmailOut)</i> generated if the Write Outbound Email to Email Repository (H99) system control value is selected. See the Suppress Order Confirmations for Orders in Error (K09) system control value for a discussion of when the ORDR_ASYNC background job generates order confirmations. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)
Customer Membership (OEC SMP)	Create or deactivate customer loyalty memberships based on total order dollars or customer class. See Loyalty Memberships for an overview.
Customer Sold To (OECSSL)	Original and current mail type Original source Current source (if Update of Current Source Code in Customer File (D08) system control value is selected)

Table	Updates
Customer Sold To Entity (OECSEP)	<p>Last order date</p> <p>On order \$</p> <p># orders LTD, \$ orders LTD</p> <p># cancels LTD, \$ cancels LTD</p> <p># soldouts LTD, \$ soldouts LTD</p> <p>Last source</p> <p>Current mail type</p> <p>Original mail type</p> <p>Active since date</p> <p>Original source code</p> <p>Last source code</p> <p>Updated if the Track Customer History at Entity Level (F89) system control value is selected.</p>

Offer (MSOFFR)	Date of first order

Table	Updates
Order Control Summary (MSORSU)	# orders entered, \$ orders entered, quantity ordered # orders cancelled, \$ orders cancelled, quantity cancelled # orders soldout/closed, \$ orders soldout, quantity soldout Note: The Billing Async updates the orders shipped, orders exchanged, and invoices credited fields. The batch order control job updates the operation and merchandising fields in the Order Control Summary table; see Reviewing Operations Control Summary (FLSH).
Order Type/ User (OEOTYU)	# Orders TD, LTD \$ Value - TD, LTD # Receipts TD, LTD # Lines TD, LTD
Order/Billing History (OEBHST)	# orders, \$ order total, qty ordered # soldout, \$ soldout total, qty soldout # canceled, \$ canceled, qty canceled
Price override reason (OEPROR)	# of overrides Total discount
SKU (INSKU)	Date of first order Date of last order
SKU Price History (SKUPHT)	# orders (actually updated with the total ordered quantity) \$ orders
Soldout Notifications (SONTFY)	Creates records
Source Code (MSSRC)	\$ ordered, soldout, canceled # of orders, soldouts, cancels Date of first order Date of last order Response percent
Tickler	Records created based on related configuration. See Workflow Management Overview and Setup for background.

 **Note:**

- Entity-level updates take place only if the [Track Customer History at Entity Level \(F89\)](#) system control value is selected.
- Order maintenance activity updates demand only if the [Update Demand for Order Maintenance Transactions \(C72\)](#) system control value is selected.

Working With the OTHR_ASYNC Job

The Other ASYNC function updates the system tables with purchase order information when purchase orders are entered, maintained, or received.

When purchase orders are entered, maintained, or received, records are sent to the Other data queue for processing. If the Other ASYNC (OTHR_ASYNC) function is active, the

records will be processed immediately. If the function is not active when the records are sent, they will be processed as soon as the OTHR_ASYNC function becomes active again. All records are processed in the sequence in which they were sent to the data queue.

If any errors exist, processing for that record stops at the error point. The system begins processing the next record in sequence. The records in error are listed on the P/O Background Job Error Listing, which is printed when the ASYNC jobs are ended. OTHR_ASYNC will continue processing the record when the error has been corrected. You should correct any errors that exist as soon as possible so that your system tables are updated properly. See [Working with OTHR_ASYNC Status Messages](#).

The status of each record in the data queue can be viewed at any point by displaying the [Display PO Header Data Queue Screen](#).

For more information: See [Troubleshooting the Async Jobs](#) for more information on the steps you should take if you suspect the async jobs are not running correctly.

In this topic:

- [Display Asynchronous Job Screen \(Displaying the Other ASYNC Job\)](#)
- [Display PO Header Data Queue Screen](#)
- [Working with OTHR_ASYNC Status Messages](#)
- [P/O Background Job Error Listing](#)
- [Updates During Background Processing](#).

Display Asynchronous Job Screen (Displaying the Other ASYNC Job)

Purpose: Use this screen to display the job attributes for each background ASYNC job, including the OTHR_ASYNC job. This screen displays descriptive information about the ASYNC job.

How to display this screen: Select Display for the OTHR_ASYNC job at the [Work with Background Jobs Screen](#)

Field	Description
Process name	The name of the process for this ASYNC job. The name of the OTHR_ASYNC data queue is OTHERDATAQ. Alphanumeric, 10 positions; display-only
Job name	The name of the ASYNC job. Alphanumeric, 10 positions; display-only
Description	The description of the ASYNC job. Alphanumeric, 40 positions; display-only.
Start	The date and time the ASYNC job was last started and the User ID of the person who started it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. (User ID): Alphanumeric; 10 positions; display-only.

Field	Description
End	The date and time the ASYNC job was last ended and the User ID of the person who ended it. (Date): Numeric, 6 positions; display-only. (Time): Numeric, 6 positions; display-only. (User ID): Alphanumeric, 10 positions; display-only.
Controlling job?	A flag indicating whether this function controls other ASYNC functions. The controlling ASYNC function starts and ends other ASYNC functions. Valid values are: <ul style="list-style-type: none"> Selected = This is a controlling ASYNC function. Unselected = This is not a controlling ASYNC function. The CNTL_ASYNC job is the only controlling ASYNC job.
System Option?	A flag indicating whether this function is a system function that cannot be deleted by the user. Valid values are: Selected - This function cannot be deleted by the user. Unselected - This function can be deleted by the user.
Status	The current status of the function. Valid status codes are: <ul style="list-style-type: none"> *ACTIVE *INACTIVE *ENDPEND *JOBQ *REORG Display-only

Display PO Header Data Queue Screen

Purpose: This screen displays the records that have been sent to the data queue for processing since the last time the ASYNC function was ended. Records are sent to the data queue when the inventory level for an item is increased.

The status of each record, which indicates if the record has been processed or if any errors exist, displays.

How to display this screen: Select Display Data Queue for the OTHR_ASYNC job on the [Display Asynchronous Job Screen \(Displaying the Other ASYNC Job\)](#)

Field	Description
Cmp (Company)	The number of the company for which the transaction was processed. If you are running operations for more than one company, transactions for all companies are submitted to the same data queue. Numeric, 3 positions; display-only.
Date	The date on which the transaction was submitted to the data queue for processing. Numeric, 6 positions (in user date format); display-only.

Field	Description
Time	The time at which the transaction was submitted to the data queue for processing. Note: The number of seconds might exceed 59 if the ASYNC job processed 60 or more records in a minute. Numeric, 6 position (HH:MM:SS format); display-only.
User	The User ID of the person who entered the transaction. Alphanumeric, 10 positions; display-only.
B/A	A code indicating whether the record represents a before image or an after image for the transaction. After records are written for all transactions; before records are written for order maintenance transactions. Valid codes are: <ul style="list-style-type: none"> • Before = The record represents the order information before the transaction was processed. • After = The record represents the order information after the transaction was processed. Alphanumeric, 1 position; display-only.
Processed	The status of the record. The record is either not processed, in process, in error, or processed. A status message displays for each step. Alphanumeric, 30 positions; display-only.
PO#	The number of the purchase order for which the record is being processed. Numeric, 7 positions; display-only.
Trans	A code that identifies the function where the transaction originated. Valid status codes are: <ul style="list-style-type: none"> • CF = Confirmation • DS = Drop Ship • EB = Evaluate Backorders • OE = Order Entry • OM = Order Maintenance • PM = Purchase Order Maintenance • PR = Receiving • RA = Return Authorization • US = Unspecified Alphanumeric, 2 positions, display-only.

Working with OTHR_ASYNC Status Messages

Purpose: The status of each data queue record can be viewed by displaying the data queue. If an error exists, the message will print on the P/O Background Jobs Error Listing that is printed when the ASYNC jobs are ended. The error must be corrected before the transaction can be fully processed.

OTHR_ASYNC status messages: This table lists the status messages that you may see when displaying the PO Header Data Queue, or when reviewing the [P/O Background Job Error Listing](#). The Error Reason/Action Required section of the table below is incomplete as of this writing.

Message	Message ID	Error Reason/Action Required
Processing has begun		None.
All updates complete		None. The record was fully processed.
Error updating buyers	OA21759	
Error updating Item/ Warehouse	OA21760	
Error updating PO Dtl audit	OA21915	
Error updating PO Hdr audit	OA21916	
Error creating PO layering	OA21897	
Error changing PO layering	OA21920	
Error creating PO layering	OA21918	
Error deleting PO layering	OA21919	
Error updating SKU Offer	OA21758	
Error updating threshold value	OA22968	
Error updating vendor	OA21732	
Error updating vendor history	OA21733	
Error updating vendor items	OA21766	

P/O Background Job Error Listing

Purpose: This report prints when the background ASYNC jobs are ended. The report lists the records that could not be processed and the reason for the error. The record will be processed when the error is corrected.

See [Working with OTHR_ASYNC Status Messages](#) for a complete description of the error messages you may encounter and the steps necessary to correct the error.

Order #: The order number for which the error occurred.

- Ship to: The ship-to suffix of the order for which the error occurred.
- Order date: The date on which the order was entered.
- User: The User ID of the operator who entered the order.
- Update area: The message describing the reason for the error. See [Working with OTHR_ASYNC Status Messages](#).
- Error ID: The ID number assigned to the error. See [Working with OTHR_ASYNC Status Messages](#).

Updates During Background Processing

Purpose: The system performs the following field and table updates during the OTHR_ASYNC procedure:

Function	Field
Update the SKU/Offer table	
---	<ul style="list-style-type: none"> • SKU CWI work field • SKU on order for PO Threshold values include: <ul style="list-style-type: none"> • Number and dollar value for Held POs • Number and dollar value for Units of Suspense Inventory • Number and dollar value for PO Receipts in Suspense
Update the Item/Warehouse table	
---	On order quantity
Update PO Layering table	
PO Maintenance + PO Receipts	Creates the record Open quantity
PO Receipts	Status Note: If you receive inventory into a pending putaway warehouse, the system keeps the PO layering record in an open status until the inventory is moved out of the pending putaway warehouse. See Pending Putaway Overview .
---	Warehouse
---	Due date
Update the Vendor/Item table	
PO Receipts	Shipments - LTD
---	Elapsed days - LTD
---	Late days - LTD
---	Number of late shipments
---	Defects - LTD
---	Undershops
---	Overships
---	Units received - LTD
PO Maintenance	Dollar value purchased - LTD
---	Units purchased - LTD
Update Vendor table	
---	Dollar value cancelled
---	Dollar value held
---	Dollar value open
---	Number of POs - LTD
---	Number of open POs
Update Vendor History table	
---	Dollar value purchase orders
---	Number of purchase orders

Function	Field
Update the Buyer table	
---	Dollar value POs - LTD
---	Number of purchase orders - LTD
Update Vendor Extended table	
---	Dollar value on order
Update IL Outbound Trigger Table	
PO Maintenance	Creates ITW outbound trigger records when you create a purchase order or maintain an open purchase if the Include PO Updates (J93) system control value is selected. See Generic Inventory Download API for an overview and details. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)

Running Period End Processing

Topics in this part:

- [Working with Periodic Functions \(WPER\)](#) describes working with the functions you can include in your periodic processing.
- [Working with Periodic Processes \(WPPR\)](#) describes how to create, change, delete or display a periodic process.
- [Executing Periodic Processes \(EPRO\)](#) describes how to set up and execute a periodic process.
- [Working with Periodic Process History \(WPHS\)](#) presents the screens you use to review periodic process history.
- [Purge Periodic Process History \(MPPR\)](#) describes how to purge periodic process history in a completed status for all Order Administration companies prior to a specified date.
- [Printing the Tax Jurisdiction Report \(PTXJ\)](#) describes how to run this report and presents a sample.
- [Releasing Orders from Time Hold](#) describes the RLSTIME periodic function.
- Working with the Marketing Download Extract describes how to download order, customer, source code, and vendor information from Order Administration to the DMT system.
- [Using the Financial Data Interface](#) describes how to extract information to the Financial Sales Download table.

Releasing Orders from Time Hold

Purpose: Use the Release Orders on Time Hold (RSLTME) function to release prepaid orders from hold automatically when the number of days to hold the order (in the Hold days field in the Pay Type table) has passed, and to release orders held for credit card authorization.

Prepaid orders: When this job runs, the system checks all open prepaid orders (pay category Cash/Check) to see if the hold days have expired. The system holds prepaid orders automatically for a certain number of days to ensure that the checks clear (you define the hold days in the Pay Type table). The system places these orders on TM hold (Time Hold), which is a system-level hold. Once the checks have cleared, these orders are eligible for pick slip preparation, unless they are on hold for some other reason. By running this program, you have the system release the eligible orders automatically, so you do not have to release them one-by-one.

See [Working with Pay Types \(WPAY\)](#) for information on setting up the Pay Type table.

Credit card orders: This job also evaluates orders placed on hold because of a declined credit card. You can specify a number of days to hold an order based on the response you receive from an authorization service; for example, if a credit card is declined because the customer is over a credit limit, it is unlikely that the customer's credit situation will change significantly in a single day. In this situation, you might set up this vendor response to hold such orders for five days before making these orders eligible for pick slip preparation and attempting authorization again.

Orders that are on hold because of a declined credit card have an order hold reason of AT (failed authorization). See [Working with Credit Card Cancellations \(WCCC\)](#) for a discussion on managing declined authorizations using Order Administration.

Pick slip preparation: When you release an order from hold, the system removes any pick slip preparation that has been applied to the order and then reevaluates the order for pick slip preparation; see [Preparing Orders for Pick Slip Generation](#).

In this topic:

- [Orders Released from Time Hold Report](#)

Define as periodic function: You must define RSLTME as a periodic function with [Working with Periodic Functions \(WPER\)](#).

Sample setup: Enter the following at the [Create Periodic Function Screen](#):

- Function: RLSTIME
- Description: Release Orders on Time Hold
- Company parameter: Y
- Appl area: C/S
- Program name: CSR0557

Add to DAILY periodic process: Next, at the [Work with Periodic Functions Screen](#), select Functions to add this periodic function to your daily periodic process.

Released orders report: The system prints the [Orders Released from Time Hold Report](#) automatically when you execute the Daily Periodic Process, which includes the Release Orders from Time Hold job. If the order is still on user hold, the system displays the user hold reason on the report.

Order history for release: The system logs messages to the Order History table automatically for orders placed on and released from time hold. Select Order History in standard Order Inquiry to advance to the Display Order History screen. This information is also available in streamlined Order Inquiry by selecting History.

History messages: Two messages are logged for orders placed on Time Hold (TM type hold) or credit card hold (AT). The first message is logged automatically when the system places the order on hold.

The second message is logged automatically when the system releases the order after the hold days expire. This message contains:

- the date the order was released from TM or AT hold (although it may remain on hold for other reasons)
- the type of transaction, which is R for "release"
- a transaction note, which identifies the type of activity performed
- the dollar amount of the order
- the user ID of the person who started the periodic process

Using the System Utilities

Topics in this part: The following topics describe the utilities available in the system that are typically used only by the System Administrator.

- [Working with Default Options \(WDFT\)](#) describes how to work with predefined field or program defaults.
- [Consolidating Order Billing History \(MOBH\)](#) describes how to consolidate order billing history.
- [Working with Inventory Resets](#) describes the options available to reset inventory levels when they become out of synch.
- [Reset Allocation Quantities \(MRPC\)](#) describes how to reset the printed quantities for orders.
- [Reset Reserve Quantity \(MRQR\)](#) describes how to reset the reserved quantity of items in inventory.
- [Reset Back Order Quantity \(MRBO\)](#) describes how to reset the backorder quantity of items in inventory.
- [Reset Item Warehouse Quantity On Hand \(MRIW\)](#) describes how to reset the quantity on-hand for each Item Warehouse record based on the total quantities on-hand.
- [Reset SKU Open Order Quantity \(MRSO\)](#) describes how to reset the fields in the SKU table based on the current open orders for the SKU.
- [Unlocking a Stranded Order or Batch \(MULO\)](#) describes how to unlock an order or batch that became locked during processing or maintenance.
- [Resetting the Order Billing History Table \(ROBH\)](#) describes how to reset the Order Billing History table based on the records in the Order Detail table.
- [Resetting Customer Sold To Amount On Order \(RONO\)](#) describes how to reset the On order amount field in the Customer Sold To Order History file so that it matches the amount of any existing open orders for the customer.
- [Unlock Purchase Order \(MUPO\)](#) describes how to reset locked purchase orders and reset the on-order quantities for Item Warehouse records.
- [Work with File Uploads \(WUPL\)](#) describes how to upload a file to a specified table in the Order Administration database.

Working with Inventory Resets

Purpose: Use the following inventory options to reset quantities when inventory levels become out-of-sync due to system problems:

- [Reset Allocation Quantities \(MRPC\)](#)
- [Reset Reserve Quantity \(MRQR\)](#)
- [Reset Back Order Quantity \(MRBO\)](#)
- [Reset Item Warehouse Quantity On Hand \(MRIW\)](#)
- [Reset SKU Open Order Quantity \(MRSO\)](#)

Note:

Do not run these resets when the Billing Async is active, or when you are running pick slip generation or performing inventory transaction processing. Also, do not run the Reserve Quantity Reset or Backorder Quantity Reset while creating or updating orders.

Working with File Imports

Purpose: Your options for uploading file data to Order Administration are:

- **File storage API:** Use the file storage API to import files for most types of imports, as well as deleting files that are no longer needed. See the [Available File Uploads](#) for details.
- The file storage API stages uploaded file data in the FILE_STORAGE database table. Upload processes point to the FILE_STORAGE table when retrieving data to update target database tables. See [File Storage API](#).
- The file storage API also supports exporting files. See [File Storage API](#).
- **Work with File Uploads (WUPL):** You can use this menu option to upload files. When you upload a file through this menu option, if the file contents need to first be placed in a staging database table before processing, the upload process populates the staging table with the file data. However, you cannot use this option for the [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\)](#) and [Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#).

Regardless of how the upload file contents are retrieved or staged, you then need to update the destination table in the Order Administration database with the uploaded data. The file layouts, edits, and periodic processes are the same, regardless of the method you use to upload the data.

In this topic:

- [File Upload Setup](#)
- [File Upload Process](#)
- [Populating the Upload File](#)
- [Processing File Uploads through Work with File Uploads \(WUPL\)](#)

- [Available File Uploads](#)
- [Purging Upload History](#)
- [Sample Upload Data](#)

File Upload Setup

Before you can use the file upload process, you must complete the required setup.

- [File Upload Properties](#)
- [Available File Uploads](#)

File Upload Properties

Order Administration uses the following properties to process a file upload.

Property Name	Description
FILE_STORAGE_MAX_SIZE Located in Working with Customer Properties (PROP) .	The maximum size, in bytes, of a file that can be uploaded to the FILE_STORAGE table. If a file's size exceeds this maximum, the API returns a 403 error and the upload fails. Uploaded files should be less than 1G in size, so this property should be set to 1073741824 or less.
CWDIRECTCP_UPLOAD_BATCH_SIZE Located in Working with Admin Properties (CPRP) .	Defines the number of records to process in an upload file at a time. The default setting is 2500, indicating the system inserts records from the upload file into the Order Administration database in batches of 2500. If a record in a batch contains an error, the system does not insert any of the records in the batch into the Order Administration database and places the upload file in an error status. For troubleshooting purposes, you can decrease the UPLOAD_BATCH_SIZE and reprocess the file upload to help you determine which record contains the error. Example: In this example, the CWDIRECTCP_UPLOAD_BATCH_SIZE is 10. You process an upload file containing 30 records. In this situation, the system processes the upload file in 3 batches: the first batch contains records 1-10; the second batch contains records 11-20; and the third batch contains records 21-30. If a record in the second batch fails, the system does not process any of the records in the second batch, but does process all of the records in the first batch and third batch.
CWDIRECTCP_USPS_UPLOAD_FILE Located in Working with Customer Properties (PROP) .	Defines the location of the USPS Zip Codes upload file.
STORE_FILE_PATH Located in Working with Customer Properties (PROP) .	Defines the path used for the Stores upload file. Note: This property is defined by Oracle and cannot be changed.

File Upload Process

The file upload process includes the following steps:

- [Populating the Upload File](#)

- Using the [File Storage API](#) or [Processing File Uploads through Work with File Uploads \(WUPL\)](#)
- Processing staged data: Some uploads, such as [Catalog Requests](#), initially populate an intermediate table in the database. For these uploads, you need to run an additional process to use the contents of the intermediate table to populate the destination table. Uploads that require the use of a staging table are described under [Available File Uploads](#).

Populating the Upload File

The file upload requires you to identify the file containing the data to upload to the Order Administration database. You can create an upload file by:

- creating your own text file, using a text editor or spreadsheet application, or
- copying the sample file upload data, pasting the data into a text editor, and saving it with the file extension .txt, unless otherwise indicated. See [Sample Upload Data](#).

Important:

In order to leave any field in an upload file blank, pass a space in an alphanumeric field and a 0 in a numeric field so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.

Processing File Uploads through Work with File Uploads (WUPL)

Run or schedule a file upload periodic function (see [Available File Uploads](#)) or use the Work with File Upload Screen to upload a file to a specified table in the Order Administration database.

RMFCS integration: You cannot use the Work with File Upload Screen to upload a file for the [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\)](#) and [Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#). See [Data Flow from RMFCS and RPCS to Order Administration](#) for a process overview.

Completing the Work with File Upload Screen

1. Use the File Name field to select the file to upload.
2. Use the File Type field to specify the type of upload to perform.
3. Select Submit File Upload.

File Upload Process

The system:

- Clears all records from the target table in the Order Administration database. **Note:** The system performs this step for each file type except Retail Integration Items.
- Moves the upload file to the directory defined in the CWDIRECTCP_UPLOAD_DIRECTORY property (CPRP); however, the USPS Zip Code Upload uses the CWDIRECTCP_USPS_UPLOAD_FILE directory, and the Sales Rep Upload uses the ASSOCIATE_FILE_PATH (CPRP).

 **Note:**

When you use Work with File Upload (WUPL), the upload file remains in this folder until you run the periodic function to populate the destination table, as described in the next step.

- Uses a bulk insert to load the records in the upload file into the specified table in the Order Administration database. The CWDIRECTCP_UPLOAD_BATCH_SIZE property defines the batch size used to process the records in the upload file. For example, if this setting is set to 2500, the system inserts records from the upload file into the Order Administration database in batches of 2500.

The Work with File Upload Screen displays the upload history record in the lower portion of the screen.

A Completed Status indicates all records in the file were processed successfully.

- An Error status indicates a record in the upload batch failed to upload to the database successfully. In this situation, the system does not insert any record in the batch into the Order Administration database. The system places the file upload in an Error status and a description of the first error encountered is assigned to the upload history record so that you can correct the error. Select View Error to display a description of the error that occurred during processing. The error description provides the upload batch number that failed to process.

 **Important:**

If you run the file upload process and an upload file does not exist to process, or if an error occurs during processing, the system will still clear the records in the associated Order Administration upload table. You must correct any errors and run the file upload process again to populate the associated Order Administration upload table.

Processing example: To import [Catalog Requests](#) through the file storage API:

1. Create or obtain the Catalog Request file named IXCRIN.txt. See the [Sample Catalog Requests Upload Data](#) for sample contents.
2. Use the Work with File Upload Screen to upload the IXCRIN.txt file.
3. This clears and populates the Catalog Request Interface table (IXCRIN). Also, the system creates a file upload record, viewable at the Work with File Upload Screen.
4. Use the Work with Catalog Request Interface (WCRU) menu option to process the records in the Catalog Request Interface table; see [Working with the Catalog Request Interface \(WCRU\)](#).

Troubleshooting the File Upload

Logging: During the file upload process, the system writes messages to the Trace log if its logging level is set to Debug or lower.

Example of log entries for successful file upload:

```
11:39:18,270 DEBUG TRACE - Upload started for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:39:18,293 DEBUG TRACE - Upload completed for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:39:18,293 DEBUG TRACE - Upload file processing started for /domain/
OMSFiles/File/Uploads/RIItemUpload50Records.txt
11:39:18,316 DEBUG TRACE - Upload file is RIItemUpload50Records.txt
11:39:18,434 DEBUG TRACE - Upload file processing ended for /domain/
OMSFiles/File/Uploads/RIItemUpload50Records.txt
11:39:48,814 DEBUG TRACE - Upload started for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:39:48,826 DEBUG TRACE - Upload completed for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:39:48,826 DEBUG TRACE - Upload file processing started for /domain/
OMSFiles/File/Uploads/RIItemUpload50Records.txt
11:39:48,840 DEBUG TRACE - Upload file is RIItemUpload50Records.txt
11:39:48,853 DEBUG TRACE - Upload path and file is /domain/OMSFiles/
File/Uploads/RIItemUpload50Records.txt
11:39:48,865 DEBUG TRACE - 10 RIItemUpload50Records.txt upload records
have been processed so far.
11:39:48,897 DEBUG TRACE - 20 RIItemUpload50Records.txt upload records
have been processed so far.
11:39:48,905 DEBUG TRACE - 30 RIItemUpload50Records.txt upload records
have been processed so far.
11:39:48,912 DEBUG TRACE - 40 RIItemUpload50Records.txt upload records
have been processed so far.
11:39:48,916 DEBUG TRACE - 49 RIItemUpload50Records.txt total upload
records were processed.
11:39:48,923 DEBUG TRACE - Upload file processing ended for /domain/
OMSFiles/File/Uploads/RIItemUpload50Records.txt
```

Example of log entries for failed file upload: If an error occurs during processing, the log indicates which batch did not process successfully. Notice in this example, the third batch of records did not process.

```
11:41:17,811 DEBUG TRACE - Upload started for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:41:17,820 DEBUG TRACE - Upload completed for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:41:17,820 DEBUG TRACE - Upload file processing started for /domain/
OMSFiles/File/Uploads/RIItemUpload50Records.txt
11:41:17,833 DEBUG TRACE - Upload file is RIItemUpload50Records.txt
11:41:17,861 DEBUG TRACE - Upload file processing ended for /domain/
OMSFiles/File/Uploads/RIItemUpload50Records.txt
11:41:44,814 DEBUG TRACE - Upload started for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:41:44,824 DEBUG TRACE - Upload completed for /domain/OMSFiles/File/
Uploads/RIItemUpload50Records.txt
11:41:44,824 DEBUG TRACE - Upload file processing started for /domain/
OMSFiles/File/Uploads/RIItemUpload50Records.txt
11:41:44,837 DEBUG TRACE - Upload file is RIItemUpload50Records.txt
11:41:44,847 DEBUG TRACE - Upload path and file is /domain/OMSFiles/
```

```
File/Uploads/RIItemUpload50Records.txt
11:41:44,863 DEBUG TRACE - 10 RIItemUpload50Records.txt upload records have
been processed so far.
11:41:44,871 DEBUG TRACE - 20 RIItemUpload50Records.txt upload records have
been processed so far.
11:41:44,957 DEBUG TRACE - 49 RIItemUpload50Records.txt total upload records
were processed.
11:41:44,977 DEBUG TRACE - Upload file processing ended for /domain/OMSFiles/
File/Uploads/RIItemUpload50Records.txt
```

Error processing: If any record in an upload batch is in error, the system does not insert any record in the batch into the Order Administration database. The system places the upload batch in an error status and a description of the first error encountered is assigned to the associated upload history record so that you can correct the error. You can select View Error to display a description of the error that occurred during processing.

If you are unable to determine which record in the upload batch is in error, you can decrease the batch size defined for the CWDIRECTCP_UPLOAD_BATCH_SIZE setting in the CWDirectCP Properties file and reprocess the records in the batch to narrow down the record that is in error. For example, if you normally process a batch size of 2500 records, for troubleshooting purposes, you can temporarily change the batch size to 10 and reprocess. The system will process the records in the upload file in batches of 10 records and fail the upload batch that contains the error. In this example, only 10 records will exist in the batch to help you determine where the error occurred.

 **Note:**

The system places the upload batch in an error status for the first error encountered. When you reprocess the upload file after correcting the error, the file may be placed in an error status again if another error is found during processing.

Error related to large batch size: An upload file is placed in an error status with the error message Stopped waiting for file to upload when a large file does not transfer from a user's local machine to the Order Administration application server within 20 minutes. To correct this issue, upload the file in smaller sections to accommodate the slow upload speed or get a faster internet connection.

Other possible errors: A file upload might also fail because:

- There is a blank line at the end of the file.
- The file is not UTF-8 encoded.

Available File Uploads

Upload steps: You can upload records to the following tables in the Order Administration database. Use the processing steps listed below to upload the data in a text file and then process the file data to populate the target table.

Using file storage API: The steps listed below under To Process for each upload assume that you have used the putFile web service method to upload the file. The file content is staged in the OMS-IMPORT container of the FILE_STORAGE table. See [File Storage API](#) for background. You will need to then run the periodic functions listed below for each upload in order to use the record in the FILE_STORAGE table to update to the target table.

Example: After you upload the PO Layering file record to the FILE_STORAGE table, run the UPPOLAY Upload PO Layering File (Program name PFR0134, Parameter POLAYR) periodic function to upload a PO Layering file named POLAYR.txt to the PO Layering table (POLAYR).

Staging table? Some of the uploads listed below initially update a staging table, and require an additional step to use the staged data to update the target table. Others can update the target table directly from the contents of the uploaded file without the use of a staging table.

Periodic processes: Some of file uploads listed below require the use of two periodic functions for processing. For example, to run the Customer Price Group Exclusions upload, you need to first run the CPGIXUP periodic function, and then the CPGIXUP periodic function. You can set up a periodic process to run these two functions.

File Upload screen: Regardless of whether the file storage API is enabled for imports, you can accomplish file uploads from the Work with File Upload Screen for each of the uploads listed below, with the exception of the batch inventory overlay import. In most cases, the upload from this screen also executes the required periodic function to process the uploaded data.

See [File Upload Process](#) for instructions on using the File Storage process or the upload from the CWDIRECTCP_UPLOAD_DIRECTORY.

File Type	Order Administration Upload Table	To Process	Sample Upload Data
ACS Tape	ACS Tape table (CSACST)	<p>After using the putFile method to upload the file (File Storage API), run the UPACSTP Upload ACS Tape File (Program name PFR0134, Parameter CS ACST) periodic function to upload an ACS Tape file named CSACST to the ACS Tape table (CSACST).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the ACS Tape file.</p> <p>Update target table: After populating the ACS Tape table, you must use the Process Address Changes (PACS) menu option, selecting an Input File Type of ACS, to process the records in the ACS Tape table; see Loading Address Updates.</p>	Sample ACS Tape Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
Batch Inventory Overlay Upload	N/A: updates the Item Location table directly	After using the putFile method to upload the file (File Storage API), run the INVOVRL periodic function. Processing File Uploads through Work with File Uploads (WUPL) is not supported for the batch inventory overlay upload.	See <i>Batch Inventory Overlay Upload</i> . For more information see the <i>Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)</i> .
Catalog Requests	Catalog Request Interface table (IXCRIN)	After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPCATRQ Upload Catalog Request File (Program name PFR0134, Parameter IXCRIN) periodic function to upload a Catalog Request file named IXCRIN to the Catalog Request Interface table (IXCRIN). Note: This step is not necessary if you use the Work with File Upload Screen to upload the Catalog Request file. Update target table: After populating the Catalog Request Interface table, you must use the Work with Catalog Request Interface (WCRU) menu option to process the records in the Catalog Request Interface table; see <i>Working with the Catalog Request Interface (WCRU)</i> .	Sample Catalog Requests Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
Cust Price Group Exclusions	Customer Price Group SKU Exclusion Upload Table (CUSTPGEUP)	<p>After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPCSTPG Upload Customer Price Group Exclusion File (Program name PFR0134, Parameter CUSTPGEUP) periodic function to upload a Customer Price Group Exclusion file named CUSTPGEUP to the Customer Price Group SKU Exclusion Upload table (CUSTPGEUP).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the Customer Price Group Exclusion file.</p> <p>Update target table: After populating the Customer Price Group SKU Exclusion Upload table, use the CPGIXUP Customer Price Group SKU Exclusion Upload periodic function (Program name PFRCPGEXUP) to process the records in the upload table; see Customer Price Group SKU Exclusion Upload.</p>	Sample Customer Price Group Exclusions Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
MBS Tape	MBS Tape table (CSMBST)	<p>After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPMBSTP Upload MBS Tape file (Program name PFR0134, Parameter CS MBST) periodic function to upload an MBS Tape file named CSMBST to the MBS Tape table (CSMBST).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the MBS Tape file.</p> <p>Update target table: After populating the MBS Tape file table, use the Process Address Changes (PACS) menu option to process the records in the MBS Tape table; see Loading Address Updates.</p>	Sample MBS Tape Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
PO Layering	PO Layering Table (POLAYR)	<p>After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPPOLAY Upload PO Layering File (Program name PFR0134, Parameter PO LAYR) periodic function to upload a PO Layering file named POLAYR.txt to the PO Layering table (POLAYR). Once the records are uploaded to the PO Layering table, the process uses the newly uploaded records to update the due date and backorder quantity for order lines on backorder.</p> <p>Note: When you run purchase order layering, the system clears the PO Layering table and rebuilds it based on the purchase order records that are uploaded to the table. In order to ensure accurate updates, you must upload the PO Layering table with ALL open purchase orders every time you perform an upload.</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the PO Layering file. See Purchase Order Layering.</p>	Sample PO Layering Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
Price Codes	Price Code Upload Table (PriceCdUpload)	<p>After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPPRCCD Upload Price Code File (Program name PFR0134, Parameter PRICECDUPLOAD) periodic function to upload a Price Code file named PRICECDUPLOAD to the Price Code Upload Table (PriceCdUpload).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the Price Code upload file.</p> <p>Update target table: You must run the PCUPLD Price Code Upload periodic function (Program name PFPRCCODUP) to process the records in the Price Code Upload table; see Price Code Upload.</p>	Sample Price Codes Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
Promotions	Promotion Upload Table (PRMUPLD)	<p>After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPPROMO Upload Promotion Code File (Program name PFR0134, Parameter PRMUPLD) periodic function to upload a Promotion file named PRMUPLD to the Promotion Upload Table (PRMUPLD).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the Promotion upload file.</p> <p>Update target table: You must run the PRMOUPL Create or Delete Promotions periodic function (Program name PRMOUPL) or use the Work with Promotion Values (WPRO) menu option to process the records in the Promotion Upload table; see Promotion Upload.</p>	Sample Promotions Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
Retail Integration Items	<p>RI Item Upload Table (RIIUPP)</p> <p>Note: You cannot use the UPRITEM Upload Retail Item File (Program name PFR0134, Parameter RIUPP) periodic function or the Work with File Upload Screen to process imports from RMFCS, although completed RMFCS imports are listed at the Work with File Upload screen. See Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration for background.</p>	<p>After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPRITEM Upload Retail Item File (Program name PFR0134, Parameter RIUPP) periodic function to upload a Retail Integration Item file named RIIUPP to the RI Item Upload Table (RIIUPP).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the Retail Integration Item file.</p> <p>Update target table: After uploading the file, run the RIUPLD Retail Integration Item Upload periodic function (Program name PFR0084) or use the Work with Retail Integration Item Upload (RIIU) menu option to process the records in the RI Item Upload table; see Working with Retail Integration Item Upload (RIIU).</p> <p>Note: You cannot use the Work with File Upload Screen to process item information from Oracle Retail Merchandising Foundation Cloud Service (RMFCS). See Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration for information on how to import item information from RMFCS.</p>	Sample Retail Integration Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
Sales Associates	Salesman Associate File	<p>After using the putFile method to upload the file, run the SLSUPLD (Program name PFR0109) periodic function to update the target table; see Salesman Associate Upload.</p> <p>This step is not necessary if you use the Work with File Upload Screen to upload the Salesman Associate file to the ASSOCIATE_FILE_PATH (CPRP).</p> <p>File name: The name of the file must start with SR and have a .TXT file extension; for example: SR00001.TXT and SR00002.TXT. If there are multiple eligible files, they are processed sequentially based on file name; SR00001 processes before SR00002. If you use the file storage API for imports, you can upload a zip file that contains a single text file with the same name, for example: SR00001.ZIP containing a text file named SR00001.TXT. See Salesman Associate Upload for more information.</p> <p>Note: The SLSUPLD periodic function uses the folder defined in the ASSOCIATE_FILE_PATH (CPRP) rather than the CWDIRECTCP_UPLOAD_DIRECTORY.</p>	Sample Sales Associates Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
Source Codes	Source Upload Table (IXSRCE)	<p>After using the putFile method to upload the file (File Storage API) or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPSRCCD Upload Source Code File (Program name PFR0134, Parameter IXSRCE) periodic function to upload a Source Code file named IXSRCE to the Source Upload Table (IXSRCE).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the Source Code file.</p> <p>Update target table: You must use the Work with Source Code Upload (WSRW) menu option to process the records in the Source Code Work table; see Generating Source Codes Using the Source Upload Table (WSRW).</p>	Sample Source Codes Upload Data
Stores	Store File	<p>File upload: Use the Work with File Upload Screen to upload the Store file to the STORE_FILE_PATH. The file name must begin with ST and have a .TXT file extension; see Store Upload.</p> <p>Update target table: Run the STRUPLD periodic function. This function uses the folder defined in the STORE_FILE_PATH rather than the CWDIRECTCP_UPLOAD_DIRECTORY.</p> <p>Note: Uploading the Store file through the file storage API is not currently supported.</p>	Sample Stores Upload Data

File Type	Order Administration Upload Table	To Process	Sample Upload Data
USPS Zip Codes	USPS Zip Codes Upload	<p>Use the putFile method to upload the file if you are using the File Storage API; otherwise, place the file in the CWDIRECTCP_UPLOAD_USPS_UPLOAD_FILE and use the Work with File Upload Screen to upload the USPS Zip Codes file.</p> <p>Update target table: After uploading the file, use the Load USPS Zip Code File (LZPS) menu option to process the uploaded file.</p> <p>The file name must be ctystate.txt, and file name matching is case-sensitive.</p> <p>See Fields in the USPS Zip/City/State Table and Fields in the USPS Zip/City/State Table for background.</p>	Sample USPS Zip Codes Upload Data
Vendors	Vendor Upload Table (VNDUPL)	<p>After using the putFile method to upload the file (File Storage API), or placing the file in the CWDIRECTCP_UPLOAD_DIRECTORY, run the UPVENDR Upload Vendor File (Program name PFR0134, Parameter VNDUPL) periodic function to upload a Vendor file named VNDUPL to the Vendor Upload Table (VNDUPL).</p> <p>Note: This step is not necessary if you use the Work with File Upload Screen to upload the Vendor Upload file.</p> <p>Update target table: After uploading the file, run the VNDUPLD Vendor Upload periodic function (Program name PFR0086) or use Working with Vendor Upload (LVUP) to process the records in the Vendor Upload table.</p>	Sample Vendors Upload Data

Purging Upload History

PURGEUP: Run the PURGEUH Purge Upload History Table (program name PFR0126) periodic function to purge Upload History records that are older than the number of days specified in the Parameter field. If the Parameter field is blank or 0, records must be 21 days old to be eligible for purge.

Sample Upload Data

You can use the sample upload data below as a starting point to creating your own upload file by copying the sample file upload data, pasting the data into a text editor, and saving it with the file extension .TXT, unless otherwise indicated.

! Important:

In order to leave any field in an upload file blank, pass a space in the field so that the file can be processed without errors. Leaving a field with no space is interpreted as null in the database and causes errors.

Setting Up Authorization Services

Topics in this part: The following topics describe the functions available to define the credit card authorization services that your company uses.

- [Reprocess Authorizations Screen \(RPAA\)](#)
- [Reprocess Drop Ship Authorizations Screen \(RPDS\)](#)
- [Working with Required Responses \(WREQ\)](#)
- [Reset Authorizations \(RSAA\)](#) describes how to reset records in the Credit Card Authorization Transaction table from a *SENT status to a *RDY status so that they can be resent to the authorization service.
- [Defining Authorization Services \(WASV\)](#) shows you how to define the authorization services that your company uses.
- [Defining Authorization Service Countries](#) shows you how to cross-reference your country codes to the country codes used by the service bureau. You can also indicate whether the service bureau performs address verification for the country.
- [Defining Vendor Paytype Codes](#) shows you how to cross-reference your payment codes to the payment codes used by the service bureau.
- [Defining Vendor Response Codes](#) shows you how to define the codes your service bureau uses to identify whether a credit card is approved or declined, and how to have the system place orders on hold based upon the vendor response code.
- [Defining Merchant ID Overrides](#) describes how to set up merchant ID overrides for different entities within your company.
- [Defining Authorization Service Currencies](#) describes how to set up cross references for your company's currency codes and the codes used by a service bureau.
- [Performing Online Credit Card Authorizations](#) provides an overview on online credit card authorization and required setup.
- [Performing Batch Authorization \(SATH\)](#) describes how to send credit cards up for batch authorization by the associated ship via.
- [Printing the Online Credit Card Authorization List \(PATL\)](#) describes how to print the Online Authorization Listing.

Defining Authorization Services (WASV)

Purpose: Use the Work with Authorization Services menu option to:

- define the service bureaus that you use, such as:
 - Authorization services, to authorize charges against a credit card or stored value card.
 - Authorization/Deposit services, to authorize card charges and receive deposit amounts.
 - Deposit services, to provide settlement for card payments.
- identify the type of service the service bureau performs
- define the parameters that identify your company to the service bureau
- define the information necessary to connect, transmit, and receive data to and from the service, such as:
 - country codes
 - valid pay types
 - response codes (vendor responses, AVS responses, and CID responses)
 - currency codes
 - merchant IDs for individual entities within your company
 - whether the order originated as an internet order

Some of the information required to establish a service bureau on your system is provided by the service bureau. For example, each service bureau will assign you a unique password.

You can use the same service bureau to process your authorizations and deposits, or you can use one service for authorizations and another for deposits.

Important:

Use the Payment Configurations option in Modern View to configure or work with any payment processing through EFTConnect. You would use Work with Authorization Services in Classic View only for other authorization services, such as for stored value cards (gift cards). You cannot create, change, or delete an authorization service that uses EFTConnect through the Work with Authorization Services option in Classic View.

In this topic:

- [Deferred/Installment Pay Plans](#)
- [Identifying Internet Orders](#)
- [Work with Authorization Services Screen](#)
- [First Create Authorization Services Screen](#)
- [Second Create Authorization Service Screen](#)

- [Work with External Authorization Service Screen](#)

Deferred/Installment Pay Plans

Deferred or installment pay plans allow you to process deposits against orders at various intervals after you bill the order shipment. For example, you could offer “no payment for 60 days” or “four easy payments” to your customers.

In order to set up deferred or installment pay plans, you must have the [Deferred and Installment Billing \(F51\)](#) system control value must be selected. See [Deferred/Installment Billing Overview](#) for more information on deferred and installment pay plans and how to set them up in Order Administration.

Identifying Internet Orders

An internet order is determined in one of two ways:

- If using the [E-Commerce Interface](#) the system loads an I in the Internet field on the order header when the order is created in Order Administration.
- An order is considered an internet order if the order type on the order matches the [E-Commerce Order Type \(G42\)](#) system control value.
- Mail = Mail order.
- Phone = Telephone order.
- Internet = Web order.

To determine where the order originated, the system:

- looks at the value in the Internet order field in the Order Header table. If this field is set to I, the order is a web order.
- determines if the order type for the order matches the E-Commerce Order Type (G42) system control value. If the order type matches, the order is a web order.
- looks at the Forecasting order category field in the Order Type table. If this value is 1, the order is a mail order. If this value is 2, the order is a phone order.

Work with Authorization Services Screen

How to display this screen: Enter WASV in the Fast path field at the top of any menu screen or select Work with Authorization Services from a menu.

Field	Description
Code	The code to identify the service bureau. Enter a full or partial code and select OK to display service codes in alphanumeric order, starting with your entry. Alphanumeric, 3 positions; optional.
Application	The type of activity performed by the service bureau. Valid values are: <ul style="list-style-type: none"> • Auth/Deposit = The service bureau authorizes card charges and deposits dollar amounts billed to cards • Authorization = The service bureau only authorizes card charges. • Deposit = The service bureau only deposits dollar amounts billed to cards. Optional.

Field	Description
Description	The name of the service bureau. Alphanumeric, 30 positions; optional.
Merchant	The account number assigned by the service bureau to identify transmissions to/from your company. This is the default ID number; you can also specify separate ID numbers for each entity in your company, and/or to use for orders using deferred or installment billing. Alphanumeric, 20 positions; optional.

Screen Option	Procedure
Change an authorization service record	Select Change for a service to advance to the Change Authorization Services Screen. At this screen you can change any information except the Service code. See the First Create Authorization Services Screen for field descriptions. Important: You cannot use this option to change an existing authorization service using EFTConnect. Use the Payment Configurations option in Modern View instead.
Delete an authorization service record	Select Delete for a service to delete it. Important: You cannot use this option to delete an existing authorization service using EFTConnect. Use the Payment Configurations option in Modern View instead.
Display an authorization service record	Select Display for a service to advance to the Display Authorization Services Screen. You cannot change any information at this screen. See the First Create Authorization Services Screen for field descriptions.
Work with country codes	Select Country for a service to add, change or delete the country codes recognized by the service bureau; see Defining Authorization Service Countries .
Work with vendor paytype codes	Select Paytypes for a service to add, change, delete or display the pay type codes recognized by the authorization service. See Defining Vendor Paytype Codes .
Work with vendor responses	Select Responses for a service to add, change, display or delete the response codes you receive from the service and the actions to take for each. See Defining Vendor Response Codes .
Work with merchant ID overrides based on entity	Select Merchant ID Override for a service to add, change, or delete merchant ID overrides by entity. See Defining Merchant ID Overrides .
Work with currency codes	Select Currency for a service to add, change, or delete cross-references between the currency codes used in your company and by the authorization service. See Defining Authorization Service Currencies .
Work with external authorization service settings	Select External Service to advance to the Work with External Authorization Service Screen . External Authorization Service Access (B25) authority is required.

Screen Option	Procedure
Create an authorization service	Select Create to advance to the First Create Authorization Services Screen . Important: You cannot use this option to create an existing authorization service using EFTConnect. Use the Payment Configurations option in Modern View instead.

First Create Authorization Services Screen

Purpose: Use this screen to define a service bureau on your system. The Authorization Service record contains information that identifies your company to the service bureau and the parameters that you must include in the transmission to the service bureau.

Each service bureau requires its own information. Not all fields are applicable for each service.

Important:

You cannot use this screen to create a new authorization service using EFTConnect. Use the Payment Configurations option in Modern View instead.

How to display this screen: Select Create at the [Work with Authorization Services Screen](#).

Field	Description
Service Code	The code to identify the service bureau. Foreign credit cards: In order to process foreign credit cards separately at billing, you must define a deposit service with a code of PRE, and then define PRE as the deposit service in the Pay Type table. See Processing Auto Deposits (SDEP) for more information on setting up a different process for foreign credit cards. Point-to-Point communication: If you are using point-to-point communication, the Service code must be a specific value for the integration: <ul style="list-style-type: none"> Oracle Retail Customer Engagement integration: To use the Customer Engagement Stored Value Card Integration, enter RLT. Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Application	The type of activity performed by the service bureau. Valid values are: <ul style="list-style-type: none"> Auth/Deposit = The service bureau authorizes card charges and deposits dollar amounts billed to the cards. Authorization = The service bureau only authorizes card charges. Deposit = The service bureau only deposits dollar amounts billed to cards. Note: PayPal should have the Application type set to Auth/Deposit. Required.

Field	Description
Merchant ID	<p>The account number assigned by the service bureau to identify transmissions to/from your company. This ID is a default. You can also identify merchant IDs to use for depositing deferred or installment pay plans (as opposed to regular deposits) below. Similarly, you can set up overrides for different entities in your company, including deferred or installment overrides. See Defining Merchant ID Overrides.</p> <p>Note: You can enter upper and lower case letters in this field. Alphanumeric, 20 positions; optional.</p>
Charge description	<p>A description that identifies your company's product line or the type of service performed. Alphanumeric, 20 positions; optional.</p>
Deferred merchant ID	<p>The account number assigned by the service to identify transmission of deferred pay plan transactions for deposit. See Deferred/Installment Billing Overview for more information on deferred and installment billing, and see Processing Auto Deposits (SDEP) for more information on processing deposits.</p> <p>You can also set up overrides for different entities in your company, including deferred or installment overrides. See Defining Merchant ID Overrides. Alphanumeric, 20 positions; optional.</p>
Installment merchant ID	<p>The account number assigned by the service to identify transmission of installment pay plan transactions for deposit. See Deferred/Installment Billing Overview, and see Processing Auto Deposits (SDEP).</p> <p>You can also set up overrides for different entities in your company, including deferred or installment overrides. See Defining Merchant ID Overrides. Alphanumeric, 20 positions; optional.</p> <p>The service bureau assigns values to the following fields:</p>
Signon	<p>A code required to sign on to the service bureau. Case-sensitive. Alphanumeric, 10 positions; optional.</p>
Receiving code	<p>A code that identifies your company to the service bureau. Alphanumeric, 10 positions; optional.</p>
Password	<p>A password required by the service bureau. Case-sensitive. Alphanumeric, 10 positions; optional.</p>
Start up information	<p>Startup text that identifies your company to the service bureau. Alphanumeric, 10 positions; optional.</p>
Presenter's ID Auth / Deposit	<p>A code required to sign on to the service bureau. Separate fields allow you to define a presenter's ID for both batch authorization and deposit transactions; if you use the same port number for both batch authorization and deposit transactions, define the presenter's ID in the first field. Alphanumeric, 10 positions; optional.</p>
PID password Auth / Deposit	<p>A password required to sign on to the service bureau. Separate fields allow you to define a PID password for both batch authorization and deposit transactions; if you use the same port number for both batch authorization and deposit transactions, define the PID password in the first field. Alphanumeric, 10 positions; optional.</p>

Field	Description
Submitter's ID Auth / Deposit	<p>A code required to sign on to the service bureau. Separate fields allow you to define a submitter's ID for both batch authorization and deposit transactions; if you use the same port number for both batch authorization and deposit transactions, define the submitter's ID in the first field.</p> <p>Alphanumeric, 10 positions; optional.</p>
SID password Auth / Deposit	<p>A password required to sign on to the service bureau. Separate fields allow you to define a SID password for both batch authorization and deposit transactions; if you use the same port number for both batch authorization and deposit transactions, define the SID password in the first field.</p> <p>Alphanumeric, 10 positions; optional.</p>
Sub code	<p>A code required to sign on to the service bureau.</p> <p>Alphanumeric, 10 positions; optional.</p>
Exclude from FPO (Exclude from flexible payment option)	<p>Indicates whether to exclude orders associated with this service bureau from a deferred or installment pay plan. If an order includes any pay type whose authorization service has this field selected, the order is not eligible for a pay plan.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> Selected = exclude from pay plan Unselected = do not exclude from pay plan <p>See Deferred/Installment Billing Overview for information on how the system determines whether an order is eligible for a pay plan in order entry.</p>
Void auth at deposit	<p>Defines whether any unused portion of an authorization should be voided at deposit time for:</p> <ul style="list-style-type: none"> A credit card pay type, or A stored value card, when the External Payment Service is used. <p>Valid values are:</p> <ul style="list-style-type: none"> Selected = The system voids any unused portion of an authorization for a credit card pay type at deposit time. Order Administration will need to obtain an additional authorization for any subsequent deposits for the order. Unselected = The system retains any unused portion of an authorization for a credit card pay type at deposit time. <p>See Void Unused Authorization After Initial Deposit for processing details.</p> <p>Important: Your end payment processor must support split shipments for you to set this flag to N.</p> <p>Stored value card pay types when not using the External Payment Service: The setting of the Retain Unused Stored Value Card Authorization After Deposit (J21) system control value defines whether the system automatically voids a partially deposited stored value card authorization when the External Payment Service is not in use. See Stored Value Card Deposits for processing details.</p>

Field	Description
Send reversal	<p>Defines whether the service bureau supports authorization reversals for credit card and stored value card payments.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> Selected = The service bureau supports authorization reversal processing for credit card and stored value card pay types. Unselected = The service bureau does not support authorization reversal processing for credit card or stored value card pay types. <p>Regardless of the setting of this field, you can still perform stored value card authorization reversals when the card is deactivated; see Stored Value Card Authorization Reversal.</p>
Supports Auth Resubmission	<p>Indicates whether to resubmit failed authorization and deposit requests for credit cards through the External Payment Service. When the request is for authorization and deposit of a failed deposit request:</p> <p>CyberSource: The subsequentAuthReason in the authorization and deposit request is set to 1 if the Supports Auth Resubmission flag is selected; otherwise it is set to 3.</p> <p>Note: If the credit card number changes since the initial deposit request, then the subsequentAuthReason is set to 3, since it is not considered a subsequent authorization and deposit request.</p> <p>External Payment Service: The subsequentAuthReason is set to RESUBMIT; otherwise, if the Supports Auth Resubmission flag is not selected, the subsequentAuthReason is set to REAUTH.</p> <p>Important: Select this flag only if your payment processor supports merchant-initiated resubmission of failed deposits.</p>

Second Create Authorization Service Screen

Important:

You cannot use this screen to create a new existing authorization service using EFTConnect. Use the Payment Configurations option in Modern View instead.

How to display this screen: Select OK at the [First Create Authorization Services Screen](#).

Field	Description
Media type	<p>The method by which the data is transmitted to the service bureau.</p> <p>Valid value is Communication.</p> <p>Optional.</p>

Field	Description
Batch/Online	<p>A code that indicates whether transactions are transmitted to/received from the service bureau immediately (online) as each order is entered, or whether groups of transactions are transmitted to/received from the service bureau at predefined times during the day (in batch).</p> <p>Valid values are:</p> <ul style="list-style-type: none">• Batch = Transactions are grouped and transmitted to/received from the service bureau at predefined times throughout the day.• On-line = Transactions are transmitted to/received from the service bureau immediately for each order.• On-line or Batch = Transactions are transmitted to/received from the service bureau immediately if the order is eligible for online authorization. Any order that does not receive an authorization immediately is grouped and transmitted to/received from the service bureau at predefined times. <p>Optional.</p>
Active production system	<p>Indicates whether you are processing in a live environment (production) or in a testing environment.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• Selected = Transactions are being processed in a live environment.• Unselected = Transactions are being processed in a testing environment.
Installment billing?	<p>Indicates if the service bureau supports installment billing of credit cards. Installment billing plans are typically established for high cost items.</p> <p>Note: This field is informational only and is not used to set up an installment pay plan in Order Administration.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• Selected = The service bureau supports installment billing.• Unselected = The service bureau does not support installment billing.
Immediate response	<p>Indicates whether a response from the service bureau is received immediately for each authorization transaction.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• Selected = Responses from the service bureau are received immediately for each transaction.• Unselected = Responses from the service bureau are not received immediately (delayed turnaround).
Immediate deposit	<p>Indicates whether the service bureau sends a detailed response to Order Administration.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• Selected = The service bureau does not send a detailed response to Order Administration; Order Administration marks the transaction as received and subsequently confirmed.• Unselected = The service bureau sends a detailed response to Order Administration; Order Administration waits for the response based on the Wait time defined for the associated integration layer job.

Field	Description
Keep history information?	<p>Indicates whether transactions sent to the service bureau will be kept online. Typically, this feature is used in test environments.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> Selected = Keep the transaction records on-line. Unselected = Do not keep the transaction records on-line.
Selected for deposit	<p>Indicates whether the service bureau is included in the next deposit run. By default, all service bureaus are selected for deposit; however, you can remove a service bureau from the next deposit run at the Select Auth Service for Deposit Screen in Processing Auto Deposits (SDEP). Once you submit the deposit run, the system reselects all service bureaus for the next deposit run.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> Selected (default) = The system includes the service bureau in the next deposit run. Unselected = The system does not include the service bureau in the next deposit run. This field displays as unselected only if you are reviewing this screen at the same time a deposit run is submitted that does not include this service bureau. <p>Display-only.</p>
Address verification	<p>Indicates whether you will be using the Address Verification Service provided by the service bureau to verify the customer's address and credit card number.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> Selected = Perform address verification Unselected = Do not perform address verification
Decline days	<p>The number of days to hold a declined credit card charge on the system before sending it for an authorization again.</p> <p>This field is not implemented. See Defining Vendor Response Codes for setup information.</p> <p>Numeric, 3 positions; optional.</p>
Industry format code	<p>A code that is assigned by the service bureau to identify your company type. Use this field to enter your DBA number.</p> <p>Alphanumeric, 5 positions; optional.</p>
Primary authorization service	<p>The primary service bureau that the service bureau uses for its transmission setup. Orders sent to this service bureau are redirected to the primary service bureau defined in this field. If this field is left blank, the data created for this service bureau will be used.</p> <p>Alphanumeric, 3 positions; optional.</p>
Deposit phone #	<p>The telephone number associated with the deposit service bureau. Informational only.</p> <p>Numeric, 11 positions; optional.</p>
Authorization phone #	<p>The telephone number associated with the authorization service bureau. Informational only.</p> <p>Numeric, 11 positions; optional.</p>

Field	Description
Communication type	Indicates the method of communication used to transmit transactions between Order Administration and the service bureau. The only valid value is Payment Link, in which the system sends transactions to the service bureau using a point-to-point integration. You must define communication settings in Working with Customer Properties (PROP) . The system also uses the Activation and Authorization Reversal integration layer jobs to process stored value card triggers. Optional.
Response check frequency	Indicates the multiple to apply to the Response time to determine how long to wait for a response after a connection when you are using an external payment service. For example, if the Response check frequency is 6 and the Response time is 10,000, the system waits 60,000 milliseconds (60 seconds or 1 minute) for a response after connection. Note: If the total response interval is exceeded for an authorization record, the record goes into *RCVD status with a response type of SU, and is then removed from the Credit Card Authorization Transaction table (CCAT00). To avoid potential timeout issues, Oracle recommends that you set the Response Time high enough for the authorization service to prevent issues that could potentially occur if the authorization process times out while processing multiple authorizations for an order. Numeric, 3 positions; optional.
Test mode?	Indicates whether you are transmitting in test mode. Valid values are: <ul style="list-style-type: none"> Selected = Test mode. The system inserts the word TEST in the transmission. Unselected (default) = Live mode. This field is not implemented.
Response time	Indicates the number of milliseconds to wait for a connection to the service bureau when you are using an external payment service. For example, set this field to 10,000 milliseconds to wait 10 seconds for a connection. Numeric, 5 positions; optional.
Merchant division	Assigned by the authorization service. Numeric, 5 positions; optional.
Authorization service provider	This field is not implemented. Alphanumeric, 10 positions; optional.
API User name	The user name, provided by the service bureau, used to establish a direct connection to the service bureau. Alphanumeric, 64 positions; optional.
API Password	The password, provided by the service bureau, used to establish a direct connection to the service bureau. Alphanumeric, 64 positions; optional.
API Signature	The encrypted signature, provided by the service bureau, used to establish a direct connection to the service bureau. You can also define API credential information at the entity level using the Create Merchant ID by Entity Screen . Alphanumeric, 128 positions; optional.

Field	Description
Override Reconciliation Id	<p>Note: This field is available only for the CyberSource integration (if the Service Code is set to CYB).</p> <p>Indicates the value to pass as the reconciliationID in a debit deposit, credit deposit, or authorization and deposit request to CyberSource. Available settings are:</p> <ul style="list-style-type: none"> • blank (default) = Do not send the invoice number or the alternate order number as the reconciliation ID. • Invoice Number = Send the invoice number as the reconciliation ID. The invoice number is assigned at billing. • Alternate Order Number = Send the alternate order number, if it exists, as the reconciliationID. For an e-commerce order, the alternate order number is the order_number passed in the <i>Inbound Order XML Message (CWORDERIN)</i> message to identify the order in the originating system or on the web storefront. The alternate order number is labeled the Alt ord at the Display Order Properties Screen. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>If the reconciliationID in the request message does not specify an invoice number or alternate order number, then CyberSource assigns a reconciliationID as a reference number for the transaction, and passes it in the response message.</p> <p>Note:</p> <ul style="list-style-type: none"> • If the Alternate Order Number is passed as the reconciliationID, it must be alphanumeric. If the reconciliationID includes any special characters, depending on the rules or requirements of the back-end processor, CyberSource may ignore the ID provided in the request and assign its own reconciliationID, to be passed in the response. • Only the debit deposit, credit deposit, and authorization and deposit messages support sending the reconciliationID. CyberSource generates a reconciliationID during authorization, so as a result, there can be more than one reconciliationID associated with the deposit. • The supported size of the reconciliationID varies based on the credit card processor. You need to confirm that the credit card processor used supports the length and attributes of the invoice number or alternate order number. • It is possible that the reconciliationID from Order Administration may not be unique in CyberSource if, for example, you have multiple companies. • In the case of an authorization + deposit request, the reconciliationID is included in both the ccAuthService node as well as the ccCaptureService node. Otherwise, it is included only in the ccCaptureService node.

Instructions:

1. At the [First Create Authorization Services Screen](#), enter the [Service Code](#), [Application](#), [Merchant ID](#), [Charge description](#) and any other information required by the service bureau.
2. Select OK to advance to the [Second Create Authorization Service Screen](#).

- Continue entering all necessary information to set up the service bureau on your system.

Work with External Authorization Service Screen

Purpose: Information will be provided by Oracle at a later date.

How to display this screen: Select External Service for an authorization service at the [Work with Authorization Services Screen](#). [External Authorization Service Access \(B25\)](#) authority is required.

For more information: See the External Payment Layer RESTful Service reference on My Oracle Support for more information on updating these settings.

Note:

All fields are required, with the exception of the External Service flag.

Field	Description
External Service	Select this field to have request messages generated for the External Payment Service.
External URL Prefix	<p>The prefix that forms the beginning of the URL where messages are sent.</p> <p>Must begin with HTTPS.</p> <p>The message type defines the suffix that is appended to the prefix to create the entire URL. For example, for a credit card authorization request, the entire URL might be <code>https://remote.auth.com:1234/authorization</code>, where <code>remote.auth.com</code> is the remote server, <code>1234</code> is the port, and <code>authorization</code> identifies an authorization request.</p> <p>The following endpoints are supported:</p> <ul style="list-style-type: none"> balanceInquiry authorization reversal getToken generateGift activateGift rechargeGift deposit return <p>Alphanumeric, 600 positions; required if the External Service flag is selected.</p>
Message Version	<p>Indicates which message version is supported with version 3.0 being the default version when creating a new authorization service. Previous versions have been removed.</p> <p>Version 3.0 no longer includes tags that pass the credit card number for an order and instead includes tags that pass the card token. It also allows an external merchant application to call for both Credit Cards and Stored Value Cards supported through the External Payment Service and EFTConnect.</p>
Authentication User	<p>The user ID for authentication of the messages to the external service.</p> <p>Alphanumeric, 256 positions; required if the External Service flag is selected.</p>

Field	Description
Authentication Password	The password for authentication of the messages to the external service. Must be at least 6 positions long, include both numbers and letters, include a special character, and cannot end with a number. Alphanumeric, 256 positions; required if the External Service flag is selected.

Defining Authorization Service Countries

Purpose: Each service bureau that your company uses may assign its own country codes to the various credit card payment methods. These country codes may differ from the country codes your company uses.

The Authorization Service Country function is used to cross reference the country codes your company uses with the country codes the authorization and deposit service uses. By cross referencing the country codes:

- You can use your country codes when entering orders.
- The country code the service bureau uses can be included in the Authorization and Deposit transactions that are transmitted to the service bureau.
- When you create the country cross-reference, you can also indicate whether the service bureau performs address verification for the country.

Note:

Use this option if you are sending transactions to the service bureau using a point-to-point integration.

Authorization service country required for double-byte customer address: If the customer's address uses a double-byte language, such as Chinese, you need to set up an authorization service country record to support address verification.

In this topic:

- [Work with Authorization Service Country Screen](#)
- [Create Authorization Service Country Screen](#)

Work with Authorization Service Country Screen

Purpose: This screen displays the country cross references currently defined for the service bureau. Use this screen to create, change, or delete the country cross reference information.

The country codes your company uses are defined in the Country table; the country codes the service bureau uses are provided by the service bureau.

How to display this screen: At the [Work with Authorization Service Country Screen](#), select Country for the service bureau.

Field	Description
Authorization service	The code and description of the service bureau for which you are defining a country cross reference. Code: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 30 positions; display-only.
Country	A code you use to identify a country. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY) . Alphanumeric, 3 positions; optional.
Authorization Service Country	The code the service bureau uses to identify a country. Vendor country codes are provided by the service bureau. Alphanumeric, 3 positions; optional.
AVS	Defines whether the service bureau performs address verification for the country. N = The service bureau does not perform address verification for the country. Y = The service bureau performs address verification for the country. Alphanumeric, 1 position; display-only.

Option	Procedure
Create a country cross reference	Select Create to advance to the Create Authorization Service Country Screen .
Change a country cross reference	Select Change for the country cross reference to advance to the Change Authorization Service Country screen. At this screen you can change the Authorization service country and the Address verification setting. See the Create Authorization Service Country Screen for field descriptions.
Delete a country cross reference	Select Delete for the country cross reference to delete it.

Create Authorization Service Country Screen

Purpose: Use this screen to cross reference the country codes your company uses with the codes the service bureau uses. For example, your company may use country code USA to identify the United States of America, whereas the service bureau may use country code US.

The country codes your company uses are defined in the Country table; the country codes the service bureau uses are provided by the service bureau.

How to display this screen: Select Create at the [Work with Authorization Service Country Screen](#).

Field	Description
Authorization service	The code and description of the service bureau for which you are defining a country cross reference. Code: Alphanumeric, 3 positions; display-only. Description: Alphanumeric, 30 positions; display-only.

Field	Description
Country	A code you use to identify a country. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY). Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.
Authorization service country	The code the service bureau uses to identify a country. Vendor country codes are provided by the service bureau. Alphanumeric, 3 positions; required.
Address verification	Defines whether the service bureau performs address verification for the country. Unselected = The service bureau does not perform address verification for the country. Selected = The service bureau performs address verification for the country.

Defining Vendor Paytype Codes

Purpose: Each service bureau that your company uses may assign its own paytype codes to the various credit card payment methods. These paytype codes may differ from the paytype codes your company uses. For example, the service bureau may use paytype code 01 to represent payment by Visa, whereas, your company may use paytype code 04 to identify payment by Visa.

The Vendor Paytype Codes function is used to cross reference the paytype codes your company uses with the paytype codes the authorization service uses. By cross referencing the paytype codes:

- you can use your paytype codes when entering orders
- the paytype code the service bureau uses can be included in the Authorization and Deposit transactions that are transmitted to the service bureau.

In this topic:

- [Work with Paytype Cross Reference Screen](#)
- [Create CC Paytype Cross Reference Screen](#)

Work with Paytype Cross Reference Screen

Purpose: This screen displays the pay type cross references currently defined for the service bureau. Use this screen to create, change, delete, or display the pay type cross reference information.

The pay type codes your company uses are defined in the Pay Type table; the pay type codes the service bureau uses are provided by the service bureau.

How to display this screen: At the [Work with Authorization Services Screen](#), select Paytypes for the service bureau.

Field	Description
Pay type	A code you use to identify a method of payment on an order. Pay type codes are defined in the Pay Type table; see Working with Pay Types (WPAY) . Numeric, 2 positions; optional.
Vendor pay code	The code the authorization service uses to identify a method of payment. Vendor pay type codes are provided by the service bureau. Alphanumeric, 5 positions; optional.
Authorization Merchant #	The merchant number to use when sending authorization requests for this pay type code to the service bureau for approval. The merchant number is assigned to your company by the service bureau. Alphanumeric, 10 positions; optional.
Deposit merchant # (Deposit merchant number)	The merchant number to use when sending deposit requests for this pay type code to the service bureau for settlement. The merchant number is assigned to your company by the service bureau. Alphanumeric, 10 positions; optional.

Option	Procedure
Create a paytype cross reference	Select Create to advance to the Create CC Paytype Cross Reference Screen for the service bureau.
Change a paytype cross reference	Select Change for the pay type cross reference you want to change to advance to the Change Paytype Cross Reference Screen. At this screen you can change any information except the Authorization service and the Pay type code. See the Create CC Paytype Cross Reference Screen for field descriptions.
Delete a paytype cross reference	Select Delete for the pay type cross reference you want to delete.
Display a paytype cross reference	Select Display for the pay type cross reference you want to display to advance to the Display CC Paytype Cross Reference Screen. You cannot change any information at this screen. See the Create CC Paytype Cross Reference Screen for field descriptions.

Create CC Paytype Cross Reference Screen

Purpose: Use this screen to cross reference the pay type codes your company uses with the codes the service bureau uses. For example, your company may use pay type code 4 to identify payment by Visa, whereas the service bureau may use pay type code 1.

The pay type codes your company uses are defined in the Pay Type table; the pay type codes the service bureau uses are provided by the service bureau.

How to display this screen: Select Create at the [Work with Paytype Cross Reference Screen](#).

Field	Description
Pay type	The code you use to identify a method of payment on an order. Pay type codes are defined in the Pay Type table; see Working with Pay Types (WPAY) . Numeric, 2 positions. Create screen: required. Change screen: display-only.
Vendor paytype/code	The code the service bureau uses to identify a method of payment. Vendor pay type codes are provided by the service bureau. Alphanumeric, 5 positions; required.
Authorization merchant #	The merchant number to use when sending authorization requests for this pay type code to the service bureau for approval. The merchant number is assigned to your company by the service bureau. Alphanumeric, 10 positions; optional.
Deposit merchant #	The merchant number to use when sending deposit requests for this pay type code to the service bureau for settlement. The merchant number is assigned to your company by the service bureau. Alphanumeric, 10 positions; optional.

Instructions:

1. Enter the pay type code your company uses to identify the payment method in the [Pay type](#) field.
2. Enter the corresponding pay type code the service bureau uses to identify the payment method in the [Vendor pay code](#).
3. Optionally, enter the authorization and deposit merchant numbers assigned to your company by the service bureau in the [Authorization Merchant #](#) and the [Deposit merchant # \(Deposit merchant number\)](#) fields.
4. Your entries are cleared from the screen and a message similar to the following displays: CC Vendor Paytype Cross Reference (NAB - 5) created.

Defining Vendor Response Codes

Vendor response codes identify the reasons that the service bureau approves (authorizes) or declines a credit card charge or deposit. The codes are assigned to each transaction by the service bureau when approving or declining the request.

You should define each code for each service bureau you work with.

The system allows you to set up the following instructions for vendor response codes:

- how many times to attempt authorization for this response
- whether to put the order on hold and, if so, for how long
- whether to flag the order for cancellation

Online credit card authorizations: If you are sending credit cards for authorization during order entry/maintenance (the [On-line Authorizations \(B89\)](#) system control value is selected), the system displays additional fields where you can enter a message

indicating whether the credit card was approved or declined and if any action should be taken, such as asking the customer to repeat the credit card number or requesting a different credit card for authorization. If you define a message, the system displays the [Select Authorization Response Option Window](#) in order entry/maintenance when a response is received from the service bureau. This window displays the pop up window messages you defined for this vendor response. See [Performing Online Credit Card Authorizations](#) for an overview on online authorizations and the required setup.

Credit card decline email: If you specify a program in the [Credit Card Decline Email Program \(K53\)](#) system control value, the batch authorization process in pick slip generation generates an email to the customer when an order is placed on hold due to a credit card decline. See that system control value for more information.

Defining Vendor Response Codes

Entity Setup

Additionally, you can set up the following instructions for a vendor response code for each entity in your company:

- Whether a dollar limit is applied to the ship via on the order. If the authorization amount is less than the ship via dollar limit, the system releases the order from any AVS hold. If the authorization amount is greater than the ship via dollar limit, the system places the order on hold using the hold reason defined for the ship via dollar limit. See [Entity ship via dollar limits](#).
- Whether a dollar limit to force an authorization is applied to a specific pay type. See [Entity pay type dollar limits](#).

- Whether a dollar limit is applied to the item class associated with an item on the order that requires authorization. If the authorization amount is less than the item class dollar limit, the system releases the order from any AVS hold. If the authorization is greater than the item class dollar limit, the system places the order on hold using the hold reason defined for the item class dollar limit. See [Entity item class dollar limits](#).
- Whether a dollar limit is applied to the postal code for the bill to or sold to customer on the order. If the authorization amount is less than the postal code dollar limit, the system releases the order from any AVS hold. If the authorization amount is greater than the postal code dollar limit, the system places the order on hold using the hold reason defined for the postal code dollar limit. See [Entity postal code dollar limits](#).

Online authorization: If you are performing online authorization, the system does not evaluate the order for entity pay type dollar limit or entity ship via dollar limit; however, the system will evaluate the order for item class dollar limit and postal code dollar limit.

Entity dollar limit hierarchy: The system uses the following hierarchy when evaluating whether the order meets an entity dollar limit.

1. Evaluate the order for [Entity pay type dollar limits](#).
2. If the order does not qualify for entity pay type dollar limits, evaluate the order for [Entity ship via dollar limits](#).
3. If the order does not qualify for entity ship via dollar limits, evaluate the order for [Entity item class dollar limits](#).
4. If the order does not qualify for entity item class dollar limits, evaluate the order for [Entity postal code dollar limits](#).

If an order qualifies for more than one of the entity dollar limits, the system holds/releases the order using the last entity dollar limit that qualifies. For example, if the order qualifies for both entity ship via dollar limit and entity postal code dollar limit, the system holds or releases the order based on the entity postal code dollar limit setup.

Entity ship via dollar limits

You can set up a ship via dollar limit for an AVS response for each entity in your company. You can use the ship via dollar limit to reduce the amount of fraud. For example, a credit card may receive an AVS response of “all address matching,” but you may want to perform an additional check against the ship via assigned to the order and the dollar amount that requires authorization.

- If the authorization amount is less than the ship via dollar limit, the system releases the order from any AVS hold.
- If the authorization amount is greater than the ship via dollar limit and the sold to customer and ship to customer are different, the system places the order on hold using the hold reason defined for the ship via dollar limit.

The system checks the following information to determine if an order should go on hold due to a ship via dollar limit:

- the service bureau code
- the AVS response code received from the service bureau
- the Entity associated with the order
- the Ship via code on the order header

- the \$ limit to hold on the order
- the sold to customer and ship to customer are different
- The [Use Credit Card Vendor Response Entity Ship Via Dollar Limits \(F94\)](#) system control value is selected. If this system control value is not selected, the system does not perform an edit against the ship via dollar limit for an AVS response to determine if an order should go on hold.

The system does not evaluate the order for ship via dollar limit if:

- The order does not pass authorization, regardless of whether the ship to customer is different than the sold to customer.
- You are performing online authorization.

Entity ship via dollar limit summary:

AVS response	Entity \$ limit	Auth amount less than entity \$ limit	Auth amount greater than or equal to entity \$ limit
hold reason	no hold reason	The system releases the order from AVS hold. Order transaction history message: AVS HLD Release - Entity Via \$Limit.	The system places the order on hold, using the hold reason defined for the AVS response. Order transaction history message: SYS HLD - Declined Credit Card.
no hold reason	hold reason	The system does not place the order on hold.	The system places the order on hold, using the hold reason defined for the entity ship via dollar limit. Order transaction history message: SYS HLD - Declined Credit Card.
no hold reason	no hold reason	The system does not place the order on hold.	The system does not place the order on hold.
hold reason	hold reason	The system releases the order from AVS hold. Order transaction history message: AVS HLD Release - Entity Via \$Limit.	The system places the order on hold, using the hold reason defined for the entity ship via dollar limit. Order transaction history message: SYS HLD - Declined Credit Card.

Ship via dollar limit example: The following is an example of how to set up a ship via dollar limit for an AVS response code.

AVS Response	Description	Hold Reason Code
I3	All Address Matching	None

The following is an example of how to set up ship via dollar limit hold values:

AVS Response	Entity	Ship Via	\$ Limit	Hold Reason Code
I3	555	1	\$50.00	J3
I3	555	2	\$75.00	J4
I3	555	3	\$150.00	J5

Using the example, if an order passed AVS because it received an AVS response of I3, all address matching, the system would then perform an edit against the ship via dollar limit defined for the response.

If a ship via dollar limit was defined for the entity associated with the order, the ship via defined on the order, and the dollar amount on the order that required authorization was greater than the dollar limit defined for the AVS response, the order would then be placed on hold, using the hold reason code defined for the ship via dollar limit.

Using the example, the system would assign the hold reason code J3 to an order if the order was associated with entity 555, ship via code 1, and the dollar amount that required authorization was greater than \$50.00.

Entity pay type dollar limits

You can set up a pay type dollar limit for a vendor response for each entity in your company. You can use the pay type dollar limit to force authorizations that have been declined.

Example: If a credit card received a vendor response of "credit card exceeds limit", you may want to force the authorization through anyway if the dollar amount that requires authorization is less than \$50.00.

If you set up a pay type dollar limit, the order receives a forced authorization if:

- the credit card on the order is declined, and
- the dollar amount that requires authorization is greater than \$1.00 and is less than the pay type dollar limit you have set up for the credit card pay type on the order. **Note:** If you wish to force authorizations for credit cards requiring authorizations less than \$1.00, enter an authorization number in the [Authorization Number for Authorizations Under \\$1.00 \(I08\)](#) system control value.

In this situation, the order receives a forced authorization, and the system writes the [Default Credit Card Authorization Number for Soft Declines \(F93\)](#) to the Authorization number field on the Authorization History record. The system processes the authorization through Order Administration, as if the number that defaulted from the system control value was an actual authorization number. The order will be processed through pick slip generation and the system will produce pick slips for the order. The system also writes an order transaction history message indicating the authorization was forced.

If the Default Credit Card Authorization Number for Soft Declines (F93) system control value is blank, the order is placed on hold, using the vendor response hold reason code. If the hold reason code for the vendor response is blank, or a hold reason code has not been defined for the vendor response, the order is not placed on hold, and is processed through pick slip generation.

Note:

The system may still place the order on hold if it fails AVS authorization.

The system checks the following information to determine if an order should receive a forced authorization after it has been declined:

- the service bureau code

- the Vendor response code received from the service bureau
- the Entity associated with the order
- the credit card Pay type on the order that requires authorization

The system does not evaluate the order for pay type dollar limit if you are performing online authorization.

Note:

The system performs an edit against the pay type dollar limit defined for a vendor response before the number of authorization attempts logic. If the order passes the pay type dollar limit edit, the system does not perform the number of attempts edit against the order.

Entity pay type dollar limit summary:

Vendor response	Auth amount less than entity \$ limit to force auth	Auth amount greater than or equal to entity \$ limit to force auth
hold reason	The system does not place the order on hold. Order transaction history message: System Forced CC Auth - Auth# 999999.	The system places the order on hold, using the hold reason defined for the vendor response. Order transaction history message: SYS HLD - Declined Credit Card.

Pay type dollar limit example: This example shows how to set up a pay type dollar limit for a vendor response code.

Vendor Response	Description	Hold Reason Code
Vendor Response Value:		
42	Declined, card over limit	H4

Vendor Response	Entity	Pay Type	Dollar Limit
Pay Type Dollar Limit Values:			
42	555	4 VISA	\$50.00
42	555	5 MASTERCARD	\$75.00

Using the example, if an order did not pass authorization because it received a vendor response of 42, declined card over limit, the system would then perform an edit against the pay type dollar limit defined for the response.

If a pay type dollar limit was defined for the entity associated with the order, the pay type defined on the order, and the dollar amount on the order that required authorization was less than the dollar limit defined for the vendor response, the order would receive a forced authorization, using the Default Credit Card Authorization Number for Soft Declines (F93).

Using the example, an order would receive a forced authorization if the pay type on the order was VISA and the dollar amount for the VISA card was under \$50.00.

Entity item class dollar limits

You can set up an item class dollar limit for an AVS response for each entity in your company. You can use the item class dollar limit to reduce the amount of fraud. For example, a credit card may receive an AVS response of “all address matching”, but you may want to perform an additional check against the item class (such as high-theft items) assigned to one or more of the items on the order and the dollar amount that requires authorization.

- If the authorization amount is less than the item class dollar limit, the system releases the order from any AVS hold.
- If the authorization is greater than the item class dollar limit, the system places the order on hold using the hold reason defined for the item class dollar limit.

The system checks the following information to determine if an order should go on hold due to an item class dollar limit:

- the service bureau code
- the AVS response code received from the service bureau
- the Entity associated with the order
- the \$ limit to hold on the order
- the item class assigned to one or more of the items on the order requesting authorization

Note:

- The item(s) assigned to the item class must be requesting authorization. For example, if the item assigned to the item class is on backorder, the other items on the order requesting authorization will not qualify for the item class dollar limit.
- If more than one item class on the order qualifies for an item class dollar limit, the system uses the item class associated with the lowest order number. For example, if order line 1 is associated with item class PNT and order line 3 is associated with item class ELC and both qualify, the system uses the item class dollar limit defined for item class PNT.

The system does not evaluate the order for item class dollar limit if the order does not pass authorization.

Entity item class dollar limit summary:

AVS response	Entity \$ limit	Auth amount less than entity \$ limit	Auth amount greater than or equal to entity \$ limit
hold reason	no hold reason	The system releases the order from AVS hold. Order transaction history message: AVS HLD Release - Item Class \$Limit.	The system places the order on hold, using the hold reason defined for the AVS response. Order transaction history message: SYS HLD - Declined Credit Card.
no hold reason	hold reason	The system does not place the order on hold.	The system places the order on hold, using the hold reason defined for the entity item class dollar limit. Order transaction history message: SYS HLD - Declined Credit Card.
no hold reason	no hold reason	The system does not place the order on hold.	The system does not place the order on hold.
hold reason	hold reason	The system releases the order from AVS hold. Order transaction history message: AVS HLD Release - Item Class \$Limit.	The system places the order on hold, using the hold reason defined for the entity item class dollar limit. Order transaction history message: SYS HLD - Declined Credit Card.

Item class dollar limit example: The following is an example of how to set up an item class dollar limit for an AVS response code.

AVS Response	Description	Hold Reason Code
I3	All Address Matching	None

Item class dollar limit to hold example:

AVS Response	Entity	Item Class	Dollar Limit	Hold Reason Code
I3	555	ELC	\$50.00	C1
I3	555	PNT	\$75.00	C2
I3	555	ZBA	\$150.00	C3

Using the example, if an order passed AVS because it received an AVS response of I3, all address matching, the system would then perform an edit against the item class dollar limit defined for the response.

If an item class dollar limit was defined for the entity associated with the order, the item class assigned to at least one of the items on the order requiring authorization, and the dollar amount on the order that required authorization is equal to or greater than the dollar limit defined for the AVS response, the order would then be placed on hold, using the hold reason code defined for the item class dollar limit.

Using the example, the system would assign the hold reason code C1 to an order if the order was associated with entity 555, item class ELC, and the dollar amount that required authorization was equal to or greater than \$50.00.

Entity postal code dollar limits

You can set up a postal code dollar limit for an AVS response for each entity in your company. You can use the postal code dollar limit to reduce the amount of fraud. For example, a credit card may receive an AVS response of “All Address Match”, but you may want to perform an additional check against the postal code assigned to the bill to or sold to customer on the order and the dollar amount that requires authorization.

- If the authorization amount is less than the postal code dollar limit, the system releases the order from any AVS hold.
- If the authorization amount is greater than the postal code dollar limit, the system places the order on hold using the hold reason defined for the postal code dollar limit.

The system checks the following information to determine if an order should go on hold due to a postal code dollar limit:

- the service bureau code
- the AVS response code received from the service bureau
- the Entity associated with the order
- the postal code for the bill to customer on the order; if a bill to customer is not defined, the system validates the postal code for the sold to customer on the order
- the \$ limit to hold on the order

The system does not place the order on postal code dollar limit hold if the order does not pass authorization.

Entity postal code dollar limit summary:

AVS response	Entity \$ limit	Auth amount less than entity \$ limit	Auth amount greater than or equal to entity \$ limit
hold reason	no hold reason	The system releases the order from AVS hold. Order transaction history message: AVS HLD Release - Postal Code \$Limit.	The system places the order on hold, using the hold reason defined for the AVS response. Order transaction history message: SYS HLD - Declined Credit Card.
no hold reason	hold reason	The system does not place the order on hold.	The system places the order on hold, using the hold reason defined for the entity postal code dollar limit. Order transaction history message: SYS HLD - Declined Credit Card.
no hold reason	no hold reason	The system does not place the order on hold.	The system does not place the order on hold.
hold reason	hold reason	The system releases the order from AVS hold. Order transaction history message: AVS HLD Release - Postal Code \$Limit.	The system places the order on hold, using the hold reason defined for the entity postal code dollar limit. Order transaction history message: SYS HLD - Declined Credit Card.

Postal code dollar limit example: The following is an example of how to set up a postal code dollar limit for an AVS response code.

AVS Response	Description	Hold Reason Code
I3	All Address Matching	None

Postal code dollar limit to hold example:

AVS Response	Entity	Postal code	Dollar Limit	Hold Reason Code
I3	555	01468	\$50.00	P1
I3	555	01701	\$75.00	P2
I3	555	02053	\$150.00	P3

Using the example, if an order passed AVS because it received an AVS response of I3, all address matching, the system would then perform an edit against the postal code dollar limit defined for the response.

If a postal code dollar limit was defined for the entity associated with the order, the postal code assigned to the sold to, and the dollar amount on the order that required authorization is equal to or greater than the dollar limit defined for the AVS response, the order would then be placed on hold, using the hold reason code defined for the postal code dollar limit.

Using the example, the system would assign the hold reason code P1 to an order if the order was associated with entity 555, postal code 01468, and the dollar amount that required authorization was equal to or greater than \$50.00.

Vendor Response Setup Examples

Examples of different vendor responses, and how you might set them up on the system for credit card authorization before shipment, are:

Stolen credit card:

- do not reattempt authorization
- put the order on CF (credit card fraud) hold
- flag the order for cancellation

Over credit limit:

- put the order on hold for 5 days before reattempting authorization
- flag the order for cancellation after a number of declined authorizations

Transmission error:

- do not put the order on hold; reattempt authorization immediately

Address verification failed:

- do not reattempt authorization
- put the order on AV (address verification) hold

Card security value should be on the credit card:

- do not reattempt authorization
- put the order on CF (credit card fraud) hold

Note:

A pick slip will not print if the authorization is declined or if the order is on hold.

Determining the maximum number of declines: The system counts the number of declines for each different vendor response code separately. For example, if an authorization is declined twice for a transmission error, and is then declined for exceeding a credit limit, the counter starts again at 1 the first time you receive the new vendor response code.

The [Maximum Number of Retries on Credit Card Orders \(E74\)](#) system control value specifies the maximum number of all declines (with any vendor response that represents a decline) an order can accumulate before being flagged for cancellation.

This value overrides the limit you specify for an individual vendor response. Be sure to set this system control value high enough that you do not inadvertently flag an order for cancellation when it still might be eligible for authorization.

Releasing held orders: The Release Orders on Time Hold periodic function evaluates held credit card orders for release based on their hold dates. See [Releasing Orders from Time Hold](#).

You can also use the Release Held Orders (ERHO) menu option to release orders one at a time..

Canceling orders: You can use the [Working with Credit Card Cancellations \(WCCC\)](#) menu option to cancel all orders flagged for cancellation automatically. You can also set up this function as part of your periodic process.

About Deposits

Response codes may be used both for credit card authorizations and deposit authorizations. Typically, you would need to authorize a deposit because the order is using deferred or installment billing, and so you would not have a current authorization for the amount of the deposit you are processing.

The system does not perform the same types of actions against the order for a deposit authorization as it does for other authorizations. Specifically, the system does not reference the following fields (defined at the [Create Vendor Response Screen](#)) when processing an authorization for a deposit:

- Hold reason
- of authorization attempts
- of days between attempts
- Cancel reason
- Letter type

Similarly, the Maximum Number of Retries on Credit Card Orders (E74) system control value does not play a role in authorizing deposits.

Force deposit: You can set a vendor response code to “force deposit” in your company when you receive this response code from the deposit service. To do so, select the [Force deposit for FPO](#) flag for the response code. Forcing deposit

means that you process all of the same updates in your company as if you had received an approval for the authorization.

Regular (non-payment plan) deposits are always forced.

Note:

You must make your own arrangements with the service bureau regarding how to deal with unconfirmed or rejected deposit transactions.

The system checks the setting of this "force deposit" flag only when:

- you process a deposit for a deferred or installment pay plan
- the service bureau supports force deposit
- the authorization is declined (that is, the response code is not 100)
- the system submitted the transaction with an action code of B (obtain both an authorization and deposit) rather than D (deposit only)

If you don't force: When a payment plan deposit fails authorization and is not forced, the deposit appears on the [Unconfirmed Deposits Listing Report](#). You can use [Manage Rejected Deposits](#) in Modern view to work with these deposits. Additionally, the order is placed on hold, and any orders that match the sold to customer and/or the credit card number are placed on hold as well.

More information:

- [Deferred/Installment Billing Overview](#)
- [Processing Auto Deposits \(SDEP\)](#)

Work with Vendor Response Screen

Purpose: This screen displays the response codes currently defined for the service bureau. Use this screen to add, delete, or change a response code for the service bureau.

You must create a vendor response code for each code used by the service bureau. If the system receives a vendor response code it does not recognize, it puts the order on AVS hold.

How to display this screen: Select Responses for the service bureau at the [Work with Authorization Services Screen](#)

Field	Description
Response code	The code assigned by the service bureau that identifies whether the credit card was authorized or declined, and the reason for the authorization or decline. Alphanumeric, 10 positions; optional.
Description	The description of the response code. Alphanumeric, up to 40 positions; optional.

Option	Procedure
Change a vendor response code	Select Change for a response code to advance to the Change Vendor Response Screen. At this screen you can change any information except the Authorization service code and the Response <i>code</i> . See the Create Vendor Response Screen for field descriptions.
Delete a vendor response code	Select Delete for a response code to delete it.
Display a vendor response code	Select Display for a response code to advance to the Display Vendor Response Screen. You cannot change any information at this screen. See the Create Vendor Response Screen for field descriptions.
Work with ship via dollar limits and pay type dollar limits for a vendor response code	Select Response/Entity Details for a response code to advance to the Work with Ship Via \$ Limit to Hold Screen .
Create a vendor response code	Select Create to advance to the Create Vendor Response Screen .

Create Vendor Response Screen

Purpose: Use this screen to define the response codes that the service bureau uses to indicate the disposition of the authorization, and how the system should then handle the order.

How to display this screen: Select Create at the [Work with Vendor Response Screen](#)

Field	Description
Response code	<p>The code assigned by the service bureau to identify whether the credit card was authorized or declined, and the reason for the authorization or decline. You should define each code used by the service bureau on the system.</p> <p>If the service bureau returns a response that the system does not recognize, the order appears on the Credit Card Authorization Listing as DECLINED (no description will appear) and is put on AVS hold; you must release the order through the Release Held Orders menu option, described in Selecting Held Orders (ERHO).</p> <p>Deposits: See About Deposits for an example of how response codes may be used during deposits processing.</p> <p>Note: The INSUFFICIENT_FUNDS response code for the RLT authorization service (WASV) must be assigned a hold reason code of SV.</p> <p>Alphanumeric, 10 positions. Create screen: required. Change screen: display-only.</p>

Field	Description
ORCE response	<p>The code assigned by the Oracle Retail Customer Engagement service bureau to identify whether the stored value card transaction was approved or declined. Use this field to map a response from Oracle Retail Customer Engagement to a vendor response code.</p> <p>This field displays only if the Authorization service code for the service bureau is RLT. See Customer Engagement Stored Value Card Integration.</p> <p>Alphanumeric, 60 positions. Create screen: optional. Change screen: display-only.</p>
Description 1	<p>The description of the response code. You can use the description provided by the service bureau or you can use your own description.</p> <p>Both lines of the description appear on the Credit Card Authorization Listing. You can also review it in standard order inquiry at the Authorization History Details Window.</p> <p>Deposits: The first line only of the response code description displays on the Display Deposit History Detail Screen in standard order inquiry when the service bureau uses this response code for a deposit authorization.</p> <p>Alphanumeric, 100 positions; required.</p>
Description 2	<p>An additional description for the response code.</p> <p>Alphanumeric, 100 positions; optional.</p>
Hold reason	<p>The hold code to use for orders receiving this response. This a paytype-level hold; the order will be put on AT hold. The hold reason you enter here displays on the Credit Card Order Cancellation List when you process cancellations, so you can use this field as a description of the vendor response for that report.</p> <p>No pick slip prints if the order is placed on hold.</p> <p>If you assign a Hold date to the order (by completing the # of days between attempts field) you can release the order through the Release Orders on Time Hold periodic function. If not, you must use the Release Held Orders or Manual Credit Card Authorization function to release the order.</p> <p>Leave the Hold field blank if orders with this response code should not be placed on hold. Hold reason codes are defined in and validated against the Order Hold Reason table; see Establishing Order Hold Reason Codes (WOHR).</p> <p>Deposits: The system does not reference this field when processing an authorization for a deposit. See About Deposits.</p> <p>Alphanumeric, 2 positions; optional.</p>

Field	Description
# authorization attempts (Number of authorization attempts)	<p>The number of times to attempt to authorize an order before flagging it for cancellation. This field defines the number of attempts for this response code only; if the vendor returns a different response code, the count begins again at one.</p> <p>Enter 1 in this field if you want to flag an order for cancellation immediately. If this value is set to more than one, the system will continue to resubmit the order for authorization until the value is reached, provided the order is not held.</p> <p>The Maximum Number of Retries on Credit Card Orders (E74) system control value overrides this limit if it is lower than the maximum specified for a given response code. This system control value will also override the limit for a response code if the combined total authorization attempts for all responses on an order meets the maximum defined in the System Control table.</p> <p>Leave this field blank if you want the system to continue to attempt authorization indefinitely (however, the system control value described above will override a blank value).</p> <p>Deposits: The system does not reference this field when processing an authorization for a deposit. See About Deposits.</p> <p>Online credit card authorization: The system does not reference this field when processing an online credit card authorizations.</p> <p>Numeric, 2 positions; optional.</p>
# of days between attempts	<p>The number of days to add to the current date when calculating a Hold until date for an order.</p> <p>Example: If the current date is 7/15, and this field is set to 5, the system assigns a <i>Hold until</i> date of 7/20.</p> <p>If you leave this field blank and:</p> <ul style="list-style-type: none"> • if the Hold reason field is also blank, the system will repeatedly submit the order for reauthorization until the Number of authorization attempts is reached; • if you have defined a Hold reason, the system will never submit the order for reauthorization repeatedly (for example, if the order is flagged for cancellation; see Cancel reason). <p>The Release Orders on Time Hold periodic function releases an order from hold once the Hold date is reached. See Releasing Orders from Time Hold.</p> <p>Deposits: The system does not reference this field when processing an authorization for a deposit. See About Deposits.</p> <p>Online credit card authorization: The system does not reference this field when processing an online credit card authorization.</p> <p>Numeric, 2 positions; optional.</p>

Field	Description
Cancel reason	<p>The cancel reason to use when an order has reached the # authorization attempts (Number of authorization attempts), or in the number in the system control value (whichever is lower). As part of this process, the order is flagged for cancellation; you use the Working with Credit Card Cancellations (WCCC) option to cancel such orders. You can also set this function up as part of your periodic processing.</p> <p>If an order becomes eligible for cancellation because its total number of authorization attempts meet the maximum defined in the System Control table, the system uses the cancellation code associated with the most recently received vendor response.</p> <p>Cancel reason codes are defined in and validated against the Cancel Reason Code table; see Establishing Cancel Reason Codes (WCNR).</p> <p>Deposits: The system does not reference this field when processing an authorization for a deposit. See About Deposits.</p> <p>Online credit card authorization: The system does not reference this field when processing an online credit card authorization.</p> <p>Numeric, 2 positions; optional (required if you enter a value in the # authorization attempts field).</p>
Force deposit for FPO	<p>Indicates whether to process all the usual updates for a deposit when you receive this response code from the service bureau, even though this response code actually represents a decline.</p> <p>Selected = force deposit Unselected (default) = Do not force deposit</p> <p>About Deposits</p>
Pop up window messages (online authorization messages)	<p>Four additional fields where you can enter a message indicating whether the credit card is approved or declined and if any action should be taken, such as asking the customer to repeat the credit card number or requesting a different credit card for authorization.</p> <p>Note: These fields only display if the On-line Authorizations (B89) system control value is selected and the Batch/online field for the service bureau is set to I (online authorization only) or C (online and batch authorization).</p> <p>If you are sending credit cards for authorization during order entry (the On-line Authorizations (B89) system control value is selected), the system displays the Select Authorization Response Option Window in order entry when a response is received from the service bureau. This window displays the pop up window messages you defined for this vendor response.</p> <p>See Performing Online Credit Card Authorizations for an overview on online authorizations and the required setup.</p> <p>Alphanumeric, four 40-positions fields; optional.</p>

Select Entity for Vendor Response Details Screen

Purpose: Use this screen to define more information for a vendor response for each entity in your company. At this screen you can:

- define a ship via dollar limit for an AVS response code to perform an additional edit against the authorization amount if the ship via on the order matches a ship via dollar limit and the sold to customer and ship to customer are different.
- define a pay type dollar limit to force an authorization for a declined vendor response code.
- define an item class dollar limit for an AVS response code to perform an additional edit against the authorization amount if one or more item(s) on the order requiring authorization has an item class that matches an item class dollar limit.
- define a postal code dollar limit for an AVS response code to perform an additional edit against the authorization amount if the postal code for the sold to on the order matches a postal code dollar limit.

How to display this screen: On the [Work with Vendor Response Screen](#) screen, select Response/Entity Details for a vendor response

Field	Description
Authorization service	The code and description to identify the service bureau for which you are working with vendor response details. This is the service bureau you selected at the Work with Authorization Services Screen . Authorization code: Alphanumeric, 3 positions; display-only. Authorization description: Alphanumeric, 30 positions; display-only.
Response code	The code and description assigned by the service bureau that identifies whether the credit card was authorized or declined, and the reason for the authorization or decline. This is the vendor response you selected on the Work with Vendor Response Screen . For ship via dollar limit, postal code dollar limit, and item class dollar limit, this must be an AVS response code. Pay type dollar limit applies to a vendor response code. Vendor response code: Alphanumeric, 10 positions; display-only. Vendor response description: Alphanumeric, 40 positions; display-only.
Entity	A code for the entity for which you wish to create vendor response details. An entity is a component of the sales reporting hierarchy. An entity can represent the business units in your company, for example, mail order, retail, wholesale). A list of all the valid entity records set up for the company you are currently in displays. Entity codes are defined in and validated against the Entity table. See Working with Entities (WENT) . Numeric, 3 positions; optional.
Description	A description of the entity. Alphanumeric, 25 positions; optional.

Screen Option	Procedure
Define ship via dollar limits for a specific entity	Select Ship Via \$ Limit for an entity to advance to the Work with Ship Via \$ Limit to Hold Screen .

Screen Option	Procedure
Define pay type dollar limits for a specific entity	Select Pay Type \$ Limit for an entity to advance to the Work with Pay Type \$ Limit to Force Authorization Screen .
Define item class dollar limits for a specific entity	Select Item Class \$ Limit for an entity to advance to the Work with Item Class \$ Limit to Hold Screen .
Define postal code dollar limits for a specific entity	Select Postal Code \$ Limit for an entity to advance to the Work with Postal Code \$ Limit to Hold Screen .

Work with Ship Via \$ Limit to Hold Screen

Purpose: Use this screen to create and maintain ship via dollar limits for a specific entity, AVS response, and service bureau.

Ship via dollar limit defines whether a dollar limit is applied to the ship via on the order.

- If the authorization amount is less than the ship via dollar limit, the system releases the order from any AVS hold.
- If the authorization amount is greater than the ship via dollar limit, the system places the order on hold using the hold reason defined for the ship via dollar limit.

You might use this if you want to keep a careful check for stolen credit cards. For example, you can place an order on hold if the order is associated with a Federal Express ship via and the dollar amount required for authorization is greater than \$200.00.

See [Entity ship via dollar limits](#) for more information on the processing the system performs.

Note:

If you are performing online authorization, the system does not validate entity ship via dollar limit.

How to display this screen: Select Ship Via \$ Limit for an entity on the [Work with Vendor Response Screen](#)

Field	Description
Authorization service	The code and description of the service bureau for which you are working with ship via dollar limits. This is the service bureau you selected on the Work with Authorization Services Screen . Authorization code: Alphanumeric, 3 positions; display-only. Authorization description: Alphanumeric, 30 positions; display-only.

Field	Description
Response code	<p>The code and description assigned by the service bureau that identifies whether the credit card passed address verification. This is the AVS response you selected on the Work with Vendor Response Screen.</p> <p>Response code: Alphanumeric, 10 positions; display-only. Response description: Alphanumeric, 40 positions; display-only.</p>
Entity	<p>The code and description of the entity you selected on the Select Entity for Vendor Response Details Screen.</p> <p>Entity code: Numeric, 3 positions; display-only. Entity description: Alphanumeric, 25 positions; display-only.</p>
Ship Via	<p>A code for the carrier you use to ship merchandise. Ship via codes are defined in and validated against the Ship Via table using Working with Ship Via Codes (WVIA).</p> <p>Numeric, 2 positions; optional.</p>
\$ Limit to Hold	<p>The dollar limit that defines when the system places the order on hold.</p> <p>The system places an order on hold when the order meets the service bureau/AVS response code/entity/ship via code combination and the dollar amount the requires authorization is greater than the amount defined for the ship via dollar limit. The system assigns the hold reason code defined for the ship via dollar limit to the order.</p> <p>Conversely, if you do not define a hold reason, the system does not place an order on hold if the order does not pass AVS authorization, but is under the ship via dollar amount specified.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Hold Reason	<p>The hold reason code to assign to orders whose authorization amount is greater than the ship via dollar limit.</p> <p>Alphanumeric, 2 positions; optional.</p>
Description	<p>A description of the hold reason code.</p> <p>Alphanumeric, 50 positions; optional.</p>

Screen Option	Procedure
Change a ship via dollar limit	Select Change for a ship via dollar limit to hold to advance to the Change Ship Via \$ Limit to Hold Screen. At this screen you can change the ship via, dollar limit, and hold reason code. See the Create Ship Via \$ Limit to Hold Screen for field descriptions.
Delete a ship via dollar limit	Select Delete for a ship via dollar limit to hold to delete it.
Display a ship via dollar limit	Select Display for a ship via dollar limit to hold to advance to the Display Ship Via \$ Limit to Hold Screen. You cannot change any information at this screen. See the Create Ship Via \$ Limit to Hold Screen for field descriptions.

Screen Option	Procedure
Create a ship via dollar limit	Select Create to advance to Create Ship Via \$ Limit to Hold Screen .

Create Ship Via \$ Limit to Hold Screen

Purpose: Use this screen to create a ship via dollar limit.

How to display this screen: Select Create on the [Work with Ship Via \\$ Limit to Hold Screen](#).

Field	Description
Authorization service	<p>The code and description of the service bureau for which you are creating a ship via dollar limit.</p> <p>This is the service bureau you selected on the Work with Authorization Services Screen.</p> <p>Authorization code: Alphanumeric, 3 positions; display-only.</p> <p>Authorization description: Alphanumeric, 30 positions; display-only.</p>
Response code	<p>The code and description of the AVS response code assigned by the service bureau that identifies whether the credit card pass address verification.</p> <p>This is the AVS response you selected on the Work with Vendor Response Screen.</p> <p>Response code: Alphanumeric, 10 positions; display-only.</p> <p>Response description: Alphanumeric, 40 positions; display-only.</p>
Entity	<p>The code and description of the entity you selected on the Work with Vendor Response Screen.</p> <p>Entity code: Numeric, 3 positions; display-only.</p> <p>Entity description: Alphanumeric, 25 positions; display-only.</p>
Ship via	<p>A code for the carrier you use to ship merchandise.</p> <p>An error message indicates if you try to create a ship via dollar limit for a ship via that already has a dollar limit defined for this AVS response code and entity: Duplicate record exists.</p> <p>Ship via codes are defined in and validated against the Ship Via table using Working with Ship Via Codes (WVIA).</p> <p>Numeric, 2 positions; optional.</p>

Field	Description
\$ limit to hold	<p>The dollar limit that defines when the system places the order on hold.</p> <p>The system places an order on hold when the order meets the service bureau/AVS response code/entity/ship via code combination and the dollar amount that requires authorization is greater than the amount defined for the ship via dollar limit. The system assigns the hold reason code defined for the ship via dollar limit to the order.</p> <p>Conversely, if you do not define a dollar limit, the system does not place an order on hold if the order does not pass AVS authorization, but is under the ship via dollar amount specified.</p> <p>An error message indicates if you try to enter a dollar limit that is less than \$1.00: Ship Via \$ Limit cannot be less than One.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Hold reason	<p>A code for the hold reason the system assigns to the order when the authorization amount is greater than the ship via dollar limit.</p> <p>This is a paytype level hold; the order will be put on AT hold.</p> <p>The hold reason you enter here displays on the Credit Card Order Cancellation List when you process cancellations.</p> <p>No pick slip prints if the order is on hold.</p> <p>Hold reason codes are defined in and validated against the Order Hold Reason table; see Establishing Order Hold Reason Codes (WOHR).</p> <p>Alphanumeric, 2 positions; optional.</p>

Work with Pay Type \$ Limit to Force Authorization Screen

Purpose: Use this screen to create and maintain pay type dollar limits.

Pay type dollar limit defines whether a dollar limit to force an authorization is applied to a specific pay type.

See [Entity pay type dollar limits](#) for more information on the processing the system performs.

 **Note:**

If you are performing online authorization, the system does not validate entity pay type dollar limit.

How to display this screen: On the [Work with Vendor Response Screen](#), select Pay Type \$ Limit for an entity.

Field	Description
Authorization service	<p>The code and description of the service bureau for which you are working with pay type dollar limits for a vendor response.</p> <p>This is the service bureau you selected on the Work with Authorization Services Screen.</p> <p>Authorization code: Alphanumeric, 3 positions; display-only.</p> <p>Authorization description: Alphanumeric, 30 positions; display-only.</p>
Response code	<p>The code and description of the vendor response assigned by the service bureau that identifies whether the credit card was authorized or declined, and the reason for the authorization or decline.</p> <p>This is the vendor response you selected on the Work with Vendor Response Screen.</p> <p>Response code: Alphanumeric, 10 positions; display-only.</p> <p>Response description: Alphanumeric, 40 positions; display-only.</p>
Entity	<p>The code and description of the entity you selected on the Select Entity for Vendor Response Details Screen.</p> <p>Entity code: Numeric, 3 positions; display-only.</p> <p>Entity description: Alphanumeric, 25 positions; display-only.</p>
Pay type	<p>A code used to identify a method of payment on an order. Pay type codes are defined in and validated against the Pay Type table.</p> <p>Numeric, 2 positions; optional.</p>
Description	<p>A description of the pay type.</p> <p>Alphanumeric, 30 positions; display-only.</p>
Dollar limit to force authorization	<p>The dollar limit that indicates whether the order is eligible for a forced authorization. If the dollar amount for the credit card is greater than \$1.00 but less than the dollar amount defined, the system forces an authorization.</p> <p>Note: If you wish to force authorizations for credit cards requiring authorizations less than \$1.00, enter an authorization number in the Authorization Number for Authorizations Under \$1.00 (I08) system control value.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Screen Option	Procedure
Change a pay type dollar limit	<p>Select Change for a pay type dollar limit to advance to the Change Pay Type \$ Limit to Force Authorization Screen. You can change the pay type code or dollar amount on this screen. See the Create Pay Type \$ Limit to Force Authorization Screen for field descriptions.</p>
Delete a pay type dollar limit	<p>Select Delete for a pay type dollar limit to delete it.</p>

Screen Option	Procedure
Display a pay type dollar limit	Select Display for a pay type dollar limit to advance to the Display Pay Type \$ Limit to Force Authorization Screen. You cannot change any information at this screen. See the Create Pay Type \$ Limit to Force Authorization Screen for field descriptions.
Create a pay type dollar limit	Select Create to advance to the Create Pay Type \$ Limit to Force Authorization Screen .

Create Pay Type \$ Limit to Force Authorization Screen

Purpose: Use this screen to create a pay type dollar limit.

How to display this screen: Select Create on the [Work with Pay Type \\$ Limit to Force Authorization Screen](#).

Field	Description
Authorization service	<p>The code and description of the service bureau for which you are creating a pay type dollar limit for a vendor response. This is the service bureau you selected on the Work with Authorization Services Screen.</p> <p>Authorization code: Alphanumeric, 3 positions; display-only. Authorization description: Alphanumeric, 30 positions; display-only.</p>
Response code	<p>The code and description of the response assigned by the service bureau that identifies whether the credit card was authorized or declined, and the reason for the authorization or decline. This is the vendor response you selected on the Work with Vendor Response Screen.</p> <p>Response code: Alphanumeric, 10 positions; display-only. Response description: Alphanumeric, 40 positions; display-only.</p>
Entity	<p>The code and description of the entity you selected on the Select Entity for Vendor Response Details Screen.</p> <p>Entity code: Numeric, 3 positions; display-only. Entity description: Alphanumeric, 25 positions; display-only.</p>
Pay type	<p>A code used to identify a method of payment on an order. Pay type codes are defined in and validated against the Pay Type table; see Working with Pay Types (WPAY).</p> <p>An error message indicates if you try to create a pay type dollar limit for a pay type that already has a pay type dollar limit defined for this vendor response and entity: Duplicate record exists.</p> <p>An error message indicates if you enter a pay type other than a credit card pay type: Pay Type entered must be a credit card. Numeric, 2 positions; required.</p>

Field	Description
\$ limit to authorization	<p>The dollar amount that you wish to use to force a credit card authorization.</p> <p>If the dollar amount defined for the credit card is greater than \$1.00 but less than the amount you define, the system forces the credit card authorization.</p> <p>If the dollar amount defined for the credit card is equal to or greater than the amount you define, the system does not authorize the credit card.</p> <p>An error message indicates if you enter a dollar amount that is less than \$1.00: Pay Type \$ Limit cannot be less than One Dollar (\$1.00).</p> <p>Note: If you wish to force authorizations for credit cards requiring authorizations less than \$1.00, enter an authorization number in the Authorization Number for Authorizations Under \$1.00 (I08) system control value.</p> <p>Numeric, 13 positions with a 2-place decimal; required.</p>

Work with Item Class \$ Limit to Hold Screen

Purpose: Use this screen to create and maintain item class dollar limits.

Item class dollar limit defines whether a dollar limit is applied to the item class associated with an item on the order that requires authorization.

- If the authorization amount is less than the item class dollar limit, the system releases the order from any AVS hold.
- If the authorization is greater than the item class dollar limit, the system places the order on hold using the hold reason defined for the item class dollar limit.

You might use this if you want to keep a careful check for stolen credit cards. For example, you can place an order on hold if at least one of the items on the order requesting authorization is assigned to item class PNT (high-fraud items) and the dollar amount required for authorization is greater than \$200.00.

See [Entity item class dollar limits](#) for more information on the processing the system performs.

How to display this screen: Select Item Class \$ Limit for an entity on the [Work with Vendor Response Screen](#).

Field	Description
Authorization service	<p>The code and description to identify the service bureau for which you are working with item class dollar limits.</p> <p>This is the service bureau you selected on the Work with Authorization Services Screen.</p> <p>Authorization code: Alphanumeric, 3 positions; display-only.</p> <p>Authorization description: Alphanumeric, 30 positions; display-only.</p>

Field	Description
Response code	<p>The code and description assigned by the service bureau that identifies whether the credit card passed address verification.</p> <p>This is the AVS response you selected at the Work with Vendor Response Screen.</p> <p>Response code: Alphanumeric, 10 positions; display-only. Response description: Alphanumeric, 40 positions; display-only.</p>
Entity	<p>The code and description of the entity you selected on the Select Entity for Vendor Response Details Screen.</p> <p>Entity code: Numeric, 3 positions; display-only. Entity description: Alphanumeric, 25 positions; display-only.</p>
Item class	<p>A code for an item class used to group like items together.</p> <p>Item class codes are defined in and validated against the Item Class table.</p> <p>Alphanumeric, 3 positions; optional.</p>
\$ Limit To Hold	<p>The dollar limit that defines when the system places the order on hold.</p> <p>The system places an order on hold when the order meets the service bureau/AVS response code/entity/item class combination and the dollar amount that requires authorization is greater than the amount defined for the item class dollar limit. The system assigns the hold reason code defined for the item class dollar limit to the order.</p> <p>Conversely, if you do not define a hold reason, the system does not place an order on hold if the order does not pass AVS authorization, but is under the item class dollar amount specified.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Hold Reason/ Description	<p>The code and description of the hold reason to assign to orders whose authorization amount is greater than the item class dollar limit.</p> <p>Code: Alphanumeric, 2 positions; optional. Description: Alphanumeric, 50 positions; display-only.</p>

Screen Option	Procedure
Create an item class dollar limit	Select Create to advance to the Create Item Class \$ Limit to Hold Screen .
Change an item class dollar limit	Select Change for an item class dollar limit to hold to advance to the Change Item Class \$ Limit to Hold Screen .
Delete an item class dollar limit	Select Delete for an item class dollar limit to hold to delete it.
Display an item class dollar limit	Select Display for an item class dollar limit to hold to advance to the Display Item Class \$ Limit to Hold Screen .

Create Item Class \$ Limit to Hold Screen

Purpose: Use this screen to create an item class dollar limit.

How to display this screen: Select Create at the [Work with Item Class \\$ Limit to Hold Screen](#).

Field	Description
Authorization service	<p>The code and description of the service bureau for which you are creating an AVS response item class dollar limit.</p> <p>This is the service bureau you selected at the Work with Authorization Services Screen.</p> <p>Authorization code: Alphanumeric, 3 positions; display-only. Authorization description: Alphanumeric, 30 positions; display-only.</p>
Response code	<p>The code and description of the AVS response code assigned by the service bureau that identifies whether the credit card passed address verification.</p> <p>This is the AVS response you selected at the Work with Vendor Response Screen.</p> <p>Response code: Alphanumeric, 10 positions; display-only. Response description: Alphanumeric, 40 positions; display-only.</p>
Entity	<p>The code and description of the entity you selected at the Select Entity for Vendor Response Details Screen.</p> <p>Entity code: Numeric, 3 positions; display-only. Entity description: Alphanumeric, 25 positions; display-only.</p>
Item class	<p>A code for an item class used to group like items together.</p> <p>Item class codes are defined in and validated against the Item Class table.</p> <p>An error message indicates if you try to create an item class dollar limit for an item class that already has a dollar limit defined for the vendor response code and entity: Duplicate record exists.</p> <p>Alphanumeric, 3 positions. Create screen: required. Change screen: display-only.</p>
\$ limit to hold	<p>The dollar limit that defines when the system places the order on hold. The system places an order on hold when the order meets the service bureau/AVS response code/entity/item class combination and the dollar amount that requires authorization is greater than the amount defined for the item class dollar limit. The system assigns the hold reason code defined for the item class dollar limit to the order.</p> <p>Conversely, if you do not define a hold reason, the system does not place an order on hold if the order does not pass AVS authorization, but is under the item class dollar amount specified.</p> <p>An error message indicates if you try to enter a dollar limit that is less than \$1.00: Item Class \$ Limit cannot be less than \$1.00.</p> <p>Numeric, 13 positions with a 2-place decimal; required.</p>
Hold reason	<p>A code for the hold reason the system assigns to the order when the order meets the item class dollar limit hold requirements.</p> <p>This is a paytype level hold; the order will be put on AT hold.</p> <p>The hold reason you enter here displays on the Credit Card Order Cancellation List when you process cancellations.</p> <p>No pick slip prints if the order is on hold.</p> <p>Hold reason codes are defined in and validated against the Order Hold Reason table; see Establishing Order Hold Reason Codes (WOHR).</p> <p>Alphanumeric, 2 positions; optional.</p>

Change Item Class \$ Limit to Hold Screen

To change: At the [Work with Item Class \\$ Limit to Hold Screen](#), select Change for an item class dollar limit to hold to advance to the Change Item Class \$ Limit to Hold screen. At this screen, you can change the \$ limit to hold and hold reason code.

See [Create Item Class \\$ Limit to Hold Screen](#) for a description of the fields on this screen.

Display Item Class \$ Limit to Hold Screen

To display: At the [Work with Item Class \\$ Limit to Hold Screen](#), select Display for an item class dollar limit to hold to advance to the Display Item Class \$ Limit to Hold screen. You cannot change any fields on this screen.

See [Create Item Class \\$ Limit to Hold Screen](#) for a description of the fields on this screen.

Work with Postal Code \$ Limit to Hold Screen

Purpose: Use this screen to create and maintain postal code dollar limits.

Postal code dollar limit defines whether a dollar limit is applied to the postal code for the sold to customer on the order.

- If the authorization amount is less than the postal code dollar limit, the system releases the order from any AVS hold.
- If the authorization amount is greater than the postal code dollar limit, the system places the order on hold using the hold reason defined for the postal code dollar limit.

You might use this if you want to keep a careful check for stolen credit cards. For example, you can place an order on hold if the order is associated with a high-crime delivery area and the dollar amount required for authorization is greater than \$200.00.

See [Entity postal code dollar limits](#) for an example and additional processing logic.

How to display this screen: Select Postal Code \$ Limit for an entity at the [Select Entity for Vendor Response Details Screen](#).

Field	Description
Authorization service	The code and description of the service bureau for which you are working with postal code dollar limits. This is the service bureau you selected on the Work with Authorization Services Screen . Authorization code: Alphanumeric, 3 positions; display-only. Authorization description: Alphanumeric, 30 positions; display-only.
Response code	The code and description assigned by the service bureau that identifies whether the credit card passed address verification. This is the vendor response you selected at the Work with Vendor Response Screen . Response code: Alphanumeric, 10 positions; display-only. Response description: Alphanumeric, 40 positions; display-only.

Field	Description
Entity	The code and description of the entity you selected on the Select Entity for Vendor Response Details Screen . Entity code: Numeric, 3 positions; display-only. Entity description: Alphanumeric, 25 positions; display-only.
Postal code	A code for a postal code or zip code representing a delivery area. Alphanumeric, 10 positions; optional.
\$ Limit To Hold	The dollar limit that defines when the system places the order on hold. The system places an order on hold when the order meets the service bureau/AVS response code/entity/postal code combination and the dollar amount that requires authorization is greater than the amount defined for the postal code dollar limit. The system assigns the hold reason code defined for the postal code dollar limit to the order. Conversely, if you do not define a hold reason, the system does not place an order on hold if the order does not pass AVS authorization, but is under the postal code dollar amount specified. Numeric, 13 positions with a 2-place decimal; optional.
Hold Reason/ Description	The code and description of the hold reason to assign to orders whose authorization amount is greater than the postal code dollar limit. Code: Alphanumeric, 2 positions; optional. Description: Alphanumeric, 50 positions; display-only.

Screen Option	Procedure
Create a postal code dollar limit to hold	Select Create to advance to the Create Postal Code \$ Limit to Hold Screen .
Change a postal code dollar limit to hold	Select Change for a postal code dollar limit to hold to advance to the Change Postal Code \$ Limit to Hold Screen .
Delete a postal code dollar limit to hold	Select Delete for a postal code dollar limit to hold to delete it.
Display a postal code dollar limit to hold	Select Display for a postal code dollar limit to hold to advance to the Display Postal Code \$ Limit to Hold Screen .

Create Postal Code \$ Limit to Hold Screen

Purpose: Use this screen to create a postal code dollar limit.

How to display this screen: Select Create at the [Work with Postal Code \\$ Limit to Hold Screen](#).

Field	Description
Authorization service	<p>The code and description of the service bureau for which you are creating an AVS response postal code dollar limit. This is the service bureau you selected at the Work with Authorization Services Screen.</p> <p>Authorization code: Alphanumeric, 3 positions; display-only. Authorization description: Alphanumeric, 30 positions; display-only.</p>
Response code	<p>The code and description of the AVS response assigned by the service bureau that identifies whether the credit card passed address verification. This is the AVS response you selected at the Work with Vendor Response Screen.</p> <p>Response code: Alphanumeric, 10 positions; display-only. Response description: Alphanumeric, 40 positions; display-only.</p>
Entity	<p>The code and description of the entity you selected at the Select Entity for Vendor Response Details Screen.</p> <p>Entity code: Numeric, 3 positions; display-only. Entity description: Alphanumeric, 25 positions; display-only.</p>
Postal code	<p>A code for a postal code or zip code representing a delivery area. Postal codes are defined in and validated against the Zip/City/State table.</p> <p>An error message indicates if you try to create a postal code dollar limit for a postal code that already has a dollar limit defined for the AVS response and entity: Duplicate record exists.</p> <p>Alphanumeric, 5 positions. Create screen: required. Change screen: display-only.</p>
\$ limit to hold	<p>The dollar limit that defines when the system places the order on hold.</p> <p>The system places an order on hold when the order meets the service bureau/AVS response code/entity/postal code combination and the dollar amount that requires authorization is greater than the amount defined for the postal code dollar limit. The system assigns the hold reason code defined for the postal code dollar limit to the order. Conversely, if you do not define a hold reason, the system does not place an order on hold if the order does not pass AVS authorization, but is under the postal code dollar amount specified.</p> <p>An error message indicates if you try to enter a dollar limit that is less than \$1.00: Postal Code \$ Limit cannot be less than \$1.00.</p> <p>Numeric, 13 positions with a 2-place decimal; required.</p>

Field	Description
Hold reason	<p>A code for the hold reason the system assigns to the order when the authorization amount is greater than the postal code dollar limit.</p> <p>This is a paytype level hold; the order will be put on AT hold. The hold reason you enter here displays on the Credit Card Order Cancellation List when you process cancellations.</p> <p>No pick slip prints if the order is on hold.</p> <p>Hold reason codes are defined in and validated against the Order Hold Reason table; see Establishing Order Hold Reason Codes (WOHR).</p> <p>Alphanumeric, 2 positions; optional.</p>

Change Postal Code \$ Limit to Hold Screen

To change: At the [Work with Postal Code \\$ Limit to Hold Screen](#), select Change for a postal code dollar limit to hold to advance to the Change Postal Code \$ Limit to Hold screen. At this screen, you can change the \$ limit to hold and hold reason code.

See [Create Postal Code \\$ Limit to Hold Screen](#) for a description of the fields on this screen.

Display Postal Code \$ Limit to Hold Screen

To display: At the [Work with Postal Code \\$ Limit to Hold Screen](#), select Display for a postal code dollar limit to hold to advance to the Display Item Class \$ Limit to Hold screen. You cannot change any fields on this screen.

See [Create Postal Code \\$ Limit to Hold Screen](#) for a description of the fields on this screen.

Defining Merchant ID Overrides

Purpose: Use merchant ID overrides to set up overrides for the different entities in your company.

When used: You use the merchant ID, which the service bureau assigns, to identify your company when you transmit information to the service bureau. Although you can set up a default ID for your company, you may need to set up overrides for each separate entity under which you perform authorizations and deposits.

Access to screens: The screens you use to work with merchant ID overrides are available through the [Work with Authorization Services Screen](#).

Source code points to entity: The system determines the entity for a customer order based on the source code on the order header. When you create a source code you must specify a division, and when you create a division you must specify an entity. In this way, the source code on the order header indicates which merchant ID override to use for transactions related to the order.

Deferred/installment pay plans: If you use deferred or installment billing, you would also use these screens to set up merchant ID overrides for transactions related to these orders. See [Deferred/Installment Billing Overview](#) for more information on pay plans.

In this topic:

- [Work with Merchant ID Overrides Screen](#)

- [Create Merchant ID by Entity Screen](#)

For more information:

- [Introducing Offer and Source Codes](#)
- [Working with Entities \(WENT\)](#)
- [Working with Divisions \(WDIV\)](#)

Work with Merchant ID Overrides Screen

How to display this screen: Select Merchant ID Override for an authorization service at the [Work with Authorization Services Screen](#).

Field	Description
Authorization service	The service code representing the authorization service you selected at the Work with Authorization Services Screen . Alphanumeric, 3 positions; display-only.
Entity	The code representing an entity with a unique merchant ID. Numeric, 3 positions; optional.
Merchant ID	An account number assigned by the service bureau to identify transmissions to/from a particular entity in your company. The default merchant ID, used for regular (as opposed to pay plan) transactions displays. To review the deferred or installment merchant IDs, select Change or Display for the entity. Alphanumeric, 20 positions; optional.

Screen Option	Procedure
Create a new merchant ID override	Select Create to advance to the Create Merchant ID by Entity Screen .
Change a merchant ID override	Select Change for a merchant ID override to advance to the Change Merchant ID Override Screen. At this screen, you can change the merchant ID fields and API fields. See the Create Merchant ID by Entity Screen for field descriptions.
Delete a merchant ID override	Select Delete for a merchant ID override to delete it.
Display a merchant ID override	Select Display for a merchant ID override to advance to the Display Merchant ID Override Screen. You cannot change any information at this screen. See the Create Merchant ID by Entity Screen for field descriptions.

Create Merchant ID by Entity Screen

Purpose: Use this screen to create a new merchant ID override for orders associated with a specific entity in your company.

How to display this screen: Select Create at the [Work with Merchant ID Overrides Screen](#).

Field	Description
Entity	<p>Enter the entity associated with the merchant ID. Entities are defined in and validated against the Entity table; see Working with Entities (WENT).</p> <p>Numeric, 3 positions.</p> <p>Create screen: required.</p> <p>Change screen: display-only.</p>
Merchant ID	<p>Enter the merchant ID to use when transmitting information to an authorization or deposit service for orders associated with this entity (based on the division associated with the source code on the order header). This is the merchant ID to use for regular, as opposed to pay plan, transactions.</p> <p>Note: You can enter upper and lower case letters in this field.</p> <p>Alphanumeric, 20 positions; required.</p>
Deferred merchant ID	<p>Enter the merchant ID to use when transmitting transactions to a service bureau for orders that are associated with this entity, and which are using a deferred billing pay plan.</p> <p>Deferred and installment pay plans are available only if the Deferred and Installment Billing (F51) system control value is selected. See Deferred/Installment Billing Overview.</p> <p>Note: You can enter upper and lower case letters in this field.</p> <p>Alphanumeric, 20 position; optional.</p>
Installment merchant ID	<p>Enter the merchant ID to use when transmitting transactions to a service bureau for orders that are associated with this entity, and which are using an installment plan.</p> <p>Deferred and installment pay plans are available only if the Deferred and Installment Billing (F51) system control value is selected. See Deferred/Installment Billing Overview.</p> <p>Note: You can enter upper and lower case letters in this field.</p> <p>Alphanumeric, 20 positions; optional.</p>
API User name	<p>The user name, provided by PayPal, used to establish a direct connection to the PayPal system during deposit processing.</p> <p>Note: You can enter upper and lower case letters in this field.</p> <p>Alphanumeric, 64 positions; optional.</p>
API Password	<p>The password, provided by PayPal, used to establish a direct connection to the PayPal system during deposit processing.</p> <p>Note: You can enter upper and lower case letters in this field.</p> <p>Alphanumeric, 64 positions; optional.</p>
API Signature	<p>The encrypted signature, provided by PayPal, used to establish a direct connection to the PayPal system during deposit processing.</p> <p>Note: You can enter upper and lower case letters in this field.</p> <p>Alphanumeric, 128 positions; optional.</p>

Defining Authorization Service Currencies

Purpose: Use the Work with Authorization Currency function to set up cross references between the currency codes you use in Order Administration and the service bureau's codes.

The system uses these cross references to determine which currency code to pass to the service bureau when authorizing credit cards and processing deposits.

In this topic:

- [Work with Authorization Service Currency Screen](#)
- [Create Authorization Service Currency Screen](#)

Work with Authorization Service Currency Screen

How to display this screen: Select Currency for the authorization service at the [Work with Authorization Services Screen](#).

Field	Description
Authorization service	The service to use the cross references. The service you selected at the Work with Authorization Services Screen displays. Code: alphanumeric, 3 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Currency	The code identifying a type of currency in Order Administration. Currency codes are defined in and validated against the Currency table; see Working with Currency (WCUR) . Alphanumeric, 3 positions; optional.
Authorization Service Currency	The related currency code used by the authorization service. Alphanumeric, 3 positions; optional.

Select Option	Procedure
Change an authorization service currency code cross reference	Select Change for a currency code to advance to the Change Authorization Service Currency Screen. At this screen you can change only the authorization service currency code. See the Create Authorization Service Currency Screen for field descriptions.
Delete an authorization service currency code	Select Delete for a currency code to delete it.
Display an authorization service currency code cross reference	Select Display for a currency code to advance to the Display Authorization Service Currency Screen. You cannot change any information at this screen. See the Create Authorization Service Currency Screen for field descriptions.
Create an authorization service currency code cross reference	Select Create to advance to the Create Authorization Service Currency Screen .

Create Authorization Service Currency Screen

Purpose: Use this screen to define an equivalency between a currency code in your company and a currency code used by the service bureau.

How to display this screen: Select Create at the [Work with Authorization Service Currency Screen](#).

Field	Description
Authorization service	The service bureau to use the cross references. The service bureau you selected at the Work with Authorization Services Screen displays. Code: alphanumeric, 3 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Currency	The code identifying a type of currency in your company. Currency codes are defined in and validated against the Currency table; see Working with Currency (WCUR). Alphanumeric, 3 positions. Create screen: optional. Change screen: display-only.
Authorization service currency	The related currency code used by the service bureau. Alphanumeric, 3 positions; optional.

Performing Online Credit Card Authorizations

Overview: Online credit card authorization allows you to send and receive the information required to authorize a credit card when the order is placed instead of when the pick slip is generated for the order.

Quotes: If the Online Authorization field for a quote order type is selected, the system performs online authorization during quote entry; see [Entering Pre-Order Quotes](#) for an overview.

In this topic: This topic provides an overview of the online credit card authorization process and the required setup.

Receiving a Credit Card Authorization During Order Entry

The system performs online authorization when you select Accept to accept an order after determining if the order should go on hold due to the credit card payment method. Note that online authorization can still take place if the order is on hold for another reason, provided the order is eligible.

Generic order interface: If you receive orders through the *Generic Order Interface (Order API)*, the system performs online authorization after determining if the order should go on hold and performing credit card tokenization; see *Performing Online Credit Card Authorization on Web Orders*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Batch order entry: If you are using batch order entry, the system performs online authorization when you accept a batch at the [Work with Error Orders Batches Screen](#) or [Select Customer Sold To For Order Screen](#).

Order maintenance: The system performs online authorization when you select Auth On-Line for a credit card payment on the [Enter Payment Methods Screen](#).

When you convert a quote to an order in order maintenance, the system will perform online authorization for eligible payment methods only if the [Authorize Full Amount During Order Entry \(G99\)](#) system control value is selected; see *Converting Quotes to Orders*.

1. The system determines if the order is eligible for online authorization. In order to receive a credit card authorization during order entry:

- the [On-line Authorizations \(B89\)](#) system control value must be selected.
- the order type defined for the order must be eligible for online authorizations (the On-line authorization field is set to Window (on-line eligible and display window) or Without Window (on-line eligible and do not display window)).
- the order must have a credit card, stored value card, or debit (Switch) card payment method.
- the order must be in an open or suspended status. **Note:** You can authorize a credit card payment during order maintenance when the order is on hold; regardless of whether the payment is authorized, the order remains on hold.
- the arrival date on the order cannot be greater than the current date.

Express bill orders: When you enter a credit card payment method on an express bill order, you must manually authorize the card or the order must be eligible for online authorization. However, since you cannot enter the Authorization Request ID at this screen, Oracle recommends that you instead use the Add Authorization option from the Order Summary page in Modern View to apply a manual authorization.

See [Online Credit Card Authorization Setup](#) for more information on setting up the required values for online authorization.

2. The system determines the amount to authorize.

What Credit Card Amount is Sent for Authorization?

- If the [Online Auth Verification Only \(I96\)](#) system control value is selected, the system processes online authorizations for \$1.00 for the purpose of validating the card. During batch authorizations, the system authorizes the card for the shippable dollar amount and voids the online authorization for \$1.00.
- If the Online Auth Verification Only (I96) system control value is unselected, the system looks at the setting of the Authorize Full Amount During Order Entry (G99) system control value to determine the amount sent for authorization.

The Authorize Full Amount During Order Entry (G99) system control value determines if the credit card is authorized for the full order amount or for the shippable amount on the order.

Authorize full amount...	Authorize shippable amount...
<p>The system sends the entire dollar amount defined for the credit card for authorization.</p> <p>If the credit card is the only payment method...</p> <p>The amount to authorize is the order total. The order total is the sum of all charges on the order, including: merchandise, freight, additional freight, tax, handling, additional charges, GST and PST.</p>	<p>The system sends the dollar amount associated with what is shippable on the order, across all ship to customers, for authorization.</p> <p>If the credit card is the only payment method...</p> <p>This shippable dollar amount includes:</p> <ul style="list-style-type: none"> • shippable merchandise amount, including drop ship items • tax associated with the shippable merchandise amount • total freight • total additional freight • total order level additional charges <p>Note: The system sends the total freight and total additional freight for authorization, regardless of whether you are prorating freight charges (the Prorate Freight Charges (D39) system control value is selected).</p>
<p>If the credit card is the catch-all payment method...</p> <p>The amount to authorize is the remaining dollar amount not associated with another payment method on the order. The system subtracts the amount applied to any other payment methods from the order total.</p> <p>order total - dollar amount associated with other payment methods = amount to authorize for this credit card</p>	<p>If the credit card is the catch-all payment method...</p> <p>The amount to authorize is the remaining shippable dollar amount not associated with another payment method on the order. The system subtracts the amount applied to any other payment methods from the shippable dollar amount.</p> <p>shippable dollar amount - dollar amount associated with other payment methods = amount to authorize for this credit card</p> <p>Excluded from authorizations:</p> <ul style="list-style-type: none"> • order lines with a future arrival date • order lines on backorder, canceled, closed, or sold out • reserved order lines that are coordinate grouped with an order line on backorder or with an order line with a future arrival date

Excluded from authorizations:

- order lines with a future arrival date
- order lines on backorder, canceled, closed, or sold out

- reserved order lines that are coordinate grouped with an order line on backorder or with an order line with a future arrival date

Regardless of whether you are authorizing the full amount or the shippable amount...

Included in authorizations:

- express bill order lines
- drop ship order lines
- non-inventory order lines

Deferred Billing

If the credit card on the order is associated with a deferred pay plan, the system:

- sends an authorization for \$1.00 if the Authorize full amount field for the pay plan is unselected.
- sends an authorization for the dollar amount available for authorization if the Authorize full amount field for the pay plan is selected.

Installment Billing

If the credit card on the order is associated with an installment pay plan, the system:

- sends an authorization for the first installment amount if the Authorize full amount field for the pay plan is unselected.
- sends an authorization for the dollar amount available for authorization if the Authorize full amount field for the pay plan is selected.

If more than one credit card is sent for authorization:

The system sends for authorization the credit card defined with a dollar amount, then sends the catch-all credit card for authorization.

Credit cards requiring authorizations less than \$1.00: If the credit card amount to authorize is less than \$1.00 and you have defined an authorization number in the [Authorization Number for Authorizations Under \\$1.00 \(I08\)](#) system control value, the system does not send the credit card to the service bureau for authorization and instead assigns the authorization number from the system control value to the credit card. If an authorization number is not defined in this system control value, the system sends the credit card to the service bureau for authorization, regardless of the amount that requires authorization.

3. The system sends the authorization amount to the service bureau. If there is an amount to authorize for the credit card, the system sends an authorization request in online format to the service bureau.

4. The service bureau sends back a response. The service bureau sends an authorization response to Order Administration.

There are 3 types of responses you can receive from the service bureau.

- R = an authorization response is received, such as declined or approved
- T = the program timed out before an authorization response was received
- U = an undefined response

Additionally, if an authorization response is received, the service bureau sends back an authorization response code, AVS response code (if performing address

verification), CID response code (if performing credit card identification verification), authorization code, and date.

Vendor response settings: If a pop up window message has been defined for the vendor response received, the system displays the [Select Authorization Response Option Window](#). Also, if a hold reason code has been defined for the vendor response received, the system places the order on hold.

Oracle Retail Customer Engagement stored value cards: When using the [Customer Engagement Stored Value Card Integration](#), if the Oracle Retail Customer Engagement stored value card is the only payment on the order and the amount authorized for the card is less than the order total, Order Administration updates the amount for the card with the amount authorized and displays the message Insufficient balance on card - please add another payment. In order to accept the order, you must add another payment to the order to cover the amount of the order that is not covered by the Oracle Retail Customer Engagement stored value card. Example: If the order total is 500.00 and the amount authorized for the Oracle Retail Customer Engagement stored value card is 236.20, the system updates the amount for the card to 236.20 and requires another form of payment to cover the remaining 289.55 balance on the order.

Hierarchy for Placing the Credit Card On Hold

The credit card pay type may be placed on hold if the credit card is not approved, the AVS verification fails, or the CID verification fails.

The system uses this hierarchy to determine if the credit card pay type should go on hold:

- Authorization response has a hold reason defined: If the credit card charge is declined (not authorized), the credit card may be placed on hold (based on the value in the Hold reason field in the Vendor Response table). The order header is also placed on AT (declined credit card) hold. You must take the order header and credit card pay type off of hold through the Release Held Orders (ERHO) menu option and resend for authorization or cancel the order.
- AVS response has a hold reason defined: If the credit card charge is approved (authorized) but the credit card fails the address verification check, the authorization may be placed on hold (based on the value in the Hold reason field in the Vendor Response table). The order header is also placed on AT (declined credit card) hold. You must contact the customer and obtain correct address information, then take the order header and credit card pay type off of hold through the Release Held Orders (ERHO) menu option and resend for authorization or cancel the order.
- Card security identification response has a hold reason defined: If the credit card charge is approved (authorized) and passes the address verification check, but the credit card fails the credit card security identification check, the credit card pay type may be placed on hold (based on the value in the Hold reason field in the Vendor Response table). The order header is also placed on AT (declined credit card) hold. You must contact the customer to verify credit card ownership, then take the order header and credit card pay type off of hold through the Release Held Orders (ERHO) menu option and resend for authorization or cancel the order.

For more information: See [Defining Vendor Response Codes](#) and [Establishing Cancel Reason Codes \(WCNR\)](#).

What Happens When a Credit Card is Approved?

When a credit card is approved during order entry, the system:

- [Select Authorization Response Option Window](#)

- places the order on hold if a hold reason code has been defined for the vendor response. Typically, if an authorization is approved, the order is not placed on hold. However, if the credit card is approved but fails address verification or card identification verification, you may want to place the order on hold.
- once you accept the order, you return to the [Select Customer Sold To For Order Screen](#), or the [Customer Selection Screen](#) if you are a CTI user.
- processes any end-of-order updates and sends the order to the Order Async.
- creates a record in the On-Line Authorization table indicating the order number, that the credit card has been approved, the dollar amount authorized, the transaction sequence number, and the authorization number. The status for this authorization is *UPDT, indicating the online authorization has completed.
- creates a record in the Authorization History table indicating the credit card has been approved, the authorization number, the date the credit card was authorized, and the dollar amount authorized. If you reject an order after the credit card has been approved, the system removes the record in the Authorization History table. You can review authorization history at the [Display Authorization History Screen](#).
- creates a record in the Void Authorization table indicating the order number and the dollar amount eligible for void. If you reject an order after the credit card has been approved, the system removes the record from the Void Authorization table.

AVS response: If the credit card charge is approved (authorized) but the order fails the address verification check and receives an AVS response that has a hold reason code, the system:

- places the order on AT hold.
- places the credit card payment method on the order on AV (AVS) hold.
- creates an order transaction history message indicating the credit card was declined: SYS HLD - DECLINED CREDIT CARD.
- updates the record in the On-Line Authorization table indicating the credit card failed AVS. The OLA AVS result field is updated with the AVS response received from the service bureau. You can review the response at the [Authorization History Details Window](#).
- updates the record in the Authorization History table indicating the credit card failed AVS. The AUH status field is updated to O (authorized but not used) and the AVS response field is updated with the AVS response received from the service bureau. You can review the status of the credit card and the AVS response at the [Authorization History Details Window](#).

You must contact the customer and obtain correct address information, then take the order off of hold through the Release Held Orders function and resend for authorization.

If the authorization has not yet expired and the transaction passes AVS, the system updates the credit card authorization record from an O (authorized but not used) status to an A (approved) status. If the authorization has expired, the system updates the credit card authorization record from an O (authorized but not used) status to a D (declined) status and resends the credit card for authorization and address verification.

Card security identification response: If the credit card charge is approved (authorized) but the order fails the credit card security check and receives a card security identification response (CID, CVV2, CVC2) that has a hold reason code, the system:

- places the order on AT hold.
- places the credit card payment method on the order on CF (credit card fraud) hold.
- creates an order transaction history message indicating the credit card was declined: SYS HLD - DECLINED CREDIT CARD.
- updates the record in the On-Line Authorization table indicating the credit card failed card security. The OLA vendor response 2 field is updated with the card security response received from the service bureau. You can review the response at the [Authorization History Details Window](#).
- updates the record in the Authorization History table indicating the credit card failed card security. The AUH status field is updated to O (authorized but not used) and the Vendor response 2 field is updated with the card security response received from the service bureau. You can review the status of the credit card and the card security response at the [Authorization History Details Window](#).

You must contact the customer to verify credit card ownership, then take the order off of hold through the Release Held Orders (ERHO) menu option and resend for authorization.

If the authorization has not yet expired and the transaction passes card security identification, the system updates the credit card authorization record from an O (authorized but not used) status to an A (approved) status. If the authorization has expired, the system updates the credit card authorization record from an O (authorized but not used) status to a D (declined) status and resends the credit card for authorization and card security identification.

Voiding an online authorization: After receiving an online authorization, if you change the price of an item in Order Maintenance, the stem voids the authorization. Because the authorization is voided, the system sends the order for batch authorization during pick slip generation.

What Happens When a Credit Card is Declined?

When a credit card is declined during order entry, the system:

- displays the [Select Authorization Response Option Window](#) if a vendor response pop up window message has been defined, the On-line authorization field for the order type is set to Window (on-line eligible and display window), and a Response time is defined for the service bureau. The message should indicate the credit card has been declined and any action you should take to correct the decline or inform the customer. From this window, you can accept the order or return to the order to make any corrections.
- places the order on hold: If a hold reason code is defined for the vendor response, the system assigns this hold reason code to the order payment method and places the order header on AT (Declined Credit Card) hold. If the response received is not defined for the service bureau, the system places the order payment method on AV (Invalid Response Code) hold.
- once you accept the order you return to the [Select Customer Sold To For Order Screen](#), or the [Customer Selection Screen](#) if you are a CTI user.
- processes any end-of-order updates and sends the order to the Order Async.
- creates a record in the On-Line Authorization table indicating the order number, that the credit card has been declined, the dollar amount submitted for authorization, and the transaction sequence number. The status of this authorization is *UPDT, indicating the online authorization has been completed.
- creates a record in the Authorization History table indicating the credit card has been declined, the reason why the credit card was declined, the date the credit card was

declined, and the dollar amount submitted for authorization. If you reject the order after the credit card has been declined, the system removes the record from the Authorization History table. You can review authorization history at the [Display Authorization History Screen](#).

You can send the credit card up for authorization again during order maintenance, using the [Performing Batch Authorization \(SATH\)](#) menu option, or during pick slip generation if the Batch/on-line field for the service bureau contains a C (on-line and batch authorizations).

When Communication Failures Occur

Communication failures can occur if the system times out before a response is received. If communication failures occur and you do not receive a response from the service bureau, the system:

- does not display the [Select Authorization Response Option Window](#) since a vendor response was not received.
- accepts the order and returns you to the [Select Customer Sold To For Order Screen](#), or the [Customer Selection Screen](#) if you are a CTI user.
- processes any end-of-order updates and sends the order to the Order Async.
- creates a record in the On-Line Authorization table. The status of this authorization is:
 - RDY, indicating online authorization has not been performed.
 - SENT, indicating the online authorization transmission failed after the credit card was sent to the service bureau for authorization.
 - RCVD, indicating the online authorization transmission failed after a response was received from the service bureau, but final updates could not be completed. This may occur if the Online Authorization integration job became inactive. The authorization does not complete processing until the job is active. Once the Online Authorization integration job is active, the system updates the status of the authorization to *UPDT.
- creates a record in the Authorization History table indicating the credit card is waiting for authorization, the date the credit card was sent for authorization, and the dollar amount waiting for authorization.

The amount of time the system waits for an authorization is defined in the Response time field for the service bureau.

Grace period: The system allows a 2 day grace period to receive a response from the service bureau if the status of the authorization is *RDY, *SENT, or *RCVD. To determine the grace period, the system takes the current date - the authorization sent date to determine the number of days. Once the 2 day grace period is passed, the system declines the transmission. You will need to resend the credit card for authorization during order maintenance or pick slip generation.

What Happens When an Undefined Response is Returned?

When an undefined response is returned, the system:

- does not display the [Select Authorization Response Option Window](#) since this vendor response has not been defined for the service bureau.
- places the order on AVS hold.

- accepts the order and returns you to the [Select Customer Sold To For Order Screen](#), or the [Customer Selection Screen](#) if you are a CTI user.
- processes any end-of-order updates and sends the order to the Order Async.
- creates a record in the On-Line Authorization table indicating the order number, that the credit card is waiting for authorization, the dollar amount waiting for authorization, and the transaction sequence number. The status of this authorization is *RDY, indicating online authorization has not been performed.
- creates a record in the Authorization History table indicating the credit card is waiting for authorization, the date the credit card was sent for authorization, and the dollar amount waiting for authorization.

You can resend the order for authorization during order maintenance, using the Performing Batch Authorization (SATH) menu option, or during pick slip generation if the Batch/on-line field for the service bureau contains a C (on-line and batch authorizations).

Select Authorization Response Option Window

Use this window to review the response received from the service bureau and any messages defined for this vendor response.

Once you review the message, you can accept the order or return to the order to make any corrections or reject the order.

Typically, a vendor response pop up window message is defined for a vendor response indicating a declined authorization, declined address verification, or declined card identification verification.

How to display this screen: This window displays when you select Accept to accept an order in order entry if:

- the dollar amount defined for the credit card payment method on the order was sent up for authorization and received a response, and
- the On-line authorization field for the order type on the order is set to Window (on-line eligible and display window), and
- a Response time is defined for the service bureau, and
- the Pop up window messages field for the vendor response returned by the service bureau contains text.

Note:

The Pop up window messages # 1 field must contain text in order to display this window. If you define text in the Pop up window messages # 2 - # 4 fields and not in the Pop up window messages # 1 field, this window will not display.

This window displays for each credit card payment method on the order that is sent up for authorization and meets the criteria above.

What message displays? You can receive a response from the service bureau for the authorization, address verification (AVS), and credit card security identification (CID, CVV2, CVC2). If you receive a response for the authorization, AVS verification, and card security identification, the system uses the following hierarchy to determine the pop up window message that displays in the Select Authorization Response Option window:

- Authorization response has a message defined: the message associated with the authorization response displays in the Select Authorization Response Option window.
- AVS response has a message defined: if the authorization response does not have a message defined, the message associated with the AVS response displays in the Select Authorization Option window.
- Card security identification response has a message defined: if the authorization response and AVS response do not have a message defined, the message associated with the card security response displays in the Select Authorization Option window.

Batch order entry: This window does not display if you are performing online credit card authorization during batch order entry.

Order maintenance: The Select Authorization Response Option window displays if you are performing online credit card authorization during order maintenance. You can authorize a credit card during order maintenance by selecting On-line Auth for a credit card payment method.

Field	Description
Order #	The order number containing the credit card payment method that received this authorization response. Numeric, 8 positions; display-only.
Pay type	The description of the credit card payment method that received the authorization response containing this message text. Alphanumeric, 30 positions; display-only.
Credit card #	The credit card number defined for the credit card payment method used on the order. Information will be provided by Oracle at a later date. Alphanumeric, 20 positions; display-only.
Exp date (credit card expiration date)	The date this credit card is no longer valid. Numeric, 4 positions (MMYY format); display-only.
Auth amt	The amount sent for authorization for this credit card. If this credit card was the catch all payment method on the order or the only payment method on the order, this field is blank. Numeric, 13 positions with a 2-place decimal; display-only.
Vendor response pop up window messages # 1 - # 4	The message text from the Pop up window messages # 1 - # 4 fields for the vendor response you received from the service bureau. This message text should indicate whether the credit card has been approved or declined and any action that you should take to correct any problems and inform the customer. Alphanumeric, four 40-position fields; display-only.

Screen Option	Procedure
Accept the order	Select Accept Order. The system returns you to the Select Customer Sold To For Order Screen or the Customer Selection Screen if the operator placing the order is a CTI user, and processes the order through the Order Async.

Screen Option	Procedure
Return to the order to make any corrections or reject the order	Select Edit Order. The system returns you to the Work with Order/Recap Screen or the Enter Payment Method Screen where you can make any corrections or reject the order.

Resending Credit Cards for Authorization

If you did not receive a response from the service bureau during order entry or the credit card was declined in order entry, you can resend the credit card for authorization:

- selecting On-line Auth for the credit card at the [Enter Payment Methods Screen in Order Maintenance](#) in order maintenance. The system sends the credit card for authorization, waits for a response as in order entry, and displays the [Select Authorization Response Option Window](#) if pop up window message text was defined for the vendor response.
- using the Performing Batch Authorization (SATH) menu option. This menu option allows you to send credit cards associated with a selected ship via for authorization.
- during pick slip generation if the Batch/on-line field for the service bureau contains a C (on-line and batch authorizations).

Pick Slip Generation

You can generate pick slips for orders that contain pre-paid payment methods, such as cash or check, and/or credit cards that have received an approved authorization by selecting the Preauthorized orders only field in the pick generation template.

If you try to generate pick slips for orders that contain credit cards that have not been authorized with the Preauthorized orders only field selected and the [Use Auto Authorization Interface \(C14\)](#) system control value selected, the system will not send the credit cards up for authorization and will not generate pick slips.

Note:

If you generate pick slips for preauthorized orders only and records exist in the Authorization History table in an S (sent) status, the system updates the records to a D (decline) status. The next time you generate pick slips with the Preauthorized orders only field unselected, the system sends orders associated with records in the Authorization History table in a D status up for authorization.

Receiving authorizations during pick slip generation: If the credit card has not yet received an approved authorization, you can resend the credit card for authorization during pick slip generation if the Preauthorized orders only field in the pick generation template is unselected and the Batch/on-line field for the service bureau is set to C (batch and on-line authorization). See [Authorizations During Pick Slip Generation](#) for more information on receiving authorizations during pick slip generation.

[Authorization Listing Screen](#)

Credit Card Authorization List

The [Online Credit Card Authorization Listing](#) is a report you can use to review credit cards that have been authorized, declined, or sent for authorization for a specific date range.

You can generate this report by:

- defining selection criteria at the and selecting Accept.
- sending credit cards for authorization using the Performing Batch Authorization (SATH) menu option.

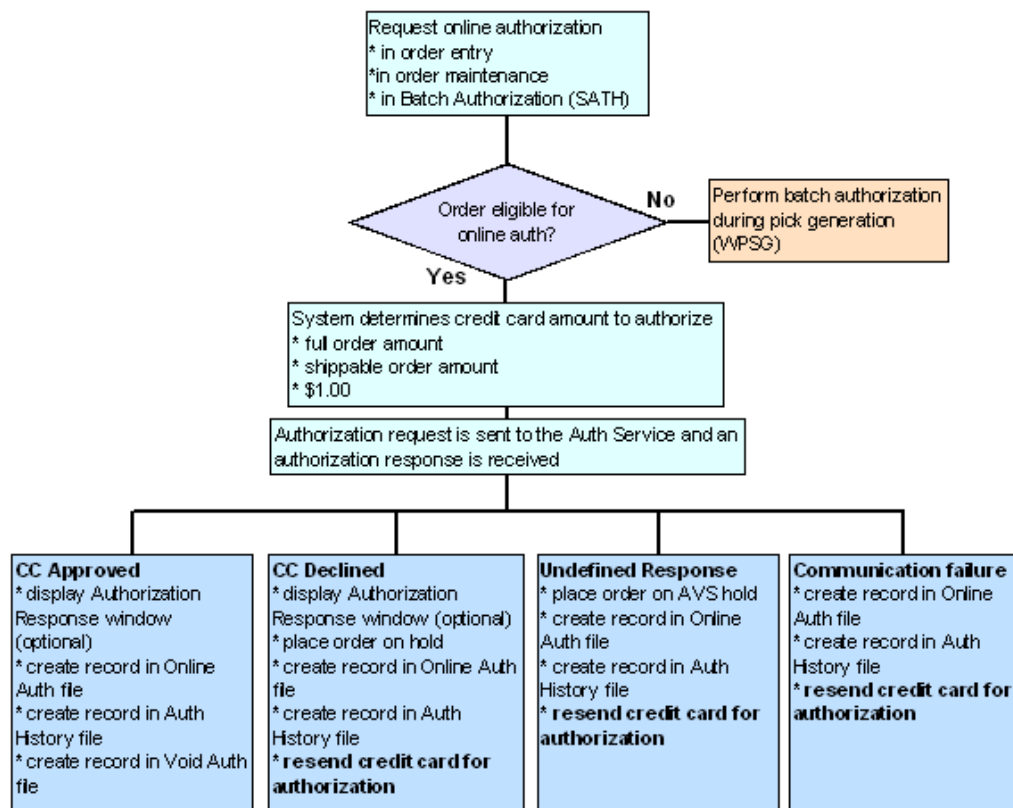

Note:

The system generates a similar report when you authorize credit cards during pick slip generation; see [Online Credit Card Authorization Listing](#).

Transmitting and Receiving Deposits

After you obtain an authorization for a credit card charge, you can generate a pick slip for the order, ship the order to the customer, and charge the credit card for the shipment. At this point, you use [Processing Auto Deposits \(SDEP\)](#) to transmit the deposit information to a deposit service for settlement.

Online Authorization Process

Online Credit Card Authorization Setup

Purpose: Before you can receive online credit card authorizations in your company, you must perform the necessary setup. Information requiring creation and setup includes:

- [System Control Values](#)

- [Number Assignment Value](#)
- [Service Bureau Settings](#), including response codes and currency codes
- [Order Types](#) eligible for online credit card authorization
- credit card [Pay Types](#)
- [Pick Slip Generation](#)

System Control Values

System Control Value	Description
On-line Authorizations (B89)	Select this field to indicate you will be performing online credit card authorizations. If this field is unselected, you will not be able to authorize credit cards in order entry or order maintenance.
Authorize Full Amount During Order Entry (G99)	Select this field to indicate you will send an order up for authorization for the full order amount. Deselect this field to indicate you will send an order up for authorization for the shippable order amount.
Online Auth Verification Only (I96)	Select this field to indicate you want the system to process online authorizations for \$1.00 for the purpose of validating the card. During batch authorizations, the system authorizes the card for the shippable dollar amount and voids the online authorization for \$1.00. If this field is unselected, the system looks at the Authorize Full Amount During Order Entry (G99) system control value to determine the amount sent for authorization.

Number Assignment Value

The number assignment Transaction Sequence # assigns the next available number to the credit card authorization.

Service Bureau Settings

- When you are setting up a service bureau to support online authorization, please note these required settings:
- Industry code: enter your DBA number.
- Batch/on-line: set to I (on-line) to perform only online credit card authorizations; set to C (on-line or batch) to perform both online credit card authorizations and batch credit card authorizations.
- Response time: set the number of seconds the system waits to receive a response from the service bureau before continuing to process the order.
- Pay type cross reference (Paytypes at the [Work with Authorization Services Screen](#)): Create a cross-reference for each pay type code for which you wish to receive online credit card authorization, using the vendor pay code information supplied by the service bureau.
- Currency cross reference (Currency at the [Work with Authorization Services Screen](#)): Create a cross-reference for each currency code you will use on orders receiving online credit card authorizations, using the vendor currency code information supplied by the service bureau.

- Vendor responses (Responses at the [Work with Authorization Services Screen](#)): Optionally, you can define Vendor response pop up window messages. The messages display in a pop up window in order entry when a credit card that was sent up for authorization is declined. You can enter up to four 40-position lines of message text. Set up vendor responses for authorizations, AVS (if you are performing address verification), and CID (if you are performing credit card identification).

Order Types

You define whether an order type is eligible for online authorizations and if the order type will display a window during order entry when a response is received from the service bureau, based on the On-line authorization field:

- Window indicates the order type is eligible for online authorizations and the [Select Authorization Response Option Window](#) displays.
- Without Window indicates the order type is eligible for online authorization and the Select Authorization Response Option Window does not display.
- Not Eligible indicates the order type is not eligible for online authorization.

Online authorization for web orders: In order to perform online authorization when Order Administration receives the web order through the *Generic Order Interface (Order API)*, the Online Authorization setting for the order type on the web order must be set to Without Window.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Pay Types

Each credit card pay type eligible for online authorization should have the service bureau set up as its authorization and deposit service. See [Working with Pay Types \(WPAY\)](#) for more information on setting up pay types.

Pick Slip Generation

If you wish to generate pick slips only for orders that contain pre-paid payment methods and/or credit cards that have received an authorization, you can create a pick slip generation template with the Preauthorized orders only field selected.

Processing Authorizations and Deposits Using Point-to-Point Communication

Purpose: Processing authorizations and deposits using point-to-point communication, allows you to post transactions directly to the service bureau in the format required by the service bureau.

Available Point-to-Point Integrations

Integration	See:
Oracle Retail Customer Engagement Stored Value Card integration: Allows you to process the stored value card transactions between Order Administration and Oracle Retail Customer Engagement in Oracle Retail Customer Engagement's message format.	Customer Engagement Stored Value Card Integration for an overview and more information on the Oracle Retail Customer Engagement messages used to process stored value card transactions between Order Administration and the Oracle Retail Customer Engagement system using point-to-point communication.

For more information: See:

- [Stored Value Card Integration](#) for more information on how to process stored value card transactions.
- [Processing Auto Deposits \(SDEP\)](#) for more information on deposit processing in Order Administration.

PayPal Direct Connection Integration

Purpose: The PayPal Direct Connection integration enables you to use PayPal as a method of payment on web orders.

- The web storefront sends the PayPal payment on the order directly to PayPal for authorization. The order must receive an approved authorization on the web storefront before it is sent to Order Administration for processing.
- During pick slip generation, Order Administration verifies that the amount required to generate the pick slip is covered by the authorization received for the PayPal payment during web storefront processing. If the amount is not covered, the system places the order on Credit Card Decline hold and the PayPal payment on PayPal Decline hold.
- During deposit processing, Order Administration sends the deposit transaction directly to PayPal for confirmation and settlement.
- When an order is canceled or the PayPal payment method deactivated, Order Administration sends an authorization reversal request to PayPal.

PayPal is an e-commerce business that allows you to perform payment and money transfers securely over the Internet. PayPal's service builds on the existing financial infrastructure of bank accounts and credit cards and utilizes fraud prevention systems to create a safe, global, real-time payment solution.

 **Note:**

PayPal is a registered trademark

The Order Administration PayPal Direct Connection integration allows you to use PayPal as a form of payment on web orders and send the deposit transactions directly to PayPal.

 **Note:**

Because the PayPal Direct Connection Integration does not send authorization transactions between Order Administration and PayPal, web orders containing a PayPal payment must receive an approved authorization on the web storefront before being sent to Order Administration for processing. In addition, you can only use PayPal as a form of payment on web orders. The Order Administration PayPal Direct Connection integration does not support PayPal as a form of payment on non-web orders.

In this topic: This topic provides an overview of the PayPal Direct Connection integration and the required setup.

PayPal Direct Connection Integration Process

- Processing Orders Containing a PayPal Payment
 - Validating a Web Order that Contains a PayPal Payment
 - Maintaining a PayPal Order
- Processing Authorizations for a PayPal Order
- Processing Deposits for a PayPal Order

PayPal Direct Connection integration illustration:

Processing Orders Containing a PayPal Payment

When a customer places an order on the web storefront and pays for the order using a PayPal account:

- The web storefront sends an authorization request for the PayPal payment directly to PayPal.
- PayPal validates the PayPal account number that is passed in the authorization request and sends PayPal confirmation information back to the web storefront.
- The web storefront completes the order and sends the order to Order Administration in the *Inbound Order XML Message (CWORDERIN)*.

Web orders containing a PayPal payment that has been authorized by PayPal contain the following information in the *Inbound Order XML Message (CWORDERIN)*. The authorization for the PayPal payment is sent to Order Administration as a manual authorization.

For more information see the Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- Regular order information
- PayPal pay type passed in the payment_type field
- PayPal transaction ID passed in the cc_number field

- Approved PayPal payment:
 - auth_amount
 - auth_number (this is the first 16 positions of the PayPal transaction ID)
 - auth_date (this is the date the PayPal payment was authorized with PayPal)

Validating a Web Order that Contains a PayPal Payment

Because the PayPal Direct Connection Integration does not send authorization transactions between Order Administration and PayPal, web orders containing a PayPal payment must receive an approved authorization on the web storefront before being sent to Order Administration for processing.

If Order Administration receives a web order that contains a PayPal payment that has not yet received an approved authorization, the system will accept the order; however, the PayPal payment will fail batch authorization and you will not be able to generate a pick slip for the order. See [Processing Authorizations for a PayPal Order](#).

Maintaining a PayPal Order

When you advance to an order in order maintenance that contains a pay type with PPL (PayPal) defined as the authorization service and deposit service, the system displays the [PayPal Warning Window](#) indicating that you should not make any changes to the order that would increase the order total. When you generate a pick slip for an order that contains a PayPal payment, the system validates that the amount required to generate the pick slip does not exceed 15% or \$75.00 of the initial authorization amount that was received from PayPal during web storefront processing.

Examples:

- If the authorization received from PayPal during web storefront processing is \$100.00, you can increase the order total up to \$115.00 ($\$100.00 + 15\% = \115.00) and still process the order without any problems. However, once you exceed \$115.00, the PayPal payment will fail batch authorization and the system will not generate a pick slip or perform drop ship processing for the order.
- If the authorization received from PayPal during web storefront processing is \$600.00, you can increase the order total up to \$675.00 and still process the order without any problems. However, once you exceed \$675.00, the PayPal payment will fail batch authorization and the system will not generate a pick slip or perform drop ship processing for the order. Note: The system does not allow you to increase the order total by 15% ($\$600.00 + 15\% = \690.00) because it would exceed \$75.00 of the initial authorization amount that was received from PayPal during web storefront processing.

Reversals? The system submits a reversal to PayPal if:

- The entire order is canceled or sold out, or;
- The payment method is deactivated before any transactions are billed.

The system does not submit a reversal to PayPal for a partial amount, such as when:

- A single item on a multi-line order is canceled or sold out.
- A single unit on an order line is canceled or sold out.
- Any items remaining on the order are canceled after a shipment has taken place.

Also, the reversal is not submitted if any of the order lines have been submitted to Order Orchestration for fulfillment.

For more information: See [Stored Value Card Authorization Reversal](#).

Applying Refunds Across Multiple Capture Transaction IDs

PayPal cannot process a refund that exceeds the amount of the initial deposit. For example, if an order includes two deposits of \$25.00, PayPal requires that any single refund processed not exceed \$25.00.

In order to be able to reconcile refunds against the initial deposits, Order Administration stores the [TRANSACTIONID](#) provided by PayPal for each deposit as the Capture Transaction ID in the Credit Card Deposit History table for each successful deposit with PayPal, so that each refund amount applies to a deposit amount.

Example: You process an order in two shipments:

- Shipment 1: \$50.00
- Shipment 2: \$40.00

During deposit processing, the capture transaction ID for each shipment is stored in the Credit Card Deposit History table. This ID is not displayed on any screen.

If you then need to process one or more refunds against the order, Order Administration uses the capture transaction IDs to reconcile the refund amounts. It uses the capture transaction ID that matches the refund amount, if any; otherwise, it uses the capture transaction ID for the lowest total shipment that exceeds the refund amount. For example:

- If the refund amount is \$40.00: Use the capture transaction ID for shipment 2, because the amount matches this shipment.
- If the refund amount is \$50.00: Use the capture transaction ID for shipment 1, because the amount matches this shipment.
- If the refund amount is \$45.00: Use the capture transaction ID for shipment 1 (because \$45.00 is more than the amount for shipment 2).
- If the refund amount is \$25.00: Use the capture transaction ID for shipment 1 (because \$25.00 does not match the amount of either deposit).
- If the refund amount is more than \$50.00: Split the refund across both capture transaction IDs.

Sometimes multiple capture transaction ID are used for a refund deposit, because no single transaction is large enough to cover the refund. In these cases, the [Display Order Payment History Screen](#) indicates the number of deposits used for the total refund amount. For example, if you process a refund totaling \$60.00 for an order with the two shipments, one for \$50.00 and another for \$25.00, the Display Order Payment History screen indicates:

- Partial Deposit confirmed \$50.00-
- Partial Deposit confirmed \$10.00-
- Deposit split into 2 separate deposits.
- Deposit confirmed \$60.00-

 **Note:**

These messages are not displayed at the Payment Method Details panel in Contact Center (Modern View Order Summary), although the purchase and deposit amounts are displayed.

In this situation, there is also an Order Transaction History message written, for example: Refund for inv# 1234 exceeds PayPal limit. Note that the message may be truncated based on the size of the invoice number.

Multiple refunds? Order Administration tracks the total returned amount for PayPal payment methods in order to ensure that subsequent refunds do not result in overusing any individual deposit amounts. For example, if there was a deposit for \$50.00 and a deposit of \$10.00, and there is already a refund amount of \$40.00 applied to the first deposit, leaving \$10.00 unrefunded, a subsequent refund of \$15.00 would be split across the two deposits.

If the deposit fails: When the deposit is not initially processed successfully and you use [Manage Rejected Deposits](#) in Modern View instead, no capture transaction ID is recorded, so a refund cannot be applied to the deposit.

 **Note:**

Deposits processed before update 20.0 will not have a capture transaction ID, so the process described above does not apply to these deposits.

Processing Authorizations for a PayPal Order

The system calls authorization processing when you generate a pick slip or perform drop ship processing for an order that contains a pay type with PPL (PayPal) defined as the authorization service. During authorization processing for an order that contains a PayPal pay type, the system validates that the required authorization amount is covered by the initial authorization received for the PayPal payment during web storefront processing.

- [Approved PayPal Authorizations](#)
 - [Example: Approved PayPal Authorization](#)
 - [Example: Multiple Approved PayPal Authorizations](#)
 - [Example: Approved PayPal Authorization for Amount Within Allowed 15%](#)
 - [Example: Approved PayPal Authorization and Credit Card Authorization](#)
- [Declined PayPal Authorizations](#)
 - [Example: Declined PayPal Authorization for Amount Over 15%](#)
 - [Example: Declined PayPal Authorization for Amount Over \\$75.00](#)

 **Note:**

Orders containing a PayPal payment should have received an authorization from PayPal on the web storefront before the order was received into Order Administration. The system does not send a PayPal payment to PayPal for authorization during pick slip generation or drop ship processing.

PayPal Authorization Processing

The system performs the following steps during PayPal authorization processing.

#	Step
1.	<p>The system determines if a manual authorization exists for the PayPal payment on the order.</p> <ul style="list-style-type: none"> If a manual authorization does not exist for the PayPal payment on the order, the system declines the authorization. See Declined PayPal Authorizations for the updates that the system performs. If a manual authorization exists for the PayPal payment on the order, the system determines if this is the first time authorization processing was called for the PayPal payment on the order.
2.	<p>If this is the first time authorization processing was called for the PayPal payment on the order, the system:</p> <ul style="list-style-type: none"> Creates an order history record indicating the manual authorization was detected. This record indicates: <ul style="list-style-type: none"> The date when the order history record was created. The first 16 positions of the PayPal transaction ID. The amount that was manually authorized. This is the amount that was authorized by PayPal on the web storefront. Creates an authorization history record for the manual authorization. This record indicates: <ul style="list-style-type: none"> That the authorization was authorized. The first 16 positions of the PayPal transaction ID in the Authorization # field. The date the PayPal payment was authorized by PayPal on the web storefront. The date the authorization expires. The amount authorized for the PayPal payment. The amount available to apply towards other authorization requests. This amount equals the amount authorized until the system approves an authorization request.

Order history record for manual authorization: The system creates an order history record for the authorization that was received from PayPal on the web storefront. For example:

Date	Type	Transaction Note	Amount	User
7/28/09	AUTH	MANUAL AUTH# DETECTED - O- AUTH_CODE	100.00	AUTH

Authorization history record for manual authorization: The system creates an approved authorization history record for the authorization that was received from PayPal on the web storefront. For example:

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_C ODE	7/28/09	8/26/09	100.00	100.00

- | # | Step |
|----|--|
| 3. | <p>The system determines if the initial authorization has expired.</p> <p>The system uses the following calculation to determine the expiration date: authorization date from Authorization History table + Reauthorization days from Pay Type table = authorization expiration date</p> <p>For example, if the initial authorization date is 7/01/09 and the Reauthorization days is 29, the initial authorization expires on 7/29/09 (7/01/09 + 29 = 7/29/09).</p> <p>If the initial authorization has expired, the system declines the authorization. See Declined PayPal Authorizations for the updates that the system performs.</p> |
| 4. | <p>The system determines if the amount of the authorization request exceeds the manual authorization. The system allows the authorization request amount to be 15%, or up to \$75.00, over the initial authorization amount.</p> <p>For example:</p> <ul style="list-style-type: none"> • If the manual authorization is for \$100.00, the authorization request cannot exceed \$115.00 ($\\$100.00 + 15\% = \\$115.00$). • If the manual authorization is for \$600.00, the authorization request cannot exceed \$675.00. The system does not allow an increase of 15% to the \$600.00 authorization because 15% of \$600.00 exceeds \$75.00 ($600.00 + 15\% = 690.00$). <p>If the authorization request amount exceeds the initial authorization by 15% or \$75.00, the system declines the authorization. See Declined PayPal Authorizations for the updates that the system performs.</p> <p>Orders that Contain a Catch-All Credit Card Pay Type</p> <p>If the order contains a catch-all credit card pay type in addition to the PayPal pay type, instead of declining the PayPal authorization, the system adds the amount that exceeds the manual authorization to the catch-all credit card pay type on the order. In this situation, the system approves the PayPal authorization for the manual authorization amount and applies the amount not covered by the manual authorization to the catch-all credit card.</p> <p>For example, if the manual authorization for the PayPal pay type is \$100.00 and the order total is \$124.00, the system approves the PayPal authorization request for \$100.00 and applies \$24.00 towards the catch-all credit card on the order.</p> |

#	Step
5.	<p>If the amount of the authorization request is covered by the manual authorization or exceeds the manual authorization but is within the 15% or \$75.00 allowance, the system approves the authorization.</p> <p>If the approved authorization amount exceeds the manual authorization, the system creates a new authorization history record for the extra amount. This record indicates:</p> <ul style="list-style-type: none"> • That the authorization was authorized. • The first 16 positions of the PayPal transaction ID in the Authorization # field. • The date the PayPal payment was authorized; this is the date the initial authorization was received from PayPal. • The date the authorization expires. • The extra amount authorized for the PayPal payment. <p>See Approved PayPal Authorizations for the updates that the system performs.</p>

Approved PayPal Authorizations

If the authorization received for the PayPal payment during web storefront processing covers the amount in the authorization request, the system:

- Generates a pick slip or performs drop ship processing for the order.
- Decreases the Amount available for the initial authorization history record by the authorization request amount. For example, if the initial authorization amount received on the web storefront is \$100.00, and the authorization request amount is \$28.00, the remaining amount available on the initial authorization is \$72.00.
- If the authorization request amount exceeds the manual authorization received for the PayPal payment, but is within the 15% or \$75.00 allowance, the system creates a new authorization history record for the extra amount.

Updated authorization history record for manual authorization:

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_COD E	7/28/09	8/26/09	100.00	72.00

New authorization history record for the amount not covered by the manual authorization but within the 15% or \$75.00 allowance:

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_COD E	7/28/09	8/26/09	12.00	.00

Example: Approved PayPal Authorization

A customer places an order on the web storefront and uses PayPal as the form of payment. The order total is \$100.00 and PayPal authorizes the payment for \$100.00. The web storefront sends the order to Order Administration with a manual authorization for the PayPal payment:

- cc_name = PAYPAL
- cc_number = O-CC_NUMBER (this is the PayPal transaction ID)
- auth_amount = 100.00
- auth_number = O-AUTH_CODE (this is the first 16 positions of the PayPal transaction ID)
- auth_date = 06262009

Order Administration receives and processes the order. Based on the Reauthorization days defined for the PayPal pay type, the PayPal payment does not expire until 29 days from the authorization date.

You generate a pick slip for the entire order. The authorization amount required to generate a pick slip for the order is \$100.00. Because the unused authorization amount of \$100.00 covers the amount required to generate a pick slip for the order, the system:

- Generates the pick slip.
- Creates an order history record:

Date	Type	Transaction Note	Amount	User
6/26/09	AUTH	MANUAL AUTH# DETECTED - O-AUTH_CODE	100.00	AUTH

- Creates an authorization history record for the PayPal payment on the order.

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_CODE	6/26/09	7/25/09	100.00	.00

Example: Multiple Approved PayPal Authorizations

A customer places an order on the web storefront and uses PayPal as the form of payment. The order total is \$100.00 and PayPal approves the payment for \$100.00. The web storefront sends the order to Order Administration with a manual authorization for the PayPal payment:

- cc_name = PAYPAL
- cc_number = O-AUTH_CODE (this is the PayPal transaction ID)
- auth_amount = 100.00
- auth_number = O-AUTH_CODE (this is the first 16 positions of the PayPal transaction ID)
- auth_date = 06262009

Order Administration receives and processes the order. Based on the Reauthorization days defined for the PayPal pay type, the PayPal payment does not expire until 29 days from the authorization date.

You generate a pick slip for part of the order. The authorization amount required to generate a pick slip for the order is \$42.00. Because the unused authorization amount of \$100.00 covers the amount required to generate a pick slip for the order, the system:

- Generates the pick slip.
- Creates an order history record:

Date	Type	Transaction Note	Amount	User
6/26/09	AUTH	MANUAL AUTH# DETECTED - O- AUTH_CODE	100.00	AUTH

Creates an authorization history record.

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorize d	O- AUTH_CODE	6/26/09	7/25/09	100.00	58.00

You generate a pick slip for the remainder of the order. The authorization amount required to generate a pick slip for the order is \$58.00. Because the unused authorization amount of \$58.00 covers the amount required to generate a pick slip for the order, the system:

- Generates the pick slip.
- Updates the authorization history record.

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O- AUTH_CODE	6/26/09	7/25/09	58.00	0.00

Example: Approved PayPal Authorization for Amount Within Allowed 15%

A customer places an order on the web storefront and uses PayPal as the form of payment. The order total is \$100.00 and PayPal approves the payment for \$100.00. The web storefront sends the order to Order Administration with a manual authorization for the PayPal payment:

- cc_name = PAYPAL
- cc_number = O-AUTH_CODE (this is the PayPal transaction ID)
- auth_amount = 100.00
- auth_number = O-AUTH_CODE (this is the first 16 positions of the PayPal transaction ID)
- auth_date = 06262009

Order Administration receives and processes the order. Based on the Reauthorization days defined for the PayPal pay type, the PayPal payment does not expire until 29 days from the authorization date.

You maintain the order and as a result the order total increases to \$110.50.

You generate a pick slip for the entire order. The authorization amount required to generate a pick slip for the order is \$110.50. Because the required authorization amount is within 15% of the unused authorization amount of \$100.00, the system:

- Generates the pick slip.
- Creates an order history record:

Date	Type	Transaction Note	Amount	User
6/27/09	AUTH	MANUAL AUTH# DETECTED - O- AUTH_CODE	100.00	AUTH

Creates authorization history records:

- One authorization history record for the original authorization amount received from PayPal on the web storefront.
- One authorization history record for the amount that was over the original authorization amount, but within 15% of the original authorization amount.

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O- AUTH_CODE	6/26/09	7/25/09	100.00	0.00
Authorized	O- AUTH_CODE	6/26/09	7/25/09	10.50	0.00

Example: Approved PayPal Authorization and Credit Card Authorization

Declined PayPal Authorizations

If the authorization received for the PayPal payment during web storefront processing does not cover the authorization request amount, the system places the order on hold and does not generate a pick slip or perform drop ship processing for the order.

The system declines the PayPal authorization for the following reasons:

- A manual authorization does not exist for the PayPal payment, or
- The initial authorization received from PayPal on the web storefront has expired, or
- The authorization request amount exceeds 15% of the initial authorization amount received from PayPal on the web storefront, or
- The authorization request amount exceeds \$75.00 of the initial authorization amount received from PayPal on the web storefront.

If the authorization received for the PayPal payment during web storefront processing cannot cover the authorization request amount, or a manual authorization for the PayPal payment does not exist, the system:

- Does not generate a pick slip or perform drop ship processing for the order.
- If the authorization was declined because the initial authorization has expired, the system updates the Amount available for the initial authorization history record to zero. For example:

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_CODE	6/26/09	7/25/09 EXPIRED	100.00	.00

- If the authorization was declined because the initial authorization amount cannot cover the authorization request amount, the system does not update the initial authorization history record. For example:

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_CODE	7/27/09	8/25/09	100.00	100.00

- Creates an authorization history record for the declined authorization amount. For example:

Status	Vendor Response	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Declined	PPLDECLINE		7/27/09	8/25/09	39.00	.00

- Places the order on Declined Credit Card (AT) hold and the PayPal payment on the hold reason defined for the PPLDECLINE response code (typically PP PayPal Decline). Note:
- If the PPLDECLINE response code has not been set up for the PPL service bureau, the system places the order on AV hold.
- If the PPLDECLINE response code exists, but a hold reason is not defined for the response code, the system does not place the order on hold, but does not generate a pick slip for the order since the initial authorization for the PayPal payment is not valid.
- Creates order history records indicating the authorization was declined and the order as put on hold. For example:

Date	Type	Transaction Note	Amount	User
7/27/09	PICKGEN	ORDER FLAGGED FOR CREDITCARD CANCELLATIO		USER
7/27/09	HOLD	SYS HLD - DECLINED CREDIT CARD	39.00	USER

Correcting PayPal authorization declines: If Order Administration declines the PayPal authorization request, you will need to correct the error by either:

- Maintaining the order and reducing the order total so that it does not exceed 15% or \$75.00 of the initial authorization amount received from PayPal on the web storefront.
- Calling the customer on the order to ask for an additional form of payment to cover the amount that exceeds the initial authorization amount received from PayPal on the web storefront.
- Canceling the order.

 **Note:**

Before you run pick slip generation or perform drop ship processing for the order again, make sure to remove the order from hold.

Example: Declined PayPal Authorization for Amount Over 15%

A customer places an order on the web storefront and uses PayPal as the form of payment. The order total is \$100.00 and PayPal approves the payment for \$100.00. The web storefront sends the order to Order Administration with a manual authorization for the PayPal payment:

- cc_name = PAYPAL
- cc_number = O-AUTH_CODE (this is the PayPal transaction ID)
- auth_amount = 100.00
- auth_number = O-AUTH_CODE (this is the first 16 positions of the PayPal transaction ID)
- auth_date = 06262009

Order Administration receives and processes the order. Based on the Reauthorization days defined for the PayPal pay type, the PayPal payment does not expire until 29 days from the current date.

You maintain the order and as a result the order total increases to \$122.50.

You generate a pick slip for the entire order. The authorization amount required to generate a pick slip for the order is \$122.50. Because the unused authorization amount of \$100.00 does not cover the amount required to generate a pick slip for the order, and the amount required exceeds 15% of the unused authorization, the system:

- Does not generate a pick slip.
- Declines the PayPal authorization.
- Places the order on Credit Card Decline (AT) hold and the PayPal payment on the hold reason defined for the PPLDECLINE response code.
- Creates order history records, indicating the PayPal authorization was declined:

Date	Type	Transaction Note	Amount	User
6/26/09	AUTH	MANUAL AUTH# DETECTED - O-42693038SP2401	100.00	AUTH
6/26/09	PICK GEN	ORDER FLAGGED FOR CREDITCARD CANCELLATIO		USER
6/26/09	HOLD	SYS HLD - DECLINED CREDIT CARD	22.50	USER

Creates authorization history records for the PayPal payment on the order, indicating the authorization was declined.

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_CODE	6/26/09	7/25/09	100.00	100.00
Declined	E	6/26/09	7/25/09	22.50	0.00

The system allows you to generate a pick slip for the order if:

- You maintain the order and decrease the amount so that it does not exceed 15% of the unused PayPal authorization (\$115.00), or
- You maintain the order and apply the amount that exceeds 15% of the unused PayPal authorization towards another form of payment.

Example: Declined PayPal Authorization for Amount Over \$75.00

A customer places an order on the web storefront and uses PayPal as the form of payment. The order total is \$600.00 and PayPal approves the payment for \$600.00. The web storefront sends the order to Order Administration with a manual authorization for the PayPal payment:

- cc_name = PAYPAL
- cc_number = O-AUTH_CODE (this is the PayPal transaction ID)
- auth_amount = 600.00
- auth_number = O-AUTH_CODE (this is the first 16 positions of the PayPal transaction ID)
- auth_date = 06262009

Order Administration receives and processes the order. Based on the Reauthorization days defined for the PayPal pay type, the PayPal payment does not expire until 29 days from the current date.

You maintain the order and as a result the order total increases to \$680.00.

You generate a pick slip for the entire order. The authorization amount required to generate a pick slip for the order is \$680.00. While \$680.00 is within 15% of the unused PayPal authorization, it is greater than \$75.00 of the unused authorization. Because the authorization amount required to generate a pick slip for the order (\$680.00) is greater than \$75.00 of the unused PayPal authorization (\$600.00), the system:

- Does not generate a pick slip.
- Declines the PayPal authorization.
- Places the order on Credit Card Decline (AT) hold and the PayPal payment on the hold reason defined for the PPLDECLINE response code.
- Creates order history records, indicating the PayPal authorization was declined:

Date	Type	Transaction Note	Amount	User
6/26/09	AUTH	MANUAL AUTH# DETECTED - O-42693038SP2401	600.00	AUTH
6/26/09	PICK GEN	ORDER FLAGGED FOR CREDITCARD CANCELLATIO		USER

Date	Type	Transaction Note	Amount	User
6/26/09	HOLD	SYS HLD - DECLINED CREDIT CARD	80.00	USER

Creates authorization history records for the PayPal payment on the order, indicating the authorization was declined.

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Authorized	O-AUTH_CODE	6/26/09	7/25/09	600.00	600.00
Declined		6/26/09	7/25/09	80.00	0.00

The system allows you to generate a pick slip for the order if:

- You maintain the order and decrease the amount so that it does not exceed \$75.00 of the unused PayPal authorization (\$675.00), or
- You maintain the order and apply the amount that exceeds \$75.00 of the unused PayPal authorization towards another form of payment.

Example: Initial PayPal Authorization Expired

A customer places an order on the web storefront and uses PayPal as the form of payment. The order total is \$100.00. Due to communication problems, the web storefront cannot send the PayPal payment to PayPal for approval. The web storefront sends the order to Order Administration without a manual authorization for the PayPal payment:

- cc_name = PAYPAL
- cc_number = O-AUTH_CODE (this is the PayPal transaction ID)

Order Administration receives and processes the order.

You generate a pick slip for the entire order. The authorization amount required to generate a pick slip for the order is \$100.00. Because a manual authorization does not exist for the PayPal payment on the order, the system:

- Does not generate a pick slip.
- Declines the PayPal authorization.
- Places the order on Credit Card Decline (AT) hold and the PayPal payment on the hold reason defined for the PPLDECLINE response code.
- Creates order history records, indicating the PayPal authorization was declined:

Date	Type	Transaction Note	Amount	User
6/26/09	PICK GEN	ORDER FLAGGED FOR CREDITCARD CANCELLATIO		USER
6/26/09	HOLD	SYS HLD - DECLINED CREDIT CARD	100.00	USER

Creates an authorization history record for the PayPal payment on the order, indicating the authorization was declined.

Status	Auth #	Auth Date	Auth Expires	Amt Submitted	Amt Available
Declined		6/26/09	7/25/09	100.00	0.00

Processing Deposits for a PayPal Order

When you process deposits for an order that contains a pay type with PPL (PayPal) defined as the deposit service, the system sends the deposit transaction directly to PayPal via PayPal SOAP API architecture.

- [PayPal Deposit Processing](#)
 - [Approved PayPal Deposits](#)
 - [Failed PayPal Deposits](#)
- [Purchase Deposit Transactions](#)
 - [PayPal DoCapture Request](#)
 - [PayPal DoCapture Response](#)
- [Return Deposit Transactions](#)
 - [PayPal RefundTransaction Request](#)
 - [PayPal RefundTransaction Response](#)

PayPal Deposit Processing

The system performs the following steps during PayPal deposit processing.

#	Step
1.	<p>Determines if the deposit is for a debit or credit transaction.</p> <ul style="list-style-type: none"> • If the deposit transaction is for a debit transaction, the system sends the PayPal DoCapture Request to PayPal. • If the deposit transaction is for a credit transaction, the system sends the PayPal RefundTransaction Request to PayPal.
2.	<p>PayPal processes the deposit and sends the response back to Order Administration.</p> <ul style="list-style-type: none"> • If the deposit transaction is for a debit transaction, PayPal sends the PayPal DoCapture Response to Order Administration. • If the deposit transaction is for a credit transaction, PayPal sends the PayPal RefundTransaction Response to Order Administration.
3.	<p>Order Administration receives the response and processes the deposit. See Approved PayPal Deposits and Failed PayPal Deposits.</p>

Approved PayPal Deposits

If the deposit for the PayPal payment was approved, the system:

- For debit transactions, updates the authorization history record with the deposit amount.
For example:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Dep
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	28.00

- Creates a deposit history record for the deposit transaction.

For debit transactions:

Inv#	Type	Date	Amt	Status	Response	Action
467	*PURCH	7/28/09	28.00	CONFIRMED	*PROCESSED	Deposit

For credit transactions:

Inv#	Type	Date	Amt	Status	Response	Action
479	*RETURN	7/30/09	20.00-	CONFIRMED	*PROCESSED	Return

- For debit transactions:
- Updates the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#). However, if a transaction ID is already defined in the Authentication value field, the system replaces the transaction ID only if the deposit amount for the current deposit transaction is equal to or greater than the deposit amount for the previous deposit transaction. For example, If you process two deposit transactions for a PayPal order: the first deposit for \$25.00 and the second deposit for \$40.00, when you process the second deposit, the system updates the transaction ID defined in the Authentication value field with the transaction ID returned for the second deposit since the second deposit amount (\$40.00) is greater than the first deposit amount (\$25.00).
- During deposit processing, updates the Credit Card Deposit History table with the transaction ID for each successful deposit, storing it as the capture transaction ID. The system then uses this capture transaction ID to tie refunds, if generated, to individual deposits; see [Applying Refunds Across Multiple Capture Transaction IDs](#) for more information. This ID is not displayed on any screen.

Example: Approved PayPal Deposit Across Multiple Authorizations

The PayPal payment on an order has the following authorization history records:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	.00
Authorized	O-AUTH_CODE	7/28/09	8/26/09	12.00	.00	.00

You submit a debit deposit transaction for the PayPal payment for \$112.00. Order Administration sends the deposit transaction to PayPal in the [PayPal DoCapture Request](#) and receives the approved response in the [PayPal DoCapture Response](#).

Order Administration:

- Updates the authorization history records with the deposit amount of \$112.00.

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	100.00
Authorized	O-AUTH_CODE	7/28/09	8/26/09	12.00	.00	12.00

- Creates a deposit history record for the deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action
469	*PURCH	7/28/09	112.00	CONFIRMED	*PROCESSE D	Deposit

- Updates the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#).

Example: Approved PayPal Deposit Across Multiple Deposits; Authentication Value Updated

The PayPal payment on an order has the following authorization history record:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	.00

You submit a debit deposit transaction for the PayPal payment for \$28.00. Order Administration sends the deposit transaction to PayPal in the [PayPal DoCapture Request](#) and receives the approved response in the [PayPal DoCapture Response](#).

Order Administration:

- Updates the authorization history record with the deposit amount of \$28.00.

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	28.00

- Creates a deposit history record for the deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action
469	*PURCH	7/28/09	28.00	CONFIRMED	*PROCESSED	Deposit

- Updates the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#).
- You submit a second debit deposit transaction for the PayPal payment for \$28.00. Order Administration sends the deposit transaction to PayPal in the [PayPal DoCapture Request](#) and receives the approved response in the [PayPal DoCapture Response](#).

Order Administration:

- Updates the authorization history record with the deposit amount of \$28.00.

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	56.00

- Creates a deposit history record for the deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action
469	*PURCH	7/28/09	28.00	CONFIRMED	*PROCESSED	Deposit
470	*PURCH	7/28/09	28.00	CONFIRMED	*PROCESSED	Deposit

- Updates the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#). The system performs this update because the deposit amount for the current deposit transaction (\$28.00) is equal to the deposit amount for the previous deposit transaction.
- You submit a third debit deposit transaction for the PayPal payment for \$44.00. Order Administration sends the deposit transaction to PayPal in the [PayPal DoCapture Request](#) and receives the approved response in the [PayPal DoCapture Response](#).

Order Administration:

- Updates the authorization history record with the deposit amount of \$44.00.

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	44.00

- Creates a deposit history record for the deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action
469	*PURCH	7/28/09	28.00	CONFIRMED	*PROCESSED	Deposit
470	*PURCH	7/29/09	28.00	CONFIRMED	*PROCESSED	Deposit
471	*PURCH	7/30/09	44.00	CONFIRMED	*PROCESSED	Deposit

- Updates the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#). The system performs this update because the deposit amount for the current deposit transaction (\$44.00) is greater than the deposit amount for the previous deposit transaction (\$28.00).

Example: Approved PayPal Deposit Across Multiple Deposits; Authentication Value Not Updated

The PayPal payment on an order has the following authorization history record:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authoriz ed	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	.00

You submit a debit deposit transaction for the PayPal payment for \$56.00. Order Administration sends the deposit transaction to PayPal in the [PayPal DoCapture Request](#) and receives the approved response in the [PayPal DoCapture Response](#).

Order Administration:

- Updates the authorization history record with the deposit amount of \$56.00.

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	56.00

- Creates a deposit history record for the deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action
472	*PURCH	7/28/09	56.00	CONFIRMED	*PROCESSED	Deposit

- Updates the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#).
- You submit a second debit deposit transaction for the PayPal payment for \$44.00. Order Administration sends the deposit transaction to PayPal in the [PayPal DoCapture Request](#) and receives the approved response in the [PayPal DoCapture Response](#).

Order Administration:

- Updates the authorization history record with the deposit amount of \$44.00.

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	44.00

- Creates a deposit history record for the deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action
472	*PURCH	7/28/09	56.00	CONFIRMED	*PROCESSED	Deposit
473	*PURCH	7/28/09	44.00	CONFIRMED	*PROCESSED	Deposit

- Does not update the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#). The system does not update this field because the deposit amount for the current deposit transaction (\$44.00) is less than the deposit amount for the previous deposit transaction (\$56.00).

Example: Approved PayPal Deposit and Catch-All Credit Card Deposit

The PayPal pay type on an order has the following authorization history record:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O-AUTH_CODE	7/28/09	8/26/09	100.00	.00	.00

The catch-all credit card pay type on the order has the following authorization history record:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	AUTH_#	7/28/09	8/26/09	24.00	.00	.00

You submit a debit deposit transaction for the order for \$124.00. Order Administration:

- Sends the deposit transaction for the credit card to the service bureau for deposit processing.
- Sends the deposit transaction to PayPal in the [PayPal DoCapture Request](#) and receives the approved response in the [PayPal DoCapture Response](#).

Order Administration:

- Updates the authorization history records with the deposit amount of \$124.00.

PayPal pay type:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	O- AUTH_CODE	7/28/09	8/26/09	100.00	.00	124.00

Catch-all Credit Card pay type:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authorized	AUTH_#	7/28/09	8/26/09	24.00	.00	24.00

- Creates a deposit history record for the deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action	Ser
475	*PURCH	7/28/09	100.00	CONFIRME D	*PROCESSE D	Deposit	PPL
475	*PURCH	7/28/09	24.00	CONFIRME D	100	Deposit	PMT

- Updates the Authentication value field in the Order Payment Method table with the transaction ID returned in the [PayPal DoCapture Response](#).

Example: Approved PayPal Credit Deposit

The PayPal payment on an order has the following authorization history records:

Status	Auth #	Auth Date	Auth Expires	Amt Submit	Amt Avail	Amt Deposit
Authoriz ed	O- AUTH_CODE	7/30/09	8/28/09	100.00	.00	100.00
Authoriz ed	O- AUTH_CODE	7/30/09	8/28/09	14.19	.00	14.19

A debit deposit history record exists for the order:

Inv#	Type	Date	Amt	Status	Response	Action
480	*PURCH	7/30/09	114.20	CONFIRME D	*PROCESSED	Deposit

The customer returns part of the order for a credit of \$22.00.

You submit a credit deposit transaction for the PayPal payment for \$22.00. Order Administration sends the deposit transaction to PayPal in the [PayPal RefundTransaction Request](#) and receives the approved response in the [PayPal RefundTransaction Response](#).

Order Administration creates a deposit history record for the credit deposit transaction.

Inv#	Type	Date	Amt	Status	Response	Action
481	*PURCH	7/30/09	22.00-	CONFIRMED	*PROCESSED	Return

Failed PayPal Deposits

The deposit transaction will be rejected if:

- Communication failures occur between Order Administration and PayPal.
- A duplicate deposit transaction already exists on the PayPal system.
- For debit deposit transactions:
 - The debit amount is greater than the associated authorization amount.
 - The transaction ID defined for the deposit does not match the associated authorization transaction.
- For credit deposit transactions:
 - The transaction ID defined for the deposit does not match the associated debit deposit transaction.
 - The credit amount is greater than the deposit amount.

For example, the PayPal payment on an order receives an authorization for \$100.00.

On 6/24, the system ships part of the order for \$40.00.

On 6/30, the system ships the rest of the order for \$60.00.

On 7/15, the system processes a return for the order for \$75.00.

Because the return amount of \$75.00 is greater than each deposit amount, PayPal fails the return deposit.

Correcting failed deposits: You can use the Submit Rejected Deposits (SRDP) menu option to cancel or resend failed deposits.

See [PayPal Direct Connection Integration Troubleshooting](#).

Purchase Deposit Transactions

Deposits for a debit (*PURCH) transaction use the PayPal DoCapture method to process the settlement. The system uses the API credentials ([API User name](#), [API Password](#), and [API Signature](#)) defined for the PPL service bureau as the credentials used to establish a direct connection to the PayPal system during deposit processing.

PayPal DoCapture Request

Order Administration sends the purchase deposit transaction to PayPal in the PayPal DoCapture Request transaction.

Parameter	Description
METHOD	DoCapture. Transactions sent to PayPal for a purchase deposit use the PayPal DoCapture API.
AUTHORIZATION ID	The transaction ID from the Credit card # field in the Order Payment Method table.

Parameter	Description
AMT	The amount of the deposit transaction. PayPal will accept an amount that is up to 15% or \$75.00 more than the original authorization amount. Note: This amount cannot exceed \$10,000.
CURRENCYCODE	The PayPal currency code, from the ASC Currency code field in the Auth Service Currency table that corresponds to the Currency in the Order Header Extended table. <ul style="list-style-type: none"> If the Currency in the Order Header Extended table is blank, the system uses the currency code defined in the Local Currency Code (A55) system control value to determine which ASC Currency code in the Auth Service Currency table to use. If a cross reference is not defined in Authorization Service Currency for the selected currency code, the system leaves the CURRENCYCODE in the PayPal DoCapture Request blank; PayPal treats a blank CURRENCYCODE as USD currency. See the Work with Authorization Service Currency Screen to cross-reference the Order Administration currency code to the PayPal currency code.
COMPLETETYPE	NotComplete. This value indicates that there may be additional captures.
INVNUM	The company number and invoice number. Also includes the ecommerce order number if the Append Ecommerce Order # to PayPal Invoice ID (M40) system control value is selected. The company number and invoice number include leading zeros. Example: 006-0000467-EC12345, where 006 is the company number, 0000467 is the invoice number, and EC12345 is the ecommerce order number.
NOTE	The charge description from the Charge description field in the Authorization Service table, followed by the order number. A plus sign (+) displays for each space. Example: PAYPAL+DIRECT+COMMUNICATION+1845, where PAYPAL DIRECT COMMUNICATION is the charge description and 1845 is the order number.

PayPal DoCapture Response

Order Administration receives the purchase deposit response transaction from PayPal in the PayPal DoCapture Response transaction.

Parameter	Description
AUTHORIZATION ID	The transaction ID from the card number field in the Order Payment Method table.

Parameter	Description
TRANSACTIONID	<p>The unique transaction ID assigned by PayPal to the deposit confirmation.</p> <p>Updates the Authentication value field in the Order Payment Method table. However, if a transaction ID is already defined in the Authentication value field, the system replaces the transaction ID only if the deposit amount for the current deposit transaction is equal to or greater than the deposit amount for the previous deposit transaction.</p> <p>Example: If you process two deposit transactions for a PayPal order: the first deposit for \$25.00 and the second deposit for \$40.00, when you process the second deposit, the system updates the transaction ID defined in the Authentication value field with the transaction ID returned for the second deposit since the second deposit amount (\$40.00) is greater than the first deposit amount (\$25.00).</p> <p>Capture transaction ID: During deposit processing, the system updates the Credit Card Deposit History table with this transaction ID for each successful deposit, storing it as the capture transaction ID. The system then uses this capture transaction ID to tie refunds, if generated, to individual deposits; see Applying Refunds Across Multiple Capture Transaction IDs for more information. This ID is not displayed on any screen.</p>
PARENT TRANSACTIONID	
PAYMENTTYPE	Indicates whether the payment is instant or delayed.
ORDERTIME	<p>The date and time when the payment was processed by PayPal.</p> <p>Example: 2009-07-24T17:23:15Z</p>
AMT	The final amount charged, including any shipping and taxes from the Merchant Profile.
FEEAMT	The PayPal fee amount charged for the transaction.
SETTLEAMT	The amount deposited in the merchant's PayPal account if there is a currency conversion.
EXCHANGERATE	The exchange rate if a currency conversion occurred.
PAYMENTSTATUS	<p>Order Administration considers a deposit successful if the following status is received:</p> <ul style="list-style-type: none"> Completed = The payment was completed, and the funds were added successfully to the merchant's account balance. Refunded = The merchant refunded the payment. Processed = A payment was accepted. <p>The system considers any other response a rejected deposit.</p> <p>Updates the Response field in the Deposit History table.</p>

Return Deposit Transactions

Deposits for a credit (*RETURN) transaction use the PayPal RefundTransaction method to process the settlement. The system uses the API credentials ([API User name](#), [API Password](#), and [API Signature](#)) defined for the PPL service bureau as the credentials used to establish a direct connection to the PayPal system during deposit processing.

PayPal RefundTransaction Request

Order Administration sends the return deposit request transaction to PayPal in the PayPal RefundTransaction Request transaction.

Parameter	Description
METHOD	RefundTransaction. Transactions sent to PayPal for a return deposit use the PayPal RefundTransaction API.
TRANSACTIONID	The transaction ID from the Authentication value field in the Order Payment Method table for the record associated with the first non-deactivated PayPal pay type. This ID is also stored in the Credit Card Deposit History table as the capture transaction ID. The system uses this value to match a purchase deposit to the return deposit. When a refund is applied across multiple transactions, the system uses the capture transaction IDs to reconcile the refund amounts and submits each refund amount separately based on the originating capture transaction ID. See Applying Refunds Across Multiple Capture Transaction IDs for a discussion. If a transaction ID does not exist in the Authentication value, the system sends a blank Authorization ID field to PayPal. Because PayPal cannot match a purchase deposit to the return deposit, the system places the return deposit in a failed status.
REFUNDTYPE	The type of refund to make. Set to Partial.
AMT	The amount of the deposit (refund) transaction. Return Amount PayPal does not accept returns for an amount that is greater than the original deposit amount. For example, the PayPal payment on an order receives an authorization for \$100.00. <ul style="list-style-type: none"> On 6/24, the system ships part of the order for \$40.00. On 6/30, the system ships the rest of the order for \$60.00. On 7/15, the system processes a return for the order for \$75.00. Because the return amount of \$75.00 is greater than each deposit amount, PayPal fails the return deposit.
NOTE	The charge description from the Charge description field in the Authorization Service table, followed by the order number. A plus sign (+) displays for each space. Example: PAYPAL+DIRECT+COMMUNICATION+1845, where PAYPAL DIRECT COMMUNICATION is the charge description and 1845 is the order number.

PayPal RefundTransaction Response

Order Administration receives the return deposit response transaction from PayPal in the PayPal RefundTransaction Response transaction.

Parameter	Description
REFUND TRANSACTIONID	The unique transaction ID assigned by PayPal to the deposit confirmation.

Parameter	Description
NETREFUNDAMT	The amount subtracted from the PayPal balance of the original recipient of payment to make this refund.
FEEREFUNDAMT	The transaction fee refunded to the original recipient of payment.
GROSSREFUND AMT	The amount of money refunded to the original payer.

PayPal Authorization Reversals

Authorization reversals use the PayPal DoVoid method to request the reversal. The system uses the API credentials ([API User name](#), [API Password](#), and [API Signature](#)) defined for the PPL service bureau as the credentials used to establish a direct connection to the PayPal system when processing a stored value card authorization trigger record (File/Key = AHR).

Sent when? The system creates authorization reversal triggers only if the [Send reversal](#) flag is selected for PayPal in [Defining Authorization Services \(WASV\)](#). Also, the system sends a DoVoid request for a reversal only if:

- The entire order is canceled or sold out, or;
- The payment method is deactivated before any transactions are billed.

The system does not submit a reversal to PayPal for a partial amount, such as when:

- A single item on a multi-line order is canceled or sold out.
- A single unit on an order line is canceled or sold out.
- Any items remaining on the order are canceled after a shipment has taken place.

For more information: See:

- [Stored Value Card Authorization Reversal](#) for background.
- [Working with Outbound Interface Transactions \(WOIT\)](#) for information on creating and processing outbound interface triggers.
- [Defining Authorization Services \(WASV\)](#) for information on setting up PayPal as an authorization service.

PayPal DoVoid Transaction Request

Order Administration sends the DoVoid request to PayPal to request an authorization reversal.

The DoVoid request specifies the stored value card number for the Order Payment Method as the AUTHORIZATIONID.

PayPal DoVoid Transaction Response

The DoVoid response confirms that the DoVoid request was successful and echoes the AUTHORIZATIONID.

PayPal Direct Connection Integration Restrictions

The Order Administration PayPal Direct Connection does not support the following.

- Online or batch authorization processing in Order Administration. Web orders containing a PayPal payment must receive an approved authorization from PayPal on the web storefront before being sent to Order Administration for processing.
- Additions to orders that contain a PayPal pay type in Order Maintenance that would exceed 15% or \$75.00 of the initial authorization received for the PayPal payment. For example, if the authorization received for the PayPal payment is \$100.00, you can apply up to \$115.00 towards the PayPal authorization ($\$100.00 + 15\% = \115.00).
- Orders that contain multiple ship to customers.
- Gift card payments.
- Alias items.
- Promotions applied to web orders in Order Administration. Final order amounts must be passed from the web storefront.
- Authorization reversals are supported only for the full amount of the authorization when the entire order is canceled or sold out, when the payment method is deactivated.
- Exchanges and returns performed through order entry are not recommended when the pay type on the order is PayPal; however, the system does not prevent either activity.
- Exchanges are not supported if there is a charge on the exchanged item. In this scenario, you must create a separate order for the new charge with a different customer payment.
- Returns/Refunds using the PayPal payment cannot be greater than the original deposit amount.

PayPal Direct Connection Integration Troubleshooting

If you have problems connecting to PayPal during deposit processing, use the following steps to help troubleshoot the issue.

PayPal service set up correctly? Verify that you have performed the required setup for the PayPal Direct Connection integration; see [PayPal Direct Connection Integration Setup](#).

PayPal Log

When you process deposits for an order containing a PayPal pay type, the system sends the deposit transaction directly to PayPal and logs the transactional information in the PayPal log.

Information in log: The PayPal log includes a copy of the deposit information sent between Order Administration and PayPal. In addition, any errors that may occur during deposit transaction processing are captured in the log.

You can use this log to confirm that communication between Order Administration and PayPal is working correctly, to isolate communication problems, or to recover information.

Sample log information:

Successful deposit process generates IFO level messages, such as the following:

```
11:56:55,831 INFO PAYPAL - [Settlement] Transmitted deposit(*PURCH)
Processed :
AMT=20.94&INVNUM=I23-1754&NOTE=PAYPAL+1754&AUTHORIZATIONID=AUTH_ID&C
OMPLETETYPE=NotComplete&METHOD=DoCapture
```

Failure deposit process and errors during processing generates ERROR level messages, such as the following:

```
11:56:55,831 ERROR PAYPAL - [Settlement] Transmitted deposit(*PURCH)
Failure : AMT=20.94=123-1234=PAYPAL+1754=AUTH_ID=NotComplete=DoCapture
11:57:06,581 ERROR PAYPAL - [Settlement] Timestamp      :
2009-05-08T15:52:55Z
11:57:08,737 ERROR PAYPAL - [Settlement] CorrelationId   : CORR_ID
11:57:10,284 ERROR PAYPAL - [Settlement] Error code      : 10002
11:57:11,972 ERROR PAYPAL - [Settlement] Short message   : Security
error
11:57:15,018 ERROR PAYPAL - [Settlement] Long message    : Security
header is not valid
11:57:17,300 ERROR PAYPAL - [Settlement] Severity code   : Error
11:57:20,297 INFO  PAYPAL - [Settlement] Transmitted
deposit(*RETURN)Failure :
AMT=68.00=123-123456=PAYPALID+7042982=AUTH_ID=NotComplete=RefundTransac
tion
```

The time elapsed to receive a response is indicated in a DEBUG level message, such as the following:

```
12:19:13,481 DEBUG PAYPAL - message: [Settlement] Got response,
elapsed time = 2 seconds
```

Errors reading the authorization service or authorization service extended generates ERROR level messages, such as the following:

```
11:31:04,471 ERROR PAYPAL - [Settlement] Defaults set. Do not
process in PayPal 'live' environment
11:31:31,841 ERROR PAYPAL - [Settlement] Exception(s)
encountered during Initialization. No Deposit processing
performed.
```

PayPal Direct Connection Integration Setup

Purpose: Before you can use the PayPal - Direct Connection integration, you must perform the necessary setup.

- [Creating the PayPal Decline Order Hold Reason](#)
- [Creating the PPL \(PayPal\) Service Bureau](#)
- [Creating a PayPal Pay Type](#)

If you are upgrading from 5.0: In 5.0, the PayPal credentials are stored in the System Properties (PPOP) menu option. When you upgrade from version 5.0, the PayPal credentials are stored in the Work with Authentication Services (WASV) menu option in the API user name, API password, and API signature fields. You will need to redefine your PayPal credentials as part of the upgrade process.

Type of PayPal integration: The PayPal Direct Connection integration uses PayPal's Express Checkout to send deposit transactions between PayPal and Order Administration. Communication protocol is provided through the PayPal SOAP API Architecture, which uses a signed SOAP request over HTTPS. The PayPal API jar file, provided by PayPal and included with Order Administration, handles communication between PayPal and Order Administration.

In order to use the PayPal Direct Connection integration, your web storefront must support a direct connection to PayPal to perform authorizations.

Related system control value: In addition to the setup described below, you can use the Append Ecommerce Order # to PayPal Invoice ID (M40) to define whether to include the ecommerce order number in the INVNUM set to PayPal.

Creating the PayPal Decline Order Hold Reason

Use the [Establishing Order Hold Reason Codes \(WOHR\)](#) menu option to create the PP (PayPal Decline) order hold reason code. The system assigns this reason to the PayPal pay type on the order when it is declined during PayPal authorization processing at pick slip generation time.

At the [Create Order Hold Reason Screen](#), enter the following information:

Field	Description
Reason	Enter PP.
Description	Enter PAYPAL DECLINE.

Creating the PPL (PayPal) Service Bureau

Use the [Defining Authorization Services \(WASV\)](#) menu option to create the PPL service bureau.

Multiple PayPal accounts: If you use multiple PayPal accounts, for example, each of your entities uses an individual PayPal account, you can:

- Use the [Work with Merchant ID Overrides Screen](#) to set up overrides for the different entities in your company. In this situation, you can define unique API credentials to establish a connection to the PayPal system for each of your PayPal accounts at the [Create Merchant ID by Entity Screen](#). You can create one PayPal pay type for all of your accounts; see [Creating a PayPal Pay Type](#).
- Use the [Work with Authorization Service Currency Screen](#) to set up a cross-reference between the Order Administration currency code and the PayPal currency code. When sending the [PayPal DoCapture Request](#) to PayPal, the system populates the **CURRENCYCODE** in the request with the ASC Currency code in the Auth Service Currency table that corresponds to the Currency in the Order Header Extended table.
 - If the Currency in the Order Header Extended table is blank, the system uses the currency code defined in the Local Currency Code (A55) system control value to determine which ASC Currency code in the Auth Service Currency table to use.
 - If a cross reference is not defined in Authorization Service Currency for the selected currency code, the system leaves the **CURRENCYCODE** in the PayPal DoCapture Request blank; PayPal treats a blank **CURRENCYCODE** as USD currency.

At the [First Create Authorization Services Screen](#), enter the following information:

Field	Description
Service code	Enter the name of the PayPal account; for example PPL.
Application	Select Auth/Deposit.
Charge description	Enter PAYPAL DIRECT CONNECTION.

At the [Second Create Authorization Service Screen](#), enter the following information:

Field	Description
Media type	Select Communication.
Batch/Online	Select Batch.
Active production system?	Select this field to send transactions to PayPal.
Primary authorization service	Enter PPL.
Test mode?	Select this field if you are sending transactions to PayPal's test "sandbox" environment. Deselect this field if you are sending transactions to PayPal's production "live" environment. The following fields are used to establish a connection to the PayPal system when using the PayPal Direct Connection Integration . You can also define API credential information at the entity level using the Create Merchant ID by Entity Screen .
API User name	Enter the user name, provided by PayPal, used to establish a direct connection to the PayPal system during deposit processing.
API Password	Enter the password, provided by PayPal, used to establish a direct connection to the PayPal system during deposit processing.
API Signature	Enter the encrypted signature, provided by PayPal, used to establish a direct connection to the PayPal system during deposit processing.

At the [Create Vendor Response Screen](#), enter the following information:

Field	Description
Response code	Enter PPLDECLINE.
Description 1	Enter PAYPAL DECLINE.
Hold reason	Enter PP. If you do not enter PP as the hold reason, the system places the PayPal payment on AV hold.

Creating a PayPal Pay Type

Use the Work with Pay Types (WPAY) menu option to create the PayPal pay type, making sure to define the following information.

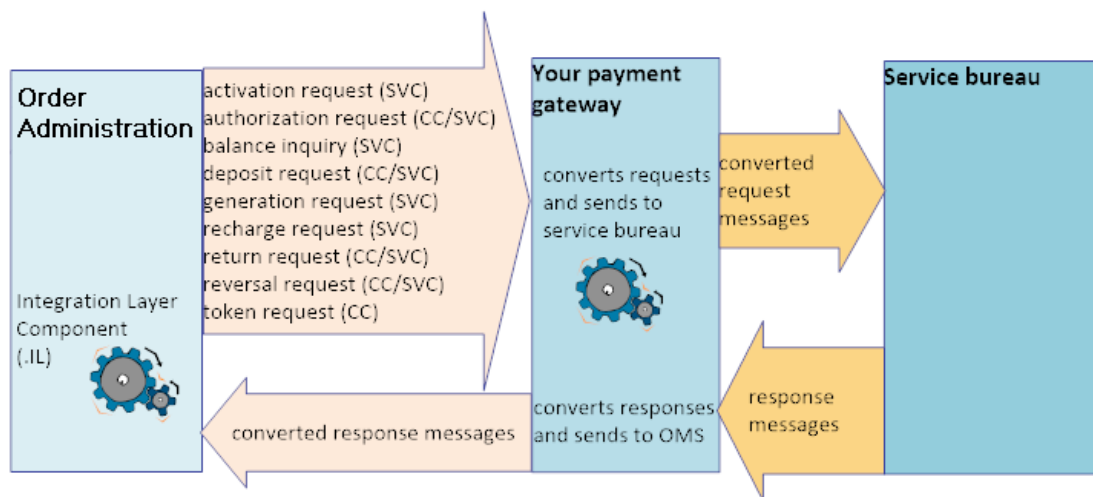

Field	Description
Pay category	Enter Credit Card (pay category 2).
Card type	Enter Credit (card type C).
Authorization service	Enter the name of the PayPal Direct Connection service bureau, for example, PPL.
Deposit service	Enter the name of the PayPal Direct Connection service bureau, for example, PPL.
Reauthorization days	Enter the number of days before PayPal payments expire. Make sure the number of days you enter matches the number of days defined in the PayPal system. Typically, PayPal payments are good for 29 days.

Field	Description
Send reversal	Select this field to enable sending reversals to PayPal when the value of the entire authorization amount is canceled or deactivated. See Stored Value Card Authorization Reversal for background.

External Payment Service

External payment service is a RESTful web service that provides an interface from Order Administration for sending stored value card transactions and receiving responses. Using this service, you can build a custom payment processor that maps to your payment provider.

This payment service needs to be configured to use the integration layer component of Order Administration, as this component controls payment service processing.

Supported stored value card transactions:

- activation request
- authorization request
- balance inquiry
- deposit request
- generation request
- recharge request
- return request
- reversal request

For more information: For background on stored value card authorization, see:

- [Defining Authorization Services \(WASV\)](#)

In this topic:

- [External Payment Service Setup](#)
 - [Authorization Service Settings](#)
 - [Work with Pay Types \(WPAY\)](#)

- [Work with Order Types \(WOTY\)](#)
- [Stored Value Card Reversal Function](#)
- [Subsequent Authorization Requests through the External Payment Service](#)

For sample messages see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

External Payment Service Setup

The required setup for the External Payment Service is described below, and includes:

- [Secured Feature](#)
- [Authentication](#)
- [Authorization Service Settings](#)
- [Work with Pay Types \(WPAY\)](#)
- [Work with Order Types \(WOTY\)](#)

Additional security requirements: For additional security-related setup requirements, including implementation of OAuth, see the External Payment Service Technical Reference Paper on My Oracle Support (2149144.1).

Secured Feature

The [External Authorization Service Access \(B25\)](#) secured feature controls access to the [Work with External Authorization Service Screen](#), where you can work with required settings for the External Payment Service. These settings are described briefly below under [External Service Settings](#)

Authentication

Use OAuth to authenticate the External Payment Service. See the Oracle Retail Omnichannel Web Service Authentication Guide on My Oracle Support (2728265.1) for more information.

Authorization Service Settings

Use [Defining Authorization Services \(WASV\)](#) to create a service bureau for the External Payment Service.

Settings for External Payment Service: The following table lists some of the required settings, in addition to the basic settings required for all service bureaus and any optional settings, to support the External Payment Service.

Fields at the first Create/Change/Display Authorization Services screen include:	Description
Service Code	Typically set to EXT or EXC, but can be set to anything.
Application	Select Auth/Deposit.

Fields at the first Create/Change/Display Authorization Services screen include:	Description
Void auth at deposit	<p>Select this field to void any unused portion of a credit card or stored value card authorization at deposit time.</p> <p>Note: The Retain Unused Stored Value Card Authorization After Deposit (J21) system control value does not control stored value card deposit updates for the External Payment Layer.</p>
Send reversal	<p>Select this field to perform a credit card authorization reversal when you process a cancellation associated with a credit card payment or deactivate a credit card payment.</p>
Fields at the second Create/Change/Display Authorization Services screen:	
Media type	Select Communication.
Batch/Online	Select Online or Batch.
Immediate response	Must be selected.
Primary authorization service	Should be blank
Communication type	Payment Link must be selected, to indicate messages sent the external payment layer are processed directly.
Response check frequency	<p>Indicates the multiple to apply to the Response time to determine how long to wait for a response after a connection when you are using the External Payment Service. For example, if the Response check frequency is 6 and the Response time is 10,000, the system waits 60,000 milliseconds (60 seconds or 1 minute) for a response after connection.</p> <p>Note: If the total response interval is exceeded for an authorization record, the record goes into *RCVD status with a response type of SU, and is then removed from the Credit Card Authorization Transaction table (CCAT00).</p>
Response time	<p>Indicates the number of milliseconds to wait for a connection to the service bureau when you are using the External Payment Service. For example, set this field to 10,000 milliseconds to wait 10 seconds for a connection. Note: Order Management System does not wait the entire response time if it is not necessary.</p> <p>To avoid potential timeout issues, Oracle recommends that you set the Response Time high enough for the authorization service to prevent issues that could potentially occur if the authorization process times out while processing multiple authorizations for an order.</p>

Fields at the first Create/Change/Display Authorization Services screen include:	Description
Country codes	<p>If needed, define a cross reference between your country code and the country code used by the service bureau.</p> <p>Note: This option also indicates whether a service bureau performs address verification processing for the country. See Defining Authorization Service Countries.</p>
Currency codes	<p>If needed, define a cross reference between your currency code and the currency code used by the service bureau; see Defining Authorization Service Currencies.</p>
Merchant ID Override	<p>If needed, define a merchant ID override for the different entities in your company; see Defining Merchant ID Overrides.</p>
Paytype codes	<p>If needed, define a cross reference between your pay type code and the pay type code used by the service bureau; see Defining Vendor Paytype Codes.</p>
Response codes	<p>Define the reasons that the service bureau approves (authorizes) or declines a transaction. The codes are assigned to each transaction by the service bureau when approving or declining the request; see Defining Vendor Response Codes.</p> <p>A response code of SU, indicating service unavailable, must be created.</p> <p>When there is a REJECT or ERROR response, the order goes on AT hold and the authorization is updated as declined when:</p> <ul style="list-style-type: none"> • The reason code passed is not defined as an authorization response code, or • The reason code passed is defined as an authorization response code but also has a hold code defined, or • No reason code is passed. <p>If no reason code is passed, a response code of SU is applied.</p>

External Service Settings

The additional External Service Settings at the [Work with External Authorization Service Screen](#) are accessible only to users with [External Authorization Service Access \(B25\)](#) authority.

All fields on the screen are required, with the exception of the External Service flag.

Tracking changes to external service settings: Changes that users make to external service settings are tracked in the User Audit table, and listed on the User Authority Change report. See [Tracking User, Authority, and Password Updates](#) for more information.

For more information: See the External Payment Layer RESTful Service technical reference on My Oracle Support for more information on updating these settings.

Setting	Notes
External Service	Select this field to have request messages generated for the External Payment Service.
External URL Prefix	<p>The prefix that forms the beginning of the URL where messages are sent.</p> <p>Must begin with https.</p> <p>The message type defines the endpoint suffix that is appended to the prefix, creating the entire URL. For example, for a credit card authorization request, the entire URL might be https://remote.auth.com:1234/authorization, where remote.auth.com is the remote server, 1234 is the port, and authorization identifies an authorization request.</p> <p>The following endpoints are supported:</p> <ul style="list-style-type: none"> • balanceInquiry • authorization • reversal • getToken • generateGift • activateGift • rechargeGift • deposit • return
Message Version	<p>Indicates which message version is supported with version 3.0 being the default version when creating a new authorization service. Previous versions have been removed.</p> <p>Version 3.0 no longer includes tags that pass the credit card number for an order and instead includes tags that pass the card token. It also allows an external merchant application to call for both Credit Cards and Stored Value Cards supported through the External Payment Service and EFTConnect.</p>
Authentication User	The user ID for authentication of the messages to the external service.
Authentication Password	The password for authentication of the messages to the external service. Must be at least 6 positions long, include both numbers and letters, include a special character, and cannot end with a number.

Work with Pay Types (WPAY)

Use [Working with Pay Types \(WPAY\)](#) to assign the authorization and deposit service to each credit card or stored value card pay type that uses the External Payment Service.

Work with Order Types (WOTY)

In order to perform online authorization on web orders, the Online Authorization setting for the order type on the web order must be set to Without Window. See [Establishing Order Types \(WOTY\)](#) for more information on setting up an order type.

Stored Value Card Reversal Function

You can use a periodic function, described below, to submit stored value card reversal requests for closed or canceled orders.

REVXHP (Program name = PFREVXHP): Reverse Partial Auth for External Payment Service: Generates SVC reversal request messages for the External Payment Service within the specified company, provided that:

- A company is specified.
- The parameter specified for the function is a valid stored value card pay type code for the company.
- The pay type is assigned to an authorization service configured as the External Payment Service.
- The pay type does not match the [Default Auth Code for CC Netting \(M25\)](#) system control value.

For more information: See [Stored Value Card Authorization Reversal](#) for an overview of the authorization reversal process.

Subsequent Authorization Requests through the External Payment Service

About subsequent authorizations: Order Management System sends information through the External Payment Service indicating whether a transaction was initiated by the merchant, or by the customer. For example, when the customer initially places the order, this is a transaction initiated by the customer; an example of a merchant-initiated transaction is a subsequent authorization that is acquired by Order Administration when the initial authorization is expired.

Message version: Additional tags are available to support passing information identifying a subsequent authorization that was not initiated by the customer. You need to have a version 3.0 selected for the External Payment Service to use the new tags. See [External Service Settings](#) for more information.

Term definitions:

- Merchant-Initiated Transactions (MIT): An authorization that the system initiates without the customer's active participation.
- Cardholder-Initiated Transactions (CIT): An authorization that uses payment information provided by the customer.
- Credentials on File (COF): The cardholder payment information that is stored by the system.

Types of subsequent authorizations: Brief descriptions of subsequent authorization types for credit cards include:

- Resubmission of a failed deposit: When the [Supports Auth Resubmission](#) flag is selected for the authorization service in [Defining Authorization Services \(WASV\)](#) and a previous deposit request for the credit card failed. A subsequent authorization and deposit request is generated, with the subsequentAuth tag set to Y and the subsequentAuthReason set to RESUBMIT. However, if the [Supports Auth Resubmission](#) flag is not selected, the subsequentAuthReason is set to REAUTH.
- Split shipment: When the order is not fulfilled in a single shipment. In this case, the request for the subsequent authorization includes a subsequentAuthReason set

to REAUTH and passes the existing `ci_transaction_id` as the `subsequentAuthTransactionID`.

- Deferred or installment billing: When the order uses deferred or installment billing. The pay type's Notify of installments setting indicates whether to send the `subsequentAuthReason` set to `INSTALLMENT` or `REAUTH`. See [Deferred/Installment Billing Overview](#) for background.
- Customer membership orders: When you generate orders for a customer membership that has been authorized. Authorization can take place either through the order originating the customer membership, or through a generated membership order. The CIT Transaction ID (customer-initiated transaction ID) and the original authorization amount are stored on the customer membership, although this information is not displayed on any screen. For more information, see [Subsequent Authorizations through the External Payment Service for Membership Orders](#).

Details on the tags in the authorization request message supporting subsequent authorization requests: See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Purging Tables

Topics in this part:

- [Purging Prestige Credit Card Deposits \(MPSP\)](#) describes how to purge processed records from the Credit Card Deposit Prestige table.
- [Purging Orders \(MPOR\)](#) described how to purge closed and canceled orders based on the date of last activity.
- [Purging Sold To Customers](#) describes how to purge eligible sold to customers based on the customer's last change date.
- [Purging Suspended Orders \(PSOR\)](#) describes how to remove orders in a suspended status from the system.
- [Purging SKUs \(MPSK\)](#) described how to remove item/SKUs based on item status from the system.
- [Additional Purges](#) summarizes the additional purges available.

Purging Sold To Customers

Purpose: Use the PURGECS Purge Sold To Customers periodic function (program name PFR0137) to purge eligible sold to customers.

Which customers are purged? For the customer to be eligible for purge, the system verifies that:

- the last change date for the customer is older than the number of days defined in the periodic function's Parameter field. If the Parameter is blank or 0, records must be 365 days old to be eligible for purge.
- there are no unpurged orders for the customer.
- the customer does not exist in the Customer Fraud table.
- there are no open refunds for the customer.
- there are no open returns for the customer.

- there are no open ticklers for the customer.
- there are no catalog requests for the customer.
- there are no active or in-process memberships for the customer.
- there are no open purchase orders for the customer.

Once the purge completes, the system generates the [Purged Customer List](#), listing the sold to customers that were removed.

The system writes processing details to the Trace log.

Purging an individual customer:

- To purge an individual sold to customer, use the Delete option in [Creating and Updating Sold-to Customers \(WCST\)](#).
- To purge an individual ship to customer, use the Delete option in [Creating and Updating Sold-to Customers \(WCST\)](#).
- To purge an individual bill to customer, use the Delete option in [Creating and Updating Bill-to Customers \(WCBT\)](#).

Updated tables: See the [Tables Updated during Customer Purge](#) for a listing of the tables purged through the PURGECS Purge Customers periodic function (program name PFR0137).

Before you purge customers:

- Use the [Purge Catalog Request History \(PCRH\)](#) menu option to delete outdated records from the Catalog Request History table.
- Use the [Deleting All Printed Catalog Requests \(DCAT\)](#) menu option to delete printed catalog requests.
- Use the [PURGEOR](#) Purge Orders periodic function (program name PFR0114) to purge orders that are closed or canceled. See [Purging Orders \(MPOR\)](#) for processing details.

In this topic:

- [Tables Updated during Customer Purge](#)

For more information: See:

- [How to Schedule a Job](#) for information on scheduling a periodic process that includes the PURGECS periodic function
- [Working with Periodic Functions \(WPER\)](#) for information on setting up periodic functi

Tables Updated during Customer Purge

Purpose: The system purges records in the following customer-related and order-related tables when you use the PURGECS Purge Customers (program name PFR0137) periodic function.

- Contract Price (PRCNPR)
- Correspondence History (MSCOHS)
- Cust Mail/Rent Changes (OECMRC)
- Cust Sold To Item Class Entity (OEICEP)

- Customer Action (CSCSAC)
- Customer Action Note (OECACN)
- Customer Address Change (CSCACP)
- Customer Affinity (CSAFFY)
- Customer Individual (CSCIFP)
- Customer Individual Mail History (CSTIMH)
- Customer Individual Order History (CSTIOH)
- Customer Membership (OEC SMP)
- Customer Membership Detail (OEC SMD)
- Customer Note (CSCUNO)
- Customer Ownership (OEC SOW)
- Customer Pay Type Exclusion (CSCPTX)
- Customer Profile (CSCPRO)
- Customer Ship To (CSSHIP)
- Customer Ship To Entity (OECHEP)
- Customer Ship To Extended (CSHXNA)
- Customer Ship To Mail History (CSHPMH)
- Customer Ship To Order History (CSHORH)
- Customer Ship To Phone # (CSCTP#)
- Customer Shipment History (FLCSHP)
- Customer Sold To (OECSSL)
- Customer Sold To BML (OEC SBM)
- Customer Sold To Email (OECSEM)
- Customer Sold To Entity (OECSEP)
- Customer Sold To Extended (CSTXNA)
- Customer Sold To Item Class (OEC SIC)
- Customer Individual (CSCIFP)
- Customer Sold To Item Class Entity (OEICEP)
- Customer Sold To Mail History (CUSTMH)
- Customer Sold To Order History (CSTOOH)
- Customer Sold To User Field (OEC SUF)
- Customer Profile (CSCPRO)
- Customer Sold To Promotion (OEC SPR)
- Customer Sold To Phone # (CSCSP#)
- Customer Sold To Xref (OEC SXR)
- Customer Source Finder (CSSFND)
- Customer Subscription (OECSSB)

- Customer Tax (OECSTX)
- Customer Warehouse (CDCWFP)
- Customer Warranty Track (CSWTRP)
- DW Correspondence History (DWCSEM)
- EC CST Ext (EXCSTE)
- Marketing Download Customer Address Change (IXDTCA)
- Marketing Download Customer Inquiry (IXDTCI)
- Marketing Download Customer Ownership (IXDTCO)
- Marketing Download Customer Profile (IXDTCP)
- Marketing Download Customer Status Change (IXDTCS)
- Tickler (MSTKLR)

Additional Purges

Purpose: In addition to the purges described earlier under [Purging Tables](#), you can use the purge options listed below to delete outdated or unneeded records in various tables. Purging unnecessary records can help save space and improve performance.

- For more information: See:
- Active Procedures: [Purging Active Procedures \(MACP\)](#).
- Correspondence History: [Purging Email History \(MPCH\)](#).
- Customer Subscriptions: [Purging Subscriptions \(MPCS\)](#).
- **Orders:** [Purging Orders \(MPOR\)](#) **Note: You can also purge a single order through the Purge Orders by Order Number menu option, fast path = MORP.**
- Prestige Credit Card Deposits: [Purging Prestige Credit Card Deposits \(MPSP\)](#).
- Refund Checks: [Reconciling Checks \(MREC\)](#).
- SKUs: [Purging SKUs \(MPSK\)](#).
- Suspended Orders: [Purging Suspended Orders \(PSOR\)](#).
- [Purge Inventory Transaction History \(MITH\)](#)
- [Purge Purchase Order \(MPOP\)](#)
- [Purge Empty Item Locations \(PITL\)](#)
- [Purge Order Billing History \(POBH\)](#)
- [Purge Orders by Order Number \(MORP\)](#)

Flexible Payment Options

Topics in this part:

- [Deferred/Installment Billing Overview](#) provides an overview of how flexible payment options work.
- [Deferred/Installment Billing Setup](#) describes the steps necessary to set up deferred or installment billing pay plans.

- [Working with Flexible Payment Options \(WFPO\)](#) describes the screens you use in the Work with Flexible Payment Options menu option.
- [Credit Card Net Exchange Billing](#) describes the process the system uses to net credit invoices with debit invoices before a deposit is sent to the service bureau for an invoice associated with an exchange.

! **Important:**

There is a known issue with deferred/installment billing functionality when processing a return. If you plan to use deferred/installment billing, contact customer support to determine if your planned use of this functionality will be impacted by this issue.

Deferred/Installment Billing Overview

Pay plans are deferred payment or installment billing options you can offer to your customers. Under a pay plan, you delay billing the customer's credit card for a prearranged interval.

There are two types of pay plans:

- **Deferred billing:** You bill the customer for the shipment after a specific number of days has passed, based on either the order date or the shipment date; or, you bill the customer on a given day of the month following the order or shipment.
- **Installment billing:** You bill the balance due for a shipment in a number of equal installment payments, which are due after specific intervals or on a given day of the month.

Different credit card types: Only credit cards (as opposed to different types such as stored value card or debit card) are eligible for deferred or installment billing. If you accept any other credit card type besides a regular credit card, you should make the Paytype one of the Qualification Values for each payment plan you create to prevent these other credit card types from being accepted. You can use the Copy option at the [Work with Flexible Payment Option Screen](#) to make a copy of the payment plan for each eligible credit card pay type.

EXC flexible payment option: The system delivers the EXC Net Billing for Exchanges flexible payment option in the [Working with Flexible Payment Options \(WFPO\)](#) menu option to use during [Credit Card Net Exchange Billing](#) (the [Use CC Net Exchange Billing \(M23\)](#) system control value is selected). You cannot change or delete this flexible payment option and you cannot use this flexible payment option for deferred/installment billing. See [Credit Card Net Exchange Billing](#) for processing details.

! **Important:**

There is a known issue with deferred/installment billing functionality when processing a return. If you plan to use deferred/installment billing, contact customer support to determine if your planned use of this functionality will be impacted by this issue.

In this topic:

- [Pick Slip Generation](#)
- [Billing Updates](#)
 - [Deposit Release Date](#)
- [Processing Deposits](#)
- [Rejected Deposits](#)
- [Order Inquiry](#)
- [Returns](#)
 - [Netting Credits](#)
- [Reporting](#)
- [More Information](#)

Not in this topic: This topic does not include general information on setting up your company to use deferred or installment billing, or on setting up the pay plans themselves; see [Deferred/Installment Billing Setup](#). Also, see [Manage Rejected Deposits](#) in Modern View and [Printing the Deposit History Summary \(PDHS\)](#) for more information.

Examples

Pay Plan Setup	Result
Payment deferred 30 days based on invoice date	Order entered on 9/1 and shipment confirmed on 9/15. Deposit eligible for processing on 10/15.
Payment deferred 30 days based on order date	Order entered on 9/1 and shipment confirmed on 9/15. Deposit eligible for processing on 10/1. Note: If the shipment did not take place until 10/1 or after, the deposit would be eligible for processing immediately after shipment confirmation.
Payment deferred until the 25th of the month	Order entered on 9/1 and shipment confirmed on 9/15. Deposit eligible for processing on 9/25.

Pay Plan Setup	Result
Four installments, 30 day intervals	Order entered on 9/1 for \$200.00 and shipment confirmed on 9/15. Four installments of \$50.00, eligible for processing on 9/15, 10/15, 11/14, 12/14
Six installments, 1st of the month	Order entered on 9/1 for \$300.00 and shipment confirmed on 9/15. Six installments of \$50.00, eligible for processing on 10/1, 11/1, 12/1, 1/1, 2/1, 3/1. Note: If the shipment did not take place until 10/1, the first installment would still be eligible for processing on that same date.

See [Deposit Release Date](#) for more examples.

Applying a Pay Plan in Order Entry

Determining eligible orders: In order to assign a pay plan to an order, the system must first determine if the order is eligible for a pay plan.

An order is eligible for a pay plan if the order:

- is within the pay plan's starting and ending date
- does not contain an item that is excluded from pay plans
- contains only one credit card
- has a source code that is not excluded from pay plans
- meets the minimum dollar amount requirement for the pay plan, if any
- meets the pay type requirement for the pay plan, if any
- meets the offer requirement for the pay plan, if any
- meets the item requirement for the pay plan, if any

Selection Hierarchy

Once the system determines which payment plans are eligible for the order, it determines the most appropriate plan.

The system selects the first qualifying pay plan as the primary plan based on the following hierarchy:

- The pay plan is set to apply automatically to a qualifying order.
- The pay plan is assigned to the source code on the order header.
- Selection based on the qualification values for the pay plan:
 - An item on the order is the qualifying item for the pay plan and the order meets the qualifying merchandise dollar amount.
 - An item on the order is the qualifying item for the pay plan but the order does not meet the qualifying merchandise dollar amount.
 - The offer on the order is the qualifying offer for the pay plan and the order meets the qualifying merchandise dollar amount but does not contain the qualifying item.
 - The offer on the order is the qualifying offer for the pay plan but the order does not meet the qualifying merchandise dollar amount or contain the qualifying item.
 - The pay type on the order is the qualifying pay type for the pay plan and the order meets the qualifying merchandise dollar amount but does not meet any other qualifying criteria.
 - The pay type on the order is the qualifying pay type for the pay plan but the order does not meet any of the other qualifying criteria.
 - The order meets the qualifying merchandise dollar amount but does not meet any other qualifying criteria.

If more than one pay plan meets the same qualifications, the system then determines the primary plan as follows:

- The pay plan is the first eligible plan in descending starting date sequence (most current date), or

- The pay plan is the first alphanumerically.

Applying the plan to the order: The system can apply the pay plan to the order in three different ways, depending on how you set up the pay plan:

- Automatically apply the plan to the order, or
- Prompt the operator to select a plan, or
- Require the operator to manually assign a plan

If the pay plan is set to....	The system....
automatically apply to the order	automatically applies the pay plan to the order when you enter payment method information
prompt the operator	displays the Select Payment Plan Window pop-up window, listing eligible payment plans, where the operator can select a plan to assign to the order
not automatically apply to the order	does not automatically apply the pay plan to the order or display a pop-up window; the operator must select a pay plan for the order

Demand Updates

In addition to the standard demand updates made for every order, the system updates the following fields in the Flexible Payment Options table when you accept an order:

- Number of orders
- Dollars ordered
- Number of soldouts
- Dollars soldout
- Number of cancels
- Dollars canceled

You can review history for a pay plan by selecting History for the plan at the [Work with Flexible Payment Option Screen](#).

The system also performs updates when you confirm and ship an order containing a pay plan. See [Billing Updates](#).

Pick Slip Generation

Authorization: Unlike regular (non-pay plan) orders, deferred or installment billing orders do not automatically require an authorization for the full pickable amount of the order when you generate pick slips. The amount authorized at pick slip generation is summarized in the table:

When you print a pick slip for...	The amount authorized is...
a regular (non-pay plan) order	the full pickable amount of the order (including any tax, shipping, and charges)

When you print a pick slip for...	The amount authorized is...
a deferred billing pay plan order	one dollar, unless the Authorize full amount field for the pay plan is selected
an installment billing pay plan order	the first payment of the installment plan, unless the Authorize full amount field for the pay plan is selected

Pick messages: Any pick slip messages you have specified for the pay plan print on the customer's pick slip, provided your pick slip printing program supports it. You can enter up to three lines of messages for a pay plan.

Billing Updates

Flexible payment option: The system updates the total numbers and dollars shipped for the pay plan when you confirm shipment and bill. You can review history for a pay plan by selecting History for the plan at the [Work with Flexible Payment Option Screen](#).

Invoice: In addition to all of the standard updates that occur during billing, the system calculates the deposit release date based on the terms of the pay plan. This date, which is stored in the Invoice Pay Method, indicates when the deposit will be eligible for processing. In the case of an installment plan, the deposit release date indicates when the first installment will be eligible for processing. Each installment has a separate [Deposit Release Date](#).

Regular (non-pay plan) orders also have a deposit release date; however, it is always the same as the invoice date.

Deposit Release Date

The system assigns a deposit release date to all orders at billing. The deposit release date indicates when the deposit is eligible for processing. In the case of a regular (non-pay plan) order, the deposit release date is always the same as the invoice date, because the deposit is eligible for processing immediately. Examples of deposit release date calculation for pay plan orders are:

Pay Plan Settings	Deposit Release Date Calculation	Examples
fixed date	Use the fixed date; however, if this date has already passed, use the invoice date	Standard calculation: Order date = 9/1 Fixed date = 10/1 Invoice date = 9/15 Deposit release date = 10/1
		If the fixed date has already passed: Order date = 9/1 Fixed date = 10/1 Invoice date = 10/5 Deposit release date = 10/5
number of days and order date	Add the number of days to the order date; however, if the resulting date has already passed, use the invoice date; or, if the pay plan expiration date is sooner than the resulting date, use the expiration	Standard calculation: Order date = 9/1 Number of days = 30 Invoice date = 9/15 Deposit release date = 10/1

Pay Plan Settings	Deposit Release Date Calculation	Examples
	date or invoice date (whichever is later)	<p>If deposit release date based on standard calculation is earlier than current (invoice) date but before the pay plan expiration date</p> <p>Order date = 9/1 Number of days = 30 Invoice date = 10/5 Expiration date = 10/15 Deposit release date = 10/5</p> <p>If deposit release date based on standard calculation is later than the pay plan expiration date:</p> <p>Order date = 9/1 Number of days = 30 Invoice date = 9/15 Expiration date = 9/30 Deposit release date = 9/30</p>
number of days and invoice date	Add the number of days to the invoice date; however, if the pay plan expiration date is sooner than the resulting date, use the expiration date	<p>Standard calculation:</p> <p>Order date = 9/1 Number of days = 30 Invoice date = 9/15 Deposit release date = 10/14</p> <p>If deposit release date based on standard calculation is later than the pay plan expiration date:</p> <p>Order date = 9/1 Number of days = 30 Invoice date = 9/15 Expiration date = 9/30 Deposit release date = 9/30</p>
fixed date	Use the next occurrence of the fixed day of the month and continue on that date for the number of installments; however, if the pay plan expiration date has occurred when you bill the order, use the invoice date	<p>Standard calculation:</p> <p>Order date = 9/1 Fixed date = 10 (10th of the month) Number of installments = 4 Invoice date = 9/15 Installment deposit release dates = 10/10, 11/10, 12/10, 1/10</p> <p>If expiration date has already occurred when you bill the order:</p> <p>Order date = 9/1 Fixed date = 10 (10th of the month) Number of installments = 4 Invoice date = 9/15 Expiration date = 9/10 Deposit release date = 9/15 (no installments)</p>
interval	Use the current date and add the number of interval days to each installment date to calculate the remaining installments; however, if the pay plan expiration	<p>Standard calculation:</p> <p>Order date = 9/1 Interval number of days = 30 Number of installments = 4 Invoice date = 9/15 Installment deposit release dates = 9/15, 10/15, 11/14, 12/14</p>

Pay Plan Settings	Deposit Release Date Calculation	Examples
	date has occurred when you bill the order, use the invoice date	<p>If expiration date has already occurred when you bill the order:</p> <p>Order date = 9/1 Interval number of days = 30 Number of installments = 4 Invoice date = 9/15 Expiration date = 9/10 Deposit release date = 9/15 (no installments)</p>

Processing Deposits

Authorization required: Unlike a regular (non-pay plan) credit card order, a pay plan order might not have a full, valid authorization at the time you process the deposit. Regular orders normally receive a full authorization at the time you generate the pick slip, and deposit processing normally occurs soon enough after pick slip generation for the authorization to still be valid. However, deposits for pay plan orders occur at intervals after pick slip generation, and authorizations from that time may no longer be valid, or may have been for less than the full deposit amount. See [Pick Slip Generation](#).

Action codes: The system sends an action code of B to the deposit service for any pay plan deposits that require authorization. The conditions under which the system sends an action code of B are described in Processing Auto Deposits (SDEP).

Force deposit: If a pay plan deposit fails authorization, the system will “force” the deposit if you have set up the vendor response code to do so. Forcing a deposit means that the system performs all the same updates as if the authorization had been approved. For example, the invoice payment method for the order will be updated, and the deposit will not be included on reports that list unconfirmed deposits, or be available through the Resubmit Rejected Deposits function.

Rejected Deposits

Overview: Rejected or unconfirmed deposits appear on the Unconfirmed Deposits Listing when you process deposits. You can use the [Resubmit Rejected Deposits Screen](#) to work with these deposits, including:

- changing the credit card number or the deposit release date
- writing off or deleting the deposit
- entering a cash payment amount
- confirming the deposit interactively
- reviewing deposit history

You can also work with rejected deposits through standard order inquiry. See [Order Inquiry](#).

Order Inquiry

Purpose: Use standard order inquiry to review information associated with a pay plan. The information and options listed below are not available in streamlined order inquiry.

- the total amount to deposit, the amount deposited, and the remaining amount to deposit
- credit card information

- the deposit release date
- installment schedule if the order uses an installment pay plan, such as:
 - the total number of installments
 - the number of installments remaining to deposit
 - the installment interval
 - the fixed installment day
 - the installment amount
- rejected deposit amount
- prepaid amount

Change options: You can also change this information related to the invoice payment method:

- the deposit release date
- installment information, such as:
 - the number of remaining installments
 - the installment interval
 - the fixed installment day
- the prepaid check or cash amount
- credit card information, such as:
 - the pay type
 - the credit card number
 - the credit card's expiration date
 - the authorization number
 - the authorization date

Rejected deposit options: If the invoice payment method is associated with a rejected deposit amount, you can perform the following updates through order inquiry:

- resubmit the rejected deposit
- write off the remaining amount to deposit for the invoice or write off a specified amount
- delete the rejected deposit

Deposit history: You can also review invoice deposit attempts and responses for each invoice payment method in order inquiry. Deposit history includes whether the invoice was associated with a pay plan, the deposit amount, and the response code received from the deposit service.

Order payment history: The system records messages describing invoice activity associated with the order payment method or invoice payment method, such as:

- deposits made
- invoices netted against each other
- changes made in order inquiry
- when a pay type is deactivated

- when you add, change, or delete the pay plan associated with the payment type on the order

Returns

Purpose: When you perform a return against an order containing a payment plan, the system does not credit a customer's credit card until a deposit amount equal to or greater than the credit amount has been processed. This check ensures that the customer does not receive a credit for the return before paying for the shipment.

For deferred payment plans, the system processes the credit invoice after the debit invoice has been deposited.

For installment payment plans, the system processes the credit invoice once the debit invoice amount deposited is equal to or greater than the credit invoice amount.

Netting Credits

You can net credit invoices against debit invoices before processing the deposit on a pay plan order. The [Net Credit Card Credits for Deferred and Installment Billing \(F55\)](#) system control value controls whether you net credits.

If you net credits:

- For deferred payment plans, the system subtracts the credit invoice amount from the debit invoice amount and sends only the net amount to the service bureau for deposit.
- For installment payment plans, the system subtracts the credit invoice amount from the debit invoice amount. The system then divides the remaining amount to deposit for the debit invoice by the number of remaining installments to determine the amount due for each remaining installment.

If you do not net credits, each credit deposit is processed separately from the related debit deposit.

See [Processing Auto Deposits \(SDEP\)](#) for more information on netting credits and examples.

Deposit release date: A credit invoice uses the deposit release date from the original (debit) invoice as long as that date is not earlier than the current date. If the deposit release date of the original invoice is earlier than the current date, the credit invoice uses the current date. This date assignment ensures that the customer is not credited until the deposit is processed; but if the customer has been billed, the credit will be released immediately.

Reporting

Related reports: The following reports may be useful in reviewing pay plan activity and status:

- [Sales Journal by Pay Type](#) (fast path = PSJP): breaks out totals billed by date, including deferred, installment, and regular (non-pay plan) orders for each pay type
- [Deposit History Summary Report](#) (fast path = PDHS): breaks out totals deposited by date, including deferred, installment, and regular (non-pay plan) orders
- [Credit Card Deposit Schedule](#) (fast path = PCCD): lists the pay plan totals scheduled for deposit for a range of dates
- [Pending Payment Plan Deposits Report](#) (fast path = PP, PD): lists pending pay plan orders for a range of invoice dates

- [Deposit History Detail Report](#) (fast path = PDHD): lists deposits processed during a specific date range. Within this date range, you can select to include only deposits for a specific authorization service, pay type, and status.

Additionally, the Submit Auto Deposits menu option produces the following reports:

- [Unconfirmed Deposits Listing Report](#): lists each deposit that was not confirmed and processed, breaking out totals by deferred, installment, and regular (non-pay plan) invoices
- [Auto Deposit Confirmation Report](#): breaks out totals sent and confirmed by deferred, installment, and regular (non-pay plan) orders for each pay type

More Information

Related to pay plans:

See	For information on...
Establishing Order Hold Reason Codes (WOHR)	Setting up order hold reason codes related to pay plans

Working with the BILL_ASYNC Job	billing updates
Working with the ORDR_ASYNC Job	order updates
Setting Up Authorization Services	authorization and deposit services
Deferred/Installment Billing Setup	setup related to pay plans
Working with Flexible Payment Options (WFPO)	setting up the pay plans themselves
Processing Deposits	processing deposits, handling rejected deposits, and reports related to pay plans

Deferred/Installment Billing Setup

Purpose: Before you can use deferred or installment billing pay plans in your company, you must perform the necessary setup. Information requiring creation and setup includes:

- system control values
- secured features
- authorization service settings, including response codes and currency codes
- order hold reason codes
- source codes that point to specific pay plans
- items that would be exempt from pay plans

Set up pay plans: Additionally, you must set up the pay plans themselves using the [Work with Flexible Payment Option Screen](#).

EXC flexible payment option: The system delivers the EXC Net Billing for Exchanges flexible payment option in the [Working with Flexible Payment Options \(WFPO\)](#) menu option to use during [Credit Card Net Exchange Billing \(the Use CC Net Exchange Billing \(M23\)\)](#) system control value is selected). You cannot change or delete this flexible payment option and you cannot use this flexible payment option for deferred/ installment billing. See [Credit Card Net Exchange Billing](#) for processing details.

In this topic:

- [System Control Values](#)
- [Secured Features](#)
- [Authorization Service Settings](#)
- [Order Hold Reason Codes](#)
- [Additional and Recommended Setup](#)

System Control Values

System Control Value	Description
Deferred and Installment Billing (F51)	Select this field to be able to apply pay plans to orders. If this field is unselected, you will not be able to apply pay plans in order entry or order maintenance.
Number of Times Flexible Payment Option is Used (F52)	Enter the number of times the same credit card number can be applied against a pay plan order before being evaluated for PV hold. This system control value works together with the Number of Days Flexible Payment Option is Used (F53) field, below.
Number of Days Flexible Payment Option is Used (F53)	Enter the number of days the system should use for evaluating a credit card against the Number of Times Flexible Payment Option is Used (F52) field, above. If the same credit card number appears on orders more than the specified number of times within this number of days, the order goes on PV hold. Example: You set the Number of Times Flexible Payment Option is Used (F52) field to 5, and the Number of Days Flexible Payment Option is Used (F53) field to 14. If the same credit card number appears on pay plan orders more than 5 times in 14 days, the sixth and subsequent orders for the credit card go on PV hold.

System Control Value	Description
Dollar Threshold for Sold To Customer Orders with Flexible Payments (F54)	<p>Enter the total dollar amount a customer can have in pay plan orders before the system puts new orders on \$P hold.</p> <p>Example: You set this field to 500.00. If a customer has 3 pay plan orders for a total of \$450.00, and you take a new pay plan order for \$75.00, the new order goes on \$P hold.</p>

**Note:**

You must also create the [Order Hold Reason Codes](#).

Each of these fields is available at the Edit Deferred/Installment Billing screen.

Secured Features

Secured Feature	Description
Override Deferred and Installment Billing Options (A81)	Controls the ability to select a pay plan other than the primary, system-selected plan in order entry
Change Invoice Payment Information (A82)	<p>Controls the ability to change information on an invoice once the order has been billed but before the invoice amount is fully deposited.</p> <p>The Change Invoice Pay Method Screen allows you to change the deposit release date, credit card information, the number of remaining installments; apply a cash payment; or writeoff, resubmit, or delete the deposit. This screen is available in order inquiry and Submit Rejected Deposits.</p>

Authorization Service Settings

When you are setting up an authorization service that supports deferred/installment billing, please note the following additional required settings:

- Industry code: enter your DBA number
- Deferred merchant ID
- Installment merchant ID
- Exclude from FPO: unselected
- Pay type cross reference Paytypes at the [Work with Authorization Services Screen](#)): Create a cross-reference for each pay type code you will allow on pay plan orders, using the vendor pay code information supplied by the authorization service.
- Currency cross reference (Currency at the [Work with Authorization Services Screen](#)): Create a cross-reference for each currency code you will use on pay plan orders, using the vendor currency code information supplied by the authorization service.

- Vendor responses (Responses at the [Work with Authorization Services Screen](#)): Optionally, you can select the Force deposit for FPO field.

You can also set up merchant ID overrides by entity.

Pay types: Each pay type eligible for deferred or installment billing should have the authorization service set up as its authorization and deposit service.

More information: See [Working with Currency \(WCUR\)](#) for more information on setting up pay types or currency codes.

Order Hold Reason Codes

The order hold reason codes you should set up in [Establishing Order Hold Reason Codes \(WOHR\)](#) as part of credit checking pay plan orders are described in this table:

Hold Reason Code	Used When...
P\$	You enter an order that makes the sold to customer's total undeposited pay plan orders exceeds the amount specified in the Dollar Threshold for Sold To Customer Orders with Flexible Payments (F54) system control value; see System Control Values for an example.
PV	You enter an order that makes the sold to customer's total pay plan orders exceed the limit specified in the Number of Times Flexible Payment Option is Used (F52) system control value, for the period specified in the Number of Days Flexible Payment Option is Used (F53) system control value; see System Control Values for an example.
SB	Any open orders for the same sold to customer are put on hold because a deposit for this customer was rejected at the Auto Deposit Screen .
CB	Any open orders for the same credit card number are put on hold because a deposit for this credit card number was rejected at the Auto Deposit Screen .

Additional and Recommended Setup

Optionally, you can set up the fields described below for use in deferred or installment pay plans.

Source code: You can use the following fields to control how pay plans apply in order entry if this source code is on the order header:

- Flex pay code: If you enter a pay plan code, it gives the pay plan priority in the evaluation hierarchy the system uses when selecting the plans that apply to an order.
- Exclude FPO: If you select this field, orders for this source code are excluded from pay plans.

See [Working with Source Codes \(WSRC\)](#) for more information on setting up source codes.

Item: Select the Exclude FPO field to exclude any order containing the item from pay plans.

See [Performing Initial Item Entry \(MITM\)](#) for more information on setting up items.

Consolidate invoice: Selecting the [Consolidated Invoice \(B49\)](#) system control value if you use deferred or installment billing will simplify pay plan management considerably by limiting the number of invoices for an order.

 **Note:**

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

Pay plan settings: Using the following settings for each pay plan you create will simplify pay plan management:

- **Auto apply:** Set this field alike for all pay plans that might apply to an order to simplify the pay plan selection hierarchy in order entry.
- **Ship complete:** Select this field to simplify pay plan management by limiting the number of invoices for an order.

See [Working with Flexible Payment Options \(WFPO\)](#).

Pay type setting for CyberSource: Use the Notify of installment setting for the payment method to control whether to send a `commerceIndicator` set to install in the subsequent authorization and deposit request to CyberSource for an order using a deferred or installment pay plan, or to have the information passed in the `ccAuthService` element similar to other subsequent authorizations, such as a split shipment.

For more information: See [Working with Pay Types \(WPAY\)](#) for more information on setting up pay types.

 **Important:**

In order to determine how to set this flag if you offer deferred or installment billing and use CyberSource, you need to confirm the information required by the end processor for deferred or installment payment plans for each payment type.

Credit Card Net Exchange Billing

Credit card net exchange billing allows the system to hold the credit invoice for a return to net it against the debit invoice for the associated exchange in order to reduce the number of transactions that occur for an exchange. The system uses the automatically created EXC Net Billing for Exchanges deferred payment option to determine how long to delay billing the customer's credit card, based on the invoice date and the # of days for deferral defined for the EXC payment option.

Examples of net exchange billing: The remaining amount after the system performs credit card netting determines whether the system charges or credits the customer's credit card.

Type of Exchange	Example
Even exchange	<p>Credit invoice for returned item = \$50.00 Debit invoice for exchange item = \$50.00</p> <p>During deposits, the system nets the credit invoice containing the returned item against the debit invoice containing the exchange item to determine the remaining amount to deposit: 50.00 debit - 50.00 credit = 0.00 balance</p> <p>The system does not charge or credit the customer's credit card. See CC Net Example: Even Exchange for more details.</p>
Uneven exchange for less expensive item	<p>Credit invoice for returned item = \$100.00 Debit invoice for exchange item = \$60.00</p> <p>During deposits, the system nets the credit invoice containing the returned item against the debit invoice containing the exchange item to determine the remaining amount to deposit: 100.00 credit - 60.00 debit = 40.00 credit</p> <p>The system credits the customer's credit card \$40.00. See CC Net Example: Uneven Exchange for Less Expensive Item for more details.</p>
Uneven exchange for more expensive item	<p>Credit invoice for returned item = \$100.00 Debit invoice for exchange item = \$140.00</p> <p>During deposits, the system nets the credit invoice containing the returned item against the debit invoice containing the exchange item to determine the remaining amount to deposit: 140.00 debit - 100.00 credit = 40.00 debit</p> <p>The system charges the customer's credit card \$40.00. See CC Net Example: Uneven Exchange for More Expensive Item for more details.</p>

Eligible orders: An order is eligible for net exchange billing if:

- the [Use CC Net Exchange Billing \(M23\)](#) system control value is selected, and
- the [Hold Days for CC Netting \(M24\)](#) is set to a number greater than 0, and
- the order contains a credit card pay type, and
- a deferred or installment pay plan has not already been assigned to the credit card pay type on the order (see [Deferred/Installment Billing Overview](#)).

Accepting an exchange transaction on an order eligible for net exchange billing: When you accept an exchange transaction on an order eligible for net exchange billing, the system:

- updates the ODT Seq # field in the RA Exchange Item table with the order detail sequence number of the exchange item added to the order in order to link the exchange item to the associated returned item.
- creates a manual authorization for the return amount, using the authorization code defined in the [Default Auth Code for CC Netting \(M25\)](#) system control value. The expiration date for the manual authorization is based on the Reauthorization days defined for the credit card pay type.
- places the associated refund on hold and updates the Hold until date based on the # of days for deferral defined for the EXC deferred payment option. The system holds the refund for this number of days to allow time for the system to net the credit invoice containing the return item against the debit invoice containing the exchange item.

Billing an exchange transaction flagged for net exchange billing: When the exchange transaction is processed through billing, the system:

- creates the credit invoice and assigns the EXC deferred payment option to the invoice. The system considers a credit invoice pending net exchange billing if the Invoice Payment Method record contains the EXC deferred payment option code in the FPO Payment Code and the credit invoice has not yet been deposited (the Deposit created date for the Invoice Payment Method record is blank).
- updates the Deposit Release Date for the Invoice Payment Method record for the credit invoice with the calculated release date using the current date + the # of days for deferral defined for the EXC payment option. The deposit release date indicates when the deposit is eligible for processing; the system will not process the credit invoice until its deposit release date has been reached.

Reviewing the order in Order Inquiry: When reviewing orders flagged for net exchange billing:

- EXC displays under the Line # field on the [Order Inquiry Detail Screen](#) for the order detail line that contains the return item to indicate the returned item is associated with an exchange item. **Note:** The system identifies the order detail line that contains the exchange item by the associated Order Line History record that contains the exchange reason code. You can review order line history on the [Display Order Line History Screen](#).
- the Net Bill field on the [Display Invoices Screen](#) for the credit invoice displays an asterisk, indicating the credit invoice is currently pending for net exchange billing. The system considers a credit invoice pending for credit card net exchange billing if the Invoice Payment Method record contains the EXC deferred payment option code in the IPM FPO Payment Code and the credit invoice has not yet been deposited (the IPM Deposit created date is blank).

Reviewing the refund: When reviewing refunds flagged for net exchange billing:

- the Net field on the [Work with Refunds Screen](#) and [Work with Refunds By Order# Screen](#) displays an asterisk for a refund that is pending net exchange billing.
- the text *NET BILLING displays next to the Amount field on the [Change Refund Screen](#) and Display Refund screen.
- the system prevents you from changing the pay type of the refund to another pay type (the Pay type field on the Change Refund screen is display-only).
- the [Refund Due List by Type](#) and the [Refund Due List by Order #](#) reports display an asterisk after the amount if the refund has been flagged for net exchange billing.

Generating a pick for the exchange item: During pick slip generation for the exchange item, the system applies the manual authorization to the shippable amount and performs batch authorization for any remaining balance due.

Shipping and billing the exchange item: When the shipment for the exchange item is processed through billing, the system:

- creates the debit invoice for the exchange item and assigns the EXC deferred payment option to the invoice.
- updates the Invoice Payment Method record for the debit invoice:
 - the IPM Auth # contains the authorization code defined in the Default Auth Code for CC Netting (M25) system control value.

- the IPM Auth Date and IPM Deposit Release Date contain the current date.
- updates the IPM Deposit Release Date for the credit invoice flagged for net exchange billing to the current date, releasing the credit invoice for netting.
- processes the refund, even if the Hold until date for the refund has not been reached. However, the system does not print or email the credit card credit acknowledgment for the refund until the next time you run process refunds.
- updates the Pay Plan Code field for the credit card pay type on the [Display Order Pay Type Screen \(2 of 2\)](#) with the EXC deferred flexible payment option.

Processing deposits: When you process deposits, the system nets the credit invoice containing the return item against the debit invoice containing the exchange item.

- If the net difference is a credit, the system sends the credit invoice to the service bureau for settlement in order to refund the customer's credit card the net amount.
- If the net difference is a debit, the system sends the debit invoice to the service bureau for settlement in order to charge the customer's credit card the net amount.
- If the net difference is zero, the system does not send any invoice amount to the service bureau for settlement. No amount is applied to the customer's credit card.

Processing refunds: When you process refunds, the system defers the printing and emailing of credit card credit acknowledgments associated with refunds flagged for net exchange billing until the system nets the credit invoice containing the return item against the debit invoice containing the exchange item.

Once netting is performed, the system prints and emails credit card credit acknowledgments for refunds flagged for net exchange billing the next time you run process refunds. In addition, the [Credit Card Credit Register](#) displays an asterisk after the refund amount if the refund is flagged for net exchange billing.

The [Display Refunds for Order Screen](#) displays the amount of the refund that was processed.

- If the net difference is a debit, the refund amount updates to .00.
- If the net difference is a credit, the refund amount updates to the net credit amount.
- If the net difference is zero, the refund amount updates to .00.

Reviewing order transaction history: The system creates the following Order Transaction History records during the net exchange process to help you understand the updates that have taken place. You can view these messages on the [Display Order History Screen](#).

When the exchange transaction is accepted and processed through billing, the system creates records similar to the following:

Type	Transaction Note	Amt	User
RTN AUTH	RA Credit pending processing	100.00	TBROWN
AUTH	MANUAL AUTH# DETECTED - CCNET	100.00	AUTH
SHIPMENT	CREDIT BILLED ON INVOICE# 0001014	100.00-	TBROWN

When you ship and bill the exchange item, the system creates records similar to the following:

Type	Transaction Note	Amt	User
REFUND	CC Crd for inv# 1014 processed-deferred	100.00	your default user
SHIPMENT	Pick# 0003977 Billed on Invoice# 0001015	60.00	TBROWN

When you process deposits, the system creates a record similar to the following:

Type	Transaction Note	Amt	User
REFUND	Refund amount netted to -40.00		TBROWN

Reviewing order payment history: The system creates the following Order Payment History records during the net exchange process to help you understand the updates that have taken place. You can view these messages on the [Display Order Payment History Screen](#).

When the exchange transaction is accepted, the system creates records similar to the following:

Type	Note	Inv	User
B	Inv# 1014 created for \$100.00-	1014	TBROWN
B	with a deposit release date of 20815.	1014	TBROWN

When you ship and bill the exchange item, the system creates records similar to the following:

Type	Note	Inv	User
B	Inv# 1015 created for \$60.00	1015	TBROWN
B	with a deposit release date of 12915.	1015	TBROWN

When you process deposits, the system creates records similar to the following:

Type	Note	Inv	User
N	Pend Dep of \$60.00 on INV1015 netted	1015	TBROWN
N	against CRD1014 reducing to \$40.00-.	1015	TBROWN
N	Pend Dep of \$60.00 on INV1015 netted	1014	TBROWN
N	against CRD1014 reducing to \$40.00-.	1014	TBROWN
D	Deposit confirmed \$ 40.00-.	1014	TBROWN

Net exchange billing considerations:

- An order is not eligible for net exchange billing if:
 - you return an item and then manually add an exchange item to the order.
 - the exchange item is soldout.

In these situations, the system does not link the exchange item with the return item and processes the return and exchange separately.

- If you cancel the exchange item, the system does not perform net exchange billing and credits the customer's credit card for the amount of the return.
- If the manual authorization created for the return amount expires before the exchange item is shipped and billed, the system performs batch authorization during pick slip generation and continues to hold the credit invoice and refund in order to perform net exchange billing during deposits.
- Regardless of whether you consolidate invoices, the system flags all credit and debit invoices associated with the return and exchange transaction for net exchange billing. See the following for examples:
 - [CC Net Example: Uneven Exchange for Less Expensive Item Plus Ship Alone Item; Invoices Not Consolidated](#)
 - [CC Net Example: Uneven Exchange for Less Expensive Item Plus Ship Alone Item; Invoices Consolidated](#)
 - [CC Net Example: Uneven Exchange for More Expensive Item Plus Ship Alone Item, Invoices Not Consolidated](#)
 - [CC Net Example: Uneven Exchange for More Expensive Item Plus Ship Alone Item; Invoices Consolidated](#)
- If the order contains more than one credit card, the system includes both credit cards in the net exchange process.
- If an item on the order is shipped and billed on the same day as the exchange item, the system includes the amount of the additional item in the net exchange process. See [CC Net Example: Even Exchange Plus Additional Item](#) for an example.

In this topic:

- [Credit Card Net Exchange Setup](#)
- [Credit Card Net Exchange Examples](#)

Credit Card Net Exchange Setup

Before you can use credit card net exchange billing, you must complete the required setup. Information requiring setup includes:

- [System Control Values for Credit Card Net Exchange Billing](#)
- [EXC Net Billing for Exchanges Flexible Payment Option](#)
- [Credit Card Net Exchange Edit in Work with Pay Types \(WPAY\)](#)

System Control Values for Credit Card Net Exchange Billing

System Control Value	Description
Use CC Net Exchange Billing (M23)	Select this system control value if you want the system to net credit invoices with debit invoices before a deposit is sent to the service bureau for an invoice associated with an exchange.
Hold Days for CC Netting (M24)	Enter the number of days the system holds debit and credit invoices for credit card net exchange billing. The system updates the # of days for deferral field for the EXC Net Billing for Exchanges flexible payment option record with this number. Any existing refunds and Invoice Payment Method records are not updated with the new hold days. Note: Net exchange billing does not work unless this system control value is set to a number greater than 0.
Default Auth Code for CC Netting (M25)	Enter the authorization code the system uses when creating a manual authorization to allow for the netting of invoices during the credit card net exchange process.
Preload Deposits (L78)	Deselect this system control value if the Use CC Net Exchange Billing (M23) system control value is selected. You cannot use preload deposit processing if you are using Credit Card Net Exchange Billing.

EXC Net Billing for Exchanges Flexible Payment Option

The system creates the EXC Net Billing for Exchanges flexible payment option automatically if you select the Use CC Net Exchange Billing (M23) system control value for use during the Credit Card Net Exchange process. You cannot change or delete this flexible payment option or use this flexible payment option for deferred/installment billing. The default settings for the EXC flexible payment option are described below; see [Working with Flexible Payment Options \(WFPO\)](#) for more information on flexible payment options.

This flexible payment option is deleted automatically if you deselect the Use CC Net Exchange Billing (M23) system control value.

Field	Description
Payment Code	Delivered as EXC.
Description	Delivered as Net Billing for Exchanges.
Type	Delivered as Deferred, indicating the system defers depositing the amount the customer owes for an order shipment for a specified period of time.
Start	Does not apply to net exchange billing.
End	Does not apply to net exchange billing.
Expiration Date	Does not apply to net exchange billing.
View in OE/OM	Delivered as unselected, since the EXC Net Billing for Exchanges flexible payment option is not an available selection during deferred/installment billing.

Field	Description
Restrict to entity	Delivered as 0, indicating the flexible payment option is not restricted to a specific entity.
Auth full amount	Delivered as unselected since this field is not used during the credit card net exchange process.
Merchant ID Message	Delivered blank since this field is not used during the credit card net exchange process.
Ship Complete	Delivered as unselected since this field is not used during the credit card net exchange process.
Display Summary	Delivered as unselected since this field is not used during the credit card net exchange process.
Auto apply	Delivered as No auto apply since this field is not used during the credit card net exchange process.
Validate CC ext dt	Delivered as unselected since this field is not used during the credit card net exchange process.
Pick Message	Delivered blank since this field is not used during the credit card net exchange process.
Deferred Values	
# of days for deferral	Delivered as 0. The system updates this field with the number of days you enter in the Hold Days for CC Netting (M24) system control value. This is the number of days the system holds debit and credit invoices for credit card net exchange billing. The system also uses this number to determine the manual authorization date during Credit Card Net Exchange Billing.
Based On	Delivered as Invoice Dt, indicating the system uses the invoice (billing) date and # of days for deferral field to calculate the deposit date.
Fixed deferral date	Delivered as 0 since this field is not used during the credit card net exchange process.
Installment Values	The # Of Installments, Interval, and Fixed Installment day fields are set to 0 for the EXC flexible payment option.
Qualification Values	The Offer and Item fields are blank and the Minimum Amt and Pay Type fields are set to 0 for the EXC flexible payment option.

Credit Card Net Exchange Edit in Work with Pay Types (WPAY)

If the Use CC Net Exchange Billing (M23) system control value is selected, you cannot define an Alternate refund type or Alternate refund category for a Credit Card Pay type category pay type; the system displays an error message: Alt refund type/category not allowed with CC Net Exchange Billing.

Also, if an alternate refund type or alternate refund category is defined for an existing pay type, the system will ignore the alternate refund values and instead perform credit card net exchange billing for eligible orders.

**CC Net Example: Uneven Exchange for Less Expensive Item Plus Ship Alone Item;
Invoices Consolidated**

The system performs the following steps during credit card net exchange processing when the exchange item is less expensive than the return item. In this example, the customer also orders an additional ship alone item for \$30.00. The Consolidated Invoice (B49) system control value is selected.

! Important:

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

#	Step
1.	The customer places an order for an item for \$100.00. The item is picked, shipped, and billed. The order is processed through deposits.
2.	The customer returns the item for \$100.00 to exchange it for a less expensive item (\$60.00). The customer also adds a ship alone item for \$30.00 to the order.

#	Step																																
3	<p>When the return and exchange transaction is accepted and billed, the system</p> <ul style="list-style-type: none"> updates the ODT Seq # field in the RA Exchange Item table with the order detail sequence number of the exchange item added to the order. creates a manual authorization for the return amount (\$100.00) using the authorization number defined in the Default Auth Code for CC Netting (M25) system control value. The expiration date for the manual authorization is based on the Reauthorization days defined for the credit card pay type. creates a refund for \$100.00 in a held status and updates the Hold until date with the calculated hold days using the current date + the # of days for deferral defined for the EXC flexible payment option. creates a credit invoice for the returned item for \$100.00. The system also updates the Invoice Payment Method record for the credit invoice: <ul style="list-style-type: none"> the IPM FPO Payment Code field contains the EXC flexible payment option code. the IPM Deposit Release Date is calculated using the current date + the # of days for deferral defined for the EXC flexible payment option. creates the following Order Transaction History records that you can view on the Display Order History screen: <table border="0"> <tr> <td>RTN AUTH</td> <td>RA Credit pending processing</td> <td>100.00</td> </tr> <tr> <td>KBROWN</td> <td></td> <td></td> </tr> <tr> <td>MAINT</td> <td>Order was maintained</td> <td>90.00</td> </tr> <tr> <td>KBROWN</td> <td></td> <td></td> </tr> <tr> <td>AUTH</td> <td>MANUAL AUTH# DETECTED - CCNET</td> <td>100.00</td> </tr> <tr> <td>OEPICKAUTH</td> <td></td> <td></td> </tr> <tr> <td>SHIPMENT</td> <td>CREDIT BILLED ON INVOICE# 0001043</td> <td></td> </tr> <tr> <td>100.00-</td> <td>KBROWN</td> <td></td> </tr> </table> creates the following Order Payment History records that you can view on the Display Order Payment History Screen: <table border="0"> <tr> <td>B</td> <td>Inv# 1043 created for \$100.00-</td> </tr> <tr> <td></td> <td>1043 KBROWN</td> </tr> <tr> <td>B</td> <td>with a deposit release date of 30115</td> </tr> <tr> <td></td> <td>1043 KBROWN</td> </tr> </table> 	RTN AUTH	RA Credit pending processing	100.00	KBROWN			MAINT	Order was maintained	90.00	KBROWN			AUTH	MANUAL AUTH# DETECTED - CCNET	100.00	OEPICKAUTH			SHIPMENT	CREDIT BILLED ON INVOICE# 0001043		100.00-	KBROWN		B	Inv# 1043 created for \$100.00-		1043 KBROWN	B	with a deposit release date of 30115		1043 KBROWN

CC Net Example: Uneven Exchange for More Expensive Item

The system performs the following steps during credit card net exchange processing when the exchange item is more expensive than the return item. In this example, no other items besides the exchange item are added to the order.

#	Step
1.	The customer places an order for an item for \$100.00. The item is picked, shipped, and billed. The order is processed through deposits.
2.	The customer returns the item for \$100.00 to exchange it for a more expensive item (\$140.00).

#	Step
3	<p>When the return and exchange transaction is accepted and billed, the system</p> <ul style="list-style-type: none"> updates the ODT Seq # field in the RA Exchange Item table with the order detail sequence number of the exchange item added to the order. creates a manual authorization for the return amount (\$100.00) using the authorization number defined in the Default Auth Code for CC Netting (M25) system control value. The expiration date for the manual authorization is based on the Reauthorization days defined for the credit card pay type. creates a refund for \$100.00 in a held status and updates the Hold until date with the calculated hold days using the current date + the # of days for deferral defined for the EXC flexible payment option. creates a credit invoice for the returned item for \$100.00. The system also updates the Invoice Payment Method record for the credit invoice: <ul style="list-style-type: none"> the IPM FPO Payment Code field contains the EXC flexible payment option code. the IPM Deposit Release Date is calculated using the current date + the # of days for deferral defined for the EXC flexible payment option. creates the following Order Transaction History records that you can view on the Display Order History screen: <pre> RTN AUTH RA Credit pending processing 100.00 KBROWN MAINT Order was maintained 140.00 KBROWN SHIPMENT CREDIT BILLED ON INVOICE# 0001046. 100.00- KBROWN </pre> creates the following Order Payment History records that you can view on the Display Order Payment History Screen: <pre> B Inv# 1046 created for \$100.00- 1046 KBROWN B with a deposit release date of 30515. 1046 KBROWN </pre>

CC Net Example: Uneven Exchange for More Expensive Item Plus Ship Alone Item; Invoices Consolidated

The system performs the following steps during credit card net exchange processing when the exchange item is more expensive than the return item. In this example, the customer also orders an additional ship alone item for \$30.00. The Consolidated Invoice (B49) system control value is selected.

Important:

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

#	Step
1.	The customer places an order for an item for \$100.00. The item is picked, shipped, and billed. The order is processed through deposits.
2.	The customer returns the item for \$100.00 to exchange it for a more expensive item (\$140.00) and also adds a ship alone item for \$30.00.
3.	<p>When the return and exchange transaction is accepted and billed, the system</p> <ul style="list-style-type: none"> updates the ODT Seq # field in the RA Exchange Item table with the order detail sequence number of the exchange item added to the order. creates a manual authorization for the return amount (\$100.00) using the authorization number defined in the Default Auth Code for CC Netting (M25) system control value. The expiration date for the manual authorization is based on the Reauthorization days defined for the credit card pay type. creates a credit invoice for the returned item for \$100.00. Processing Deposits

Topics in this part:

- [Processing Auto Deposits \(SDEP\)](#) describes the Submit Auto Deposits menu option.
- [Manage Rejected Deposits](#) in Modern View describes how to review and work with rejected or unconfirmed deposits.
- [Printing the Deposit History Summary \(PDHS\)](#) describes how to print a report summarizing credit card deposits by date.
- [Printing the Credit Card Deposit Schedule \(PCCD\)](#) describes how to print a report listing the your projected deposits for deferred or installment billing pay plans.
- [Printing the Pending Payment Plan Deposits Report \(PPPD\)](#) describes how to print a report listing future deferred or installment deposits by order and invoice number.
- [Printing the Deposit History Detail Report \(PDHD\)](#) describes how to print a report listing deposits processed during a specific date range. Within this date range, you can select to include only deposits for a specific authorization service, pay type, and status.

E-Commerce Interface

Topics in this part:

- *E-Commerce Catalog Requests* describes how the system processes a catalog request received from the web storefront.
- *E-Commerce Item Availability Processing* describes how the system extracts item availability information for download to the web storefront.
For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- [Working with Batch Order Maintenance Transactions \(WBOM\)](#) describes how the system processes a cancellation request from the web storefront and how to work with order cancel request errors.
- [E-Commerce Setup](#) describes the setup required in Order Administration for the e-commerce interface, and specifies additional documentation detailing setup requirements for communicating and for the web storefront.
- [Downloading E-Commerce Offer Files \(EOFR\)](#) describes the process you use to extract information related to items, source codes and offers to staging files for subsequent download to the web storefront.
- [Working with E-Mail Notification Templates \(WEMT\)](#) describes how to set up templates for the various email notifications you can send to customers.
- [Sending Internet Order Ship Confirmation \(ESCF\)](#) describes the menu option you use to send email confirmations for shipment of orders received through the web storefront.

Workflow Management

Topics in this part: The following topics describe the functions available for workflow management.

- [Workflow Management Overview and Setup](#) provides an overview on workflow management and required setup.
- [Working with Tickler User Groups \(WTUG\)](#) explains how to create and work with tickler user groups.
- [Working with Tickler Category \(WTCT\)](#) explains how to create and work with tickler categories.
- [Working with Tickler Resolution Reasons \(WTRR\)](#) explains how to create and work with tickler resolution reasons.
- [Working with Tickler Events \(WTEV\)](#) explains how to define tickler event settings at the event level and event rule level and create, change, delete, and define procedures for event rules.
- [Working with Tickler Users/User Groups \(WTIC\)](#) allows workflow users to review and work with ticklers in the user's or user group's tickler work queue.
- [Workflow Management \(WWFM\)](#) allows workflow supervisors to review and work with ticklers in a tickler work queue.
- [Purging Ticklers \(MPTK\)](#) allows you to purge resolved ticklers by date range.

Workflow Management Overview and Setup

Workflow management allows you to automate system actions, during which tasks (ticklers) are assigned to a user for action, according to a defined set of procedures, until the issues associated with the ticklers are resolved.

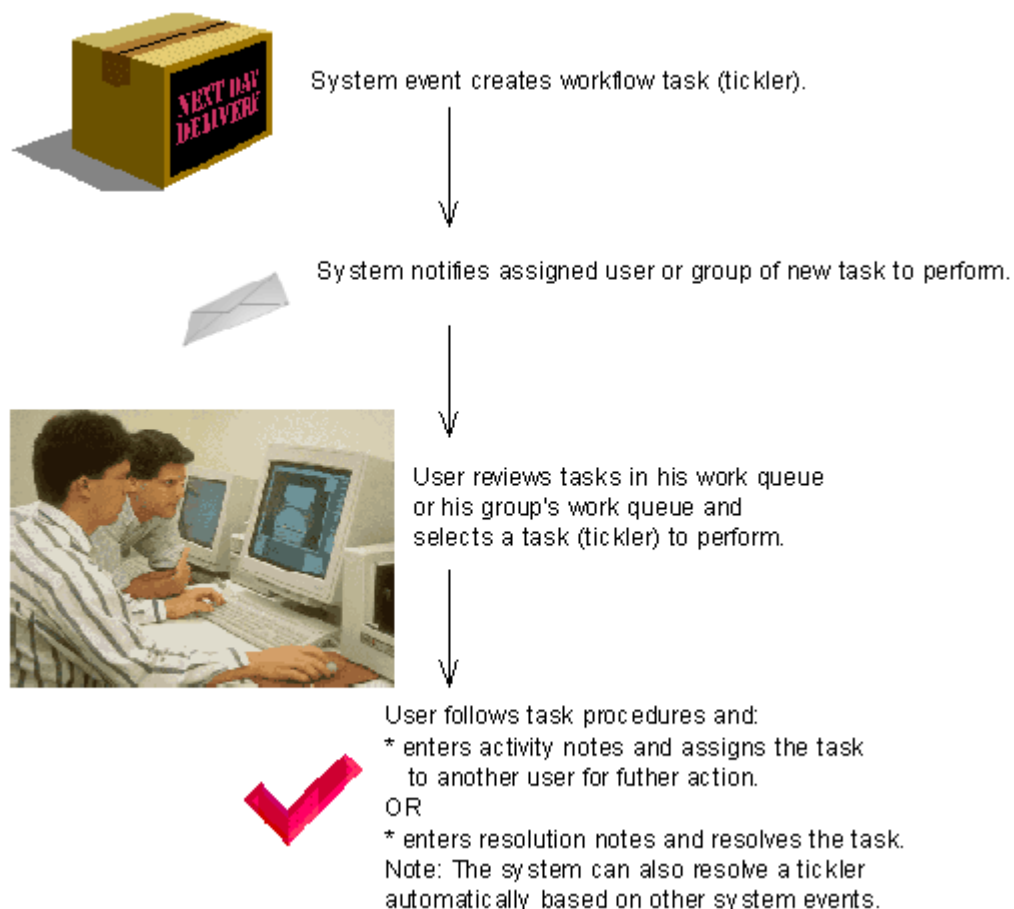

Tickler events are the system actions for which the system may create a workflow task (tickler).

Tickler event rules are the criteria that must be met by the system action for the system to create a tickler for a user to resolve.

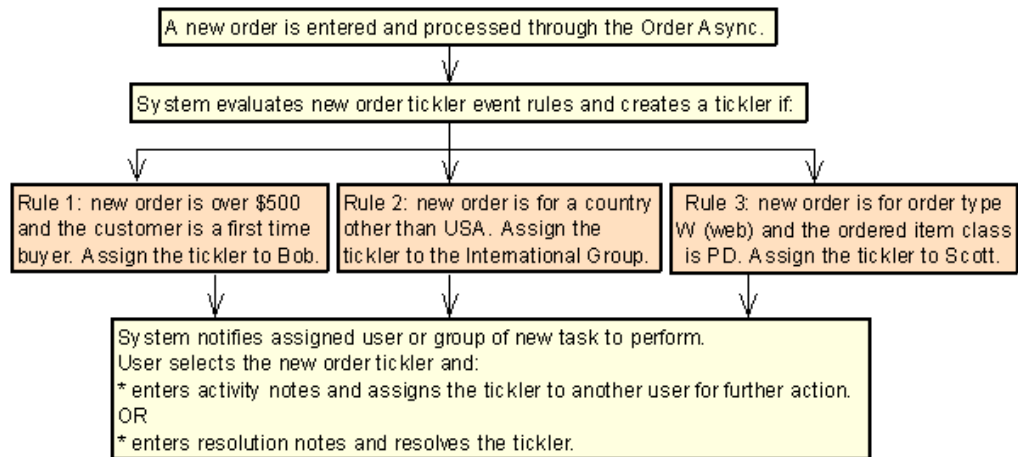

Ticklers are tasks automatically created by the system and assigned to a user when a system action meets the criteria defined for a tickler event rule. For each tickler, you can define the procedures, or instructions, the user should follow to complete the task. A tickler can also be created manually.

Tickler procedures are the instructions a user follows to complete the tickler task.

Workflow Management Illustration

Example: This flowchart provides an example of the workflow process.

With workflow management:

- the system automatically creates ticklers when a task must be performed and resolved.
- the system assigns tasks to a specific user or group of users as soon as a tickler is created ensuring the tasks are not misplaced, stalled, or duplicated. Tickler assignment allows only authorized users access to the tickler and the associated data.
- supervisors are notified if a tickler remains unresolved for a specified number of days to ensure the tasks are resolved in a timely manner. Supervisors can reassign ticklers to the appropriate resource.
- the procedures to resolve a task are formally documented to ensure users are following the instructions exactly and reducing the cost of training staff.
- the most important ticklers are worked on first by a specified priority so users don't waste time choosing which tickler to work on or putting off difficult tasks.
- a history of the activity performed against the tickler is stored for easy tracking and review of what was done and when.

System Delivered Tickler Events

This table describes the 11 system delivered events that can create ticklers, based on the system action and the criteria defined for the event rules. You use the [Working with Tickler Events \(WTEV\)](#) menu option to set up each tickler event and define criteria for each event rule.

Note:

Each tickler event is delivered as inactive.

Tickler Event...	creates a tickler when the system...	and one or more of the following criteria is met...
BO backorders	places an item on backorder	<p>An item is backordered, regardless of any other criteria.</p> <p>The backordered item is initially backordered in order entry/maintenance and not by some other program.</p> <p>The customer's life-to-date order dollars is less than, equal to, or greater than a specified life-to-date order dollars.</p> <p>The customer class defined for the sold to customer matches a specified customer class.</p> <p>The item/SKU on backorder matches a specified item/SKU.</p> <p>The item status of the backordered item matches a specified item status.</p> <p>The item class of the backordered item matches a specified item class.</p> <p>The ship via on the backordered order matches a specified ship via.</p> <p>The ship via priority for the ship via on the backordered order matches a specified ship via priority.</p> <p>See BO (Backorders) Event Processing.</p>

Tickler Event...	creates a tickler when the system...	and one or more of the following criteria is met...
CO cancelled orders	cancels an item	<p>An item is cancelled, regardless of any other criteria.</p> <p>The item is cancelled by a batch process instead of interactively.</p> <p>The customer's life-to-date order dollars is less than, equal to, or greater than a specified life-to-date order dollars.</p> <p>The customer class defined for the sold to customer matches a specified customer class.</p> <p>The cancelled item/SKU matches a specified item/SKU.</p> <p>The item status of the cancelled item matches a specified item status.</p> <p>The item class of the cancelled item matches a specified item class.</p> <p>The cancel reason matches a specified cancel reason.</p> <p>The ship via on the cancelled order matches a specified ship via.</p> <p>The ship via priority for the ship via on the cancelled order matches a specified ship via priority.</p> <p>See CO (Cancelled Orders) Event Processing.</p>
HO held orders	places an order, order recipient, or order payment method on hold	<p>The hold reason (order or pay type) matches a specified hold reason (order or pay type).</p> <p>The pay type on the held order matches a specified pay type.</p> <p>The order total for the held order is less than, equal to, or greater than a specified order total.</p> <p>The ship via on the held order matches a specified ship via.</p> <p>The ship via priority for the ship via on the held order matches a specified ship via priority.</p> <p>See HO (Held Orders) Event Processing.</p>
MN manually created	manually creates a workflow task	<p>You cannot define criteria for this tickler event.</p> <p>See MN (Manually Created) Event Processing.</p>

Tickler Event...	creates a tickler when the system...	and one or more of the following criteria is met...
NO new orders	updates the status of an order line to open (during order accept) or closed (during the Billing Async)	<p>The order line status is updated to open or closed.</p> <p>The quantity ordered/shipped for the open/closed order line matches a specified quantity.</p> <p>The item status for the item on the open/closed order line matches a specified item status.</p> <p>The sold to customer on the order is a first time buyer.</p> <p>The item class for the item on the open/closed order line matches a specified item class.</p> <p>The item/SKU on the open/closed order line matches a specified item/SKU.</p> <p>The order type for the order matches a specified order type.</p> <p>The country code for the order matches a specified country code.</p> <p>The country code for the order is a country other than the Default Country for Customer Address (B17) system control value.</p> <p>The last order date for the sold to customer is past the current date by a specified number of days.</p> <p>The order total on the order is less than, equal to, or greater than a specified order dollars.</p> <p>The ship via code on the order line or order header matches the ship via code on the event rule.</p> <p>The priority for the ship via code on the order line or order header matches the ship via priority on the event rule.</p> <p>See NO (New Orders) Event Processing.</p>
OO aged open orders	evaluates aged open orders using the Evaluate Create/Resolve Ticklers periodic function (program name PFR0072)	<p>The order's entered date or arrival date is older than the current date by a specified number of days.</p> <p>The ship via on the order matches a specified ship via.</p> <p>The ship via priority for the ship via on the order matches a specified ship via priority.</p> <p>See OO (Aged Open Orders) Event Processing.</p>
SD stored value card activation decline	receives a declined stored value card activation response from the service bureau	<p>You cannot define criteria for this tickler event.</p> <p>See SD (SVC Activation Decline) Event Processing.</p>

Tickler Event...	creates a tickler when the system...	and one or more of the following criteria is met...
SO soldout orders	sells out an item	<p>The order line is soldout by a batch process and not interactively.</p> <p>The order line is sold out interactively in order entry or order maintenance.</p> <p>The life-to-date order dollars for the sold to customer is less than, equal to, or greater than a specified life-to-date order dollars.</p> <p>The customer class for the sold to customer matches a specified customer class.</p> <p>The soldout item/SKU matches a specified item/SKU.</p> <p>The item status for the soldout item matches a specified item status.</p> <p>The item class for the soldout item matches a specified item class.</p> <p>The ship via on the soldout order matches a specified ship via.</p> <p>The ship via priority for the ship via on the soldout order matches a specified ship via priority.</p> <p>See SO (Soldout Orders) Event Processing.</p>
SV stored value card number assignment	processes an order containing a stored value card item without a number assignment through the Billing Async	<p>You cannot define criteria for this tickler event.</p> <p>See SV (SVC Number Assignment) Event Processing.</p>
UP unconfirmed pick tickets	evaluates unconfirmed pick slips using the Evaluate Create/Resolve Ticklers periodic function (program name PFR0072)	<p>The pick control date for the unconfirmed pick slip is older than the system date by a specified number of days.</p> <p>The pick category for the unconfirmed pick slip matches a specified pick category.</p> <p>The ship via on the unconfirmed pick slip matches a specified ship via.</p> <p>The ship via priority for the ship via on the unconfirmed pick slip matches a specified ship via priority.</p> <p>See UP (Unconfirmed Pick Tickets) Event Processing.</p>
VP voided pick tickets	voids a pick slip	<p>The ship via on the voided pick slip matches a specified ship via.</p> <p>The ship via priority for the ship via on the voided pick slip matches a specified ship via priority.</p> <p>The item/SKU on the voided pick slip matches a specified item/SKU.</p> <p>See VP (Voided Pick Tickets) Event Processing.</p>

Tickler Event...	creates a tickler when the system...	and one or more of the following criteria is met...
WF remote workflow	receives a CWWorkflow XML message from an external system	The source value in the CWWorkflow XML message matches the value in the Source field for the event rule. See WF (Remote Workflow) Event Processing .

Defining Tickler Events and Event Rules

To create a tickler, you must define:

- the tickler events that can create a tickler; see [System Delivered Tickler Events](#).
- tickler event settings, that define how the system creates ticklers for each event; see [Tickler Event Settings](#).
- event rule settings, that override the settings defined at the event level and determine how the event rule is processed; see [Event Rule Settings](#).
- event rule criteria, that define the criteria the system action must meet to create a tickler; see [Event Rule Criteria](#).
- event rule procedures, that define the instructions a user should follow to work with and resolve a tickler created by the event rule.

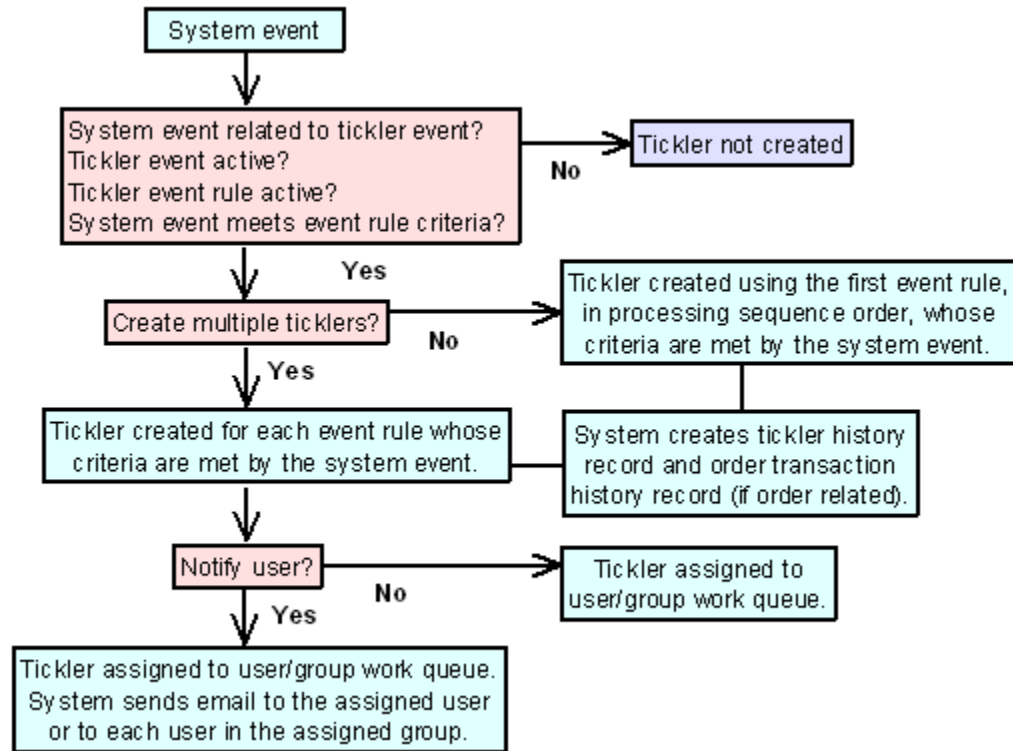

You use the Working with Tickler Events (WTEV) menu option to set up the system delivered tickler events and define event rules.

Creating Ticklers

The Create Tickler program determines if the system creates a tickler during certain system actions.

You can also manually create a tickler for the MN (manually created) tickler event; see [MN \(Manually Created\) Event Processing](#).

Ticker creation logic: This flowchart describes the process the system uses to determine if a tickler is created for a system action.

The Create Tickler program:

1. Determines the tickler event to evaluate, based on the system action currently being performed.

See [System Delivered Tickler Events](#) for more information on when the system evaluates tickler events.

2. Determines if the tickler event is active.

In order to create a tickler for a tickler event, the Active field defined for the event must be selected.

- If the Active field for the event is selected, the tickler event is active and the system can create a tickler for the event.
- If the Active field for the event is unselected, the tickler event is not active and the system cannot create a tickler for the event.

See [Active Tickler Events and Rules](#).

3. Determines if any event rules for the tickler event are active.

In order to create a tickler for an event rule, the Active field defined for the event rule must be selected.

- If the Active field for an event rule is selected, the event rule is active and the system can create a tickler if the system action meets the rule's criteria.
- If the Active field for an event rule is unselected, the event rule is not active and the system cannot create a tickler for the system action.

See [Active Tickler Events and Rules](#).

4. Determines if the system action meets the criteria required for any of the event rules to create a tickler.

In order to create a tickler for an event rule, the system action must meet the criteria defined for the event rule. If the system action does not meet the criteria, the system does not create a tickler.

- the system only evaluates event rules whose Active field is selected.
- the system evaluates the active event rules in processing sequence order, from lowest sequence number to highest. You define the processing sequence number for an event rule in the Processing sequence number field; see [Event Rule Processing Sequence](#).

5. Determines if more than one tickler can be created.

The Allow multiple ticklers field for the tickler event must be selected in order to create a tickler for each event rule whose criteria are met by the system action.

- If the Allow multiple ticklers field is unselected, the system creates one tickler for the first event rule, in processing sequence order, whose criteria are met by the system action. The AR, OO, and UP tickler events do not allow multiple ticklers.
- If the Allow multiple ticklers field is selected, the system creates a separate tickler for each event rule whose criteria are met by the system action.

See [Allowing Multiple Ticklers](#).

6. The system creates a tickler for the system action.

The system creates a tickler record in the Tickler table in an open status.

7. The system determines if the assigned to user or assigned to tickler group should be notified of the created tickler.

The Notify user/group field defined for the tickler event that created the tickler indicates whether the system sends an email notifying the user or tickler group of the created tickler.

- If the Notify user/group field is selected, the system sends an email to the assign to user or all users associated with the assign to tickler group. The system uses the email address defined for the user in the User Extended table. See [Tickler Notification](#) to review a sample email.
- If the Notify user/group field is unselected, the system does not send an email. The user must review the ticklers assigned to him or his user group at the [Work with Tickler Screen \(user/group view\)](#).

Regardless if the user is notified by email of the newly created tickler, the user can review the ticklers assigned to him and his tickler user group at the Work with Tickler screen; see [Working with Ticklers](#).

8. Creates a record in the Tickler History table.

The Tickler History table tracks the work cycle of a tickler; the system creates a tickler history record when a tickler is created, updated, or resolved. You can review tickler history at the [Display Tickler History Screen](#).

9. Creates a record in the Order Transaction History table if the tickler is associated with an order.

For MN ticklers:

```
MN TICKLER# 000009999 HAS BEEN CREATED
```

```
NOTE:SHORT NOTE DEFINED FOR TICKLER
```

For all other ticklers, where XX is the tickler event code:

XX TICKLER# 000009999 HAS BEEN CREATED
 RULE:DESCRIPTION OF RULE ASSOCIATED WITH TICKLER

You can review order transaction history at the [Display Order History Screen](#).

For more information: For more information on the processing that occurs for each tickler event, see:

- [BO \(Backorders\) Event Processing](#)
- [CO \(Cancelled Orders\) Event Processing](#)
- [HO \(Held Orders\) Event Processing](#)
- [MN \(Manually Created\) Event Processing](#)
- [NO \(New Orders\) Event Processing](#)
- [OO \(Aged Open Orders\) Event Processing](#)
- [SD \(SVC Activation Decline\) Event Processing](#)
- [SO \(Soldout Orders\) Event Processing](#)
- [SV \(SVC Number Assignment\) Event Processing](#)
- [UP \(Unconfirmed Pick Tickets\) Event Processing](#)
- [VP \(Voided Pick Tickets\) Event Processing](#)
- [WF \(Remote Workflow\) Event Processing](#)

Why Wasn't a Tickler Created?

Use the list below as a checklist to determine why the system did not create a tickler.

A tickler is not created because...	Reason
You did not restart the background jobs after you changed an event or event rule, or created a new event rule.	The system evaluates new updates only after the background async jobs in the Background Job Control menu option are restarted.
The Active field for the tickler event is unselected.	The system only evaluates tickler events that are active. See Active Tickler Events and Rules .
The Active field for the event rule is unselected.	The system only evaluates event rules that are active. See Active Tickler Events and Rules .
The Allow multiple ticklers field for the tickler event is unselected.	If Allow multiple ticklers is selected, the system creates 1 tickler for the first event rule, in processing sequence order, whose criteria are met by the system action. If the criteria for another event rule is met, the system does not create a tickler. See Allowing Multiple Ticklers .
BO tickler event: the backordered item did not meet the BO event rule criteria.	See BO (Backorders) Event Processing .
CO tickler event: the cancelled item did not meet the CO event rule criteria.	See CO (Cancelled Orders) Event Processing .

A tickler is not created because...	Reason
HO tickler event: the held order did not meet the HO event rule criteria.	See HO (Held Orders) Event Processing .
NO tickler event: the open/closed order line did not meet the NO event rule criteria.	<p>The system evaluates the NO event when an order:</p> <ul style="list-style-type: none"> • is accepted (because the status of an order line updates from suspended to open), before creating a pre-generated pick. If a web order is placed in an error status in an order batch, the system evaluates the NO event when you edit and accept the order batch. Note: The system does not evaluate the NO event when you accept an order in order maintenance. • is processed through the Billing Async (because the status of an order line updates to closed). <p>See NO (New Orders) Event Processing.</p>
OO tickler event: the aged open order did not meet the OO event rule criteria.	See OO (Aged Open Orders) Event Processing .
SD tickler event: the stored value card received an approved activation response from the service bureau.	
SO tickler event: the soldout item did not meet the SO event rule criteria.	See SO (Soldout Orders) Event Processing .
SV tickler event: the stored value card item was assigned a number.	See SV (SVC Number Assignment) Event Processing .
UP tickler event: the unconfirmed pick slip did not meet the UP event rule criteria.	See UP (Unconfirmed Pick Tickets) Event Processing .
VP tickler event: the voided pick slip did not meet the VP event rule criteria.	See VP (Voided Pick Tickets) Event Processing .
WF tickler event: the remote workflow message did not meet the WF event rule criteria.	See WF (Remote Workflow) Event Processing .

Working with Ticklers

Once a tickler is created, a user can review, work with, and resolve ticklers using the following screens:

- [Work with Tickler Screen \(user/group view\)](#)
- [Workflow Management Screen \(tickler supervisor\)](#)
- [Work with Ticklers Screen \(sold to customer view\)](#)
- [Work with Ticklers Screen \(ship-to customer view\)](#)
- [Work with Ticklers Screen \(bill-to customer view\)](#)

- [Work with Ticklers Screen \(order view\)](#)

Update All Ticklers Secured Feature

The [Update All Ticklers \(B09\)](#) secured feature controls whether you can update all ticklers, regardless if the tickler is not assigned to you or your tickler groups.

If you have access to this feature, you can update any tickler, regardless if the tickler is not assigned to you or your tickler groups by:

- selecting Change for a tickler to change it.
- selecting Delete for a tickler to delete it.
- selecting In process for a tickler to assign the tickler to yourself.
- selecting Resolve for a tickler to resolve it.

If you do not have access to this feature, you can update only ticklers assigned to you or your tickler groups. However, you can still release an order associated with the tickler from hold.

User Workflow Management Window

Purpose: The system displays this window when you sign-in to Order Administration if open or in process ticklers exist that are assigned to you or your tickler groups.

You can review, work with, and resolve ticklers assigned to you or your tickler groups using the [Working with Tickler Users/User Groups \(WTIC\)](#) menu option

Customer Workflow Management Window

Purpose: The system displays this window if open or in process ticklers exist that are associated with the customer or order you are reviewing.

How to display this screen:

- select Change for a customer at the [Changing Sold To Customers](#) screens.
- select Change for a ship-to customer at the [Work with Customer Ship Tos Screen](#).
- select Change for a customer at the [Change Bill-to Customer Screen](#).
- advance to the [Order Inquiry Header Screen](#).
- select a customer for order entry at the [Select Customer Sold To For Order Screen](#).
- select a customer (CTI user) at the [Customer Selection Screen](#).
- select an order for return at the [Select Orders For Return Authorization Screen](#).

The window displays once per functional area for each customer you review that has open or in process ticklers.

Example: In standard order inquiry, if you select an order for a customer with open ticklers, the system displays the Customer Workflow Management window; if you then advance to order maintenance for that customer, the system does not display the window again. Back in standard order inquiry, if you select an order for a different customer with open ticklers, the system re-displays the Customer Workflow Management window for the new customer you are reviewing.

Screen Option	Procedure
Review and work with the ticklers associated with the customer or order	<p>Select Ticklers to advance to the Work with Ticklers screen. The view of this screen varies, depending on the function you were performing:</p> <ul style="list-style-type: none"> • sold to customers: Work with Ticklers Screen (sold to customer view) • ship to customers: Work with Ticklers Screen (ship-to customer view) • bill to customers: Work with Ticklers Screen (bill-to customer view) • orders: Work with Ticklers Screen (order view)

Tickler Merge/Purge

Customer merge/purge: If you perform customer merge/purge (sold to or bill to), the system adds the ticklers associated with the source customers to the target customer.

Order purge: If you purge orders associated with ticklers, the system also purges the ticklers.

Resolving Ticklers

A tickler is resolved when you:

- select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).
- perform an action that automatically resolves the tickler; for example when you release an order from hold, the system automatically resolves HO ticklers associated with the order.

When you resolve a tickler associated with an order, the system creates an order transaction history message indicating the tickler has been resolved.

For MN ticklers:

```
MN TICKLER# 000009999 HAS BEEN RESOLVED
RES RSN(XXX) BY (USER/GROUP ID) NOTE (SHORT NOTE DEFINED FOR TICKLER)
```

For all other ticklers, where XX is the tickler event code:

```
XX TICKLER# 000009999 HAS BEEN RESOLVED
RES RSN(XXX) BY (USER/GROUP ID) RULE (DESCRIPTION OF RULE ASSOCIATED WITH TICKLER)
```

You can review order transaction history at the [Display Order History Screen](#).

Workflow Management Setup

Purpose: To use workflow management, you must perform the necessary setup. Information requiring creation and setup includes:

- [System Control Value](#)
- [Secured Feature](#)
- [Number Assignment Value](#)
- [Menu Options](#)
- [Periodic Functions](#)

System Control Value

System Control Value	Description
Use Workflow Management (H96)	Select this field if you wish to use workflow management.

Secured Feature

Secured Feature	Description
Update All Ticklers (B09)	Eligible users can update all ticklers, regardless if the tickler is not assigned to him or his tickler user groups. Prohibited users cannot update all ticklers, only those ticklers assigned to him or his tickler user groups.
Create Manual Tickler (B13)	Eligible users can manually create ticklers. Prohibited users cannot manually create ticklers.

Number Assignment Value

Number Assignment	Description
Tickler Number	Assigns the next available number to a newly created tickler. Note: The system automatically creates this number assignment value when the first tickler is created.

Menu Options

Menu Option	Description
Working with Tickler User Groups (WTUG)	Allows you to create, change, and delete tickler user groups. For each tickler event and event rule, you can define the tickler user group the system assigns to a newly created tickler.
Working with User Records (WUSR)	Allows you to define the e-mail address the system uses when the user is notified of a tickler. Also, allows you to assign a tickler user group to a user.
Working with Tickler Category (WTCT)	Allows you to create, change, and delete a tickler category. Tickler categories are used to further group ticklers.

Menu Option	Description
Working with Tickler Resolution Reasons (WTRR)	Allows you to create, change, and delete a tickler resolution reason. The system assigns a tickler resolution reason to a tickler once it is resolved. You can define the tickler resolution reason to use for ticklers associated with a particular event or event rule.
Working with Tickler Events (WTEV)	Allows you to change the settings for a tickler event, create, change, or delete event rules, and create or modify event rule procedures. Note: You must restart the async jobs in the Background Job Control menu option after you change an event or event rule, or create a new event rule.
Working with Tickler Users/User Groups (WTIC)	Allows a user to review and work with ticklers assigned to him or his tickler user groups.
Workflow Management (WWFM)	Allows a supervisor to review and work with ticklers.
Purging Ticklers (MPTK)	Allows you to purge resolved ticklers, based on date.

Periodic Functions

Periodic Function	Description
Evaluate Create/Resolve Ticklers (program name PFR0072)	Evaluates the: <ul style="list-style-type: none"> • OO tickler event to determine if any open orders qualify for an OO event rule. Also, determines if any existing OO ticklers can be resolved. • UP tickler event to determine if any unconfirmed pick slips qualify for a UP event rule. Also, determines if any existing UP ticklers can be resolved. • AR tickler event to determine if any existing AR ticklers can be created or resolved. • Next notification date for an existing open or in process tickler to determine if the system sends an email to the tickler supervisor notifying him of the aged tickler.

Event Rule Settings

For each event rule you define for a tickler event, you can define:

- whether the event rule is active; see [Active Tickler Events and Rules](#).
- the tickler user/group assigned to work with ticklers created by this event rule and the supervisor to monitor the ticklers; see [Tickler Assignment](#).
- if tickler users are notified when a new tickler is created and if the supervisor is notified when a tickler remains unresolved for a certain number of days; see [Tickler Notification](#).
- the tickler category assigned to ticklers created by this event rule; see [Tickler Category](#).

- the tickler resolution reason assigned to ticklers created by this event rule; see [Tickler Resolution Reason](#).
- how the rules are processed; see [Event Rule Processing Sequence](#).
- the criteria the system action must meet to create a tickler; see [Event Rule Criteria](#).
- the procedures a user should follow to resolve the tickler; see [Event Rule Procedures](#).

You can define event rule settings at the [Create Tickler Event Rule Screen](#) or Change Tickler Event Rule Screen.

**Note:**

If you create or change a tickler event rule, you must restart the asyncs in the Background Job Control menu option before your updates are applied to new ticklers.

Event Rule Processing Sequence

For each event rule you create, you can define a processing sequence number. In addition, the system assigns a rule sequence number to each event rule, based on the order in which the rules were created (the first rule created is assigned rule sequence number 1, etc.).

The Processing sequence number defined for each event rule indicates the order in which the system evaluates event rules to determine if a tickler is created.

The event rule with the lowest processing sequence number is evaluated first (where 0 is the lowest number); the event rule with the highest processing sequence number is evaluated last.

If all of the event rules have the same processing sequence number, the system evaluates the rules in rule sequence order. The event rule with the lowest rule sequence number is evaluated first; the event rule with the highest rule sequence number is evaluated last.

**Note:**

If the event rule is not active (the Active field is unselected), the system does not evaluate the event rule and instead skips the rule and evaluates the next event rule, based on processing or rule sequence order.

Remember: Give the most important rule the lowest processing sequence number and the least important rule the highest processing sequence number. This way the system evaluates the rules in the order of the most important to the least important. This is especially true if you do not allow multiple ticklers: you want the system to create a tickler for the most important rule whose criteria are met by the system action.

If you allow multiple ticklers, you do not need to define a processing sequence number since the system creates a tickler for each rule whose criteria are met.

Example: This example displays the order in which the system evaluates tickler rules based on processing sequence number and rule sequence number.

Processing seq #	Rule seq #	Rule active?	Action meets criteria?	Results
0	2	N	N	The system does not create a tickler for this event rule since the event rule is not active and the system action does not qualify.
0	5	Y	N	The system does not create a tickler for this event rule since the system action does not qualify.
1	4	N	Y	The system does not create a tickler for this event rule since the event rule is not active.
2	1	Y	Y	The system creates a tickler for this event rule since the event rule is active and the system action qualifies.
3	3	Y	Y	The system creates a tickler for this event rule only if the Allow multiple ticklers field for the event is selected; see Allowing Multiple Ticklers .
3	6	Y	Y	The system creates a tickler for this event rule only if the Allow multiple ticklers field for the event is selected; see Allowing Multiple Ticklers .

Event Rule Criteria

For each event rule, you must define the criteria that the system action must meet to create a tickler. Different criteria display for each tickler event. You can create multiple rules for each event by defining different criteria for each rule.

You can define more than one criterion for each event rule; however, you must define at least one criterion. If you define more than one criterion for an event rule, the system action must meet all of the rule's criteria to create a tickler.

Example: If you create an event rule whose criteria are Pay type is 1 and Ship via is 1, the system creates a tickler only if the pay type on the order is 1 and the ship via is 1. The system does not create a tickler if the ship via on the order is 1 but the pay type on the order is 4.

Remember: If you allow multiple ticklers, you must think carefully before you create event rules. For example, if you create the following rules and you allow multiple ticklers, the system creates 3 ticklers, even though event rule 3 is a combination of rules 1 and 2:

- Event rule 1: Ship via is 1 (UPS)
- Event rule 2: Pay type is 1 (cash/check)
- Event rule 3: Ship via is 1 (UPS) and Pay type is 1 (cash/check)

You can define event rule criteria at the [Create Tickler Event Rule Screen](#).

 **Note:**

You cannot create a duplicate event rule, meaning, you cannot create 2 rules that have the same criteria or an error message indicates: Duplicate rule exists.

 **Important:**

If you create or change a tickler event rule, you must restart the asyncs in the Background Job Control menu option before your updates are applied to new ticklers.

For more information: For more information on the criteria you can define for each tickler event, see:

- [BO \(Backorders\) Event Processing](#)
- [CO \(Cancelled Orders\) Event Processing](#)
- [HO \(Held Orders\) Event Processing](#)
- [MN \(Manually Created\) Event Processing](#)
- [NO \(New Orders\) Event Processing](#)
- [OO \(Aged Open Orders\) Event Processing](#)
- [SD \(SVC Activation Decline\) Event Processing](#)
- [SO \(Soldout Orders\) Event Processing](#)
- [SV \(SVC Number Assignment\) Event Processing](#)
- [UP \(Unconfirmed Pick Tickets\) Event Processing](#)
- [VP \(Voided Pick Tickets\) Event Processing](#)
- [WF \(Remote Workflow\) Event Processing](#)

Event Rule Procedures

For each event rule, you can create tickler instructions for a user to follow to resolve the tickler.

You can create and modify event rule procedures at the [Work with Tickler Event Rule Procedure Screen](#).

Example: These procedures may display for ticklers that are created when an order payment method is placed on AT (declined credit card hold) and the ship via is UPS Second Day.

1. Release order from hold.
2. Resend credit card for authorization.
3. Contact UPS to determine if they can deliver by expected arrival date.
4. If package will arrive late, notify customer of possible late delivery.

5. If customer is a valued customer, give customer 25% off coupon on next purchase.

 **Note:**

A tickler user may not complete all of the tasks required to complete the tickler. Using the example above, the first assigned to user may release the order from hold and then assign the tickler to another user to resend the credit card for authorization.

Tickler work notes: The tickler user completing some or all of the tasks associated with the tickler can enter notes regarding the steps he performed for other users and the supervisor to review. See [Tickler Work Notes](#).

Work with Tickler Event Screen

Purpose: Use this screen to change, review, or define rules for a tickler event.

When you first advance to this screen, the system automatically creates the system delivered tickler events if the [Use Workflow Management \(H96\)](#) system control value is selected. However, you must still define settings for each tickler event you wish to enable. You cannot create other tickler events for the system to evaluate for tickler creation.

 **Note:**

You cannot delete a tickler event. If you do not wish to use a tickler event, set the Active field for the event to unselected.

How to display this screen: Enter WTEV in the Fast path field or select Work with Tickler Event from a menu.

Field	Description
Event	<p>A code that determines the system action for which the system may create a tickler.</p> <p>There are 11 system actions that can create ticklers. You cannot create other tickler events for the system to evaluate for tickler creation.</p> <p>BO: backorders; see BO (Backorders) Event Processing</p> <p>CO: cancelled orders; see CO (Cancelled Orders) Event Processing</p> <p>HO: held orders; see HO (Held Orders) Event Processing</p> <p>MN: manually created; see MN (Manually Created) Event Processing</p> <p>NO: new orders; see NO (New Orders) Event Processing</p> <p>OO: aged open orders; see OO (Aged Open Orders) Event Processing</p> <p>SD: stored value card activation decline; see SD (SVC Activation Decline) Event Processing</p> <p>SO: soldout orders; see SO (Soldout Orders) Event Processing</p> <p>SV: stored value card number assignment; see SV (SVC Number Assignment) Event Processing</p> <p>UP: unconfirmed pick tickets; see UP (Unconfirmed Pick Tickets) Event Processing</p> <p>VP: voided pick tickets; see VP (Voided Pick Tickets) Event Processing</p> <p>WF: remote workflow; see WF (Remote Workflow) Event Processing</p> <p>Alphanumeric, 2 positions; optional.</p>
Description	<p>A description of the tickler event.</p> <p>Alphanumeric, 40 positions; optional.</p>
Cat (Tickler event category)	<p>A code for the tickler category assigned to the tickler event. Tickler categories are used to group ticklers.</p> <p>Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT).</p> <p>Alphanumeric, 3 positions; optional.</p>
Pty (Tickler event priority)	<p>The priority assigned to the tickler event, used to determine the importance of ticklers created for this event.</p> <p>Numeric, 1 position; optional.</p>
Act (Tickler event active flag)	<p>Indicates whether the tickler event is active.</p> <p>Selected = The tickler event is currently active; the system creates a tickler if the system action qualifies for an event rule.</p> <p>N = The tickler event is not currently active; the system does not create a tickler, regardless of whether the system action qualifies for an event rule.</p> <p>See Active Tickler Events and Rules.</p>

Screen Option	Procedure
Change the settings of a tickler event	Select Change for a tickler event to advance to the Change Tickler Event Screen .

Screen Option	Procedure
Display a tickler event	Select Display for a tickler event to advance to the Display Tickler Event Screen. You cannot change any information at this screen. See the Change Tickler Event Screen for field descriptions.
Work with tickler event rules	Select Rules for a tickler event to advance to the Work with Tickler Event Rule Screen . You cannot define event rules for the MN (manually created) or SV (SVC number assignment) tickler events.

Create Tickler Event Rule Screen

Purpose: Use this screen to create an event rule for a specific tickler event.

This screen is divided into 2 areas:

- The top half of the screen displays the event rule settings, such as who to notify, the tickler category, resolution reason, and processing sequence number; see [Event Rule Settings](#).
- The bottom half of the screen displays the event rule options, or criteria, that must be met by the system action in order for the system to create a tickler. The event rule options are different for each tickler event.

For each event rule you create, you must define at least one event rule option, or criterion, the system uses to determine if a tickler should be created. If you define more than one rule criterion, the system action must meet all of the options defined for the event rule to create a tickler.

Note:

You cannot create a duplicate event rule, meaning, you cannot create 2 rules that have the same criteria or an error message indicates: Duplicate rule exists.

The Processing sequence number defined for each event rule determines the sequence in which the system validates each event rule to determine if a tickler should be created, 1 being the first priority. You should assign the most important event rules a lower sequence number.

Important:

If you create or change an event rule, you must restart the async jobs in the Background Job Control menu option before your updates are applied to new ticklers.

How to display this screen: Select Create at the [Work with Tickler Event Rule Screen](#).

Field	Description
Event	<p>The code and description for the tickler event associated with the event rule.</p> <p>Code: Alphanumeric, 2 positions; display-only.</p> <p>Description: Alphanumeric, 40 positions; display-only.</p>
Rule description	<p>A description of the event rule, usually indicating the criteria defined for the rule.</p> <p>Alphanumeric, 40 positions; required.</p>
Category	<p>A code for the tickler category assigned to the event rule. Tickler categories are used to group ticklers.</p> <p>The tickler category at the event level defaults, but you can override it. The tickler category defined at the event rule level overrides the tickler category defined at the event level.</p> <p>Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT).</p> <p>Alphanumeric, 3 positions; optional.</p>
Resolution reason	<p>A code for the reason why a tickler for this event rule is resolved. Tickler resolution reason codes are assigned to a tickler once the tickler has been resolved.</p> <p>The resolution reason at the event level defaults, but you can override it. The resolution reason defined at the event rule level overrides the resolution reason defined at the event level.</p> <p>You must define a tickler resolution reason for all tickler events except for the MN (manually created) tickler event.</p> <p>Tickler resolution reasons are defined in and validated against the Tickler Resolution Reason table; see Working with Tickler Resolution Reasons (WTRR).</p> <p>Alphanumeric, 3 positions; required except for MN tickler event.</p>
Active	<p>Indicates whether the event rule is active.</p> <p>selected = The event rule is currently active; the system creates a tickler for the event rule if its criteria are met by the system action. Remember, to create a tickler for the event rule, the Active flag at the event level must also be selected.</p> <p>unselected = The event rule is not currently active; the system does not create a tickler, regardless of whether the system action qualifies for the event rule.</p> <p>See Active Tickler Events and Rules.</p>
Processing seq	<p>The processing sequence number for the event rule. The processing sequence number defines the order in which the system evaluates the rules to determine if a tickler is created, from lowest sequence number to highest.</p> <p>Note: The first tickler event rule that meets the criteria creates a tickler. It is important that you assign the most important event rule the lowest processing sequence number.</p> <p>If you do not define a processing sequence number for an event rule, the system assigns the event rule a processing sequence number of 0.</p> <p>If all of the rules have the same processing sequence number, the system evaluates the rules in rule sequence number.</p> <p>See Event Rule Processing Sequence.</p> <p>Numeric, 3 positions; optional.</p>

Field	Description
Notify user/group	<p>Indicates whether the system sends a Tickler Notification email to the assigned user or to all of the users in the assigned tickler user group when a tickler is created for this event rule.</p> <p>selected = Notify the assigned user/user group when a tickler is created; use the email address defined for the user in the User Extended table. If the tickler is assigned to a user group, send a notification to each user in the group, using the email address defined for each user in the User Extended table.</p> <p>unselected = Do not notify the assigned user/user group when a tickler is created; the user can review the ticklers in his queue at the Work with Tickler Screen (user/group view).</p> <p>The notify user/group setting at the event level defaults, but you can override it. The notify user/group setting at the event rule level overrides the notify user/group setting defined at the event level. See Tickler Notification for a sample Tickler Notification email.</p>
Assign to orig user	<p>Indicates if ticklers created for this event rule are assigned to the user that entered the order associated with the tickler.</p> <p>selected = Assign ticklers created for this event rule to the user that entered the associated order. If this field is selected, you must also enter a user ID in the Assign to user field.</p> <p>unselected = Do not assign ticklers created for this event rule to the user that entered the associated order; instead, assign the tickler to the specified user or tickler user group.</p> <p>The assign to original user setting at the event level defaults, but you can override it. The tickler assignment defined at the event rule level overrides the tickler assignment defined at the event level.</p> <p>Note: See Tickler Assignment.</p>
Assign to user	<p>The user ID of the user the system assigns to ticklers for this event rule.</p> <p>The assign to user setting at the event level defaults, but you can override it. The assign to setting at the event rule level overrides the assign to setting defined at the event level.</p> <p>You can define either an assign to user or assign to user group for the event rule, but not both.</p> <p>Users are defined in and validated against the User table; see Working with User Records (WUSR).</p> <p>See Tickler Assignment.</p> <p>Alphanumeric, 10 positions; optional.</p>

Field	Description
Assign to user group	<p>The tickler user group the system assigns to ticklers for this event rule.</p> <p>The assign to user group setting at the event level defaults, but you can override it. The assign to setting at the event rule level overrides the assign to setting defined at the event level.</p> <p>You can define either an assign to user or assign to user group for each event, but not both.</p> <p>The tickler user group you enter must be defined as a user type and not a supervisor type.</p> <p>Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG).</p> <p>See Tickler Assignment.</p> <p>Alphanumeric, 10 positions; optional.</p>
Supervisor group	<p>The tickler supervisor group the system assigns to ticklers for this event rule.</p> <p>The supervisor group setting at the event level defaults, but you can override it. The supervisor group at the event rule level overrides the supervisor group defined at the event level.</p> <p>The tickler user group you enter must be defined as a supervisor type and not a user type.</p> <p>Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG).</p> <p>See Tickler Assignment.</p> <p>Alphanumeric, 10 positions; optional.</p>
Notify supervisor	<p>Indicates when a Supervisor Notification Count email is sent to the supervisor, based on the number of days since a tickler was created.</p> <p>The system uses this calculation to determine the next notification date when a tickler is first created: tickler creation date + value in Number of days to notify supervisor field for the event/rule that created the tickler = next notification date. The system does not update the next notification date after a tickler is created.</p> <p>The system sends the email to the email address defined for the supervisor user group in the Tickler User Group table.</p> <p>The system continues sending an email to the supervisor group as long as a tickler assigned to the supervisor group is in an open or in process status and the Next notification date in the Tickler table is equal to or past the current date. If the next notification date is a future date, the system does not send an email until the next notification date is reached. If all ticklers assigned to the supervisor are resolved, the system no longer sends a Supervisor Notification Count email.</p>

Field	Description
	<p>Leave this field blank if you do not want to notify the supervisor about aging ticklers for this event rule; the supervisor can review ticklers using the Workflow Management (WWFM) menu option.</p> <p>The notify supervisor setting at the event level defaults, but you can override it. The notify supervisor setting at the event rule level overrides the notify supervisor setting defined at the event level.</p> <p>If you define a number of days in this field, you must also define the supervisor group.</p> <p>See Tickler Notification for a sample Supervisor Notification Count email.</p> <p>Numeric, 3 positions; optional.</p>

Event rule options: For each event rule, you must define the options, or criteria, that must be met by the system action in order for the system to create a tickler. The event rule options are different for each tickler event. You must define at least one option, or criterion, for each tickler event rule. For more information on defining event rule options, see:

- [BO \(Backorders\) Event Processing](#)
- [CO \(Cancelled Orders\) Event Processing](#)
- [HO \(Held Orders\) Event Processing](#)
- [MN \(Manually Created\) Event Processing](#)
- [NO \(New Orders\) Event Processing](#)
- [OO \(Aged Open Orders\) Event Processing](#)
- [SD \(SVC Activation Decline\) Event Processing](#)
- [SO \(Soldout Orders\) Event Processing](#)
- [SV \(SVC Number Assignment\) Event Processing](#)
- [UP \(Unconfirmed Pick Tickets\) Event Processing](#)
- [VP \(Voided Pick Tickets\) Event Processing](#)
- [WF \(Remote Workflow\) Event Processing](#)

BO (Backorders) Event Processing

The system creates a tickler for the BO tickler event when an item on an order is placed on backorder and the order qualifies for a BO event rule.

When is the BO event evaluated? The system evaluates the BO event when you or the system place an item on backorder:

- during order entry processing
- during order maintenance processing
- during batch order entry (this includes orders received via the phone order interface and ecommerce)
- when you void and unreserve a pick ticket in order maintenance or in the [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#) menu option

- when you unreserve an item during the [Working with Interactive Reservation \(MIRV\)](#) menu option

Allowing multiple ticklers for the BO event:

- If you allow multiple ticklers, the system creates multiple ticklers for an order that contains one or more backordered items; a separate tickler is created for each event rule whose criteria are met.
- If you do not allow multiple ticklers, the system creates only 1 tickler per order ship to that contains one or more items on backorder, regardless of whether the backordered order qualifies for more than one event rule; the system does not create a separate tickler for each transaction that backorders an item on the order.

BO Event Rule Criteria

You can define the following criteria for a BO event rule.

 **Note:**

The system creates a separate tickler for each ship to order that has a backordered item that meets the rule's criteria, regardless of the Allow multiple ticklers setting.

Criterion	Event rule set up
An item is placed on backorder by a batch process, such as voiding and unreserving a pick ticket or unreserving an item during Interactive Reservation.	Deselect the Initial backorder field.
The backordered item was initially backordered in order entry/ maintenance and not by some other program.	Select the Initial backorder field.
The life-to-date order dollars for the sold to customer (the \$ orders LTD field in the Customer Sold To Order History table) on the order meets the comparison criteria on the event rule.	<p>Enter a comparison value (valid values are GT greater than, GE greater than or equal to, LT less than, LE less than or equal to) in the Comparison field and a dollar amount in the LTD order dollars field.</p> <p>You can only define a whole number for the life-to-date order dollars.</p> <p>You can review the life-to-date order dollars for a sold to customer at the Display Customer Order History Screen.</p>
The customer class for the sold to customer on the order matches the customer class on the event rule.	<p>Enter a customer class in the Customer class field.</p> <p>Note: The system does not look at the customer class defined for the ship to customer.</p>

Criterion	Event rule set up
The item and/or SKU on backorder matches the item and/or SKU on the event rule.	Enter an item code in the Item field and optionally, a SKU code in the SKU field. If you define an item but not a SKU code and the item contains SKUs, the system creates a tickler for the item if any of the SKUs for the item are on backorder. If you define both an item and SKU, the system creates a tickler only if that specific SKU is on backorder.
The item status for the item on backorder matches the item status on the event rule.	Enter an item status in the Item status field.
The item class for the item on backorder matches the item class on the event rule.	Enter an item class in the Item class field.
The ship via for the order line or order where the item on backorder is located matches the ship via on the event rule.	Enter a ship via code in the Ship via field. The system evaluates the ship via on the detail line first, then the ship via on the order header. If you enter a Ship via, you cannot define a Ship via priority for the event rule. Note: To create a tickler for each ship to order, the ship via for the ship to must match the ship via on the event rule.
The priority of the ship via for the order line or order where the item on backorder is located matches the ship via priority on the event rule.	Enter a ship via priority number in the Ship via priority field. The system evaluates the ship via on the detail line first, then the ship via on the order header. If you enter a Ship via, you cannot define a Ship via priority for the event rule. Note: To create a tickler for each ship to order, the ship via priority for the ship to must match the ship via priority on the event rule.

BO Event Examples

Example 1: Allow multiple ticklers is unselected for the BO event.

The following event rules are defined for the BO event, displayed in processing sequence order.

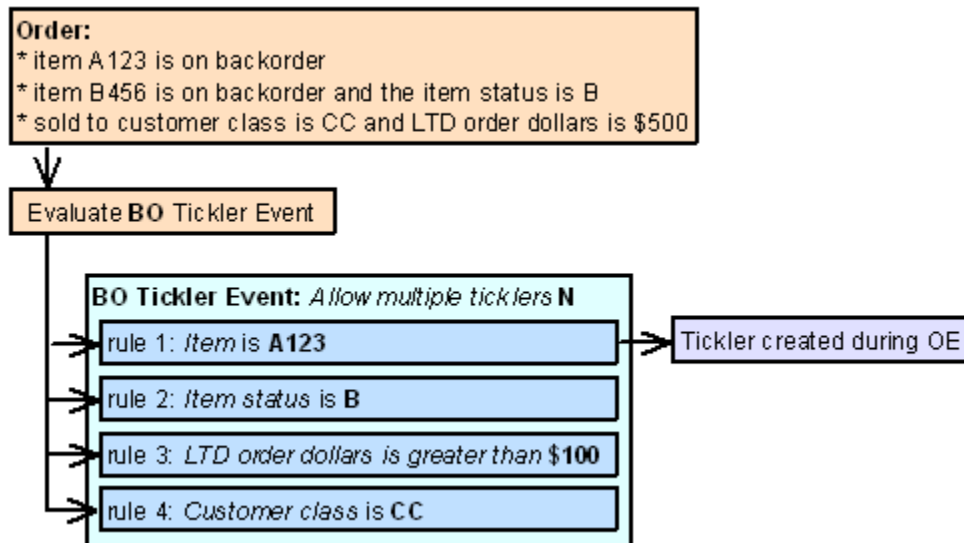

- Event rule 1: Item is A123.
- Event rule 2: Item status is B.
- Event rule 3: LTD order dollars is greater than \$100.
- Event rule 4: Customer class is CC.

You enter an order and:

- item A123 is on backorder.
- item B456 is on backorder and the item status is B.
- the sold to customer's class is CC and life-to-date order dollars is \$500.

The system creates 1 tickler for rule 1: Item is A123.

In this scenario, the system creates only 1 tickler for the order containing backordered items even though the order qualified for all of the event rules.

Example 2: Allow multiple ticklers is selected for the BO event.

The following event rules are defined for the BO event, displayed in processing sequence order.

- Event rule 1: Item is A123.
- Event rule 2: Item status is B.
- Event rule 3: LTD order dollars is greater than \$100.
- Event rule 4: Customer class is CC.

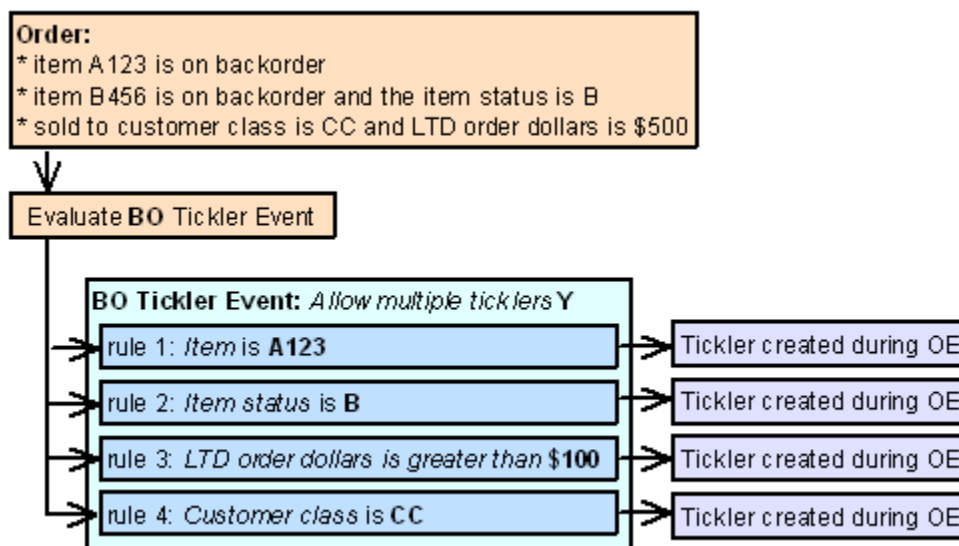

You enter an order and:

- item A123 is on backorder.
- item B456 is on backorder and the item status is B.
- the sold to customer's class is CC and life-to-date order dollars is \$500.

The system creates 4 ticklers for the order:

- the first tickler is created for rule 1: Item is A123.
- the second tickler is created for rule 2: Item status is B.
- the third tickler is created for rule 3: LTD order dollars is greater than \$100.
- the fourth tickler is created for rule 4: Customer class is CC.

In this scenario, the system creates 4 ticklers for the order containing backordered items; a separate tickler is created for each rule whose criteria are met.

Resolving BO Ticklers

A BO tickler is resolved when you or the system:

- select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).
- receive inventory for the backordered item.
- cancel the order containing the backordered item.

CO (Cancelled Orders) Event Processing

The system creates a tickler for the CO tickler event when an order is cancelled or contains an order line that is cancelled and the order qualifies for a CO event rule.

When is the CO event evaluated? The system evaluates the CO event when you or the system cancels an order or order line during:

- order maintenance
- [Working with Backorders Pending Cancellation \(WBPC\)](#)
- [Processing Item Substitutions \(PSUB\)](#)
- [Working with Credit Card Cancellations \(WCCC\)](#)
- [Processing Auto Soldout Cancellations \(MASO\)](#)

Allowing multiple ticklers for the CO event:

- If you allow multiple ticklers, the system creates multiple ticklers for an order that is cancelled or contains cancelled order lines; a separate tickler is created for each event rule whose criteria are met.
- If you do not allow multiple ticklers, the system creates only 1 tickler per order ship to that contains a cancelled order/order line, for example if 1 tickler is created during order maintenance another tickler cannot be created during Process Auto Soldout Cancellations.

CO Event Rule Criteria

You can define the following criteria for a CO event rule.

Note:

The system creates a separate tickler for each ship to order that has a cancelled order line and meets the rule's criteria, regardless of the Allow multiple ticklers setting. When you cancel an order, the system creates a separate tickler for each ship to order you cancel.

Criterion	Event rule set up
The order or order line is cancelled, regardless of whether it is by a batch process or interactively.	Deselect the Batch process only field.
The order or order line is cancelled by a batch process and not interactively.	Select the Batch process only field. You can cancel an order/order line during a batch process using: <ul style="list-style-type: none"> Processing Item Substitutions (PSUB) Working with Credit Card Cancellations (WCCC) Processing Auto Soldout Cancellations (MASO)
The life-to-date order dollars for the sold to customer (the \$ orders LTD field in the Customer Sold To Order History table) on the order meets the comparison criteria on the event rule.	Enter a comparison value (GT greater than, GE greater than or equal to, LT less than, LE less than or equal to) in the Comparison field and a dollar amount in the LTD order dollars field. You can only define a whole number for the life-to-date order dollars. You can review the life-to-date order dollars for a sold to customer at the Display Customer Order History Screen .
The customer class for the sold to customer on the order matches the customer class on the event rule.	Enter a customer class in the Customer class field. Note: The system does not look at the customer class defined for the ship to customer.
The item and/or SKU on the cancelled order line matches the item and/or SKU on the event rule.	Enter an item code in the Item field and optionally, a SKU code in the SKU field. If you define an item but not a SKU code and the cancelled item contains SKUs, the system creates a tickler for the item if any of the SKUs for the item are cancelled. If you define both an item and SKU, the system creates a tickler only if that specific SKU is cancelled.
The item status for the item on the cancelled order line matches the item status on the event rule.	Enter an item status in the Item status field.
The item class for the item on the cancelled order line matches the item class on the event rule.	Enter an item class in the Item class field.

Criterion	Event rule set up
The cancel reason on the cancelled order line/order matches the cancel reason on the event rule.	Enter a cancel reason code in the Cancel reason field.
The ship via for the cancelled order/order line matches the ship via on the event rule.	<p>Enter a ship via code in the Ship via field.</p> <p>The system evaluates the ship via on the detail line first, then the ship via on the order header.</p> <p>If you enter a Ship via, you cannot define a Ship via priority for the event rule.</p> <p>Note: To create a tickler for each ship to order, the ship via for the ship to customer must match the ship via on the event rule.</p>
The priority of the ship via for the cancelled order/order line matches the ship via priority on the event rule.	<p>Enter a ship via priority number in the Ship via priority field.</p> <p>The system evaluates the priority of the ship via on the detail line first, then the priority of the ship via on the order header.</p> <p>If you enter a Ship via priority, you cannot define a Ship via for the event rule.</p> <p>Note: To create a tickler for each ship to order, the priority of the ship via for the ship to customer must match the ship via priority on the event rule.</p>

CO Event Examples

Example 1: Allow multiple ticklers is unselected for the CO event.

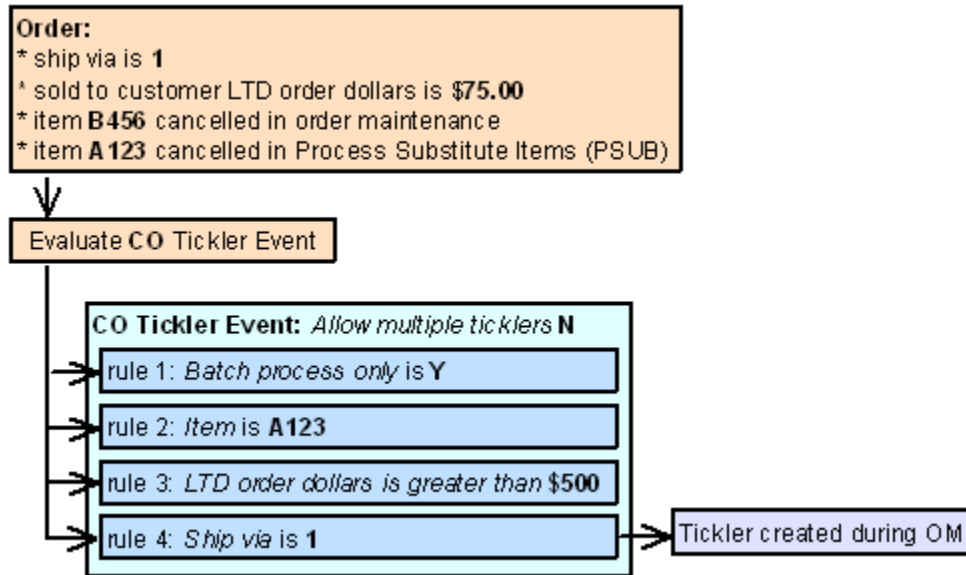

The following event rules are defined for the CO event, displayed in processing sequence order.

- Event rule 1: Batch process only is selected
- Event rule 2: Item is A123
- Event rule 3: LTD order dollars is greater than 500
- Event rule 4: Ship via is 1

You enter an order and:

- the ship via on the order header is 1.
- the items on the order are A123 and B456.
- the sold to customer's life-to-date order dollars is \$75.00.
- in order maintenance, you cancel order line 1 for item B456.
- in Processing Item Substitutions (PSUB), you cancel item A123.

In this scenario, the system creates 1 tickler during order maintenance for rule 4: Ship via is 1. The system does not create a tickler for the other rules whose criteria are met. The system does not create a tickler during Process Substitute Items since a CO tickler already exists for the order/order ship to.

Example 2: Allow multiple ticklers is selected for the CO event.

The following event rules are defined for the CO event, displayed in processing sequence order.

- Event rule 1: Batch process only is selected
- Event rule 2: Item is A123
- Event rule 3: LTD order dollars is greater than 500
- Event rule 4: Ship via is 1

You enter an order and:

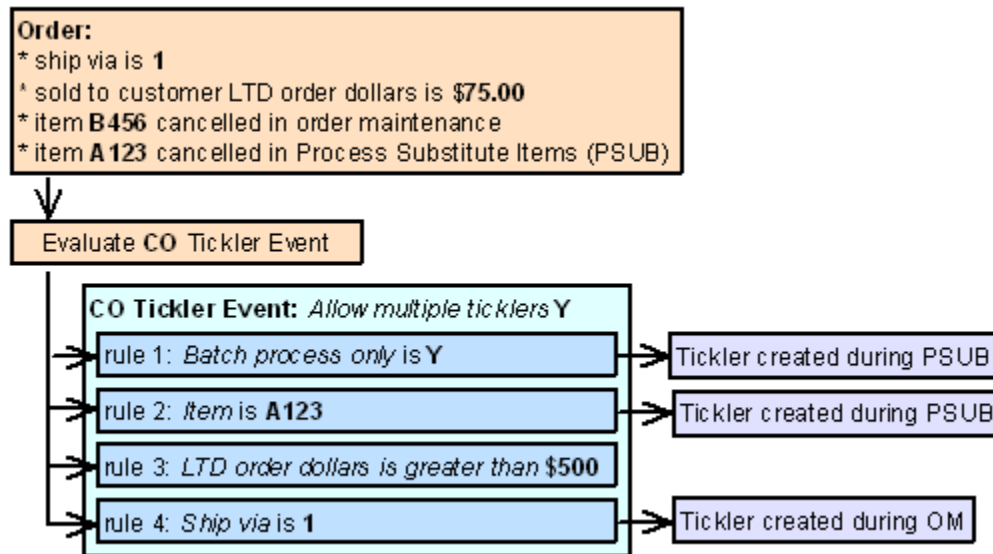

- the ship via on the order header is 1.
- the items on the order are A123 and B456.
- the sold to customer's life-to-date order dollars is \$75.00.
- in order maintenance, you cancel order line 1 for item B456.
- in Processing Item Substitutions (PSUB), you cancel item A123.

In this scenario, the system creates 1 tickler during order maintenance for rule 4: Ship via is 1.

The system creates 2 ticklers during Process Substitute Items:

- the first tickler is created for rule 1: Batch process only is selected.
- the second tickler is created for rule 2: Item is A123.

A tickler is not created for rule 3 during Process Substitute Items because a tickler already exists for that order using that rule.

Resolving CO Ticklers

A CO tickler is resolved when you or the system select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).

HO (Held Orders) Event Processing

The system creates a tickler for the HO tickler event when an order's order header, order ship to (recipient), or order payment method is placed on hold and the order qualifies for an HO event rule. The system does not create a tickler for an order line placed on hold.

When is the HO event evaluated? The system evaluates the HO event when you or the system place an order on hold during:

- order entry processing
- order maintenance processing
- batch order entry (this includes orders received via the phone order interface and ecommerce)
- credit card authorization (during order entry (online authorization), pick slip generation, and drop ship processing)

Allowing multiple ticklers for the HO event:

- If you allow multiple ticklers, the system creates multiple ticklers for an order or order payment method that is held; a separate tickler is created for each event rule whose criteria are met.
- If you do not allow multiple ticklers, the system creates only 1 tickler per order ship to that places an order or order payment method on hold, for example if the system creates 1 HO tickler during order entry the system will not create another HO tickler during credit card authorizations.

HO Event Rule Criteria

You can define the following criteria for an HO event rule.

 **Note:**

The system creates a separate tickler for each ship to customer order that meets the rule's criteria, regardless of the Allow multiple ticklers setting.

Criterion	Event rule set up
The order hold reason for the held order matches the order hold reason on the event rule.	<p>Enter a hold reason in the Order hold reason field.</p> <p>This setting is used for order header holds and recipient holds.</p> <p>The system creates a tickler for both system and user hold reasons.</p>
The pay type for the held order matches the pay type on the event rule.	<p>Enter a pay type code in the Pay type field.</p>
The pay type hold reason for the held order payment method matches the pay type hold reason on the event rule.	<p>Enter a hold reason in the Pay type hold reason field.</p> <p>The system creates a tickler for both system and user hold reasons.</p> <p>Note: The system does not create a tickler for the CW (awaiting credit card authorization) pay type hold.</p>
The order total for the held order meets the order total comparison on the event rule.	<p>Enter a comparison value (valid values are GT greater than, GE greater than or equal to, LT less than, LE less than or equal to) in the Comparison field and a dollar amount in the Order total field.</p> <p>You can only define a whole number for the order total.</p> <p>The order total is the sum of all charges on the order, including merchandise, freight, additional freight, tax, handling, and additional charges across all recipients on the order.</p>
The ship via for the held order/order line matches the ship via on the event rule.	<p>Enter a ship via code in the Ship via field.</p> <p>The system evaluates the ship via on the detail line first, then the ship via on the order header.</p> <p>If you enter a Ship via, you cannot define a Ship via priority for the event rule.</p> <p>Note: To create a tickler for each ship to order, the ship via for the ship to customer must match the ship via on the event rule.</p>
The priority of the ship via for the held order/order line matches the ship via priority on the event rule.	<p>Enter a ship via priority number in the Ship via priority field.</p> <p>The system evaluates the priority of the ship via on the detail line first, then the priority of the ship via on the order header.</p> <p>If you enter a Ship via priority, you cannot define a Ship via for the event rule.</p> <p>Note: To create a tickler for each ship to order, the priority of the ship via for the ship to customer must match the ship via priority on the event rule.</p>

HO Event Examples

Example 1: Allow multiple ticklers is selected for the HO event.

The following event rules are defined for the HO event, displayed in processing sequence order.

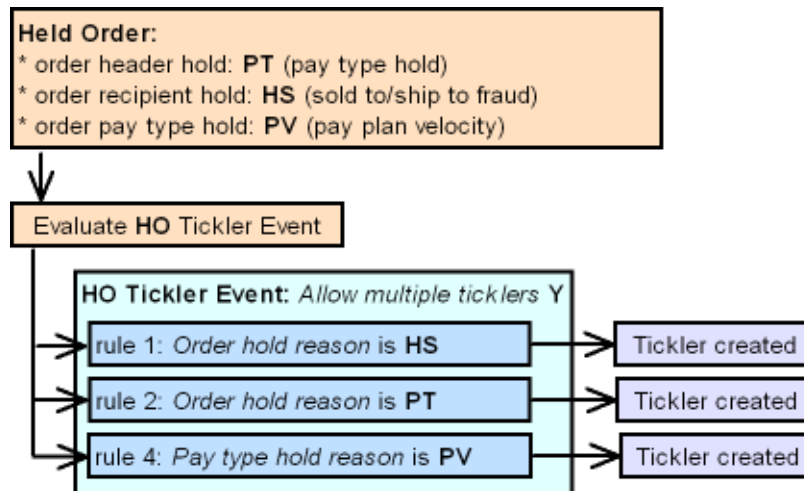

- Event rule 1: Order hold reason is HS (sold to/ship to fraud)
- Event rule 2: Order hold reason is PT (pay type hold)
- Event rule 3: Pay type hold reason is PV (pay plan velocity hold)

You enter an order and:

- the sold to customer on the order is a fraud (F in the Hold/bypass/fraud field for the customer). The system places the order ship to customer on HS (sold to/ship to fraud).
- the order pay type on the order is credit card with deferred payment and the card has been used too many times within a specified time period with a deferred payment option. The system places the order header on PT (pay type) hold and the order pay type on PV (pay plan velocity) hold.

In this scenario, the system creates 3 ticklers:

- the first tickler is created for the order ship to hold using rule 1: Order hold reason is HS (sold to/ship to fraud).
- the second tickler is created for the order header hold using rule 2: Order hold reason is PT (pay type hold).
- the third tickler is created for the pay type hold using rule 3: Pay type hold reason is PV (pay plan velocity hold)

Example 2:

Allow multiple ticklers is unselected for the HO event.

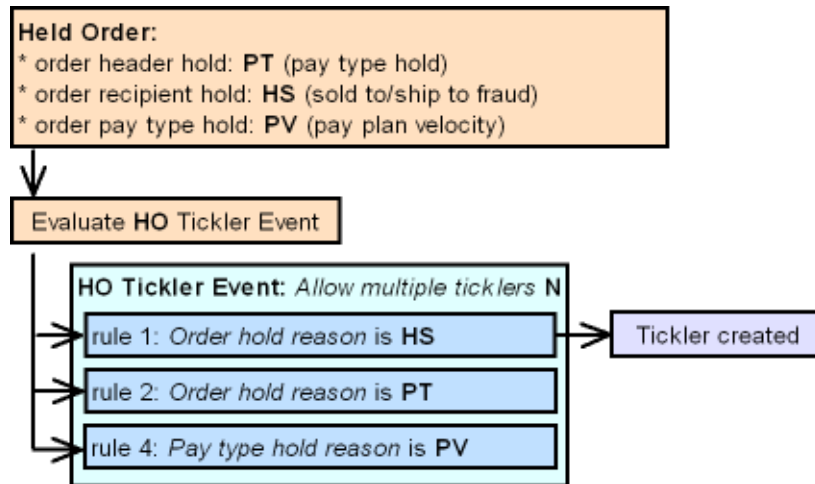

The following event rules are defined for the HO event, displayed in processing sequence order.

- Event rule 1: Order hold reason is HS (sold to/ship to fraud)
- Event rule 2: Order hold reason is PT (pay type hold)
- Event rule 4: Pay type hold reason is PV (pay plan velocity hold)

You enter an order and:

- the sold to customer on the order is a fraud (F in the Hold/bypass/fraud field for the customer). The system places the order ship to customer on HS (sold to/ship to fraud).

- the order pay type on the order is credit card with deferred payment and the card has been used too many times within a specified time period with a deferred payment option. The system places the order header on PT (pay type) hold and the order pay type on PV (pay plan velocity) hold.

In this scenario, the system creates 1 tickler for the order ship to hold using the first rule: Order hold reason is HS (sold to/ship to fraud). The system does not create a tickler for the other rules whose criteria are met.

Resolving HO Ticklers

An HO tickler is resolved when you:

- select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).
- release the order from hold by selecting Release for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).
- release the order from hold by selecting Release for a tickler in the Release Held Orders menu option; see [Performing the Release](#).
- release the order from hold in order maintenance by:
 - removing the order header hold reason.
 - adding a pay type for a balance due hold.

MN (Manually Created) Event Processing

You can manually create a tickler at the [Create Tickler Screen](#).

How to display this screen: You can advance to the Create Tickler screen from the:

- [Workflow Management Screen](#) (workflow supervisor)
- [Work with Tickler Screen \(user/group view\)](#) (workflow user)
- [Work with Ticklers Screen \(sold to customer view\)](#)
- [Work with Ticklers Screen \(ship-to customer view\)](#)
- [Work with Ticklers Screen \(bill-to customer view\)](#)
- [Work with Ticklers Screen \(order view\)](#)
- [Work with Return Authorization Detail Screen](#)

- [Work with Returns for Order Screen](#)
- [Work with Email by Order Number Screen](#)
- [Work with Email by Customer Sold To Number Screen](#)
- [Work with Email by Customer Ship To Number Screen](#)
- [Work with Email by Customer Bill To Number Screen](#)
- [Display Item Availability Screen](#)

Allowing multiple ticklers for the MN event: The Allow multiple ticklers setting does not apply to manually created ticklers.

MN event rule criteria: You cannot define event rules for the MN tickler event. However, you can associate a manually created tickler with a specific:

- order number and ship to number
- customer sold to number
- customer ship to number
- customer bill to number
- existing tickler number

Depending on how you advance to the Create Tickler screen, the system automatically associates the tickler with a specific order or customer. For example, if you advance to the Create Tickler screen from the [Work with Ticklers Screen \(sold to customer view\)](#), the system automatically associates the manually created tickler with the sold to customer.

Resolving MN Ticklers

A MN tickler is resolved when you select Resolve for a tickler at the Work with Tickler Screen (user/group view) or [Workflow Management Screen](#).

NO (New Orders) Event Processing

The system creates a tickler for the NO tickler event when the status of an order line updates to open or closed and the order qualifies for an NO event rule.

The system creates a tickler for each order containing one or more order lines that are updated to open or closed; the system does not create a separate tickler for each order line that is updated to open or closed.

Soldout orders: The system will never create an NO tickler for an order that is entirely soldout; this is because none of the lines on the order are ever updated to open or closed.

Note:

Even if a NO tickler exists for an order, the order can continue through the order cycle.

When is the NO event evaluated? The system evaluates the NO event when an order:

- is accepted (because the status of an order line updates from suspended to open), before creating a pre-generated pick. If a web order is placed in an error status in an

order batch, the system evaluates the NO event when you edit and accept the order batch. **Note:** The system does not evaluate the NO event when you accept an order in order maintenance.

- is processed through the Billing Async (because the status of an order line updates to closed).

Allowing multiple ticklers for the NO event:

- If you allow multiple ticklers, the system creates multiple ticklers for an order containing one or more order lines that are updated to open or closed; a separate tickler is created for each event rule whose criteria are met.
- If you do not allow multiple ticklers, the system creates only 1 tickler for an order containing one or more order lines that are updated to open or closed, regardless of whether the order qualifies for more than one event rule; the system does not create a separate tickler for each transaction that updates or closes an order.

NO Event Rule Criteria

You can define the following criteria for an NO event rule.

The Order line status setting is used with all other criteria you define for an event rule. For example, if you define an item status, the item on the order line must match the specified item status and the status of the order line must update to open or closed (whichever order line status you specify).

Hold reason: If you enter a valid hold reason in the Hold reason field, the system places the order on hold at the user level when a NO tickler is created for the event rule. In this situation, the system removes any pick slip preparation from the order; see [Preparing Orders for Pick Slip Generation](#).

Note:

Unless otherwise noted, the system creates a separate tickler for each ship to customer on the order that has an open/closed order line that qualifies for an event rule, regardless of the Allow multiple ticklers setting.

Criterion	Event rule set up
The order line status changes to open/closed.	Enter an order line status code in the Order line status field. blank = The order line status changes to open; for example, you enter a new order line. X = the order line status changes to closed; for example, you ship an order line.
The ordered quantity or shipped quantity for the open/closed order line is equal to or greater than the quantity on the event rule.	Enter a quantity in the Quantity ordered/shipped field. <ul style="list-style-type: none"> • the quantity represents the ordered quantity if the Order line status is blank. • the quantity represents the shipped quantity if the Order line status is X.

Criterion	Event rule set up
The item status for the item on the open/closed order line matches the item status on the event rule.	Enter an item status in the Item status field.
The open/closed order line is for a first time buyer.	Select the First time buyer field. The system considers the sold to customer a first time buyer if the Current mail type field for the customer is a value other than B (buyer). Note: The system creates one tickler for the first ship to order if the sold to customer on the order qualifies; the system does not create a tickler for subsequent ship to orders.
The item class for the item on the open/closed order line matches the item class on the event rule.	Enter an item class in the Item class field.
The item and/or SKU on the open/closed order line matches the item and/or SKU on the event rule.	Enter an item code in the Item field and optionally, a SKU code in the SKU field. If you define an item but not a SKU code and the item contains SKUs, the system creates a tickler for the item if any of the SKUs for the item are on an open/closed order line. If you define both an item and SKU, the system creates a tickler only if that specific SKU is on an open/closed order line.
The order type on the order matches the order type on the event rule.	Enter an order type in the Order type field. Note: A tickler is created for each ship to order whose order type matches the order type on the event rule.
The last order date for the sold to customer (the Last order field in the Customer Sold To Order History table) on the order is past the current date by the number of days on the event rule.	Enter a number in the Number days since field. You can review the last order date for a sold to customer on the Display Customer Order History Screen . Note: The system does not create a separate tickler for each ship to.
The country code on the ship to order matches the country code on the event rule.	Enter a country code in the Country field. Note: A tickler is created for each ship to order whose country code matches the country code on the event rule. If you define a country code you cannot exclude the default country.
The country code on the ship to order must be a country other than the Default Country for Customer Address (B17) .	Select the Exclude default country field. Note: A tickler is created for each ship to order whose country code qualifies for the event rule. If you exclude the default country you cannot define a country code.

Criterion	Event rule set up
The order total on the order meets the order dollars comparison criteria on the event rule.	<p>Enter a comparison value (valid values are GT greater than, GE greater than or equal to, LT less than, LE less than or equal to) in the Comparison field and a dollar amount in the Order dollars field.</p> <p>The order total is the sum of all charges on the order, including merchandise, freight, additional freight, tax, handling, and additional charges across all recipients on the order.</p> <p>You can only define a whole number for the order dollars.</p>
The ship via code on the order line or order header matches the ship via code on the event rule.	<p>Enter a ship via code in the Ship via field. Ship via codes are defined in and validated against the Ship Via table.</p> <p>The system evaluates the ship via on the detail line first, then the ship via on the order header.</p> <p>A tickler is created for each ship to order whose ship via code at the line level or header level matches the ship via code on the event rule.</p> <p>If you enter a Ship via, you cannot define a Ship via priority for the event rule.</p>
The priority for the ship via code on the order line or order header matches the ship via priority on the event rule.	<p>Enter a ship via priority (1-9) in the Ship via priority field.</p> <p>The system evaluates the ship via on the detail line first, then the ship via on the order header.</p> <p>A tickler is created for each ship to order whose ship via code at the line level or header level has a ship via priority that matches the ship via priority on the event rule.</p> <p>If you enter a Ship via priority, you cannot define a Ship via for the event rule.</p>

NO Event Examples

Example 1: Allow multiple ticklers is selected for the NO event.

The following event rules are defined for the NO event, displayed in processing sequence order.

- Event rule 1: Order line status is blank and Order type is I.
- Event rule 2: Order line status is X.
- Event rule 3: Order line status is blank and Exclude default country is selected.

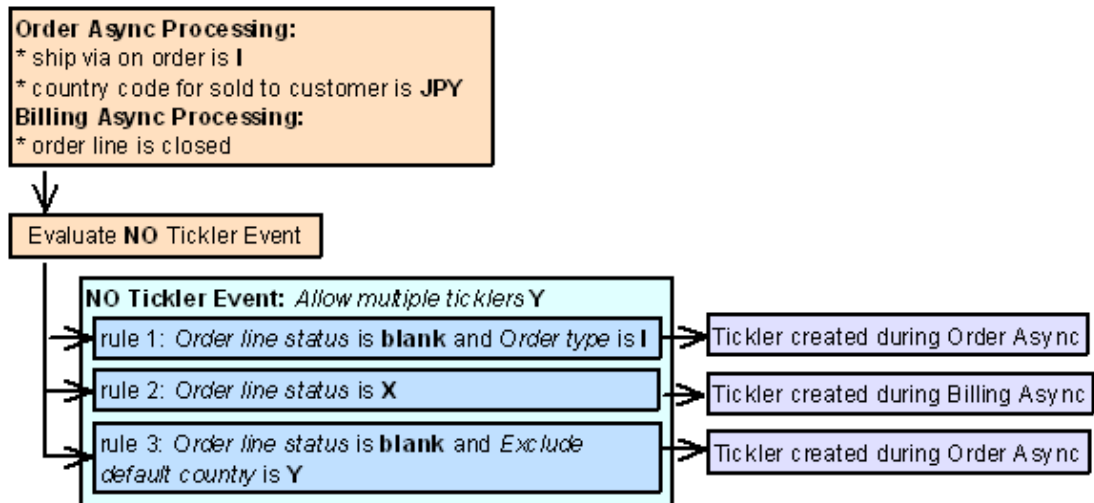

You enter an order and:

- the order type is I.
- the country code on the order is JPY (the default country code is USA).

In this scenario, the system creates 2 ticklers when the order is processed by the Order Async:

- the first tickler is created for rule 1: Order line status is blank and Order type is I.
- the second tickler is created for rule 3: Order line status is blank and Exclude default country is selected.

You generate a pick ticket and ship the order. The system creates 1 tickler when the order is processed by the Billing Async for rule 2: Order line status is X.

Example 2: Allow multiple ticklers is unselected for the NO event.

The following event rules are defined for the NO event, displayed in processing sequence order.

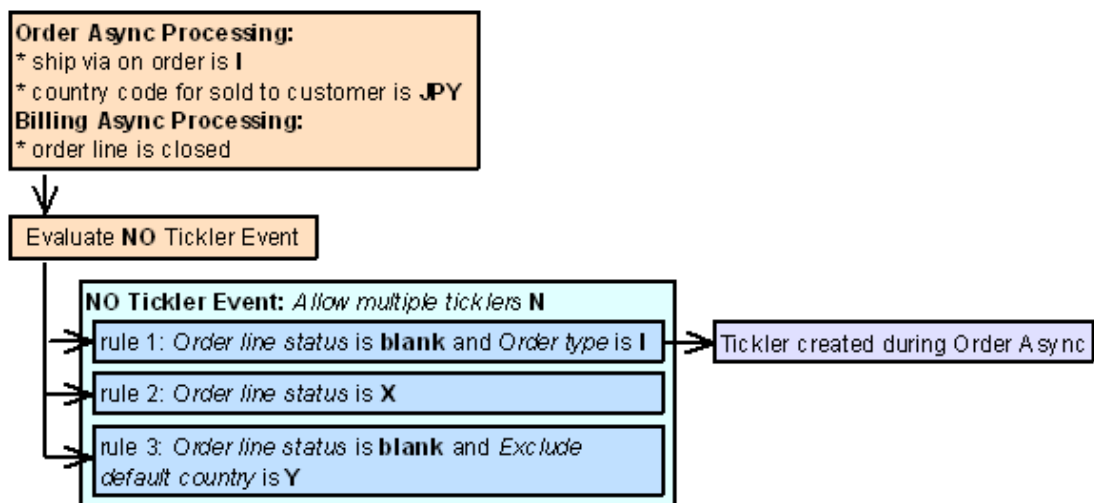

- Event rule 1: Order line status is blank and Order type is I.
- Event rule 2: Order line status is X.
- Event rule 3: Order line status is blank and Exclude default country is selected.

You enter an order and:

- the order type is I.
- the country code on the order is JPY (the default country code is USA).

In this scenario, the system creates 1 tickler when the order is processed by the Order Async for rule 1: Order line status is blank and Order type is I.

You generate a pick ticket and ship the order. The system does not create a tickler when the order is processed by the Billing Async.

Resolving NO Ticklers

A NO tickler is resolved when you:

- select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).
- use [Selecting Held Orders \(ERHO\)](#) to release the order from hold. The system resolves the tickler when you release the order from hold only if the reason the order was held was because of the tickler and a resolution reason is defined for the tickler event rule.

OO (Aged Open Orders) Event Processing

The system creates a tickler for the OO tickler event when an aged open order exists.

An aged open order is:

- an order whose order header is open or held, and
- the order contains one or more order lines that are open or held, and
- the order line is not reserved (Quantity reserved is 0) or is reserved but not printed (Quantity reserved is greater than 0 and Quantity printed is 0), and
- the order is older than a specified number of days, based on entered date or arrival date defined for the order lines on the order.

One tickler is created for each ship to customer on an aged open order that qualifies for an OO event rule; if an aged open order qualifies for more than 1 event rule, the system creates 1 tickler for the first event rule, in processing sequence order, that qualifies.

Note:

The system does not allow multiple ticklers for the OO event (the Allow multiple ticklers field must be unselected).

When is the OO event evaluated? The system evaluates the OO event when you run the Evaluate Create/Resolve Tickler periodic function (program name PFR0072).

Graduating OO ticklers: Each time you run the Evaluate Create/Resolve Tickler periodic function, the system determines if any existing OO ticklers should be graduated.

- If an OO tickler exists for an aged open order and the aged open order qualifies for a new event rule, based on processing sequence order, the system keeps the existing tickler open and applies the new event rule to the tickler.
- If an OO tickler exists for an aged open order and the aged open order qualifies for the event rule currently assigned to the existing tickler, the system does not create a new tickler and keeps the existing tickler without any updates.
- If an OO tickler exists for an aged open order and the aged open order no longer qualifies for the current event rule and does not qualify for any other OO event rules, the system resolves the tickler; see [Resolving OO Ticklers](#).

The system updates the existing tickler with the information related to the event rule that is now associated with the tickler:

- Rule number updates to the new event rule assigned to the tickler.
- Category updates to the category for the new event rule.
- Priority updates to the priority for the new event rule.
- Assigned to updates to the assigned to user/group for the new event rule.
- Assigned date updates to the date the tickler is graduated.
- Supervisor group updates to the supervisor group for the new event rule.
- Date to notify supervisor updates, based on the new supervisor group assigned.
- Tickler procedures updates to the procedures for the new event rule.
- if the tickler was in-process, the system changes the status back to open.
- if the Notify user/group field is selected for the new event rule, the system sends a Tickler Reassignment email; see [Tickler Notification](#) for a sample email. **Note:** The system sends a Tickler Reassignment email only if the new event rule has a different assigned to user/group from the previous event rule assigned to the tickler.
- the system creates a tickler history record, indicating the tickler has been graduated from one event rule to another.

OO Event Rule Criteria

You can define the following criteria for an **OO event rule**.

The Orders older than date setting is used with all other criteria you define for an event rule. For example, if you define a ship via, the aged open order must match the specified ship via and the order's entered/arrival date must be older than the system date by the number of days defined.

Note:

The system creates a separate tickler for each ship to order that has an order line that qualifies; the system does not create a separate tickler for each order line that qualifies.

Criterion	Event rule set up
The order line's entered date/arrival date is older than the current date by the number of days on the event rule.	<p>Enter a date indicator code (E = entered date, A = arrival date) in the Date indicator field and enter a number in the Orders older than field.</p> <p>The system requires you to enter a date indicator and number of days.</p> <p>Note: The system evaluates the entered date/arrival date on the order detail line; the system does not evaluate the entered date/arrival date on the order header.</p>

Criterion	Event rule set up
The ship via for the aged open order matches the ship via on the event rule.	<p>Enter a ship via code in the Ship via field.</p> <p>The system evaluates the ship via on the detail line first, then the ship via on the order header.</p> <p>If you define a ship via for the event rule, you cannot define a ship via priority.</p> <p>Note: To create a tickler for each ship to order, the ship via for the ship to customer must match the ship via on the event rule.</p>
The priority of the ship via for the aged open order matches the ship via priority on the event rule.	<p>Enter a ship via priority number in the Ship via priority field.</p> <p>The system evaluates the priority of the ship via on the detail line first, then the priority of the ship via on the order header.</p> <p>If you define a ship via priority for the event rule, you cannot define a ship via.</p> <p>Note: To create a tickler for each ship to order, the priority of the ship via for the ship to customer must match the ship via priority on the event rule.</p>

OO Event Example

The following event rules are defined for the OO event rule, in processing sequence order.

- Event rule 1: Orders older than 5 days by Arrival date and Ship via is 2
- Event rule 2: Orders older than 1 day by Arrival date and Ship via is 2

You run the Evaluate Create/Resolve Ticklers periodic function and:

- Order # 6599 qualifies for event rule 2 (an order line's arrival date is older than 1 day and the ship via is 2)
- Order # 6601 qualifies for event rule 2 (an order line's arrival date is older than 1 day and the ship via is 2)

The system creates an OO tickler for each order.

You run the Evaluate Create/Resolve Ticklers periodic function again and:

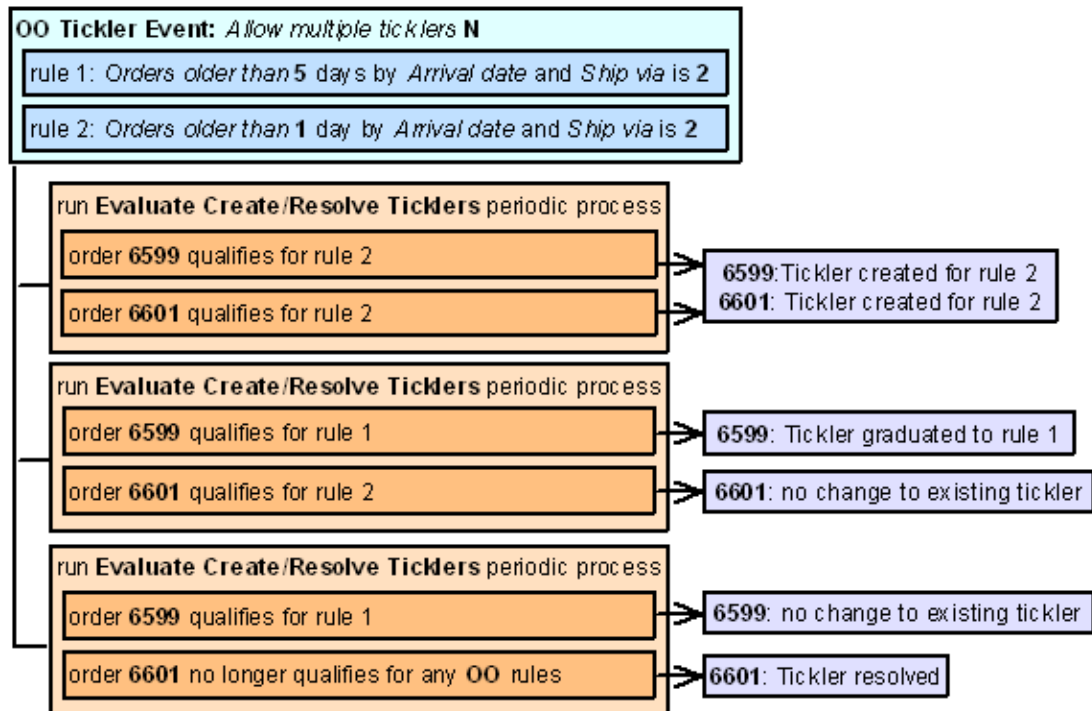

- Order # 6599 qualifies for event rule 1 (an order line's arrival date is older than 5 days and the ship via is 2)
- Order # 6601 qualifies for event rule 2 (an order line's arrival date is older than 1 day and the ship via is 2)

The system graduates the existing tickler for order # 6599 to event rule 1; the existing tickler for order # 6601 continues using rule 2.

You run the Evaluate Create/Resolve Ticklers periodic function again, and:

- order # 6599 qualifies for event rule 1 (an order line's arrival date is older than 5 days and the ship via is 2)
- order # 6601 does not qualify for any rules (a pick has been generated)

The existing tickler for order # 6599 continues using rule 1. The system resolves the existing tickler for order # 6601.

Resolving OO Ticklers

An OO tickler is resolved when you:

- select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).
- run the Evaluate Create/Resolve Ticklers periodic function (program name PFR0072), if the tickler no longer applies to any OO event rules. For example, the order is now cancelled.
- generate a pick slip for the order. **Note:** When you generate a pick slip for the order, the system resolves the tickler automatically and does not wait until you run the Evaluate Create/Resolve Ticklers periodic function.

SD (SVC Activation Decline) Event Processing

The system creates a tickler for the SD tickler event when a stored value card activation request receives a declined activation response from the service bureau.

The system creates a tickler for each stored value card activation request that receives a declined response.

The tickler indicates the:

- order number and ship to number associated with the stored value card
- customer number (sold to and ship to) on the order
- stored value card item number, SKU code, and description

To activate a declined stored value card: You must call the service bureau to activate the card.

When is the SD tickler event evaluated? The system evaluates the SD tickler event when the SVC_OUT job receives a stored value card activation response from the service bureau.

Allowing multiple ticklers for the SD event: The Allow multiple ticklers setting does not apply to SD ticklers.

SD event rule criteria: You cannot define event rules for the SD tickler event.

Resolving SD Ticklers

An SD tickler is resolved when you select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or Workflow Management Screen.

For more information: See [Stored Value Card Purchase and Activation](#).

SO (Soldout Orders) Event Processing

The system creates a tickler for the SO (soldout orders) event each time an item on an order is soldout and the order qualifies for an SO event rule.

When is the SO event evaluated? The system evaluates the SO event when you or the system sell out an item during:

- order entry processing
- order maintenance processing
- batch order entry (this includes orders received via the phone order interface and ecommerce)
- [Processing Auto Soldout Cancellations \(MASO\)](#)

Quotes: The system does not evaluate the SO tickler event for a quote until you convert it to an order.

Allowing multiple ticklers for the SO event:

- If you allow multiple ticklers, the system creates multiple ticklers for an order containing soldout order lines; a separate tickler is created for each event rule whose criteria are met.
- If you do not allow multiple ticklers, the system creates only 1 tickler per order ship to that sells out an order line, for example if the system creates 1 tickler during order entry the system will not create another tickler during auto soldout cancellations.

SO Event Rule Criteria

You can define the following criteria for an SO event rule.

Hold reason: If you enter a valid hold reason in the Hold reason field, the system places the order on hold at the user level when an SO tickler is created for the event rule unless the order is in a closed status. If the order contains more than one ship to, both ship to orders are placed on hold.

 **Note:**

The system creates a separate tickler for each ship to order that has a soldout item, regardless of the Allow multiple ticklers setting.

Criterion	Event rule set up
The order line is soldout by a batch process, such as Process Auto Soldout Cancellations, and not interactively.	Select the Batch process only field. Note: If the Batch process only field is selected, the Interactive mode field must be blank.
The order line is sold out interactively in order entry, order maintenance, or batch order entry (this includes orders received via the phone order interface and ecommerce).	Enter a mode in the Interactive mode field. E = The order line is soldout interactively in order entry or batch order entry. M = The order line is soldout interactively in order maintenance. B = The order line is soldout interactively in order entry, order maintenance, or batch order entry. Note: If you enter a value in the Interactive mode field, the Batch process only field must be unselected; this means the system creates ticklers for soldout items during the specified interactive mode and during batch processing.
The life-to-date order dollars for the sold to customer (the \$ orders LTD field in the Customer Sold To Order History table) on the order meets the life-to-date order dollars comparison on the event rule.	Enter a comparison value (valid values are GT greater than, GE greater than or equal to, LT less than, LE less than or equal to) in the Comparison field and a dollar amount in the LTD order dollars field. You can only define a whole number for the life-to-date order dollars. You can review the life-to-date order dollars for a sold to customer at the Display Customer Order History Screen .
The customer class for the sold to customer on the order matches the customer class on the event rule.	Enter a customer class in the Customer class field. Note: The system does not look at the customer class defined for the ship to customer.
The item and/or SKU on the soldout order line matches the item and/or SKU on the event rule.	Enter an item code in the Item field and optionally, a SKU code in the SKU field. If you define an item but not a SKU code and the soldout item contains SKUs, the system creates a tickler for the item if any of the SKUs for the item are soldout. If you define both an item and SKU, the system creates a tickler only if that specific SKU is soldout.
The item status for the soldout item matches the item status on the event rule.	Enter an item status in the Item status field.
The item class for the soldout item matches the item class on the event rule.	Enter an item class in the Item class field.

Criterion	Event rule set up
The ship via for the soldout order line matches the ship via on the event rule.	<p>Enter a ship via code in the Ship via field.</p> <p>The system evaluates the ship via on the detail line first, then the ship via on the order header.</p> <p>If you enter a Ship via, you cannot define a Ship via priority for the event rule.</p> <p>Note: To create a tickler for each ship to order, the ship via for the ship to customer must match the ship via on the event rule</p>
The priority of the ship via for the soldout order line matches the ship via priority on the event rule.	<p>Enter a ship via priority number in the Ship via priority field.</p> <p>The system evaluates the ship via on the detail line first, then the ship via on the order header.</p> <p>If you enter a Ship via priority, you cannot define a Ship via for the event rule.</p> <p>Note: To create a tickler for each ship to order, the priority of the ship via for the ship to customer must match the ship via priority on the event rule.</p>

SO Event Examples

Example 1: Allow multiple ticklers is unselected for the SO event.

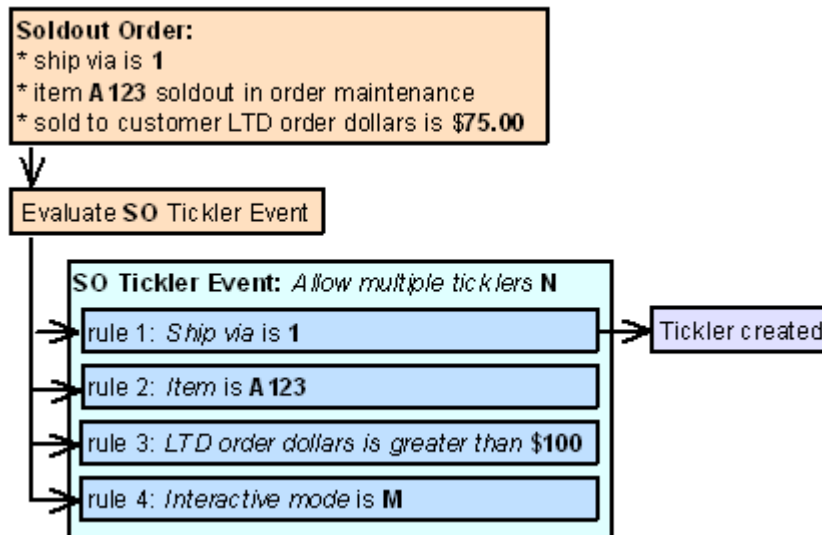

The following event rules are defined for the SO event, displayed in processing sequence order.

- Event rule 1: Ship via is 1
- Event rule 2: Item is A123
- Event rule 3: LTD order dollars is greater than \$100
- Event rule 4: Interactive mode is M (order maintenance)

You enter an order and:

- the ship via on the order header is 1.
- the item on the order is A123 and is not soldout in order entry.
- the sold to customer's life-to-date order dollars is \$75.00.
- in order maintenance, you sell out item A123.

In this scenario, the system creates 1 tickler during order maintenance for the first rule: Ship via is 1. The system does not create a tickler for the other rules whose criteria are met.

Example 2: Allow multiple ticklers is selected for the SO event.

The following event rules are defined for the SO event, displayed in processing sequence order.

- Event rule 1: Ship via is 1
- Event rule 2: Item is A123
- Event rule 3: LTD order dollars is greater than \$100
- Event rule 4: Interactive mode is M (order maintenance)

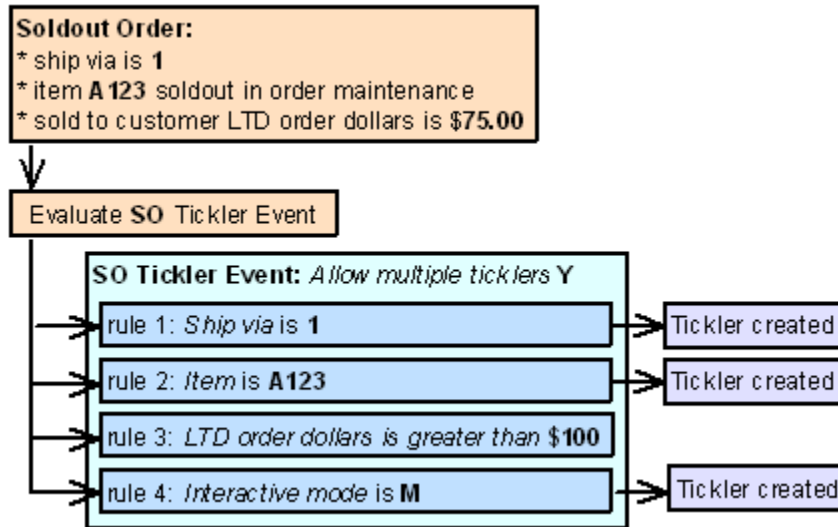

You enter an order and:

- the ship via on the order header is 1.
- the item on the order is A123 and is not soldout in order entry.
- the sold to customer's life-to-date order dollars is \$75.00.
- in order maintenance, you sell out item A123.

In this scenario, the system creates 3 ticklers during order maintenance:

- the first tickler is created for rule 1: Ship via is 1.
- the second tickler is created for rule 2: Item is A123.
- the third tickler is created for rule 4: Interactive mode is M (order maintenance).

A tickler is not created for rule 3: LTD order dollars is greater than \$100, since the sold to customer's life-to-date order dollars is less than \$100.

Resolving SO Ticklers

An SO tickler is resolved when you select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or Workflow Management Screen.

SV (SVC Number Assignment) Event Processing

The system creates a tickler for the SV tickler event when an order containing a stored value card item is processed by billing without a number assignment. This may occur if you send a physical stored value card item to the manifesting station without first using the [Working with Physical Stored Value Card Assignment \(WPSA\)](#) menu option to assign a number to the card.

The system creates a tickler for each unit of the item that is not assigned a stored value card number.

The tickler indicates the:

- order number and ship to number associated with the stored value card
- customer number (sold to and ship to) on the order
- stored value card item number, SKU code, and description
- pick control number containing the stored value card item

If the stored value card is a physical card (SVC type P or E), you must call the customer, indicate the stored value card has not yet been activated, and ask for the number printed on the card.

If the stored value card is a virtual card (SVC type V), you must assign a number from the [Virtual Card Number Table \(FLSVCA\)](#) to the card and email this information to the recipient card holder.

When is the SV tickler event evaluated? The system evaluates the SV tickler event when an order containing a stored value card item is processed through the Billing Async.

Allowing multiple ticklers for the SV event: The Allow multiple ticklers setting does not apply to SV ticklers.

SV event rule criteria: You cannot define event rules for the SV tickler event.

Resolving SV Ticklers

An SV tickler is resolved when you select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).

For more information: See [Stored Value Card Purchase and Activation](#).

UP (Unconfirmed Pick Tickets) Event Processing

The system creates a tickler for the UP tickler event when a pick ticket exists that has not been confirmed.

Note:

You can use the UP event in place of printing the Carryover report.

The system considers a pick ticket unconfirmed if the pick control header status is blank (open), M (submitted to manifest), or O (carryover). If the pick ticket's status is some other value, the system does not create a tickler for the pick ticket.

One tickler is created for each unconfirmed pick ticket that qualifies for a UP event rule; if an unconfirmed pick ticket qualifies for more than 1 event rule, the system creates 1 tickler for the first event rule, in processing sequence order, that qualifies.

Note:

The system does not allow multiple ticklers for the UP event (the Allow multiple ticklers field must be unselected).

When is the UP event evaluated? The system evaluates the UP event when you run the Evaluate Create/Resolve Tickler periodic function (program name PFR0072).

Graduating UP ticklers: Each time you run the Evaluate Create/Resolve Tickler periodic function, the system determines if any existing UP ticklers should be graduated.

- If a UP tickler exists for an unconfirmed pick ticket and the unconfirmed pick ticket qualifies for a new event rule, based on processing sequence order, the system keeps the existing tickler open and applies the new event rule to the tickler.
- If a UP tickler exists for an unconfirmed pick ticket and the unconfirmed pick ticket qualifies for the event rule currently assigned to the existing tickler, the system does not create a new tickler and keeps the existing tickler without any updates.
- If a UP tickler exists for an unconfirmed pick ticket and the unconfirmed pick ticket no longer qualifies for the current event rule and does not qualify for any other UP event rules, the system resolves the tickler; see [Resolving UP Ticklers](#).

The system updates the existing tickler with the information related to the event rule that is now associated with the tickler:

- Rule number updates to the new event rule assigned to the tickler.

- Category updates to the category for the new event rule.
- Priority updates to the priority for the new event rule.
- Assigned to updates to the assigned to user/group for the new event rule.
- Assigned date updates to the date the tickler is graduated.
- Supervisor group updates to the supervisor group for the new event rule.
- Date to notify supervisor updates, based on the new supervisor group assigned.
- Tickler procedures updates to the procedures for the new event rule.
- if the tickler was in-process, the system changes the status back to open.
- if the Notify user/group field is selected for the new event rule, the system sends a Tickler Reassignment email; see [Tickler Notification](#) for a sample email. **Note:** The system sends a Tickler Reassignment email only if the new event rule has a different assigned to user/group from the previous event rule assigned to the tickler.
- the system creates a tickler history record, indicating the tickler has been graduated from one event rule to another.

UP Event Rule Criteria

You can define the following criteria for a UP event rule.

Note:

The Pick older than setting is used with all other criteria you define for an event rule. For example, if you define a pick category, the pick ticket must match the specified pick category and the pick control date for the pick ticket must be older than the system date by the number of days defined.

Criterion	Event rule set up
The Pick control date for the unconfirmed pick ticket is older than the system date by the number of days on the event rule.	Enter a number in the Picks older than field. The system requires you to enter a number of days.
The pick category defined for the pick ticket matches the pick category on the event rule.	Enter a pick category code in the Picks category field. D = The pick category for the unconfirmed pick ticket is D (drop ship pick ticket). R = The pick category for the unconfirmed pick ticket is R (regular pick ticket). S = The pick category for the unconfirmed pick ticket is S (special handling pick ticket).
The ship via for the unconfirmed pick ticket matches the ship via on the event rule.	Enter a ship via code in the Ship via field. The system evaluates the ship via on the unconfirmed pick ticket, not the ship via on the order. If you enter a ship via for the event rule, you cannot define a ship via priority.

Criterion	Event rule set up
The priority of the ship via for the unconfirmed pick ticket matches the ship via priority on the event rule.	Enter a ship via priority number in the Ship via priority field. The system evaluates the priority of the ship via on the unconfirmed pick ticket, not the ship via on the order. If you enter a ship via priority for the event rule, you cannot define a ship via.

UP Event Example

The following event rules are defined for the UP event rule, in processing sequence order.

- Event rule 1: Pick control date is 5 days for Pick category R (regular picks)
- Event rule 2: Pick control date is 1 day for Pick category R (regular picks)

You run the Evaluate Create/Resolve Ticklers periodic function and:

- Pick ticket # 69 qualifies for event rule 2
- Pick ticket # 72 qualifies for event rule 2

The system creates a UP tickler for each pick ticket.

You run the Evaluate Create/Resolve Ticklers periodic function again and:

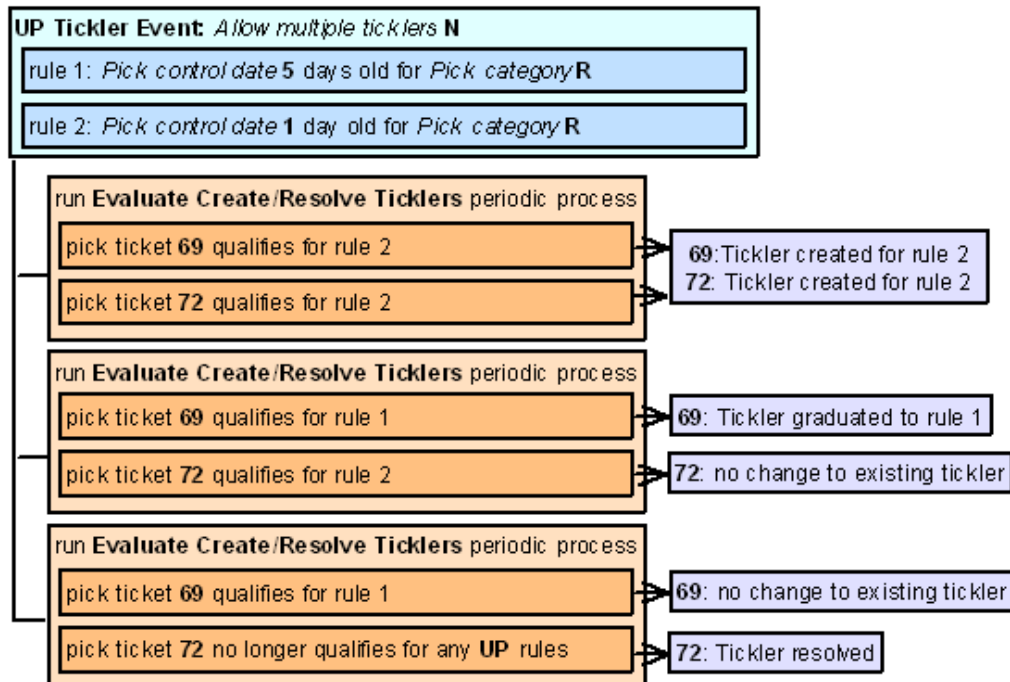

- Pick ticket # 69 qualifies for event rule 1
- Pick ticket # 72 qualifies for event rule 2

The system graduates the existing tickler for pick ticket # 69 to event rule 1; the existing tickler for pick ticket # 72 continues using rule 2.

You run the Evaluate Create/Resolve Ticklers periodic function again, and:

- pick ticket # 69 qualifies for event rule 1
- pick ticket # 72 does not qualify for any rules (the pick ticket has been confirmed)

The existing tickler for pick ticket # 69 continues using rule 1. The system resolves the existing tickler for pick ticket # 72.

Resolving UP Ticklers

A UP tickler is resolved when you:

- select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).
- run the Evaluate Create/Resolve Ticklers periodic function (program name PFR0072), if the tickler no longer applies to any OO event rules. For example, the pick ticket has been voided or reprinted.
- confirm the pick ticket. **Note:** When you confirm the pick ticket, the system resolves the tickler automatically and does not wait until you run the Evaluate Create/Resolve Ticklers periodic function.

VP (Voided Pick Tickets) Event Processing

The system creates a tickler for the VP tickler event when a pick ticket is voided.

When is the VP event evaluated? The system evaluates the VP event when you void a pick ticket by:

- selecting Void or Void/Unreserve for a pick ticket in the [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#) menu option or order maintenance.
- selecting Void for a pick ticket during [Manually Confirming Shipments \(MCON\)](#).
- selecting Void All/Cancel Order in the [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#) menu option.
- selecting Void All in order maintenance.

**Note:**

The [Void Pick Batch \(WSVP\)](#) option does not create VP ticklers.

Allowing multiple ticklers for the VP event:

- If you allow multiple ticklers, the system creates multiple ticklers for the voided pick ticket; a separate tickler is created for each event rule whose criteria are met.
- If you do not allow multiple ticklers, the system creates only 1 tickler for the voided pick ticket.

VP Event Rule Criteria

You can define the following criteria for a VP event rule.

Hold reason: If you enter a valid hold reason in the Hold reason field, the system places the order on hold at the user level when a VP tickler is created for the event rule. In this situation, the system removes any pick slip preparation from the order; see [Preparing Orders for Pick Slip Generation](#).

Criterion	Event rule set up
The ship via for the order ship to associated with the voided pick ticket matches the ship via on the event rule.	Enter a ship via code in the Ship via field. If you enter a Ship via, you cannot define a Ship via priority for the event rule. The system evaluates the ship via on the order ship to, on the ship via on the pick ticket header.
The priority of the ship via for the order ship to associated with the voided pick ticket matches the ship via priority on the event rule.	Enter a ship via priority number in the Ship via priority field. If you enter a Ship via priority, you cannot define a Ship via for the event rule. The system evaluates the ship via on the order ship to, not the ship via on the pick ticket header.
The item and/or SKU on the voided pick ticket matches the item and/or SKU on the event rule.	Enter an item code in the Item field and optionally, a SKU code in the SKU field. If you define an item but not a SKU code and the item contains SKUs, the system creates a tickler for the item if any of the SKUs for the item are on a voided pick ticket. If you define both an item and SKU, the system creates a tickler only if that specific SKU is on a voided pick ticket.

VP Event Examples

Example 1: Allow multiple ticklers is unselected for the VP event.

The following event rules are defined for the VP event, displayed in processing sequence order.

- Event rule 1: Ship via is 1
- Event rule 2: Item is A123
- Event rule 3: Item is SKU2002 RED

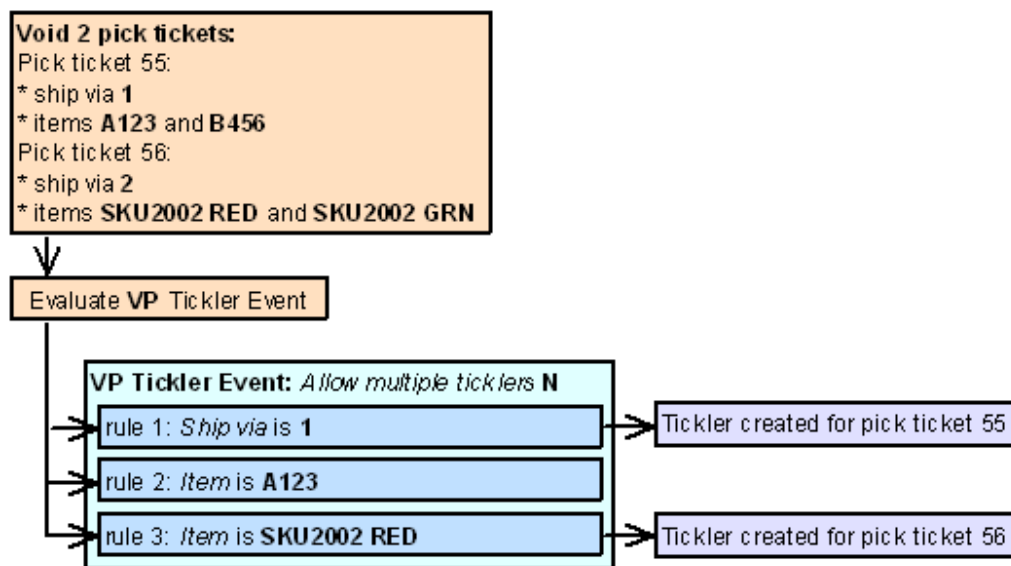

You void 2 pick tickets:

- pick ticket 55 is for ship via 1 and contains 2 pick ticket lines:
- pick ticket line 1: item A123
- pick ticket line 2: item B456
- pick ticket 56 is for ship via 2 and contains 2 pick ticket lines:
- pick ticket line 1: item SKU2002 GRN
- pick ticket line 2: item SKU2002 RED

In this scenario, the system creates:

- 1 tickler for pick ticket 55 for rule 1: Ship via is 1.
- 1 tickler for pick ticket 56 for rule 3: Item is SKU2002 RED.

The system does not create a tickler for the other rules whose criteria are met.

Example 2: Allow multiple ticklers is selected for the VP event.

The following event rules are defined for the VP event, displayed in processing sequence order.

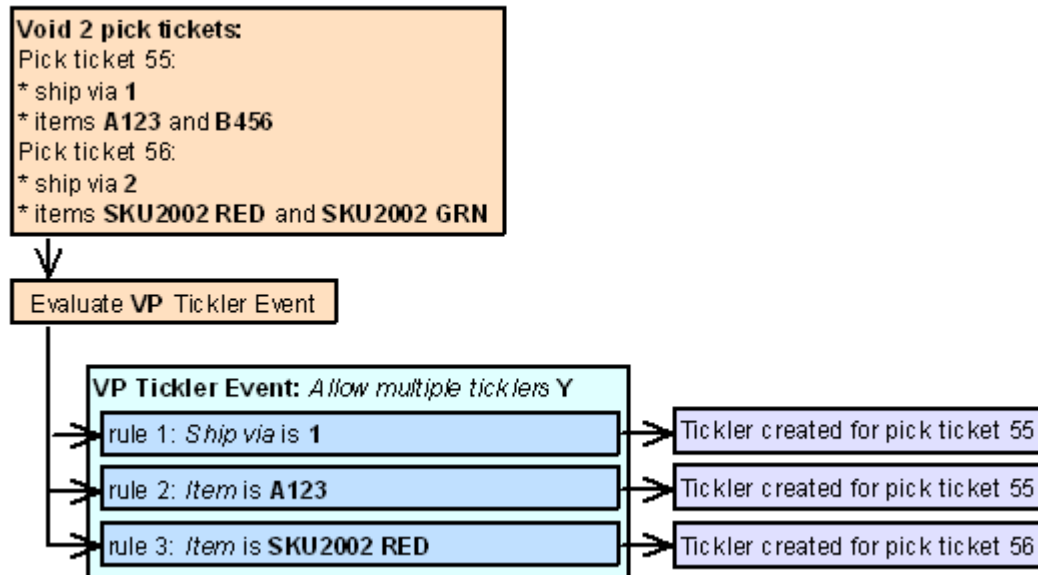

- Event rule 1: Ship via is 1
- Event rule 2: Item is A123
- Event rule 3: Item is SKU2002 RED

You void 2 pick tickets:

- pick ticket 55 is for ship via 1 and contains 2 pick ticket lines:
- pick ticket line 1: item A123
- pick ticket line 2: item B456
- pick ticket 56 is for ship via 2 and contains 2 pick ticket lines:
- pick ticket line 1: item SKU2002 GRN
- pick ticket line 2: item SKU2002 RED

In this scenario, the system creates:

- 2 ticklers for pick ticket 55 for rule 1: Ship via is 1 and rule 2: Item is A123.
- 1 tickler for pick ticket 56 for rule 3: Item is SKU2002 RED.

Resolving VP Ticklers

A VP tickler is resolved when you select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).

WF (Remote Workflow) Event Processing

The system creates a tickler for the WF tickler event when a CWWorkflow XML message is received into Order Administration from an outside source.

When is the WF event evaluated? The system evaluates the WF event when the Workflow Processing integration layer job receives the CWWorkflow XML message into Order Administration.

CWMessageIn web service: You can use the *CWMessageIn Web Service* to route CWWorkflow messages. In this situation, the target for each inbound message must match the Inbound program name for the integration layer process queue, as specified at the [Integration Layer Process Queue Screen](#).

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Web service authentication: Use the [Working with Web Service Authentication \(WWSA\)](#) menu option to define a valid user for basic web service authentication, or client ID if using OAuth. You must also create a corresponding user profile in Oracle Identity Cloud Service and assign the user to the corresponding web service role defined for the Order Management application.

Allowing multiple ticklers for the WF event: The Allow multiple ticklers setting does not apply to the WF tickler event.

WF Event Rule Criteria

You can define the following criterion for a WF event rule.

Criterion	Event rule set up
The source of the workflow XML message received matches the message source defined for the event rule.	Enter a message source code in the Message source field. Note: The source from the CWWorkflow XML message must match the Message source for the WF event rule.

Resolving WF Ticklers

A WF tickler is resolved when you select Resolve for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#).

Work with Tickler Event Rule Procedure Screen

Purpose: Use this screen to create or change the procedures, or instructions, a user should follow when working with a tickler.

How to display this screen: Select Procedures for an event rule at the [Work with Tickler Event Rule Screen](#).

Field	Description
Event	The code and description for the tickler event associated with the tickler event rule procedures. Code: Alphanumeric, 2 positions; display-only. Description: Alphanumeric, 40 positions; display-only.
Rule	The description of the event rule associated with the event rule procedures. Alphanumeric, 40 positions; display-only.
Procedure	Free-form lines where you can enter procedures, or instructions, a user should follow to resolve the tickler. Alphanumeric, 60 positions; optional.

Screen Option	Procedure
Toggle the procedure lines between add mode and change mode	Select Add/Change to toggle the procedure lines between add mode and change mode. In add mode, you can enter new procedure lines; in change mode, you can enter new procedure lines and also change existing procedure lines.

Work with Tickler Event Rule Screen

Purpose: Use this screen to create, change, and delete event rules defined for a specific tickler event. You can also create procedure notes for each event rule.

 **Note:**

Event rules display on this screen in processing sequence order, allowing you to easily see the order in which the system evaluates the rules to determine if a tickler is created; see [Event Rule Processing Sequence](#).

How to display this screen: Select Rules for a tickler event at the [Work with Tickler Event Screen](#).

Field	Description
Event	The code and description of the event associated with the event rules. Code: Alphanumeric, 2 positions; display-only. Description: Alphanumeric, 40 positions; display-only.
Proc seq #	The processing sequence number for the event rule. The processing sequence number defines the order in which the system evaluates the rules to determine if a tickler is created, from lowest sequence number to highest. Note: The first tickler event rule that meets the criteria creates a tickler. It is important that you assign the most important tickler event rule the lowest processing sequence number. If you do not define a processing sequence number for an event rule, the system assigns the event rule a processing sequence number of 0. If all of the rules have the same processing sequence number, the system evaluates the rules in rule sequence number. See Event Rule Processing Sequence . Numeric, 3 positions; optional.
Rule seq #	The rule sequence number for the event rule. The system assigns a rule sequence number to each rule you create; the first rule you create is assigned a rule sequence number of 1, etc. Note: If all of the rules have the same processing sequence number, the system evaluates the rules to determine if a tickler is created in rule sequence number, from lowest rule number to highest. See Event Rule Processing Sequence . Numeric, 3 positions; optional.
Description	A description of the event rule, usually indicating the criteria defined for the rule. Alphanumeric, 40 positions; optional.
Pty (Priority)	The priority assigned to the event rule, used to determine the importance of ticklers created for the event rule. You can scan for ticklers by priority at the Work with Tickler Screen (user/group view) (tickler users) and Workflow Management Screen (tickler supervisors). You can assign a tickler event priority between 1-9, where 1 is the lowest priority and 9 is the highest priority. The priority defined at the tickler event level defaults, but you can override it. The tickler priority defined at the event rule level overrides the tickler priority defined at the event level. Numeric, 1 position; display-only.

Field	Description
Act (Active flag)	<p>Indicates whether the event rule is active.</p> <p>selected = The event rule is currently active; the system creates a tickler for the event rule if its criteria are met by the system action. Remember, to create a tickler for the event rule, the Active flag at the event level must also be selected.</p> <p>unselected = The event rule is not currently active; the system does not create a tickler, regardless of whether the system action qualifies for the event rule.</p> <p>See Active Tickler Events and Rules.</p>
Cat (Tickler category)	<p>A code for the tickler category assigned to the event rule. Tickler categories are used to group ticklers.</p> <p>Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT).</p> <p>Alphanumeric, 3 positions; optional.</p>

Screen Option	Procedure
Create a tickler event rule	Select Create to advance to the Create Tickler Event Rule Screen .
Change a tickler event rule	<p>Select Change for an event rule to advance to the Change Tickler Event Rule Screen. You can change all fields on this screen except Event code. See Create Tickler Event Rule Screen for field descriptions.</p> <p>Note: If you create or change a tickler event rule, you must restart the asynchronous jobs the Background Job Control menu option before your updates are applied to new ticklers.</p>
Delete a tickler event rule	<p>Select Delete for an event rule to delete it.</p> <p>Note: You can delete an event rule only if it is not associated with an open or in process tickler.</p>
Display a tickler event rule	Select Display for an event rule to advance to the Display Tickler Event Rule Screen. You cannot change any information at this screen. See the Create Tickler Event Rule Screen for field descriptions.
Create or change tickler event rule instructions	Select Procedures for an event rule to advance to the Work with Tickler Event Rule Procedure Screen .

Change Tickler Event Screen

Purpose: Use this screen to define tickler event settings at the event level.

Important:

If you change a tickler event, you must restart the asyncs in the Background Job Control menu option before your updates are applied to new ticklers.

How to display this screen: Select Change for a tickler event at the [Work with Tickler Event Screen](#).

Field	Description
Event	<p>A code that determines the system action for which the system may create a tickler.</p> <p>There are 11 system actions that can create ticklers. You cannot create other tickler events for the system to evaluate for tickler creation.</p> <p>BO: backorders; see BO (Backorders) Event Processing</p> <p>CO: cancelled orders; see CO (Cancelled Orders) Event Processing</p> <p>HO: held orders; see HO (Held Orders) Event Processing</p> <p>MN: manually created; see MN (Manually Created) Event Processing</p> <p>NO: new orders; see NO (New Orders) Event Processing</p> <p>OO: aged open orders; see OO (Aged Open Orders) Event Processing</p> <p>SD: stored value card activation decline; see SD (SVC Activation Decline) Event Processing</p> <p>SO: soldout orders; see SO (Soldout Orders) Event Processing</p> <p>SV: stored value card number assignment; see SV (SVC Number Assignment) Event Processing</p> <p>UP: unconfirmed pick tickets; see UP (Unconfirmed Pick Tickets) Event Processing</p> <p>VP: voided pick tickets; see VP (Voided Pick Tickets) Event Processing</p> <p>WF: remote workflow; see WF (Remote Workflow) Event Processing</p> <p>Alphanumeric, 2 positions; display-only.</p>
Description	<p>A description of the tickler event.</p> <p>Alphanumeric, 40 positions; required.</p>
Category (Tickler category)	<p>A code for the tickler category assigned to the tickler event. Tickler categories are used to group ticklers.</p> <p>You can also define a tickler category for each event rule; the tickler category defined at the event rule level overrides the tickler category defined at the event level.</p> <p>Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT).</p> <p>Alphanumeric, 3 positions; optional.</p>
Resolution reason	<p>A code for the reason why a tickler for this event is resolved. Tickler resolution reason codes are assigned to a tickler once the tickler has been resolved.</p> <p>You can also define a resolution reason for each event rule; the resolution reason defined at the event rule level overrides the resolution reason defined at the event level.</p> <p>You must define a tickler resolution reason for all tickler events except for the MN (manually created) tickler event.</p> <p>Tickler resolution reasons are defined in and validated against the Tickler Resolution Reason table; see Working with Tickler Resolution Reasons (WTRR).</p> <p>Alphanumeric, 3 positions; required except for MN tickler event.</p>

Field	Description
Priority	<p>The priority assigned to the tickler event, used to determine the importance of ticklers created for this event.</p> <p>You can assign a tickler event priority between 1-9, where 1 is the lowest priority and 9 is the highest priority.</p> <p>You can also define a tickler priority for each event rule; the tickler priority defined at the event rule level overrides the tickler priority defined at the event level.</p> <p>Numeric, 1 position; required.</p>
Active	<p>Indicates whether the tickler event is active.</p> <p>selected = The tickler event is currently active; the system creates a tickler if the system action qualifies for an event rule.</p> <p>unselected = The tickler event and its event rules are not currently active; the system does not create a tickler, regardless of whether the system action qualifies for an event rule.</p> <p>See Active Tickler Events and Rules.</p>
Allow mult ticklers	<p>Indicates if the system creates multiple ticklers for this tickler event if the system action qualifies for more than one event rule.</p> <p>selected = The system creates a tickler for each event rule whose criteria are met by the system action.</p> <p>unselected (default) = The system creates one tickler for the first event rule, in processing sequence order, whose criteria are met by the system action. The system does not create more than one tickler for the tickler event, regardless of whether the system action meets the criteria of more than one event rule.</p> <p>Multiple ticklers are not allowed for tickler events OO (aged open orders) or UP (unconfirmed pick tickets).</p> <p>See Allowing Multiple Ticklers.</p>
Assign to orig user	<p>Indicates if ticklers created for this tickler event are assigned to the user that entered the order associated with the tickler.</p> <p>selected = Assign ticklers created for this tickler event to the user that entered the associated order. If this field is selected, you must also enter a user ID in the Assign to user field.</p> <p>unselected (default) = Do not assign ticklers created for this tickler event to the user that entered the associated order; instead, assign the tickler to the specified user or tickler user group.</p> <p>You must also define tickler assignment for each event rule; the tickler assignment defined at the event rule level overrides the tickler assignment defined at the event level.</p> <p>Note: This field defaults to selected for MN (manually created) ticklers.</p> <p>See Tickler Assignment.</p>

Field	Description
Notify user/group	<p>Indicates whether the system sends a Tickler Notification email to the assigned user or to all of the users in the assigned tickler user group when a tickler is created for this tickler event.</p> <p>selected = Notify the assigned user/user group when a tickler is created; use the email address defined for the user in the User Extended table. If the tickler is assigned to a user group, send a notification to each user in the group, using the email address defined for each user in the User Extended table.</p> <p>unselected (default) = Do not notify the assigned user/user group when a tickler is created; the user can review the ticklers in his queue at the Work with Tickler Screen (user/group view).</p> <p>You must also define the Notify user/group setting for each event rule; the notify user/group setting at the event rule level overrides the notify user/group setting defined at the event level.</p> <p>See Tickler Notification for a sample Tickler Notification email.</p>
Assign to user	<p>The user ID of the user the system assigns ticklers to for this tickler event.</p> <p>You must also define the Assign to setting for each event rule; the assign to setting at the event rule level overrides the assign to setting defined at the event level.</p> <p>You can define either an assign to user or assign to user group for each event, but not both.</p> <p>Users are defined in and validated against the User table; see Working with User Records (WUSR).</p> <p>See Tickler Assignment.</p>
Assign to group	<p>Alphanumeric, 10 positions; optional.</p> <p>The tickler user group the system assigns ticklers to for this tickler event.</p> <p>You must also define the Assign to setting for each event rule; the assign to setting at the event rule level overrides the assign to setting defined at the event level.</p> <p>You can define either an assign to user or assign to user group for each event, but not both.</p> <p>The tickler user group you enter must be defined as a user type and not a supervisor type.</p> <p>Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG).</p> <p>See Tickler Assignment.</p>
Supervisor group	<p>Alphanumeric, 10 positions; optional.</p> <p>The tickler supervisor group the system assigns ticklers to for this tickler event.</p> <p>You can also define the Supervisor group for each event rule; the supervisor group at the event rule level overrides the supervisor group defined at the event level.</p> <p>The tickler user group you enter must be defined as a supervisor type and not a user type.</p> <p>Tickler groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG).</p> <p>See Tickler Assignment.</p> <p>Alphanumeric, 10 positions; optional.</p>

Field	Description
Notify supervisor	<p>Indicates when a Supervisor Notification Count email is sent to the supervisor based on the number of days since a tickler was created.</p> <p>The system uses this calculation to determine the next notification date when a tickler is first created: tickler creation date + value in Number of days to notify supervisor field for the event/rule that created the tickler = next notification date. The system does not update the next notification date after a tickler is created.</p> <p>The system sends the email to the email address defined for the supervisor user group in the Tickler User Group table.</p> <p>The system continues sending an email to the supervisor group as long as a tickler assigned to the supervisor group is in an open or in process status and the Next notification date in the Tickler table is equal to or past the current date. If the next notification date is a future date, the system does not send an email until the next notification date is reached. If all ticklers assigned to the supervisor are resolved, the system no longer sends a Supervisor Notification Count email.</p> <p>Leave this field blank if you do not want to notify the supervisor about aging ticklers; the supervisor can review ticklers using the Workflow Management (WWFM) menu option.</p> <p>You can also define the Notify supervisor setting for each event rule; the notify supervisor setting at the event rule level overrides the notify supervisor setting defined at the event level.</p> <p>If you define a number of days in this field, you must also define the supervisor group.</p> <p>See Tickler Notification for a sample Supervisor Notification Count email.</p> <p>Numeric, 3 positions; optional.</p>
Note type	<p>Indicates the type of notes you enter for ticklers created for this tickler event.</p> <p>A = Action notes; you use the Edit Customer Actions Window to enter tickler notes.</p> <p>B = Bill to notes; you use the Work with Bill To Notes Screen to enter tickler notes.</p> <p>O = Order notes; you use the Work with Order Messages Screen to enter tickler notes.</p> <p>S = Sold to notes; you use the Edit Customer Notes Screen to enter tickler notes.</p> <p>T = Tickler notes; you use the Work with Tickler Notes Screen to enter tickler notes.</p> <p>You can only define the tickler work notes setting at the event level.</p> <p>If you change the note type for a tickler event, the system does not change the note type for previous ticklers.</p> <p>Alphanumeric, 1 position; required.</p>

Tickler Event Settings

For each tickler event, you must define settings that determine how the system creates ticklers for the event. The settings you define are used as defaults for the created ticklers. You can also define settings at the event rule level. Unless otherwise noted, the settings at the event rule level override the settings at the event level.

You can define tickler event settings at the [Change Tickler Event Screen](#) and event rule settings at the [Create Tickler Event Rule Screen](#) or Change Tickler Event Rule Screen.

Active Tickler Events and Rules

The Active field defines whether the system creates ticklers for the event or event rule.

- Select the Active field for a tickler event to have the system evaluate the event when the associated system action is performed. The system does not create ticklers for tickler events that are not active, regardless of whether one or more of the event's rules is active.
- Select the Active field for an event rule to have the system evaluate the event rule when the associated system action is performed. The system does not create ticklers for event rules that are not active, regardless of whether the event rule criteria are met.

If you do not want the system to create ticklers for a system action, deselect the Active field for the associated tickler event.

If you want the system to create ticklers for a system action, but do not want the system to create ticklers for a specific event rule, select the Active field for the associated tickler event and deselect the Active field for the event rule. Remember, to create a tickler for a tickler event at least one event rule must be active.

Tickler Assignment

You can define the user(s) to work with and resolve ticklers created for the tickler event and also the tickler supervisor to monitor the ticklers created for the tickler event.

The tickler assignment settings at the event rule level override the tickler assignment settings at the event level.

Tickler user: You can define the user or group of users to work with and resolve ticklers created by the tickler event.

- select the Assign to original user field to assign ticklers to the order entry operator that entered the order associated with the tickler. If you assign ticklers to the original order entry operator, you must also enter a user ID in the Assigned to user field in case the original order entry operator is no longer valid. **Note:** If the order is an ecommerce order, the system uses the user ID from the Assigned to user field.
- enter a user ID in the Assigned to user field to assign ticklers to a specific user.
- enter a tickler user group code in the Assigned to group field to assign ticklers to a specific tickler user group. You can create tickler user groups using the [Working with Tickler User Groups \(WTUG\)](#) menu option; the tickler user group type indicates if the tickler group is a user group (type U).

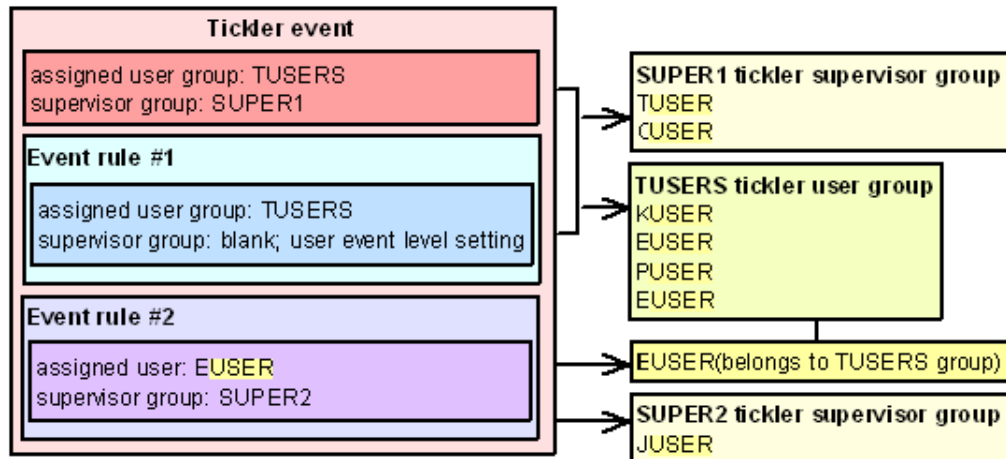

Tickler supervisor: Optionally, you can define the supervisor to monitor the ticklers created by the tickler event by entering a supervisor group in the Supervisor group field.

Tickler supervisors perform all the actions a tickler user performs (works with and resolves ticklers) and also monitors the ticklers assigned to his supervisor group or monitor all ticklers, regardless of the assigned supervisor. A tickler supervisor can also reassign ticklers to different users or different tickler user groups.

You can create supervisor groups using the Working with Tickler User Groups (WTUG) menu option; the tickler user group type indicates if the group is a supervisor group (type S).

Tickler assignment example: The flowchart below displays tickler assignment at the event level and event rule level. In this example:

- ticklers created for event rule 1 are assigned to user group TUSERS and placed in this group's work queue. Any user belonging to the TUSERS user group can work with and resolve the ticklers. Additionally, the supervisor group SUPER1 monitors the ticklers created for event rule 1. Any user belonging to the SUPER1 supervisor group can monitor the ticklers.
- ticklers created for event rule 2 are assigned to user ERIKH and placed in his work queue. User ERIKH belongs to user group TUSERS, but other members of this group cannot work with and resolve ticklers created for event rule 2 unless user ERIKH or a supervisor reassigns the tickler. Additionally, the supervisor group SUPER2 monitors the ticklers created for event rule 2. User JANEK monitors the ticklers since she is the only user assigned to this supervisor group.

Allowing Multiple Ticklers

The Allow multiple ticklers field defines whether the system creates more than one tickler for a tickler event.

- Select this field to create a tickler for each event rule whose criteria are met by the system action.
- Deselect this field to create one tickler for the first event rule, in processing sequence order, whose criteria are met by the system action. The system does not create more than one tickler for the tickler event, regardless of whether the system action meets the criteria of more than one event rule. The Allow multiple ticklers setting must be unselected for the AR, OO, and UP tickler events.

Regardless of the Allow multiple ticklers setting:

- the system creates a separate tickler for each tickler event that qualifies. For example, if you enter an order and the order meets the criteria for a HO event rule and a SO event rule, the system creates a separate tickler for each event.
- the system does not create a tickler if a tickler already exists for the same event/order/order ship to combination. For example, if a tickler already exists for the NO tickler event, order 5988, and order ship to 1, the system does not create another tickler if you add a new order line to order 5988 for ship to 1 and it qualifies for an NO event rule.

Remember: If you allow multiple ticklers, you must think carefully before you create event rules. For example, if you create the following rules and you allow multiple ticklers, the system creates 3 ticklers, even though event rule 3 is a combination of rules 1 and 2:

- Event rule 1: Ship via is 1 (UPS)
- Event rule 2: Pay type is 1 (cash/check)
- Event rule 3: Ship via is 1 (UPS) and Pay type is 1 (cash/check)

Tickler Notification

For each tickler event, you can define whether the system sends an email when:

- a tickler is created for the event
- an existing tickler for the event is reassigned to another user or user group
- existing open or in process ticklers exist and are older than a specified number of days

Tickler Notification email: The Tickler Notification email informs the assigned to user/group that a new tickler has been created and placed in the tickler work queue. Users can review and work with ticklers assigned to them or their tickler user group using the [Working with Tickler Users/User Groups \(WTIC\)](#) menu option.

To generate: An email is generated and sent to the assigned to user or to all of the users in the assigned to user group each time the system creates a new tickler or a user manually creates a tickler and the Notify user/group field in the Tickler table is selected. The system uses the email address from the User Extended table.

The notify user/group setting at the event rule level overrides the notify user/group setting at the event level.

Email template: The format of the Tickler Notification email differs based on whether the system action that creates the tickler is an interactive process or batch process.

- If ticklers are created for an interactive process, such as order entry, the system sends an email to the assigned to user/user group for each tickler created.
- If ticklers are created for a batch process, the system sends one email to the assigned to user/user group for all of the ticklers created by the batch process. The system includes a report with the email, which displays the ticklers created by the batch process. The batch processes that create ticklers are:
 - [Processing Auto Soldout Cancellations \(MASO\)](#)
 - [Working with Credit Card Cancellations \(WCCC\)](#)
 - [Working with Backorders Pending Cancellation \(WBPC\)](#)
 - [Processing Item Substitutions \(PSUB\)](#)
- Evaluate Tickler periodic function (program name PFR0072); used to create ticklers for the OO and UP tickler events.

Note:

When you manually create a tickler and assign the tickler a future date, the system sends a Tickler Notification email when the tickler is created, not when the assigned future date is reached.

Sample email (interactive): The system generates an email similar to the sample below for all interactive system actions that create ticklers.

From: flast@EXAMPLE.COM

To: eleanorjohnson@example.com

Subject: Tickler # 000002923 CO# 555

Tickler # 000002923 ORDER LINE STATUS IS BLANK (OPEN) has been assigned to you with a date of 10/11/22.

Contents:

- From: The email address of the user that started the background async jobs.
- To: The Email address field in the User Extended table for:
 - the assigned to user.
 - the user belonging to the assigned to user group.
 - the user that entered the order associated with the tickler (the assigned to original user).
- Subject: Standard subject for tickler notification emails.
 - the tickler number is the next available number for the [Tickler Number](#) number assignment value.
 - the company number is the company where the system action occurred that created the tickler.
- Message line: Standard message notifying the user of the newly created tickler.
 - For MN ticklers, the text defined for the Short note displays after the tickler number. The date is the assigned date defined for the tickler. The text of the line differs if the tickler is assigned to you (...assigned to you...) or one of your tickler groups (...assigned to KAB...).
 - For all ticklers except MN, the description of the event rule that created the tickler displays after the tickler number. The date is the assigned date defined for the tickler. The text of this line differs if the tickler is assigned to you (...assigned to you...) or one of your tickler groups (...assigned to KAB...).

Sample email (batch): The system generates an email similar to the sample below for batch processes that create ticklers.

From: flast@EXAMPLE.COM

To: eleanorjohnson@example.com

Subject: XXREPORT.TXT

Sold Out Orders Report Count for CO# 555 for KAB is 4. Please see attached report for more information.

Contents:

- From: The email address of the user that started the background async jobs.
- To: The Email address field in the User Extended table for:
 - the assigned to user.
 - the user belonging to the assigned to user group.
 - the user that entered the order associated with the tickler (the assigned to original user).

- Subject: Standard subject for tickler notification batch emails, where XX is the tickler event code.
- Message line: Standard message notifying the user of the newly created ticklers, displaying:
 - the name of the process that created the ticklers, for example Sold Out Orders.
 - the user ID or tickler group assigned to the ticklers.
 - the number of ticklers created.

Tickler Notification batch report: The report sorts in event, user/user group, created date, tickler number sequence.

The name of the report is based on the batch process that created the ticklers:

- Backorders Report displays for newly created BO ticklers.
- Cancelled Orders Report displays for newly created CO ticklers.
- Aged Open Orders Report displays for newly created OO ticklers.
- Sold Out Orders Report displays for newly created SO ticklers.
- Unconfirmed Picks Report displays for newly created UP ticklers.

Total ticklers for event SO			3				

Total ticklers 3

- **Contents:**

- Event: The description of the tickler event associated with the ticklers created by the batch process.
- User/user group: The user or tickler group assigned to the newly created ticklers.
- Created: The date the tickler was created.
- Assigned: The date the tickler was assigned to the current user/tickler user group; the assigned date is the same date as the created date.
- Tickler#: The newly created tickler number.
- Status: The status of the tickler; when a tickler is first created, the status is O (open).
- Event: the code for the tickler event associated with the newly created tickler.
- Category: The tickler category assigned to the tickler.
- Rule: The event rule that created the tickler.
- Description: A description of the event rule that created the tickler.
- Order#: The order associated with the tickler.
- Status: The status of the order associated with the tickler.
- Customer#: The sold to customer associated with the tickler. If this email is for the AR tickler event, the bill to customer associated with the tickler displays.
- Name: The sold to customer associated with the tickler.
- Email: The primary email address defined for the sold to customer.
- Telephone: The telephone number defined for the sold to customer.
- Total ticklers for event: The total number of newly created ticklers for the tickler event.
- Total ticklers: The total number of newly created ticklers across all tickler events.

Tickler Reassignment email: The system sends an email each time an existing tickler is reassigned to a new user or tickler user group.

Note:

The system sends a Tickler Reassignment email only if the Notify user/group field for the event rule associated with the tickler is selected.

To generate: An email is generated when an existing tickler is:

- reassigned to a new user or tickler user group. A tickler user can reassign ticklers currently assigned to him at the [Change Tickler Screen](#); a tickler supervisor can reassign ticklers, regardless of who is currently assigned, at the Change Tickler screen or [Reassign Ticklers Window](#).
- graduated to a new event rule; only ticklers for the AR, OO, and UP events are graduated. The system sends a Tickler Notification Reassignment email only if the

new event rule has a different assigned to user/group from the previous event rule assigned to the tickler.

From: flast&EXAMPLE.EXAMPLE.COM

To: eleanorjohnson@example.com

Subject: Tickler # 000002923 CO# 555 (REASSIGNED)

Tickler# 7159 OLDER THAN 5 DAYS (ARRIVAL0, SHIP VIA 2 has been assigned to KAB with a date of 10/14/02.

Contents:

- From: The email address of the user that started the background async jobs.
- To: The Email address field in the User Extended table for:
 - the new assigned to user.
 - the user belonging to the new assigned to user group.
- Subject: Standard subject for tickler reassignment emails.
 - The tickler number is the number of the tickler that has been reassigned.
 - the company number is the company where the system action occurred that created the tickler.
- Message line 1: Standard message notifying the user of the reassigned tickler.
 - For MN ticklers, the text defined for the Short note displays after the tickler number. The date is the assigned date defined for the tickler. The text of the line differs if the tickler is assigned to you (...assigned to you...) or one of your tickler groups (...assigned to KAB...).
 - For all ticklers except MN, the description of the event rule defined for the tickler displays after the tickler number. The date is the assigned date defined for the tickler. The text of this line differs if the tickler is assigned to you (...assigned to you...) or one of your tickler groups (...assigned to KAB...).

Supervisor Notification Count email: The Supervisor Notification Count email informs the users in the tickler supervisor group that open and in process ticklers exist that are assigned to the supervisor group and have not yet been resolved. The email includes a report which displays the number of open ticklers assigned to the supervisor group that have not yet been resolved. The tickler supervisor can use the report to determine if he should reassign ticklers based on the current workload of users assigned to work with and resolve the ticklers.

To generate: An email is generated and sent to all of the users in the supervisor group when you run the Evaluate Tickler periodic function if:

- an open or in process tickler exists, and
- the tickler is assigned to a supervisor group, and
- the Next notification date defined for the tickler in the Tickler table is equal to or past the current date.

The system sends an email to the email address defined for the supervisor user group in the Tickler User Group table.

 **Note:**

If a user belongs to more than one tickler supervisor group, that user will receive a separate Supervisor Notification Count email for each tickler supervisor group that has aged ticklers.

The supervisor setting at the event rule level overrides the supervisor setting at the event level.

Once an initial Supervisor Notification Count email is sent to the supervisor group, the system sends an email each time you run the Evaluate Tickler periodic function.

- When the system creates a tickler, the system calculates the date when the supervisor should be notified and updates the Next notification date field in the Tickler table with the initial notice date. The system uses this calculation to determine the next notification date when a tickler is first created: tickler creation date + value in Number of days to notify supervisor field for the event rule that created the tickler = next notify date.
- Once an initial Supervisor Notification Count email is sent to the supervisor, the system sends an email to the supervisor group each time you run the Evaluate Tickler periodic function since the next notification date is past the current date. The system does not update the next notification date once an initial email is sent to the supervisor.

 **Note:**

The system does not use the Notify user/group setting defined for the event to determine if a Supervisor Notification Count email is sent to the supervisor.

The system continues sending an email to the supervisor as long as a tickler assigned to the supervisor group is in an open or in process status and the Next notification date is equal to or past the current date. If all ticklers assigned to the supervisor are resolved, the system no longer sends a Supervisor Notification Count email.

Sample email:

From: flast&EXAMPLE.COM

To: eleanor.johnson@example.com

Subject: SUPERVSR.TXT

Supervisor Notification Count for CO# 555 for HOSUPER is 55. Please see attached report for more information.

Contents:

- From: The email address of the user that started the background async jobs.
- To: The email address defined for the supervisor user group in the Tickler User Group table.
- Subject: Standard subject for supervisor notification count emails.

- Message line: Standard message notifying the supervisor of the supervisor notification count. The tickler count is the number of ticklers in an open or in process status that are assigned to the supervisor group and the next notification date for the tickler in the Tickler table is equal to or past the current date.

Supervisor Notification report: The Supervisor Notification report breaks by event and within event by user/user group. The report sorts in event, user/user group, created date, tickler number sequence. A total displays for each event and across all events.

Total ticklers for event BO 1

Total ticklers 2

Contents:

- Supervisor group: The name of the supervisor group assigned to the open or in process ticklers.
- Event: The description of the tickler event associated with open or in process ticklers.
- User/user group: The user or tickler group assigned to open or in process ticklers for the event.
- Created: The date the tickler was created.
- Assigned: The date the tickler was assigned to the current user/tickler user group.
- Tickler #: The tickler number that is open or in process.
- Status: The status of the tickler; O (open) or I (in process).

- Event: The code for the tickler event associated with the tickler.
- Category: The tickler category assigned to the tickler.
- Rule: The event rule that created the tickler.
- Description/Note:
 - For MN ticklers: the text from the Short note field displays. If the Short note field for the tickler is blank, the description of the MN event displays.
 - For all ticklers except MN: the description of the event rule displays.
- Order#: The order and ship to associated with the tickler.
- Status: The status of the order.
- Customer#: The sold to customer associated with the tickler.
- Name: The name of the sold to customer.
- Email: The primary email address defined for the sold to customer.
- Telephone#: The telephone number defined for the sold to customer.
- Total ticklers for event: The number of open or in process ticklers assigned to the supervisor group for the tickler event.
- Total ticklers: The number of open or in process ticklers assigned to the supervisor group across all tickler events

Tickler Work Notes

The Note type field defines the type of tickler work notes a user enters for each tickler event; these work notes describe resolution notes and progress notes.

- A = Action notes; the user enters tickler work notes at the [Edit Customer Actions Window](#).
- B = Bill to notes; the user enters tickler work notes at the [Work with Bill To Notes Screen](#).
- O = Order notes; the user enters tickler work notes at the [Work with Order Messages Screen](#).
- S = Sold to notes; the user enters tickler work notes at the [Edit Customer Notes Screen](#).
- T = Tickler notes; the user enters tickler work notes at the [Work with Tickler Notes Screen](#).

You can only define the tickler work notes setting at the event level. If you change the note type setting, the system does not change the note type for previously created ticklers.

Tickler Priority

The tickler priority defines the importance of ticklers created for the tickler event; you can scan for ticklers by priority at the [Work with Tickler Screen \(user/group view\)](#) (tickler users) and [Workflow Management Screen](#) (tickler supervisors).

You can assign a tickler priority between 1-9, where 1 is the lowest priority and 9 is the highest priority.

The tickler priority defined at the event rule level overrides the tickler priority defined at the event level.

Tickler Category

Optionally, if you wish to group ticklers, you can assign a tickler category to ticklers.

You can scan for ticklers assigned to this category at the Work with Tickler Screen (user/group view) (tickler users) and Workflow Management Screen (tickler supervisors).

Example: To view only ticklers created for a specific HO rule, create a tickler category for each HO rule you create. This way you can view all ticklers created for HO rule 1 (paytype hold reason is AT) versus ticklers created for HO rule 2 (order hold reason is SF). In this example, tickler category for rule 1 may be HAT and tickler category for rule 2 may be HSF.

The tickler category defined at the event rule level overrides the tickler category defined at the event level.

You can create tickler categories using the [Working with Tickler Category \(WTCT\)](#) menu option.

Tickler Resolution Reason

Tickler resolution reasons are required when you or the system resolves a tickler; the resolution reason indicates the reason why the tickler is resolved.

You can define a tickler resolution reason for a tickler event or event rule; when the system creates a tickler for the tickler event/rule, the system updates the Resolution reason field in the Tickler table.

It is recommended you create at least 2 ticklers resolution reasons: one reason to use when the system resolves the tickler, and one reason to use when you manually resolve a tickler.

The resolution reason defined at the event rule level overrides the resolution reason defined at the event level.

You can create tickler resolution reasons using the [Working with Tickler Resolution Reasons \(WTRR\)](#) menu option

Point of Sale Integration

Topics in this part: This part describes integration between Order Administration and a POS (point of sale) system.

- [Point of Sale Integration Overview](#) provides a brief overview of the various integrations available.
- *Generic Inventory Transaction Upload* describes the process of uploading inventory transactions.
- *Generic Item Download API* describes the process of downloading item/SKUs.
- *Generic Vendor Download API* describes the process of downloading vendors.
- *Generic Invoice Download API* describes the process of downloading invoices.
- [Working with Outbound Interface Transactions \(WOIT\)](#) allows you to review triggers in the IL Outbound Trigger table.
- [Generating Outbound Interface Triggers \(GOIT\)](#) describes how to create triggers in the IL Outbound Trigger table for item/SKUs, vendors, and/or invoices.

- *Generic Customer History API* describes how the system responds to requests for customer or order history information.
- *Generic Inventory Inquiry API* describes how the system responds to requests for inventory information about an item/SKU.
- *Generic Inventory Download API* describes the process of downloading item availability information.
- *Generic Customer Inquiry (Search) API* describes how the system responds to requests for customer records based on various search criteria.
- [Work with Store Cross Reference \(WSCR\)](#) describes how to set up a cross reference table to map store locations between Order Administration and an external system such as Order Orchestration or a POS application.
- [Store Upload](#) explains how to upload store cross reference information from an external system to create or update records the Store Cross Reference table.
- *Generic Customer Download API* describes the process of downloading customer information.
- *Mass Customer Download* describes the process of creating a batch file containing customer information for sold to customers that meet the Mass Customer Download customer class criterion. Note that this option is not currently implemented.
- [Customer Engagement Batch Customer and Sales Integration](#) describes the process of sending customer, item, sales and return information from Order Administration to Oracle Retail Customer Engagement.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Point of Sale Integration Overview

Purpose: The point of sale integration allows you to send data from Order Administration to your point of sale system and receive data from your point of sale system into Order Administration.

In this topic:

- [Point of Sale Download Processing](#)
 - [What Data Can I Download?](#)
 - [When are Download Triggers Created?](#)
 - [Identifying Download Triggers](#)
 - [Outbound Interface Trigger Rules](#)
 - [Outbound Interface Trigger Monitor](#)
 - [Trigger Cleanup](#)
 - [Processing Delete Triggers](#)
 - [Outbound Interface Message Builder](#)
 - [Outbound Interface Queues](#)
 - [Generic Download Message Formatting](#)
- [Point of Sale Upload Processing](#)

- Generic Order Interface
- Inventory Transaction Upload
- Point of Sale Bi-Directional Processing
 - Customer Inquiry (Search) Integration
 - Customer History Integration
 - Inventory Inquiry Integration
- Point of Sale Integration Setup
 - System Control Values
 - Menu Options
 - Periodic Functions

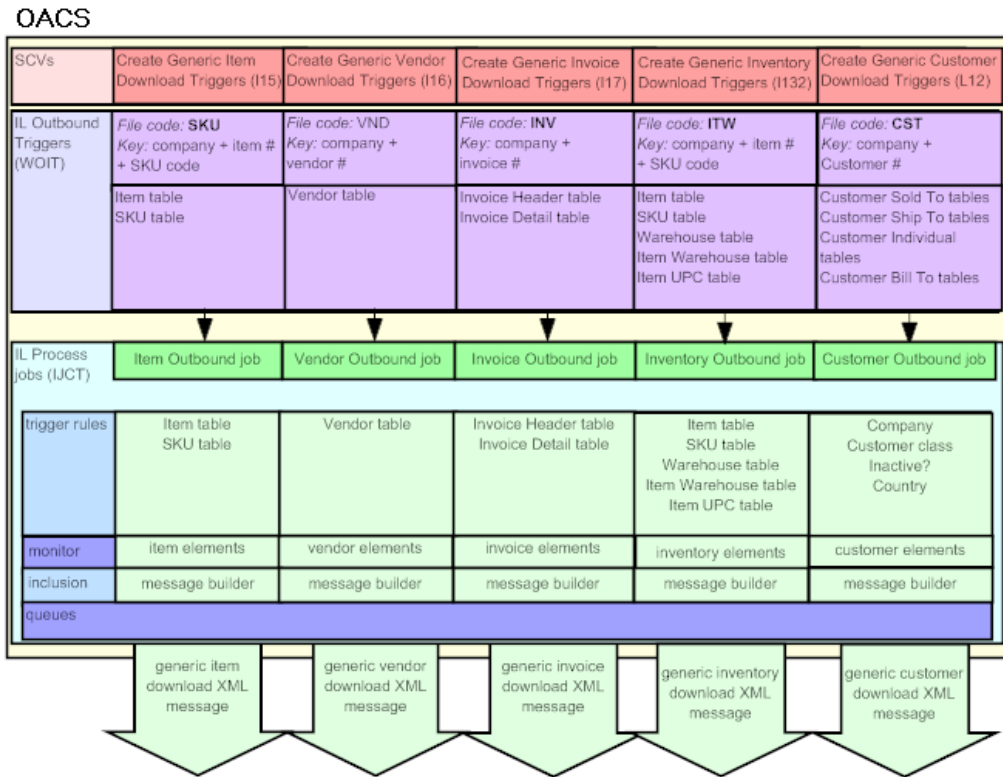

Point of Sale Download Processing

Overview: Order Administration allows you to capture the following information to download to a point of sale system:

- item/SKUs; see *Generic Item Download API*
- vendors; see *Generic Vendor Download API*
- invoices; see *Generic Invoice Download API*
- inventory; see *Generic Inventory Download API*
- customers; see *Generic Customer Download API*

For information on the above referenced APIs, see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Information flow: This flowchart explains how information is downloaded from Order Administration to a point of sale system.

What Data Can I Download?

Jobs in the [Working with Integration Layer Processes \(IJCT\)](#) menu option control what information is downloaded to another system:

- Item Outbound job: generates an item download XML message for each trigger in the IL Outbound table with a File code of SKU.
- Vendor Outbound job: generates a vendor download XML message for each trigger in the IL Outbound table with a File code of VND.
- Invoice Outbound job: generates an invoice download XML message for each trigger in the IL Outbound table with a File code of IHD.
- Inventory Outbound job: generates an inventory download XML message for each trigger in the IL Outbound table with a File code of ITW.
- Customer Download job: generates a customer download XML message for each trigger in the IL Outbound table with a File code of CST.

When are Download Triggers Created?

System control values control the type of data downloaded to a point of sale system.

- If the system control value is selected, certain actions in Order Administration triggers the system to create triggers in the IL Outbound Trigger table. The IL Outbound Trigger table acts as a “to do” list for the data that requires download.
- If the system control value is unselected, the system does not create triggers in the IL Outbound Trigger table.

You can also create triggers for existing data in your company using the [Generating Outbound Interface Triggers \(GOIT\)](#) menu option.

System Control Value	Description
Create Generic Item Download Trigger Records (I15)	Select this field to create item download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Vendor Download Trigger Records (I16)	Select this field to create vendor download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Invoice Download Trigger Records (I17)	Select this field to create invoice download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Inventory Download Triggers (I32)	Select this field to create inventory download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Customer Download Triggers (L12)	Select this field to create customer download triggers in the IL Outbound Trigger table to download to the point of sale system.

Identifying Download Triggers

Each trigger in the IL Outbound Trigger table has a:

- File code: indicating the type of information to download and which IL process job processes the trigger.
- Key: indicating the specific record to download.
- Capture type: indicating the type of activity performed against the record:
 - A = the record was created.
 - C = the record was maintained. **Note:** The system removes any duplicate change triggers; see [Trigger Cleanup](#).
 - D = the record was deleted. **Note:** The system processes delete triggers immediately; see [Processing Delete Triggers](#).

You can review point of sale download triggers in the [Working with Outbound Interface Transactions \(WOIT\)](#) menu option.

File code	Created when	Refers to table(s)	Key	IL Process job
SKU	An item/SKU is added, updated or deleted; see <i>Item Outbound Trigger Activities</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Outbound Interface Trigger Rules

Outbound interface trigger rules define the criteria a record must meet in order for the system to create an IL outbound trigger. For each IL Process outbound job, you can define trigger rules for certain tables. For example, you can define trigger rules for the Item table and SKU table for the Item Outbound job. If you define more than one criterion, the record must meet all of the criteria defined in order to generate a trigger.

See [Defining Outbound Interface Trigger Rules](#) for more information on setting up trigger rules for each IL Process job.

For IL Process job:	you can create trigger rules for:	Example:
Item Outbound	Item table SKU table	<p>You can specify to only create item download triggers for company 555, items that are SKU'ed and whose SKUs are located in warehouse 20. To do this:</p> <ul style="list-style-type: none"> • in the Item table trigger rules, enter EQ and 555 next to the Company trigger field and EQ and 'Y' next to the Allow SKU's trigger field. • In the SKU table trigger rules, enter EQ and 20 next to the Warehouse trigger field. <p>See <i>Item Outbound Trigger Rules</i> in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
Invoice Outbound	Invoice Header table Order Header table	<p>You can specify to only create invoice download triggers for debit invoices and not credit invoices. To do this, enter EQ and I (invoice) next to the Invoice type trigger field.</p> <p>See <i>Invoice Outbound Trigger Rules</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
Vendor Outbound	Vendor table	<p>You can specify to only create vendor download triggers for companies 27 and 555 and vendor 202. To do this, enter LIST and 27 555 next to the Company trigger field and EQ and 202 next to the Vendor # trigger field.</p> <p>See <i>Vendor Outbound Trigger Rules</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
Inventory Outbound	Item SKU Warehouse Item Warehouse Item UPC	<p>You can specify not to create inventory download triggers for non-inventory items. To do this, enter NE and 'Y' next to the Non-inventory trigger field.</p>
Customer Download Outbound	Company Customer class Inactive? Country	<p>You can specify not to create customer download triggers for inactive customers. To do this, enter NE and 'Y' next to the Inactive? trigger field.</p> <p>See <i>Customer Outbound Trigger Rules</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

Outbound Interface Trigger Monitor

When active, each IL Outbound job monitors the IL Outbound Trigger table for unprocessed triggers at defined intervals, based on the Outbound delay time.

Each IL Outbound job:

- looks for triggers with the appropriate File code and a Status of ready (R).
 - the Item Outbound job looks for File code SKU.
 - the Invoice Outbound job looks for File code IHD.
 - the Vendor Outbound job looks for File code VND.
 - the Inventory Outbound job looks for File code ITW.
 - the Customer Download Outbound job looks for File code CST.
- sends each trigger to the IL Outbound message builder to generate an XML message.

Trigger Cleanup

Before processing triggers in the IL Outbound table, the system looks for duplicate unprocessed download triggers with the same Capture type for the same File code and Key. If duplicate triggers exist, the system removes the duplicates, leaving only the most recent trigger for the Capture type, File code and Key.

Example: The following change triggers exist in the IL Outbound table.

File	Status	Key	Results
SKU	unprocessed	555AB105004 RED GRLS SMLL	The system deletes 2 of these triggers, leaving only one trigger to process.
SKU	unprocessed	555AB105004 RED GRLS SMLL	
SKU	unprocessed	555AB105004 RED GRLS SMLL	

Note:

If both an add and change trigger exist for the same File code and Key, the system generates a download message for both triggers.

Processing Delete Triggers

The system processes triggers in the IL Outbound Trigger table with a delete (D) Capture type immediately, regardless if the IL Outbound job is active or inactive.

Note:

Since you cannot delete an invoice, the system never creates a delete download trigger for an invoice.

If one or more unprocessed triggers exist in the IL Outbound Trigger table for the same File code and Key, the system:

- if one of the matching triggers is an add (A) Capture type: does not create the delete trigger and removes any other matching triggers (add and change). Since the point of sale system never received the add trigger, you do not want to send a delete trigger or any other triggers.

 **Note:**

However, if an Original processed date and time exist for the add trigger (indicating the trigger was previously downloaded and then reset to reprocess again), the system generates a download message for the delete trigger and removes any other matching triggers (add and change). Since the point of sale system previously received the add trigger, you want to send a delete notification to the system.

- if the matching trigger is a change (C) Capture type: generates a download message for the delete trigger and removes any other matching change triggers. Since the point of sale system is receiving a delete trigger, you do not need to send any change triggers.

Outbound Interface Message Builder

For each trigger, the IL Outbound message builder:

- determines what information requires download. The system uses the Key field for the trigger to determine which records require download.
 - The Key field for item download triggers consists of company + item number + SKU code. The SKU code is included only if the item is a SKU'ed item. For example the Key 555AB100112 BLUE GRSL SMLL indicates the item and SKU information is located in company 555 for item number AB100112 and SKU code BLUE GRSL SMLL.
 - The Key field for invoice download triggers consists of company + order number + invoice number. For example the Key 55500049680000583 indicates the invoice information is located in company 555 for order number 4968 and invoice number 583.
 - The Key field for vendor download triggers consists of company + vendor number. For example the Key 5550002006 indicates the vendor information is located in company 555 for vendor number 2006.
 - The Key field for inventory download triggers consists of company + item number + SKU code. The SKU code is included only if the item is a SKU'ed item. See the description of the item download trigger key above.
- determines which elements to include in the download message, based on XML inclusion rules. You can define XML inclusion rules for each IL Outbound job at the [Outbound Interface XML Inclusion Screen](#). XML inclusion defines which elements to include in a download message.
 - If the element is included, that element and its parents are included in the generated download XML message.
 - If the element is excluded, that element and its children are excluded from the generated download message.

- sends the generated download message to the queues defined for the Outbound job that are active.

For more information:

- item download: *Item Outbound XML Inclusion*
- vendor download: *Vendor Outbound XML Inclusion*
- invoice download: *Invoice Outbound XML Inclusion*
- inventory download: *Inventory Download XML Inclusion*
- customer download: *Customer Outbound XML Inclusion*

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Outbound Interface Queues

Once the Outbound message builder determines which elements to include in the download XML message, the IL Outbound job sends each download XML message to the appropriate queues whose Enabled field is selected. If the queue is not enabled, the system does not send the download message to that queue.

You can define outbound queues for each IL Outbound job at the [Work with Integration Layer Process Queues Screen](#).

For example, you can define a separate queue to send the download message to your:

- retail store
- warehouse management system

Generic Download Message Formatting

For each download message:

- numeric fields are not zero-filled, for example 000001 displays as 1.
- blank spaces are removed from the beginning and end of alphanumeric fields.
- decimal places for numeric fields are implied.
- empty elements are not included; for example, if an item/SKU does not have a vendor item defined, the system does not send the VendorItem element or its children (VITPriceBreak, VITAdditionalCharge, VITNote, and VITUserField) in the item download message.
- empty attributes are not included; for example, if the Kit type field for an item/SKU is blank, the system does not send the Kit_type attribute in the item download message.

For more information:

- *Item Download XML Message (CWItemOut)*
- *Vendor Download XML Message (CWVendorOut)*
- *Invoice Download XML Message (CWInvoiceOut)*
- *Inventory Download XML Message (CWInventoryDownload)*
- *Customer Download XML Message (CWCustomerDownload)*

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Point of Sale Upload Processing

The following uploads allow you to bring information into Order Administration from another system.

Generic Order Interface

Overview: Use the generic order interface to send orders into Order Administration. You can use this interface for any type of order, including retail point of sale transactions, orders received through a remote call center, and orders taken at a web storefront.

Options: Your options through the generic order interface include:

- response: generating a detailed response, a simple response, or no response
- separate payment message: sending the payment information separately or in the same message as the rest of the order information
- batching: batched or non-batched orders
- deposit and refund suppression: suppressing the order from deposit processing and refund generation
- returns: entering a return by specifying a negative order quantity
- customer updates: updating an existing sold-to, or creates a new sold-to, bill-to, or permanent ship-to customer

For more information: See the *Generic Order Interface (Order API)* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1)

Inventory Transaction Upload

Overview: You can use the *Generic Inventory Transaction Upload* to synchronize inventory levels in Order Administration with another system. For example, you can upload counts in retail stores. To do so, you can identify each store as a warehouse in Order Administration. The inventory counts of each store are then available for review through a menu option such as [Using Inventory Inquiry \(DINI\)](#) or [Inquiring into Item Availability \(DIAV\)](#).

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

You can use the upload for any type of inventory transaction that is also available in [Working with Inventory Transactions \(WITI\)](#); for example, you can upload transfers, adjustments, returns to vendor, and resets of on-hand quantity. System transactions such as shipments or purchase order receipts are not allowed. The upload performs the same edits and validations as in batch or interactive inventory transactions.

For more information: See *Generic Inventory Transaction Upload* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Other inventory integrations: In addition to the inventory transaction upload, you can use the:

- *Generic Inventory Download API* to download current inventory information, such as availability and warehouses where an item/SKU is stored, to an external system, such as Order Orchestration. You can schedule the download periodically, such as once a day; the system also creates trigger records based on changes to availability levels.

- *Generic Inventory Inquiry API* to respond to requests for inventory information from an external system. Through this API, the system responds to requests “behind the scenes,” and the activity is not visible on any screen.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- integration with Order Orchestration to share item and inventory information with multiple systems and to submit orders to another system for fulfillment. See the [Order Orchestration Integration Overview](#) for background.

Point of Sale Bi-Directional Processing

The following process allows you to receive a request from an external system or Order Orchestration, and generate a response.

Customer Inquiry (Search) Integration

Purpose: Use the generic customer inquiry integration to enable an external system to find a customer based on standard search criteria, such as alternate customer number, postal code, last name, phone number, or email address. The information in the response from Order Administration includes the customer number as well as name and address.

This search function has options similar to the [Select Customer Sold To Screen](#), and produces similar results. When you enter search criteria at the [Select Customer Sold To Screen](#), you advance to a subsequent screen listing customers in alphanumeric order based on values that match your search criteria. Similarly, when the system receives a customer inquiry request, it responds with a message listing customers in alphanumeric order based on values that match the search criteria from the request.

You can use this integration together with the customer history integration described below so that, once Order Administration has provided the matching customer(s) from the Customer Sold To table, the external system can then send a customer history request for a selected customer.

For more information: See *Generic Customer Inquiry (Search) API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Customer History Integration

Purpose: Use the generic customer history integration to provide a customer's order history to an external system and detailed information about a single order.

The external system can request information using the Order Administration customer number or order number. It can also use its own numbers if they map to the alternate customer number or alternate (web) order number in Order Administration.

When the request provides information on the customer, Order Administration produces a customer history message in response. When the request provides information on the order, Order Administration produces a detailed or summary order message. The request can include the Order Administration customer or order numbers, or the external system can use its own numbers if they map to the alternate customer number or alternate (web) order number in Order Administration.

For more information: See *Generic Customer History API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Inventory Inquiry Integration

Purpose: Use the generic inventory inquiry integration to provide current inventory information for items upon request. For example, you might use this integration to send up-to-date inventory information when it is requested by an external system. See [Inventory Transaction Upload](#) for a comparison between this integration and other generic inventory integrations.

For more information: See *Generic Inventory Inquiry API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Point of Sale Integration Setup

You must perform the necessary Order Administration setup and processing to use the point of sale Integration.

Information requiring setup includes:

- [System Control Values](#)
- [Menu Options](#)
- [Periodic Functions](#)

For more information: See the *Generic Order Interface (Order API)* and the *Generic Inventory Transaction Upload* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for information on setup related to these interfaces.

System Control Values

System Control Value	Description
Create Generic Item Download Trigger Records (I15)	Select this field to create item download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Vendor Download Trigger Records (I16)	Select this field to create vendor download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Invoice Download Trigger Records (I17)	Select this field to create invoice download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Inventory Download Triggers (I32)	Select this field to create inventory download triggers in the IL Outbound Trigger table to download to the point of sale system.
Create Generic Customer Download Triggers (L12)	Select this field to create customer download triggers in the IL Outbound Trigger table to download to the point of sale system.

System Control Value	Description
Outbound Interface Trigger File Purge Days (I14)	<p>Enter the number of days to retain records in the IL Outbound Trigger table before purging them. Run the PURGIJT periodic function (program name ILR0026) to delete any records if: Last processed date is less than the current system date by the number of purge days and Status is X. You can also use the Purge option at the Work with Outbound Interface Transactions Screen to purge records.</p> <p>Example: Today is 2/07, and you have set this value to 1. Any record whose <i>Last processed date</i> is 2/06 or earlier is purged.</p>

Menu Options

Menu Option	Description
Generating Outbound Interface Triggers (GOIT)	Allows you to create an IL outbound trigger record for each item/SKU, vendor, and/or invoice in your company. Run this process to initially send your data to the point of sale system.
Working with Outbound Interface Transactions (WOIT)	Allows you to review, delete, or resend IL outbound trigger records.
Working with Integration Layer Processes (IJCT)	<p>Use this option to create the process queues and required message queues and queue managers to send and receive messages for each integration. Also, define trigger rules, XML inclusion rules, and queues for the following IL Process jobs related to point of sale:</p> <p>Item Outbound: processes triggers with a File code of SKU and generates an item download message.</p> <p>Invoice Outbound: processes triggers with a File code of IHD and generates an invoice download message.</p> <p>Vendor Outbound: processes triggers with a File code of VND and generates a vendor download message.</p> <p>Inventory Outbound: processes triggers with a File code of ITW and generates an inventory download message.</p>

Periodic Functions

Periodic Function	Description
Purge IJCT Download (program name ILR0026)	Run this periodic function to purge processed IL outbound triggers, based on the Outbound Interface Trigger File Purge Days (I14) system control value: Capture date is less than the current system date by the number of purge days and Status is X

Periodic Function	Description
Start All IJCT Jobs (program name MSX1288)	Run this periodic function to start all IL Process jobs in the Working with Integration Layer Processes (IJCT) menu option.
Stop All IJCT Jobs (program name MSX1289)	Run this periodic function to end all IL Process jobs in the Working with Integration Layer Processes (IJCT) menu option.

Batch Inventory Overlay Upload

Purpose: Use the batch inventory overlay upload process to update the on-hand quantities for a batch of item locations.

A periodic function processes the contents of a pipe-delimited text file that is placed in the CWDIRECTCP_UPLOAD_DIRECTORY through the Work with File Uploads (WUPL) option, or uploaded through the [File Storage API](#).

Processing: The batch overlay upload:

- Processes the inventory upload file if it is found in the directory:
 - Defined in the CWDIRECTCP_UPLOAD_DIRECTORY property or,
 - In the OMS-IMPORTS container of the FILE_STORAGE table.
- For each row in the file, updates the Item Location record with the on-hand quantity, or creates the Item Location record if the Item Warehouse exists.
- Resets the on-hand quantity for the Item Warehouse record.
- Submits a record to the Evaluate Backorder queue, if needed.
- Writes any errors to an error file in the:
 - Errors subfolder of the CWDIRECTCP_UPLOAD_DIRECTORY, as described below, or
 - OMS-ERRORS container of the FILE_STORAGE table.
- Deletes the file after processing is complete after writing any errors to the:
 - Errors subfolder, or
 - OMS-ERRORS container of the FILE_STORAGE table. You can download this file through the file storage API.

The periodic function does not:

- Reset the on-hand quantity to be lower than the reserved quantity.
- Write an Inventory Transaction History record.

Setup: Setup for the batch overlay process includes:

- Create the INVOVRL (Program Name PFINVOVR) periodic function and assign it to a periodic process.
- [Working with Admin Properties \(CPRP\)](#): Set the following admin properties:
 - **COMMIT_RATE**: The number of records to process at a time. In most cases, should be set to 1000 for optimal processing.

- **OVERLAY_DEBUG**: Set to Y in order to create entries in the Job.log file. The log notes the number of records in the file, the number of records successfully processed, the number of errors, and the time to process, for example: File: INV_OVERLAY_005.TXT Rows: 4 Success: 1 Errors: 3 Start Time: Mon Mar 04 16:03:11 EST 2019 End Time: Mon Mar 04 16:03:11 EST 2019 Time In Seconds: 0.041420431 Time In Minutes: 6.903405166666667E-4
- **CWDIRECTCP_UPLOAD_DIRECTORY**: Indicates the location where the periodic function looks for the batch overlay import file if you are not using the file storage API; otherwise, see the [File Storage API](#) for more setup information.

File name: The batch overlay upload file placed in the upload directory or uploaded through the file storage API should be named INV_OVERLAY_SEQ.TXT. A zip file such as INV_OVERLAY_SEQ.ZIP is also supported if using the file storage API, provided the zip file includes a single file using the same name, for example, INV_OVERLAY_SEQ.ZIP contains INV_OVERLAY_SEQ.TXT. In all cases, the SEQ is a unique, optional sequence number. If there are multiple files in the upload directory or the OMS-IMPORTS container, the function processes them in order based on the sequence number.

File layout: A sample row in the batch overlay upload file is:

```
6|1000|RED 5|1|A010101|50
```

Where:

- 6 is the company.
- 1000 is the item code.
- RED 5 is the SKU, if any; otherwise, this field should be empty.
- 1 is the warehouse code.
- A010101 is the warehouse location.
- 50 is the new on-hand quantity to overlay the current on-hand quantity.

Errors: If the function finds any errors, it writes a copy of the file in:

- The Errors subfolder in the CWDIRECTCP_UPLOAD_DIRECTORY or
- The OMS-ERRORS container of the FILE_STORAGE table.

The TXT suffix is replaced with ERROR: for example, INV_OVERLAY_123.ERROR. The function adds a description of the error to the row in the error file. Possible errors include:

- Location is not valid: Either the location or the company is invalid.
- No Item Warehouse row found: Possible explanations include:
 - A matching Item Warehouse record does not exist for the specified Item Location.
 - The item specified is invalid.
 - No SKU is specified for a SKU'd item.

 **Note:**

Matching for alphanumeric data, including the item, SKU, and location code, is case-sensitive.

- Requested overlay brings on hand below Printed or Reserved: The overlay quantity is lower than the current printed or reserved quantity for the Item Location.
- Invalid number of entries: Possible explanations include:
 - A row is empty.
 - There is no company or quantity specified for the row.
- One or more entries are invalid: Possible explanations include:
 - No item was specified.
 - No warehouse was specified.
 - No location was specified.

Logging: The process writes records to the App.log file indicating:

- The number of records successfully updated.
- The number of records in error.
- That the file was deleted after processing.

 **Note:**

- To prevent potential errors, Oracle recommends not passing updates to the same Item Location in the same upload file.
- If the zip file in the OMS-IMPORTS folder does not contain a text file with a matching name, no processing occurs and the file is deleted.

Importing Store Cross Reference Locations through Order Orchestration's Discovery Web Service

Purpose: You can use Order Orchestration's discovery web service to request the codes, descriptions and addresses of locations from Order Orchestration, and use this information to create Store Cross Reference records in Order Administration. A periodic function calls the web service and specifies the system in Order Orchestration whose locations should be imported and used to create the cross-reference records.

Location discovery setup:

- Periodic function: Create a periodic function such as IMPSTLC using the Program name PFR0122 and assign it to a periodic process. The Parameter for the periodic function is composed of up to 11 positions, where:
 - position 1 = Y or y if the store cross-reference records should be created with the [Ship for Pickup](#) flag selected; otherwise, you would typically set the first position

to N. If the first position is set to anything other than Y or y, the Ship for pickup flag is unselected for the Store Cross Reference record.

- positions 2-11 = The code identifying the system associated with the locations. Must be a valid system code in Order Orchestration.

Example: If the parameter is set to NPOS, the periodic function imports location records for system POS in Order Orchestration, and leaves the Ship for pickup flag for each imported location unselected.

- Required property file setting: To import locations using the discovery web service, you need to set the OROB_DISCOVERY_SERVICES_WSDL_LOCATION property in [Working with Customer Properties \(PROP\)](#) to the endpoint for the Discovery Services web service. This entry should be set to `https://SERVER:8443/Locate/DiscoveryServices`, where SERVER is the name of your Oracle Retail Order Orchestration server.

 **Note:**

If the discovery web service requires basic web service authentication, you must define a valid web service authentication user and password in [Working with Web Service Authentication \(WWSA\)](#), or client ID if using OAuth.

Location discovery processing: The periodic function:

- Sends a request to Order Orchestration's discovery web service for locations in the system specified in the Parameter for the periodic function, as described above.
- Receives a response from Order Orchestration's discovery web service, listing all locations in the specified system, excluding the Default Unfulfillable Location.
- For each location code specified in the response message that does not match an existing record, creates a new Store Cross Reference record in the company specified for the periodic process, using the first position of the periodic function's Parameter to determine whether to select the Ship for Pickup flag for the new record. See below for mapping details.

 **Note:**

- Prior to Order Broker 15.0, the Default Unfulfillable Location is labeled the Default Shipping Location at the **Preferences** screen.
- If there is already a Store Cross Reference record for a location specified in the response message, the function does not update it.
- If the first position of the Parameter is not Y or y, the Store Cross Reference records are created with the Ship for pickup flag unselected.
- If a valid system in Order Orchestration is not specified by positions 2-11 of the Parameter, Order Orchestration does not return any locations in the response, and no Store Cross Reference records are created.
- All characters are converted to uppercase when creating the Store Cross Reference records.
- If the information passed for a field from Order Orchestration exceeds the length of the corresponding field in Order Administration, it is truncated.
- Only the fields listed below are mapped. For example, the apartment or suite, if any, for the location is not mapped from Order Orchestration to Order Administration.
- Order Orchestration does not log the discovery web service messages; however, Order Administration logs the activity in the [OROB \(Oracle Retail Order Orchestration\) Log](#).
- The function does not validate the data passed, such as city, state, or postal code, when creating new records.

For more information: See:

- the Order Orchestration Web Services Guide <https://support.oracle.com> (ID 2953017.1) for details on the discovery web services.
- [Working with Periodic Functions \(WPER\)](#) and [Working with Periodic Processes \(WPPR\)](#) for information on setting up and running the periodic function.
- [Work with Store Cross Reference \(WSCR\)](#) for information on working with Store Cross References and on how they are used.

Location data mapping: The table below describes how the function maps the data from the web service response when creating Store Cross Reference records.

From OROB	Store Cross Reference Record	Comments
N/A	Company code	From the Company specified when executing the periodic process.
location code	Store #	
Name	Description	
N/A	Ship for Pickup	From the first position of the Parameter specified for the periodic function; see above.
Address lines 1-4	Address lines 1-4	Truncated if they exceed 32 positions.

From OROB	Store Cross Reference Record	Comments
City	City	
State or province	State	Truncated if it exceeds 2 positions.
Postal code	Postal code	
Country code	Country code	
Telephone number	Telephone number	Truncated if it exceeds 14 positions.
N/A	Active	Selected (set to Y).

Stored Value Card Integration

Topics in this part: The following topics describe the functions available for stored value card integration.

- [Stored Value Card Overview and Setup](#) provides an overview of stored value card processing and required setup.
- [Stored Value Card Purchase and Activation](#) describes the processing that occurs when a stored value card is purchased and activated.
- [Working with Physical Stored Value Card Assignment \(WPSA\)](#) describes how to assign a number to a physical stored value card.
- [Stored Value Card Balance Inquiry \(MSVB\)](#) describes the processing that occurs when you perform a stored value card balance inquiry.
- [Stored Value Card Authorization Reversal](#) describes the processing that occurs when you reimburse a stored value card payment a cancellation or deactivation amount.
- [Transmitting Activation and Reversal Transactions \(SSVC\)](#) describes how to process stored value card download triggers and generate stored value card XML messages to send to the service bureau for processing.
- [Generating Stored Value Card Refunds](#) describes how to generate a new stored value card to send to the sold to customer when you process a stored value card credit.
- [Customer Engagement Stored Value Card Integration](#) describes the integration between Order Administration and the Oracle Retail Customer Engagement stored value card system.

Stored Value Card Overview and Setup

Overview: Stored value cards are gift cards assigned a pre-paid dollar amount that you can purchase and use as a form of payment. There are two types of stored value cards available in Order Administration: physical cards you ship to the recipient card holder and virtual cards you email to the recipient card holder.

In this topic:

- [Stored Value Card Overview](#)

- [Stored Value Card Setup](#)
 - [Creating a Stored Value Card Item](#)
 - [System Control Values](#)
 - [Periodic Function](#)
 - [Menu Options](#)
 - [Virtual Card Number Table \(FLSVCA\)](#)
 - [Creating a Stored Value Card Pay Type](#)
 - [Notify Properties](#)

For more information:

- [Stored Value Card Purchase and Activation](#): provides information on purchasing and activating a physical or virtual stored value card.
- [Working with Physical Stored Value Card Assignment \(WPSA\)](#): provides information on assigning a number to a physical stored value card.
- [Stored Value Card Balance Inquiry \(MSVB\)](#): provides information on inquiring on the remaining balance of a stored value card.
- [Stored Value Card Authorization Reversal](#): provides information on reimbursing a stored value card when you process a cancellation or deactivate the card and an open, unused authorization exists.
- [Transmitting Activation and Reversal Transactions \(SSVC\)](#): provides information on processing stored value card download triggers to generate activation and authorization reversal messages to send to the service bureau for processing.
- [Generating Stored Value Card Refunds](#): provides information on generating a new stored value card for a refund amount.
- [Customer Engagement Stored Value Card Integration](#): provides information on the integration between Order Administration and the Oracle Retail Customer Engagement stored value card system.

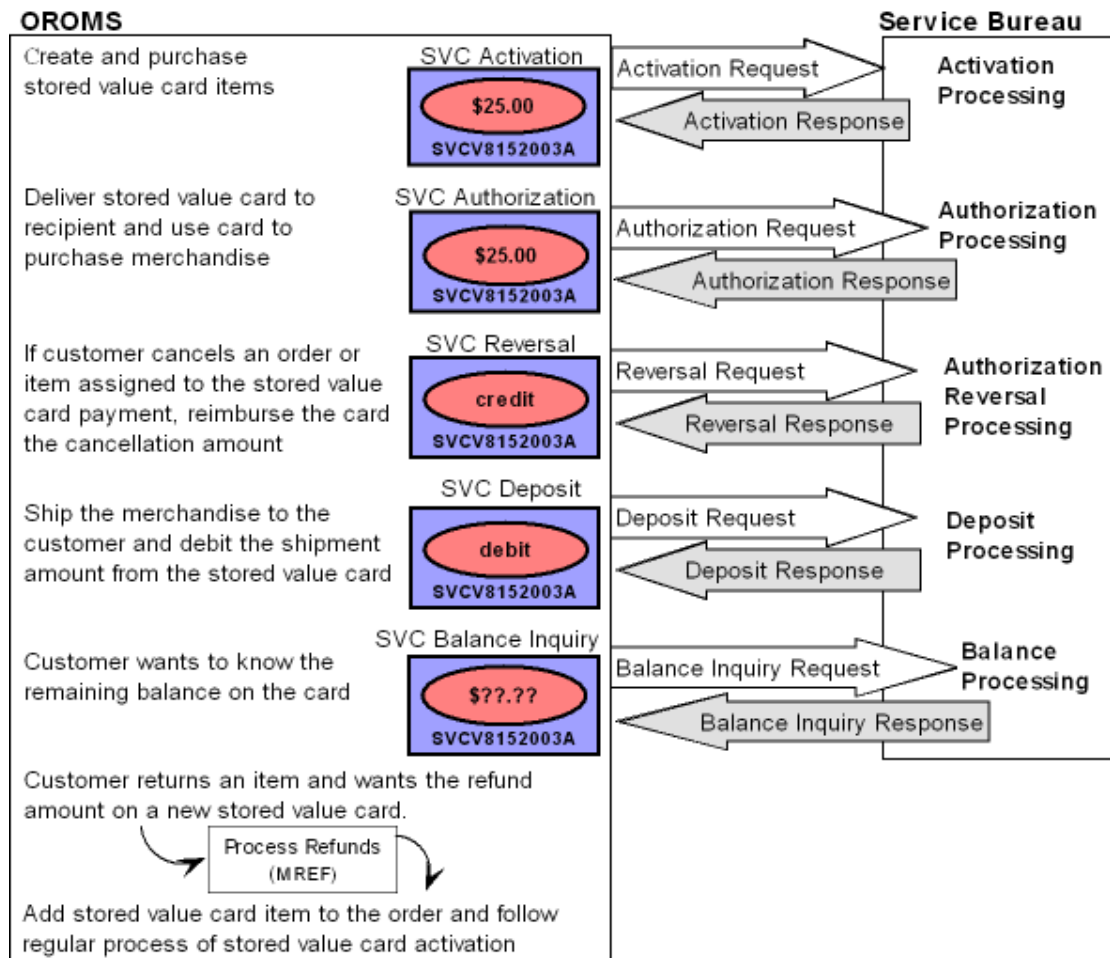

Stored Value Card Overview

In Order Administration:

- You can create an item identified as a *physical* or *virtual* stored value card.
 - *Physical* stored value cards are cards that you can stock in a warehouse or retail location. Physical cards are reserved on an order based on available inventory and printed on a separate pick slip from the other items on the order. Once the card is activated, the system delivers the physical card to the recipient card holder on the order.
 - *Virtual* stored value cards are cards that you do not stock. Virtual cards are automatically reserved on an order and express-billed during pick slip generation. Once the card is activated, an email is sent to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and providing the stored value card number and dollar amount to use as a form of payment.
- Customers can purchase the stored value card item on an order; see [Stored Value Card Purchase and Activation](#).
- Once you generate a pick slip for the order, you must assign a number to the *physical* stored value card before the card is shipped to the customer. The system automatically assigns a number to *virtual* stored value cards during pick slip generation.

- Once the stored value card is billed, the card is sent to the service bureau for activation.
- Once activated, the card is delivered to the recipient card holder on the order.
- The customer can then use the stored value card as a form of payment on an order.
- The service bureau authorizes and deposits the amount assigned to the stored value card payment.
- The customer can inquire on the remaining balance on the stored value card; see [Stored Value Card Balance Inquiry \(MSVB\)](#).
- In addition:
 - If the customer cancels an order or order line that is paid for by a stored value card payment with an open authorization or deactivates the stored value card payment, the system generates a stored value card authorization reversal to reimburse the stored value card the original authorization amount; see [Stored Value Card Authorization Reversal](#).
 - If the customer returns a line that is paid for by a stored value card payment, the system generates a refund credit against the stored value card. When you deposit a refund credit against a stored value card, the service bureau sends back a new authorization number with the deposit response; because of this, the system creates a new authorization for the credit amount that is already updated to a deposit status. At this point, the credit amount is reimbursed to the stored value card.
 - You can define a stored value card credit as an alternate refund type; when you process stored value card credits, the system issues a new stored value card to the sold to customer for the refund amount; see [Generating Stored Value Card Refunds](#).

Stored value card process flow

Stored Value Card Setup

Purpose: Before you can use stored value cards, you must perform the necessary setup.

Required setup includes:

- [Creating a Stored Value Card Item](#)
- [System Control Values](#)
- [Periodic Function](#)
- [Menu Options](#)
- [Virtual Card Number Table \(FLSVCA\)](#)
- [Creating a Stored Value Card Pay Type](#)
- [Notify Properties](#)

Creating a Stored Value Card Item

There are two types of stored value cards in Order Administration:

Physical stored value cards are physical cards that you can stock in a warehouse or retail location. Physical stored value cards are reserved on an order based on available inventory and printed on a separate pick slip from the other items on the order. You must assign a number to the physical card before the card can be billed. Once the card receives an

approved activation from the service bureau, the system delivers the physical card to the recipient card holder on the order. In addition, an email may be sent to the recipient card holder, notifying the customer that the physical card is in the process of being delivered.

Virtual stored value cards are virtual (non-physical) cards that you do not stock. Virtual stored value cards are automatically reserved on an order and express-billed during pick slip generation. During pick slip generation, the system also assigns a number to the virtual card. Once the card receives an approved activation from the service bureau, an email is sent to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and providing the stored value card number and dollar amount to use as a form of payment.

The *SVC type* field at the item level indicates if the stored value card is a physical or virtual card:

- Physical Card indicates the stored value card is a physical card.
- Physical Card/Early Notify indicates the stored value card is a physical card and, as soon as the stored value card is activated, the system sends an email notification to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and is in the process of being delivered.
- Virtual Card indicates the stored value card is a virtual (non-physical) card. Virtual cards automatically reserve when added to an order and are express-billed during pick slip generation, regardless of the *Non-inventory* flag. Once the stored value card is activated, the system sends an email notification to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and the stored value card number to use when making a purchase.

Some things to note when creating a stored value card:

- The offer price is used as the pre-defined amount assigned to the stored value card if the [Stored Value Card Activation Pricing Method \(I25\)](#) system control value is set to OFFER. This is important to note if you create a stored value card as a SKU item and each SKU represents a different dollar amount; make sure you create a SKU offer for each SKU instead of using the item offer; otherwise each SKU of the stored value card will be assigned the dollar amount defined at the item offer level.
- It is recommended you create the stored value card as a regular SKU or non-SKU item. For example, do not create the stored value card as a membership item or with a kit type.
- You can create the stored value card item as an inventory or non-inventory item. If you wish to track how many cards are available for pre-defined denominations, you should create the stored value card as an inventory item.
- You cannot assign a specific group of numbers to a stored value card item. See [Assigning a Stored Value Card Number](#).

Stored value card refund item: When you process stored value card refunds, the system adds a stored value card item to the order for the refund amount. You define the stored value card refund item in the [Default SVC Refund Item Number \(I73\)](#) system control value. This item must be a non-SKU item with the *SVC type* field set to P or E. See [Generating Stored Value Card Refunds](#).

Stored Value Card example using non-SKU:

Item Level	Item Offer Level
Item #: SVCE25 SVC type: Physical Card/Early Notify	Price: \$25.00
Item #: SVCE50 SVC type: Physical Card/Early Notify	Price: \$50.00
Item #: SVCE75 SVC type: Physical Card/Early Notify	Price: \$75.00

Stored Value Card example using SKU:

Item Level	SKU Level	SKU Offer Level
Item #: SVCV SVC type: V (virtual card)	SKU: 25	Price: \$25.00
Item #: SVCV SVC type: V (virtual card)	SKU: 50	Price: \$50.00
Item #: SVCV SVC type: V (virtual card)	SKU: 75	Price: \$75.00

System Control Values

The [Stored Value Card Processing Values \(I71\)](#) umbrella system control value contains the following values to control how stored value cards are processed.

System Control Value	Description
Use Streamlined Stored Value Card Billing (I23)	Select this field if you wish the system to send pick control records containing physical stored value cards to billing once you assign numbers to the physical cards; this assumes you never send pick control records containing physical stored value cards to a manifesting station to wand and bill the stored value card items.

System Control Value	Description
Stored Value Card Modulus Checking Method (I24)	Enter the type of modulus check, if any, you wish to perform against the stored value card number. If you enter a modulus check, you can validate the stored value card number before sending the card to the service bureau for activation.
Stored Value Card Activation Pricing Method (I25)	Enter the price the system will assign to the stored value card as the card's issue amount. You can select the offer price or order detail line price.
Stored Value Card Activation Authorization Service (I26)	Enter the code for the service bureau used to process stored value card activation requests. If you use the Customer Engagement Stored Value Card Integration, you must enter RLT.
Stored Value Card Email Notification Program (I30)	Enter the name of the program the system uses to generate a Stored Value Card Notification Email . You can send an email notification to the recipient card holder for virtual stored value cards and physical stored value cards set up with email notification, or generate the <i>Outbound Email XML Message (CWEmailOut)</i> . For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). The base program name is SVCNOTF.
Use Activation / Reversal Batch Processing (I50)	Select this field if you wish to process stored value card activation and authorization reversal transactions in batch mode. When you activate a stored value card or process a stored value card authorization reversal, the system generates a stored value card download trigger record. <ul style="list-style-type: none"> • If this system control value is selected, the system does not process the stored value card trigger records until you submit the batch process using the Transmitting Activation and Reversal Transactions (SSVC) menu option or a periodic function. In this situation, the SVC Activation and SVC Reversal integration layer jobs can remain inactive. • If this system control value is unselected, when active, the SVC Activation and SVC Reversal integration layer jobs monitor for stored value card download trigger records to process immediately.
Default SVC Refund Item Number (I73)	Enter the stored value card item the system adds to an order when you process a stored value card refund. This item represents the new stored value card that is sent to the customer for the amount of the processed refund. The system adds this item to the order at no charge and defaults the Price Override Reason for SVC Refund Item (I74) to the order line.
Price Override Reason for SVC Refund Item (I74)	Enter the price override reason code the system defaults to the stored value card no charge order line that is added to an order when you process a stored value card refund.
Default Pick Generation Template for SVC Refund Processing (I75)	Enter the streamlined pick slip generation template (WSPS) the system uses to automatically generate a pick slip for the stored value card item that is added to an order when you process a stored value card refund.

System Control Value	Description
Perform Balance Inquiry during Batch Authorizations (J19)	<p>Select this field if you wish to perform a balance inquiry against a stored value card pay type before performing a batch authorization against the card.</p> <p>The system sends a balance inquiry request in batch format to the service bureau to determine the balance on the card.</p> <ul style="list-style-type: none"> • If the balance on the card is equal to or greater than the amount to authorize for the pay type on the order, the system continues with pick slip generation and sends a batch authorization request to the service bureau to authorize the card for the specified amount. • If the balance on the card is less than the amount to authorize for the pay type on the order, and: <ul style="list-style-type: none"> – the stored value card is the catch-all pay type on the order, the system places the order on hold, using the Hold Reason for Stored Value Cards with Insufficient Funds (J18) and does not generate a pick slip for the order.
Hold Reason for Stored Value Cards with Insufficient Funds (J18)	<div data-bbox="802 800 1458 999" style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; margin-bottom: 10px;"> <p> Note:</p> <p>If a hold reason code is not defined, a pick slip is not generated; however, the order remains in an open status.</p> </div> <ul style="list-style-type: none"> – there is a different catch-all pay type on the order, such as a credit card, the system authorizes the stored value card for the remaining balance and authorizes the catch-all pay type for the remaining amount to authorize. <p>See Batch Authorization Balance Inquiry for more information.</p> <p>If you are using the Customer Engagement Stored Value Card Integration, select this system control value. Oracle Retail Customer Engagement will approve an authorization for an amount that is less than the required authorization amount for an order. If you do not select this system control value, you must require another credit card payment on an order.</p>
Perform Authorization Reversal during Deposit Processing (J20)	<p>Select this field if you wish to perform a stored value card authorization reversal during deposits processing if the authorization amount is greater than the deposit amount.</p> <p>Deselect this system control value if you are using the Customer Engagement Stored Value Card Integration.</p>

System Control Value	Description
Retain Unused Stored Value Card Authorization After Deposit (J21)	<p>Select this field if you want the system to retain a stored value card authorization after it has been partially deposited. For example, if the authorization amount is 50.00 and the deposit amount is 40.00, the system retains the remaining 10.00 on the authorization.</p> <p>Leave this field unselected if you want the system to void the remaining balance against the authorization. For example, if the authorization amount is 50.00 and the deposit amount is 40.00, the system voids the remaining 10.00 on the authorization. If there are multiple authorizations for the order, the system does not void the other authorizations.</p> <p>Select this system control value if you are using the Customer Engagement Stored Value Card Integration.</p>
Use Gift Card Fraud Checking (L72)	<p>If selected, the system places an order on GC Gift Card order hold if it contains a stored value card item and a stored value card payment method.</p>

Periodic Function

Periodic Function	Description
Stored Value Card Unactivated Report (program name PFR0075)	<p>Create this periodic function to generate the Unactivated Stored Value Card Report. Use this report to review any stored value cards that require attention because:</p> <ul style="list-style-type: none"> the stored value card was declined by the service bureau for activation the stored value card was billed at the manifest station without a number assignment
Process Stored Value Card Activations (program name PFR0076)	<p>Create this periodic function to process stored value card activation trigger records that are in a ready (R) status.</p>
Process Stored Value Card Reversals (program name PFR0077)	<p>Create this periodic function to process stored value card authorization reversal trigger records that are in a ready (R) status.</p>

Menu Options

Menu Option	Description
Working with Physical Stored Value Card Assignment (WPSA)	<p>Allows you to assign a number to a physical stored value card.</p> <p>See Assigning Numbers to Physical Stored Value Cards for more information.</p>

Menu Option	Description
Working with Tickler Events (WTEV)	<p>Activate the SV tickler event to generate a tickler when a stored value card item is billed without a number assignment.</p> <p>Activate the SD tickler event to generate a tickler when a stored value card activation request is declined by the service bureau.</p> <div data-bbox="1164 541 1383 1066" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>To create ticklers, the Use Workflow Management (H96) system control value must be selected.</p> </div>
Working with Pay Types (WPAY)	<p>Create a stored value card pay type. See Creating a Stored Value Card Pay Type for additional setup.</p> <p>Additionally, if you wish to always generate a stored value card refund for a particular pay type, enter a stored value card pay type as the alternate refund type.</p>

Menu Option	Description
Working with Integration Layer Processes (IJCT)	<p>Stored Value Card Reversal: The SVC_REVRSL job creates a stored value card authorization reversal request for each unprocessed AHR download trigger in the IL Outbound Trigger table.</p> <p>If the Communication type field for the service bureau is Integration Layer, you must define:</p> <ul style="list-style-type: none"> • the outbound queue where messages are placed to send to the service bureau. • the inbound queue that receives responses from the service bureau.

 **Note:**

Order Administration is hard-coded to use the SVC_REVRSL job to process stored value card authorization reversals; you cannot create a new integration layer job with a different process name to process stored value card authorization reversals.

Menu Option	Description
Defining Authorization Services (WASV)	Create a service bureau for the service that you will use to process stored value cards.
Transmitting Activation and Reversal Transactions (SSVC)	Allows you to process stored value card download triggers and generate stored value card XML messages to send to the service bureau for processing.
Working with Refunds, Writeoffs and Balances Due (WREF)	Allows you to change a refund to a stored value card refund (refund type V) by entering a stored value card pay type in the <i>Pay type</i> field.
Order Entry/Maintenance Balance Inquiry	Allows you to inquire on the remaining amount available on a specified stored value card pay type and card number.
Virtual Card Number Table (FLSVCA)	

 **Note:**

To avoid conflict, make sure you set up each integration layer process that sends messages to the external system with a unique queue so that the system can identify the different types of messages it is receiving.

Use this table to automatically assign the next available number to a virtual stored value card during pick slip generation. Once the system assigns the number to a virtual stored value card, the number is removed from this table and the virtual stored value card is processed through billing.

Oracle Retail Customer Engagement stored value card integration: If you use the [Customer Engagement Stored Value Card Integration](#), you do not need to populate this table; during pick slip generation for a virtual stored value card, Order Administration sends a Generate Card Request to Oracle Retail Customer Engagement and Oracle Retail Customer Engagement returns a Generate Card Response to Order Administration with the assigned virtual card number.

 **Note:**

It is your responsibility to populate this table with stored value card numbers supplied by your service bureau. If this table does not contain an available number to assign to a virtual stored value card, the order for the stored value card will not be billed and the order will print on the [Stored Value Card Assignment Errors Report](#).

Field	Description
Company	The company where the virtual stored value cards are processed.
Card #	A number to assign to a virtual stored value card, provided by the service bureau.
ID #	An ID number to assign to a virtual stored value card, provided by the service bureau.

 **Note:**

Define an ID number only if your stored value card processor supports it.

Virtual card numbers threshold: You can define a threshold for the system to notify you when the number of records in the Virtual Card Number table is below a specified number. When the actual number of records in the Virtual Card Number table falls below the threshold value, the system sends an email notification to the specified email address, providing you time to add records to this table before all of the virtual stored value card numbers are used.

If you do not already have the Virtual Card Number threshold created, the system automatically creates the threshold when you run the Batch Order Control job; however, you still need to define the threshold criteria; see [Updating Threshold Actual Values](#).

Example: The threshold number you define is 25 with a less than comparison (the actual value must be less than the threshold value you define). Once the actual number of available virtual card number records is 24, the system sends an email to the specified email address.

Threshold Code and Description	Comparison	Number Value	Actual Number	Email address
VC: Virtual card numbers	L (actual value is less than the threshold value)	25	24	tbrown@example.com

Sample email: A sample Threshold Monitor Breach email is displayed below.

From: htruman@CWIEX1.example.COM

To: eleanor.johnson@example.com

Subject: ****ALERT**** Threshold Monitor Breach

Virtual Card Numbers threshold exceeded.

Add numbers to the Virtual Card Number file (FLSVCA)

Co#: 555 Actual\$: 000000024 > Thresh\$: 000000025

Review screens and reports to monitor this breach.

For more information: See [Working with Threshold Values \(WTHR\)](#) for more information on defining threshold values.

Creating a Stored Value Card Pay Type

When creating a stored value card pay type in Working with Pay Types (WPAY), you must define the following information:

- *Pay category:* enter Credit Card as the pay category.
- *Card type:* enter Stored Value as the card type.
- *Authorization service:* enter the authorization service that you will use to process stored value cards.
- *Deposit service:* enter the deposit service that you will use to process stored value cards.
- *Reauthorization days:* Enter the number of days before a stored value card authorization is set to expire. Enter 999 if you use the Customer Engagement Stored Value Card Integration.
- *Modulus check:* enter a modulus check to verify the stored value card number is valid before sending the card to the service bureau for authorization.

In addition to creating a stored value card pay type:

- Enter the stored value card pay type in the *Alternate refund type* field for each pay type for which you always wish to generate a stored value card refund.
- Create a credit card number format if you do not want the full stored value card number to display on Order Administration screens and reports.

Notify Properties

In order to respond to Order Administration jobs that may require user intervention to proceed, you must set up the notify properties in Working with Admin Properties (CPRP).

Why would a job require user intervention?

- An error occurred during processing

- The job is used to send transactions to another system and communication failures occur before the transmission completes

Which types of job require user intervention?

- Stored Value Card (activation, balance inquiry or authorization reversal) integration layer job
- Authorization (batch only, for all card types) integration layer job
- Deposit integration layer job

Property Name	Description
RESPONSE_RETRIES	The number of times Order Administration looks for a response to a job that requires user intervention before using the default response in order to proceed with the job. For example, if this setting is 5, Order Administration will look for a user response five times, waiting 60 seconds between each time.
RESPONSE_EMAILS	The list of email addresses that receive the Response Required email when a job requires user intervention. Each email address entered must be separated by a semi-colon (;). For example: email1@add.com;email2@add.com.

For more information: See [Working with Required Responses \(WREQ\)](#) for more information on the steps performed when a job requires user intervention.

Stored Value Card Purchase and Activation

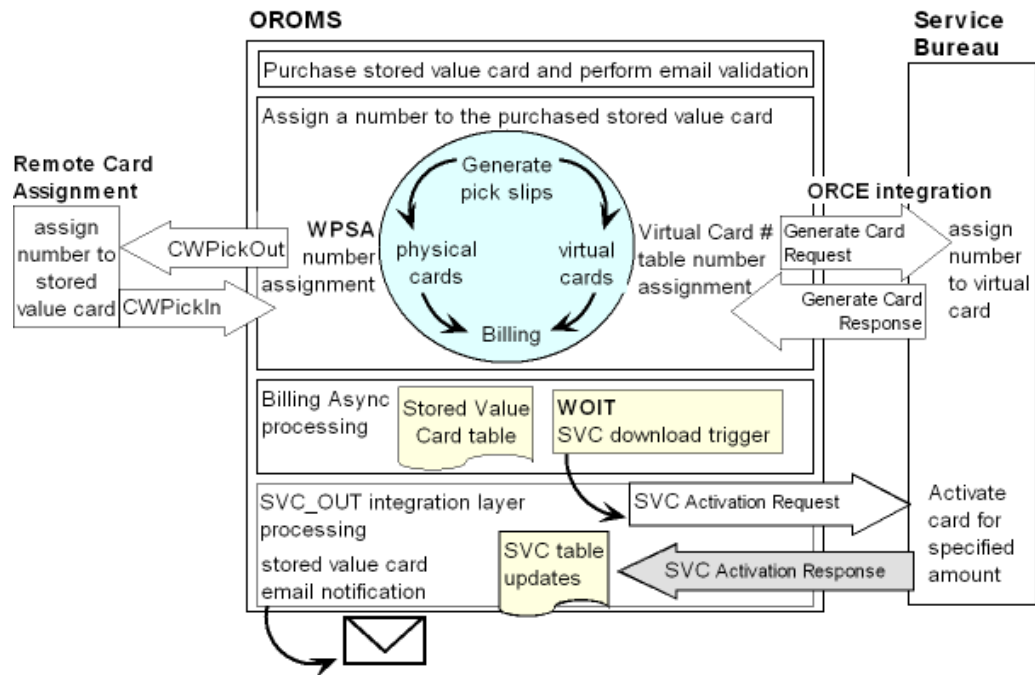

Purpose: You can purchase a stored value card item on an order to deliver to the recipient card holder by mail or email. However, before the recipient card holder can use the stored value card as a form of payment, the card must be activated by the service bureau.

Activation processing: To activate a stored value card:

#	Step
1.	A customer purchases a stored value card item on an order. If the stored value card is a <i>virtual</i> card, the system verifies that an email address is defined for the recipient card holder. See Purchasing a Stored Value Card .

#	Step
2.	<p>During pick slip preparation, the system creates a separate pre-generated pick for each <i>physical</i> stored value card.</p> <ul style="list-style-type: none">• After the picks are printed, you must:<ul style="list-style-type: none">– Use Working with Physical Stored Value Card Assignment (WPSA) to assign a number to <i>physical</i> stored value cards by pick control number, <i>OR</i>– If you use an external system to assign numbers to physical cards, receive the card number in the <i>CWPickIn XML Message</i>. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>See Assigning Numbers to Physical Stored Value Cards for additional details.</p> <ul style="list-style-type: none">• For virtual stored value cards, during pick slip generation the system:<ul style="list-style-type: none">– Assigns a number to the card from the Virtual Card Number Table (FLSVCA), <i>OR</i>– If you are using the Customer Engagement Stored Value Card Integration, assigns a number to the card by sending a Customer Engagement Generate Card Request to the Oracle Retail Customer Engagement system. <p>See Assigning Numbers to Virtual Stored Value Cards.</p>
3.	<p>Once the stored value card is billed (see Billing a Stored Value Card), the system generates an SVC download trigger containing the information required to activate the card.</p>
4.	<p>The system sends a stored value card activation request to the service bureau for activation.</p> <ul style="list-style-type: none">• If the Use Activation / Reversal Batch Processing (I50) system control value is selected, the system does not process the SVC download trigger until you submit the batch process from the Transmitting Activation and Reversal Transactions (SSVC) menu option. In this situation, the SVC Activation integration layer job can remain inactive.• If the Use Activation / Reversal Batch Processing (I50) system control value is unselected, when active, the SVC Activation integration layer job monitors for SVC download trigger records to process immediately. <p>See Activating a Stored Value Card.</p>
5.	<p>Once an approved stored value card activation is received from the service bureau, the system updates the stored value card and sends a Stored Value Card Notification Email to the customer, if defined, indicating the stored value card activation information.</p>

Stored Value Card Activation Process:

In this topic:

 - [Stored Value Card Table](#)
- [Activating a Stored Value Card](#)
 - [Identifying SVC Download Triggers](#)
 - [Generating the Stored Value Card Activation Request](#)
 - [What Happens When the Stored Value Card Activation is Approved?](#)
 - [Stored Value Card Notification Email](#)
 - [What Happens When the Stored Value Card Activation is Declined?](#)
- [Reviewing Stored Value Card Activation Status](#)
 - [Display Stored Value Cards Screen](#)

Purchasing a Stored Value Card

You purchase a stored value card as you would any item.

Physical stored value cards: When you purchase a physical stored value card (SVC type Physical Card or Physical Card/Early Notify), the system:

- Reserves the item on the order, based on available inventory.
- Does not require an email address, even if the stored value card is eligible for email notification. If you ordered a physical stored value card (with email notification) and an email address is not defined, the system still allows you to accept the order; however, the [Stored Value Card Notification Email](#) is not sent.

 **Note:**

You can create a custom special handling template to capture stored value card information, such as the gift giver's name, recipient's name, and any gift message.

Virtual stored value cards: When you purchase a virtual stored value card (SVC type Virtual Card), the system:

- Automatically reserves the item on the order and express bills the item during pick slip generation.
- Requires an email address to send the [Stored Value Card Notification Email](#) to the recipient card holder. An email address is required because the email notification is the only way the recipient of the virtual stored value card will receive the stored value card number associated with the order. If you order a virtual stored value card item and an email address is not defined or the opt in/out value is invalid, the system displays an error and does not allow you to accept the order: `Invalid e-mail address/opt in for order containing virtual SVC item.` A similar error also displays when you process a web order. See [Stored Value Card Email Hierarchy](#).

For more information: See [Assigning a Stored Value Card Number](#) for more information on how to assign a number to a stored value card.

Gift card hold: If the [Use Gift Card Fraud Checking \(L72\)](#) system control value is selected, the system places an order on GC Gift Card order hold if it contains a stored value card item and a stored value card payment method.

Stored Value Card Email Hierarchy

When a stored value card is activated and an email address is defined, the system sends a [Stored Value Card Notification Email](#) to the recipient of the stored value card.

The system uses the following hierarchy to determine the email address used to send a Stored Value Card Notification email to the recipient card holder. This email validation occurs in order entry and maintenance and during the generic order interface edit.

1. Send to ship to email address: Send the email to the email address defined for the ship to on the order.
 - Order ship to: Send the email to the email address defined for the order ship to. The system requires an email address for the order ship to if a stored value card item exists on the order: `Invalid email address/opt in for order containing virtual SVC item.`
 - Customer ship to: If an order ship to does not exist, send the email to the email address defined for the customer ship to. The system requires an email address for the customer ship to if a stored value card item exists on the order. In addition, the *Opt in/opt out* setting must allow for email delivery (codes O1 or O2): `Invalid email address/opt in for order containing virtual SVC item.`

- Recipient (Sold To/Recipient): If an order ship to or customer ship to does not exist, send the email to the email address defined for the recipient customer. The system requires an email address for the recipient if a stored value card item exists on the order. In addition, the *Opt in/opt out* setting must allow for email delivery (codes O1 or O2): Invalid email address/opt in for order containing virtual SVC item.
2. Send to customer sold to email address: If a ship to does not exist on the order, send the email to the email address defined for the customer sold to. The system requires an email address for the customer sold to if a stored value card item exists on the order. In addition, the *Opt in/opt out* setting must allow for email delivery (codes O1 or O2): Invalid email address/opt in for order containing virtual SVC item.

Note:

If the email address or opt in/opt out value changes after the order has been accepted and before the stored value card is activated, it is possible that a [Stored Value Card Notification Email](#) may not be generated.

Assigning a Stored Value Card Number

Before you can activate a stored value card, you must first assign a number to the card. Assigning a number to a stored value card occurs during or after pick slip generation, depending on if the stored value card is a physical or virtual card.

- [Assigning Numbers to Physical Stored Value Cards](#)
- [Assigning Numbers to Virtual Stored Value Cards](#)

Assigning Numbers to Physical Stored Value Cards

Follow these steps to assign a number to a physical stored value card (*SVC type* Physical Card or Physical Card/Early Notify):

1. Generate a pick slip for the order containing the physical stored value card.

When you generate a pick slip for an order containing a physical stored value card, the system:

- prints a separate pick slip for each order line containing a physical stored value card. However, if you wish to print a separate pick slip for each unit of the stored value card item, set up the item as ship alone (*Ship alone* = Ship Alone).
- creates a record in the [Pick Stored Value Card Table](#) for each unit of the stored value card item printed.
- includes the stored value card item on the [Pick Unit Report](#).

Pick Stored Value Card Table

This table contains a record for each physical stored value card item purchased whose pick control number has not yet been confirmed. Once you confirm the pick control number, the system deletes the stored value card record from this table. The system also uses this table to validate that a number has been assigned to the physical card before the card is shipped and confirmed.

Field	Description
Company	The company where you created the pre-generated pick containing the stored value card item.
PCH control #	The pick control number assigned to the pick containing the stored value card item.
Line #	The pick control line number containing the stored value card item.
Seq#	The pick stored value card sequence number.
Card Number	The number assigned to the stored value card. This field is blank when the record is created during pick slip preparation; you use the Working with Physical Stored Value Card Assignment (WPSA) menu option or the <i>svc_card_nbr</i> in the <i>CWPickIn XML Message</i> to assign a number to the physical stored value card after pick slip generation. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

If you void or reprint the pick slip: The system updates the Pick Stored Value Card table if you use the [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#) menu option to void or reprint a pick slip and the pick control number containing the physical stored value card item has not yet been billed.

In WVRP when you:	The system:
Decrease the quantity allocated	Deletes the last pick stored value card record(s) created for the order line.
Void the pick slip	Deletes the associated pick stored value card records.
Reprint the pick slip	Deletes the associated pick stored value card records referencing the old pick control number and creates new pick stored value card records for the new pick control number.
Void and unreserve the pick slip	Deletes the associated pick stored value card records.

2. Assign a number to the physical stored value card.

- Use Working with Physical Stored Value Card Assignment (WPSA) to assign a number to a physical stored value card by pick control number, *OR*
- Use the *svc_card_nbr* tag in the *CWPickIn XML Message* to receive a card assignment from an external system.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

3. Bill the pick control number containing the stored value card item.

The [Use Streamlined Stored Value Card Billing \(I23\)](#) system control value determines when the physical stored value card is sent to billing.

- If this system control value is selected, the system sends the pick control number assigned to the stored value card to billing immediately after you assign a number to the card.

- If this system control value is unselected, the system sends the pick control number assigned to the stored value card to billing after you wand and bill the card at the manifesting station.

If you use the [Manually Confirming Shipments \(MCON\)](#) menu option to confirm a pick control number containing a stored value card item, the system verifies that the stored value card is assigned a number. If the stored value card is not assigned a number, the system does not allow you to confirm the pick control number or change the status of the pick slip to carryover and instead displays an error message: `All stored value card numbers must be entered before accepting.`

For more information: See [Billing a Stored Value Card](#) for more information on the processing the system performs when you bill a stored value card.

Assigning Numbers to Virtual Stored Value Cards

To assign a number to a virtual stored value card (*SVC type V*), generate a pick slip for the order containing the virtual stored value card.

When you generate a pick slip for an order containing a virtual stored value card, the system:

- automatically assigns a stored value card number to the virtual card, using the next available number from the [Virtual Card Number Table \(FLSVCA\)](#) and deletes the record from the Virtual Card Number table.

Note:

Make sure a number is available in the Virtual Card Number table to assign to the virtual stored value card; if a number is not available to assign to the card, the entire order line containing the stored value card item will not be billed and the order will print on the [Stored Value Card Assignment Errors Report](#).

- express bills the item and sends the pick control number containing the virtual stored value card to billing.
- does not include the stored value card item on the [Pick Unit Report](#).

Oracle Retail Customer Engagement Stored Value Card integration: If you are using the [Customer Engagement Stored Value Card Integration](#), the system does not assign a number to a virtual card from the Virtual Card Number table. Instead, the system:

- generates a [Customer Engagement Generate Card Request](#) and sends the message to Oracle Retail Customer Engagement.
- receives the [Customer Engagement Generate Card Response](#) from Oracle Retail Customer Engagement, containing the assigned card number.
- express bills the item and sends the pick control number containing the virtual stored value card to billing.
- does not include the stored value card item on the [Pick Unit Report](#).

For more information: See [Billing a Stored Value Card](#) for more information on the processing the system performs when you bill a stored value card.

Billing a Stored Value Card

When a pick control record containing a stored value card item is billed, the system:

1. Deletes the associated record in the [Pick Stored Value Card Table](#), if the stored value card is a physical card.
2. Determines the issue amount to apply to the stored value card.

The system control value determines the price the system uses as the amount to apply to the stored value card.

- [Stored Value Card Activation Pricing Method \(I25\)](#)
- If this system control value is set to OFFER, the stored value card amount is the offer price. If the offer price is \$0.00, the system uses the order line price.
- If this system control value is set to ORDER or blank, the stored value card amount is the order line price. If the order line price is \$0.00, the system uses the offer price.

If both the offer price and order line price are \$0.00, the stored value card amount is \$0.00.

3. Creates a record in the [Stored Value Card Table](#) for each unit of the stored value card item.

Stored Value Card Table

This table contains a record for each stored value card item that has been billed.

Once you receive an approved activation response from the service bureau, the system updates this table with the activation information. You can review the stored value card at the [Display Stored Value Cards Screen](#).

Additionally, when you purge an order, the system deletes any associated records in this table.

Field	Description
Company	The company where you processed the stored value card.
Order #	The order number where the stored value card was purchased.
Ship to #	The ship to number receiving the stored value card.
Seq #	The order line sequence number.
Seq #	The stored value card sequence number.
Card #	The stored value card number. If the Remove Stored Value Card Number After Activation (J22) system control value is selected, the words REMOVED BY SYSTEM display instead of the credit card number.
Card type	The type of stored value card. <ul style="list-style-type: none"> • P = Physical card • E = Physical card with email notification • V = Virtual card
Issue date	The date the stored value card was billed.
Issue amount	The amount assigned to the stored value card.
Activation date	The date the stored value card was activated; this is the date the system received and processed the approved stored value card activation response.

Field	Description
Activation time	The time the stored value card was activated; this is the time the system received and processed the stored value card activation response.
Email sent date	The date a Stored Value Card Notification Email was sent to the customer. The system sends an email when an approved activation response is received from the service bureau.
Auth service	The service bureau where the stored value card was sent for activation.
Response code	The activation response received from the service bureau. The system does not update this field until the system receives a stored value card activation response from the service bureau.
ID #	The ID number assigned to the stored value card.

- Creates an SV tickler, if you [Use Workflow Management \(H96\)](#), for each stored value card item that was processed through billing without a number assignment.

A stored value card may be billed without a number assignment if you send the physical stored value card to the manifesting station without first using the Working with Physical Stored Value Card Assignment (WPSA) menu option to assign a number to the card. The system will not create a SVC download trigger for the stored value card until the card is assigned a number.

See [SV \(SVC Number Assignment\) Event Processing](#) for more information on how to resolve this tickler.

- Creates an SVC download trigger in the Outbound Interface Transaction table for each stored value card that has been billed and is assigned a stored value card number.

You can review download triggers in the [Working with Outbound Interface Transactions \(WOIT\)](#) menu option. See [Identifying SVC Download Triggers](#).

For more information: See [Activating a Stored Value Card](#) for more information on processing the SVC download triggers.

Activating a Stored Value Card

The system creates an SVC download trigger in the IL Outbound Trigger table when a stored value card item is billed (see [Billing a Stored Value Card](#)).

Identifying SVC Download Triggers

You can view all download triggers in the IL Outbound Trigger table at the [Work with Outbound Interface Transactions Screen](#).

Each SVC download trigger in the IL Outbound Trigger table contains a:

- File code:* indicating the type of information to download and which IL process job processes the trigger. For SVC download triggers, the *File code* is SVC.
- Key:* indicating the specific record to download. For SVC download triggers, the *Key* identifies the specific company, order number, ship to number, order detail sequence number, and stored value card sequence number associated with the SVC download trigger. For example, the *Key* 555000066760010000100004 indicates the stored value card information is located

in company 555 for order number 6676, ship to number 1, order detail sequence number 1, and stored value card number 4.

- *Capture type*: indicating the type of activity performed against the record. SVC download triggers are always capture type A indicating the stored value card was created.

SVC download triggers in a ready status are processed by the SVC_OUT integration layer job.

File code	Refers to table	Key	IL Process job
SVC	Stored Value Card	1112222222233344444 55555 where: 111 is the company code 22222222 is the order number 333 is the ship to number 44444 is the order detail line sequence number 55555 is the stored value card sequence number	SVC_OUT

Generating the Stored Value Card Activation Request

To generate a stored value card activation request, the system:

#	Step
1.	Creates an SVC download trigger when an order containing a stored value card item assigned a number is billed; see Identifying SVC Download Triggers .
2.	Looks for unprocessed SVC download triggers to process, based on the setting of the Use Activation / Reversal Batch Processing (I50) system control value. <ul style="list-style-type: none"> • If this system control value is selected, the system does not process the stored value card trigger records until you submit the batch process using the Transmitting Activation and Reversal Transactions (SSVC) menu option or the SVCACT periodic function (program name PFR0076). In this situation, the SVC Activation integration layer job can remain inactive. • If this system control value is unselected, when active, the SVC Activation integration layer job monitors for stored value card download trigger records to process at defined intervals, based on the <i>Outbound delay time</i>. <p>The system:</p> <ul style="list-style-type: none"> • looks for SVC download triggers with the <i>File code</i> SVC and a status of ready (R). • determines which stored value card activation to download, based on the <i>Key</i> field for the activation download trigger. • looks for a record in the Stored Value Card Table that contains this information.
3.	Looks at the Stored Value Card Activation Authorization Service (I26) system control value to determine the service bureau used to activate stored value cards.

#	Step
4.	<p>Looks at the <i>Communication type</i> field for the service bureau to determine how transactions are processed between Order Administration and the service bureau.</p> <ul style="list-style-type: none"> Integration Layer = The system sends activation transactions to the service bureau using the queues defined for the activation integration layer job. Payment Link = Point-to-point integration. The system sends activation transactions to the service bureau using a point-to-point integration. You must define communication settings in Working with Customer Properties (PROP). The system does not use the activation integration layer job to communicate with the service bureau; however, the system uses the job to process activation triggers. See Process Activations Using Payment Link Communication: <p>Process Activations Using Payment Link Communication</p> <p>If the <i>Communication type</i> field for the service bureau is Payment Link:</p> <ul style="list-style-type: none"> Order Administration uses the settings in Working with Customer Properties (PROP) to send the activation request directly to the service bureau in the format of the other system. The service bureau receives the activation request, processes the activation, and sends a response back to Order Administration.
5.	<p>Order Administration processes the activation response accordingly. See:</p> <ul style="list-style-type: none"> What Happens When the Stored Value Card Activation is Approved? What Happens When the Stored Value Card Activation is Declined?

What Happens When the Stored Value Card Activation is Approved?

A stored value card receives an approved activation if the activation response contains an authorization number. In this case, the system:

- updates the associated record in the Integration Process Control table to CMP complete (if the *Communication type* field for the service bureau is Integration Layer).
- updates the associated record in the [Stored Value Card Table](#) with the activation date, activation time, and activation response.
- generates a [Stored Value Card Notification Email](#) and sends the email to the recipient card holder.

You can review the activated stored value card at the [Display Stored Value Cards Screen](#). The activated stored value card number will have an *Activation date, time, and response*. Additionally, if a [Stored Value Card Notification Email](#) was sent, the *Email sent* field will display the date the email was sent to the customer.

Note:

If you receive a declined stored value card activation response after you have already received an approved response, the system does not deactivate the stored value card; the card remains activated and available to use as payment.

If a customer returns a stored value card or reports the card stolen: If a customer returns a stored value card or reports the card stolen, you must call the service bureau to deactivate the card.

Stored Value Card Notification Email

The system sends a Stored Value Card Notification email or XML message to the recipient card holder when the SVC_OUT job processes an approved stored value card activation request and:

- The *SVC type* field for the stored value card item is E (physical card with notification) or V (virtual card).
- An email is defined for the recipient card holder. The system uses the [Stored Value Card Email Hierarchy](#) to determine the email address used to send a Stored Value Card Notification email to the stored value card recipient.
- The [Stored Value Card Email Notification Program \(I30\)](#) system control value specifies a valid program name.

A separate email is sent for each unit of a stored value card item ordered. For example, if a customer purchases a stored value card for a quantity of 2 to send to a recipient customer, the recipient card holder receives 2 stored value card emails.

Order history message: The system writes an order transaction history message, indicating a stored value card notification was sent to the stored value card recipient customer: SVC Notice to acustomer@example.net.

For more information: See [Working with E-Mail Notification Templates \(WEMT\)](#) for more information on how the system generates email notifications, and see [Stored Value Card Notification Sample and Contents](#) for a sample email message. Also, see the *Outbound Email API* for information on when the system generates the *Outbound Email XML Message (CWEmailOut)* instead of an email, and the XML message layout.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

What Happens When the Stored Value Card Activation is Declined?

A stored value card receives a declined activation if the activation response does not contain an authorization number. In this case, the system:

- updates the associated record in the Integration Process Control table to FLD error (if the *Communication type* field for the service bureau is Integration Layer).
- creates a SD tickler if you Use Workflow Management (H96), indicating the stored value card activation request was declined. See [SD \(SVC Activation Decline\) Event Processing](#) for more information on how to resolve this tickler.
- includes the order containing the declined stored value card on the [Unactivated Stored Value Card Report](#). This report prints when you run the Unactivated Stored Value Cards periodic function (program name PFR0075).
- does not send a [Stored Value Card Notification Email](#) to the customer, since the stored value card was not activated.

You can review the declined stored value card at the [Display Stored Value Cards Screen](#). The declined stored value card number will have an *Activation response*, but a blank *Activation date and time*.

To activate a declined stored value card: You must call the service bureau to activate the card. You cannot re-send an activation request to the service bureau.

Reviewing Stored Value Card Activation Status

In standard Order Inquiry, you can review the stored value cards purchased on an order at the Display Stored Value Cards screen. This screen is also helpful if the customer purchased a virtual stored value card and forgot the number to use when making a purchase.

Note:

This screen is not available until the stored value card item has been assigned a number and processed through billing.

Display Stored Value Cards Screen

This screen indicates:

- the type of stored value card purchased
- the issue amount applied to the stored value card
- the card number
- the date the card was processed through billing
- the date and time the card was activated and the response received (if the card received a declined activation response, the system updates the *Response* field but does not update the *Activation date and time*)
- the date a [Stored Value Card Notification Email](#) was sent to the customer

If the [Remove Stored Value Card Number After Activation \(J22\)](#) system control value is selected, the words REMOVED BY SYSTEM display instead of the credit card number.

How to display this screen: At the standard Order Inquiry detail screen, select SVC for an order line containing a stored value card that has been billed.

Field	Description
Order#	The order number and ship to number where the stored value card item was purchased. <i>Order#:</i> Numeric, 8 positions; <i>display-only</i> . <i>Ship to#:</i> Numeric, 3 positions; <i>display-only</i> .
Line#	The order line number containing the stored value card item. <i>Numeric, 3 positions; display-only</i> .
Card type	Indicates the type of stored value card purchased. <ul style="list-style-type: none"> • Physical card • Physical card with email notification • Virtual card <i>Alphanumeric, 1 position; display-only</i> .
Issue amount	The initial amount applied to the stored value card. This amount does not reflect the remaining balance on the card, if the card has already been used as payment for a purchase. <i>Numeric, 13 positions with a 2-place decimal; display-only</i> .
Card#	The number assigned to the stored value card. If the Remove Stored Value Card Number After Activation (J22) system control value is selected, the words REMOVED BY SYSTEM display instead of the credit card number. <i>Alphanumeric, 20 positions; display-only</i> .

Field	Description
Issue date	The date the stored value card was processed through billing. <i>Numeric, 6 positions (user date format); display-only.</i>
Activation date	The date the stored value card was activated; this is the date the SVC_OUT process received and processed the approved stored value card activation response. <i>Numeric, 6 positions (user date format); display-only.</i>
Activation time	The time the stored value card was activated; this is the time the SVC_OUT process received and processed the stored value card activation response. <i>Numeric, 6 positions (user date format); display-only.</i>
Activation response	The activation response received from the service bureau. <i>Alphanumeric, 10 positions; display-only.</i>
Email sent	The date a Stored Value Card Notification Email was sent to the customer. The system sends an email when an approved activation response is received from the service bureau. <i>Numeric, 6 positions (user date format); display-only.</i>

Stored Value Card Authorization Reversal

Overview: When you process a cancellation associated with a stored value card payment or deactivate a stored value card payment, the system reimburses the original authorization amount to the stored value card.

In addition, if the [Perform Authorization Reversal during Deposit Processing \(J20\)](#) system control value is selected, when you process deposits and the deposit amount is less than the original authorization amount, the system reimburses the stored value card the difference; see [Authorization Reversal Process During Deposits](#).

In this topic:

- [Stored Value Card Authorization Reversal Process](#)
 - [What Happens When the Authorization Reversal is Approved?](#)
 - [What Happens When the Authorization Reversal is Declined?](#)
- [Authorization Reversal Process During Deposits](#)

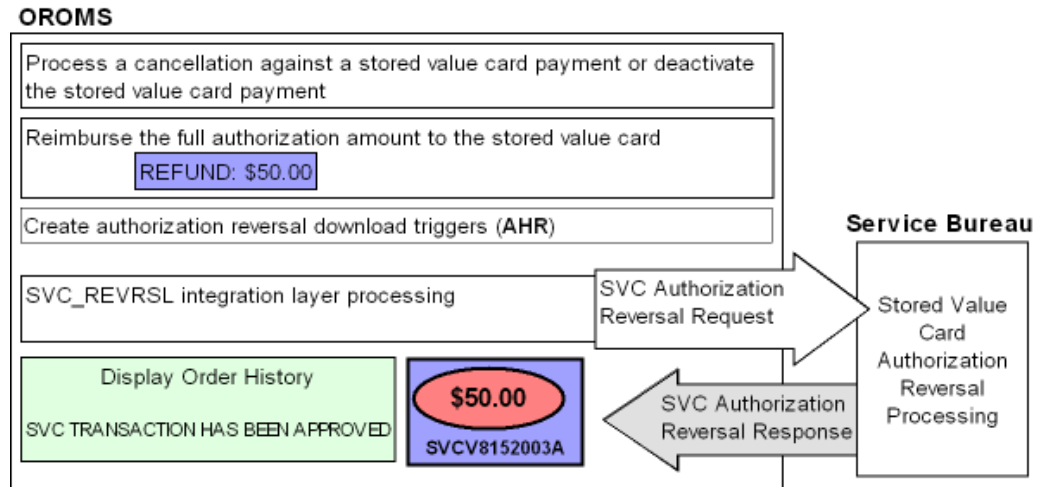

Stored Value Card Authorization Reversal Process

Purpose: The system reimburses a stored value card the original authorization amount associated with the card when you process a cancellation associated with a stored value card payment or deactivate the stored value card.

Note:

If the [Perform Authorization Reversal during Deposit Processing \(J20\)](#) system control value is selected, when you process deposits and the deposit amount is less than the original authorization amount, the system reimburses the stored value card the difference; see [Authorization Reversal Process During Deposits](#).

Stored Value Card Authorization Reversal Process:

- | # | Step |
|----|---|
| 1. | <p>You process a cancellation associated with a stored value card payment or deactivate the stored value card.</p> <p>You can process a cancellation by:</p> <ul style="list-style-type: none"> • Selecting Cancel for an order line or selecting Cancel to cancel the entire order in order maintenance. • Selecting Void All/Cancel Order to void the pick slip and cancel the order at the Reprint/Void Pick Slips by Order Screen. • Selecting Cancel Group to cancel a group of order lines based on the cancellation date or item in the Working with Backorders Pending Cancellation (WBPC) menu option. • Processing soldout cancellations by submitting the job using the Processing Auto Soldout Cancellations (MASO) menu option or by selecting Sell Out for an order line in order maintenance. • Submitting a job to cancel orders flagged for cancellation due to credit card decline using the Working with Credit Card Cancellations (WCCC) menu option. • Submitting a job to cancel order lines for a given item and adding a substitute item to each order using the Processing Item Substitutions (PSUB) menu option. • Cancelling an order line or order on the web storefront using the Maintenance E-Commerce Process. <p>You can deactivate a stored value card payment by selecting Deactivate for a stored value card payment at the Enter Payment Method Screen.</p> |

#	Step
2.	<p>The system determines if the order is eligible for stored value card authorization reversal.</p> <p>For an order to be eligible for stored value card authorization reversal, the order must:</p> <ul style="list-style-type: none"> • contain a stored value card payment method that is associated with a cancellation or deactivation. Stored value card payments have a <i>Pay category</i> of Credit Card and a <i>Card type</i> of Stored Value. • have an open, unused authorization remaining for the stored value card. <p>An open, unused authorization is an authorization that is:</p> <ul style="list-style-type: none"> • in an A (authorized) or O (authorized, but not used) status • not associated with an outstanding pick slip for the order • not partially confirmed or deposited. <p>Also, a reversal is not submitted when any lines on the order are submitted to Order Orchestration for fulfillment.</p> <p>Multiple payment methods: If the order contains one or more stored value card and/or credit card payments, the system performs authorization reversal for each eligible payment method.</p> <p>Authorizations in sent status: When you process a cancellation or deactivate a stored value card payment and the authorization is in an S (sent, but not received) status, the system does NOT create a SVC authorization reversal for the payment even if you later receive an approved authorization response.</p> <p>Expired authorizations: If the original authorization for an order is expired and the order received a new authorization during pick slip generation, the system will create an authorization reversal against the expired authorization when you process deposits. However, the service bureau will reject this authorization reversal since they have already expired the authorization and reimbursed the stored value card.</p>

 **Note:**

When the [Send reversal](#) flag is not selected for the authorization service, the system does not create an authorization reversal trigger record, described below, unless the reversal is created because the stored value card payment method is deactivated.

Example 1: The following transactions are applied against a stored value card payment on an order.

Order Activity	Result
You enter an order and pay for the order with a stored value card payment. The balance on the stored value card is 46.31.	The system authorizes the stored value card for \$10.00. The balance on the stored value card is 36.31.
The order amount is 10.00. You send the stored value card for authorization using online authorization.	

Order Activity	Result
You cancel the order in order maintenance.	The system creates a stored value card authorization reversal for \$10.00. Once the authorization reversal is processed, the balance on the stored value card is updated to 46.31.

Example 2: The following transactions are applied against a stored value card payment on an order.

Order Activity	Result
You enter an order and pay for the order with a stored value card payment. The balance on the stored value card is 46.31. The order amount is 10.00. You send the stored value card for authorization using online authorization.	The system authorizes the stored value card for \$10.00. The balance on the stored value card is 36.31.
You cancel an order line in order maintenance for 4.00.	The system creates a stored value card authorization reversal for \$10.00. Once the authorization reversal is processed, the balance on the stored value card is updated to 46.31. The remaining items on the order will be resent to the service bureau for authorization during pick slip generation.

Example 3: The following transactions are applied against a stored value card payment on an order.

Order Activity	Result
You enter an order and pay for the order with a stored value card payment. The balance on the stored value card is 40.31. The order amount is 10.00. You send the stored value card for authorization using online authorization.	The system authorizes the stored value card for \$10.00. The balance on the stored value card is 30.31.
You generate a pick slip for an order line on the order for 6.00.	The balance on the stored value card remains at 30.31.
You cancel the remaining order line in order maintenance for 4.00.	The system does not create an authorization reversal. The balance on the stored value card remains at 30.31.
You ship and bill the order line for 6.00.	The system updates the deposit amount for the authorization on the Authorization History Details screen to 6.00. The balance on the stored value card remains at 30.31.
You deposit the order line for 6.00.	The system creates a deposit record for 6.00 and updates the status of the authorization to voided. The balance on the stored value card is updated to 34.31.

#	Step
3.	The system creates an authorization reversal for the original authorization amount, not the actual amount of the reversal.
4.	The system creates a record in the Auth History SVC Reversal table for the authorization amount to reimburse.

Auth History SVC Reversal table:

Field	Description
Company	The company where you processed the stored value card authorization reversal.
Order #	The order number associated with the stored value card authorization reversal.
OPM Seq #	The order payment method sequence number associated with the stored value card payment.
AUH Seq #	The authorization history sequence number associated with the stored value card payment.
Seq#	The Auth History SVC Reversal sequence number.
Creation date	The date, in CYYMMDD format, the stored value card authorization reversal was created.
Creation time	The time, in HHMMSS format, the stored value card authorization reversal was created.
Approval date	The date, in CYYMMDD format, the stored value card authorization reversal was approved by the service bureau.
Approval time	The time, in HHMMSS format, the stored value card authorization reversal was approved by the service bureau.
Reversal amount	The amount to reimburse to the stored value card. In the case of PayPal, this is the original authorization amount.
Response	The response received from the service bureau, indicating if the authorization reversal was approved or declined.

#	Step
5.	<p>The system creates an authorization reversal download trigger for the stored value card authorization reversal.</p> <p>You can view all download triggers in the IL Outbound Trigger table at the Work with Outbound Interface Transactions screen.</p> <p>Each authorization reversal download trigger in the IL Outbound Trigger table contains a:</p> <ul style="list-style-type: none"> • <i>File code</i>: indicating the type of information to download and which IL process job processes the trigger. For authorization reversal download triggers, the <i>File code</i> is AHR. • <i>Key</i>: indicating the specific record to download. For AHR download triggers, the <i>Key</i> identifies the specific company, order number, order payment method sequence number, authorization sequence number, and authorization reversal sequence number in the SVC Authorization Reversal table. For example, the <i>Key</i> 55500006794001001001 indicates the authorization reversal information is located in company 555 for order number 6794, order payment method sequence number 001, authorization sequence number 001, and authorization reversal sequence number 001. • <i>Capture type</i>: indicating the type of activity performed against the record. AHR download triggers are always capture type A indicating the authorization reversal was created.
6.	<p>Looks at the <i>Authorization service</i> field defined for the stored value card payment to determine the service bureau used to process the authorization reversal.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When the Send reversal flag is not selected for the authorization service, the system does not create an authorization reversal trigger record unless the reversal is created because the stored value card payment method is deactivated.</p> </div>
7.	<p>The system looks for unprocessed AHR download triggers to process, based on the setting of the Use Activation / Reversal Batch Processing (I50) system control value.</p> <ul style="list-style-type: none"> • If this system control value is selected, the system does not process the stored value card trigger records until you submit the batch process using the Transmitting Activation and Reversal Transactions (SSVC) menu option or the SVCREV periodic function (program name PFR0077). • If this system control value is unselected, the SVC Activation and SVC Reversal integration layer jobs monitor for stored value card download trigger records to process at defined intervals, based on the <i>Outbound delay time</i>. <p>The system:</p> <ul style="list-style-type: none"> • looks for AHR download triggers with the <i>File code</i> AHR and a status of ready (R). • determines which stored value card authorization reversal to download, based on the <i>Key</i> field for the authorization reversal download trigger.
8.	<p>For each authorization reversal download trigger, the system generates a Stored Value Card Authorization Reversal Request.</p>

#	Step
9.	<p>The system looks at the <i>Communication type</i> field for the service bureau to determine how transactions are processed between Order Administration and the service bureau.</p> <ul style="list-style-type: none">• Integration Layer = The system sends authorization reversal transactions to the service bureau using the queues defined for the authorization reversal integration layer job.• Payment Link = Point-to-point integration. The system sends authorization reversal transactions to the service bureau using a point-to-point integration. You must define communication settings in Working with Customer Properties (PROP). The system does not use an integration layer job to communicate with the service bureau; however, the system uses the job to process authorization reversal triggers.

 **Note:**

This option is available for the [Customer Engagement Stored Value Card Integration](#). See [Processing Authorization Reversals Using Payment Link Communication](#).

Processing Authorization Reversals Using Payment Link Communication

If the *Communication type* field for the service bureau is Payment Link:

- Order Administration sends the authorization reversal request in the format of the other system. If you are using the [Customer Engagement Stored Value Card Integration](#), the system sends the [Customer Engagement Release Auth Request](#) to the Oracle Retail Customer Engagement system.
 - The service bureau receives the Authorization Reversal Request, processes the authorization reversal, and sends a response back to Order Administration. If you are using the [Customer Engagement Stored Value Card Integration](#), the system receives the authorization reversal response from Oracle Retail Customer Engagement in the [Customer Engagement Release Auth Response](#) message.
10. Order Administration processes the authorization reversal response accordingly. See:
- [What Happens When the Authorization Reversal is Approved?](#)
 - [What Happens When the Authorization Reversal is Declined?](#)
 - [When Communication Failures Occur](#)

 **Note:**

Stored value card authorization reversal responses contain a *Response code* and *Response date*, but may not contain an *Authorization code*. In this case, if the *Response code* is 100, the system updates the *Authorization code* with a dummy authorization number so that the authorization reversal is approved.

What Happens When the Authorization Reversal is Approved?

An authorization reversal is approved if the Authorization Reversal Response message contains an authorization number. In this case, the system:

- updates the associated record in the Integration Process Control table to CMP complete (if the *Communication type* field for the service bureau is Integration Layer).
- updates the associated record in the SVC Authorization Reversal table with the approval date, approval time, and reversal response.
- creates an order transaction history message indicating the authorization reversal was approved: `Reversal Has Been Approved`.
- voids the authorization history record.

 **Note:**

If the stored value card authorization reversal response contains an amount, the system ignores the amount sent back and continues to use the amount from the Auth History SVC Reversal table.

You can review the stored value card authorization reversal at the [Display Authorization Reversals Screen](#). The approved reversal will have a *Response* and an *Approval date and time*.

What Happens When the Authorization Reversal is Declined?

An authorization reversal receives a declined reversal if the Authorization Reversal Response Message does not contain an authorization number. In this case, the system creates an order transaction history message indicating the authorization reversal was declined: `Reversal Has Been Rejected`.

You can review the declined stored value card authorization reversal at the [Display Authorization Reversals Screen](#). The declined reversal will have a blank *Response*, *Approval date* and *time*. You cannot resend a SVC authorization reversal request to the service bureau.

 **Note:**

- Except for the order transaction history message, there is no other indication that the stored value card authorization reversal request was declined.
- Because the cancellation or deactivation amount was not reimbursed to the stored value card, the customer will not be able to use that amount on future purchases paid for against the stored value card.
- The response received from the service bureau does not display in the *Response* field on the [Display Authorization Reversals Screen](#) unless it is set up as a vendor response for the service bureau in Work with Authorization Services (WASV).

When Communication Failures Occur

Communication failures can occur if the SVC_REVRSL job is inactive, the connection between Order Administration and the service bureau is down, or the system times out before a response is received. If communication failures occur and you do not receive a response from the service bureau, the system:

- updates the associated record in the Integration Process Control table to FLD error (if the *Communication type* field for the service bureau is Integration Layer).
- does not update the associated record in the SVC Authorization Reversal table.
- does not create an order transaction history message.

You cannot resend a stored value card authorization reversal request to the service bureau.

Authorization Reversal Process During Deposits

Purpose: If the [Perform Authorization Reversal during Deposit Processing \(J20\)](#) system control value is selected, when you process deposits and the deposit amount is less than the original authorization amount, the system reimburses the stored value card the difference.

#	Step
1.	You process a deposit for an amount that is less than the original authorization amount.
2.	<p>The system looks at the <i>Communication type</i> field for the service bureau to determine how transactions are processed between Order Administration and the service bureau.</p> <ul style="list-style-type: none"> • Integration Layer = The system sends authorization reversal transactions during deposits to the service bureau using the queues defined for an integration layer job. • Payment Link = Point-to-point integration. The system sends authorization reversal transactions during deposits to the service bureau using a point-to-point integration. You must define communication settings in Working with Customer Properties (PROP). The system does not use the integration layer job to communicate with the service bureau; however, the system uses the job to process authorization reversal triggers.

Note:

This option is available for the [Customer Engagement Stored Value Card Integration](#) and this integration does not allow authorization reversals during deposits. See [Process Authorization Reversals During Deposits using Payment Link Communication](#).

Process Authorization Reversals During Deposits using Payment Link Communication

If the *Communication type* field for the service bureau is Payment Link:

- Order Administration uses the settings in Working with Customer Properties (PROP) to send the deposit request directly to the service bureau in the format of the other system.
- The service bureau receives the deposit request, processes the deposit, and sends a response back to Order Administration.

#	Step
3.	<p>When a deposit response is received, Order Administration:</p> <ul style="list-style-type: none"> compares the <i>merchantReference</i> value in the deposit response against the <i>Alpha order #</i> field in the CC Deposit Transaction table to match a received deposit with a sent deposit record. When a match is found, the system updates the Credit Card Deposit Transaction table with the values in the deposit response message. updates the status of the Integration Layer Process Control record to CMP complete (if the <i>Communication type</i> field for the service bureau is Integration Layer). updates the Credit Card Deposit History table. completes auto deposit processing.

Examples:

Original authorization amount is equal to deposit amount

Stored Value Card Activity	SCV J20 selected	SCV J20 unselected
Before placing an order, you inquire on the remaining balance for a stored value card.		
Stored value card balance:	53.49	53.49
You pay for the order using the stored value card as payment. The order total is 11.50.		
You authorize the stored value card and generate a pick slip for the order.		
Authorization amount:	11.50	11.50
After the stored value card is authorized, you inquire on the remaining balance for the stored value card.		
Stored value card balance:	41.99	41.99
You ship the order and bill the order. The invoice amount is 11.50.		
You process deposits. The deposit amount (11.50) equals the original authorization amount (11.50).		
Deposit amount:	11.50	11.50
Once the deposit is processed, you inquire on the remaining balance on the stored value card.		
Stored value card balance:	41.99	41.99

Original authorization amount is greater than deposit amount

Note:

The following example does not apply to PayPal reversals.

Stored Value Card Activity	SCV J20 selected	SCV J20 unselected
Before placing an order, you inquire on the remaining balance for a stored value card.		
Stored value card balance:	88.49	88.49
You pay for the order using the stored value card as payment. The order total is 11.50.		
You authorize the stored value card and generate a pick slip for the order.		
Authorization amount:	11.50	11.50
After the stored value card is authorized, you inquire on the remaining balance for the stored value card.		
Stored value card balance:	76.99	76.99
You void one of the items from the pick slip.		
You partial ship the remaining items on the pick slip and bill the order for the shipment amount. The invoice amount is 6.25.		
You process deposits. The original authorization amount is greater than the deposit amount.		
Deposit amount:	6.25	6.25
Reversal amount:	5.25	blank
Once the deposit is processed, you inquire on the remaining balance on the stored value card.		
Stored value card balance:	82.24	76.99

Original authorization amount is less than deposit amount

Note:

The following example does not apply to PayPal reversals.

Stored Value Card Activity	SCV J20 selected	SCV J20 unselected
Before placing an order, you inquire on the remaining balance for a stored value card.		
Stored value card balance:	82.24	82.24

Stored Value Card Activity	SCV J20 selected	SCV J20 unselected
You pay for the order using the stored value card as payment. The order total is 11.50.		
You authorize the stored value card and generate a pick slip for the order.		
Authorization amount:	11.50	11.50
After the stored value card is authorized, you inquire on the remaining balance for the stored value card.		
Stored value card balance:	70.74	70.74
You add an item to the order for 5.25. You authorize the stored value card and generate a pick slip for the added item.		
Authorization amount:	5.25	5.25
After the stored value card is authorized, you inquire on the remaining balance for the stored value card.		
Stored value card balance:	65.49	65.49
You ship the entire order and bill the order for the shipment amount. The invoice amount is 16.75. You process deposits.		
Deposit amount:	16.75	16.75
Once the deposit is processed, you inquire on the remaining balance on the stored value card.		
Stored value card balance:	65.49	65.49

Generating Stored Value Card Refunds

Stored value card refunds allow you to generate a credit card credit against the original stored value card on the order or generate a new stored value card for the amount of the refund to send to the customer when you process a refund.

In this topic:

- [Stored Value Card Refunds: Credit Card Credit](#)
- [Stored Value Card Refunds: New Stored Value Card](#)
- [Changing the Type of Stored Value Card Refund Generated](#)
- [When is a New Stored Value Card Generated for a Refund?](#)
- [Consolidating New Stored Value Cards Generated for Refunds by Order](#)
- [Processing New Stored Value Cards Generated for Refunds](#)

For more information: See:

- overview and setup: [Stored Value Card Overview and Setup](#)
- activating the new stored value card for the refund amount: [Stored Value Card Purchase and Activation](#)

Stored Value Card Refunds: Credit Card Credit

If you process a return against a stored value card pay type that does not have an alternate pay type or alternate refund category defined, the system generates a credit card credit refund against the original stored value card pay type, allowing you to reimburse the refund amount to the original stored value card instead of sending a new stored value card to the customer.

Stored Value Card Refunds: New Stored Value Card

If you process a return against a stored value card pay type that has an alternate pay type or alternate refund category of stored value card defined, the system generates a new stored value card to send to the customer when you process a refund. The card is issued for the refund amount. When you process stored value card refunds, the system adds a stored value card item to the order at no charge and performs pick slip preparation. You can then follow the normal process of generating a pick slip for the stored value card item so that the card can be picked, activated, billed, and shipped to the customer.

You may wish to generate a new stored value card for the refund amount if:

- The sold to customer paid for the order using a stored value card, but has since thrown the card away. Instead of reimbursing the original stored value card on the order the refund amount, the customer has requested a new stored value card.
- The sold to customer paid for the order using multiple pay types. Instead of refunding each separate pay type on the order, the customer has requested the refund amount in the form of a stored value card.

Changing the Type of Stored Value Card Refund Generated

You can use [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#) to change the type of refund that is generated for a stored value card pay type.

Credit card credit refund: If the original pay category and current pay category associated with the refund is a stored value card pay type (*pay category* Credit Card and *Card type* Stored Value), the system allows you to change the refund by entering a different refund type in the *Type* field on the [Change Refund Screen](#). You can only change the refund type to a credit card credit refund (C) or stored value card refund (V). If you change the refund type to a credit card credit refund, the system adds the refund amount to the original stored value card on the order.

Stored value card refund: The system allows you to change any refund to a stored value card refund by entering a stored value card pay type in the *Pay type* field on the Change Refund Screen.

In addition, if the original pay category and current pay category associated with the refund is a stored value card pay type (*pay category* Credit Card and *Card type* Stored Value), the system allows you to change the refund by entering a different refund type in the *Type* field on the Change Refund Screen. You can only change the refund type to a credit card credit refund (C) or stored value card refund (V). If you change the refund type to a stored value card refund, the system generates a new stored value card for the refund amount.

When is a New Stored Value Card Generated for a Refund?

If the pay type associated with the refund is set up to generate a stored value card refund, the system generates a refund for refund type V (stored value card).

The system generates a stored value card refund when:

- The alternate refund type defined for a pay type is a stored value card.
- You process a return outside the [Return Grace Period \(B52\)](#) and the [Alternate Pay Type \(B51\)](#) is a stored value card pay type.
- You change a refund to a stored value card refund (refund type V) in [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#).

Alternate currency and stored value card refunds: The system can process stored value cards in the US currency only. If the order is for a currency other than US, you should change the refund to a refund type other than stored value card.

Consolidating New Stored Value Cards Generated for Refunds by Order

The system consolidates open stored value card refunds that are for the same pay type on the same order.

Example: The following activity occurs for an order. The pay type on the order has an alternate refund type of stored value card.

Activity	Results
You return order line 1 for 50.00	The system creates a stored value card refund for 50.00.
You return order line 2 for 25.00	The system updates the existing refund to 75.00.
You process stored value card refunds	The system generates a stored value card for a refund amount of 75.00.
You return order line 3 for 30.00	Since the first stored value card refund for the order has been processed, the system creates a new stored value card refund for 30.00.

Multiple pay types on the same order: If the system generates a stored value card refund for different pay types on the same order, the system will not consolidate the stored value card refunds.

Example: The following activity occurs for an order. The order contains 2 pay types: cash/check for 50.00 and credit card for 55.00. Both pay types have an alternate refund type of stored value card.

Activity	Results
You return order line 1 for 50.00	The system creates a stored value card refund for 50.00. The current pay category assigned to the refund is credit card; the original pay category assigned to the refund is cash/check.
You return order line 2 for 25.00	The system creates a stored value card refund for 25.00. The current pay category assigned to the refund is credit card; the original pay category assigned to the refund is credit card.
You process stored value card refunds	The system generates 2 stored value cards: 1 for a refund amount of 50.00 and the other for a refund amount of 25.00.

 **Note:**

In Working with Refunds, Writeoffs and Balances Due (WREF), if you change existing refunds for an order to stored value card refunds (by entering a stored value card pay type in the *Pay type* field at the Change Refund Screen), the system will not consolidate the stored value card refunds. For example, if 2 refunds exist for an order and you change both refunds to stored value card, the system will not consolidate the 2 refunds.

Processing New Stored Value Cards Generated for Refunds

To generate stored value card refunds, select a *Bank*, select the *Generate SVC credits* field and optionally, specify the *Amount to generate* at the [Process Refunds Screen](#).

 **Note:**

If multiple stored value card refunds exist for an order and the first stored value card refund processed places the order on hold (due to credit checking), the system will not process the subsequent stored value card refunds since the order is now on hold.

When you process stored value card refunds, the system:

- Produces the [Stored Value Card Credit Register](#); this report displays each order and sold to customer associated with a stored value card refund and the amount of the refund.
- Writes an order transaction history message: F Stored Value Card refund created.
- Adds the [Default SVC Refund Item Number \(I73\)](#) to the order and performs pick slip preparation. This item represents the new stored value card that is sent to the customer for the amount of the processed refund. The system adds this item to the order at no charge and defaults the [Price Override Reason for SVC Refund Item \(I74\)](#) to the order line.

 **Note:**

The system will not generate a stored value card refund unless the stored value card refund item has available inventory. If the item does not have available inventory, the stored value card refund remains unprocessed.

- Automatically generates a pick slip for the new stored value card item added to the order if the [Default Pick Generation Template for SVC Refund Processing \(I75\)](#) system control value contains a pick slip generation template. If a pick slip generation template is not defined, you will need to advance to Streamlined Pick Slip Generation (WSPS) and select to generate a pick slip for the stored value card refund item.

Once a pick slip is generated for the stored value card item, the system goes through the regular process of assigning a number, activating, billing, and shipping the new stored value card to the sold to customer. See [Activating a Stored Value Card](#).

Once the customer receives the stored value card containing the refund amount, the card can be used on future purchases.

Importing Item/SKU and Set Data

Topics in this part: The following topics describe how to import item/SKU and set data into Order Administration from an external system.

- [Importing Item-Related Supporting Data \(SDUP\)](#) provides details on importing items/SKU information, item-related supporting table information, and set components into Order Administration.
- [Importing Set Components \(WCUP\)](#) provides details on building sets, including finished goods and variable sets.
 - [Work with Component Upload Screen \(WCUP\)](#)

Integration Layer Processes and Web Services

Purpose: This topic provides a master listing of integration layer processes and their characteristics, including whether they process inbound or outbound messages, require queues, or must be stopped and started. This topic also includes a listing of web services that do not use integration layer processes, and provides troubleshooting information for XML messages.

In this topic:

- [Integration Layer Processes](#)
- [Web Services without Integration Layer Processes](#)
- [Troubleshooting XML Messages and Integration Layer Processes](#)

For more information: See:

- *Generic Web Services* describes how to use the *CWMessageIn Web Service* to process XML messages for integration layer jobs that ordinarily use advanced queuing. This topic also describes how to use the *CWMessageIn Web Service*, which does not require an integration layer job to process the message.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- [Working with Integration Layer Processes \(IJCT\)](#) describes the screens you use to work with and configure integration layer jobs.
- [Advanced Queuing](#) for more information on using advanced queuing to send messages between Order Administration and an external system.
- [Working with Web Service Authentication \(WWSA\)](#) describes how to define which Order Administration web service endpoints require web service authentication.

Integration Layer Processes

This table describes:

- the integration layer processes
- their functions
- the jobs they initiate
- the messages they handle

- whether they require a queue
- whether they need to be active
- their communication type setting

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Order Orchestration integration	Order Administration sends and receives order information and updates. See the Order Orchestration Integration for an overview.	BROKER (ILR0022)	Sends and receives information using Order Orchestration's message formats; see Sample Order Orchestration Messages for examples.	no	yes	web service
Customer history, order inquiry (inbound/outbound)	Order Administration receives a CustHistRequest for customer order history or information on a specific order, and generates a response (CWCUSTHISTOUT or CWORDEROUT). See <i>Generic Customer History API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	CUST_HIST (ILO0012)	CustHistRequest (to Order Administration) CWCUSTHISTOUT (from Order Administration) CWORDEROUT (from Order Administration)	no (if passing target of CUSTHISTIN)	no (if passing target of CUSTHISTIN)	message queue or CWMessa geIn web service

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Customer download (outbound)	Order Administration generates an outbound CWCustomerDownload XML message when you create, change, or delete a customer. See <i>Generic Customer Download API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	CUST_OUT (ILR0022)	CWCustomerDownload (from Order Administration)	yes	yes	message queue
Customer inquiry/search (inbound/outbound)	Order Administration receives a CWCustomerInq Request for information on one or more customers matching specific search criteria, and generates a CWCustomerInq Response. See <i>Generic Customer Inquiry (Search) API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	CUST_SRCH (ILO0022)	CWCustomerInq Request (to Order Administration) CWCustomerInq Response (from Order Administration)	no (if passing target of CWCUSTOMSRCH)	no (if passing target of CWCUSTOMSRCH)	message queue or CWMessagesIn web service

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Customer API (inbound)	Order Administration receives a new customer or a change to an existing customer. See <i>Generic Customer API</i> for an overview. Note: If using the CWCustomer web service, the CUSTOMR_IN_IJCT job is not used. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	CUSTOMR_IN (ILO0019)	CWCustomerIn (to Order Administration)	no	no	CWCustomer web service or CWMMessageIn web service
Email (outbound)	Order Administration generates the a generic outbound XML message rather than an actual email, so that you can use the information to produce a reformatted HTML email that includes promotional material. See <i>Outbound Email API</i> . For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	EMAIL_OUT	CWEmailOut (from Order Administration)	yes	yes	message queue

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Inventory download (outbound)	Order Administration sends inventory availability information to another system in the CWInventoryDownload message. See <i>Generic Inventory Download API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	INV_DOWNLOAD (ILR0022)	CWInventoryDownload (from Order Administration)	yes	yes	message queue
Inventory inquiry (inbound/outbound)	Order Administration receives a CWInventoryInquiryRequest for inventory availability on a specific item/SKU and generates a CWInventoryInquiryResponse. See <i>Generic Inventory Inquiry API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	INV_INQUIRY (ILO0013)	CWInventoryInquiry (to Order Administration) CWInventoryInquiryResponse (from Order Administration)	yes	yes	message queue or CWMessageIn web service

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Invoice Outbound (outbound)	Order Administration s ends invoice information in the CWInvoiceOut message to another system, such as a retail store, financial system, or warehouse management system. See <i>Generic Invoice Download API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	INVOIC_OUT (ILR0022)	CWInvoiceOut (from Order Administration)	yes	yes	message queue

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Inventory transaction processor (inbound)	Order Administration receives inventory transactions in the inCreateInvXaction message and updates inventory information, such as in the Item Location and Item Warehouse tables. Any errors create Item Transaction Error records. See <i>Generic Inventory Transaction Upload</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	INVTRAN_IN (ILO0008)	inCreateInvXaction (to Order Administration)	yes	yes	message queue or CWMMessageIn web service

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Item Outbound (outbound)	Order Administration sends item and SKU information in the CWItemOut message to another system, such as a retail store or warehouse management system. See <i>Generic Item Download API</i> . For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	ITEM_OUT (ILR0022)	CWItemOut (from Order Administration)	yes	yes	message queue
Merchandise locator (outbound/inbound)	Order Administration sends a request for inventory information to an external system, such as Order Orchestration, and receives a response listing external warehouse and store locations where the specified item is available. See Merchandise Locator API for an overview.	N/A	LocateItems request (from Order Administration) LocateItems response (to Order Administration) Note: The CWMerchLoc request and response messages are used only to support processing the LocateItems request and response messages and the merchandise locator API, and are not themselves generic API messages.	no	no	web service

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Order Cleanup	Rejects orders that have been abandoned on the web storefront if, for example, the customer closes the browser window. This process uses the Time Limit for Suspended E-Commerce Orders (G43) setting to determine the number of minutes to wait before rejecting an order. Only orders of the type specified in the E-Commerce Order Type (G42) system control value are eligible for cleanup. The system generates the E-Commerce Orders Cleanup Log each time it deletes a suspended order and writes a record in the Deleted Order Table.	ORDER_CLN	This job does not generate or receive any messages and is used only to submit the order cleanup.	no	no	message queue

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Order processor (inbound/outbound)	Order Administration receives new orders through a generic order interface and optionally generates detailed or simple acknowledgments, as requested in the inbound order message. See <i>Generic Order Interface (Order API)</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	ORDER_IN (ILO0003) If the ORDER_IN job uses a web service and does not read from or write to queues (the default setting in Order Management System 1.1 or higher), or Order Administration, there is no need to start or stop the job.	CWOrderIn (to Order Administration) CWOrderOut (from Order Administration)	no	no	CWOrderIn web service (but can specify message queue or use CWMessageIn web service)
Pick Outbound	Order Administration sends a Pick Message from Order Administration (CWPickOut) for each pick slip generated. See <i>Generic Pick Out API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	PICK_OUT (ILR0022)	CWPickOut (from Order Administration)	yes	yes	message queue

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Purchase Order Outbound	Order Administration sends a CWPurchaseOrderOut message to a warehouse management system or an EDI vendor. See <i>Generic Outbound Purchase Order API</i> . For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	PO_OUT (ILR0022)	CWPurchaseOrderOut (from Order Administration)	yes	yes	message queue

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Return Inbound	Order Administration receives a <i>Return Request Message (CWReturnIn)</i> to create and process a return against a specified order line. Optionally, the process sends a <i>Return Response Message (CWReturnOut)</i> to the external system, indicating if the return processed successfully or if an error occurred. See <i>Inbound Return API</i> for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	RETURN_IN (ILO0021)	CWReturnIn (to Order Administration) CWReturnOut (from Order Administration)	no (if passing target of CWRETURN)	no (if passing target of CWRETURN)	message queue or CWMessageIn web service
Return Authorization Outbound	Order Administration sends a <i>Return Authorization Outbound XML Message (CWReturnRAOut)</i> when a return authorization is created, changed, or deleted.	RETURN_OUT (ILR0022)	CWReturnAuthorizationOut (from Order Administration)	yes	yes	message queue

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Tax Request (inbound / outbound)	Order Administration s ends a request for tax information for an order to an external system, and then receives the response. See Use Generic Tax XML Interface (J10) and the Vertex Interface .	TAX_INT This process does not submit a job; it is used to determine the XML message format and the queue used to transmit the message. You do not need to start or end this job.	CWTaxRequest (from Order Administration) CWTaxResponse (to Order Administration)	no	no	web service
Vendor Outbound (outbound)	Order Administration s ends a CWVendorOut message to another system, such as a retail store or warehouse management system. See <i>Generic Vendor Download API</i> for more information. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	VENDOR_OUT (ILR0022)	CWVendorOut (from Order Administration)	yes	yes	message queue

Process	Function	Submitted job or program	Messages	Needs Queue?	Must be Active?	Comm type?
Workflow processing (inbound)	Order Administration receives the CWWorkflow XML message from an outside source and creates a tickler, based on the information in the message. This process does not process any message other than CWWorkflow. See Workflow Management Overview and Setup and WF (Remote Workflow) Event Processing.	WORKFLOW (ILO0002)	CWWorkflow (to Order Administration)	yes	yes	message queue or CWMessageIn web service

Web Services without Integration Layer Processes

The following web services allow you to process XML messages directly without using a process at the [Work with Integration Layer Process Screen](#).

Web Service	Inbound Message	Outbound Message	For More Information
CWOrderIn	<i>Inbound Order XML Message (CWORDERIN)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	<i>Detailed Order XML Response (CWORDEROUT), or Order Acknowledgement XML Message (CWORDEROUT)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	<i>Generic Order Interface (Order API)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Web Service	Inbound Message	Outbound Message	For More Information
CWCustomer	<i>Inbound Customer Message (CWCustomerIn)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	<i>Outbound Customer Response Message (CWCustomerOut)</i>	<i>Generic Customer API</i>
CWReceiptIn	<i>PO Receipt In XML Message (CWReceiptIn)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	none	<i>Purchase Order Receipt In API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
CWPickIn	<i>CWPickIn XML Message</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	none	<i>Generic Pick In API (Shipments, Voids, and Backorders)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
CWServiceIn	<i>Order Transaction History Message (CWOrderTransactionHistory)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	none	<i>Generic Order Transaction History API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
	<i>Order Line History In Message (CWOrderLnHstIn)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	none	<i>Order Line History In API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
	<i>Item Availability Request XML Message (CWItemAvailabilityWeb)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	<i>Availability Response XML Message (CWItemAvailabilityResponseWeb)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	<i>Item Availability API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Troubleshooting XML Messages and Integration Layer Processes

See also [Using the JOBCLN Function to Resolve Job Status Across Servers](#).

Question	Possible Solution
What are some reasons why inbound messages might not be processed?	<p>If the process uses a JMS provider (advanced queuing):</p> <ul style="list-style-type: none"> • Is the queue name correct? (Note: Queue names are case-sensitive.) • Is the Enabled flag selected for the process queue at the Integration Layer Process Queue Screen? • Did the server end unexpectedly while the process was active? If so, the Work with Integration Layer Process Screen might display a Status of Active even if the process is no longer running. See Starting or Ending a Process for information on how to reset the status.
Do you need to use a JMS provider (advanced queuing) for integration layer processes or e-commerce?	<p>You can use the <i>Generic Web Services</i> to send XML messages if you prefer not to use advanced queuing.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

Question	Possible Solution
What is the purpose of an integration layer job that doesn't need to be stopped or started?	Some possible purposes: <ul style="list-style-type: none"> To specify the version of an outbound XML message To specify the queue where an interactive process writes an outbound message
Are all integration layer processes listed at the Work with Integration Layer Process Screen?	If you have hidden a process, it is not listed. See Hiding an Integration Layer Process .
How can I track the messages processed?	See Order Administration Application Logs for information on the logs you can use to track XML messages.
How can the version number of an XML message be higher than the Order Administration release number?	XML version numbers do not increase in sync with the current Order Administration release number; instead, the XML version number increases each time new elements or attributes are added to the message, which can occur multiple times between major Order Administration releases. See XML Versions for a discussion.
Does the inbound XML version number matter?	The inbound XML version number is informational, indicating when new elements or attributes are added. Even if the inbound XML version number is lower than the one in which the new elements or attributes were added, the integration layer job can still process the inbound message if the elements or attributes were added prior to the current Order Administration release. See XML Versions for a discussion.
Is it necessary to start and stop a process manually?	See Scheduling Jobs and Additional Interface (INT) Periodic Functions for more information on how to schedule a periodic function and for a list of the periodic functions used to start and stop the integration layer jobs.
Where can I find DTDs and schemas, for XML messages?	See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service

Overview: Use the integration with Sales Audit module of the Oracle Retail Merchandising Foundation Cloud Service (Sales Audit module) to export information on sales and returns.

Types of information sent for transactions: The following information is included:

- transaction header
- customer
- items
- discounts
- tax
- payment

- tenders
- transaction tail

The file also includes transaction open and close records, and file header and trail records.

Tracking shipments and credits: If you enable the Sales Audit module sales audit integration in Order Administration, the system writes records in the INT_RESALOG table in the database, and updates the table with records as shipments and order credits bill throughout the day.

Packaging the DAT file into a ZIP file: On a daily basis, you use a periodic process to add file header and trailer records to “wrap” the transaction information, and convert the contents of the INT_RESALOG table into a DAT file that is ready for Sales Audit module to retrieve and process. This file is named RTLOG_6_20190721145902950.DAT, where 6 is the company number or the store number, and 20190721145902950 is the date and time stamp. The DAT file is then packaged into a ZIP file of the same name, for example, RTLOG_6_20190721145902950.ZIP.

In this topic:

- [Configuration for the Sales Audit Module Integration](#)
 - [Configuration within Order Administration](#)
 - [Mapping Configuration between Order Administration and the Sales Audit Module](#)
 - [Additional Things to Note](#)
- [Considerations for the Sales Audit module Integration](#)
- [Invoice to RTLog Mapping](#)

Data Flow from Order Administration to Sales Audit Module

If your company is configured for Sales Audit module integration, processing takes place as follows:

- Sale or credit invoices are created through the day and are processed by the billing async job in [Background Job Control \(MBCJ\)](#).
- Outbound Interface Transaction trigger records with a *File* setting of IHD are created based on the invoices. You can review these trigger records in [Working with Outbound Interface Transactions \(WOIT\)](#).
- The INVOIC_OUT process in [Working with Integration Layer Processes \(IJCT\)](#) works through the IHD trigger records to collect the required information for each invoice, and creates records in the INT_RESALOG database table for transactions in each company that is configured for the Sales Audit module integration.
- When the RTLOG periodic function runs, it:
 - Consolidates multiple records for the same invoice found in the INT_RESALOG table. This can occur if, for example, you ship multiple ship-alone items on a single order and you have the [Consolidated Invoice \(B49\)](#) system control value selected.

 **Note:**

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

- Uses the records in the INT_RESALOG table to create a DAT file that contains the transaction data from the temporary file for the company specified for the function, as well as the header, close store, and footer records. The DAT file name is RTLOG_1234_20190621140400561.DAT, where:
 - * 1234 is the *Parameter* specified for the periodic function. This needs to be the store number assigned by the Sales Audit module. If no store number is specified as the parameter, the company number is used.
 - * 20190621140400561 is the date and time.
- Creates a compressed ZIP file containing the DAT file, using the same naming convention as described above for the DAT file and places the ZIP file in the [CWDIRECTCP_FTP_FOLDER](#).

The Sales Audit module then needs to retrieve the ZIP file from the CWDIRECTCP_FTP_FOLDER.

Transmitting the RTLOG File to Object Storage

Use the following process to transmit the RTLOG file to object storage.

 **Note:**

Object storage is supported in Sales Audit module version 21.0 and later.

Run the RTLOG periodic function, as described above, to create the RTLOG file and place it in the CWDIRECTCP_FTP_FOLDER.

Run the [SNDRTL](#) periodic function. If there is an RTLOG file in the CWDIRECTCP_FTP_FOLDER, and if the [Sales Audit File Service URL \(M64\)](#) and [Sales Audit Import Folder Path \(M65\)](#) are populated, this function:

- Sends a POST request message for each RTLOG file to the Sales Audit module, using the authentication set up for the Sales Audit File Service through the [Work with Outbound Web Service Authentication Screen](#).
- If the Sales Audit module returns a response indicating that the pre-authentication request (PAR) was successful, the periodic function processes a PUT to the URL that was returned in the Sales Audit module response.
- After processing the PUT, the periodic function:
 - Removes the RTLOG file from the CWDIRECTCP_FTP_FOLDER.
 - Saves a copy of the RTLOG zip file in the OMS-SALES-AUDIT container of the FILE_STORAGE table. This copy is available in case there was an issue with the Sales Audit module receiving the file, so it will be available to be

resent, if necessary, through the RCVRTLG periodic function, described below.

- If no pre-authentication response is received, the [Order Administration Support Notification](#) is generated. Possible reasons for an unsuccessful process include an invalid setting for any of the [Additional System Control Values Related to Transmitting to Object Storage](#).

Resending the RTLOG file: If the pre-authentication response was received during SNDRTLG processing, but the Sales Audit module did not actually receive the RTLOG file, you can use the RCVRTLG periodic function to resend the file.

For example, Sales Audit module staff indicate the date and time when the RTLOG file was expected but not received. In this case:

- Use the `getFiles` file storage request to obtain a list of files in the OMS-SALES-AUDIT container of the FILE_STORAGE table. See [File Storage API](#) for information on the file storage API and the FILE_STORAGE table.
- Based on the date and time when the missing RTLOG file was generated, obtain the exact file name to send.
- Enter the exact RTLOG file name as the *Parameter* for the [RCVRTLG](#) periodic function, and run the function.

Note:

The records in the OMS-SALES-AUDIT container of the FILE_STORAGE table are not purged automatically. You can use the `deleteFile` file storage request to delete these records.

Configuration for the Sales Audit Module Integration

Configuration within Order Administration

The configuration required in Order Administration to support the integration with Sales Audit module includes the following.

System Control Values

Set the following system control values:

- [ReSA RTLOG Format \(M39\)](#): Must be set to RTLOG or RTLOGQ.
- Consolidated Invoice (B49): Needs to be unselected. Otherwise, if this system control value is selected, it is possible to generate multiple transaction heads with the transaction numbers, as individual lines on the order are billed. The items that bill first could then accumulate and repeat on each subsequent transaction: for example, if 3 items ship separately, invoice 1 contains item 1; invoice 2 contains items 1 and 2; invoice 3 contains invoice 1, 2, and 3.

 **Note:**

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

- [Create Generic Invoice Download Trigger Records \(I17\)](#): Must be selected in order to create the IHD trigger records for processing.
- [Use Async Start Date for Billing Transactions \(E95\)](#): Oracle recommends leaving this system control value unselected.
- [Item for Non-Merchandise Amounts \(L39\)](#): Used as the non-merchandise item (NMITEM) in the DAT file for Sales Audit module.
- [ReSA Warehouse for Non-Inventory Returns \(M56\)](#): Used as the return warehouse for a credit invoice for a return that does not affect inventory. Must map to a Physical Warehouse defined in the Sales Audit module.
- [Default Warehouse \(A04\)](#): Used as the return warehouse for a credit invoice for a return that does not affect inventory, if no ReSA Warehouse for Non-Inventory Returns (M56) is specified.

Additional System Control Values Related to Transmitting to Object Storage

Set the following additional required system control values for [Transmitting the RTLOG File to Object Storage](#):

- [Sales Audit File Service URL \(M64\)](#): Defines the endpoint for the SNDRTLG periodic function to use when submitting the RTLOG file to object storage.
- [Sales Audit Import Folder Path \(M65\)](#): Defines the folder where RTLOG files should be placed when you are using object storage.
- [IDCS Enterprise Endpoint Scope \(M66\)](#): Defines the limits that control where the OAuth token can be used to support posting to object storage.
- [IDCS Enterprise Endpoint URL \(M67\)](#): Defines the endpoint to use for OAuth authentication to support posting to object storage.

Property

The process uses the CWDIRECTCP_FTP_FOLDER, displayed in [Working with Admin Properties \(CPRP\)](#), for the RTLOG function to place the ZIP file for the Sales Audit module.

Periodic Functions and Processes

Use [Working with Periodic Functions \(WPER\)](#) to set up:

- The RTLOG periodic function. If the function needs to run in more than one company, mapping to more than one store in the Sales Audit module, you can name the function RTLOGN, where N is a unique number. When setting up the function:
 - Set the *Program name* to PFR0201

- Set the *Parameter* to the store number assigned by the Sales Audit module, but if not passed, uses company number
- The SNDRTLG periodic function for [Transmitting the RTLOG File to Object Storage](#). When setting up the function:
 - Set the *Program name* to PFR0206
 - Set the *Parameter* to the store number assigned by the Sales Audit module, but if not passed, uses company number
- The RCVRTLG periodic function for [Transmitting the RTLOG File to Object Storage](#). When setting up the function:
 - Set the *Program name* to PFR0208
 - Set the *Parameter* to the name of the RTLOG file that you are resubmitting to object storage, but if not passed, uses company number. See [Transmitting the RTLOG File to Object Storage](#) for more information

Use [Working with Periodic Processes \(WPPR\)](#) to assign each periodic function to a periodic process. The RTLOG and SNDRTLG processes should run at the end of day, because records accumulate in a temporary file until the function runs.

Authentication

In order to use the process described under [Transmitting the RTLOG File to Object Storage](#), you need to use the Work with Web Service Authentication screen (WWSA) to set up authentication for the Sales Audit File Service, using an authentication type of OAuth. See the [Work with Outbound Web Service Authentication Screen](#) for background.

Miscellaneous Setup

Do not set Trigger Rules or XML Inclusion rules for the INVOIC_OUT job in Working with Integration Layer Processes (IJCT).

Set the Outbound version for INVOIC_OUT to 3.0 in Working with Integration Layer Processes (IJCT).

Mapping Configuration between Order Administration and the Sales Audit Module

In addition to the [Configuration within Order Administration](#), described above, you need to map the following information from the Sales Audit module:

- **Store number:** Specify as the *Parameter* for the RTLOG periodic function. This store number is used as part of the DAT file name, as described above, and also populates the *Location Number* in the FHEAD record. If no *Parameter* is specified for the periodic function, the company number is used.
- **Return Reason Codes:** The return reason codes used must map to SARR codes defined in the Sales Audit module.
- **Return Warehouse Codes:** Any warehouse codes that might be passed as return warehouses must map to Physical Warehouses defined in the Sales Audit module.
- **Pay Types:** Each pay type sent must map to a Pay Type in the Sales Audit module.
- **Items:** The *Reference #* for the item must map to an item in the Sales Audit module. Items are ordinarily imported from Oracle Retail Merchandising Foundation Cloud Service (RMFCS) into the Sales Audit module and Order Administration, and the *Reference #* is set to the same value as the item code. The *Reference #* should not be changed. See [Oracle Retail Merchandising Foundation Cloud Service \(RMFCS\) and Oracle Retail Pricing Cloud Service \(RPCS\) Integration](#) for background.

Considerations for the Sales Audit module Integration

Cross-channel orders are not excluded from the RTLOG file for the Sales Audit module, and as a result can be submitted by multiple systems that integrate with the Sales Audit module.

Example: Xstore submits an order to Order Orchestration, and the order is fulfilled through assignment to Order Administration; in this case, both Xstore and Order Administration submit the order to the Sales Audit module. Similarly, if the [Use OROB for Fulfillment Assignment \(M31\)](#) system control value is selected, Order Administration sends invoices for both the originating order and fulfilling order, or there could be multiple transactions sent for same order if a line splits in Order Orchestration.

The [Cross Channel Orders to Exclude in Sales Feed \(L35\)](#) does not affect the selection of orders to include in the export file.

If the Consolidated Invoice (B49) system control value is selected, the RTLOG periodic function consolidates the records for an invoice into a single record in the RTLOG file.

Important:

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

Additional Things to Note

It is not necessary to create queues for the INVOIC_OUT job in Working with Integration Layer Processes (IJCT) if the trigger records are required only for the Sales Audit module integration. In this case, you should set the ReSA RTLOG Format (M39) to RTLOG, and no invoice out message is generated or logged. If you set the ReSA RTLOG Format (M39) to RTLOGQ rather than RTLOG, errors will be logged if no queues have been created.

The invoice amount passed in the RTLOG file may not be the same as the paid amount in the case of an underpayment, overpayment, or canceled return.

Invoice to RTLog Mapping

The file type record descriptors for each record type included in the RTLog file, and a brief summary of their contents:

- **FHEAD**: The header for the file, indicating basic information such as the originating system, the store number, and the file creation date and time. Added through the RTLOG periodic function. One header per file.
- **THEAD (SALE or RETURN transaction)**: This *File Type Descriptor* contains the header for each transaction, indicating the date and time generated, the invoice (transaction) number, and whether the transaction was a shipment (SALE) or refund (RETURN).
- The first THEAD record in the file is the **THEAD (OPEN transaction)** following the initial FHEAD, and the last THEAD record is the **THEAD (CLOSE transaction)** at

the end of the transactions. Unlike the OPEN transaction, the CLOSE transaction is created through the RTLOG periodic function.

- **TCUST**: Information about the customer, including customer number and name and address.
- **TITEM**: Information about each item sold or returned, including item number, quantity, and pricing, as well as the order number and invoice number.
- **IDISC**: Discount line information for sales transactions.
- **IGTAX**: Item-level tax amounts.
- **TTAX**: Tax amounts.
- **TPYMT**: Payment amounts for sales, exclusive of tax.
- **TTEND**: Tender information for each transaction.
- **TTAIL**: Indicates the total number of lines in the transaction.
- **FTAIL**: The total number of lines in the file. The last entry in the file. Added through the RTLOG periodic function.

The following table describes the fields that are mapped into the RTLog file, or that are hard-coded.

Note:

Fields that are left blank are not included in the following table.

Field	Data Type and Length	Value Passed	Description/ Comments
FHEAD			This <i>File Type Descriptor</i> identifies a single record at the beginning of the file. Created by the RTLog periodic function, and not found in the temporary file.
File Line Identifier	Number (10)	0000000001	Identifies the line number in the file. Zero-padded. Set to 0000000001 for the FHEAD.
File Type Definition	Character (4)	RTL G	Hard-coded.
File Create Date	Character (14)	System date and time	The date and time when the file was created. Example: 20190621140400, where 2019 is the year, 06 is the month, 21 is the date, and 140400 is the time.
Business Date	Character (8)	System date	The date when the file was created. Example: 20190621, where 2019 is the year, 06 is the month, and 21 is the date.
Location Number	Character (10)	Location ID	The location ID assigned in the Sales Audit module. From the Parameter defined for the RTLOG periodic function. If no Parameter was defined, this is the company number.
RTLOG Originating System	Character (3)	OMS	Hard-coded.

Field	Data Type and Length	Value Passed	Description/ Comments
THEAD (OPEN transaction)			The first record in the file with a <i>File Type Descriptor</i> of THEAD is an OPEN transaction, and follows the initial FHEAD record in the DAT file created by the RTLOG periodic function.
File Line Identifier	Number (10)	Next sequential number in the file.	Identifies the line number in the file. Ordinarily set to 0000000002, since this line follows the FHEAD record. Zero-padded.
Register	Character (5)	01	Hard-coded.
Transaction Date	Character (14)	System date and time	The date and time when the record was created. Example: 20190621140400, where 2019 is the year, 06 is the month, 21 is the date, and 140400 is the time.
Transaction Number	Number (10)	Next transaction number in the file.	Zero-padded. Ordinarily set to 0000000002 for the OPEN transaction type.
Transaction Type	Character (6)	OPEN	Hard-coded.
Sub-transaction Type	Character (6)	OSTORE	Hard-coded.
THEAD (SALE or RETURN transaction)			Records with this <i>File Type Descriptor</i> contains the header for each transaction, indicating the date and time generated, the invoice (transaction) number, and whether the transaction was a shipment (SALE) or refund (RETURN). The first THEAD record in the file is an OPEN transaction following the initial FHEAD, and the last THEAD record is a CLOSE transaction at the end of the transactions.
File Line Identifier	Number (10)	Next sequential number	Identifies the line number in the file. Zero-padded.
Register	Character (5)	01	Hard-coded.
Transaction Date	Character (14)	System date and time	The date and time when the INVOIC_OUT job processed the transaction record. Example: 20190621140400, where 2019 is the year, 06 is the month, 21 is the date, and 140400 is the time.
Transaction Number	Number (10)	Invoice number	The unique number identifying the invoice in Order Administration.
Cashier	Character (10)	Salesman number	The unique number identifying the salesman, if any, associated with the order.
Salesperson	Character (10)	Salesman number	The unique number identifying the salesman, if any, associated with the order.

Field	Data Type and Length	Value Passed	Description/ Comments
Transaction Type	Character (6)	SALE or RETURN	Set to SALE if the merchandise was shipped; otherwise, set to RETURN if the merchandise was returned, or if a negative additional charge was applied and express-billed. NOTE: Typically, if the merchandise was shipped, the invoice type is I, but it is possible that negative additional charges, applied through the non-inventory item, could exceed the value of the shipped items. Similarly, if the merchandise is returned, the invoice type is C, but it is possible that positive additional charges could exceed the value of the returned items.
Value Sign	Character (1)	P	Set to P for both sales and credit invoices.
Rounded Amount Sign	Character (1)	P	Set to P for both sales and credit invoices.
Rounded Off Sign	Character (1)	P	Set to P for both sales and credit invoices.
Transaction Processing System	Character (3)	POS or OMS	Passes POS: <ul style="list-style-type: none"> For a debit invoice, the delivery type for the Order Ship To is P (store pickup) or R (retail pickup), or For a debit invoice, the delivery type is S (ship-for-pickup) and the Payment at POS for Ship for Pickup Orders (L60) SCV is set to Y, or For a credit invoice, the return disposition value matches the Return Disposition Code to Exclude in ORCE Sales Feed (M22), and <i>Suppress Refund = Y</i>. Otherwise, passes OMS.
TCUST			Records with this <i>File Type Descriptor</i> contains information about the sold-to customer, including customer number and name and address. TCUST records follow THEAD records with <i>File Type Descriptors</i> of SALE or RETURN. The information in this record type is primarily from the Sold To Customer record.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.
Customer ID	Character (16)	Sold-to customer number.	The sold-to customer on the order.
Customer Type ID	Character (6)	CUSTID	Hard-coded.
Customer Name	Character (120)	Customer first name, last name, and company.	Values are concatenated, with spaces between each.

Field	Data Type and Length	Value Passed	Description/ Comments
Address 1	Character (240)	First address line	All address and phone number information is for the sold-to customer.
Address 2	Character (240)	Second address line	Blank if no second address line exists. Apartment number is not passed.
City	Character (120)	City	
State	Character (12)	State or province code	If blank, spaces are passed.
Zip Code	Character (30)	Zip or postal code	If blank, spaces are passed.
Country	Character (3)	Country code	Two positions.
Home Phone	Character (20)	Day phone	
Work Phone	Character (20)	Evening phone	
E-mail	Character (100)	Email address	The sold-to customer's primary email address.
TITEM			Records with this <i>File Type Descriptor</i> contains information about each item sold or returned, including item number, quantity, and pricing, as well as the order number and invoice number. The information for this record type is primarily from the Invoice Detail table.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.
Item Status	Character (6)	ORD or C	Set to ORD if the invoice is for a shipment; otherwise, set to R if the invoice is for a return, or for a negative additional charge that was express-billed.
Item Type	Character (6)	ITEM or NMITEM	Set to NMITEM for the Item for Non-Merchandise Amounts (L39); otherwise, set to ITEM.
Item Number Type	Character (6)	ITEM	Hard-coded.
Item	Character (25)	Item code	The item's <i>Reference #</i> (retail reference number) from the SKU table. The <i>Reference #</i> is automatically populated with the item number through Importing Enterprise Foundation Data through Omnichannel Cloud Data Service (OCDS) . If for any reason the <i>Reference #</i> is blank, the base item code is passed instead. The item code passed does not include a SKU. SKUs are not supported in the Sales Audit module. NOTE: Each item must map to an item in the Sales Audit module.

Field	Data Type and Length	Value Passed	Description/ Comments
Non-Merchandise Item	Character (25)	Non-merchandise item code	From the Item for Non-Merchandise Amounts (L39) system control value. This must be a valid item code in the Sales Audit module.
Quantity Sign	Character (1)	P or N	Typically set to P for a sale invoice; otherwise, set to N for a credit invoice. However, if this is the NMITEM, the Quantity Sign indicates the effect of the charge, for example: <ul style="list-style-type: none"> If a negative additional charge applies to a sale invoice, the Quantity Sign is set to N. If a positive additional charge applies to a credit invoice, the Quantity Sign is set to P.
Quantity	Number (12)	Shipped or returned unit quantity	Zero-padded with a 4-position implied decimal; for example, a quantity of 2 is passed as 000000020000. Absolute value. Quantity of 1 is passed for the <i>Item for Non-Merchandise Amounts</i> .
Selling Unit of Measure	Character (4)	EA	Hard-coded.
Unit Retail	Number (20)	Pre-discount price	Zero-padded with a 4-position implied decimal; for example, a price of 1.50 is passed as 00000000000000015000. Absolute value. If the selling price is less than the offer price on a sales transaction, an IDISC record provides details on the discount. NOTE Ordinarily the same as the Original Unit Retail, except for the following scenarios. <ul style="list-style-type: none"> When the selling price exceeds the offer price, this is the selling price. When this is a return, this is the actual price credited. When the record is for the <i>Item for Non-Merchandise Amounts</i>, then this field is the net total of the additional charge amount, freight amount, and the handling charge amount.
Override Reason	Character (6)	OMS	Hard-coded.
Original Unit Retail	Number (20)	Offer price from the Order Detail record	The original offer price. Set to 0.00 if no offer price is defined. See Overriding the Item/SKU Offer Price for a discussion of how the offer price for an Order Detail record is determined when offers are not set up, and a price override reason code is used to set the price for the order line. If the selling price is lower than the original offer price, the <i>Unit Discount Amount</i> specified in the IDISC record indicates the unit amount of the discount.

Field	Data Type and Length	Value Passed	Description/ Comments
Taxable Indicator	Character (1)	Y or N	Set to Y, unless: <ul style="list-style-type: none"> The item is tax exempt; see Working with Item Tax Exemptions (WITX), or This is the <i>Item for Non-Merchandise Amounts</i>.
Item_swiped_ind	Character (1)	N	Hard-coded.
Return Reason Code	Character (6)	Return reason code	The return reason code used for a return of an order line. See Establishing Return Reason Codes (WRTR) for background. NOTE The return reason codes used MUST map to SARR codes defined in the Sales Audit module
Salesperson	Character (10)	Salesman number	The unique number identifying the salesman, if any, associated with the order.
Drop Ship Ind	Character (1)	Y or N	Set to Y for a drop ship item on a sale transaction; otherwise, set to N. Set to N for a return.
Uom_qty	Number (12)	Shipped quantity	The shipped quantity on the invoice detail. Zero-padded with a 4-position implied decimal; for example, a quantity of 2 is passed as 00000020000. Absolute value. Quantity of 1 passed for the <i>Item for Non-Merchandise Amounts</i> .
Catchweight_ind	Character (1)	N	Hard-coded.
Total_igtax_amount	Number (21)	Invoice detail tax amount	The total tax for the invoice detail line.
Selling item	Character (25)	Item code	The base item code. Does not include a SKU. SKUs are not supported in the Sales Audit module.
Customer Order Number	Character (48)	Order number	The Order Administration order number. Does not include the ship-to suffix.
Customer Order Date	Character (14)	Order date	The order date from the Order Header. YYYYMMDD format.
Fulfillment Order Number	Character (48)	Invoice number	Included only for sales transactions. Not included for returns.
No Inventory Return	Character (1)	Y or N	Used only for credit invoice records. Set to Y when inventory was not updated for the transaction creating the invoice detail record (there is no Item Transaction History record, as indicated in Display Inventory Transaction History (DITH)). For example, this flag is selected when a negative additional charge express bills against a closed order. Otherwise, set to N if inventory was updated, or if this is a non-merchandise item (NMITEM).

Field	Data Type and Length	Value Passed	Description/ Comments
Sales Type	Character (1)	E	Hard-coded.
Return Warehouse	Character (10)	Warehouse code	<p>Used only for return records that are not for the non-merchandise item (NMITEM):</p> <ul style="list-style-type: none"> • If inventory updated: If <i>No Inventory Return</i> is set to N and this is a return that affected inventory (that is, not for the NMITEM), the Return Warehouse is the warehouse code from the inventory transaction history record. • If inventory not updated: If <i>No Inventory Return</i> is set to Y and this is not for the NMITEM, this is the warehouse defined in the: <ul style="list-style-type: none"> – ReSA Warehouse for Non-Inventory Returns (M56) system control value. If this system control value is blank, – Default Warehouse (A04) system control value. Otherwise, – Hard-coded to 1.
<div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;">  Note: Any warehouse codes that might be passed MUST map to Physical Warehouse defined in the Sales Audit module. </div>			
Return Disposition	Character (10)	COR	Sent only when <i>No Inventory Return</i> is set to N, or the record is for the NMITEM.
Location Type	Character (2)	Location type identifier	<ul style="list-style-type: none"> • ST for a store pickup, retail pickup, or ship-for-pickup order. • WH for a delivery order. • Blank for any other order type. <p>Not passed for returns.</p>
Location Number	Character (10)	Code identifying fulfilling or pickup location	<ul style="list-style-type: none"> • The pickup location code from the Order Orchestration record for a store pickup, retail pickup, or ship-for-pickup order. • The fulfilling location code from the Order Orchestration record, for a brokered backorder, if specified. • Otherwise, the OCDS RMS Location Identifier (M52). <p>Not passed for returns.</p>

Field	Data Type and Length	Value Passed	Description/ Comments
IDISC			Records with this <i>File Type Descriptor</i> contain discount line information for sales transactions when the selling price is lower than the offer price. These records are not created for returns. Also, if the offer price is lower than the selling price, such as when the offer price is zero, no discount record is created. This record follows the TITEM record for the discounted item. The information for this record type is primarily from the Invoice Detail table.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.
RMFCS Promotion Number	Character (6)	2000	Hard-coded.
Discount Type	Character (6)	ITEM	Hard-coded.
Quantity Sign	Character (1)	P	Hard-coded. A quantity sign of N is not used, since only sales transactions create these records.
Quantity	Number (12)	Shipped quantity	The shipped quantity on the invoice detail. Zero-padded with a 4-position implied decimal; for example, a quantity of 2 is passed as 000000020000.
Unit Discount Amount	Number (20)	Discount amount divided by shipped quantity	The discount amount shipped quantity on the invoice detail. Zero-padded with a 4-position implied decimal; for example, a unit discount amount of 2.5 is passed as 000000025000.
Uom_qty	Number (12)	Shipped quantity	The shipped quantity on the invoice detail. Zero-padded with a 4-position implied decimal; for example, a quantity of 2 is passed as 000000020000.
Catchweight_ind	Character (1)	N	Hard-coded.
IGTAX			Records with this <i>File Type Descriptor</i> contain item-level tax amounts. This record type follows the IDISC , if any; otherwise, follows the TITEM . NOTE VAT amounts are not passed in this record type, since they are included in item prices.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.
Tax Authority	Character (10)	TOTALTAX	Hard-coded.
Igtax Code	Character (6)	TOTAX	Hard-coded.
Igtax Amount Sign	Character (1)	P or N	Set to P for a sale invoice; otherwise, set to N for a credit invoice.

Field	Data Type and Length	Value Passed	Description/ Comments
Igtax Amount	Number (21)	Tax amount	The total tax amount for the invoice detail line, including any GST or PST as well as tax on any special handling or gift wrap for the item. For the NMITEM, includes the total order-level freight tax from the Invoice Payment Method record for all payment methods. Zero-padded with a 5-position implied decimal; for example, a tax amount of 2.38 is passed as 00000000000000238000. Absolute value.
TTAX			Records with this <i>File Type Descriptor</i> contain tax amounts. NOTE VAT amounts are not passed in this record type, since they are included in item prices.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.
Tax Code	Character (6)	TOTAX	Hard-coded.
Tax Sign	Character (1)	P or N	Set to P for a sale invoice; otherwise, set to N for a credit invoice.
Tax Amount	Number (20)	Tax amount	The total tax amount for the invoice, including any GST or PST. Zero-padded with a 4-position implied decimal; for example, a tax amount of 2.38 is passed as 0000000000000023800. Absolute value.
TPYMT			Records with this <i>File Type Descriptor</i> contain payment amounts for sales, exclusive of tax, although VAT is not subtracted if the order is subject to VAT. These records are not created for return or credit transactions.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.
Payment Sign	Character (1)	P	Hard-coded. A payment sign of N is not used, since only sales transactions create these records.
Payment Amount	Number (20)	Deposit amount minus tax	The deposit amount for the invoice payment method, exclusive of tax. Zero-padded with a 4-position implied decimal; for example, a payment amount of 37.60 is passed as 0000000000000376000.
TTEND			Records with this <i>File Type Descriptor</i> contain tender information for each transaction.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.

Field	Data Type and Length	Value Passed	Description/ Comments
Tender Type Group	Character (6)	CHECK, CCARD, or VOUCH	Set to: <ul style="list-style-type: none"> CHECK if the payment method is a check pay category. CCARD if the payment method is a credit card. VOUCH if the payment method is a stored value card when the <i>Send Payment Card Data in ReSA RTLOG (M74)</i> system control value is selected.
Tender Type ID	Number (6)	Pay type code	The pay type code, as set up in Work with Pay Types (WPAY). NOTE Each pay type must map to a Pay Type in the Sales Audit module.
Tender Sign	Character (1)	P or N	Set to P for a sale invoice; otherwise, set to N for a credit invoice.
Tender Amount	Number (20)	Deposit amount	The deposit amount for the invoice payment method, including tax. Zero-padded with a 4-position implied decimal; for example, a payment amount of 39.98 is passed as 00000000000000399800.
CC_no	Character (40)	Last 4 positions of the credit card number	The last 4 positions of the credit card or stored value card. From the Order Payment Method table. Included only if the Send Payment Card Data in ReSA RTLOG (M74) system control value is selected, and only if numeric; otherwise, blank.
cc_token	Character (40)	Character (40)	The tokenized credit card number, if any, from the Invoice Payment Method table. A stored value card or gift card number is not passed in this field. Included only if the order payment method is a credit card and is tokenized, and if the Send Payment Card Data in ReSA RTLOG (M74) system control value is selected; otherwise, blank.
Voucher_no	Character (25)	Gift card number or stored value card number	The stored value card number from the Invoice Payment Method table. Included only for a gift card or stored value card, and if the Send Payment Card Data in ReSA RTLOG (M74) system control value is selected; otherwise, blank.
TTAIL			A <i>Type Record Descriptor</i> for the transaction trailer record following each transaction, including an OPEN or CLOSE transaction.
File Line Identifier	Number (10)	Line number	Identifies the line number in the file. Zero-padded.
Transaction Record Counter	Number (10)	Number of records in the transaction	Set to 0000000000 for an OPEN or CLOSE transaction. Zero-padded.

Field	Data Type and Length	Value Passed	Description/ Comments
THEAD (CLOSE transaction)			The last record in the file with a <i>File Type Descriptor</i> of THEAD is a CLOSE transaction. This record is followed by the TTAIL and FTAIL records. Created by the RTLog periodic function, and not found in the temporary file. The CLOSE THEAD record is followed by a TTAIL record, and then the FTAIL record.
File Line Identifier	Number (10)	Next sequential number in the file.	Identifies the line number in the file. Zero-padded.
Register	Character (5)	01	Hard-coded.
Transaction Date	Character (14)	Date and time	The date and time when the RTLOG function created the DAT file.
Transaction Number	Number (10)	Next transaction number in the file.	Identifies the transaction number in the file. Zero-padded.
Transaction Type	Character (6)	DCLOSE	Hard-coded.
Sub-transaction Type	Character (6)	DSTORE	Hard-coded.
FTAIL			The total number of lines in the file. The last entry in the file. Added through the RTLOG periodic function.
File Line Identifier	Number (10)	Next sequential number in the file	Identifies the line number in the file. Zero-padded.
File Record Counter	Number (10)	Next sequential number in the file	Identifies the transaction number in the file. Zero-padded.

Merchandise Locator API

Purpose: Use the merchandise locator integration to request current availability information about an item/SKU in retail stores within a geographic search area or in external warehouses.

The merchandise locator search finds locations where the item is available for pickup, as well as indicating whether the item is available for shipment from a location. Your search specifies the requested quantity, and Order Administration uses the ProductAvailability request and response to communicate with Order Orchestration.

Does not create orders: The merchandise locator search is an inquiry only, and does not create or update an order. See the [Order Orchestration Integration](#) for information on submitting a brokered backorder (delivery or ship-for-pickup), store pickup, or ship-for-pickup order to Order Orchestration.

For more information: See:

- [Order Orchestration Integration Overview](#) for background on integration between Order Orchestration and Order Administration
- [Order Orchestration Configuration](#) for required setup in Order Administration
- the Order Orchestration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for details on the LocatelItems request and response messages or the ProductAvailability request and response messages, your options in configuring merchandise locator searching, and details on logging and troubleshooting in Order Orchestration

In this topic:

 - [Searching for Pickup Locations and Shipment Availability](#)
 - [Merchandise Locator for Different Types of Items](#)
 - [Merchandise Locator Troubleshooting](#)
- [Merchandise Locator Search Window \(Searching for an Item\)](#)
- [Merchandise Locator Search Results Screen](#)
- [Display Merchandise Locator Search Result Screen](#)

Merchandise Locator Process Overview**Searching for Pickup Locations and Shipment Availability**

Overview: A typical process of inquiring on locations where an item is available for pickup, as well as whether the item is available for shipment from a location, is described below.

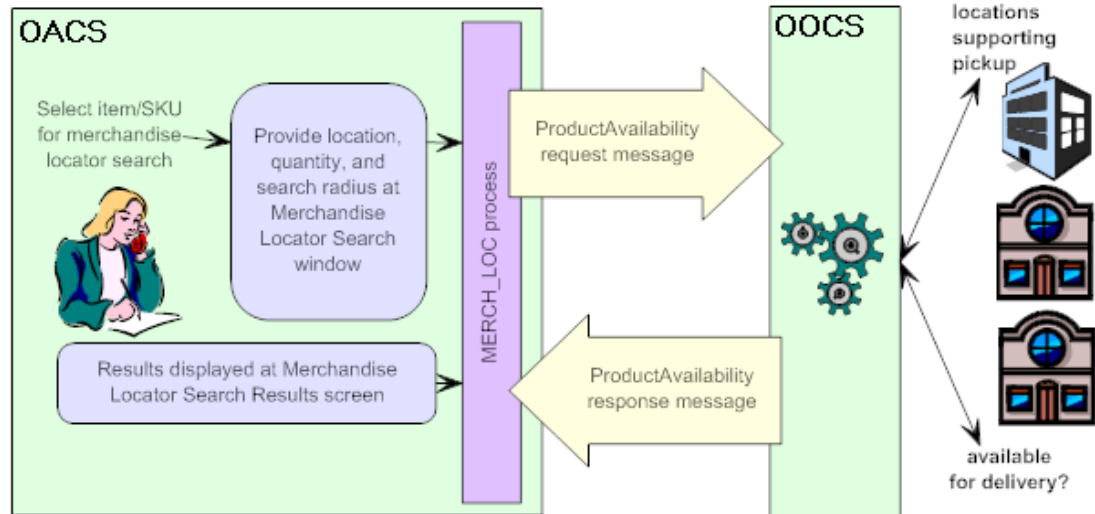

1. A customer wants to know if an item/SKU is available for pickup at a nearby store or available for shipment from a store location. You select the item/SKU for merchandise locator inquiry. This option is available in order entry, order maintenance, and at the [Display Item Availability Screen](#).
2. You advance to the [Merchandise Locator Search Window \(Searching for an Item\)](#), where you provide or confirm the customer's geographic location, the requested quantity of the item, and the radius to search within (for example, search all stores within 25 miles of the customer's home).

 **Note:**

Order Orchestration supports merchandise locator searches only in the U.S. and Canada.

3. In the background, the MERCH_LOC process:
 - Generates the ProductAvailability request message and sends it to Order Orchestration. Order Orchestration checks the availability of the item in stores that stock the item/SKU within the search area, as well as whether the item is available for shipment at any store locations within the same search area.
 - Receives the ProductAvailability response returned by Order Orchestration. This message lists:

- the item/SKU's current or estimated availability in each searched location that stocks the item for pickup
 - an indicator of whether the requested quantity of the item/SKU is available for shipment within the search area
4. You advance to the [Merchandise Locator Search Results Screen](#), displaying the item/SKU's availability for pickup in each of the locations, including information on any open purchase orders. The screen also indicates whether the requested quantity of the item/SKU is available for delivery from a store within the same search area.

How does Order Orchestration select the locations to include?

- Locations eligible to fulfill pickup orders:
 - Only store locations flagged as *Pickup available* can be included in the search results displayed at the [Merchandise Locator Search Results Screen](#).
 - Order Orchestration uses any probability rules you have set up to determine whether to include locations in the results, and the available quantity to indicate. For example, you might set up a probability rule for certain locations indicating to exclude them if the available quantity falls below 5 units, or to reduce the available quantity returned in the response message by 10%.

Results displayed: For each location included in the search results as eligible for a pickup order, the [Merchandise Locator Search Results Screen](#) indicates:

- the available quantity, next purchase order date, and next purchase order quantity
- whether the store location will ship the item for pickup in another store location
- the name, address, and phone number of the location
- the distance from the search address:
 - * locations are sorted in ascending order by distance (closest location listed first)
 - * locations that are not flagged to *Use Proximity Locator* are listed without a distance

 **Note:**

- Any locations associated in Order Orchestration with your Order Administration system are excluded from the results, regardless of whether there is a corresponding warehouse record in Order Administration.
 - If a location that stocks the item and is within the search radius is flagged in Order Orchestration as *Backorder Available*, it is returned in the search results even if it does not have the item available. In this case, the *Pickup avail qty* listed can be blank, or can be a negative quantity.
 - If there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as *Backorder Available*), the [Merchandise Locator Search Results Screen](#) displays the locations, but does not indicate the *Dist*, *Pickup avail qty*, *Open PO qty*, or *Next PO date*. This situation could occur if, for example, the customer requests 5 units, and none of the locations have more than 4 units available. To display the full information for the displayed locations, search again with a lower *Search quantity*.
- Locations eligible to fulfill delivery orders: Only store locations flagged as *Shipping available* are eligible to fulfill a delivery order. Also, Order Orchestration:
 - uses any probability rules you have set up to determine whether to include locations in the results, and the available quantity. For example, you might set up a probability rule for certain locations indicating to exclude them if the available quantity falls below 5 units, or to reduce the available quantity indicated in the response message by 10%.
 - does not exclude locations flagged as *Backorder available*, even if the available quantity in the location is less than the requested quantity.
 - restricts eligible locations to a fulfillment zone based on the search address, if configured in Order Orchestration.
 - excludes locations associated with Order Administration's system in Order Orchestration, if the *Disallow shopping within same system* option is selected for the Order Administration system in Order Orchestration.
 - excludes locations that have already been assigned the *Maximum Daily Orders*, if *Use Maximum Order Limits* preference is selected in Order Orchestration.

Results displayed: If the results indicate that one or more locations could deliver the requested quantity, the [Merchandise Locator Search Results Screen](#) indicates Delivery From Store Is Available; otherwise, the screen indicates Delivery From Store Is Not Available. This message might be displayed even if one or more locations could ship the requested quantity, even if these locations are not displayed in the search results.

 **Note:**

The delivery evaluation uses the same search radius as the pickup evaluation. To determine whether the item can be shipped without restricting the results to locations within driving distance of the customer, retry the search with a higher search radius.

For more information: See the [Merchandise Locator Search Results Screen](#) and the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for more information on the search results.

ProductAvailability request not used when creating a pickup order: Unlike the merchandise locator search described here, when you create a pickup order in order entry by selecting the Store Pickup option, Order Administration uses the `LocateItems` request message to search for store locations where the customer can pick up the order, regardless of the `CW_LOCATE_MESSAGE_VERSION` specified in [Working with Customer Properties \(PROP\)](#).

Merchandise Locator for Different Types of Items

Merchandise locator searches are not useful for the following types of items:

- membership item
- subscription item
- component of a set (although you can include the main set item)

Also, an item must have its [OROB eligible](#) flag selected in order to be eligible for a merchandise locator search. Typically, you would use this flag to exclude inappropriate items, such as gift cards or any other items that are not available in external store locations.

 **Note:**

The restriction against set components applies only if the item is added to the order as a component of a set. If you enter the item as a separate order line, merchandise locator searching is still available.

Merchandise Locator Troubleshooting

Problem	Possible Explanation or Solution
A location that stocks the requested item is not listed at the Merchandise Locator Search Results Screen	The location might: <ul style="list-style-type: none"> • not have the <i>Pickup available</i> flag selected in Order Orchestration • be excluded because of probability rules • be outside of the search radius
The merchandise locator request message is producing invalid XML	Check that text fields included in the message, such as the item or SKU description, do not include any special characters. For example, the carat (^) and the pipe symbol () are not valid characters in an XML message.

Problem	Possible Explanation or Solution
<p>The Merchandise Locator Search Results Screen displays the error: Availability information is not accessible at this time</p>	<p>Could occur because:</p> <ul style="list-style-type: none"> communications between Order Administration and Order Orchestration are not active Order Orchestration could not identify the search location based on the information sent in the search request (for example, it has no record of the provided zip code). See the Order Orchestration Web Services Guide https://support.oracle.com (ID 2953017.1) for more information. None of the locations within the search area have the item/SKU in stock. You can select Search again to change the search location or distance to search within. None of the locations within the search area stock the item/SKU. You can select Search again to change the search location or distance to search within. The customer address information provided in the merchandise locator request was invalid or incomplete. This could occur if, for example, you entered a Canadian address, but the database used to identify customer locations in Order Orchestration includes only U.S. addresses.
<p>The Merchandise Locator Search Results Screen displays the error Item/Sku not Merchandise Locator eligible</p>	<p>The item's <i>OROB eligible</i> flag is unselected, so Order Orchestration would not be able to identify the item.</p>
<p>The Merchandise Locator Search Results Screen displays the error FAILED: 1002 - Invalid item (system product), item (ROBOT) does not exist</p>	<p>The selected item is <i>OROB eligible</i>, but has not yet been created in Order Orchestration.</p>
<p>The Merchandise Locator Search Results Screen does not indicate the <i>Dist, Pickup avail qty, Open PO qty, or Next PO date</i></p>	<p>This situation can occur if there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as <i>Backorder Available</i>): for example, the customer requests 5 units, and none of the locations have more than 4 units available. To display the full information for the displayed locations, search again with a lower <i>Search quantity</i>.</p>
<p>The Merchandise Locator Search Results Screen lists a location with no quantity, or with a negative quantity</p>	<p>This situation can occur if a location that stocks the item and is within the search radius is flagged in Order Orchestration as <i>Backorder Available</i>.</p>

Merchandise Locator Search Window (Searching for an Item)

Purpose: Use this window to check availability for an item across external locations, such as retail stores, typically through Order Orchestration. To search, you need to specify the customer's location, either by city and state or postal code, the search radius, and a search quantity.

Address defaults: If you advance to this window in order entry or order maintenance, the customer's address information defaults. Also, if you have overridden the address

information in order entry or order maintenance, the system continues to default the override information until you are working with a different customer. For example, if you perform a search using the customer's work address for an item/SKU, and then select another item/SKU for a search while working with the same order, the customer's work address defaults.

How to display this window: Select Merch locator for an item at the:

- [Work with Order Lines Screen \(Adding Items to the Order\)](#)
- [SKU Scan Screen](#)
- [Scan Order Lines Screen](#)
- [Display Item Availability Screen](#)

 **Note:**

This option is available only if:

- The [Use Merchandise Locator \(I38\)](#) system control value is selected. Otherwise, the screen displays an error message: `Merchandise Locator is not enabled`. Also, merchandise locator searching is not available for all items; see [Merchandise Locator for Different Types of Items](#) for a listing of items that are not eligible.
- You have not already selected a quantity of the item to add to the current order at the Display Item Availability Screen in order entry. Otherwise, the screen displays an error message: `Option not allowed since item already selected`.

 **Important:**

Order Orchestration supports merchandise locator searches only within the U.S. and Canada.

The merchandise locator search is an inquiry only, and does not create or update an order. See the [Order Orchestration Integration](#) for information on submitting a brokered backorder, store pickup, or ship-for-pickup order to Order Orchestration.

Field	Description
Item	The item selected at the previous screen. The SKU information, if any, is to the right. <i>Item code: alphanumeric, 12 positions; display-only.</i> <i>SKU: alphanumeric, three 4-position fields; display-only.</i>
Item description	The description of the item. Even if the item has SKUs, the item description is displayed. <i>Alphanumeric, 120 positions; display-only.</i>

Field	Description
Postal code	<div data-bbox="906 302 1458 533" style="border: 1px solid #0070C0; padding: 10px; margin-bottom: 10px;">  Note: If you advanced to this window from order entry or order maintenance, the customer's address information defaults. </div> <p>The customer's U.S. zip or Canadian postal code, to serve as the central point for the search radius. For example, if the <i>Search within</i> field is set to 25 miles, the search includes stores within 25 miles of this postal code.</p> <p>The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.</p> <div data-bbox="906 814 1458 987" style="border: 1px solid #0070C0; padding: 10px; margin-bottom: 10px;">  Note: Your entry in this field is not validated against the Zip/City/State table. </div> <p><i>Alphanumeric, 10 positions; required if you do not enter a city and state.</i></p>
Address	<p>The customer's street address, to serve as the central point for the search radius.</p> <p>The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.</p> <p><i>Alphanumeric, 32 positions; optional.</i></p>
City	<p>The customer's city, to serve as the central point for the search radius.</p> <p>The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.</p> <p><i>Alphanumeric, 25 positions; required if you do not enter a postal code.</i></p>
State	<p>The customer's U.S. state or Canadian province, to identify the location of the city.</p> <p>The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.</p> <p><i>Alphanumeric, 2 positions; required if do not enter a postal code.</i></p>

Field	Description
Country	<p>The customer's country. The country defaults from the customer address if you advanced to this window from order entry or order maintenance; otherwise, it defaults from the vDefault Country for Customer Address (B17) system control value. Defined in and validated against the Country table; see Setting Up the Country Table (WCTY) for more information.</p> <p>The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.</p> <p><i>Alphanumeric, 2 positions; required.</i></p>
Search quantity	<p>The requested quantity of the item. Defaults to 1.</p> <p><i>Numeric, 7 positions; required.</i></p>
Search within	<p>Indicates the search radius, in miles or kilometers, to search within for the selected item. The search radius defaults from the Default Search Within Radius (I40) system control value, but you can override it.</p>

 **Note:**

- The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.
- The distance unit of measure (miles or kilometers) specified with the Merchandise Locator Distance Measurement (I39) system control value is displayed to the right.
- Typically, a search for a delivery location can use a broader search radius than a search for a pickup location, which is generally within driving distance. To see if the item is available for delivery as opposed to pickup, you might search twice, specifying a different search radius when determining if the item is available for delivery.

Numeric, 5 positions; required.

Completing this window:

- If they have not already defaulted, indicate the postal code or the city and state to serve as the central point for the search radius.
- Optionally, override the *Search quantity*.
- Optionally, override the *Search within* radius to a different distance.

- Click OK. The system generates the ProductAvailability request message. See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more information.

When the system receives the response message, you advance to the [Merchandise Locator Search Results Screen](#).

Merchandise Locator Search Results Screen

Purpose: Use this screen to review an item's availability in external locations and the details about the external location.

The *Ship for Pickup* and *Pickup Available Quantity* fields indicate whether the store location supports store pickup orders, ship-for-pickup orders, or both.

- If the *Ship for Pickup* field is set to Y and a quantity is defined in the *Pickup Available Quantity* field, the store location supports both ship-for-pickup orders and store pickup orders.
- If the *Ship for Pickup* field is set to Y and the *Pickup Available Quantity* field is blank, the store location supports ship-for-pickup orders but not store pickup orders.
- If the *Ship for Pickup* field is set to N and a quantity is defined in the *Pickup Available Quantity* field, the store location supports store pickup orders but not ship-for-pickup orders.
- If the *Ship for Pickup* field is set to N and the *Pickup Available Quantity* field is blank, the store location does not support ship-for-pickup orders or store pickup orders.

If you advanced to this screen during Order Entry and the *Ship for Pickup* field is set to Y for a store, you can select Ship for Pickup to convert the order to a ship-for-pickup order; in this situation, the system updates the one-time ship to address on the order to the store's name and address and sends a broker backorder for the ship-for-pickup order to the Order Orchestration for fulfillment assignment. See [Brokered Backorders](#) for processing details.

How to display this screen: Complete the [Merchandise Locator Search Window \(Searching for an Item\)](#) and click OK.

Troubleshooting: See [Merchandise Locator Troubleshooting](#).

For more information: See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for an example of the actual response messages used to populate the information on this screen.

Note:

You cannot submit an order to Order Orchestration through this screen. See the [Order Orchestration Integration](#) for information on submitting a brokered backorder, store pickup, or ship-for-pickup order to Order Orchestration.

Field	Description
Locations closest to	<p>The address information provided at the Merchandise Locator Search Window (Searching for an Item). This information could be just a postal code or a city and state, or could include additional information such as the street address. The information is truncated if it exceeds the space allowed on this screen.</p> <p>The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.</p> <p><i>Alphanumeric, 55 positions; display-only.</i></p>
Radius	<p>The Search within radius selected at the Merchandise Locator Search Window (Searching for an Item). The setting of the Merchandise Locator Distance Measurement (I39) (miles or kilometers) is to the right.</p> <p>The search radius applies only to locations that use proximity rules. You might set up Order Orchestration so that proximity rules apply to stores only and not warehouses.</p> <p><i>Numeric, 5 positions; display-only.</i></p>
Location types	<p>Always set to All (both stores and warehouses).</p> <p><i>Alphanumeric, 3 positions; display-only.</i></p>
Item	<p>The item selected for search. The SKU information, if any, is to the right.</p> <p><i>Item code: alphanumeric, 12 positions; display-only.</i></p> <p><i>SKU: alphanumeric, three 4-position fields; display-only.</i></p>
Item description	<p>The description of the item. Even if the item has SKUs, the item description is displayed.</p> <p><i>Alphanumeric, 120 positions; display-only.</i></p>
Delivery availability (unlabeled field to the right of the item description)	<p>If the results indicate that one or more locations could deliver the requested quantity, the Merchandise Locator Search Results Screen indicates Delivery From Store Is Available; otherwise, the screen indicates Delivery From Store Is Not Available. This message might be displayed even if one or more locations could ship the requested quantity, even if these locations are not displayed in the search results.</p>

Field	Description
Dist	<p>Each location in the search results where the customer could pick up the item is displayed below. Locations are sorted by distance (nearest to farthest away).</p> <p>The number of miles or kilometers, based on the Merchandise Locator Distance Measurement (I39), from the search location. This distance might be approximate, depending on the actual criteria used to search (for example, postal code or city), and does not represent an actual driving distance.</p> <p>No distance is displayed if the location is not set up in Order Orchestration to use proximity rules. In this situation, the location is always considered to be within the specified search radius. Also, no distance is displayed if the store location and the search location are in the same zip or postal code.</p> <p>The distance is rounded down when determining whether to include the location in the search results. For example, if the Search radius is 10 miles, and the location is 10.84 miles away, the location is included in the results.</p> <p>The distance is shown if the location is shown. The location is shown when:</p> <ul style="list-style-type: none">• Pickup qty > 0 and store flagged as pickup even though not ship for pickup• Pick qty = 0, store not flagged as pickup available but store is flagged for ship for pickup <p>Location is not shown if no inventory and not flagged as ship for pickup.</p> <p><i>Numeric, 7 positions with a 2-place decimal.</i></p>
Ship for Pickup	<p>Indicates whether the store location is available for selection as a destination for a ship-for-pickup order. This is from the <i>Ship for Pickup</i> setting for the store location in the Work with Store Cross Reference (WSCR) menu option.</p> <p>Y = the store location is available for selection as a destination for a ship-for-pickup order. During Order Entry, if you select Ship for Pickup for the store location, the system updates the ship to address on the order to the address defined for the store location and converts the order to a ship-for-pickup order. See Brokered Backorders for processing details.</p> <p>N = the store location is not available for selection as a destination for a ship-for-pickup order.</p> <p><i>Alphanumeric, 1 position; display-only.</i></p>

Field	Description
Location	<p>The description and address of the location where the item/SKU is available, and can include:</p> <ul style="list-style-type: none">• description• city• state• postal code• country <p>This information is provided directly from Order Orchestration, and is not derived from the Store Cross Reference table in Order Administration.</p>

 **Note:**

Searching the locations displayed on the screen based on location name is not currently implemented.

Description: alphanumeric, 40 positions; display-only.

City: alphanumeric, 25 positions; display-only.

State: alphanumeric, 2 positions; display-only.

Postal code: alphanumeric, 10 positions; display-only.

Country: alphanumeric, 3 positions; display-only.

Field	Description
Pickup avail qty	The quantity of the item/SKU reported in the response message as available for pickup in this location. Depending on your settings within Order Orchestration, this quantity may be approximate, or calculated based on probability rules.

 **Note:**

- If a location that stocks the item and is within the search radius is flagged in Order Orchestration as *Backorder Available*, it is returned in the search results even if it does not have the item available. In this case, the *Pickup avail qty* listed can be blank, or can be a negative quantity.
- If there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as *Backorder Available*), the [Merchandise Locator Search Results Screen](#) displays the locations, but does not indicate the *Dist*, *Pickup avail qty*, *Open PO qty*, or *Next PO date*. This situation could occur if, for example, the customer requests 5 units, and none of the locations have more than 4 units available. To display the full information for the displayed locations, search again with a lower *Search quantity*.

Numeric, 7 positions; display-only.

Field	Description
Open PO qty	The quantity of the item/SKU reported on open purchase orders for this location; depends on how the external system calculates the open PO quantity.

 **Note:**

If there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as *Backorder Available*), the [Merchandise Locator Search Results Screen](#) displays the locations, but does not indicate the *Dist*, *Pickup avail qty*, *Open PO qty*, or *Next PO date*. This situation could occur if, for example, the customer requests 5 units, and none of the locations have more than 4 units available. To display the full information for the displayed locations, search again with a lower *Search quantity*.

Next PO date	<i>Numeric, 7 positions; display-only.</i> The date when the next purchase order for this item/SKU is due to be received at this location; depends on how the external system calculates the next PO date.
---------------------	---

 **Note:**

If there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as *Backorder Available*), the [Merchandise Locator Search Results Screen](#) displays the locations, but does not indicate the *Dist*, *Pickup avail qty*, *Open PO qty*, or *Next PO date*. This situation could occur if, for example, the customer requests 5 units, and none of the locations have more than 4 units available. To display the full information for the displayed locations, search again with a lower *Search quantity*.

Numeric, 6 positions (user date format); display-only.

Display a location	Select Display for a location to advance to the Display Merchandise Locator Search Result Screen .

Option	Procedure
<p>Select the store location as the pickup location for a ship-for-pickup order</p>	<p>Select Ship for Pickup for a location. The system:</p> <ul style="list-style-type: none"> • updates the one-time ship to name and address on the order to the selected store location and converts the order to a ship-for-pickup order. • sends a broker backorder for the ship-for-pickup order to the Order Orchestration for fulfillment assignment. See Brokered Backorders for processing details.

 Note: This option is available only if you advance to

Option	Procedure
	h i s s c r e e n d u r i n g O r d e r E n t r y .
Search again	Select Search again to return to the Merchandise Locator Search Window (Searching for an Item) .

Display Merchandise Locator Search Result Screen

Purpose: Use this screen to review additional details about a location where the customer might be able to pick up the item. You cannot make any changes on this screen.

The address components, such as postal code, country, and phone number, are provided by external systems and might not be formatted or validated at this screen the same way as they are for data stored in Order Administration.

How to display this screen: Select Display for a location at the [Merchandise Locator Search Results Screen](#).

Field	Description
Item	The item selected for search. The SKU information, if any, is to the right. <i>Item code: alphanumeric, 12 positions; display-only.</i> <i>SKU: alphanumeric, three 4-position fields; display-only.</i>
Description	The description of the item. Even if the item has SKUs, the item description is displayed. <i>Alphanumeric, 120 positions; display-only.</i>

Field	Description
Loc type	Always set to All (both stores and warehouses).
	<div style="border: 1px solid #0070c0; padding: 10px; background-color: #e6f2ff;"> <p> Note:</p> <p>Not included if the CW_LOCATE_MESSAGE_VERSION in Working with Customer Properties (PROP) specifies a message version of 5.0 or higher.</p> </div>
Distance	<p><i>Alphanumeric, 3 positions; display-only.</i></p> <p>The number of miles or kilometers, based on the Merchandise Locator Distance Measurement (I39), from the search location. This distance might be approximate, depending on the actual criteria used to search (for example, postal code or city), and does not represent an actual driving distance. The setting of the Merchandise Locator Distance Measurement (I39) (miles or kilometers) is to the right. The distance displayed is .00 if the location is not set up in Order Orchestration to use proximity rules. In this situation, the location is always considered to be within the specified search radius.</p> <p><i>Numeric, 7 positions with a 2-place decimal.</i></p>
Location	<p>The description and address of the location where the item/SKU is available, consisting of:</p> <ul style="list-style-type: none"> • description (the <i>Name</i> from Order Orchestration) • street address (up to four lines) • city • state • postal code • country • phone number (does not include the extension or the fax number) <p>This information is provided directly from Order Orchestration, and is not derived from the Store Cross Reference table in Order Administration.</p> <p><i>Description: alphanumeric, 40 positions; display-only.</i></p> <p><i>Street: alphanumeric, 40 positions each; display-only.</i></p> <p><i>City: alphanumeric, 25 positions; display-only.</i></p> <p><i>State: alphanumeric, 2 positions; display-only.</i></p> <p><i>Postal code: alphanumeric, 10 positions; display-only.</i></p> <p><i>Country: alphanumeric, 3 positions; display-only.</i></p> <p><i>Phone number: alphanumeric, 14 positions; display-only.</i></p>

Field	Description
Available	The quantity of the item/SKU reported in the response message as available for pickup in this location. Depending on your settings within Order Orchestration, this quantity may be approximate, or calculated based on probability rules.

 **Note:**

- If a location that stocks the item and is within the search radius is flagged in Order Orchestration as *Backorder Available*, it is returned in the search results even if it does not have the item available. In this case, the *Pickup avail qty* listed can be blank, or can be a negative quantity.
- If there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as *Backorder Available*), the [Merchandise Locator Search Results Screen](#) displays the locations, but does not indicate the *Dist*, *Pickup avail qty*, *Open PO qty*, or *Next PO date*. This situation could occur if, for example, the customer requests 5 units, and none of the locations have more than 4 units available. To display the full information for the displayed locations, search again with a lower *Search quantity*.

Numeric, 7 positions; display-only.

Field	Description
Open PO	<p>The quantity of the item/SKU reported on open purchase orders for this location; depends on how the external system calculates the open PO quantity.</p> <p>If there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as <i>Backorder Available</i>), the Merchandise Locator Search Results Screen displays the locations, but does not indicate the <i>Dist</i>, <i>Pickup avail qty</i>, <i>Open PO qty</i>, or <i>Next PO date</i>. This situation could occur if, for example, the customer requests 5 units, and none of the locations have more than 4 units available. To display the full information for the displayed locations, search again with a lower <i>Search quantity</i>.</p> <p><i>Numeric, 7 positions; display-only.</i></p>
Next PO	<p>The date when the next purchase order for this item/SKU is due to be received at this location; depends on how the external system calculates the next PO date.</p> <p>If there are locations that stock the item and are within the search radius, but none have the full requested quantity available (and are not flagged as <i>Backorder Available</i>), the Merchandise Locator Search Results Screen displays the locations, but does not indicate the <i>Dist</i>, <i>Pickup avail qty</i>, <i>Open PO qty</i>, or <i>Next PO date</i>. To display the full information for the displayed locations, search again with a lower <i>Search quantity</i>.</p> <p><i>Numeric, 6 positions (user date format); display-only.</i></p>

Brokered Backorders

Purpose: If the [Send B/O to OROB \(K08\)](#) system control value is selected, you can use the [Order Orchestration Integration](#) to send backordered order lines to Order Orchestration for fulfillment.

- If the [Use OROB for Fulfillment Assignment \(M31\)](#) system control value is unselected, the system sends eligible backordered items to Order Orchestration for fulfillment. Order Orchestration will choose the best store location to fulfill and ship the item to the customer. Items that are in stock follow normal reservation and fulfillment processing.
- If the [Use OROB for Fulfillment Assignment \(M31\)](#) system control value is selected, the system bypasses reservation and places all eligible items on backorder, even if the item is available in an Order Administration warehouse. Order Orchestration will choose the best store location or Order Administration location to fulfill and ship the item to the customer.
- If the [Use OROB for Ship for Pickup Fulfillment Assignment \(M34\)](#) system control value is set to ALWAYS, the system bypasses reservation in order to send eligible items on a ship-for-pickup order to Order Orchestration for fulfillment assignment. In this situation, the fulfilling location may be a store location or an Order Administration warehouse and the merchandise is shipped to the customer's selected store for pickup. See [Creating a Ship-for-Pickup Order in Order Administration](#) for more information on how to create a ship-for-pickup order.

 **Note:**

If the item is flagged as a active PO item the system does not submit it to Order Orchestration for fulfillment using the standard process described here; instead, it uses the process described under [Enterprise Order Integration \(Future Receipts and Active PO/Pre-Order Processing\)](#).

When using Order Orchestration for fulfillment assignment, the fulfilling location can be a store location or an OACS warehouse location. In addition, for ship-for-pickup orders, the fulfilling location ships the order to the customer's selected store for pickup.

In this topic:

- [Brokered Backorder Processing Overview](#)
- [Brokered Backorder Fulfillment: Initial Order Creation](#)
- [Fulfillment Process: After Order Creation and Status Updates](#)
- [Rules for Submitting Backorders to Order Orchestration](#)
 - [BROKER Periodic Function](#)
- [Brokering Items with Soldout Control Codes](#)
- [Things to Note About Brokered Backorders](#)

Brokered Backorder Processing Overview

Order Orchestration assignment: Assigning a backordered item to Order Orchestration can occur through:

- order entry or order API: When you create an order that includes a backordered line, Order Administration assigns the line, if eligible, to Order Orchestration for fulfillment, and withholds it from normal fulfillment processing within Order Administration.

 **Note:**

- If the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system bypasses reservation for all eligible items on an order and places them on backorder so that Order Orchestration can determine the fulfilling location.
- If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS, the system bypasses reservation for all eligible items on a ship-for-pickup order and places them on backorder so that Order Orchestration can determine the fulfilling location.

- batch process: A periodic function finds eligible backordered lines and assigns them to Order Orchestration.

Eligibility rules: Order Administration determines whether an order line is eligible for Order Orchestration fulfillment based on certain basic criteria, such as whether it is fully backordered and authorized; also, you can use related system control values to further restrict Order Orchestration assignment based on your business rules, such as

omitting items you are due to receive soon on open purchase orders. Also, the item must be flagged as [OROB eligible](#). See [Rules for Submitting Backorders to Order Orchestration](#) for details.

If the authorization for the order line has expired, the system obtains a new authorization.

Does each line create a separate order in Order Orchestration? Each eligible backordered line on an order is sent to Order Orchestration:

- as a separate order if the [Use Split Order \(L56\)](#) system control value is unselected. In this case, the fulfillment of each line is tracked individually. Order Orchestration does not attempt to assign multiple order lines from the same fulfilling location.
- as part of a single order if the [Use Split Order \(L56\)](#) system control value is selected. In this case, Order Orchestration attempts to assign all lines on the same order to the same fulfilling location; however, it notifies Order Administration about multiple assigned fulfilling locations if the order or lines are split. If a single backordered item is unfulfillable through Order Orchestration, that line returns to standard backorder processing, but additional lines on the order can still be fulfilled through Order Orchestration.

What information is sent to Order Orchestration? Order Administration sends the following information to Order Orchestration:

- sold-to and ship-to customers' names and addresses.
- details on the requested item.

It does not send payment information, although only fully paid and authorized items are eligible for Order Orchestration fulfillment. If the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value is selected, ship-for-pickup orders are authorized for verification only and payment is collected when the customer picks up the items at the store.

If the authorization for an order line has expired, the system obtains a new authorization.

For more information on the information sent to Order Orchestration, see Sample Order Orchestration Messages in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Brokered Backorder Fulfillment: Initial Order Creation

#	Step
1.	<p>The process begins when you create an order in Order Administration.</p> <p>If the Send B/O to OROB (K08) system control value is selected, the system sends eligible backordered items to Order Orchestration to determine the fulfilling location.</p> <p>In addition:</p> <ul style="list-style-type: none"> • If the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system bypasses reservation and places all eligible items on backorder, even if the item is available in an Order Administration warehouse, in order to have Order Orchestration determine the fulfilling location. • If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS, the system bypasses reservation and places all eligible items on a ship-for-pickup order on backorder, even if the item is available in an Order Administration warehouse, in order to have Order Orchestration determine the fulfilling location. <p>The order creation can occur through interactive order entry, batch order entry, or the order API. You can also use the BROKER periodic function to submit existing backordered lines to the Order Orchestration for fulfillment; see Additional Order Orchestration Setup in Order Administration for more information.</p>

#	Step
2.	If the order line meets the Rules for Submitting Backorders to Order Orchestration , the BROKER_ORD process in Order Administration generates a request message to Order Orchestration and creates an Order Orchestration record.

 **Note:**

Order lines that meet the [Rules for Submitting Backorders to Order Orchestration](#) do not sell out initially, even if the items are flagged with soldout control codes. See [Brokering Items with Soldout Control Codes](#) for more information.

If the order includes multiple backordered lines and the Use Split Order (L56) system control value is selected, the request message includes all eligible backordered lines; otherwise, each backordered item is submitted as a separate order. Each Order Orchestration record has a status of R (ready) at creation. Also, the order line is updated to restrict it from standard backorder processing in Order Administration:

- the *Drop ship* flag is set to D.
- the *Printed quantity* is updated to the ordered quantity.
- an order line that is assigned to Order Orchestration for fulfillment displays a status of OBR in standard order inquiry.
- the quantity to be brokered does not update the *Backordered quantity* for the Item Warehouse.
- if the Use OROB for Fulfillment Assignment (M31) system control value is selected, the *Bypass reservation* flag is selected with a *Backorder reason* of `Reservation bypassed` indicating the brokered backorder was created for fulfillment assignment.
- if the order is a ship-for-pickup order sent for fulfillment assignment, the *Bypass reservation* flag is selected with a *Backorder reason* of `Reservation bypassed` indicating the brokered backorder was created for fulfillment assignment.

 **Note:**

Order Orchestration status is not displayed in [Streamlined Order Inquiry \(DORI\)](#).

#	Step
3.	<p>If the BROKER_ORD process in Working with Integration Layer Processes (IJCT) is active, it immediately generates the submit order request message to Order Orchestration to request order creation and assignment in Order Orchestration. At this time, it also changes each Order Orchestration record's status to W (waiting) and creates an Order Orchestration History record for each line to track the order submission (A - Send Order Request).</p> <p>See the Sample Order Orchestration Messages in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
	<div style="border-left: 2px solid #0070C0; padding-left: 10px;"><p> Note:</p><p>Although the BROKER_ORD process generates the submit order requests (and cancellation requests, if needed), the BROKER process handles other requests to Order Orchestration.</p></div>
4.	<p>The Routing Engine module in Order Orchestration receives the submit order message. If Order Administration sent each line separately, Order Orchestration creates each order line as a separate order in its database; otherwise, if you use the split order option, Order Orchestration creates a single order including all of the order lines that were eligible for submission as brokered backorders. Order Orchestration assigns each order or line to a location for fulfillment based on inventory availability and the business rules you have defined in Order Orchestration. At this point, the order status in the Order Orchestration database is new_order.</p>
5.	<p>Order Orchestration sends a response message to Order Administration indicating each assigned fulfilling location and the unique request ID it uses to identify each order. See the Submit Order Response Message Sample in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
	<div style="border-left: 2px solid #0070C0; padding-left: 10px;"><p> Note:</p><p>The message version is specified in the Order Orchestration Properties; this property must be set to 16.0 or higher in order to use brokered backorders for fulfillment assignment and to use ship-for-pickup processing.</p></div>
6.	<p>If Order Orchestration successfully created an order and assigned it to one or more fulfilling locations, Order Administration:</p> <ul style="list-style-type: none">• updates each Order Orchestration record with:<ul style="list-style-type: none">– the fulfilling location, using the description set up through the Work with Store Cross Reference (WSCR) option.– the request ID.– a status of A (acknowledged).• writes an Order Transaction History message indicating that the order line was acknowledged by Order Orchestration (for example, Ln#: 2 Acknowledged by Broker).• creates an Order Orchestration History record (B - Receive Order Response).

Split line? If the *Allow Split Line?* preference in Order Orchestration is selected, Order Orchestration might split the quantity of a single brokered backorder line across more than one fulfilling location. For example, you create an order for item AB100 with a quantity of 10. There is no single location that has a quantity of 10 available. Order Orchestration assigns 8 units to location 100, and 2 units to location 200.

Order Orchestration splits order lines or line quantities only if you have selected the *Allow Split Order?* and *Allow Split Line?* preferences in Order Orchestration, and if there is not a single location that can fulfill the entire order or line quantity. See the Use Split Order (L56) system control value for examples, and see the Order Orchestration Operations Guide or online help for background.

If Order Administration is the fulfilling location: If the Use OROB for Fulfillment Assignment (M31) system control value is selected or the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS, Order Orchestration may determine that a warehouse in Order Administration is the best location to fulfill the order, or some portion of the order. In this situation:

- Order Orchestration assigns the Order Administration location to the order in Order Orchestration as the *Fulfilling location*.
- At defined intervals, the BROKER process in Work with Integration Layer Processes (IJCT) periodically sends a fulfillments request message to Order Orchestration to poll for newly assigned orders (those whose *Fulfilling location* is an Order Administration location).
- When the BROKER process receives the order in the fulfillments response message:
 - If the original order is not a ship-for-pickup order, it creates a new delivery order and assigns the order type defined in the [Order Type for Delivery Orders Originating in OROMS \(M33\)](#) system control value to the order.
 - If the original order is a ship-for-pickup order, it creates a new retail pickup order and assigns the order type defined in the [Order Type for Retail Pickup Orders Originating in OROMS \(M35\)](#) system control value to the order.
- In order to tie the originating order (the original order sent to Order Orchestration for fulfillment assignment) with the new fulfilling order (the delivery or retail pickup order created to fulfill the original order), Order Administration:
 - stores the originating order number in the *E-commerce order number* field in the Order Header Extended table for the newly created sourcing order. For example, the system updates the *E-commerce order number* with ORIG#: 9999-001, where ORIG#: indicates the order has been created as a result of OROB fulfillment assignment, 9999 is the order number, and 001 is the ship-to number.
 - assigns the *Request ID* defined for the originating order to the newly created sourcing order.

See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information on how Order Administration processes a delivery or retail pickup order.

If the assigned fulfilling location rejects the order: The location assigned to fulfill an order or line can reject it if, for example, it does not have sufficient inventory. In this situation, Order Orchestration uses the rules set up at the **Preferences** screen in Order Orchestration to select another location to fulfill the order. If the location where the order is currently assigned changes, Order Administration updates this information

the next time it sends a status inquiry to Order Orchestration, typically through pick slip generation, and receives the new information in the response.

 **Note:**

An order normally remains in Rejected status in Order Orchestration only for a moment. If for any reason Order Orchestration receives a status inquiry request when the order's status is Rejected, Order Administration does not update the order until the next time it sends a periodic status inquiry.

What if Order Orchestration cannot find a location to fulfill the order or line? In some cases, Order Orchestration cannot assign an order to a location because there are no locations with sufficient inventory that are eligible based on the business rules set up in Order Orchestration at the **Preferences** screen. In this situation, Order Orchestration assigns the order to the *Default Unfulfillable Location* specified in Order Orchestration, which should match the setting of the [OROB Default Location Code for Unfulfillable Orders \(K56\)](#) system control value. When Order Administration receives a response message indicating that the order was assigned to the unfulfillable location and has a status of `Unfulfillable`, it:

- Clears the *Drop ship* flag and the *Printed quantity* on the Order Detail line.
- If the Use OROB for Fulfillment Assignment (M31) system control value is selected or the original order is a ship-for-pickup order, unselects the *Bypass reservation* flag and updates the *Backorder reason* to `Not enough avail in whse`.
- Changes the status of the Order Orchestration record to U (unfulfillable).
- Writes an Order Transaction History record (for example, `Ln#: 2 Unfulfillable by Broker`).
- Returns the line to standard backorder or soldout processing, including updating the *Backorder quantity* for the Item Warehouse and updating the PO Layering record.

An order might be flagged as unfulfillable when Order Orchestration first receives the request message, or after one or more locations have rejected the order for fulfillment; in this case, Order Administration receives notification the next time it sends a periodic status inquiry, as described below.

Notifying the customer of fulfillment assignment through Order Orchestration: The order confirmation email indicate a status of Store Ship for order lines assigned to Order Orchestration. See the [Order Confirmation Email Sample and Contents](#) for more information.

Fulfillment Process: After Order Creation and Status Updates

Status list inquiry request and response process: The BROKER process in [Working with Integration Layer Processes \(IJCT\)](#) sends periodic status list inquiry requests to Order Orchestration. You use the [Order Broker Status Update Interval \(K10\)](#) system control value to define how many minutes Order Administration should wait before sending status inquiry requests.

If status has not changed: Once the order line is in Accepted status, Order Administration does not write a history record for the status list inquiry response as long as the record remains in this status.

Activity	Status in OACS	Status in OACS	Updates to Order Orchestration and Order Transaction History
<p>Order Administration sends the submit order message to Order Orchestration and restricts the order line from standard processing in Order Administration by setting the <i>Drop ship</i> flag and the <i>Printed quantity</i>.</p>	not yet created	Waiting (W)	<ul style="list-style-type: none"> creates an Order Orchestration History record to track the order submission (A - Send Order Request)

Order rejected? If the assigned fulfilling or sourcing location cannot fulfill the order or line, or the pickup location for a ship-for-pickup order indicates that the inventory for the item was not received or was damaged in transit, it sends a status update rejecting the order or line to Order Orchestration. Order Orchestration then:

- Attempts to find another location, subject to the rules you have set up in Order Orchestration. If it finds another location, Order Orchestration updates the record in its database and changes the order status back to new_order. Then the process begins again as Order Orchestration waits until the newly-assigned location polls for orders.
 - new_order Acknowledged (K) (after receiving status inquiry response)
 - creates an Order Orchestration History record (D - Receive Status Response)
 - writes an Order Transaction History message (for example, Ln#: 1 Acknowledged by Broker)

Activity	Status in OACS	Status in OACS	Updates to Order Orchestration and Order Transaction History
<ul style="list-style-type: none"> If Order Orchestration does not find another fulfilling location, it flags the order or line as unfulfillable by assigning it to the <i>Default Unfulfillable Location</i> you have set up in Order Orchestration (matching the OROB Default Location Code for Unfulfillable Orders (K56) in Order Administration). When Order Administration receives the status inquiry update indicating a fulfilling location that matches the OROB Default Location Code for Unfulfillable Orders (K56), it flags the order or line as unfulfillable and returns the line to standard backorder or soldout processing, clearing the <i>Drop ship</i> flag and the <i>Printed quantity</i> for the order line. 	new_order	unfulfillable (U) (after receiving status inquiry response)	<ul style="list-style-type: none"> creates an Order Orchestration History record (D - Receive Status Response) writes an Order Transaction History message (for example, Ln#: 5 Unfulfillable by Broker)

Activity	Status in OACS	Status in OACS	Updates to Order Orchestration and Order Transaction History
<p>In Transit (ship-for-pickup, retail pickup): The location assigned to fulfill a ship-for-pickup order has sent the inventory to the location where the customer will pick up the order. Once the fulfilling location has shipped the order or line, it sends a status update message to Order Orchestration, providing the ship via and tracking number if available. Order Orchestration changes the status to In Transit and stores the ship via and tracking number so that it can send this information to Order Administration. The tracking number is not available as a live link on screens.</p>	In Transit	intransit	<ul style="list-style-type: none"> • creates an Order Orchestration History record (D - Receive Status Response) • writes Order Transaction History messages indicating the ship via and the tracking number passed from Order Orchestration (for example, ----VIA: UPS and ----TRK#: ABCDEFG1234567890). If there is not tracking information available, writes an Order Transaction History message such as Ln#: 1 Store Shipped Order <p>Create invoice? If the Invoice Ship For Pickup Order Once Intransit (M73) system control value is selected, Order Administration may create the invoice for the originating order when it receives a status inquiry response from Order Orchestration indicating that order lines on a ship-for-pickup order are now in transit. See that system control value for more information.</p>

Activity	Status in OOCs	Status in OACS	Updates to Order Orchestration and Order Transaction History
<p>Intransit Polled (ship-for-pickup): The pickup location for a ship-for-pickup order:</p> <ul style="list-style-type: none"> • has received the order in the intransit response message, if the system is not flagged to <i>Require Status Update</i>; or • has sent a status update request changing the status to intransit polled 	In Transit Polled	intransit polled	<ul style="list-style-type: none"> • creates an Order Orchestration History record (D - Receive Status Response) • writes an Order Transaction History message (for example, Ln#: 1 Intransit Polled by Broker) <p>Create invoice? If the Invoice Ship For Pickup Order Once Intransit (M73) system control value is selected, Order Administration may create the invoice for the originating order when it receives a status inquiry response from Order Orchestration indicating that order lines on a ship-for-pickup order are now in transit polled, if the invoice was not already created. See that system control value for more information.</p>

Activity	Status in OCS	Status in OACS	Updates to Order Orchestration and Order Transaction History
Order status changes? If the Send Held Orders to OROB (M18) system control value is selected, Order Administration sends held brokered backorders to Order Orchestration, but with the <i>Under Review</i> flag set to Y; also, Order Administration sends an order update to Order Orchestration if the order's status changes from held to open, or vice versa.	no change	no change	<ul style="list-style-type: none"> when the change occurs after initial order creation and submission, writes an Order Transaction History message (for example, Request ID: 78390 Under Review: N)

Picked? If the assigned fulfilling location reports that a brokered backorder is in Picked status, the [Working with Order Broker \(WOBR\)](#) option indicates a status of Accepted.

Canceling a brokered backorder: See [Canceling a Brokered Backorder Request](#) for a discussion of the updates that take place when you cancel an Order Orchestration request at the [Work with Order Broker Screen](#) or in order maintenance.

Reviewing brokered backorders in order inquiry: You can use the [Brokered Backorder Summary Screen](#) to review the current status of all brokered backordered lines on a single order. Also, you can select D/S Status for a single brokered backorder line at the [Order Inquiry Detail Screen](#) to advance to the [Display Order Broker Details Screen](#), where you can review a single brokered backorder line on the order.

Quantity not indicated in order transaction history messages: The order transaction history messages do not specify the quantity affected by the update; however, if you split orders and lines, the quantity affected may be less than the total order line quantity. For example, if Order Orchestration splits an order line across two locations for fulfillment, and one of the locations fulfills its assigned quantity, the order transaction history message of Ln#: 2 Store Shipped Order does not indicate the fulfilled quantity.

Rules for Submitting Backorders to Order Orchestration

To be eligible for submission to Order Orchestration, the backordered item must have the [OROB eligible](#) flag selected. Also, the order line must be:

- fully backordered
- in open status

In addition, if the Use OROB for Fulfillment Assignment (M31) system control value is selected or the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS and the original order is a ship-for-pickup order, the order or order line can include the following; otherwise, the order or order line cannot include the following.

- be gift wrapped
- have any special handling

 **Note:**

only custom special handling instructions are sent to Order Orchestration in the submit order request; however, the system does not prevent items with standard special handling from being sent to Order Orchestration

- have a future arrival date or be flagged as a future order
- be for a customer flagged to bypass reservation

If the Use OROB for Fulfillment Assignment (M31) system control value is set to ALWAYS, the originating location passed to Order Orchestration on a delivery order is the location defined in the [Originating Location to Pass to OROB \(M32\)](#) system control value.

Also, if the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS, the order line can be on a ship-for-pickup order; otherwise, if this system control value is set to NEVER or blank, order lines on a ship-for-pickup order are not eligible for submission to Order Orchestration to determine fulfillment assignment and instead are sent to Order Orchestration during pick slip generation and drop ship order processing time; see [Ship-for-Pickup Orders](#).

Regardless of the settings of the Use OROB for Fulfillment Assignment (M31) and Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control values, the order line must not be:

- Flagged as a drop ship item
- A retail pickup or delivery order received from Order Orchestration
- A main set item or a set component
- A membership item
- A stored value card item
- A non-inventory item

Order Administration does not consider the item's *Projected returns* quantity, if any, when determining whether the item is eligible for fulfillment through Order Orchestration.

Also, the order must be:

- Open, if the Send Held Orders to OROB (M18) system control value is unselected; otherwise, the order can be held. In this case, the order's *Under Review* flag is selected. See the system control value for more information.
- Fully paid and authorized. If the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value is selected, ship-for-pickup orders are authorized for verification only and payment is collected when the customer picks up the items at the store.

System control values: If the Use OROB for Fulfillment Assignment (M31) system control value is selected or if the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS and the original order is a ship-for-pickup order, regardless of the setting of the following system control values, the system sends items to Order Orchestration for fulfillment assignment. Otherwise, the following system control values also determine whether an order line is eligible to send to Order Orchestration for fulfillment:

- [Order Broker Due Date Threshold \(K11\)](#): the system does not send an item to Order Orchestration if the item is expected on an open purchase order line for the related warehouse with a due date within the threshold defined in this system control value.
- [Order Broker Include Ship Complete Orders \(K12\)](#): if this system control value is unselected, the system does not send items to Order Orchestration that are on an order flagged to ship complete.
- [Order Broker Include Coordinate Grouped Orders \(K13\)](#): if this system control value is unselected, the system does not send items to Order Orchestration that are coordinate grouped with other items.
- [Order Broker Include Gift Orders \(K14\)](#): if this system control value is unselected, the system does not send items to Order Orchestration that are on a gift order.

Sellout prevented: If an order line meets all of the criteria, it is brokered even if the item is flagged with a soldout control code. See [Brokering Items with Soldout Control Codes](#) for a discussion.

BROKER Periodic Function

The BROKER periodic function submits orders to Order Orchestration if they were not eligible for submission when they were created. For example, the periodic function submits order lines if:

- Your company was not configured to send brokered backorders to Order Orchestration when the order was created.
- The order was in held status at initial creation and was subsequently released from hold, and the Send Held Orders to OROB (M18) system control value is unselected.
- The order previously included an active PO item (see [About Active PO Items](#) for background).
- The order line was partially reserved, but then the reserved quantity was shipped and there is still a backordered quantity remaining on the order line. The order line is not eligible to be submitted to Order Orchestration until any reserved quantity is printed and shipped.

 **Note:**

This situation occurs only if the Use OROB for Fulfillment Assignment (M31) system control value is unselected; also, this situation does not apply to ship-for-pickup orders sent to Order Orchestration for fulfillment assignment.

 **Note:**

When the periodic function submits an order line as a brokered backorder, the function performs all the updates described under [Brokered Backorder Fulfillment: Initial Order Creation](#), but also decreases the *Backorder quantity* for the Item Warehouse record, since this quantity had been increased when the line was created.

If an authorization is required, the BROKER function obtains an authorization for the entire order.

See [Additional Order Orchestration Setup in Order Administration](#) for background on setting up the BROKER periodic function.

Brokering Items with Soldout Control Codes

Items that are *OROB eligible* and flagged with a *S/O control* code are still eligible for brokering rather than selling out, provided they meet the [Rules for Submitting Backorders to Order Orchestration](#).

In addition, the following applies if the Use OROB for Fulfillment Assignment (M31) system control value is unselected and the order is not a ship-for-pickup order.

If the soldout control status is:

- sell out immediately: the item is eligible for brokering even if there is an available quantity in an allocatable warehouse.
- include on-order: the item is eligible for brokering if it is backordered. There cannot be an open purchase order that could fulfill the order that is due within Order Orchestration Due Date Threshold (K11), if specified. If no Order Broker Due Date Threshold (K11) is specified, the item is eligible for brokering regardless of open purchase orders. The *Projected returns* quantity, if any, for the item is not evaluated; see Projected Returns for background on how you can use the *Projected returns* quantity to prevent selling out items in certain situations.
- exclude on-order: the item is eligible for brokering if it is backordered, regardless of whether there are any open purchase orders.

If the item is unfulfillable: If Order Orchestration is unable to fulfill an order line, the line returns to standard backorder or soldout processing. The process flow is:

- An item is assigned a soldout control value and would be sold out on the order if the item were not *OROB eligible*. Order Administration submits the order line to Order Orchestration, but there is no store location that can fulfill the item, so Order Orchestration returns a status of Unfulfillable.
- When Order Administration receives the status update from Order Orchestration, it changes the order line status to sold out (S) if the order line is currently eligible to sell out based on the soldout control value and availability.
- The next time you use the [Processing Auto Soldout Cancellations \(MASO\)](#) option, the soldout line is listed on the [Auto Soldout Register](#), even though it did not sell out through Process Auto Soldouts and even if it is not assigned a soldout control status of 1 (sell out immediately).
- The next time you use the Generating Soldout Notifications (MSON) option, Order Administration generates a soldout notification.

The same processing occurs if Order Orchestration returns an error for the brokered order line.

Gift wrap or special handling: Based on the [Rules for Submitting Backorders to Order Orchestration](#), if the Use OROB for Fulfillment Assignment (M31) system control value is unselected or the order is not a ship-for-pickup order, an order line is not eligible for brokering if it is flagged for gift wrap or special handling. If gift wrap or special handling applies to the item:

- When the order line is initially created, then the line does not broker; instead, it sells out or remains backordered, as if it were not flagged as *OROB eligible*. This is the case when the order API or ecommerce interface creates the order.

- After the order line is initially created (for example, by selecting Special Handling for the line in order entry), then if the soldout control status is:
 - sell out immediately: the line sells out the next time you use Processing Auto Soldout Cancellations (MASO).
 - include on-order quantity or exclude on-order quantity: the line does not sell out automatically.

You can use a backorder report to identify order lines that could not be brokered because of gift wrap or special handling, and that did not sell out automatically. See [Order Status and Activity Reports](#) for more information.

Future orders: If the Use OROB for Fulfillment Assignment (M31) system control value is unselected or the order is not a ship-for-pickup order, future orders are not eligible to be brokered; in this situation, items flagged *OROB eligible* and assigned soldout control values sell out automatically on future orders, just as they would if they were not flagged *OROB eligible*. Once an order is no longer considered a future order, *OROB eligible* items on the order can be brokered through the BROKER periodic function if they meet the [Rules for Submitting Backorders to Order Orchestration](#).

If reserving against a non-allocatable warehouse: Based on the [Reserve from Non-Allocatable Warehouse \(J25\)](#) and [Disregard Soldout Controls for Non-Allocatable Warehouses \(J27\)](#) system control values, you can reserve inventory against a non-allocatable (retail) warehouse for a retail order, and disregard an item's soldout control assignment. In this case, even if the item's *OROB eligible* field is selected, the item reserves against the non-allocatable (retail) warehouse if the order type is associated with that warehouse and there is inventory in that warehouse.

Things to Note About Brokered Backorders

Canceling order lines: It is important to confirm that the remote store location assigned to fulfill the order line has not begun the shipment process before you cancel an order line or Order Orchestration request in Order Administration. Depending on the Order Broker Status Update Interval (K10), the most current information about the Order Orchestration request in Order Administration might be out of date.

Freight charges included? Freight charges for the order are included in the SubmitOrder message only if the Use Split Order (L56) system control value is selected.

Customer address updates: If you change the customer's name or address in Order Administration after generating the initial Order Orchestration request, the Order Orchestration integration does not send this updated information to the assigned fulfilling location. For ship-for-pickup orders, the system does not allow you to change the store location defined as the one-time ship-to address on the order once the order is accepted.

Held orders submitted? When the Send Held Orders to OROB (M18) system control value is unselected, if an order is initially created in held status and then released from hold, Order Administration does not automatically submit the order to Order Orchestration. To submit the order, you can run the [BROKER Periodic Function](#) (program PFR0083). See [Order Orchestration Configuration](#) for background.

Order lines not resubmitted: If an order line has previously been submitted to Order Orchestration and the Order Orchestration request was flagged as unfulfillable or put in error status, the BROKER periodic function does not resubmit the order line to Order Orchestration for fulfillment.

Reserve quantity limit: If an order line exceeds the [Reserve qty \(Reserve quantity limit\)](#) specified for an item, Order Administration still submits the order line to Order

Orchestration for fulfillment, provided the line is eligible based on the [Rules for Submitting Backorders to Order Orchestration](#).

Inventory transaction history: If the [Create Item Transaction History for Non-Inventory Items \(E39\)](#) system control value is selected, Order Administration writes a NONINVISSU transaction record when the BROKER process receives a status update indicating that the assigned location has shipped the order or line. See that system control value for more information.

Backorder notices: The [Generate Backorder Notices \(GBOC\)](#) option does not generate backorder notices for an order line when it has an Order Orchestration request in process; however, if the status of the Order Orchestration request changes to unfulfillable (U) or error (E), or if you cancel the Order Orchestration request (Z) without canceling the order line itself, the order line returns to standard backorder processing and is eligible to have backorder notices generated.

Tracking numbers in shipment confirmation email: If the fulfilling location supplies information on the shipping agent and a tracking number, Order Orchestration passes this information to Order Administration. If the shipping agent matches a valid ship via code in Order Administration, the shipment confirmation email lists the description of the ship via and the tracking number as a live link. Otherwise, if the shipping agent does not match a ship via set up in Order Administration, then the shipment confirmation lists the shipping agent as it was passed from Order Orchestration, and the tracking number is plain text.

**Note:**

If a brokered backorder ships on the same day as a warehouse shipment, the shipment confirmation email includes just the tracking number for the brokered backorder. This occurs regardless of whether you consolidate invoices.

See the [Shipment Confirmation Email Sample and Contents](#) for more information, and see the *OrderShipmentLineDetail* for detailed mapping.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

**Important:**

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

Tracking numbers in customer history API: If Order Orchestration passes the shipping agent and a tracking number, the *Detailed Order Inquiry Response XML Message (CWORDEROUT)* includes this information provided Order

Administration can link the line number, shipping agent, and tracking number from the Order Transaction History messages to the invoice based on date.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Example:

The fulfilling location supplies information on the shipping agent and the tracking number to Order Orchestration, and Order Orchestration passes this information to Order Administration.

Order Administration writes Order Transaction History records such as:

```
SHIPMENT Ln#: 5 Store Shipped Order  
SHIPMENT ----VIA: ABC  
SHIPMENT ----TRK#: ABI123
```

The Order Transaction History records have the same date as the invoice.

The CWORDEROUT message passed through the customer history API includes the tracking information, for example:

```
<Shipment invoice_nbr="123456" invoice_ship_quantity="1"  
invoice_ship_date="11292011" invoice_tracking_nbr="ABI123"  
invoice_ship_via_desc="ABC"/>
```

 **Note:**

- If Order Administration writes the Order Transaction History for the shipment of a brokered backorder on a date that differs from the invoice date, then no tracking information is included in the customer history response. This situation might occur if, for example, Order Administration receives the status update of the shipment before midnight, but the billing async job does not create the invoice until after the job is automatically stopped and restarted, so that the next date is assigned to the invoice.
- The tracking information from Order Orchestration is not available as a live link on screens.

Other Order Orchestration orders not eligible: Order Administration does not submit a backordered delivery or retail pickup order to Order Orchestration for fulfillment. In addition, if the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER or blank, Order Administration does not submit a backordered ship-for-pickup order to Order Orchestration for fulfillment.

Line_locate_eligible flag in the CWORDEROUT message: If the Send B/O to OROB (K08) system control value is selected, the *Detailed Order XML Response* (CWORDEROUT) message used in the generic order API includes a flag for each order line to indicate whether the order line meets the [Rules for Submitting Backorders to Order Orchestration](#). Even if this flag is set to Y, it is possible that the line cannot be fulfilled as a brokered backorder if, for example, Order Orchestration does not find a location that has the item available.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

The *Generic Customer History API* also uses the CWORDEROUT message. The message includes the `line_locate_eligible` flag if the order line is still open. In the case of the generic customer history API, the `line_locate_eligible` flag might be set to Y even if, for example, the line was already submitted to Order Orchestration, and then returned to normal backorder processing because Order Orchestration did not find a location to fulfill it.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Order Orchestration requires postal code: If the shipping address on a brokered backorder does not include a postal code, the Order Orchestration Order Orchestration rejects it. The *Require postal code?* flag for the country determines whether a postal code is required. See [Setting Up the Country Table \(WCTY\)](#) for background.

Reviewing brokered backorders in order inquiry: You can use the [Brokered Backorder Summary Screen](#) to review the current status of all brokered backordered lines on a single order. Also, you can select D/S Status for a single brokered backorder line at the [Order Inquiry Detail Screen](#) to advance to the [Display Order Broker Details Screen](#), where you can review a single brokered backorder line on the order.

The OBR status remains on each order line that is fully or partially fulfilled through Order Orchestration as a brokered backorder. This status is displayed on the [Order Inquiry Detail Screen](#).

The original backorder reason remains on the order line after fulfillment through Order Orchestration as a brokered backorder. This reason is displayed on the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#). Typically, the backorder warehouse also remains on the order line as well, and is displayed on the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#); however, if a shipment from the warehouse follows the fulfillment through Order Orchestration, the backorder warehouse field is cleared.

Order Orchestration Originating Location, Fulfilling Location, and Pickup Location

The screens in the [Working with Order Broker \(WOBR\)](#) menu option display the following types of locations: originating, fulfilling, and pickup.

- The *Originating location* is the location (store or warehouse) where the order originated. This location displays as the *Placed* location in Order Orchestration.
- The *Fulfilling location* is the location supplying the inventory for the order. This location displays as the *Sourced* location in Order Orchestration.
- The *Pickup location* is the location where the customer picks up the order; this location does not display for orders that are shipped to the customer. This location displays as the *Pickup* location in Order Orchestration.

The following table explains how the system determines the originating, fulfilling, and pickup locations for each broker delivery type.

Broker delivery type	Originating location	Fulfilling location	Pickup location
blank (brokered backorder for delivery or ship-for-pickup)	<p>an Order Administration warehouse</p> <p>this is the <i>location_cd</i> in the <i>store_location</i> element of the submit order request message:</p> <ul style="list-style-type: none"> if the <i>transaction_type_id</i> is DELIVERY and the Use OROB for Fulfillment Assignment (M31) is unselected, from the OROB Default Location (K51) if the <i>transaction_type_id</i> is DELIVERY and the Use OROB for Fulfillment Assignment (M31) is selected or the <i>transaction_type_id</i> is SHIPFORPICKUP, from the Originating Location to Pass to OROB (M32) 	<p>the store location or Order Administration warehouse assigned to ship the item to the customer</p> <p>this is the <i>fulfillment_location_cd</i> in the <i>fulfillment_detail</i> element of the submit order response message; when a status request response message is received, the location may update based on the <i>fulfilling_location_cd</i> in the <i>items</i> element</p>	<p>delivery: N/A; the order is shipped to the customer</p> <p>ship-for-pickup: this is the <i>location_cd</i> in the <i>shipforpickup_location</i> element of the submit order request message: from the store code in the one-time ship-to address</p>
delivery	<p>a store location or Order Administration warehouse</p> <p>this is the <i>request_location_cd</i> in the <i>store_location</i> element of the fulfillments response message</p>	<p>an Order Administration warehouse</p> <p>this is the <i>location_cd</i> in the <i>store_location</i> element of the fulfillments response message</p>	<p>N/A; the order is shipped to the customer</p>
store pickup	<p>an Order Administration warehouse</p> <p>this is the <i>location_cd</i> in the <i>store_location</i> element of the submit order request message: from the OROB Default Location (K51)</p>	<p>the store location the customer has selected to pick up the order; the inventory is available at this location and does not need to be transferred there</p> <p>this is the <i>fulfillment_location_cd</i> in the <i>fulfillment_detail</i> element of the submit order response message</p>	<p>the store location where the customer has selected to pick up the order</p> <p>this is the <i>location_cd</i> in the first <i>transaction_detail</i> element of the submit order request message: from the location, selected at the Store Pickup Search Results Screen, where the customer wants to pick up the order</p>

Broker delivery type	Originating location	Fulfilling location	Pickup location
retail pickup (traditional retail pickup and retail pickup created as a result of a brokered ship-for-pickup)	the store location where the customer would like to pick up the merchandise this is the <i>request_location_cd</i> in the <i>store_location</i> element of the fulfillments response message	an Order Administration warehouse this is the <i>location_cd</i> in the <i>store_location</i> element of the fulfillments response message	the store location where the customer has selected to pick up the order this is the <i>location_cd</i> in the <i>shipforickup_location</i> element of the fulfillments response message
ship-for-pickup (pick gen/drop ship)	an Order Administration warehouse this is the <i>location_cd</i> in the <i>store_location</i> element of the submit order request message: from the OROB Default Location (K51) if the Send Inventory by Warehouse to OROB (L06) system control value is unselected or for a drop ship item; otherwise, from the OROB location from the warehouse associated with the order	an Order Administration warehouse this is the <i>location_cd</i> in the <i>transaction_detail</i> element of the submit order request message: from the OROB Default Location (K51) if the Send Inventory by Warehouse to OROB (L06) system control value is unselected or for a drop ship item; otherwise, from the OROB location from the warehouse associated with the order	the store location where the customer has selected to pick up the order this is the <i>location_cd</i> in the <i>shipforpickup_location</i> element of the submit order request message: from the store code in the one-time ship-to address

Location description: Even if the location is a warehouse within your company in Order Administration, the description of the location is from the cross-reference record set up through [Work with Store Cross Reference \(WSCR\)](#), and is separated from the code by a hyphen. For example, a request assigned to warehouse 10, East Coast DC, lists a location of 10 - East Coast. Although the location code field in the Order Administration database is 25 positions, you cannot create a code that exceeds 10 positions in Order Orchestration.

 **Note:**

- The location description is stored in the Order Orchestration table. Entering or updating a location cross reference through Work with Store Cross Reference (WSCR) does not update the originating location displayed here.
- The location description displayed here is blank if you had not set up the cross reference at the time the response was received from Order Orchestration.
- Even if the location is an Order Administration warehouse, the warehouse description is not displayed here; you need to set up the cross-reference through Work with Store Cross Reference (WSCR).

When is the fulfilling location blank? The fulfilling location is blank for:

- *store pickup orders*: if you canceled the order in Order Administration. If another location sent a cancel request to Order Orchestration, which relayed it to Order Administration through a status inquiry request, the Order Orchestration record retains the fulfilling location; however, if a single line on a store pickup order is rejected, the entire order (including any additional lines) is canceled, and in this situation the fulfilling location is blank for all items except the rejected item.
- *brokered backorders* whose status is:
 - **Z: Canceled**
 - **C: Closed**
 - **J: Rejected**
 - **R: Ready**
 - **W: Waiting**

The field might also be blank for requests in E: Error status, depending on the nature of the error. For example, requests that Order Orchestration did not receive and create successfully are not assigned to fulfilling locations.

Unfulfillable status: If Order Orchestration was unable to find a location to fulfill a brokered backorder, the fulfilling location matches the OROB Default Location Code for Unfulfillable Orders (K56) system control value. In this situation, the current status is Unfulfillable.

Order Orchestration Status Summary Table

The following table summarizes the status codes displayed at the screens in the [Working with Order Broker \(WOBR\)](#) menu option.

OACS status	OOCS status	Order types	Description
A (Accepted)	<i>Accepted or Picked</i>	brokered backorder (delivery or ship-for-pickup) or store pickup	The location assigned to fulfill the order has accepted it, or has accepted the order and is preparing it for shipment or pickup.
C (Closed)	N/A	brokered backorder (delivery or ship-for-pickup)	You canceled the request when its status was R (Ready), before it was submitted to Order Orchestration.
E (Error)	N/A	Any order type	Order Orchestration has returned an error response. See Troubleshooting the Order Orchestration Integration for information on some possible errors. A record might also be in Error status if another system submitted a status update request to Order Orchestration to cancel the order line.
F (Picking)	<i>New_Order or Picked</i>	retail pickup, delivery, or ship-for-pickup (pickgen/drop ship)	The pick slip has been printed.

OACS status	OACS status	Order types	Description
G (Resend Fulfilled)	N/A	delivery	The Order Status Update request message to change the status in Order Orchestration to fulfilled did not generate a response message from Order Orchestration, possibly because message authentication failed or communication is down. In this case, the BROKER_ORD job re-sends the Order Status Update request the next time it runs.
H (Resend Intransit)	N/A	ship-for-pickup	The Order Status Update request message to change the status in Order Orchestration to intransit did not generate a response message from Order Orchestration, possibly because message authentication failed or communication is down. In this case, the BROKER_ORD job re-sends the Order Status Update request the next time it runs.
I (In Process)	<i>Accepted</i>	retail pickup or delivery	The order was received from Order Orchestration and created without error.
J (Rejected)	unknown (order reassigned to new fulfilling location)	retail pickup or delivery	The order was sold out after creation in Order Administration.
K (Acknowledged)	<i>New_Order</i>	brokered backorder (delivery or ship-for-pickup) or store pickup	Order Orchestration has received the order request, assigned a request ID, selected a fulfilling location (brokered backorder), and created the order in its database.
L (Partial Fulfill)	<i>Partially Fulfilled</i>	retail pickup, ship-for-pickup, or store pickup	The customer has picked up one or more items on the order, but not the complete order.
N (New)	<i>Polled</i>	retail pickup or delivery	The order was received from Order Orchestration but is in error.
O (Posted)	<i>Posted</i>	brokered backorder, store pickup, or ship-for-pickup	Order Orchestration has submitted the order or order line for enterprise fulfillment. See Enterprise Order Integration (Future Receipts and Active PO/Pre-Order Processing) for background.
P (Polled)	<i>Polled</i>	Any order type	Brokered backorder (delivery or ship-for-pickup) or store pickup: The assigned fulfilling location has polled Order Orchestration for new orders and been notified of this order. Retail pickup or delivery order: Order Administration created the order in held status.

OACS status	OACS status	Order types	Description
R (Ready)	N/A	brokered backorder (delivery or ship-for-pickup), store pickup	<p>Brokered backorder: The request is ready to be sent to Order Orchestration, but the BROKER_ORD process has not yet generated the request message.</p> <p>Store pickup: Order Administration attempted to send the order to Order Orchestration, but Order Orchestration has not responded. In this case, Order Administration retains the order information in the Store Pickup tables until communication with Order Orchestration resumes.</p>
S (Received by Store)	<i>Received</i>	brokered backorder (ship-for-pickup), retail pickup or ship-for-pickup	<p>The order has been received by the store location but not yet picked up by the customer.</p> <p>NOTE: This status is not displayed for ship-for-pickup or retail pickup orders that are actually in this status in Order Orchestration after Order Administration has submitted a status update message to Order Orchestration indicating that the merchandise is in transit to the pickup location; instead, the displayed status is X (Completed).</p>
T (In Transit)	<i>Intransit</i>	brokered backorder (ship-for-pickup), retail pickup or ship-for-pickup	<p>Ship-for-pickup: The location fulfilling the order has shipped the merchandise to the store for pickup.</p> <p>NOTE his status is displayed for ship-for-pickup if Use OROB for Ship for Pickup Fulfillment Assignment (M34) is set to ALWAYS; however, it is not displayed for retail pickup orders, or for ship-for-pickup orders if Use OROB for Ship for Pickup Fulfillment Assignment is set to NEVER, if the orders are actually in this status in Order Orchestration after Order Administration has submitted a status update message to Order Orchestration indicating that the merchandise is in transit to the pickup location; instead, the displayed status is X (Completed).</p>
U (Unfulfillable)	N/A (brokered backorder) or <i>Rejected (store pickup)</i>	brokered backorder (delivery or ship-for-pickup) or store pickup	<p>Brokered backorder: Order Orchestration has not found a location able to fulfill the order based on the rules set up in Order Orchestration. When it receives a response indicating that Order Orchestration cannot fulfill the order, Order Administration returns the order line to standard backorder or soldout processing.</p> <p>Store pickup: the assigned store location has rejected the order.</p>

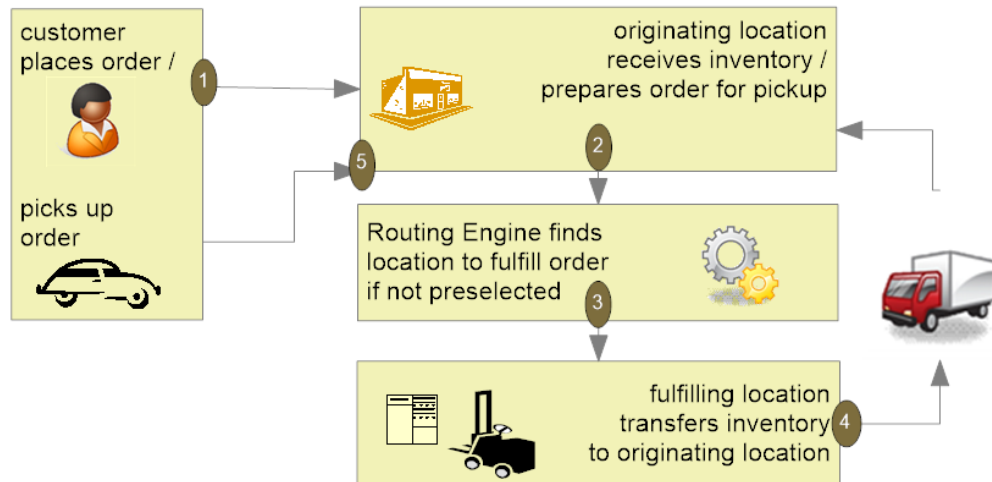

OACS status	OACS status	Order types	Description
V (In Transit Polled)	<i>Intransit Polled</i>	brokered backorder (ship-for-pickup), retail pickup or ship-for-pickup (pick gen/drop ship)	<p>The pickup location for a ship-for-pickup order line:</p> <ul style="list-style-type: none"> has received the order line in the intransit response message, if the system is not flagged to Require Status Update; or has sent a status update request changing the status to intransit polled. <p>Only the pickup location for a ship-for-pickup order can update the status to intransit polled. This status applies only to ship-for-pickup orders.</p> <p>NOTE: This Status is not displayed for ship-for-pickup or retail pickup orders that are actually in this status in Order Orchestration after Order Administration has submitted a status update message to Order Orchestration indicating that the merchandise is in transit to the pickup location; instead, the displayed status is X (Completed).</p>
W (Waiting)	unknown	brokered backorder (delivery or ship-for-pickup)	<p>The order request message has been sent to Order Orchestration, but Order Administration has not yet received a response.</p>
X (Completed)	<i>Fulfilled</i>	all order types	<ul style="list-style-type: none"> Brokered backorder (delivery or ship-for-pickup): The fulfilling location assigned by Order Orchestration has shipped the item to the customer or the customer has picked up the entire order from the store. When Order Administration receives a status update indicating that the order line has been shipped, it bills the order line and saves the ship via and tracking number, if indicated in the response message, to the Order Transaction History table. Delivery: You have confirmed shipment of the order to the customer. Retail pickup, ship-for-pickup (pick gen), or store pickup: The customer has picked up the entire order. <p>NOTE: This status is also displayed for retail pickup orders, and ship-for-pickup orders if Use OROB for Ship for Pickup Fulfillment Assignment (M34) is set to NEVER, after Order Administration has submitted a status update message to Order Orchestration indicating that the merchandise is in transit to the pickup location, even if the customer has not yet picked up the order.</p>

OACS status	OACS status	Order types	Description
Y (Pending Cancel)	unknown	brokered backorder (delivery or ship-for-pickup), store pickup, retail pickup, delivery, or special ship-for-pickup	<p>Brokered backorder: You have canceled the order line (including the Order Orchestration request), or you have canceled just the Order Orchestration request at the Work with the Order Orchestration Screen, but you have not yet received a confirmation of the cancellation from Order Orchestration.</p> <p>Store pickup: You have canceled the order, but you have not yet received a confirmation of the cancellation from Order Orchestration.</p> <p>Retail pickup, delivery, or special ship-for-pickup: You have voided the pick slip through the generic pick in API and the Cancel Reason (Pick In) (L86) system control value specifies a cancel reason, or a backorder cancellation reason code is specified in the <i>CWPickIn XML Message</i>, but you have not yet received a confirmation of the cancellation from Order Orchestration.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
Z (Canceled)	<i>Canceled</i>	brokered backorder (delivery or ship-for-pickup), store pickup, special ship-for-pickup, or retail pickup	<p>You have requested that the Order Orchestration order be canceled, and Order Orchestration has confirmed the cancellation. If the order line itself is not canceled, it returns to regular backorder processing.</p> <p>Note: If a status inquiry list response from Order Orchestration indicates that a brokered backorder line is canceled, the original Order Administration order line is put in error status; as a result, the canceled order line is either reserved, backordered, or sold out in Order Administration. If there is a fulfilling (bounceback) order that was created in Order Administration, it is put in Held status, with an order transaction history note of Order held - line[s] canceled in Order B.</p>

Retail Pickup (including Ship-for-Pickup) or Delivery Orders

Overview: Use the retail pickup or delivery options in the [Order Orchestration Integration](#) to receive orders from Order Orchestration in order to fulfill the orders in Order Administration.

- If the order is a retail pickup order or a retail pickup order that originated as a ship-for-pickup order, Order Administration ships the merchandise to the customer-selected store location for pickup.
- If the order is a delivery order, Order Administration ships the merchandise to the customer's ship-to address.

If the originating location was Order Administration: If the [Use OROB for Fulfillment Assignment \(M31\)](#) system control value is selected or the [Use OROB for Ship for Pickup Fulfillment Assignment \(M34\)](#) system control value is set to ALWAYS, the order may have originated in Order Administration and during [Brokered Backorders](#) processing, Order Orchestration determined that Order Administration was the best fulfilling location. In this situation:

- Order Orchestration assigns the Order Administration location to the originating order in Order Orchestration as the *Fulfilling location*. See [Brokered Backorders](#) for additional processing information.
- At defined intervals, the BROKER process in Work with Integration Layer Processes (IJCT) periodically sends a fulfillments request message to Order Orchestration to poll for newly assigned orders (those whose *Fulfilling location* is an Order Administration location). See [Retail Pickup \(including Ship-for-Pickup\) and Delivery Order Processing](#) for additional processing information.
- When the BROKER process receives the order in the fulfillments response message, it looks at the values in the fulfillments response to determine the type of order to create.
 - The system creates a new delivery order if the *transaction_type_id* is DELIVERY.
 - The system creates a new retail pickup order if the *transaction_type_id* is RETAILPICKUP or SHIPFORPICKUP.

See [Building the Retail Pickup \(including Ship-for-Pickup\) or Delivery Order](#) for additional information.

- In order to tie the originating order (the original order sent to Order Orchestration for fulfillment assignment) with the new sourcing order (the delivery or retail pickup order created to fulfill the original order), Order Administration stores the originating order number in the *E-commerce order number* field in the Order Header Extended table for the newly created sourcing order and prefixes the order number with the text ORIG#: . For example, the system updates the *E-commerce order number* with ORIG#: 9999-001, where ORIG#: indicates the order has been created as a result of Order Orchestration fulfillment assignment, 9999 is the order number, and 001 is the ship-

to number. See [Reviewing Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders in Order Inquiry](#) for additional information.

In this topic:

- [Building the Retail Pickup \(including Ship-for-Pickup\) or Delivery Order](#)
- [Retail Pickup \(including Ship-for-Pickup\) or Delivery Processing after Order Creation](#)
- [Reviewing Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders in Order Inquiry](#)
- [Things to Note about Retail Pickup \(including Ship-for-Pickup\) and Delivery Orders](#)

For more information: See [Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration](#).

Retail Pickup (including Ship-for-Pickup) and Delivery Order Processing

Poll for orders? If both the [Order Type for Orders Brokered for Delivery \(K91\)](#) and [Order Type for Retail Pickup Orders Brokered to OROMS \(K92\)](#) system control values specify order types, the BROKER process in [Working with Integration Layer Processes \(IJCT\)](#) periodically sends a fulfillments request message to Order Orchestration to poll for newly assigned orders. The polling interval is based on the *Outbound delay time* specified for the BROKER process.

fulfillments request: Information in the fulfillments request message includes:

- requesting location: From the [OROB Default Location \(K51\)](#) if the [Send Inventory by Warehouse to OROB \(L06\)](#) system control value is unselected; otherwise, from the OROB location from each warehouse that has this field populated. The requesting location must match an existing location set up in Order Orchestration.
- message source and requesting system: From the [OROB System \(K50\)](#).
- destination: From the [OROB Account \(K49\)](#).

See the Fulfillments Request Message Sample (Retail Pickup, Ship-for-Pickup, or Delivery Orders) in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for an example.

The endpoint where Order Administration sends the fulfillments request message is specified in [Working with Customer Properties \(PROP\)](#).

Create order? When the BROKER process receives an order in the fulfillments response message, it:

- Checks the setting of the [Retain Backordered Lines Brokered to OROMS \(K89\)](#) system control value. If this value is unselected and there is not a purchase order that might be able to fulfill the order expected within the [Order Broker Due Date Threshold \(K11\)](#), the process rejects the order. The process uses the [Send Inventory by Warehouse to OROB \(L06\)](#) system control value to determine whether to check a specific warehouse, or to check across all warehouses.
- Regardless of the setting of the [Retain Backordered Lines Brokered to OROMS \(K89\)](#) system control value, if the only item on the order is sold out, the process rejects the order.

 **Note:**

- Drop ship items are eligible to be fulfilled on a retail pickup or delivery order regardless of whether any units are currently stocked in the warehouse, provided they are not flagged with a soldout control value.
- If a retail pickup or delivery order includes multiple order lines, and one of them is sold out, Order Administration still accepts the order. To avoid this situation, have integrating systems submit each order line as a separate order.

Multiple order lines? Submit each ordered unit to Order Orchestration as a separate order. Sending orders this way prevents any inconsistencies in order status that might occur if, for example, a multi-line order in Order Administration included a soldout item, but the other order lines could still be shipped from the warehouse, or if a multi-unit line was split across different warehouses for fulfillment.

Building the Retail Pickup (including Ship-for-Pickup) or Delivery Order

The processing to build a new retail pickup or delivery order from the contents of the fulfillments response message is similar to that used by the generic order API. In addition to the system (company) and location (warehouse) sent in the fulfillments request message, the information used to build the order includes the following.

- [Header Information](#)
- [Customer Mapping and Updates](#)
- [Ship-to Information](#)
- [Detail Information](#)
- [Payment Information](#)
- [Order Messages](#)
- [Additional Information on Mapping](#)

Header Information

- order type: from one of the following system control values:
 - [Order Type for Orders Brokered for Delivery \(K91\)](#): the system assigns this order type to delivery orders whose originating location is not Order Administration.
 - [Order Type for Retail Pickup Orders Brokered to OROMS \(K92\)](#): the system assigns this order type to retail pickup orders whose originating location is not Order Administration.
 - [Order Type for Delivery Orders Originating in OROMS \(M33\)](#): the system assigns this order type to delivery orders whose originating location is Order Administration. The system identifies the originating location as Order Administration if the `request_system_cd` in the fulfillments response message matches the system code in the OROB System (K50) system control value.
 - [Order Type for Retail Pickup Orders Originating in OROMS \(M35\)](#): the system assigns this order type to retail pickup orders whose originating location is Order Administration. The system identifies the originating location as Order

Administration if the `request_system_cd` in the fulfillments response message matches the system code in the OROB System (K50) system control value.

The `transaction_type_id` in the fulfillments response message indicates whether the order is a retail pickup or delivery order.

- DELIVERY displays if the order is a delivery order.
- RETAILPICKUP displays if the order is a retail pickup order.
- SHIPFORPICKUP displays if the order is a retail pickup order that originated as a brokered ship-for-pickup order.
- order channel (Internet order): set to C. The `transaction_channel` specified in the fulfillments response message is not used.
- alternate order number: from the order number in the originating system, passed as the `order_id` from the fulfillments response (the external system's order number). The system stores this number in the *E-commerce order number* field in the Order Header Extended table. If the originating location is Order Administration, the system prefaces the alternate order number with `ORIG#: 1234-001`, where `ORIG#:` indicates the order was created as a result of OROB fulfillment assignment, `1234` is the order number, and `001` is the ship-to number.

 **Note:**

The system identifies the originating location as Order Administration if the `request_system_cd` in the fulfillments response message matches the system code in the OROB System (K50) system control value.

- order date: the current date.
- entered date: the current date.
- *source code*:
 - If the order *did* originate in Order Administration:
 - * Use the [Order Broker Source Code \(K93\)](#), if specified; otherwise, if this system control value is blank,
 - * Use the source code, if any, specified for the store cross reference record for the originating location, which is based on the Originating Location to Pass to OROB (M32) system control value; otherwise,
 - * Use the source code passed in the fulfillments response message from Order Orchestration, which would be from the originating order.
 - If the order *did not* originate in Order Administration:
 - * Use the `source_code`, if any, passed in the fulfillments response message from Order Orchestration; otherwise,
 - * Use the source code, if any, specified for the store cross reference record for the originating location; otherwise,
 - * Use the Order Broker Source Code (K93), if specified; otherwise, if this system control value is blank,
 - * The order is created in error status because of the missing source code.

Customer Mapping and Updates

If the [ORCE Customer ID in OROB Fulfillment \(M72\)](#) system control value is NOT selected:

- customer number:
 - if the `customer_no` passed in the fulfillments response is a valid customer number, then use this customer. For example, a `customer_no` of 13827 or 000013827 indicates sold-to customer 13827. Zero-filling the customer number is optional. Otherwise,
 - if the `customer_no` passed is invalid, or if no `customer_no` was passed, then Order Administration uses standard name and address matching. See *Customer Sold To Selection, Creation and Update* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more background.

 **Note:**

If the `customer_no` is invalid, the error is logged in Order Administration's `APP.log` file, even though the order can still be created successfully using the name and address information in the message.

 **Note:**

If the [Sold to Email Update for Orders Brokered to OROMS \(K96\)](#) or [Sold to Address Update for Orders Brokered to OROMS \(K97\)](#) system control values are selected, Order Administration updates the existing customer record with any changed information.

- email address updated? The [Sold to Email Update for Orders Brokered to OROMS \(K96\)](#) system control value indicates whether to update the customer's email address with the email address passed for the order.
- sold-to phone numbers: the `phone1` passed updates the customer's daytime phone number and the `phone2` passed updates the customer's evening phone number if the [Sold to Address Update for Orders Brokered to OROMS \(K97\)](#) system control value is selected. Any non-numeric characters passed in the phone numbers are stripped out.

If the [ORCE Customer Integration \(L37\)](#) system control value IS selected and the [ORCE Customer ID in OROB Fulfillment \(M72\)](#) is not selected:

- customer number:
 - *Matching customer number:* if the `customer_no` passed in the fulfillments response is a valid customer number, then use this customer. For example, a `customer_no` of 13827 or 000013827 indicates sold-to customer 13827. Zero-filling the customer number is optional.

- * If the matching customer based on the customer number has an ORCE customer ID, update the customer and pass the update to Customer Engagement.
- * If the matching customer based on the customer number does not have an ORCE customer ID, update the customer and pass the update to Customer Engagement, then update the customer with the ORCE customer ID returned from Customer Engagement.
- *No matching customer number*: if the `customer_no` passed is invalid, or if no `customer_no` was passed, then Order Administration uses standard name and address matching. See *Customer Sold To Selection, Creation and Update* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more background.
- Order Administration then passes the customer information to Customer Engagement, and updates the customer with the ORCE customer ID returned from Customer Engagement.

 **Note:**

If the `customer_no` is invalid, the error is logged in Order Administration's `APP.log` file, even though the order can still be created successfully using the name and address information in the message.

If the ORCE Customer Integration (L37) system control value IS selected and the ORCE Customer ID in OROB Fulfillment (M72) IS ALSO selected:

- *Matching customer based on ORCE customer ID*: If the ORCE customer ID is passed as the `customer_no`, and a customer with same ORCE customer ID is found, update the customer record if needed but do not send an update to Customer Engagement.
- *No matching customer based on ORCE customer ID*: If the ORCE customer ID is passed as the `customer_no`, but no matching customer based on the ORCE customer ID is found, call out to Customer Engagement to get the customer information based on the ORCE customer ID, and create the customer in Order Administration based on the response from Customer Engagement.
- *No customer_no passed*: Order Administration uses standard name and address matching. See *Customer Sold To Selection, Creation and Update* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more background.
- Order Administration then passes the customer information to Customer Engagement, and updates the customer with the ORCE customer ID returned from Customer Engagement.

Additional customer information updates if not matching based on ORCE customer ID:

- *sold-to name and address*: the information passed in the fulfillments response message is used to create or update the customer; however, if the customer number passed in the fulfillments response is valid and the Sold to Address Update for Orders Brokered to OROMS (K97) system control value is unselected, the process does not update the customer information. If the customer does not already exist, the name is created in all upper case even if passed from Order Orchestration in upper and lower case.
- *apartment or address line 4*:

- If the apartment tag is passed, the first 10 positions are saved as the sold-to apartment number.
 - If no apartment tag is passed, but an address line 4 is passed, the first 10 positions of address line 4 are saved as the sold-to apartment number.
 - If both the apartment tag and address line 4 are passed, then the first 10 positions of the apartment are saved as the sold-to apartment number, as indicated above, and address line 4 is saved as the fourth address line for the sold-to customer.
- email address updated? The Sold to Email Update for Orders Brokered to OROMS (K96) system control value indicates whether to update the customer's email address with the email address passed for the order.
 - sold-to phone numbers: the `phone1` passed updates the customer's daytime phone number and the `phone2` passed updates the customer's evening phone number if the Sold to Address Update for Orders Brokered to OROMS (K97) system control value is selected. Any non-numeric characters passed in the phone numbers are stripped out.

Ship-to Information

- ship complete? from the `ship_complete` setting passed in the fulfillments response message; otherwise, from the [Ship Complete for Orders Brokered to OROMS \(L01\)](#) system control value.
- ship via: from the Order Broker Ship Via (K94) system control value if there is not a valid, numeric `ship_via` passed in the fulfillments response message. If the Order Broker Ship Via (K94) is blank, the [Default Ship Via \(A77\)](#) applies.
- gift order? from the [Gift Flag for Orders Brokered to OROMS \(L03\)](#). This system control value overrides the setting passed in the fulfillments response message.
- freight charges: from the `freight_amount` specified in the fulfillments response message, if any; otherwise, Order Administration calculates freight. If an additional freight charge is specified for the ship via, Order Administration adds it to the order.
- tax: the total of the detail-level `tax amount` passed in the fulfillments response message for each item, plus any tax calculated based on freight and handling charges. The order-level tax amount passed in the message is not used to build the order.
- freight tax override: always selected, regardless of the setting of the [Tax on Freight \(B14\)](#) system control value.
- purchase order number: from the `ref_transaction_no` passed in the fulfillments response message. Displayed at the [Display Order Properties Screen](#) in standard order inquiry and at the [Third Streamlined Order Inquiry Screen \(Order Summary\)](#).
- warehouse: If the Send Inventory by Warehouse to OROB (L06) system control value is selected, this is based on the OROB location for the warehouse sending the fulfillments request message.
- delivery type (retail pickup or delivery): from the `transaction_type_id` specified in the fulfillments response message. SHIPFORPICKUP transaction types map to a retail pickup delivery type.
- ship-to name and address: from the `ship_to` information for the first item on the order; the ship-to information for any additional item(s) is not used. Creates an Order Ship To Address record, which you can review at the [Display Alternate](#)

Address Screen. The one-time ship-to phone number is from the `phone1`, if any, for the first item. If no `phone1` is passed for the first item, then the `phone2` for the first item is used. For a retail pickup order, the ship-to name and address should specify the name and address of the originating store location. The process creates a one-time ship-to address. If the customer does not already exist, the name is created in all upper case even if passed from Order Orchestration in upper and lower case.

- **store location and system:**
 - `location_cd`: the location fulfilling the order. This is the fulfilling, or sourced, location. For delivery and retail pickup orders, this is always an Order Administration warehouse. This is the Store # for the Store Cross Reference record.
 - `system_cd`: Order Administration. This is the OROB System (K50).
 - `request_location_cd`: the location generating the order. This is the originating, or placed, location. This can be a store location or an Order Administration warehouse if the original order was from Order Administration and was brokered for fulfillment assignment. This is the Store # for the Store Cross Reference record.
 - `request_system_cd`: If the order originated in a store, this is the code identifying your POS system, from the System Code, if any, for the Store Cross Reference record; otherwise, from the [Name in OROB for Point of Sale \(L09\)](#). If the order originated in Order Administration, from the System Code, if any, for the Store Cross Reference record; otherwise, from the OROB System (K50).
- **ship-for-pickup location and system:**
 - `location_cd`: the store location where the customer picks up a ship-for-pickup order. This is the pickup location. From the Store # for the Store Cross Reference record.
 - `system_cd`: The code identifying your POS system, from the System Code, if any, for the Store Cross Reference record; otherwise, from the Name in OROB for Point of Sale (L09).

Detail Information

The process creates an order detail line for each item passed in the fulfillments response message. Also:

- `price`: the `unit_price` from the fulfillments response message. Order Administration does not recalculate the price.
- `price override reason code`: from the Order Broker Price Override (K95) system control value.
- `requesting system line number`: from the `requesting_system_line_no` passed in the fulfillments response message. Identifies the line number in the originating system.
- `quantity`: the `qty` from the fulfillments response message.
- `gift wrap`: from the `order_line_gift_wrap` flag setting passed in the fulfillments response message. The gift wrap charge specified in the Item Offer, multiplied by the unit quantity, is included in the *Handling* bucket.
- `order line messages`: from the `order_line_message` passed in the fulfillments response message:
 - If the message passed exceeds the field length of 60 positions, the message is continued on an additional message line.
 - The *Print* flag for the message lines is set to B (both invoices and pick slips).
- `customization`: customization is created for an order line only if:

- the Item Offer associated with the source code on the order header specifies an additional charge code for a custom special handling format that includes a single line of customization instructions, and
- the `customizations` element in the message specifies a `customization_code` and `customization_message`

If:

- there is no custom special handling format specified for the Item Offer, the information from the `customization_code` and `customization_message` are saved as Order Line Messages, with a *Print* flag of P (Picks), and the order is not suspended with an error.
- the special handling format detail specifies any valid responses, and the customization message passed is not one of the responses, the order is suspended with an error of `Input not valid response`
- the special handling format detail specifies a *Max # characters*, and the customization message passed exceeds this length, the order is suspended with an error of `Exceeds max character`

Note:

- Order Administration does not validate that the `customization_code` matches the *Field label* for the special handling format detail.
 - Custom special handling formats that include more than one detail line are not currently supported for retail pickup and delivery orders received from Order Orchestration.
 - Regardless of whether Order Administration creates custom special handling for an order line, any `order_line_customization_charge` is still applied to the *Handling* bucket on the order.
 - The [Evaluate Special Handling Charges by Order Line \(D67\)](#) system control value determines whether to multiply the customization charge passed in the message by the unit quantity.
- Tax amount: from the `tax amount` passed for the item in the fulfillments response message. Order Administration does not recalculate tax for items.

Note:

Only the tax amounts passed at the detail level are added to the order in Order Administration; the `transaction_tax` from the fulfillments response message header level is not used.

Payment Information

- pay type: from the [Order Broker Payment Type \(K98\)](#).
- credit card number: From the description of this pay type.
- suppress deposit flag: set to Y.

- suppress refund flag: set to Y.

 **Note:**

The tender information, if any, passed in the fulfillments response message is not used.

Order Messages

- originating store location: written as an Order Message, for example: `Originating Store: 317`.
- request ID: written as an Order Message, for example: `OROB Request ID: 123456`. This information is also saved in the Order Orchestration record.
- special instructions: the `special_instructions` at the Order level from the fulfillments response message are written as an Order Message in capital letters, for example: `ADD MONOGRAM HEB`.
- additional order messages: the `order_message` is written as one or more Order Message lines:
 - If the message passed exceeds the field length of 60 positions, the message is continued on an additional message line.
 - The *Print* flag for the message lines is set to B (both invoices and pick slips).

 **Note:**

Special instructions passed at the item level in the fulfillments response message are not retained.

See the Fulfillments Response Message Sample in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for an example.

Additional Information on Mapping

If any of the information passed in the fulfillments response message exceeds the maximum field length in Order Administration, the information is truncated.

Order count and demand updates: If the originating location is Order Administration, the system does not increase the order count that is displayed on the [About Application Screen](#) or perform any demand updates for the delivery or retail pickup order.

 **Note:**

The system identifies the originating location as Order Administration if the `request_system_cd` in the fulfillments response message matches the system code in the OROB System (K50) system control value. In this situation, the system prefaces the *E-commerce order number* in the Order Header Extended table with `ORIG#:` 9999-001, where `ORIG#:` indicates the order was created as a result of OROB fulfillment assignment, 9999 is the order number, and 001 is the ship-to number.

Not mapped: The following information is not mapped from Order Orchestration when creating the order in Order Administration:

- order additional freight charges
- order additional charges
- the setting of the *Under Review* flag
- order line extended freight
- the setting of the order line *Ship Alone* flag
- order line ship weight
- item UPC or EAN codes

Response messages: After receiving the fulfillments response message, depending on whether it was able to create the order successfully:

- *order creation successful:* The BROKER process sends a status update message with a status of *Accepted*.
- *order created on hold:* The BROKER process sends a status update message with a status of *Polled*.
- *order in error:* If the [Re-Polling for Orders Brokered to OROMS \(L04\)](#) system control value is:
 - selected: the BROKER process sends a status update message with a status of *Polled*
 - unselected: the BROKER process does not send a status update message

Also, if the order is in error, it is assigned to the Order Broker Error Batch Number (K90).

- *order cannot be created:* If the BROKER process cannot create the order in Order Administration, it sends a status update with a status of *Rejected*.

Order Orchestration record: The process creates an Order Orchestration record regardless of whether the order is in error. The initial status of the Order Orchestration record is *New* if there are any errors; otherwise, it is *In process*.

Canceled by originating system? If the order is initially created in Order Administration in error status and then corrected, Order Administration sends an inquiry request to Order Orchestration before changing the order's status to open. If the response from Order Orchestration indicates that the originating system has canceled the order, Order Administration then puts the order on hold and writes an order transaction history message, such as: *Order held - line[s] canceled in Order B*.

Changing the order in batch order entry: If the order is suspended or in error, you can use batch order entry to make changes to the order, although you cannot add an order line. Once the order is in held or open status, the restrictions described under [Maintaining Retail Pickup or Delivery Orders from the Order Orchestration](#) apply.

Retail Pickup (including Ship-for-Pickup) or Delivery Processing after Order Creation

Checking for canceled or under review retail pickup or delivery orders during pick slip generation: Pick slip generation sends an inquiry to Order Orchestration for all retail pickup and delivery orders eligible for pick slips based on their current status, item availability, and the pick slip selection criteria, to determine whether an eligible order has been canceled in the originating system.

When the response indicates that an order is in canceled status, the program does not generate a pick slip for the order; instead, it puts the order on hold using the Order Broker Hold Reason (Cancel) (L02) system control value.

When the response indicates that an order is under review, the program does not generate a pick slip for the order; instead, it puts the order on hold using the AU hold reason (BROKER ORDER UNDER REVIEW).

Otherwise, Order Administration puts the Order Orchestration record into Picking status when the pick slip is printed and sends a status update message to Order Orchestration indicating that the order or line is in Picked status. Note that this occurs regardless of whether communication with Order Orchestration is successful when pick slip generation sends the inquiry.

Note:

Pick slip generation does not check that the sourcing location for the order is still set to an Order Administration location. For example, a user in Order Orchestration may have changed the sourcing location for the order to a location other than an Order Administration location. In this situation, Order Administration will still generate a pick slip for the order.

Which status request message? Pick slip generation uses the order inquiry status request only if the [Use OROB Status Inquiry List Web Service \(M05\)](#) system control value is set to NO or blank; otherwise, it uses the order status list request. See [Use OROB Status Inquiry List Web Service \(M05\)](#) for details on how Order Administration confirms whether to generate a pick slip for retail pickup and delivery orders.

Streamlined allocation? If there are any retail pickup or delivery orders eligible for pick slip generation, the program can use streamlined allocation only when it uses the status list request. See [Use Streamlined Allocation \(L63\)](#) for background.

Sample messages: See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Shipment confirmation: Once the shipment is confirmed, the Order Orchestration record status changes to Intransit for a retail pickup order, or Completed for a delivery order. The corresponding statuses for the orders in Order Orchestration are Intransit and Fulfilled.

Status updates after shipment of a retail pickup order: Once the Order Orchestration record for a retail pickup is in Intransit Polled status, the order status in Order Administration is X (completed); however the requesting store location still needs to receive the order, notify the customer, and have the customer pick up the order.

Deactivating the payment method: When you ship a retail pickup or delivery order, the billing async job deactivates the payment method. Once the payment method is deactivated, you cannot process a refund against the order unless you add a new payment method.

Sending the ship via and tracking number to Order Orchestration: When you confirm shipment, the BROKER process sends a message to Order Orchestration. The information includes the description of the ship via used (even if it is different from the ship via on the order) and the tracking number, if available.

This information is available for review in Order Orchestration at the Order screen. The actual ship via used and tracking number used are displayed on the History tab.

Status inquiry: The BROKER process includes shipped retail pickup orders in order status inquiry list requests just once a day. The Order Orchestration record might be put in any of the following statuses:

- Received: indicates that the originating store has received the transfer.
- Completed: indicates that the customer has picked up the order.
- Partially fulfilled: indicates that the customer has picked up part of the order.

See [Setting the Daily Status Inquiry Time Window \(all versions\)](#) for more information.

Other status updates after order creation:

Order Orchestration integration supports a business process in which only the originating location cancels a retail pickup or delivery order, since the customer is not necessarily aware that the distribution center can be involved in order fulfillment. As a result:

- Sell out: If you sell out an order line, either in order maintenance or through the Process Auto Soldouts option, Order Administration sends a status update to Order Orchestration indicating the order or order line (based on whether you split orders) was Rejected. Order Orchestration then attempts to reassign the order or line to another location for fulfillment. The Order Orchestration record's status in Order Administration changes to Rejected.
- Cancel: If you cancel an order or order line, Order Administration changes the Order Orchestration record's status to Canceled and sends a status inquiry request to Order Orchestration. If the order's status in Order Orchestration is:
 - Canceled: Order Administration does not send a status update to Order Orchestration; otherwise,
 - If the order's status in Order Orchestration is anything but Canceled, Order Administration sends a status update to Order Orchestration indicating the order was Rejected. In this situation, if Order Orchestration is configured to "reshop" the order and there are any other possible fulfilling locations, Order Orchestration reassigns the order to the next possible location based on the fulfillment rules set up in Order Orchestration, and the order returns to new order status; otherwise, if Order Orchestration cannot "reshop" the order, the order is assigned to the OROB Default Location Code for Unfulfillable Orders (K56), and the order status is unfulfillable.

You cannot cancel a partial quantity of an order line on a retail pickup or delivery order.

 **Note:**

Although Order Administration does not prevent you from canceling a retail pickup or delivery order, some business processes require that only the originating location can cancel an order. In this situation, if the customer contacts the call center to cancel the order, the operator notifies the originating store location and requests that the store perform the cancellation and trigger the status update to Order Orchestration. Using this process, Order Administration receives notification of the cancellation the next time it sends a periodic status inquiry on the order to Order Orchestration, and then holds the entire order (even if only one line was canceled) using the Order Broker Hold Reason (Cancel) (L02).

- Voiding a pick slip for a retail pickup or delivery order: If the Cancel Reason (Pick In) (L86) system control value specifies a valid cancel reason or if a backorder cancellation reason code is specified in the *CWPickIn XML Message*, and you use the generic pick in API to void a pick slip for a retail pickup or delivery order, then Order Administration cancels the order and sends a status update to Order Orchestration to reject the order. Otherwise, if the system control value is blank, you need to use order maintenance to cancel the order and send the status update to Order Orchestration.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- Rejecting the order: If you reject a batch that includes a retail pickup or delivery order, the BROKER process sends a status update rejecting the order; also, it deletes the related Order Orchestration and Order Orchestration History records.

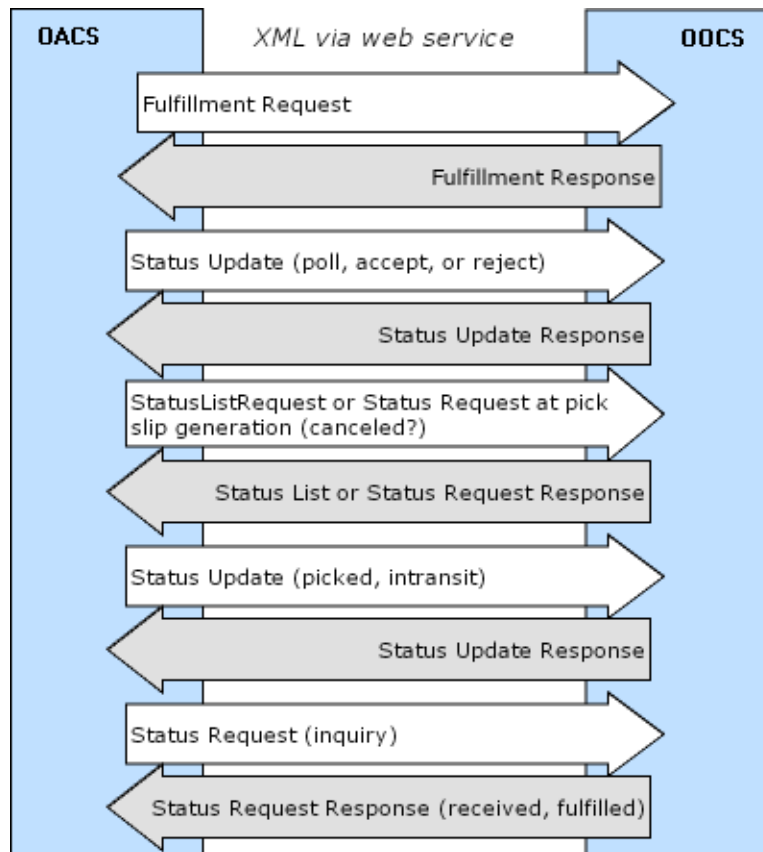

Cancel reason sent? The status update message to reject a retail pickup or delivery order includes a cancel reason code and description if you:

- cancel the order in order maintenance: the entered cancel reason is sent
- void the pick slip: the Cancel Reason (Pick In) (L86) system control value is sent if a backorder cancellation reason code is not specified in the *CWPickIn XML Message*,

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- reject the batch that includes the retail pickup or delivery order: no cancel reason is sent

For more information: See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for a sample of the information sent to Order Orchestration when you cancel a retail pickup or delivery order.

Reviewing Retail Pickup (including Ship-for-Pickup) or Delivery Orders in Order Inquiry

In addition to reviewing information through the [Working with Order Broker \(WOBR\)](#) menu option, you can also use standard order inquiry. Your options include:

- Finding the order number: Use the *Order cross ref #* at the [Order Inquiry Scan Screen](#) to find a retail pickup or delivery order based on the order number in the originating system. This number also displays as the *Alt ord* number at the [Display Order Properties Screen](#). The system stores the originating order number in the *E-Commerce order number* field in the Order Header Extended table. If the originating system is Order Administration, the system prefaces the originating order number with the text *ORIG#:*. For example: *ORIG#: 9999-001*, where *ORIG#:* indicates the order originated in Order Administration, 9999 is the original order number in Order Administration, and 001 is the ship-to number.

Note:

To review all retail pickup and delivery orders whose originating system is Order Administration, you can enter *ORIG#:* in the *Order cross ref #* field and select OK to advance to the Scan by Order Cross Reference # screen where all orders whose *E-Commerce order number* in the Order Header Extended table begin with *ORIG#:* display.

- **Originating order message:** If the *E-Commerce order number* in the Order Header Extended table begins with the text `ORIG#:`, indicating the originating system for a retail pickup or delivery order is Order Administration, the message `This order is fulfilling another order: 9999-001` displays for the sourcing order, where 9999 is the originating order number in Order Administration, and 001 is the ship-to number. This message displays on the Order Inquiry Header screen (OIOM), Order Inquiry Detail screen (OIOM), and in Streamlined Order Inquiry (DORI) for the sourcing order.
- **Broker detail and history:** Use the [Display Order Broker Details Screen](#) to review Order Orchestration Detail and Order Orchestration History, as well as other information such as the delivery type and the request ID.
- **Identifying the Order Orchestration type:** In addition to the [Display Order Broker Details Screen](#), you can also review the Broker delivery type at the [Display Order Properties Screen](#) and the [Display Order Broker Details Screen](#) to determine whether the order originated as a Retail Pickup or Delivery order.
- **Originating store, request ID, and special instructions:** The originating store number and request ID are available for review at the [Work with Order Messages Screen](#), for example:

Originating Store: 317

OROB Request ID: 70122

Also, if any special instructions were passed for the order, this information is also available for review at this screen.

- **Order history:** The [Display Order History Screen](#) displays activity related to sending status updates to and from Order Orchestration, such as:
 - `Ln#: 1 Ready for Fulfillment:` Written for each line received on a retail pickup or delivery order when the order is accepted and put into Open or Held status.
 - `Ln#: 1 Selected for Fulfillment:` Written for each line printed on a pick slip.
 - `Ln#: 1 Fulfilled:` Written for each delivery order line when you confirm shipment.
 - `Ln#: 1 In Transit:` Written for each retail pickup order line when you confirm shipment.

 **Note:**

After you ship a retail pickup order, Order Administration checks for status updates on a daily basis, and writes a single Order Transaction History message for each status change until the order is fulfilled. See [Setting the Daily Status Inquiry Time Window \(all versions\)](#) for setup information.

- `Ln#: 1 Store Received:` Written after the originating store location has received a retail pickup order.
- `Ln#: 1 Customer Partial Pick Up:` Written after the customer has picked up part of a retail pickup order.
- `Ln#: 1 Customer Picked Up:` Written after the customer has picked up all units of a retail pickup order.
- `Ln#: 1 Cancel Acknowledged by Broker:` Written when you cancel an order line in order maintenance or through [Working with Backorders Pending Cancellation \(WBPC\)](#).

- Ln#: 1 Rejected for Fulfillment: Written when Order Administration rejects an order line because the item is soldout or backordered; if you reject the order when it is suspended; or when you sell out a line afterward in order maintenance or through [Processing Auto Soldout Cancellations \(MASO\)](#).
- Order held - line[s] canceled in OROB: Written if Order Orchestration responds to a status inquiry indicating that any of the lines on the order were canceled. In this situation, Order Administration puts the order on hold using the Order Broker Hold Reason (Cancel) (L02).

Things to Note about Retail Pickup (including Ship-for-Pickup) and Delivery Orders

Both system control values required: You need to complete both the Type for Orders Brokered for Delivery (K91) and the Order Type for Retail Pickup Orders Brokered to OROMS (K92) system control values in order for Order Administration to request new orders from Order Orchestration, even if you do not process both order types.

In addition:

- if the Use OROB for Fulfillment Assignment (M31) system control value is selected, you need to complete the Order Type for Delivery Orders Originating in OROMS (M33) system control value in order for Order Administration to assign the correct order type to delivery orders created as a result of the [Brokered Backorders](#) process assigning an Order Administration warehouse to fulfill a brokered backorder.
- if the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS, you need to complete the [Order Type for Retail Pickup Orders Originating in OROMS \(M35\)](#) system control value in order for Order Administration to assign the correct order type to retail pickup orders created as a result of the [Brokered Backorders](#) process assigning an Order Administration warehouse to fulfill a brokered backorder on a ship-for-pickup order.
- if the Send Inventory by Warehouse to OROB (L06) system control value is selected but the OROB location for a warehouse does not specify a valid location in Order Orchestration, the fulfillments request message is not generated.

Discounts: If the customer is eligible for a discount, such as one from a loyalty membership, Order Administration still applies the discount to a retail pickup or delivery order.'

Additional freight: If the ship via on the order is subject to additional freight charges, these charges are added to the order.

Gift flag: The setting of the Gift Flag for Orders Brokered to OROMS (L03) system control value overrides the setting of the *gift* flag passed in the fulfillments response message.

Outbound invoice message: If you generate the CWInvoiceOut message, the message is generated for retail pickup or delivery orders unless excluded based on trigger rules (for example, not including these order types).

Tax: The tax amount for each order detail line is passed as a tax override amount.

Customer matching: If the fulfillments response message from Order Orchestration does not specify a valid sold-to customer number, Order

Administration uses its standard customer name and address matching to either select an existing customer or create a new customer.

Oracle Retail Customer Engagement customer integration: If you use the [Customer Engagement Customer Integration](#), Order Administration may also new customer records in Oracle Retail Customer Engagement as part of creating retail pickup and delivery orders. See [Building the Retail Pickup \(including Ship-for-Pickup\) or Delivery Order](#) for more information.

Order maintenance: The [Maintain Brokered Fulfillment Orders \(B20\)](#) secured feature controls the ability to maintain a retail pickup or delivery order. Even if you have authority under this secured feature, your ability to maintain the order is limited. For example, you cannot add or change an order line. See [Maintaining Retail Pickup or Delivery Orders from the Order Orchestration](#) for a discussion.

Creating the invoice for a ship-for-pickup order: The [Invoice Ship For Pickup Order Once Intransit \(M73\)](#) system control value controls whether to create the invoice for a ship-for-pickup order when Order Orchestration indicates that the order is now in transit or received. See that system control value for more information.

If the payment method expires: If the payment method for an order expires, the system sends an update to Order Orchestration indicating to put the order Under Review. Also, if a fulfilling retail pickup order was created for the originating order, the order goes on hold, and any open pick slips are canceled.

Processing returns: If the [Suppress Returns for Retail Pickup/Delivery \(L88\)](#) system control value is:

- selected: You cannot process a return against a retail pickup or delivery order, or create a return authorization
- unselected: You can process a return against a retail pickup or delivery order or create a return authorization; however, the Order Broker Payment Type (K98) is deactivated when you ship a retail pickup or delivery order. As a result, in order to process a return against the order, you need to add a new payment method.

 **Note:**

Regardless of the setting of the Suppress Returns for Retail Pickup/Delivery (L88) system control value, you cannot process an exchange against a retail pickup or delivery order, enter an item with a negative quantity, enter a negative additional charge, or apply a discount to a shipped order line.

Order Administration does not send a status update to Order Orchestration when you process a return against a retail pickup or delivery order.

Membership items: You should not set up your Order Orchestration integration to include membership items on retail pickup or delivery orders, since the customer membership would not be created correctly in Order Administration. To prevent Order Administration from sending membership items to Order Orchestration as part of [Order Orchestration's Product, Product Location, and Incremental Inventory Import Process](#), do not flag them as *OROB eligible*.

Voiding or reprinting pick slips:

- If you use [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#) to void or reprint a pick slip for a retail pickup or delivery order, this activity does not produce a status update to Order Orchestration.

- If you use the *Generic Pick In API (Shipments, Voids, and Backorders)* to void a pick slip for a retail pickup or delivery order and the Cancel Reason (Pick In) (L86) system control value specifies a cancel reason code, or if a backorder cancellation reason code is specified in the *CWPickIn XML Message*, Order Administration cancels the order using the specified cancel reason and sends a status update rejecting the order to Order Orchestration, including the cancel reason from the system control value.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Important:

To prevent inconsistent updates to Order Orchestration for retail pickup and delivery orders:

- Prevent Order Administration from generating multiple pick slips for a single retail pickup or delivery order:
 - Select the Ship Complete for Orders Brokered to OROMS (L01) system control value.
 - Do not create retail pickup or delivery orders for ship-alone items.
 - Do not select the Retain Backordered Lines Brokered to OROMS (K89) system control value.
- Do not process void/unreserve transactions or partial backorders for these orders through the *Generic Pick In API (Shipments, Voids, and Backorders)*; confirm or void the entire pick slip.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Note:

Retail pickup and delivery orders that originate in Xstore include a single item.

Documents for store receiving: In order to support store receiving, you can generate the Pick Message from Order Administration (*CWPickOut*) or the *PO Download XML Message (CWPurchaseOrderOut)*. Each of these messages includes details on the order, including the Order Orchestration request ID, the order number in the originating system, and the delivery type. See the *Generic Pick Out API* and the *Generic Outbound Purchase Order API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more information.

For more information: See [Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration](#).

Ship-for-Pickup Orders

Overview: You can use the ship-for-pickup option in the [Order Orchestration Integration](#) to send the merchandise for an order to a designated store, where the

customer can pick it up. The Order Orchestration integration facilitates communication between Order Administration and the designated store location, so the store receives notification that the order is in transit, and sends notification back to Order Administration after the merchandise is received and when the customer picks up the order.

The items on the order do not need to be stocked in the store. In addition, the [Use OROB for Ship for Pickup Fulfillment Assignment \(M34\)](#) system control value controls whether Order Administration fulfills the order or whether the order is sent to Order Orchestration for fulfillment assignment.

- If this system control value is set to NEVER, Order Administration fulfills the order and sends the items on the order to the store selected for customer pick up. In this situation, if an item on the order is not in stock, the item is placed on backorder until it can be fulfilled by Order Administration. The order can include up to two locations for processing:
 - the originating, or placed, location that creates the order. For ship-for-pickup orders, the originating location is always an Order Administration warehouse.
 - the fulfilling, or sourcing, location that provides the inventory for the order. If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER, this is always an Order Administration warehouse.
 - the pickup location where the customer picks up the items on the order. For ship-for-pickup orders, this is always the store location the customer selected for pickup.
- If this system control value is set to ALWAYS, the system sends the order to Order Orchestration for fulfillment assignment. In this situation, Order Orchestration determines the best location to fulfill the order and the order can include up to three locations for processing:
 - the originating, or placed, location that creates the order. For ship-for-pickup orders, the originating location is always an Order Administration warehouse.
 - the fulfilling, or sourcing, location that provides the inventory for the order. If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS, this is the location Order Orchestration selected for fulfillment of the order. This location can be a store location or an Order Administration warehouse.
 - the pickup location where the customer picks up the items on the order. For ship-for-pickup orders, this is always the store location the customer selected for pickup.

If Order Orchestration determines that Order Administration is the best location to fulfill the order, the system creates a new retail pickup order in Order Administration to fulfill the ship-for-pickup order; see [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#)

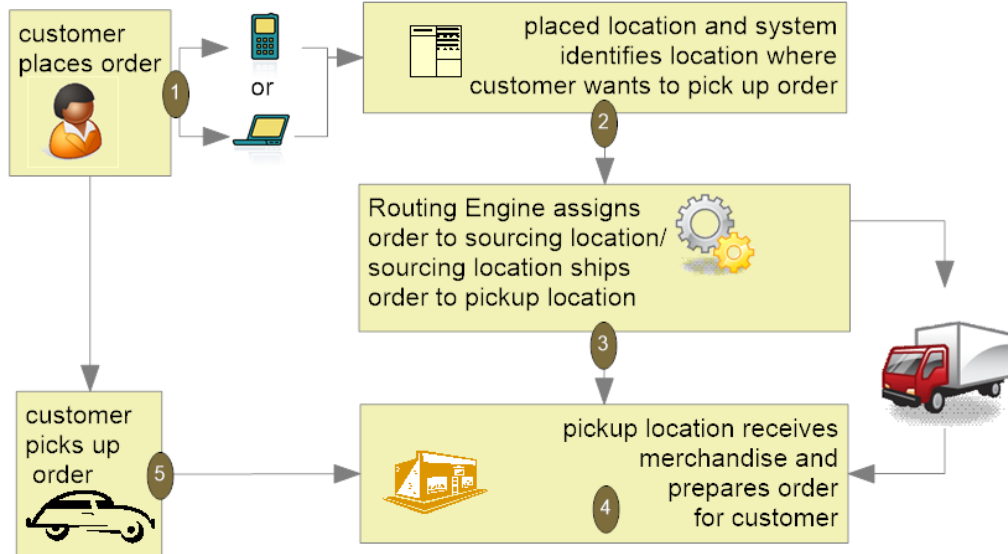

! Important:

Regardless of when you send ship-for-pickup orders to Order Orchestration, in order to use ship-for-pickup processing, you must select the *Enable Ship For Pickup* option on the Organization window in Order Orchestration. Once you enable ship for pickup, the *Ship for Pickup Enabled Date* displays on the Organization window and this option cannot be changed.

Examples: Examples of ship-for-pickup include the following.

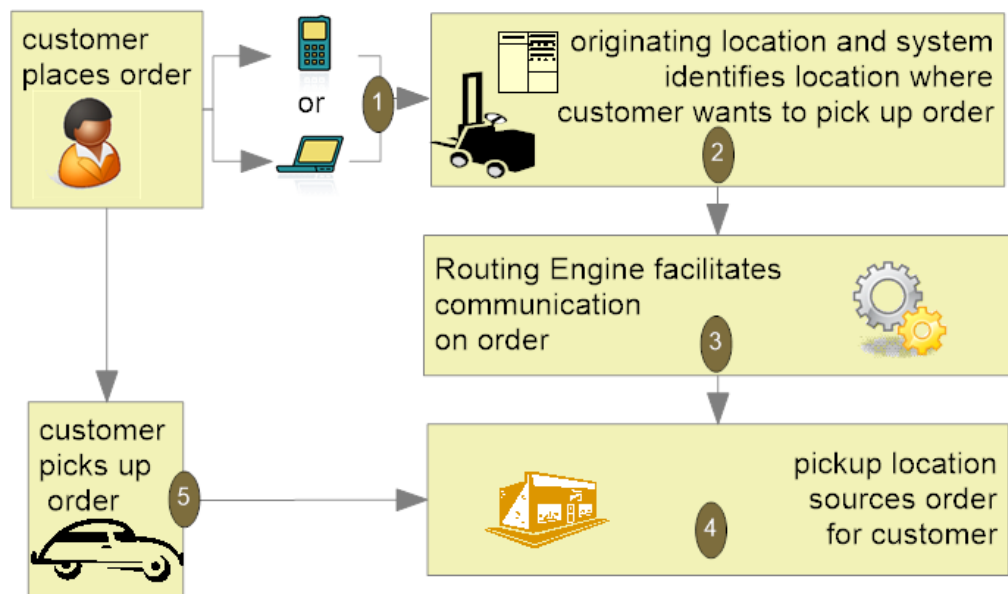

Example 1 (three different locations):

The customer places an order on the web site (originating location A, Order Administration) and wants to pick the order up at store location B. Order Orchestration selects store location C as the fulfilling, or sourcing, location. Store location C ships the inventory to store location B, where the customer can pick it up.

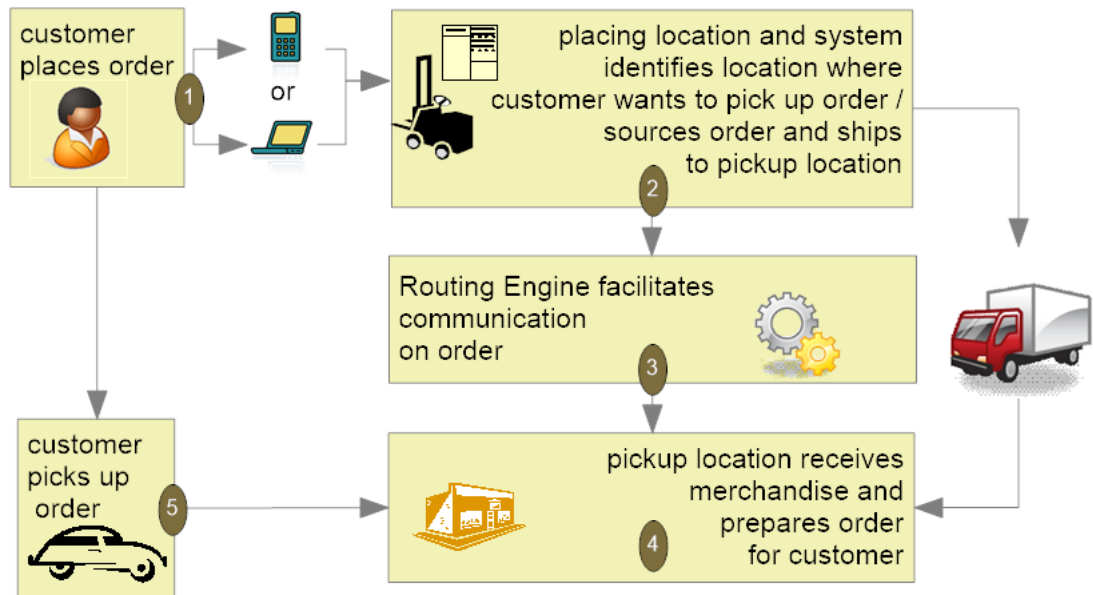

Example 2 (fulfilling location and pickup location are the same):

The customer places an order on the web site (originating location A, Order Administration) and wants to pick the order up at store location B. Order Orchestration selects store location B as the fulfilling, or sourcing, location. Once the order is ready at store location B, the customer can pick it up.

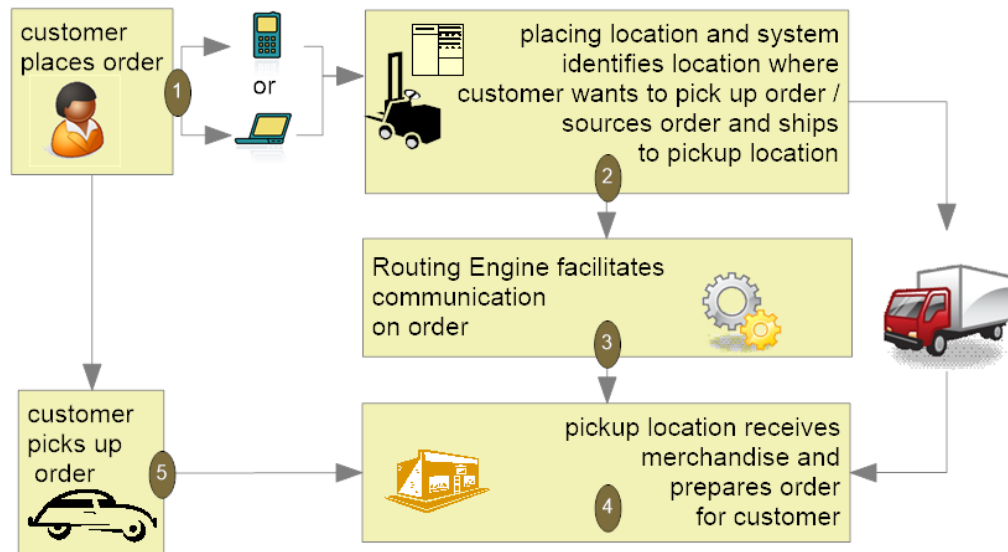

Example 3 (originating location and fulfilling location are the same):

The customer places an order on the web site (originating location A, Order Administration) and wants to pick the order up at store location B. Order Orchestration selects warehouse location A, Order Administration, as the fulfilling, or sourcing, location. Order Administration ships the items on the order to store location B. Once the order is ready at store location B, the customer can pick it up.

Example 4 (originating location and fulfillment location are the same; items on the order are shipped to the store during pick slip generation/drop ship processing):

The customer places an order on the web site (originating location A, Order Administration) and wants to pick the order up at store location B. Order Administration fulfills the items on the order and during pick slip generation, ships the items on the order to store location B. Order Orchestration manages communication between Order Administration and store location B. Once the order is ready at store location B, the customer can pick it up.

Version compatibility: Fulfillment assignment and ship-for-pickup functionality is available in release 16.0 or higher of Order Management System, or Order Administration, and release 16.0 or higher of Order Broker, or Order Orchestration. Also, in order to use ship-for-pickup processing, you must select the *Enable Ship For Pickup* option on the Organization window in Order Orchestration. Once you enable ship for pickup, the *Ship for Pickup Enabled Date* displays on the Organization window and you cannot deselect this option.

An `OROB_MESSAGE_VERSION` of 16.0 or higher is required to use the [Ship-for-Pickup Orders](#) integration with Order Orchestration. Note that this property cannot be set higher than 19.9 for integration with Order Broker 19.x, or higher than 21.1 for integration with Order Broker 22.2.301.0 or higher, or Order Orchestration.

In this topic:

- [Creating a Ship-for-Pickup Order in Order Administration](#)
- [Communicating with Order Orchestration about a Ship-for-Pickup Order](#)
- [Special Ship-for-Pickup Orders](#)
- [Collect Payment for a Ship-for-Pickup Order at the Store?](#)
- [Updates to a Ship-for-Pickup Order in Order Administration](#)
- [Ship-for-Pickup Order Processing on or after Shipment](#)
- [Reviewing a Ship-for-Pickup Order in Order Inquiry](#)

Creating a Ship-for-Pickup Order in Order Administration

You can create a ship-for-pickup order through interactive order entry, or through the order API.

Note:

A ship-for-pickup order should have a single ship-to.

Creating a Ship-for-Pickup Order in Order Entry

Ship-for-pickup orders originate in Order Administration, either through order entry or through the generic order API. The order creation process is similar to that of a regular order, except that a ship-for-pickup order includes a one-time ship-to address representing the store location.

To select the store location in order entry:

1. Select the One Time Ship To option.
2. At the [Create One Time Ship To Address Screen](#), select Store.
3. Select a store at the [Store Location Screen](#). This screen displays each store location set up through [Work with Store Cross Reference \(WSCR\)](#) whose *Ship for Pickup* flag is selected. The description and address set up for the Store Cross Reference default to the Create One Time Ship To Address screen.
4. Complete entry of the order.
 - If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER, the system uses existing logic to reserve items in order to fulfill the ship-for-pickup order from an Order Administration warehouse. See [Sending a Ship-for-Pickup Order to Order Orchestration during Pick Slip Generation and Drop Ship Order Processing](#).
 - If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS and the [Send B/O to OROB \(K08\)](#) system control value is selected, the system bypasses reservation and places all eligible items on backorder, even if the item is available in an Order Administration warehouse, in order to send all eligible items to Order Orchestration for fulfillment assignment; see [Rules for Submitting Backorders to Order Orchestration](#). Order Orchestration will choose the best store location or Order Administration location to fulfill and ship the item to the store location selected by the customer for store pickup. See [Brokered Backorders](#) for processing details.

Note:

To avoid shipment problems, once you accept a ship-for-pickup order, the system does not allow you to change the store selected as the one-time ship-to address; in order to change the pickup store location, you must cancel the order and create a new ship-for-pickup order.

Ship-alone items on ship-for-pickup orders: If an item is flagged as Ship alone, Order Administration does not let you enter an order line on a ship-for-pickup order with a quantity greater than one. If the customer wants more than one unit, enter a separate order line for each unit. This restriction applies even if the item is not flagged as [OROB eligible](#).

Creating a Ship-for-Pickup Order through the Generic Order API

In the *Inbound Order XML Message (CWORDERIN)*:

- use the `store_code` attribute to specify the store location code. This needs to be a store location set up through Work with Store Cross Reference (WSCR), as described above for order entry.
- specify a `delivery_type` of S

- use the `ShipTo` element in the *Inbound Order XML Message (CWORDERIN)* to specify the shipping address of the store, or leave the shipping name and address attributes blank in order to use the information set up in the Store Cross Reference record.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Name and address for ship-for-pickup order: If the ship-to name and address fields are passed for a ship-for-pickup order, these fields should indicate the shipping address of the store selected for pickup; otherwise, if no ship-to name and address is passed, the information defaults from the Store Cross Reference record.

Partial ship-to address? The name or address fields from the Store Cross Reference record default for any fields not passed in the message.

Example: If the `CWOrderIn` message indicates the ship-to customer's first and last name, this information defaults to the order, in addition to the company name and address from the Store Cross Reference record.

Communicating with Order Orchestration about a Ship-for-Pickup Order

Submitting the order to Order Orchestration: The setting of the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value controls when the order is submitted to Order Orchestration.

The system submits a ship-for-pickup order to Order Orchestration for fulfillment assignment when the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS and the Send B/O to OROB (K08) system control value is selected, and:

- You create an order that contains an eligible item in interactive order entry or through the generic order interface (Order API).
- You run the [BROKER Periodic Function](#) to find eligible items to send to Order Orchestration.

See [Brokered Backorders](#) for processing details.

The system submits a ship-for-pickup order to Order Orchestration during pick slip generation or drop ship purchase order processing in the following scenarios.

- When the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER or blank, or
- When the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS but the Send B/O to OROB (K08) system control value is unselected.

See [Sending a Ship-for-Pickup Order to Order Orchestration during Pick Slip Generation and Drop Ship Order Processing](#) for processing details.

Sending a Ship-for-Pickup Order to Order Orchestration during Pick Slip Generation and Drop Ship Order Processing

Submitting the order to Order Orchestration: The system submits a ship-for-pickup order to Order Orchestration when you generate the pick slip or drop ship purchase order in the following scenarios.

- When the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER or blank.

- When the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to ALWAYS but the Send B/O to OROB (K08) system control value is unselected.

At this time, the system also creates the Order Orchestration record displayed at the [Work with the Order Orchestration Screen](#).

Which items are included in the Submit Order message? Only items that are flagged as [OROB eligible](#) are included in the message to Order Orchestration. However, all items that print on the pick slip or purchase order can be included in the shipment to the store location.

 **Note:**

It is important to confirm that including additional items on the pick slip or purchase order and in the shipment will not present a problem to the store receiving the ship-for-pickup order.

No items OROB eligible? If you create a ship-for-pickup that does not include any [OROB eligible](#) items, Order Administration does not submit the order to Order Orchestration or create an Order Orchestration record; however, you can still generate the pick slip or drop ship purchase order and ship the order to the store location for customer pickup. It is important to note that, in this case, the selected store does not receive advance notification of the order.

For more information on the contents of the message, see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Submit separate orders for each order line? If the [Create Separate Picks for Ship for Pickup Orders \(L89\)](#) system control value is selected, Order Administration generates a separate pick slip or drop ship purchase order for each item, and as a result, submits each order line as a separate order to Order Orchestration. Creating separate orders in Order Orchestration can prevent confusion about order status if, for example, a single order line is canceled or fulfilled. See the [Create Separate Picks for Ship for Pickup Orders \(L89\)](#) system control value for more information.

What if Order Orchestration is unavailable? If Order Orchestration does not respond to the submit order request during pick slip or drop ship purchase order generation, Order Administration does not print the pick slip or purchase order. Instead, it writes an order transaction history message: `Submit Order Failed - OROB Unavailable`. The order is eligible for selection the next time you generate pick slips or drop ship purchase orders.

Creating the Order Orchestration record: When the job generates the Submit Order request, it initially creates the Order Orchestration record in In Process status.

Message response: The Submit Order response message indicates whether Order Orchestration was able to create the order:

- *Order rejected?* If Order Orchestration returns an error in the response message, Order Administration puts the order on hold using the [Hold Reason for Errored Ship for Pickup Orders \(L10\)](#). Order Orchestration might return an error if, for example, the order includes an item that does not exist in Order Orchestration or in the point-of-sale system associated with the store location. In this case, the Order Orchestration record in Order Administration is deleted and Order Transaction History indicates:

Submit Order Rejected/Order Held

Rsn:PRODUCT NOT STOCKED IN REQUESTED LOCATION.

- *Order accepted?* If Order Orchestration accepts the order, the generation process sends a status update indicating a status of Picked. The process finishes and the Order Orchestration record remains in Picking status until you confirm shipment of the pick slip or purchase order.

**Note:**

The designated store location cannot reject a ship-for-pickup order.

Sample message: See Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for a sample message and more information.

Fulfilling location in Order Administration vs. Order Orchestration:

- **When order submitted to Order Orchestration:**
 - originating / placed location = the OACS warehouse shipping the merchandise to the store location.
 - fulfilling / sourced location = the OACS warehouse shipping the merchandise to the store location.
 - pickup location = the store location the customer selected for store pickup.
- **When store receives the merchandise or customer picks up the order:** Once Order Administration receives a status inquiry response indicating that the store location has received the merchandise on the order, or that the customer has picked the order up, the store location is identified as the fulfilling location.
 - originating / placed location = the OACS warehouse shipping the merchandise to the store location.
 - fulfilling / sourced location = the OACS warehouse shipping the merchandise to the store location.
 - pickup location = the store location the customer selected for store pickup.

Excluded from brokered backorder processing: If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER, backordered items on ship-for-pickup orders are not eligible for processing through the brokered backorder integration with Order Orchestration.

Creating ship-for-pickup orders for drop ship items: When you create a ship-for-pickup order for a drop ship item, Order Administration submits the order to Order Orchestration when you use [Selecting Vendors for Drop Ship Processing \(MDSP\)](#).

**Note:**

There is no warehouse associated with a drop ship item, so in this case Order Administration designates the [OROB Default Location \(K51\)](#) as the requesting location. If you are generating ship-for-pickup orders for drop ship items, you need to specify a valid Order Orchestration location in this system control value; otherwise, Order Orchestration returns an error indicating that the requesting location is invalid.

Documents for store receiving: In order to support store receiving, you can generate the *Pick Message from Order Administration (CWPickOut)* or the *PO Download XML Message (CWPurchaseOrderOut)*. Each of these messages includes details on the order submitted to Order Orchestration, including the Order Orchestration request ID, the order number in the originating system, and the delivery type. See the *Generic Pick Out API* and the *Generic Outbound Purchase Order API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more information.

Special Ship-for-Pickup Orders

In order to support processing special ship-for-pickup orders that originated in a retail location and then sent to Order Administration through the order API:

- If the order type matches the [Order Type for Special Orders \(L15\)](#), the Submit Order message specifies the e-commerce order number, rather than the Order Administration order number, as the `order_id`, so that the originating location can more easily identify and track the order.
- If the pay type matches the [Pay Type for Special Orders \(L16\)](#), the `balance_due` specified in the Submit Order message is the order total, indicating that the customer needs to pay for the order when picking it up. Otherwise, if the pay type on the order does not match this system control value, the Submit Order message does not specify a balance due, even if the order type matches the Order Type for Special Orders (L15).

See the Order Type for Special Orders (L15) and Pay Type for Special Orders (L16) system control values for more information.

If you use the *Generic Pick In API (Shipments, Voids, and Backorders)* to void a pick slip for a special ship-for-pickup order and the [Cancel Reason \(Pick In\) \(L86\)](#) system control value specifies a cancel reason code, or a backorder cancel reason is specified in the *CWPickIn XML Message*, Order Administration cancels the order using the specified cancel reason and sends a status update to Order Orchestration canceling the order.

! Important:

To prevent inconsistent updates to Order Orchestration for special ship-for-pickup orders, do not process partial backorders for these orders through the *Generic Pick In API (Shipments, Voids, and Backorders)*; confirm or void the entire pick slip. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Collect Payment for a Ship-for-Pickup Order at the Store?

You can use the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value to indicate that the customer pays for a ship-for-pickup order when picking up the order at the store, rather than billing the order when you ship it to the store from the warehouse. In this case:

- The order must include only credit card payment methods; also, each pay type's *Card type* must be set to Credit. No other card types, such as stored value cards, can be included.
- The payment method's *Suppress deposit* and *Suppress refund* flags are set to Y.
- The payment method is authorized for \$1.00 only during online authorization.
- Authorization is suppressed during pick slip generation.

- Order Administration sends the order total to Order Orchestration as the `balance_due` in the Submit Order message.

**Note:**

The above restrictions do not apply to ship-for-pickup orders whose order type matches the Order Type for Special Orders (L15).

Returns suppressed: Selecting the Payment at POS for Ship for Pickup Orders (L60) system control value suppresses most options for creating a return authorization, processing a return, and creating a refund. See that system control value for details.

Updates to a Ship-for-Pickup Order in Order Administration

Add an item? If you add an item to a ship-for-pickup order, or are able to ship a backordered item once you have generated the pick slip and created the ship-for-pickup order in Order Orchestration, the new item is not added to the original Order Orchestration record or to the order in Order Orchestration. Printing the pick slip for the new order line creates a new Order Orchestration record and a new order in Order Orchestration.

Voiding or reprinting a pick slip: Order Administration sends a status update to Order Orchestration if you void a pick slip for an order line on an existing ship-for-pickup order:

- **Special ship-for-pickup orders:** If the Cancel Reason (Pick In) (L86) system control value specifies a cancel reason or if a backorder cancellation reason code is specified in the *CWPickIn XML Message*, and you void the pick slip for a special ship-for-pickup order through the generic pick in API, Order Administration cancels the order or line and sends a cancellation to Order Orchestration, including the cancel reason from the system control value. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1). Also see [Special Ship-for-Pickup Orders](#) for background on these orders.
- **Regular ship-for-pickup orders:** If the Create Separate Picks for Ship for Pickup Orders (L89) system control value is selected and you void the pick slip for a regular (not special) ship-for-pickup order, Order Administration does not cancel the order or line, but it does send a cancellation to Order Orchestration. No cancel reason is included in this case. This status update occurs regardless of whether you use the generic pick in API to void the pick slip, or void it at an Order Administration screen.

If you then reprint the pick slip for a regular ship-for-pickup order in this situation, Order Administration submits a new order to Order Orchestration; however, if you cancel the order after voiding the pick slip, no update is sent to Order Orchestration.

Aside from the two scenarios described above, Order Administration does not send a status update to Order Orchestration when you void or reprint a pick slip.

Canceling a ship-for-pickup order: Aside from the two scenarios, described above, which generate status updates for voided pick slips, Order Administration sends a status update to Order Orchestration when you cancel the order or item. In most cases, this status update includes the cancel reason you enter:

- **Cancel after voiding pick slip:** If you cancel an item or the entire ship-for-pickup order in order maintenance after voiding the pick slip, and Order

Administration has not already sent a status update when the pick slip was voided, it sends a status update that includes the cancel reason you enter. This situation can occur if, for example, you void a ship-for-pickup order through the Void/Reprint Picks menu option, or if you void a regular ship-for-pickup order with the Create Separate Picks for Ship for Pickup Orders (L89) system control value unselected.

- Cancel drop ship purchase order in purchase order maintenance: If you cancel a drop ship purchase order in purchase order maintenance, Order Administration sends a status update that includes the [Auto Soldout Cancel Reason \(C20\)](#), since you do not have an opportunity to enter a cancel reason in this case.
- Cancel drop ship purchase order sent to vendor through drop ship integration: To cancel items fulfilled through the drop ship integration, you need to use the [Display P/O Drop Ship Screen](#) in order inquiry. If you cancel a drop ship purchase order at this screen, and the purchase order is successfully canceled through the drop ship integration, it sends a status update that includes the cancel reason you enter.

 **Note:**

- Canceling single item cancels entire order in Order Orchestration: If you do not split orders and the pick slip creating the order in Order Orchestration included multiple items, canceling a single item in Order Administration results in canceling the entire order in Order Orchestration. This situation might occur if the Create Separate Picks for Ship for Pickup Orders (L89) system control value is not selected.
- Canceling before order created in Order Orchestration: If you cancel the order before pick slip generation or drop ship purchase order generation, there is no need to notify Order Orchestration, since the order was never sent.
- Cancel after shipment confirmation? Once you have confirmed shipment, it is not possible to cancel the ship-for-pickup order in Order Orchestration.

Ship-for-Pickup Order Processing on or after Shipment

Confirm shipment: When you confirm shipment of the pick slip, Order Administration changes the status of the Order Orchestration record and sends a status update to Order Orchestration with a status of Intransit, indicating that the order is on its way.

Additional processing:

- When the assigned location sends a fulfillments request message to Order Orchestration to poll for newly assigned orders, it receives notification of the ship-for-pickup order.

 **Note:**

The location assigned to a ship-for-pickup order cannot reject the order.

- The assigned store location sends the following additional status updates:
 - Received when the merchandise arrives at the store
 - Fulfilled (Order Administration status = Completed) when the customer picks up the order, or Partially fulfilled if the customer does not initially pick up the entire order

 **Note:**

When Order Administration receives a status list inquiry response from Order Orchestration indicating that the merchandise was received at the store or that the customer has picked up the order, the fulfilling location on the Order Orchestration record in Order Administration changes from the warehouse shipping the order to the store location where the customer picks up the order.

How Order Administration checks for additional status updates: Once you confirm shipment of the ship-for-pickup order to the store location, Order Administration includes the order in a status list inquiry request message once a day to Order Orchestration to check on whether the order has been received or picked up. See [Setting the Daily Status Inquiry Time Window \(all versions\)](#) for more information.

Returning a ship-for-pickup order: Selecting the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value suppresses most options for creating a return authorization, processing a return, and creating a refund. See that system control value for details.

Reviewing a Ship-for-Pickup Order in Order Inquiry

In addition to reviewing information through the Working with Order Broker (WOBR) menu option, you can also use order inquiry. Your options include:

- Identifying the Order Orchestration type: The *Broker delivery type* at the [Display Order Properties Screen](#) and the [Display Order Broker Details Screen](#) identifies a Ship for Pickup order.
- Broker detail and history: Use the [Display Order Broker Details Screen](#) to review Order Orchestration Detail and Order Orchestration History.
- Designated store: The [Display Alternate Address Screen](#) displays the store shipping address. You can advance to this screen by selecting the Ship To option from the header screen in order inquiry.
- Order history: The [Display Order History Screen](#) displays activity related to sending status updates to and from Order Orchestration, such as:
 - Ln#: 1 Selected for Fulfillment: Written for each line on a ship-for-pickup order printed on a pick slip and sent to Order Orchestration in the Submit Order Message.
 - Ln#: 1 In Transit shipment: Written for each printed line when you confirm shipment.
 - Ln#: 1 Accepted by Broker: Written when you receive the status inquiry request indicating that the location where the customer is picking up the ship-for-pickup order has been notified.
 - Ln#: 1 Cancel Acknowledged by Broker: Written when you receive the status update response message following the cancellation of a ship-for-pickup order. This situation occurs if you void the pick slip after initially notifying Order Orchestration about the order.
 - Ln#: 1 Store Received: Written when you receive the status inquiry response message indicating that the order merchandise has been received at the store where the customer will pick up the order. At this point, the fulfilling location on the Order Orchestration record in Order Administration changes

from the warehouse shipping the merchandise to the store location where the customer picks up the order.

- Ln#: 1 Customer Partial Pick Up: Written when you receive the status inquiry response message indicating that the customer has picked up some, but not all, of the merchandise on the order.
- Ln#: 1 Shipped by Broker order: Written when you receive a status inquiry response message indicating that the customer has picked up the order in full.

If Order Orchestration returns an error: If Order Orchestration returns an error during pick slip generation, Order Administration writes Order Transaction History messages such as:

```
Submit Order Rejected/Order Held
Rsn:INVALID ITEM (SYSTEM PRODUCT), ITEM
(PEN BLUE ) DOES NOT
EXIST. PRODUCT NOT STOCKED IN REQU
```

If the error occurs as a result of Selecting Vendors for Drop Ship Processing (MDSP), the messages might also indicate that the pick slip or purchase order was created, for example:

```
DROP SHIP PO# 1234567 CREATED.
```

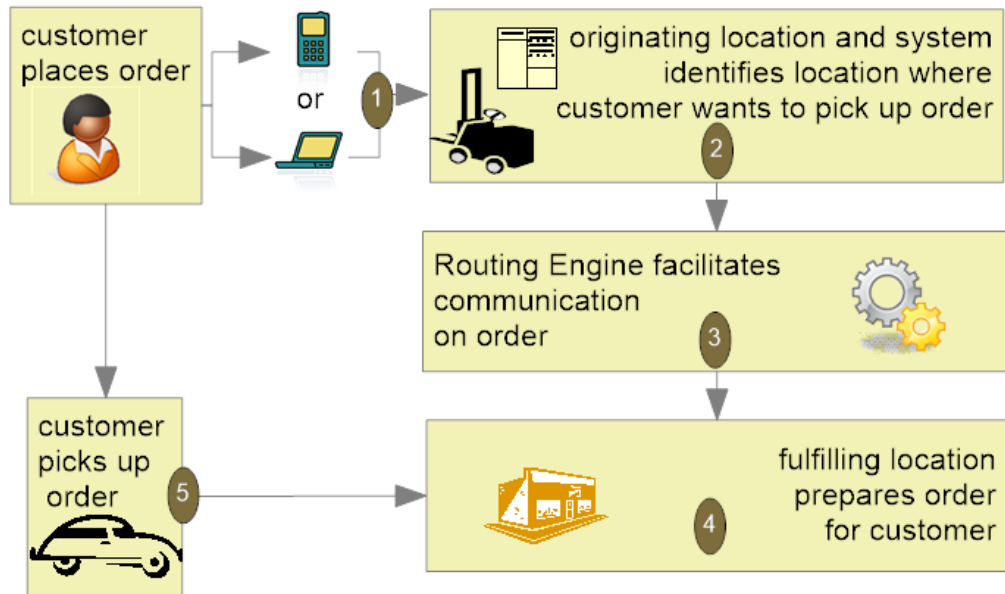

However, in this situation the process does not produce the pick slip or purchase order.

If you submit a drop ship order and the [OROB Default Location \(K51\)](#) system control value does not specify a valid location in Order Orchestration, Order Orchestration returns an error during drop ship processing. In this case, Order Administration writes Order Transaction History messages such as:

```
Submit Order Rejected/Order Held
Rsn:INVALID OR MISSING REQUESTING LOCATI
ON LOCATION CODE, (STORE_LOCATION.LO
CATION_CD) IS REQUIRED.
```

Store Pickup Orders

Overview: You can create a store pickup order if the customer prefers to pick up an order from a retail location where the inventory is already available rather than waiting for a shipment from the warehouse. Unlike ship-for-pickup orders, store pickup orders do not require you to transfer the inventory from a warehouse or other store location; instead, the customer selects a location that already has the ordered quantity of all the items in stock.

In this topic:

- [Store Pickup Order Creation Overview](#)
- [Merchandise Locator Search Window \(Store Pickup\)](#)
- [Store Pickup Search Results Screen](#)
- [Status Inquiry and Updates after Creation](#)
- [Notifying the Customer that the Store Pickup Order is Ready](#)
- [Store Pickup Order Fulfillment](#)
- [Creating a Store Pickup Order through the Order API](#)
- [Reviewing a Store Pickup Order in Order Inquiry](#)
- [Canceling a Store Pickup Order](#)
- [Troubleshooting Creation of Store Pickup Orders and Things to Note](#)

Store Pickup Order Creation Overview

Store Pickup option: You can create a store pickup order by selecting the Store Pickup option at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) after entering the items on the order. The Store Pickup option is available only if the [Use Merchandise Locator \(I38\)](#) system control value is selected and the [Store Pickup Order Type \(L33\)](#) system control value specifies an order type. Also, this option is available in order entry only, not in order maintenance.

Requirements: You cannot select the Store Pickup option if the order includes any items that:

- are not flagged [OROB eligible](#)
- are flagged for special handling or have the *Gift wrap* flag selected
- are held
- are sold out

Also, the order must:

- not include more than one ship-to
- not be a ship-for-pickup order

What if the order is held? Order Administration submits a store pickup order to Order Orchestration regardless of whether the order is held; however, if the order is held and the [Payment at POS for Store Pickup \(M16\)](#) system control value is unselected, Order Administration submits the order to Order Orchestration with the *Under Review* flag selected. This setting indicates that the order should not be picked up until the *Under Review* flag is cleared, because Order Administration needs to be able to collect payment, but enables the store associates with the opportunity to reserve the inventory and prepare the order in the meantime. When the order is released from hold, Order Administration sends the order status update message, indicating to clear the *Under Review* flag.

See the [Payment at POS for Store Pickup \(M16\)](#) system control value for a discussion.

Searching for locations: When you select the Store Pickup option on a qualifying order, you advance to the [Merchandise Locator Search Window \(Store Pickup\)](#) so that you can find a store location near the customer's location where the items are available. Optionally, you can specify a different location or change the search radius. See the [Merchandise Locator Search Window \(Store Pickup\)](#) for more information.

Note:

The Order Orchestration Routing Engine supports merchandise locator searches only in the U.S. and Canada.

Locateltems request and response messages: Order Administration sends the Locateltems request message to Order Orchestration. This message specifies the items on the order, the customer's location, and the search radius.

Selecting a location: After you complete the [Merchandise Locator Search Window \(Store Pickup\)](#), you advance to the [Store Pickup Search Results Screen](#). This screen lists locations that:

- were included in the Locateltems response message, indicating that the location is flagged as *Pickup available* in Order Orchestration, it stocks the item(s) on the order, and
- have records in the Store Cross Reference table, set up through the [Work with Store Cross Reference \(WSCR\)](#) option.

See the [Store Pickup Search Results Screen](#) for more information.

When you select a location at this screen, Order Administration:

- flags all Order Detail lines with a *Pickup type* of SP
- updates the *Pickup location ID* and *Location system ID* with the selected location code and the [System Code](#), if any, from the Store Cross Reference record; otherwise, from the [Name in OROB for Point of Sale \(L09\)](#).
- sets the *Delivery type* field in the Order Ship To table to P

Requirements to accept the order: When you accept the order, Order Administration verifies that:

- the order has a credit card payment method, and no other pay types

- all lines on the order are flagged for store pickup and do not include any special handling or gift wrap charges

 **Note:**

If you have changed the quantity on an order line or added any new items to the order, you need to select the Store Pickup option again before you accept the order.

Also, the customer must have:

- an email address, and
- the opt-in/out flag for the email address set to O1 (all emails) or O2 (order-related emails).

The email address and opt-in/out setting are required so that Order Administration or Order Orchestration can notify the customer by email when the order is ready for pickup at the designated store location. See [Store Pickup Notifications](#) for more information on a notification you can have Order Administration generate; however, the Store Connect module uses a notification email generated by Order Orchestration. See the Order Orchestration online help for more information.

Updates at accept: At acceptance, Order Administration performs additional updates to order-related tables:

- *Order Detail:*
 - *Drop ship* flag set to D
 - *Printed quantity* set to the ordered quantity
 - *Reserved quantity, Backorder quantity, and Backorder warehouse* set to zero
- *Order Ship To:*
 - *Freight and Freight balance*, if any, set to zero and the *Calculate freight* flag set to N if the [Calculate Freight for Store Pickup Orders \(L32\)](#) system control value is unselected
- *Order Header:* *Order type* set to the [Store Pickup Order Type \(L33\)](#). If the Store Pickup Order Type (L33) is not flagged for online authorization, this change prevents Order Administration from sending the payment method out for authorization
- *Order Ship To Address:* creates a record using the information set up through the Work with Store Cross Reference (WSCR) option; however, if you entered a name or apartment/suite, or selected a permanent ship-to number, this information is retained
- *Order Payment Method:* If the Payment at POS for Store Pickup (M16) is:
 - selected:
 - * the payment method is authorized for \$1.00
 - * the *Suppress deposit* flag set to Y, so that the deposit is not processed in Order Administration when the order is billed
 - * the `balance_due` specified in the SubmitOrder message is equal to the order total

- unselected:
 - * the payment method is authorized for the full amount
 - * the *Suppress deposit* flag is set to N, so that the deposit is processed in Order Administration when the order is billed
 - * the `balance_due` specified in the SubmitOrder message is zero

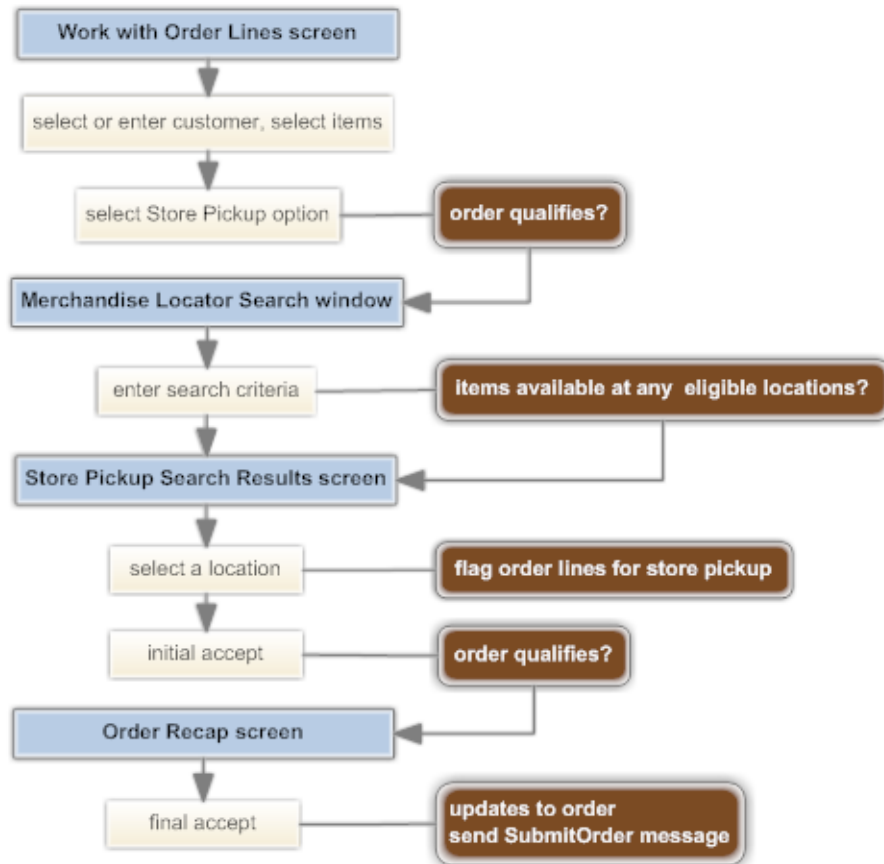

Sending the SubmitOrder request to Order Orchestration: When you accept a store pickup order, Order Administration sends a SubmitOrder request to Order Orchestration. See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more information.

When Order Administration receives the SubmitOrder response message from Order Orchestration, it sets the Order Orchestration record in Acknowledged status and writes an Order Transaction History message on the order: `Submit Order Succeeded`. This message indicates that the order was created successfully in Order Orchestration, not that the selected location has already accepted the order. The system also updates the line number(s) in the Order Orchestration and Order Orchestration History records.

What if the order is held? Order Administration submits a store pickup order to Order Orchestration regardless of whether the order is held; however, if the order is held and the Payment at POS for Store Pickup (M16) system control value is unselected, Order Administration submits the order to Order Orchestration with the *Under Review* flag selected. This setting indicates that the order should not be picked up until the *Under Review* flag is cleared, because Order Administration needs to be able to collect payment, but enables the store associates with the opportunity to reserve the inventory and prepare the order in the meantime.

If the order is not held, or if the Payment at POS for Store Pickup (M16) system control value is selected, Order Administration does not select the *Under Review* flag when submitting the order, so the order is eligible for pickup.

When a store pickup order is released from hold, Order Administration sends an update to Order Orchestration indicating to clear the *Under Review* flag. See the Order Update Request sample in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more information.

Merchandise Locator Search Window (Store Pickup)

Purpose: Use this window to enter the search criteria when selecting a store location where the customer can pick up all the items on the order. See [Store Pickup Orders](#) for background.

How to display this screen: Select Store Pickup at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) after entering the items on the order. The Store Pickup option is available only if:

- the Use Merchandise Locator (I38) system control value is selected and the Store Pickup Order Type (L33) system control value specifies an order type
- you are in order entry, and not order maintenance
- you are entering the first and only ship-to on the order

You cannot select the Store Pickup option if the order includes any items that:

- are not flagged [OROB eligible](#)
- have special handling instructions or have the *Gift wrap* flag selected
- are held (however, if the order itself is held after acceptance, Order Administration still submits it to Order Orchestration for fulfillment)

Also, the order must:

- include at least one item that is not sold out

- not be a ship-for-pickup order

**Note:**

This window is very similar to the [Merchandise Locator Search Window \(Searching for an Item\)](#) you use for informational merchandise locator searches for a single item. See [Merchandise Locator API](#) for background on merchandise locator searches.

**Important:**

Order Broker and Order Orchestration support merchandise locator searches only within the U.S. and Canada.

Field	Description
	<p>NOTE</p> <ul style="list-style-type: none"> • The information at this window defaults from the sold-to customer address, or the last entered information if you are repeating a search for the same customer. • The search radius you enter applies only to locations that use proximity rules.
Postal code	<p>The customer's U.S. zip or Canadian postal code, to serve as the central point for the search radius. For example, if the <i>Search within</i> field is set to 25 miles, the search includes stores within 25 miles of this postal code.</p> <p>NOTE: Your entry in this field is not validated against the Zip/City/State table.</p> <p><i>Alphanumeric, 10 positions; required if you do not enter a city and state.</i></p>
Address	<p>The customer's street address, to serve as the central point for the search radius.</p> <p><i>Alphanumeric, 32 positions; optional.</i></p>
City	<p>The customer's city, to serve as the central point for the search radius.</p> <p><i>Alphanumeric, 25 positions; required if you do not enter a postal code.</i></p>
State	<p>The customer's U.S. state or Canadian province, to identify the location of the city.</p> <p><i>Alphanumeric, 2 positions; required if you do not enter a postal code.</i></p>
Country	<p>The customer's country. The country defaults from the customer address if you advanced to this window from order entry or order maintenance; otherwise, it defaults from the Default Country for Customer Address (B17) system control value. Defined in and validated against the Country table; see Setting Up the Country Table (WCTY) for more information.</p> <p><i>Alphanumeric, 2 positions; required.</i></p>

Field	Description
Search within	<p>Indicates the search radius, in miles or kilometers, to search within for the selected item. The search radius defaults from the Default Search Within Radius (140) system control value, but you can override it.</p> <p>NOTE: The distance unit of measure (miles or kilometers) specified with the Merchandise Locator Distance Measurement (139) system control value is to the right.</p> <p><i>Numeric, 5 positions; required.</i></p>

Completing this window:

- Optionally, override the postal code or the city and state to serve as the central point for the search radius.
- Optionally, override the *Search within* radius to a different distance.
- Click OK. Order Administration generates the LocateItems request message. When it receives the LocateItems response message, you advance to the [Store Pickup Search Results Screen](#).

Troubleshooting: If you cannot display this window, or if the screen displays an error message after you attempt to search, see [Troubleshooting Creation of Store Pickup Orders and Things to Note](#) for help.

Store Pickup Search Results Screen

Purpose: Use this screen to select a store location for the customer to pick up all the items on the order.

Which locations listed? This screen lists locations that:

- Have records set up through the Work with Store Cross Reference (WSCR) option, and
- Were returned in the LocateItems response message from Order Orchestration, indicating that:
 - They are within the search radius specified at the [Merchandise Locator Search Window \(Store Pickup\)](#)
 - Have the requested quantity of all items on the order in stock
 - Are flagged in Order Orchestration as *Pickup available*
 - Were not eliminated from the search results due to probability rules in Order Orchestration
 - Were not eliminated from the search results because the number of eligible locations exceeded the *Maximum No. Responses* specified in Order Orchestration.

 **Note:**

A distance of zero indicates that the location is not flagged to *Use proximity locator* in Order Orchestration. In this case, the location is always eligible to be included in the search results if it is also flagged as *Pickup available*, if it has the requested quantity of the items on the order, and if there is a Store Cross Reference record set up in Order Administration.

Troubleshooting:

- Only store locations that have Store Cross Reference records are eligible for display at this screen. See [Work with Store Cross Reference \(WSCR\)](#) for background.
- See [Troubleshooting Creation of Store Pickup Orders and Things to Note](#) for possible error messages.

Updates when you select a store location: When you select a location, Order Administration updates all Order Detail records:

- Sets the *Pickup type* for each item to SP
- Updates the *Pickup location ID* with the code of the selected location
- Updates the *Location system ID* with the System Code, if any, from the Store Cross Reference record; otherwise, from the Name in OROB for Point of Sale (L09)

For more information: See [Store Pickup Orders](#) for an overview, including details on information required before you can accept a store pickup order.

How to display this screen: Complete the [Merchandise Locator Search Window \(Store Pickup\)](#).

 **Note:**

Although the information at this screen is from the location record in Order Orchestration, when you accept a store pickup order Order Administration uses the Store Cross Reference record to create the Order Ship To Address for the order.

Field	Description
Store	<p>Select the store location where the customer would like to pick up the order. The store information consists of:</p> <p>Store code The code identifying the store location in Order Orchestration and in the Store Cross Reference table. <i>Alphanumeric, 10 positions.</i></p> <p>Store name The name of the store location from Order Orchestration. If the name exceeds 35 positions, it is truncated. <i>Alphanumeric, 35 positions.</i></p> <p>Street The street address of the store location from Order Orchestration. If the street address exceeds 40 positions, it is truncated. <i>Alphanumeric, 40 positions.</i></p> <p>City The city of the store location from Order Orchestration. If the city name exceeds 35 positions, it is truncated. <i>Alphanumeric, 35 positions.</i></p> <p>State The state of the store location from Order Orchestration. <i>Alphanumeric, 2 positions.</i></p> <p>Postal code The postal code of the store location from Order Orchestration. <i>Alphanumeric, 10 positions.</i></p> <p>Country The country of the store location from Order Orchestration. <i>Alphanumeric, 3 positions.</i></p> <p>Phone number The phone number of the store location from Order Orchestration. If the phone number exceeds 14 positions it is truncated. <i>Alphanumeric, 14 positions.</i></p>

Field	Description
Distance	<p>The number of miles or kilometers, based on the Merchandise Locator Distance Measurement (I39), from the search location. This distance might be approximate, depending on the actual criteria used to search (for example, postal code or city), and does not represent an actual driving distance.</p> <p>No distance is displayed if the location is not set up in Order Orchestration to use proximity rules. In this situation, the location is always considered to be within the specified search radius. Also, no distance is displayed if the store location and the search location are in the same zip or postal code.</p> <p>The distance is rounded down when determining whether to include the location in the search results. For example, if the Search radius is 10 miles, and the location is 10.84 miles away, the location is included in the results.</p> <p>The distance is shown if the location is shown. The location is shown when:</p> <ul style="list-style-type: none"> • Pickup qty > 0 and store flagged as pickup even though not ship for pickup • Pick qty = 0, store not flagged as pickup available but store is flagged for ship for pickup <p>Location is not shown if no inventory and not flagged as ship for pickup.</p> <p><i>Numeric, 7 positions with a 2-place decimal.</i></p>

Status Inquiry and Updates after Creation

Overview: Once Order Administration submits the order to Order Orchestration, it begins including the order in periodic status inquiry list requests to determine when:

- the selected store location polls Order Orchestration for new orders and is notified about the order
- the location accepts or rejects the order
- the customer picks up the order, either partially or completely
- potentially, the customer cancels the order at the store location

How often? The BROKER process in [Working with Integration Layer Processes \(IJCT\)](#) sends periodic status inquiry list request messages to Order Orchestration for store pickup orders:

- If the current status of the Order Orchestration record in Order Administration is Acknowledged, Polled, or Accepted, the process uses the [Order Broker Status Update Interval \(K10\)](#) to determine how often to request an update.
- If the current status is Partially Fulfilled, the process sends the message once a day. See [Setting the Daily Status Inquiry Time Window \(all versions\)](#) for background.

Updates based on status inquiry responses: Order Administration initially creates the Order Orchestration record in Acknowledged status, indicating that Order Orchestration has received notification of the order and assigned it a request ID. The following table summarizes the updates that take place in Order Administration based on the current status indicated in the response message from Order Orchestration.

Status in Update Response from OACS	Status of Order Orchestration record in OACS	Additional Updates
Polled	Polled	None
Accepted	Accepted	None
Picked	Accepted	None
Partial Fulfill	Partially Fulfilled	None
Fulfilled	Completed	See Store Pickup Order Fulfillment .
Unfulfillable	Rejected	Order Administration cancels the order using the Cancel Reason (Rejected Store Pickup Orders) (G11) and writes Order Transaction History messages such as the following: Order was maintained Web cancel request processed. Ln#: 1 Rejected by Store Ln#: 2 Rejected by Store An Order Transaction History message such as the above is written for each line on the order.
Canceled	Canceled	See Canceling a Store Pickup Order .

**Note:**

If the status in Order Orchestration is Verified or Processed, Order Administration does not update the status of the Order Orchestration record.

Sample messages: See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Other ways to update store pickup orders? After you create a store pickup order, maintenance to the order is prohibited. The only possible update you can make within Order Administration is to cancel the order; see [Canceling a Store Pickup Order](#).

Notifying the Customer that the Store Pickup Order is Ready

If the order is assigned to a Store Connect location, you can configure Order Orchestration to generate its own pickup notification email. See the Order Orchestration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) or the Order Orchestration online help for more information.

Your point-of-sale system can use the CWEmailRequest message to request that Order Administration generate Store Pickup Notifications. The notification indicates that the customer's order is ready for pickup in the designated store location.

See [Store Pickup Confirmation Email Program \(L48\)](#) and the [Store Pickup Notification Sample and Contents](#) for more information.

 **Note:**

This program is not used for Store Connect. If the order is assigned to a Store Connect location, you can configure Order Orchestration to generate its own pickup notification email. See the Order Orchestration *Web Services Guide* on <https://support.oracle.com> (ID 2953017.1) or the Order Orchestration online help for more information.

Store Pickup Order Fulfillment

When Order Administration receives a status list response message from Order Orchestration indicating that a store pickup order is in Fulfilled status, it:

- Changes the status of the Order Orchestration record to Completed (X).
- Submits the order to the BILL_ASYNC job.
- Clears the *Drop ship* flag on the order details.
- Deactivates the payment method(s).
- If the [Payment at POS for Store Pickup \(M16\)](#) is selected, sets the *Suppress deposit* flag for the order payment method to Y, so that the deposit is not processed in Order Administration when the order is billed; otherwise, the *Suppress deposit* flag is set to N, so that the deposit is processed in Order Administration.
- Clears the hold reason(s), if any, on the order.
- Writes Order Transaction History messages such as:

```
Ln#1: Shipped by Broker
```

```
CC DEPOSIT BYPASSED ON INVOICE # 1234567
```

```
Pick# 0000000 Billed on Invoice# 1234567
```

For more information: See [Fulfillment Process: After Order Creation and Status Updates](#) for details on additional updates at fulfillment, including invoice creation.

Creating a Store Pickup Order through the Order API

Overview: You can create a store pickup through the order API by specifying:

- a `delivery_type` of P
- the `store_code` identifying the store location where the customer would like to pick up the order

Other requirements: Creating a store pickup order through the order API is subject to the same requirements described under [Store Pickup Orders](#).

Freight calculation: The [Calculate Freight for Store Pickup Orders \(L32\)](#) system control value does not apply to the order API. To prevent freight from applying to a store pickup order, the `CWOrderIn` message can include the `calc_frt` attribute set to N; otherwise, normal freight calculation applies.

Ship-to address: As in interactive order entry, the order API uses the Store Cross Reference record to create the Order Ship To Address for the order. If the `CWOrderIn` message included any ship-to name and address information, only the name and apartment/suite number (and permanent ship-to number, if any) are retained on the order.

 **Note:**

The order API does not prevent the creation of multiple shipping addresses for a store pickup order; however, you should avoid submitting such orders through the order API to prevent errors in order processing.

CWORDEROUT message: If the `response_type` in the `CWOrderIn` message indicates to return a detailed response, the `CWORDEROUT` response message includes the following information related to a store pickup order:

- `ShipTo` element:
 - `delivery_type` is Store Pickup
 - ship-to name and address is from the Store Cross Reference record for the selected store location
- `Detail` element:
 - `pickup_type` is SP
 - `pickup_system_location` is from the System Code, if any, for the Store Cross Reference record; otherwise, from the [Name in OROB for Point of Sale \(L09\)](#)
 - `pickup_location` is the selected location's store code from Order Orchestration and the Store Cross Reference record
 - `broker_status` is Acknowledged if the `SubmitOrder` message was successfully processed by Order Orchestration; otherwise, the `broker_status` is not included

Errors: In addition to the normal edits that take place in the order API, the following errors can apply to store pickup orders:

- HDR errors:
 - Invalid Store Code = The `store_code` is invalid, or no `store_code` was specified. If the message specified an invalid store code that is not in the Store Cross Reference table, additional errors related to the ship-to address are included (such as Invalid Ship To Address, State Blank, City Blank, and so on)
 - Invalid Delivery Type = the `delivery_type` was not P (store pickup) or S (ship-for-pickup)
 - Email Missing/Ineligible = The customer does not have an email address, or the customer's opt-in/out setting is not O1 (all emails) or O2 (order-related emails). The email address and opt-in/out setting are required so that Order Administration can generate the store pickup notification email when the order is ready for pickup at the designated store location. See Store Pickup Notifications for more information.
- DTLS errors:
 - Ineligible for Store Pick = The order does not meet the requirements for a store pickup order, such as an invalid pay type; see [Store Pickup Order Creation Overview](#)
 - Store Fulfillment Loc Msg = Included if there is no `store_code` specified

- Store Fulfillment Subscription = Included if the order included a subscription item
- Store Fulfillment Membership = Included if the order included a membership item

If there are any errors on the order, Order Administration does not submit it to Order Orchestration. You can use batch order entry to correct the errors and submit the order for store pickup.

Order type change: The order type does not change to the [Store Pickup Order Type \(L33\)](#) until after the order is submitted for online authorization.

For more information: See:

- [Generic Order Interface \(Order API\)](#)
- [Order Creation Errors](#)

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Reviewing a Store Pickup Order in Order Inquiry

Identifying a store pickup order in order inquiry: The following information identifies a store pickup order in order inquiry:

- Order properties: The *Delivery type* at the [Display Order Properties Screen](#) and the [Display Order Broker Details Screen](#) is Store Pickup.
- Order detail: The line is flagged with a status of SPU at the [Order Inquiry Detail Screen](#), and the *Printed quantity* is the same as the ordered quantity. You can select D/S Status for a single line at the [Order Inquiry Detail Screen](#) to advance to the [Display Order Broker Details Screen](#), where you can review details and history for the order line.
- Order type: The order *Type* on the [Order Inquiry Header Screen](#) matches the [Order Type for Retail Pickup Orders Brokered to OROMS \(K92\)](#).
- Order ship to address: The ship-to name and address at the [Display Alternate Address Screen](#) defaults from the Store Cross Reference record for the selected store location.
- Broker detail and history: Use the [Display Order Broker Details Screen](#) to review Order Broker Detail and Order Broker History.

Reviewing Order Transaction History messages: The following table provides sample Order Transaction History messages and their explanations. You can review these messages at the [Display Order History Screen](#).

Order Transaction History Message(s)	Explanation
Submit Order Failed - OROB Unavailable	Communication with Order Orchestration is not available, or the Order Orchestration application is not active. Order Administration saves the information about the order in the Store Pickup tables, and attempts to submit the order to Order Orchestration the next time you start the BROKER_ORD process.
Submit Order Succeeded	Order Administration submitted the order to Order Orchestration.

Order Transaction History Message(s)	Explanation
Ln#: 1 Acknowledged by Broker	Order Orchestration created the order and responded with the request ID.
	NOTE: A similar message is included for each line on the order.
Ln#: 1 Accepted by Broker	Order Orchestration responded to a status inquiry and indicated that the selected location has accepted the order.
	NOTE: A similar message is included for each line on the order.
Store Pickup conf to flast@example.com	Order Administration generated the store pickup notification email to the customer, indicating that the order is ready for pickup at the designated store location.
	The email address may be truncated if the entire message exceeds 30 positions.
	See Store Pickup Notifications for more information.
Could not send Store Pickup Email	Order Administration could not generate the store pickup notification. Possible reasons are: <ul style="list-style-type: none"> no email address on the order (NOTE: The email address is stored in the Order Header Extended table, but is not displayed on any screen.) the opt-in/out setting is not O1 or O2 for the email address on the order
	If Order Administration could not generate the store pickup notification for any other reason (for example, if the order is closed or canceled), no Order Transaction History message is written.
	NOTE: This notification is not used by the Store Connect module.
	See Store Pickup Notifications for more information.
Ln#: 1 Customer Partial Pick Up	Order Orchestration responded to a status inquiry and indicated that the customer has picked up part of the order from the selected location.
	NOTE: A similar message is included for each line on the order. Order Orchestration does not indicate which line(s) have been picked up and which have not.
Ln#: 1 Shipped by Broker	Order Orchestration responded to a status inquiry and indicated that the customer has picked up the entire order from the selected location.
MANUAL AUTH# DETECTED - auth	
Pick# 0000000 Billed on	NOTE: The first message line is included for each line on the order.
Invoice# 1238008	
Order was maintained	Order Orchestration responded to a status inquiry and indicated that the selected location has rejected the order. In this situation, Order Administration cancels the order, using the Cancel Reason (Rejected Store Pickup Orders) (G11).
Web cancel request processed.	
Ln#: 1 Rejected by Store	NOTE: The last message line is included for each line on the order.

Order Transaction History Message(s)	Explanation
Submit Order Rejected/Order Not Canceled	Order Orchestration responded to a status inquiry and indicated that the selected location has rejected the order; however, the Cancel Reason (Rejected Store Pickup Orders) (G11) system control value is blank, so Order Administration could not cancel the order.
Order was maintained Web cancel request processed. Ln#: 1 Canceled by Store	Order Orchestration responded to a status inquiry and indicated that the order has been canceled at an external location, typically the location selected for pickup. In this situation, Order Administration cancels the order, using the Cancel Reason (Rejected Store Pickup Orders) (G11). NOTE: The last message line is included for each line on the order.
Order was maintained Ln#: 1 Cancel Acknowledged by Broker	You canceled the order in order maintenance, and the status update message was sent to and acknowledged by Order Orchestration. NOTE: The last message line is included for each line on the order.
Submit Order Rejected/Order Canceled Rsn:INVALID FULFILLING LOCATION CODE. LO CATION (10) DOES NOT EXIST FOR SYSTE M (SYSTEM01)	Order Orchestration was not able to create the order, because the selected location was not set up correctly in Order Orchestration. In this situation, Order Administration cancels the order, using the Cancel Reason (Rejected Store Pickup Orders) (G11).
Order was maintained Web cancel request processed.	
Submit Order Rejected/Order Canceled Rsn:Invalid or missing fulfillment system code system_cd) is required for a pickup request	Order Orchestration was not able to create the order, because the SubmitOrder request message from Order Administration to create the order did not specify a valid location associated with a valid system code in Order Orchestration. Check the System Code, if any, from the Store Cross Reference record, or the Name in OROB for Point of Sale (L09), and confirm that the code sent to Order Orchestration is a valid system code associated with the store location code.

You can also review information about the order through the [Working with Order Broker \(WOBR\)](#) option.

Canceling a Store Pickup Order

Canceling a store pickup order in order maintenance: You cannot maintain a store pickup order, although you can cancel it in order maintenance if you have authority under the [Cancel Order Broker Lines \(B19\)](#) secured feature:

- If you do not have authority under the secured feature, when you select a store pickup order for maintenance a pop-up window indicates: Not authorized to maintain brokered order.

- If you have authority under the secured feature, when you select a store pickup order for maintenance a pop-up window indicates: This is a Store Pickup order and can only be canceled!
 - If you click OK, you advance directly from this pop-up window to the Confirm Cancel window.
 - If you click OK at the Confirm Cancel window, you advance to the [Enter Cancel Reason Window](#).
 - If you complete the Enter Cancel Reason window, Order Administration cancels the order.

Hold reason(s) removed: When you cancel a store pickup order, Order Administration removes the hold reason(s), if any, on the order.

Notification to Order Orchestration: After you cancel a store pickup order, Order Administration changes the Order Orchestration record's status to Pending Cancel, and then to Canceled once the BROKER_ORD job has sent the status update message to Order Orchestration and received the response. The status update includes the cancel reason you entered at the Enter Cancel Reason window. When it processes the response, Order Administration writes Order Transaction History messages such as:

```
Order was maintained
```

```
Ln#: 1 Cancel Acknowledged by Broker
```

A line-specific message such as in the above sample is written for each line on the order.

See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for a sample.

Notification timing: The BROKER_ORD process in Working with Integration Layer Processes (IJCT) uses its *Outbound delay time* to determine how often to “wake up” and start evaluating Order Orchestration records. If it finds orders in Pending Cancel status, it generates the status update immediately and does not wait for the entire Order Broker Status Update Interval (K10).

Example: The *Outbound delay time* for the BROKER_ORD process is 60 seconds. When you start the process, it sends status updates for any orders in Pending Cancel status, then evaluates whether to send any other request messages based on the Order Broker Status Update Interval (K10). Once it has evaluated all orders in all companies, it then waits 60 seconds before restarting the process of checking for orders in Pending Cancel status and evaluating whether to send inquiry request messages for orders in other statuses.

Order Administration does not verify the pickup order's current status in Order Orchestration before processing the cancellation.

 **Note:**

Although the BROKER_ORD process generates the submit order requests (and cancellation requests, if needed), the BROKER process handles other requests to Order Orchestration.

Receiving a Store Pickup Cancellation from Order Orchestration

If the customer cancels the order, or an item on the order, at a retail location, Order Administration receives the cancel status update when it sends a periodic status inquiry list request and receives the response. In this situation, Order Administration cancels the order or item using the Cancel Reason (Rejected Store Pickup Orders) (G11); also, it writes Order Transaction History such as:

```
Order was maintained
Web cancel request processed.
Ln#: 1 Canceled by Store
```

A line-specific message such as in the above sample is written for each canceled line on the store pickup order.

Note:

- The Cancel Reason (Rejected Store Pickup Orders) (G11) system control value must specify a valid cancel reason in order to correctly cancel an order or item based on messages received from Order Orchestration.
- Canceling individual lines is supported only if the [Use Split Order \(L56\)](#) system control value is selected, and the corresponding preference is selected in Order Orchestration. See [Order Orchestration Configuration](#) and the Order Orchestration online help for background.

Troubleshooting Creation of Store Pickup Orders and Things to Note

Issue or Note	Explanation or Solution
Merchandise locator searching: errors	
One or more pickup item(s) is not eligible for Store Pickup	<ul style="list-style-type: none"> • Even though the item is flagged as <i>OROB eligible</i>, it is not a valid item in Order Orchestration. This situation could occur if, for example, you have not yet run Order Orchestration's Product, Product Location, and Incremental Inventory Import Process since creating the item or flagging it as <i>OROB eligible</i>; or, • There are no store locations within the search radius that have all the items on the order available in the requested quantities. <p>Optionally, you can:</p> <ul style="list-style-type: none"> • expand the search radius • use the Merchandise Locator option for individual order lines to determine the locations where each item is available, and the available quantities of each
Cannot identify customer location	The postal code or location specified at the search window were not found in the Order Orchestration proximity database.
Item XXXXXX is not eligible for store pickup	This item is not flagged as <i>OROB eligible</i> . If multiple items on the order are not flagged as <i>OROB eligible</i> , the error message lists just the first one on the order.

Issue or Note	Explanation or Solution
<p>No Response or Web Service Failure</p> <p>Merchandise locator searching: things to note</p> <p>The item is listed as available in a particular location in Order Orchestration, but the location is not included at the search results screen</p>	<p>The Order Orchestration application is not active.</p> <p>Can occur if:</p> <ul style="list-style-type: none"> • The number of locations where the item is available exceeds the <i>Maximum No. Responses</i> specified in Order Orchestration. • The location is not flagged as <i>Pickup available</i> in Order Orchestration. • there is no Store Cross Reference record set up in Order Administration through the Work with Store Cross Reference (WSCR) option.

 **Note:**

The Merchandise Locator option for individual order lines does not require a Store Cross Reference record in order to include a location at its search results screen. As a result, if you use both options there is a possible discrepancy between the results listed at the [Merchandise Locator Search Results Screen](#) and those available for selection at the [Store Pickup Search Results Screen](#).

Order acceptance: errors

<p>Credit card pay method only is required for Store Pickup</p>	<p>The Work with Order/Recap screen displays this error if there are any payment methods on the order are not credit cards.</p>
<p>Item(s) on order not identified as Store Pickup - select Store Pickup again.</p>	<p>The Work with Order/Recap screen displays this error if any items have been added to the order since you selected a store location at the Store Pickup Search Results Screen. To correct, go back to the Work with Order Lines screen and select Store Pickup again.</p>
<p>Invalid email setup for Store Pickup order</p>	<p>There is no email address specified for the customer, or the associated opt-in/out setting is not O1 (all emails) or O2 (order-related emails). The email address and opt-in/out setting are required so that Order Administration can generate the store pickup notification email when the order is ready for pickup at the designated store location. See Store Pickup Notifications for more information.</p>

Order creation and acceptance: things to note

Issue or Note	Explanation or Solution
If the Order Orchestration record is not created immediately after order acceptance	This situation can occur if communication with Order Orchestration is interrupted or if the Order Orchestration application is inactive. In this case, Order Administration creates a record in the Store Pickup tables to use as a trigger for each store pickup order that it needs to submit to Order Orchestration when the connection is restored. Order Administration also writes an Order Transaction History message such as <code>Submit Order Failed - OROB Unavailable.</code>
If Order Orchestration cannot create the order	<p>If the selected store location was not created correctly in Order Orchestration—for example, if it was not assigned to the System Code, if any, for the Store Cross Reference record, or the Name in OROB for Point of Sale (L09)—then Order Orchestration responds to the <code>SubmitOrder</code> request indicating that it cannot create the order. In this case, Order Administration cancels the order using the Cancel Reason (Rejected Store Pickup Orders) (G11) and writes Order Transaction History messages such as the following:</p> <pre>Submit Order Rejected/Order Canceled Rsn:INVALID FULFILLING LOCATION CODE. LO CATION (10) DOES NOT EXIST FOR SYSTE M (CWS) Order was maintained Web cancel request processed.</pre>
If the order is held	<p>Order Administration uses its regular credit-checking routine at order acceptance of a store pickup order, and may put the order on hold. A held order status does not prevent Order Administration from submitting the store pickup order to Order Orchestration, although Order Administration does select the order's <i>Under Review</i> flag if the order is held and the Payment at POS for Store Pickup (M16) system control value is unselected. However, Order Administration removes the hold reason(s), if any, when the order is canceled for any reason (cancellation in Order Administration or Order Orchestration, an error in Order Orchestration, or rejection by the selected store) or is fulfilled.</p> <p>If a store pickup order was submitted with the <i>Under Review</i> flag selected, and the order is subsequently released from hold, Order Administration sends Order Orchestration an order update message indicating to clear the <i>Under Review</i> flag. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for a sample message.</p>
Free gifts or promotional inserts	Once an order is flagged for store pickup, Order Administration does not add free gifts or promotional inserts when you accept the order. To prevent Order Administration from adding free gifts or promotional inserts, select the Store Pickup option before attempting repricing.

Issue or Note	Explanation or Solution
Batch order entry	When you work with store pickup orders in batch order entry, you might need to change or add individual order lines that are in error. After you do so, use the Store Pickup option and select a location where the customer can pick up the order.
Alternate Shipping Charges by Via Window still opens	Even if the Calculate Freight for Store Pickup Orders (L32) system control value is unselected, this window still opens in order entry. In this case, exit out of the window without making a selection.
Creating the Order Ship To Address record	Order Administration creates the Order Ship To Address record using the description and address from the Store Cross Reference record for the selected store.
Separate Order Orchestration record for each order line	There is a separate Order Orchestration record for each order line sent to Order Orchestration; however, the entire order has a single request ID, and creates a single order in Order Orchestration.
Entering a negative quantity	Although Order Administration does not prevent you from creating a store pickup order with a negative quantity, the order creates an error in Order Orchestration and cannot be processed normally. The error (<code>Index out of range</code>) is noted in Order Orchestration's error log.
System control value setting requirements for order API	If the order API receives a store pickup order, but the required system control values are not set correctly, the API creates the order and ignores the store pickup information in the CWOrderIn messages. To create a store pickup order through the order API, as in interactive order entry, the Use Merchandise Locator (I38) system control value must be selected and the Store Pickup Order Type (L33) system control value must specify an order type.
After order creation: things to note	
If the order remains open rather than canceled when the selected location rejects the order or if Order Orchestration cannot create the order	If you have not specified a Cancel Reason (Rejected Store Pickup Orders) (G11), then the system cannot cancel the order, and the order remains open if it cannot be fulfilled through Order Orchestration.
Maintenance prohibited	You cannot maintain a store pickup after creation except to cancel it (although you can use batch order entry to correct an order received through the order API if there are any errors). See Canceling a Store Pickup Order for more information.
Returns prohibited	You cannot process a return in Order Administration against a store pickup order.

Issue or Note	Explanation or Solution
Email notifications for store pickup orders	You can select the different types of email notifications to generate from Order Administration based on the Cancel Reason (Rejected Store Pickup Orders) (G11). The <i>Email notification</i> flag for this order type must be selected in order to generate the store pickup notification to the customer when the order is ready for pickup. Also, the opt-in/out setting for the email address on the order must be O1 (all emails) or O2 (order-related emails).
Skipped by Process Auto Soldouts	The Process Auto Soldouts program ignores lines on store pickup orders. See Processing Auto Soldout Cancellations (MASO) ,

Troubleshooting the Order Orchestration Integration

See the Order Orchestration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for information on possible errors returned by Order Orchestration and additional troubleshooting information.

See also:

- [Order Orchestration Status Summary Table](#)
- [Things to Note About Brokered Backorders](#)
- [Things to Note about Retail Pickup \(including Ship-for-Pickup\) and Delivery Orders](#)
- [Troubleshooting Creation of Store Pickup Orders and Things to Note](#)
- [Order Orchestration Integration](#)
- [Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration](#)

Credit card authorization reversals: Authorization reversals take place when the Order Orchestration status is:

- C (Closed): The request was canceled before submission to Order Orchestration.
- E (Error): Order Orchestration returned an error response.
- J (Rejected): The order was rejected by the pickup location. Reversal takes place only for a pickup order.
- U (Unfulfillable): Order Orchestration cannot fulfill the order or line.
- Y (Pending Cancel): A request to cancel the order or line has been sent to Order Orchestration.
- Z (Canceled): Order Orchestration has confirmed that the order or line was canceled.

For more information:

- See [Order Orchestration Status Summary Table](#) for more information on Order Orchestration statuses.
- Use the *Order Broker Lines* option at the **Batch Job Statistics** page in Modern View to check the total number of Order Broker lines in the currently selected company, broken out by current status.

Problem	Possible Explanation
No fulfilling location is displayed at the Work with Order Broker Screen	Is the Order Orchestration request's status E (error), U (unfulfillable), C (Closed) or Z (canceled)? In this case, the order line will not be fulfilled through Order Orchestration.
The status of the Order Orchestration request is Closed, but there have not been any shipments	Order Administration changes the status of a brokered backorder request to C (closed) if you cancel it before it has been submitted to Order Orchestration (when its status is R (ready)).
A backordered order line is not being submitted to Order Orchestration for fulfillment	<ul style="list-style-type: none"> • Check that the order is eligible under the Rules for Submitting Backorders to Order Orchestration • Confirm that you have completed the Order Orchestration Configuration • Confirm that the customer is not flagged to <i>Bypass reservation</i> • Confirm that the item has the OROB eligible flag selected • If the order was previously in held status and then released, use the BROKER periodic function or select the order for maintenance and then accept your maintenance session
I created a ship-for-pickup order, but it is not listed at the Work with Order Broker Screen or on the Order Inquiry screen in Order Orchestration	If the Use OROB for Ship for Pickup Fulfillment Assignment (M34) system control value is set to NEVER, Order Administration does not send ship-for-pickup orders to Order Orchestration until you generate the pick slip. See Ship-for-Pickup Orders for an overview.
Order Orchestration returned an error	<p>The error is displayed at the Display Order Broker History Screen.</p> <ul style="list-style-type: none"> • An error of <code>Null response from OROB</code> indicates that the OROB Account (K49) system control value is not set correctly. • An error of <code>Invalid Sold To address, missing req</code> indicates that the sold-to customer is missing the first and last name or the company name; a first and last name or a company name are required for the sold-to customer on all orders sent to Order Orchestration. • An error of <code>Duplicate Order/line (code 2040)</code> indicates that the order or line was already created in Order Orchestration. This situation can occur if the Use Duplicate Order Checking option is selected in Order Orchestration and the order or line was already created there, but for some reason Order Administration did not receive or process the original response message. In this case, Order Administration puts the Order Orchestration record's status to Acknowledged, and the order line continues processing normally. <p>See the Order Orchestration Web Services Guide on My Oracle Support (ID 2953017.1) for a list of possible errors that Order Orchestration might return to a Submit Order request.</p>

Problem	Possible Explanation
Will there be Order Orchestration records in error if the Order Orchestration application is not running?	If Order Administration includes orders in a status inquiry list request and does not receive a response from Order Orchestration, the Order Orchestration records remain in their current status.
Where are messages logged between Order Administration and Order Orchestration?	If specified in the <i>XML Logging</i> setting at the Event Logging screen in Order Orchestration, Order Orchestration logs the messages.
Retail pickup and delivery orders not created in Order Administration	If the Send Inventory by Warehouse to OROB (L06) system control value is selected, Order Administration does not send fulfillments requests to Order Orchestration unless an <i>OROB location</i> is specified for the warehouse.
Ship-for-pickup orders are not created	An OROB_MESSAGE_VERSION of 16.0 or higher is required to use the Ship-for-Pickup Orders integration with Order Orchestration. Note that this property cannot be set higher than 19.9 for integration with Order Broker 19.x, or higher than 21.1 for integration with Order Broker 22.2.301.0 or higher, or Order Orchestration.
Status updates are not generated when ship-for-pickup orders are in transit	The Order Type for Retail Pickup Orders Brokered to OROMS (K92) and Order Type for Orders Brokered for Delivery (K91) system control values must be populated to generate the status update message when a ship-for-pickup order is in transit.
Order initially created in Order Administration in error status, then put on hold after error corrected	Canceled by originating system? If an order is initially created in Order Administration in error status and then corrected, Order Administration sends an inquiry request to Order Orchestration before changing the order's status to open. If the response from Order Orchestration indicates that the originating system has canceled the order, Order Administration then puts the order on hold and writes an order transaction history message, such as: Order held - line[s] canceled in Order B.
Tax is not calculated correctly for the invoice on a fulfilling order, while it is calculated correctly on the originating order	Select the Tax on Freight (B14) system control value if this issue occurs.

Problem	Possible Explanation
Multiple invoices are created for the lines on a single order that was fulfilled on the same day	<p>The invoice is consolidated for order lines that were previously in the same status and confirmed as fulfilled in the same status inquiry response from Order Orchestration, even if your company is not configured to consolidate invoices.</p> <p>Example: A line on the order is set to fulfilled in Order Orchestration at 9:00, and the other line at 9:02:</p> <ul style="list-style-type: none"> • The two shipments create a single invoice if they are returned in the same status inquiry response. • The two shipments create two separate invoices if Order Administration receives the update on the second line in a separate status inquiry response. <p>NOTE:</p> <ul style="list-style-type: none"> • In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date. • If the Invoice Ship For Pickup Order Once Intransit (M73) system control value is selected, the invoice is created after the status inquiry response indicates a ship-for-pickup order is in transit or received, as well as fulfilled.
An order received from Order Orchestration is created in error status because the Price Override Limit Percent (E55) was exceeded	<p>This situation can occur if the order includes a free or low-priced item, such as through a BOGO promotion. A possible solution to prevent this error is to set the Order Broker Price Override (K95) to a price override reason code whose <i>Override item offer price</i> flag is selected.</p>
Delivery orders are in G (Resend Fulfilled) status, or ship-for-pickup orders are in H (Resend Intransit) status	<p>Orders can be in these statuses if the order status update request message, generated to set their statuses to Complete (delivery order) or Intransit (ship-for-pickup order), did not receive a response from Order Orchestration. This might occur if, for example, message authentication failed or communication is down. In this case, the BROKER_ORD job resends the request the next time it runs.</p>

Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration

Checking status in pick slip generation: A retail pickup or delivery order is put on AU (Broker Order Under Review) hold when:

- Pick slip generation sends a status list request to Order Orchestration, and
- The response message indicates that the order is under review.

Checking if under review through the BROKER process: When the BROKER integration layer process sends the status list request to Order Orchestration and receives a response indicating that an order is not under review, it removes the AU hold, if any, on the order. However, if the response from Order Orchestration indicates that the order is now canceled, the order is put on hold using the [Order Broker Hold](#)

Reason (Cancel) (L02). If that system control value is blank, the order remains on AU hold.

 **Note:**

If there are other holds on the order, they are not automatically removed.

When an originating order is put on AR hold: When both an originating and fulfilling order exist, the holds applied work as follows:

- A ship-for-pickup order or brokered backorder that originated in Order Administration was assigned by Order Orchestration to Order Administration for fulfillment, and Order Administration created a new fulfilling order.
- The originating order's initial authorization expired.
- The attempt to reauthorize the originating order through the REAUTH periodic function failed, and the originating order was put on AR hold.

In this case, the system:

- Applies the AU hold reason to the fulfilling order.
- Voids any pending pick slips that have expired authorizations. Also, writes an order transaction history record such as: Pick ##### voided due to expired auth.
- Writes an order transaction history message such as SYS-HLD - BROKER ORDER UNDER REVIEW, where BROKER ORDER UNDER REVIEW is the description of the hold reason code.
- If the Generic Pick Out API is in use, generates a trigger for a CWPickout message indicating that the pick slip was voided.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

 **Note:**

Drop ship pick slips or purchase orders, including those fulfilled through supplier direct fulfillment in Order Orchestration, are not updated when the reauthorization fails. You need to monitor these orders separately.

If the reauthorization is declined after shipment through the fulfilling order: It is possible, based on the timing of the REAUTH job and billing, that the REAUTH job can attempt to reauthorize the originating order after the fulfilling order has made the shipment. In this case, the system still sends the order update to Order Orchestration indicating to put the order under review, even though the order may already be closed in Order Orchestration. If the order is already closed, no additional automatic updates take place.

Releasing Orders from AR or AU Holds

Restrictions: Orders on AR (Declined Credit Card Authorization) or AU (Broker Order Under Review) system holds can only be released under the following conditions:

- AR: You cannot release an order on AR system hold unless the order has a valid authorization for the balance of the order. Otherwise, you can cancel the order.

- AU: You cannot release an order on AU hold through a screen in Classic or Modern View. Instead, based on the response received from Order Orchestration through the BROKER integration layer process, the AU hold is removed automatically if the response indicates that the order is no longer under review. Also, the order can be canceled based on the response received through the BROKER process.

Tracking User, Authority, and Password Updates

Overview: Order Administration tracks updates to users, and user classes, and external payment service settings in the User Audit table, and tracks user password changes in the Password Audit table.

User Audit table: The User Audit table tracks activity that has taken place in creating or changing user records, user classes, and user authority. The table also tracks changes to external payment services. The activities that trigger updates to the User Audit table include:

- Creating, changing, or deleting a user in Work with Users (WUSR), including updates to:
 - Company authority
 - Menu option authority
 - Secured features
 - Tickler group assignment
- Creating, changing, or deleting a user classes in Work with User Classes (WUCL), including updates to:
 - Company authority
 - Menu option authority
 - Secured feature authority
 - Vendor authority
- Changes to user or user class authority for order hold reasons (WOHR)
- Changes to user or user class authority for return disposition value codes (WRDV)
- Creating, changing, copying, or deleting a secured feature (WSYS or NSEC)
- Updating a user's email address (MUEE)
- Updating a user's default menu (pressing F17 at a menu screen)
- Creating or changing information at the Work with External Service screen (WASV)
- Deleting an active procedure (MACX)
- Creating, changing, or deleting an inbound or outbound web service user or client ID, and password or client secret in Work with Web Service Authentication (WWSA)
- Generating a client, updating access, updating a client secret, or refreshing the applications displayed at the Manage External Application Access page in Modern View (MEAA)

Reporting: Use the [Print User Security Audit Reports \(PUSA\)](#) menu option to generate reports of the activity tracked in the User Audit and Password Audit tables. Note that not all activity tracked in the User Audit table is included in these reports.

Purging the audit tables: The PURGEUA periodic function (*Program name* = PFR0215) purges User Audit and Password Audit records based on date.

Use the *Parameter* field for the periodic function to specify the number of days old a User Audit or Password Audit record must be to be eligible for purge. If the *Parameter* is blank or 0, records must be 365 days old to be eligible for purge.

In this topic:

- [User Audit Table Updates](#)
- [Fields Used by Updated Table \(User Audit\)](#)
- [Password Audit Table](#)
- [Print User Security Audit Reports \(PUSA\)](#)
 - [User Authority Change Report](#)
 - [Password Change Report](#)

User Audit Table Updates

The updates to the User Audit table, based on updates to users, user classes, and secured features, are described below. See the [Fields Used by Updated Table \(User Audit\)](#) for a listing of the fields updated in the User Audit table for each updated source table.

Field	Attributes	Description
Common Fields		The following fields are populated for all records in the User Audit table.
Change date	Numeric, 7 positions (CYY/MM/DD format)	The date when the change occurred. Always populated.
Change time	Numeric, 6 positions (HHMMSS format)	The time when the change occurred. Always populated.
B/A	Alphanumeric, 1 position	Indicates whether the record reflects: <ul style="list-style-type: none"> • A = The record after the activity. • B = The record before the activity. Change: A change to an existing record creates both an A and a B audit record. Addition: Creation of a new record creates just an A audit record. Deletion: Deletion of an existing record creates just a B audit record. Always populated.

Field	Attributes	Description
Action	Alphanumeric, 1 position	<p>The type of action that took place:</p> <ul style="list-style-type: none"> • A = add • C = change • D = delete • E = edit access (used when you add or delete access through the Manage External Application Access option in Modern View (MEAA)) • R = refresh (used when you select the Refresh option at the Manage External Application Access page in Modern View (MEAA)) • S = regenerate secret (used when you regenerate a client secret through the Manage External Application Access option in Modern View (MEAA)) <p>Always populated.</p>

 **Note:**

Creating a new user results in audit records for the User and Users tables, as well as the User Extended table if you specify an email address. Additional table updates take place as you work with different types of user authorization, such as assigning authority to a company and then setting that company as the user's default.

Field	Attributes	Description
Updated table	Alphanumeric, 25 positions	<p>The table updated by the activity. See the Fields Used by Updated Table (User Audit) for a listing, including the activities that create each type of audit record and the included fields.</p> <p>All fields populated: All fields that are populated in the updated table are populated in the audit record. For example, a user record includes a default company and a default output queue. If you make any change to the user record, the default company and default output queue are included in the before and after records, even if these settings have not changed. However, the User Authority Change Report includes fields only if they have been updated. Also, the report does not include all types of updates.</p> <p>Certain activities update multiple tables: For example, deleting a user also deletes the User Extended record, the Auth User Company record, and other dependent records.</p> <p>Always populated.</p>
Updated by user	Alphanumeric, 10 positions	<p>The ID of the user who performed the activity. Always populated.</p>
Updated by user name	Alphanumeric, 30 positions	<p>The name of the user who performed the activity at the time of the update. From the User record. Always populated.</p>
Authority changed	Alphanumeric, 10 positions	<p>The record affected by the activity. Possible authority entries:</p> <ul style="list-style-type: none"> • a <i>user ID</i> when the user is created, changed, or deleted, or when an external payment service is changed • a <i>user class</i> when the user class is created, changed, or deleted • a <i>secured feature code</i> when the company-level secured feature is created, changed, or deleted <p>Always populated except for records created when the updated table is Webservice Users, Webserviceout, and INT Cloud App Client.</p>
Auth type	Alphanumeric, 1 position	<p>The authority type affected by the activity. Possible types:</p> <ul style="list-style-type: none"> • U = user ID (this code is also used for external auth service updates) • C = user class • F = secured feature <p>Always populated except for records created when the updated table is Webservice Users, Webserviceout, and INT Cloud App Client.</p>

Field	Attributes	Description
Name/ description	Alphanumeric, 30 positions	<p>The name of the user, user class, or secured feature related to the activity. Always populated except for records created when the updated table is Webservice Users, Webserviceout, and INT Cloud App Client.</p> <p>User name: Populated with a user name by a change related to the user, when the <i>Updated Table</i> is User, Users, User Extended, Auth User Company, Auth User Feature, Auth User Menu Option, User Field Authority, or User Tickler Group. In the case of an External Payment Service update, this is the user who performs the update. From:</p> <ul style="list-style-type: none"> • the <i>User name</i> set up through the User Control screen available through Advance Commands if the activity updates the Users table, even if the update took place through the Work with Users option. Fields in the Users table but also accessible through the Work with Users option include: <ul style="list-style-type: none"> – <i>Advanced commands</i> – <i>All jobs authority</i> – <i>Status</i> – <i>Rank</i> • the <i>Name</i> set up through Work with Users for any other activity related to the user. <p>User class: Populated with the user class name by a change related to the user class, when the <i>Updated Table</i> is User Class, Auth User Class Company, Auth User Class Feature, Auth User Class Option, User Class Field Auth, or User Class Vend Auth. In this case, the <i>Name/ description</i> is the same as the User class description.</p> <p>Secured feature: Populated with the secured feature description, when the <i>Updated Table</i> is Secured Feature. In this case, the <i>Name/ description</i> is the same as the Secured feature description.</p>

Field	Attributes	Description
Before/after changes	Alphanumeric, 512 positions	<p>Lists the settings of any changed fields:</p> <ul style="list-style-type: none"> • Before record: Lists the affected field settings before the activity. • After record: Lists the affected field settings after the activity. <p>Example: You changed the default company for a user from 12:</p> <p>After: Default Company: 3 Before: Default Company: 12</p> <p>This information is listed on the User Authority Change Report or on the generated spreadsheet file if the information's length exceeds the available space on the report.</p> <p>A <i>Before</i> record is not created as the result of a Refresh in Manage External Application Access (MEAA). Instead, there is just an <i>After</i> record, such as After: IDCS Refresh Applications job is executed by: FIRST.LAST. Note that the user name may be truncated.</p>
Additional Fields		<p>Each remaining field in the User Audit table is populated only if the corresponding source table includes the same field, and it is populated in the source table. For example, only the User table includes the CTI user type field, so this field can be populated in the User Audit table only for an audit record of a User record that has a CTI user type specified.</p>

Field	Attributes	Description
Company	Numeric, 3 positions	<p>The <i>Company</i> related to the update. Populated for the following tables by:</p> <ul style="list-style-type: none"> • <i>User</i>: Changing or deleting a user if a <i>Default company</i> was assigned. Not populated by adding a user, because you first need to assign company authority for a user before setting the default company. • <i>Auth User Company</i>: Changing a user's company authority, or deleting a user who had company authority. When you delete a user with authority to multiple companies, a separate audit record is created for each authorized company. • <i>Auth User Feature</i>: Adding or changing secured feature authority for a user. • <i>User Class</i>: Adding, deleting, or changing the default company for a user class. • <i>Auth User Class Company</i>: Adding or deleting company authority for a user class. • <i>Auth User Class Feature</i>: Adding, changing, or deleting secured feature authority for a user class. • <i>Auth User Class Vendor Auth</i>: Deleting authority to a vendor for a user class. • <i>Secure Feature</i>: Creating, changing, or deleting a secured feature at the company level. • <i>User Field Authority</i>: Adding, changing, or deleting authority to a hold reason code or a return disposition value for a user. • <i>User Class Field Auth</i>: Adding, changing, or deleting authority to a hold reason code or a return disposition value for a user class. • <i>External Auth Service</i>: Updating any settings at the Work with External Authorization Service screen. <p>Updates that are not specific to a company, such as creating or updating web service users, have the company set to 0.</p>
<p>The following fields are populated only for User table updates, not for web service user updates.</p>		
CTI user	Alphanumeric, 1 position	<p>The <i>CTI user</i> setting for the created, changed, or deleted user. Possible settings:</p> <ul style="list-style-type: none"> • Y = CTI user • N = User does not have fast path authority <p>Populated only for User table updates.</p>

Field	Attributes	Description
CTI user type	Alphanumeric, 1 position	The <i>CTI user type</i> setting for the created, changed, or deleted user. Optional field. Possible types: <ul style="list-style-type: none"> • 1 = Receive inbound only • 2 = Initiate outbound only • 3 = Inbound and outbound Populated only for User table updates.
CTI default screen	Alphanumeric, 1 position	The <i>CTI default screen</i> setting for the created, changed, or deleted user. Optional field. Possible settings: <ul style="list-style-type: none"> • 1 = Always display CTI screen • 2 = Display CTI screen with call Populated only for User table updates.
CTI default phone ext	Alphanumeric, 4 positions	The <i>CTI telephone extension</i> setting for the created, changed, or deleted user. Optional field. Populated only for User table updates.
User class	Alphanumeric, 10 positions	Populated for the following tables by: <ul style="list-style-type: none"> • <i>User</i>: Creating, updating, or deleting a user with a User class assigned. Optional field. • <i>User Class</i>: Creating, updating, or deleting a user class. • <i>Auth User Class Company</i>: Changing the company authority for a user class, or deleting a user class. • <i>Auth User Class Feature</i>: Deleting or changing the feature authority for a user class. • <i>Auth User Class Option</i>: Changing user class menu option authority, or deleting a user class. • <i>User Class Vendor Auth</i>: Deleting vendor authority for a user class. • <i>User Class Field Auth</i>: Adding, changing, or deleting authority to a hold reason code or a return disposition value for a user class.
User class description	Alphanumeric, 30 positions	The <i>Description</i> of the created, changed, or deleted user class. Populated only for User Class table updates.

Field	Attributes	Description
Default authority	Alphanumeric, 8 positions	<p>Possible settings are:</p> <ul style="list-style-type: none"> • *ALLOW • *EXCLUDE • *DISPLAY (menu option authority only) <p>Populated for the following tables by:</p> <ul style="list-style-type: none"> • <i>User</i>: Creating, changing, or deleting a user. • <i>User Field Authority</i>: Adding, changing, or deleting authority to a hold reason code or a return disposition value for a user. • <i>Auth User Feature</i>: Adding or changing secured feature authority for a user. • <i>Auth User Menu Option</i>: Adding, changing, or deleting menu option authority for a user. • <i>User Class Field Authority</i>: Adding, changing, or deleting authority to a hold reason code or a return disposition value for a user class. • <i>Auth User Class Option</i>: Adding, changing, or deleting menu option authority for a user class. • <i>Auth User Class Feature</i>: Adding or changing secured feature authority for a user class. • <i>Secure Feature</i>: Changing the default authority for a secured feature at the company level.
Log use	Alphanumeric, 1 position	<p>The <i>Log use</i> setting for the created, changed, or deleted user. Optional field. Possible settings:</p> <ul style="list-style-type: none"> • Y = Log use • N or blank = Do not log use <p>Populated only for User table updates.</p>
Security adm	Alphanumeric, 1 position	<p>The <i>Security administrator</i> setting for the created, changed, or deleted user. Optional field. Possible settings:</p> <ul style="list-style-type: none"> • Y = Security administrator • N or blank = Not a security administrator <p>Populated only for User table updates.</p>
Allow fast path	Alphanumeric, 1 position	<p>The <i>Fast path</i> setting for the created, changed, or deleted user. Optional field. Possible settings:</p> <ul style="list-style-type: none"> • Y = User has fast path authority • N or blank = User does not have fast path authority <p>Populated only for User table updates.</p>
Output queue	Alphanumeric, 10 positions	<p>The default <i>Output queue</i> for the created, changed, or deleted user. Optional field. Populated only for User table updates.</p>

Field	Attributes	Description
Menu	Alphanumeric, 10 positions	The <i>Default menu</i> setting for the created, changed, or deleted user. Optional field. Populated only for User or User Class table updates.
Language	Alphanumeric, 3 positions	The <i>Language</i> for the created, changed, or deleted user. Optional field. Populated only for User table updates.
E-mail address	Alphanumeric, 50 positions	The user's <i>Email address</i> . Populated only for User Extended table updates.
Secured feature	Alphanumeric, 3 positions	The code identifying the secured feature. Populated for the following tables by: <ul style="list-style-type: none"> • <i>Auth User Feature</i>: Adding or changing secured feature authority for a user. • <i>Auth User Class Feature</i>: Adding or changing secured feature authority for a user class. • <i>Secured Feature</i>: Adding, changing, or deleting a secured feature at the company level.
Secured feature desc	Alphanumeric, 40 positions	The description of the secured feature. Populated only for Secured Feature updates.
Tickler grp ID	Alphanumeric, 10 positions	The code identifying the tickler group added to or deleted from the user. Populated only for User Tickler Group updates for a user.
Vendor#	Numeric, 7 positions	The vendor whose authority was changed for the user class. Populated only for User Class/ Vendor Auth updates.
CPG program	Alphanumeric, 10 positions	Not currently implemented.
Hold reason	Alphanumeric, 2 positions	The code identifying a: <ul style="list-style-type: none"> • hold reason code if the <i>User field auth type</i> is HR, or • return disposition value if the <i>User field auth type</i> is RD Populated for the following tables by: <ul style="list-style-type: none"> • <i>User Field Authority</i>: Creating, changing, or deleting user authority to a hold reason code or a return disposition value. • <i>User Class Field Authority</i>: Creating, changing, or deleting user class authority a hold reason code or a return disposition value.

Field	Attributes	Description
User field auth type	Alphanumeric, 2 positions	<p>The code identifying the type of user field changed. Possible values:</p> <ul style="list-style-type: none"> • HR = hold reason code • RD = return disposition value <p>Populated for the following tables by:</p> <ul style="list-style-type: none"> • <i>User Field Authority</i>: Creating, changing, or deleting user authority to a hold reason code or a return disposition value. • <i>User Class Field Authority</i>: Creating, changing, or deleting user class authority a hold reason code or a return disposition value.
Menu option	Alphanumeric, 4 positions	<p>The <i>Fast path</i> identifying a menu option. Populated for the following tables by:</p> <ul style="list-style-type: none"> • <i>Auth User Menu Option</i>: Adding, changing, or deleting menu option authority for a user. • <i>Auth User Class Option</i>: Adding, changing, or deleting menu option authority for a user class.
UDF seq#	Numeric, 5 positions	Not currently implemented.
Use LDAP	Alphanumeric, 1 position	<p>Indicates if the user is flagged for LDAP authentication. This setting is always set to N since LDAP authentication is not currently implemented.</p> <p>Populated only for User table updates.</p>
Domain	Alphanumeric, 10 positions	<p>The domain to use for LDAP authentication. Populated only for User table updates.</p> <p>Not currently implemented.</p>
LDAP name	Alphanumeric, 50 positions	<p>The user name that matches the network user ID for network authentication. Used only for LDAP authentication, which is not currently implemented. Populated only for User table updates.</p>
Locale	Alphanumeric, 2 positions	<p>The two-position code identifying the user's locale. Possible locales:</p> <ul style="list-style-type: none"> • de = German • en = English • es = Spanish • fr = French • it = Italian

Field	Attributes	Description
Date Format	Alphanumeric, 3 positions	<p>The three-position code identifying the date format for the user. Possible date formats:</p> <ul style="list-style-type: none"> • DMY = DDMMYY format • MDY = MMDDYY format • YMD = YYMMDD format <div data-bbox="1117 466 1459 783" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>The current date format at the time of the change is included in the Before and After entries for each user change.</p> </div>
Rank	Numeric, 1 position	<p>The user's authority rank. Set to:</p> <ul style="list-style-type: none"> • 1 = the user can see and edit all other users through the User Control option (admin-level user authority). If the <i>All jobs</i> flag is selected, the user also has access to other users' documents and forms at the Document Management and Form Management screens. <div data-bbox="971 1104 1459 1304" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Assign this authority only to those users whose responsibilities require it.</p> </div> <ul style="list-style-type: none"> • any value from 2 to 9 = the user can use the User Control screen only to change his or her own password if IDCS or OCI IAM is not in use, and has access to the documents and forms of other users (through the My Docs and My Forms options) only if those users share the same rank assignment and the <i>All jobs</i> flag is selected. For example, a user assigned to rank 5 has access to the forms of other users who are also assigned to rank 5. <p>Populated only for Users table updates made either through the Work with Users option, or the User Control screen available through Advanced Commands.</p>

Field	Attributes	Description
Advanced command	Alphanumeric, 1 position	<p>Set to:</p> <ul style="list-style-type: none"> Y = user should has authority to the Advanced Commands option through My Docs, My Forms, or My Jobs N = the user does not have authority to the Advanced Commands option through My Docs, My Forms, or My Jobs <p>Populated only for Users table updates made either through the Work with Users option, or the User Control screen available through Advanced Commands.</p>
Password expired	Alphanumeric, 10 positions	<p>Indicates when the password for a user expires when IDCS or OCI IAM is not enabled. Valid values are:</p> <ul style="list-style-type: none"> *NO = the password does not expire; for security reasons, this setting is not recommended. expiration date in MM/DD/YYYY format = If the expiration date is on or earlier than the current date, then the next time the user logs in Order Administration advances directly to the Password Expired screen. The user will need to change the password before it is possible to advance to another screen. <p>Populated only for Users table updates through either the Work with Users option or the User Control screen available through Advanced Commands.</p>

Field	Attributes	Description
All jobs authority	Alphanumeric, 1 position	<p>Indicates the user's authority to other users' submitted jobs:</p> <ul style="list-style-type: none"> Y = the user can see and has authority to all other users' jobs. <div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>Assign this authority only to those users whose responsibilities require it.</p> </div> <p>If this flag is selected and the <i>User rank</i> is:</p> <ul style="list-style-type: none"> – 1: the user has access to all other users' documents and forms. – 2 through 9: the user has access to the documents and forms of other users of the same rank. • N = the user can see and has authority only to the jobs, documents, and forms associated with the user's own user ID. <p>Populated only for Users table updates made either through the Work with Users option, or the User Control screen available through Advanced Commands.</p>
Status	Alphanumeric, 10 positions	<p>Indicates if the user has access to Order Administration. Possible settings:</p> <ul style="list-style-type: none"> • *ENABLED = the user can use Order Administration. • *DISABLED = the user cannot use Order Administration. <p>Populated only for Users table updates made either through the Work with Users option, or the User Control screen available through Advanced Commands.</p>
Job Name	Alphanumeric, 200 positions	<p>The code identifying the job whose active procedure was deleted. Used only when the updated table is Active Procedure.</p>
Job Number	Numeric, 19 positions	<p>The number identifying the active procedure that was deleted. Used only when the updated table is Active Procedure.</p>

Fields Used by Updated Table (User Audit)

Fields for all audit records: All records in the User Audit table use the following fields:

- [Change date](#)
- [Change time](#)
- [B/A](#)
- [Action](#)
- [Updated table](#)

- Updated by user
- Updated by user name
- Before/after changes

Additional fields for different types of audit records: Additional fields used for the different possible updated tables are listed below:

Webserviceout	No additional fields updated.	<p>Work with Web Service Authentication (WWSA) creates records for the following Action types:</p> <ul style="list-style-type: none"> • A: Add an outbound web service user and password, or client ID and secret • C: Change authentication type, password, or client secret for an outbound web service <p>Sample Before/after changes entry: After: Webservice: Job Notification Only Client Secret is changed</p>

Password Audit Table

Password changes are not tracked when the IDCS_ENABLED property is set to `true`. Once IDCS (Oracle Identity Cloud Service) or OCI IAM (Oracle Cloud Infrastructure Identity and Access Management) use is enabled, password tracking ends; however, password audit records created before IDCS or OCI IAM use was enabled remain in the table.

The information in the Password Audit table is listed below:

Field	Attributes	Description
Change date	Numeric, 7 positions (CYY/MM/DD format)	The date when the change occurred.
Change time	Numeric, 6 positions (HHMMSS format)	The time when the change occurred.
User ID of password	Alphanumeric, 10 positions	The user ID whose password was updated.
User name	Alphanumeric, 30 positions	The name of the user. From the <i>Name</i> set up through Work with Users.
Updated by user	Alphanumeric, 10 positions	The ID of the user who performed the activity.
Updated by user name	Alphanumeric, 30 positions	The name of the user who performed the activity at the time of the update. From the User record.

Translating Special Characters

Certain special characters cannot be passed in an attribute of an XML message except through the use of replacement text strings. For outbound XML messages, Order Administration replaces these with the text strings listed below. Similarly, for inbound messages, you can pass the special characters listed below by replacing them with the related text strings. For example, if the item description includes a double quote, Order Administration replaces it in the `item_description` attribute in the *Detailed Order Response Message: Sample XML* with `"`. Similarly, you can pass a single quote in the `line_hyperlink` attribute in the *Inbound Order XML Message (CWORDERIN)* by replacing it with `'`

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

If an inbound message includes any of the special characters listed below without using the replacement text string, the system returns an error: `Cannot Parse XML Message` or `Invalid XML Message`.

Special Character	Description	Replacement Text String
'	single quote	'
"	double quote	"
>	greater than	>
<	less than	<
&	ampersand	&

Other special characters (such as \$ or !) can be passed in an attribute of an XML message without using replacement text strings.

Warehousing

- [Performing Inventory Transactions](#)
- [Transaction History](#)
- [Inventory Transaction Setup](#)
- [Item Where Used](#)
- [Purchase Order Receipts](#)
- [Managing Warehouses](#)
- [Docking Purchase Orders](#)
- [Warehouse Management Integration](#)

Transaction History

Topics in this part: The following topics describe the history information maintained for inventory transactions and how to display and print this information.

- [Display Inventory Transaction History \(DITH\)](#) describes the amount of history available, describes the inventory transaction history scan screen, and tells you how to display a specific record.
- [Print Inventory Transaction History \(PITH\)](#) tells you how to use the selection screen and how to print inventory transaction history. It also describes a sample report.

Inventory Transaction Setup

Topics in this part: The following topics describe the setup required to perform inventory transactions.

- [Work with Inventory Transaction Codes \(WITC\)](#) explains the purpose of transaction codes, tells you how to work with the code scan screen, and tells you how to create, change, display, delete, and print transaction codes.
- [Work with Inventory Transaction Reason Codes \(WIT1\)](#) explains how to use the Transaction Reason Code scan screen, and how to create, change, display, delete, and print a list of reason codes.
- [Verifying Inventory Sharing \(VISH\)](#) explains how to generate the [Verify Inventory Sharing Report](#), which lists the items in the sharing warehouse that are not setup correctly for inventory sharing.

Item Where Used

Topics in this part: The following topics describe the finished good explosion functions and the reports they produce.

- [Finished Good/Component On Hand \(MFGO\)](#) defines the terms used in this topic.

- [Explode Finished Good Items \(MKEX\)](#) defines the purpose of this function, describes the Finished Good Explosion screen, and describes a sample report.
- [Where Finished Good Component Item Usage \(MKCU\)](#) defines the purpose of this function, displays the Where F. Good Component Item Usage screen, and explains the sample report.
- [Where Set Component Item Usage \(MSCU\)](#) defines the purpose of this function, displays the Where Set Component Item Usage screen, and explains the sample report.
- [Where Variable Set Component Item Usage \(MVCU\)](#) defines the purpose of this function, displays the Where Variable Set Component Item Usage screen, and describes the sample report.

Selecting Purchase Orders for Receipt (PORC)

Purpose: Use the Select Purchase Order For Receipt screens to enter or scan for the purchase order you are receiving. If you know information unique to the purchase order, such as its number, you can enter the number and advance directly to purchase order receiving. If you do not know the number of the purchase order, you can search for the purchase order using any of the following search criteria:

- Due date
- Reference #
- Vendor #
- Vendor name
- Vendor reference #
- Vendor item #
- Item/SKU
- Item alias
- Buyer code

Additionally, you can simply select OK at the [Select P/O For Receipt Screen](#) to display each purchase order available for receipt.

Select P/O For Receipt Screen

Purpose: Use this screen to select the particular purchase order you are receiving. You can enter the purchase order number to advance directly to the [Work with P/O Receipt Detail Screen](#), or enter information in any of the fields on the screen to display a list of purchase orders.

How to display this screen: Enter PORC in the *Fast Path* field at the top of any menu.

Scanning for purchase orders: You can use the fields on this screen to find the purchase order you want to work with.

Note that the fields are grouped, and some fields are indented under the heading for the group. You can scan in the following combinations:

- Within a group, you can enter as much data to scan on as you want. For instance, you can enter data in the *Vendor name*, *Reference* and *Item* fields.

- You cannot scan on multiple fields from different groups, except that you can always scan on the *Buyer* field plus any other group.

Field	Description
Control #	The purchase order receipt control number. This number can be the number assigned to a purchase order when you docked it. See Docking Purchase Orders . If the Cross company scan field is selected for your company and you enter a control number from another company, the system makes the company associated with the control number the active company. <i>Numeric, 6 positions; may be display-only or optional.</i>
Purchase order information:	Purchase order information:
PO #	The number assigned to a purchase order. <i>Numeric, 7 positions; optional.</i>
Due date	The date this purchase order is due to be received, based on the purchase order date and the lead days from the Vendor/Item record or a user-defined date. <i>Numeric, 6 positions (user date format); optional.</i>
Reference #	An internal reference number associated with the purchase order. For example, the reference number may represent an internal purchase order number from a pre-printed purchase order or an internal control for departmental purchase orders. <i>Alphanumeric, 15 positions; optional.</i>
Vendor information:	Vendor information:
Vendor	A user-defined code to identify the supplier of an item. See Working with Vendors (WVEN) . <i>Numeric, 7 positions; optional.</i>
Name	The name of one of your suppliers, identified on the system by a vendor number. Enter a full or partial vendor name to display a pop-up window listing each vendor name, number, and number of open purchase orders, beginning with the name you entered. You can select a vendor from the list by entering 1 next to the name. <i>Alphanumeric, 30 positions; optional.</i>
Reference	The vendor's internal reference number for the purchase order; for example, the vendor's order number. <i>Alphanumeric, 15 positions; optional.</i>
Item	The vendor's code for the item. See Working with Vendor Items (WVNI) . <i>Alphanumeric, 20 positions; optional.</i>
Your item code information:	Your item code information:
Item/SKU	A code that represents a unit of inventory, and any information on the item's unique characteristics, such as its color or size. <i>(Item) Alphanumeric, 12 positions; optional.</i> <i>(SKU) Alphanumeric, three 4-position fields; optional.</i>

Field	Description
Alias	The substitute item code for an actual item code on your system. No on-hand inventory levels are maintained for the alias item code. You may offer an item through both alias and the true item code in the same catalog to determine the effect of an item's location and placement on sales. See the Work with Alias Screen . <i>Alphanumeric, 12 positions; optional.</i>
Your authorized buyer: Buyer	Your authorized buyer: A code that identifies the employee who requested the purchase. See Working with Buyers (WBUY) . <i>Alphanumeric, 3 positions; optional.</i>

Performing Inventory Transactions

Topics in this part: This part describes how to perform inventory transactions.

- [Working with Inventory Transactions \(WITI\)](#) tells you how to perform transactions which change inventory immediately.
- [Working with Inventory Transaction Errors \(WITE\)](#) allows you to review all of the errors that have occurred while performing inventory transactions.
- [Finished Good Work Order Processing \(WWOR\)](#) allows you to reserve component items while you assemble a finished good.

Purchase Order Receipts

Topics in this part: The following topics describe the functions available when using receiving merchandise from your vendors.

- [Purchase Order Receiving Overview](#) describes the options available when receiving purchase orders, explains how the system determines the cost of an item and how the Suggest Warehouse Placement function works, and shows you how to locate the function.
- [Working with P/O In Transit Information \(MPIT\)](#) shows you how to quickly update a purchase order with shipping information.
- [Selecting Purchase Orders for Receipt \(PORC\)](#) shows you how to enter the purchase order number you want to post receipts against, and how to scan for open purchase orders.
- [Receiving Purchase Orders \(PORC\)](#) describes the various methods of posting receipts to a purchase order, shows you how to post receipts using each of the available methods, and describes each of the options available in PO receipts.
- [Placing Suspended Stock \(SUSP\)](#) shows you how to transfer merchandise from suspense to inventory.

Purchase Order Receiving Overview

Purpose: Use purchase order receipts to record the receipt of inventory on open purchase orders.

You can record receipt:

- in the warehouse, to record stock receipts immediately as merchandise is being brought into the warehouse.
- as an office function, where receipts are entered after the merchandise is put away.

Purchase Order Receipt In API: You can use the Purchase Order Receipt In API to process PO receipts received from another system, such as a warehouse management system. See the *Purchase Order Receipt In API* for an overview and the required setup.

PO download triggers: The setting of the [Create Generic PO Download Trigger for PO Receipt \(K27\)](#) system control value determines whether the system creates a purchase order download (POH) trigger when a purchase order line is received. See *Generic Outbound Purchase Order API* for an overview.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

In this topic:

- [Docking Stock](#)
- [Receiving Merchandise into Suspense](#)
- [Receiving Merchandise into a Pending Warehouse](#)
- [Suggest Location Placement](#)
- [Additional Functions During Purchase Order Receiving](#)
- [Warning about Conflicting Jobs](#)
- [Receipt Cost Calculation](#)
- [Distributing Overhead Costs](#)
- [Receiving Inventory](#)
- [Suggest Warehouse/Location Placement](#)
- [Receiving Overages and Underages](#)

For more information:

- [Maintaining Purchase Orders](#)
- [Purchase Order Inquiry \(MPOI\)](#)

Docking Stock

You have the option of recording a purchase order as "docked" before you receive it. A docked status indicates that you have received inventory associated with the purchase order, but have not yet confirmed items or quantities. You can dock a purchase order just once or many times for different deliveries. Until you actually receive the purchase order, inventory inquires do not indicate that any of the associated inventory is on-hand in your warehouse.

A standard process might include:

- dock the purchase order
- count the merchandise and perform quality control
- receive the purchase order

Docking stock provides a record of when the inventory actually arrived at your warehouse, as opposed to when you completed quality control and recorded the receipt. This can be helpful if there is a question on whether the vendor delivered the merchandise on time.

If you dock stock, the system assigns a purchase order receipt control number at the time you dock it.

For more information: See [Docking Purchase Orders](#).

Receiving Merchandise into Suspense

Receiving merchandise into suspense gives you the opportunity to inspect the merchandise before it becomes part of your inventory. Once the inventory has been inspected, you can transfer the inventory to its final destination. See [Receiving into Suspense](#) for more information.

Receiving Merchandise into a Pending Warehouse

Pending warehouses are warehouses where you can place inventory that is on its way to its final destination, for example, a staging area.

Use a *pending putaway* warehouse to temporarily store saleable inventory on its way to its final destination warehouse. Inventory received into a *pending putaway* warehouse retains its on order status so that the inventory is visible in PO Layering, yet the system recognizes the inventory as being in a warehouse location so that you can manipulate it.

You can define a warehouse as a pending warehouse using the [Working with Default Warehouse Locations \(WWDL\)](#) menu option.

When you place stock in a pending putaway warehouse, the system creates a record in the Pending Putaway Detail table. See [Pending Putaway Overview](#) for more information.

Suggest Location Placement

Use Suggest Location Placement to have the system recommend the locations where the inventory should be placed.

Values in the System Control table determine how this feature works. If you use a staging warehouse to receive inventory before you put it away, the system would suggest locations within your staging warehouse; the staging location indicates where the stock should ultimately be placed. See [Working with Default Warehouse Locations \(WWDL\)](#) for information on using a staging warehouse.

Additional Functions During Purchase Order Receiving

During Purchase Order Receiving, you can also add, change or view the messages associated with the purchase order, a line item on the purchase order, or with the vendor.

Warning about Conflicting Jobs

A warning pop-up window opens automatically when you select this option if Pick Slip Generation is active (in the Active Procedures table).

Reason: The warning pop-up window opens because each of these options affect inventory at the location level in the warehouse, as does the current option you are trying to use.

Responding to the Warning: Select OK to use the option anyway or select Exit to receive the items into inventory at a later time when the other jobs are finished running.

 **Note:**

The warning pop-up window(s) opens again if you selected OK at the first warning window to perform the receipt, then selected Accept to accept your entries. You can select OK to continue or Exit to wait to receive the inventory until the conflicting job has finished.

Receipt Cost Calculation

The system does not recalculate standard cost at purchase order receipt. You enter and maintain all cost information; the system does not update any cost information automatically.

The system retains the standard cost for each item, the cost at receiving for each receipt, and the cost at payables for each item invoiced. Overhead charges for a purchase order or a vendor/item are not included in the cost at receiving.

You can update the standard cost with the landed cost (primary vendor price + additional charges) through:

- the *Update Standard Cost* periodic function (see [Working with Periodic Functions \(WPER\)](#))
- creating your own query reports to compare the standard cost of an item against its current cost, and making any necessary adjustments manually.

The system includes the following in the receipt cost calculation:

- cost of item
- discounts: You can include the following discounts in the receipt cost calculation:
 - primary vendor discount: (from the Discount % (Primary discount percentage) field.
 - additional vendor discounts: Discounts in Work with Vendors.
 - vendor terms discount: from the Terms field. The [Vendor Discount % to Costing at Receiving \(D76\)](#) system control value must be selected in order for the system to include the vendor terms discount.
- additional charges. You can include the following additional charges in the receipt cost calculation:
 - purchase order additional charges: You can define purchase order additional charges at the [Work with PO Header Estimated Charges Screen](#) and Work with PO Detail Estimated Charges Screen.
 - vendor item additional charges: You can define vendor item additional charges at the [Work with Vendor Item Add'l Charges Screen](#).
- costing calculation method: The system calculates the receipt cost using the item cost plus any additional charges and discounts.

Distributing Overhead Costs

Overhead costs: When you receive a shipment, you might incur additional costs that you want to distribute across the cost of all items received. These costs might include freight charges, duty charges, import charges, brokerage fees, commissions, surcharges or any other user-defined costs.

You can include overhead costs in the cost of an item by applying them to items:

- received on a single purchase order
- purchased from specific vendors

When the [Allow Additional Costs to P/O Receipts \(A60\)](#) system control value is selected, the system allows you to advance to the Work with Additional Charges, where you can enter the overhead costs associated with the purchase order.

Additional PO estimated charges: You can also define overhead costs to apply to each detail line on a purchase order or to a specific detail line on a purchase order if the [Include PO Estimated Charges in Receipt Cost Calculation \(G29\)](#) system control value is selected.

Additional charge calculation guidelines: The table below presents the guidelines the system uses in determining the purchase order additional charges to factor into the cost of an item at purchase order receipt when using receipt controls.

Standard PO Receipt Cost Calculation Method	Vendor Item Additional Charges (Charges in WVNI)	PO Additional Estimated Charges (Est charges when creating the PO or Estimated charges when maintaining)
NA	All, whether unit or percentage, if Default Vendor Item Additional Charges (I21) is selected and Include PO Estimated Charges in Receipt Cost Calculation (G29) is selected	All, whether unit or percentage, if Include PO Estimated Charges in Receipt Cost Calculation (G29) is selected

Which costs are updated? The *Average cost* and the *Last purchase cost* in the SKU table are always updated when you receive a purchase order.

The standard cost is not updated at purchase order receipt.

Note:

Additional charges you enter by selecting Add'l Charges when receiving a specific purchase order do not update any of the costs in the SKU table.

Additional costing factors: The following system control values control the discounts you factor into the *Last purchase cost* in the SKU table based on purchase order receiving:

- [Vendor Discount % to Costing at Receiving \(D76\)](#): If this field is selected, the system applies the terms code assigned to the vendor through [Working with Vendors \(WVEN\)](#), and subtracts the related discount percentage from the cost at receiving.

- [Apply Discount To Manual Cost \(D96\)](#): If this field is selected, the system subtracts any discounts assigned to the vendor.

Receiving Inventory

Receiving choices: You can receive merchandise:

- **Directly into inventory:** the system updates inventory immediately, and the merchandise is available to be reserved and picked. See [Receiving into Inventory](#).
- **Into suspense:** inventory is not updated until the merchandise is transferred from suspense to inventory. Suspended merchandise is not available for reservation and picking. You control whether merchandise can be received into suspense by completing the [Allow Receipt to Suspense \(A59\)](#) system control value. You can receive an entire purchase order into suspense, or only specific items. You determine how the inventory will be received during purchase order receipts. See [Receiving into Suspense](#).
- **Into a pending putaway warehouse:** the system creates a record in the Pending Putaway Detail table and creates a PO layering record for the “final destination” warehouse. The pending putaway detail record indicates the quantity to be placed in the “final destination” warehouse and the expected due date when the inventory will be moved. See [Receiving into a Pending Warehouse](#).
- **Into a staging warehouse:** you would normally define the staging warehouse as non-allocatable, and the staging locations as non-pickable, to prevent the system from attempting to reserve or pick from the staging area. See [Receiving into a Staging Warehouse](#).

When the entire quantity of the item is received, the purchase order detail line is closed. When the entire purchase order is received, the purchase order is closed. See [Receiving Overages and Underages](#) for information on special receipt quantities.

Receiving into Inventory

When merchandise is received directly into inventory, it is available for reservation and picking immediately.

If you receive merchandise directly into inventory, the following system updates occur at receiving:

- The on-order quantity for the item is decreased
- The on-hand quantity of the item is increased in the item warehouse and the item location.
- Vendor item analysis is performed

All or part of a purchase order can be received into inventory.

You can use the Suggest Location Placement function to recommend the locations where the items should be placed when the inventory is received. See [Suggest Warehouse/Location Placement](#).

Receiving into Suspense

Placing merchandise into suspense can help you quickly move merchandise from the loading dock to a secured setting where it can be processed for quality control.

When merchandise is received into suspense:

- It is not available for order fulfillment.
- Inventory is not updated until the merchandise is transferred from suspense to inventory.

- Suspended merchandise is not available for reservation and picking.

To receive into suspense: You can receive merchandise into suspense only if the [Allow Receipt to Suspense \(A59\)](#) system control value is selected.

Inventory can be received into suspense using the [Work with P/O Receipt Detail Screen](#):

- You can receive the entire balance of the purchase order into suspense using the Receive Suspense option. In this situation, the quantity due for each item on the purchase order is placed into suspense and the purchase order is closed. See [Receiving an Entire Purchase Order Into Suspense](#) for instructions.
- You can receive a purchase order line into suspense using the Suspense On/Off option: Select this option for an item on a purchase order to change the suspense receiving status of the line. The word *Suspense* displays next to the *Location* field and indicates the line item will be placed into suspense when the purchase order is accepted. If the word *Suspense* is not displayed, the quantity received for the line will be placed into inventory. A *Location* is not required if you are placing the item into suspense. See [Using the Direct Entry Method](#) or [Using the Change Purchase Order Details Method](#) for instructions on working with individual line items during PO Receipts.

Suspense updates: The system performs the following updates when merchandise is received into suspense:

- Creates a record in the PO Suspense table for each purchase order line indicating the quantity received into suspense.
- Creates a record in the PO Receipt table for each purchase order line, with the *Suspense flag* set to Y.
- Updates the *Received quantity* for each purchase order line on the Purchase Order History screen by the quantity received into suspense.
- Decreases the *Quantity Due* for each purchase order line on the [First Display Purchase Order Detail Screen](#) by the quantity received into suspense.
- Updates the *Suspense quantity* on the Display Item/Warehouse Information Screen by the quantity received into suspense.

The following updates *do not occur* when merchandise is received into suspense:

- The on-hand quantity for the item is not changed.
- The costing calculation is not performed.
- Vendor Item analysis is not performed.

These updates occur when the merchandise is transferred from suspense to inventory using the [Placing Suspended Stock \(SUSP\)](#) menu option.

Receiving into a Pending Warehouse

Pending warehouses are warehouses where you can place inventory that is on its way to its final destination, for example, a staging area. Inventory in a pending warehouse is not available for reservation and picking.

Use a *pending putaway* warehouse to temporarily store saleable inventory on its way to its final destination warehouse. Inventory received into a *pending putaway* warehouse retains its on order status so that the inventory is visible in PO Layering, yet the system recognizes the inventory as being in a warehouse location so that you can manipulate it.

You can define a warehouse as a pending warehouse using the [Working with Default Warehouse Locations \(WWDL\)](#) menu option.

When you receive merchandise into a pending warehouse, the system performs the following updates at receiving time:

- Creates a pending putaway detail record. If a pending putaway detail record already exists for the purchase order and item/SKU, the system adds the receipt quantity to the existing pending putaway detail record. The pending putaway detail record indicates:
 - The quantity of the item in the pending warehouse *for this receipt*. The on hand quantity for the item at the item warehouse level indicates the total pending putaway quantity for the item.
 - The “final destination” warehouse where the inventory will be placed.
 - The expected due date of the inventory; this due date is displayed in order entry, order maintenance, standard or streamlined order inquiry, inventory inquiry, and item availability for the “final destination” warehouse.
- Creates a PO layering record for the “final destination” warehouse.
- Decreases the on-order quantity for the item in the “final destination” warehouse.
- Creates an inventory transaction history record for the pending warehouse.

The following updates *do not occur* when merchandise is received into a pending warehouse.

- The on-hand quantity for the item in the “final destination” warehouse is not changed.
- The costing calculation is not performed.
- Vendor Item analysis is not performed

These updates occur when the merchandise is transferred from the pending putaway warehouse to the “final destination” warehouse.

See [Pending Putaway Overview](#) for an overview of the updates the system performs when you place inventory into a pending warehouse.

Receiving into a Staging Warehouse

When you receive into a staging warehouse, the same updates take place at receiving as when you receive into inventory. However, you normally define the staging warehouse to be non-allocatable and non-viewable in Order Entry, and define each location to be non-pickable; the result is that the inventory is not generally available or visible on the system until you place it in your main warehouse.

See [Working with Default Warehouse Locations \(WWDL\)](#) for an overview of defining default locations within a staging warehouse.

Suggest Warehouse/Location Placement

Purpose: Use the Suggest Location Placement function to have the system determine where merchandise should be placed. The system searches through the available locations in your warehouse to determine where you should place the merchandise. You can accept, reject or change any of the system suggested placements for an item.

When suggest placement is used: Suggest Location Placement can be used during the following functions:

- [Receiving Purchase Orders \(PORC\)](#): when merchandise is being received into inventory

- [Placing Suspended Stock \(SUSP\)](#): when merchandise is being transferred from suspense to inventory
- [Suggest Location Placement \(MSLO\)](#): when you are placing items in locations independent of the Purchase Order Receipts and Place Suspended Stock functions.

Standard Warehouse/Location Placement

Purpose: The system will attempt to place the merchandise in a single location where the item is currently stored, if possible. If a single location cannot be found, the system will spread the merchandise across as many locations where the item is stored as is necessary. If the full quantity cannot be placed in existing item locations, the system will search for any suitable location (e.g., a location class compatible with the item type, a location that is not frozen, etc.) that can hold the placement quantity.

Note:

The Suggest Location Placement function searches existing warehouse locations only; new warehouse locations will not be created using this function.

Your company decides the criteria for how locations are suggested and the order in which the system will search for available locations.

- [System Control Values](#)
- [Searching for Locations](#)
- [Determining Location Capacity](#)
 - [Determining Location Capacity by Units](#)
 - [Determining Location Capacity by Volume](#)

System Control Values

The following values in the System Control table allow you to define whether to use suggest placement, and how the system will search for available locations when recommending stock placements. The following values are used:

- [Suggest Location Placement \(A27\)](#), which controls whether the function is used.
- [Type of Location to Search First during Suggest Location Placement \(C40\)](#), which defines the location type that will be searched first.
- [Type of Location to Search Second during Suggest Location Placement \(C41\)](#), which defines the location type that will be searched second.
- [Type of Location to Search Third during Suggest Location Placement \(C42\)](#), which defines the location type that will be searched last.
- [Suggest Multiple Items in a Location during Suggest Location Placement \(C43\)](#), which determines whether the merchandise can be placed in a location the contains other merchandise when the system is searching for any available location.
- [Location Capacity Method \(A31\)](#), which determines how the system determines when a location is full.

Suggest Location Placement searches primary, secondary and bulk locations in the sequence you define. You do not have to include all three location types. For example, you can choose to suggest only primary locations, or only bulk and secondary locations for item placements. Temporary locations cannot be recommended for placements.

Searching for Locations

The Suggest Location Placement program searches for a location as follows:

1. First, search locations whose *Location type* code matches the Type of Location to Search First during Suggest Location Placement (C40) in location code sequence until it finds a single location for the placement; otherwise,
2. Search locations whose *Location type* code matches the Type of Location to Search Second during Suggest Location Placement (C41) until it finds a single location for the placement; otherwise,
3. Search locations whose *Location type* code matches the Type of Location to Search Third during Suggest Location Placement (C42) until it finds a single location for the placement; otherwise,
4. If the full quantity cannot be placed in one location, search through all applicable locations again, in the same sequence, and fill each eligible location to capacity until the full quantity has been placed; otherwise,
5. If the full quantity cannot be placed in the existing locations where the item is stored, search for any available location in the warehouse that can hold the full placement quantity. If the Suggest Multiple Items in a Location during Suggest Location Placement (C43) value is selected, the program places two different items in the same location if it can hold the full capacity; otherwise, if the value is unselected, the program evaluates only empty locations.

Determining Location Capacity

The system evaluates the location capacity when determining whether the placement quantity can fit in a location. The location capacity can be evaluated by units, by cubic volume, or by weight. The unit capacity, cubic capacity, and weight capacity for a location are defined in the Location table. See [Creating and Maintaining Locations \(WLOC\)](#).

Determining Location Capacity by Units

When determining capacity by units, the system evaluates the number of units currently on hand in the location against the placement quantity to determine if the quantity can fit in the location. The total quantity cannot exceed maximum number of units from the Item Location table or the Location table.

In addition, the system checks the combined item weight to ensure that the location can support the on-hand quantity and the proposed placement quantity.

Determining Location Capacity by Volume

When determining capacity by volume, the system evaluates the cubic volume of the units currently on hand in the location against the cubic volume of the placement quantity to determine if the quantity can fit in the location. The Fill factor defined for the location is used to determine the total cubic volume that can fit in the location. See [Creating and Maintaining Locations \(WLOC\)](#).

If item dimensions (height, length, and width) are defined in the Item/SKU table, the item dimensions will be used to calculate the cubic volume. If item dimensions are not defined, the *Cube factor* is used.

In addition, the system checks the combined item weight to ensure that the location can support the on-hand quantity and the proposed placement quantity.

Receiving Overages and Underages

Overages: At times, a vendor may overship an item. The [Over Receipt % \(A61\)](#) value in the System Control table allows you to receive more than the quantity ordered for an item if the quantity received is within the tolerance limit.

If a vendor ships you more merchandise than you ordered, the system allows you to record the receipt if the overage is within an acceptable tolerance limit. For example, if you set the [Over Receipt % \(A61\)](#) to 10%, you can receive a quantity up to ten percent above the amount that was ordered. If the overage exceeds the tolerance amount, the following message indicates:

```
Invalid over receipt quantity
```

The [Override Tolerance \(A18\)](#) value in the Security table lets you accept any overage amount the vendor may ship. When this option is allowed, the system accepts any receipt quantity you enter without displaying a message.

Underages: At times, a vendor may under-ship an item and may not be able to fulfill the entire purchase request. The [Under Receipt % \(A62\)](#) value in the System Control table allows the system to close a purchase order line if only a certain percentage of the order quantity is received.

If a vendor short-ships an item and the quantity received is within the defined tolerance, the purchase order line will be closed even if the full order quantity was not received. This allows you to close purchase order lines when vendors short-ship merchandise and are unable to complete the shipment.

For example, if you define the [Under Receipt % \(A62\)](#) at 10%, a purchase order line will be closed when at least 90% of the merchandise is received. If you order 100 units and receive 92 units, the line will be closed when the receipt for 92 units is accepted.

If the vendor ships you the balance of the merchandise at a later time, you can add a line to the purchase order during Purchase Order Receipts to record the additional receipt, if you have the proper authority. The [Add PO Detail Line during PO Receipts \(A21\)](#) value in the Security table determines whether you can add lines to a purchase order at receiving.

Managing Warehouses

Topics in this part: The following topics describe the functions available from the Warehouse Management menu. These functions are used to define your warehouses, establish warehouse locations and assign inventory, and analyze your current warehouse utilization.

- [Creating and Maintaining Warehouses \(WWHS\)](#) shows you how to establish each of your warehouses on the system. In addition, this topic explains how to define the warehouse sequence to use when you fulfill customer orders from more than one warehouse.
- [Creating and Maintaining Location Classes \(WLCL\)](#) explains how location classes can be used to define the type of merchandise that will be stored in a warehouse location.
- [Creating and Maintaining Locations \(WLOC\)](#) shows you how to define the locations in the warehouse where merchandise is stored. Warehouse locations

can be comprised of a series of zone, aisle, shelf, and bin indicators, or they can be free-form user-defined location codes.

- [Using the Location Generator \(MLOC\)](#) explains how to use the automated location generator to create multiple warehouse locations at the same time.
- [Creating Item Warehouse/Locations \(MIWL\)](#) shows you how to assign an item to a warehouse location or change existing item location information, or change existing item warehouse information.
- [Suggest Location Placement \(MSLO\)](#) describes how to use the Suggest Warehouse Placement function to have the system determine the warehouse location where an item should be stored.
- [Creating and Maintaining Item Warehouses](#) describes how to assign items to a warehouses and how inventory history is captured for each item at the warehouse level.
- [Working with Default Warehouse Locations \(WWDL\)](#) describes how to create and work with the default locations the system checks automatically for certain inventory transactions.
- [Pending Putaway Overview](#) describes the updates the system performs when you place inventory into a pending putaway warehouse.

Creating and Maintaining Item Warehouses

Purpose: Work with Item Warehouses is used to change, delete, display, or create item warehouse records. An item warehouse record must exist for each item/SKU that is stocked in the warehouse. These records also provide the ability to capture inventory history for each item/SKU in the warehouse.

Item warehouse records are created automatically during item setup using the Work with Items function or the SKU Generator if you specify a warehouse for the item/SKU. Use the Work with Item Warehouse function to assign an item to a warehouse manually, if the item was not stocked in the warehouse at the time of setup.

In this topic:

- [Reset On-Order PO Quantity Periodic Function](#)
- [Inventory Extract Periodic Function](#)
- [Work with Item Warehouse Screen](#)
- [Create Item Warehouse Screen](#)
- [Display Item Warehouse Screen](#)
- [Work with Item Locations Screen](#)
- [Create Item Location Screen](#)
- [Change Item Location Screen](#)

Reset On-Order PO Quantity Periodic Function

You can use the PORST periodic function to reset the open PO quantities in the Item Warehouse table based on purchase order detail lines that are open or held, or received into suspense or into a pending putaway warehouse location.

Sample setup: Enter the following at the [Create Periodic Function Screen](#):

- Function: PORST

- Description: PO On Order Reset
- Company parameter: Y
- Appl area: ALL
- Program name: OER1018

Add to periodic process: You can, optionally, add this periodic function to a periodic process at the [Work with Periodic Processes Screen](#), select Functions.

You can also run the on-order reset through the [Unlock Purchase Order \(MUPO\)](#) menu option.

Inventory Extract Periodic Function

Use the Inventory Extract INVEXT periodic function (program name URR0003) to create records in the Inventory Extract table for each item location in your company. You can use the Inventory Extract table to determine the on-hand inventory for each item/SKU in your company.

No on-hand quantity: If all of the item locations for an item/SKU have an on-hand quantity equal to or less than zero, the system creates only 1 record in the Inventory Extract table for the item/SKU. This 1 record indicates that the item/SKU does not have any on-hand inventory.

- The location for this inventory extract record is the primary primary location for the item.
- If a primary primary location has not been defined for the item, the location for this inventory extract record is blank.

Note:

The “primary primary” location is stored in the [Primary location](#) field in the SKU table.

Records remain in the Inventory Extract table until they are downloaded to another system. It is your responsibility to delete the records in the Inventory Extract table. Each time you run the On-Hand by Location Extract program, the system appends records to this table; because of this, duplicate records may exist in the table.

Work with Item Warehouse Screen

Purpose: Use this screen to create, change, delete, or display records that define the items that are stocked in the warehouse. An item/warehouse record must exist for each item/SKU in the warehouse.

How to display this screen:

- Select Items for the desired warehouse at the [Work with Warehouses Screen](#).
- Select Warehouse for the item at the [Work with Items Screen](#).

Field	Description
Item	The number of the item assigned to the warehouse. <i>Alphanumeric, 12 positions; optional.</i>

Field	Description
SKU	The Split SKU codes associated with the item. The three elements (color, size, and width) are used to further identify the item.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note: The SKU elements are defined in the System Control table.</p> </div>
On-hand	<p><i>Alphanumeric, three 4-position fields; optional.</i></p> <p>The number of units of this item across all locations in the warehouse.</p> <p><i>Numeric, 7 positions; optional.</i></p>
On order	<p>The total quantity of this item in this warehouse that is due to be received through purchase orders.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Protected	<p>An amount of inventory that cannot be reserved using immediate or batch reservation for this item or SKU across all locations in this warehouse.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Reservation freeze	<p>Indicates whether the item or SKU in this warehouse is on hold, or frozen.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = The item/SKU warehouse is frozen. • Unselected = The item/SKU warehouse is not frozen. <p>If an item or SKU warehouse is frozen:</p> <ul style="list-style-type: none"> • Pick Slip Generation ignores the item warehouse when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. • Inventory does not reserve during Order Entry. See Reviewing Reservation Types.

Screen Option	Procedure
Create an item warehouse record	Select Create to advance to the Create Item Warehouse Screen .
Change item warehouse information	Select Change for an Item Warehouse record to advance to the Change Item Warehouse Screen. See the Create Item Warehouse Screen for field descriptions.

Screen Option	Procedure
Delete item warehouse information	Select Delete for an Item Warehouse to delete it.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>You cannot delete an item warehouse record if there are any on-hand quantities, open purchase order quantities, or backordered or reserved quantities for the item in the selected warehouse. If there are any Item Location records or Item Warehouse History records associated with this item and warehouse, the system will display a warning message:</p> <p>Deleting this warehouse will also delete any dependent records.</p> </div>
Display item warehouse information	Select Display for an Item Warehouse record to advance to the Display Item Warehouse Screen .
Work with locations	Select Locations for an Item Warehouse record to advance to the Work with Item Locations Screen .
Display Pending Put away Details	Select Pend Putaway for an Item Warehouse record to advance to the Display Pending Putaway Details Screen .

Create Item Warehouse Screen

Purpose: Use this screen to create an item warehouse.

The Work with Items function and the SKU generator automatically create Item Warehouse records if you enter a warehouse code, and Item Location records if you enter a location code during item setup. See [Creating Item Warehouse/Locations \(MIWL\)](#).

How to display this screen: At the initial [Work with Item Warehouse Screen](#), select Create.

Field	Description
Item	The item number you are assigning to the warehouse. The item number is validated against the Item/SKU table. <i>Alphanumeric, 12 positions.</i> <i>Create screen: required.</i> <i>Change screen: display-only.</i>

Field	Description
Color/Style/Size	<p>The Split SKU codes associated with the item. The three elements (color, style, and size) are used to further identify the item. The SKU codes entered are validated against the SKU tables.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The SKU elements are defined in the System Control Table.</p> </div>
	<p><i>Alphanumeric, three 4-position fields.</i> <i>Create screen: required, if applicable.</i> <i>Change screen: display-only.</i></p>
Reservation freeze	<p>Indicates whether the item or SKU in this warehouse is on hold, or frozen.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = The item/SKU warehouse is frozen. • Unselected = The item/SKU warehouse is not frozen. <p>If an item or SKU warehouse is frozen:</p> <ul style="list-style-type: none"> • Pick Slip Generation will ignore the item warehouse when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. • Inventory will not reserve during Order Entry. See Reviewing Reservation Types.
Protected qty	<p>An amount of inventory that cannot be reserved (using immediate or batch reservation) for this item/ SKU across all locations in this warehouse. The system will only use this inventory in Interactive Reservation.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Min qty	<p>The least amount of inventory on hand for this item/ SKU.</p> <p>An error message indicates if you try to enter a minimum quantity and you do not have authority to the Maintain Item Warehouse Minimum/Maximum Quantity (A92) secured feature:</p> <p>Not authorized to change.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Protect min/max (Protect minimum and maximum quantities)	<p>This field is not currently implemented.</p> <p>This field is included only if the Use Store File (G15) system control value is selected.</p> <p>An error message indicates if you try to change this value and you do not have authority to the Maintain Item Warehouse Minimum/Maximum Quantity (A92) secured feature:</p> <p>Not authorized to change.</p>

Field	Description
Max qty	<p>The maximum amount of inventory on hand for this item/ SKU.</p> <p>An error message indicates if you try to enter a maximum quantity and you do not have authority to the Maintain Item Warehouse Minimum/Maximum Quantity (A92) secured feature:</p> <p>Not authorized to change.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Economic order qty	<p>The recommended optimum ordering quantity for this item/ SKU, based on a set of criteria such as cost. Used for inventory reporting purposes.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Reorder qty	<p>Defines the quantity of this item/ SKU that should be ordered when the item/ SKU reaches the minimum stock level.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Original retail price	<p>The original price of this item in the retail store. You can use this field to track the original retail price for the item if the warehouse represents a retail store.</p> <p>This field is included only if the Use Store File (G15) system control value is selected.</p> <p>An error message indicates if you try to enter a price and you do not have authority to the Maintain Item Warehouse Retail Price (A91) secured feature:</p> <p>Not authorized to change.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>
Protect price (Protect current price)	<p>This field is not currently implemented.</p> <p>This field is included only if the Use Store File (G15) system control value is selected.</p> <p>An error message indicates if you try to change this value and you do not have authority to the Maintain Item Warehouse Retail Price (A91) secured feature:</p> <p>Not authorized to change.</p>
Current retail price	<p>The current price of this item in the retail store. You can use this field to track the current retail price for the item if the warehouse represents a retail store.</p> <p>This field is included only if the Use Store File (G15) system control value is selected.</p> <p>An error message indicates if you try to enter a price and you do not have authority to the Maintain Item Warehouse Retail Price (A91) secured feature:</p> <p>Not authorized to change.</p> <p><i>Numeric, 13 positions with a 2-place decimal; optional.</i></p>
User field 1	<p>An informational field where you can enter additional item warehouse information.</p> <p><i>Alphanumeric, 10 positions; optional.</i></p>
User field 2	<p>An informational field where you can enter additional item warehouse information.</p> <p><i>Alphanumeric, 10 positions; optional.</i></p>

Display Item Warehouse Screen

To display: Select Display for an item warehouse at the [Work with Item Warehouse Screen](#) to advance to the Display Item Warehouse screen. You cannot change any fields on this screen.

Field	Description
Item	The item number assigned to the warehouse. <i>Alphanumeric, 12 positions.</i>
SKU	The SKU associated with the item. <i>Alphanumeric, three 4-position fields.</i>
Warehouse	The code and description of the warehouse where the item is located. <i>Code: Numeric, 3 positions.</i> <i>Description: Alphanumeric, 30 positions.</i>
Reservation freeze	Indicates whether the item or SKU in the warehouse is on hold, or frozen. Valid values are: <ul style="list-style-type: none"> Selected = The item/SKU warehouse is frozen. Unselected = The item/SKU warehouse is not frozen. If an item or SKU warehouse is frozen: <ul style="list-style-type: none"> Pick Slip Generation will ignore the item warehouse when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. Inventory will not reserve during Order Entry. See Reviewing Reservation Types.
Economic order qty	The recommended optimum ordering quantity for this item/SKU, based on a set of criteria such as cost. Used for inventory reporting purposes. <i>Numeric, 7 positions.</i>
Backorder qty	The quantity of the item/SKU in this warehouse that is currently on open orders but not available in your warehouse. <i>Numeric, 7 positions.</i>
Protected qty	The amount of inventory that cannot be reserved (using immediate or batch reservation) for this item/ SKU across all locations in this warehouse. The system will only use this inventory in Interactive Reservation. <i>Numeric, 7 positions.</i>
Min qty	The least amount of inventory on hand for this item/ SKU. <i>Numeric, 7 positions.</i>
Max qty	The maximum amount of inventory on hand for this item/SKU. <i>Numeric, 7 positions.</i>
Reorder qty	Defines the quantity of this item/SKU that should be ordered when the item/ SKU reaches the minimum stock level. <i>Numeric, 7 positions.</i>
Reserve quantity	The quantity of this item/SKU in this warehouse that is reserved for existing orders. This total increases through immediate, batch, and interactive reservation, and decreases through confirmation or pick void/reprint. <i>Numeric, 7 positions.</i>

Field	Description
On hand quantity	The number of units of this item in all locations in this warehouse. <i>Numeric, 7 positions.</i>
On order quantity	The total quantity of this item in this warehouse that is due to be received on open purchase orders. This quantity increases when you enter a purchase order and decreases when you receive a purchase order. If you receive purchase orders into suspense, the suspended quantity remains in this total until you place the suspended stock. <i>Numeric, 7 positions.</i>
S/H reserve qty	The quantity of this item/SKU in this warehouse that is reserved for existing orders and requires special handling. This total increases through immediate, batch, and interactive reservation, and decreases through confirmation or pick void/reprint. <i>Numeric, 7 positions.</i>
Reserve transfer qty	The quantity of this item/SKU in this warehouse that is set to be transferred to another warehouse through replenishment. <i>Numeric, 7 positions.</i>
Protect min/max	This field is not currently implemented. This field is included only if the Use Store File (G15) system control value is selected.
Cost of goods	The total cost of units shipped from this warehouse, based on the defined unit cost of the item or SKU.
	<div data-bbox="906 1052 1458 1257" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note: The Display Cost in Inventory (A38) secured feature controls the display of this field.</p> </div>
	<i>Numeric, 13 positions with a four-place decimal.</i>
Picks generated	This field is not currently implemented.
Dollars returned	The total dollar value of units returned to this warehouse, based on the actual selling price of each unit. <i>Numeric, 20 positions with a 2-place decimal.</i>
Units returned	The total number of units returned to this warehouse by customers. <i>Numeric, 9 positions.</i>
Dollars sold	The total dollar value of units shipped and billed from this warehouse, based on the actual selling price of each unit. <i>Numeric, 20 positions with a 2-place decimal.</i>
Units sold	The total number of units shipped and billed from this warehouse. <i>Numeric, 9 positions.</i>

Field	Description
Original retail price	The original price of this item in the retail store. You can use this field to track the original retail price for the item if the warehouse represents a retail store. This field is included only if the Use Store File (G15) system control value is selected. <i>Numeric, 13 positions with a 2-place decimal.</i>
Current retail price	The current price of this item in the retail store. You can use this field to track the current retail price for the item if the warehouse represents a retail store. This field is included only if the Use Store File (G15) system control value is selected. <i>Numeric, 13 positions with a 2-place decimal.</i>
Protect price	This field is not currently implemented. This field is included only if the Use Store File (G15) system control value is selected.
User field 1	An informational field where you can enter additional item warehouse information. <i>Alphanumeric, 10 positions.</i>
User field 2	An informational field where you can enter additional item warehouse information. <i>Alphanumeric, 10 positions.</i>

Work with Item Locations Screen

Purpose: Use this screen to create, change, delete, or display a location for an item/SKU within a warehouse. Essential user-defined and system-updated quantity information is kept at the item/SKU location level.

How to display this screen: At the [Work with Item Warehouse Screen](#), select Locations for an item warehouse.

Field	Description
Location	A code that identifies a location for an item/SKU within the warehouse. <i>Numeric, 7 positions; optional.</i>
On-hand	The number of units for this item in this location. <i>Numeric, 7 positions; optional.</i>
Pending	The quantity of an item for which a batch inventory transaction has been entered, but not processed. A negative quantity in this field indicates component items picked from this location for a finished good work order. This field is cleared once you process the work order. See Finished Good Work Order Processing (WWOR) . <i>Numeric, 7 positions; optional.</i>
Min	The least amount of units to stock in this location. <i>Numeric, 7 positions; optional.</i>
Max	The maximum amount of units to stock in this location. <i>Numeric, 7 positions; optional.</i>

Field	Description
Reservation freeze	<p>Indicates whether the item location or SKU location is frozen. Valid values are:</p> <ul style="list-style-type: none"> Selected = The item/SKU location is frozen. Unselected = The item/SKU location is not frozen.

 **Note:**

Even though a pick slip does not print for an item from a frozen item location, the system still reserves the item on the [Order Lines Fields](#) in Order Entry.

Screen Option	Procedure
Create an item location	Select Create to advance to the Create Item Location Screen .
Change an item location	Select Change for an item location to advance to the Change Item Location Screen .
Delete an item location	Select Delete for an item location to delete it.

 **Note:**

The system will prevent you from deleting Item Locations if the quantity on-hand for the item in this location is greater than zero, or if there are any pending Inventory Transactions for the item in this location.

Display an item location	Select Display for an item location to advance to the Display Item Location Screen. You cannot change any information at this screen. See the Change Item Location Screen for field descriptions.
--------------------------	---

Create Item Location Screen

Purpose: Use this screen to create an item location.

Temporary location: If the item is assigned to a temporary location, the system automatically deletes the location when the on-hand quantity reaches zero. Order Administration does not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location.

How to display this screen:

- Select Create at the [Work with Item Locations Screen](#).

- Select Create Loc at the [Work with Inventory Transactions Screen](#).

Field	Description
Location	<p>The code representing the area within the warehouse that contains the item or SKU.</p> <p>An error message indicates if you enter a location whose location class does not match the location class for the item and the Allow Location Class Edit in Inventory Transaction (F86) system control value is selected: Item is not compatible with Location.</p> <p>Typically the location code is composed of a single alphanumeric character for Zone, and two numbers each for Aisle, Shelf, and Bin. For instance, the location A010201 indicates:</p> <pre>Zone Aisle Shelf Bin A 01 02 01</pre> <p>Free-form location codes can also be used. The location code entered is validated against the Location table.</p> <p><i>Alphanumeric, 7 positions; required.</i></p>
Reservation freeze	<p>Indicates whether the item location or SKU location is frozen.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • Selected = The item/SKU location is frozen. • Unselected= The item/SKU location is not frozen.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Even though a pick slip does not print for an item from a frozen item location, the system still reserves the item on the Order Lines Fields in Order Entry.</p> </div>
Min qty	<p>The desired least amount of inventory on hand for this item/SKU in this warehouse location.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Max qty	<p>The desired highest amount of inventory on hand for this item or SKU in this warehouse location.</p> <p><i>Numeric, 7 positions; optional.</i></p>

Change Item Location Screen

Purpose: Use this screen to change the item location's reservation freeze status, minimum quantity and maximum quantity, and to view inventory transaction information.

How to display this screen: Select Change for an item location at the [Work with Item Locations Screen](#).

See the [Create Item Location Screen](#) for the field descriptions not shown below.

Field	Description
On-hand quantity	<p>The number of units of the item in this location.</p> <p><i>Alphanumeric, 7 position; display-only.</i></p>

Field	Description
Pending transfer quantity	<p>The quantity of an item for which an inventory transaction has been entered, but not processed.</p> <p>A positive quantity reflects that inventory is in the process of being transferred to this location while a negative quantity indicates inventory is in the process of being transferred <i>from</i> this location. Reflects an adjustment, transfer, or finished good work order, and is not included in the on-hand quantity.</p> <p><i>Numeric, 7 positions; display-only.</i></p>
Printed quantity	<p>The number of units currently “allocated” for the item in this location, determined by the total quantity of the item on printed pick slips.</p> <p>When determining the locations from which to reserve items during pick slip generation, the printed quantity is subtracted from the on-hand quantity in the location to determine the quantity available for reservation.</p> <p><i>Numeric, 7 positions; display-only.</i></p>
Placement date	<p>The date when you first placed the item in this location, for example through purchase order receiving, customer returns, transfers, or adjustments.</p> <p><i>Numeric, 6 positions (user date format); display-only.</i></p>
Item transfer pending	<p>Indicates whether an inventory transaction is pending for the item in this location.</p> <p>For example, the system selects this field if you enter a finished good work order, but do not approve or process the request. See Finished Good Work Order Processing (WWOR).</p>

Pending Putaway Overview

Purpose: A pending putaway warehouse is a warehouse where you keep stock that still needs to be moved to its final destination: for example, a staging area.

Use a *pending putaway* warehouse to temporarily store saleable inventory on its way to its final destination warehouse. Inventory received into a *pending putaway* warehouse is included in the on-hand quantity for that warehouse, but also retains its on-order status; the inventory is also visible in PO Layering. Stock moved into or out of a pending putaway warehouse increases or decreases the on-order quantity in the pending putaway item warehouse.

How do I create a pending warehouse? You can define a warehouse as a pending putaway warehouse using the [Working with Default Warehouse Locations \(WWDL\)](#) menu option.

Note:

Inventory in a pending putaway warehouse should not be available for reservation and picking. You should leave the *Allocatable flag* for the warehouse unselected.

In this topic:

- [Pending Putaway Processing](#)
 - [Purchase Order Receipt Transactions](#)
 - [Warehouse Transfer Transactions](#)
 - [Positive Inventory Adjustments Transactions](#)
 - [Negative Inventory Adjustments Transactions](#)
- [Display Pending Putaway Details Screen](#)

Pending Putaway Processing

Purpose: When you place stock into a *pending putaway* warehouse, the system performs the following steps.

1. Creates a record in the Pending Putaway Detail table. You can review inventory in a pending putaway warehouse on the [Display Pending Putaway Details Screen](#).

The pending putaway detail record indicates:

- *PO #* = The purchase order number on which the inventory was originally received. If the inventory is not associated with a purchase order, the system uses 9999999 as the purchase order number.
 - *PO detail* = The purchase order line number on the purchase order on which the inventory was originally received. If the inventory is not associated with a purchase order, this field remains blank.
 - *PO warehouse* = The “final destination” warehouse where the inventory will be placed.
 - *Due date* = The expected due date of the inventory; this due date will display in order entry, order maintenance, order inquiry, inventory inquiry, and item availability for the “final destination” warehouse.
 - *Pending qty* = The quantity of the item in the *pending putaway* warehouse for this transaction. The on hand quantity and on order quantity for the item at the item warehouse level indicates the total pending quantity for the item.
 - *Offer* = The offer associated with the pending putaway detail record. If the inventory is associated with a purchase order, this is the offer on the purchase order.
2. For inventory placed in a *pending putaway* warehouse, the system creates a PO layering record for the “final destination” warehouse. The *Open quantity* field represents the quantity placed in pending putaway for the transaction.
 3. Decreases the on order quantity for the item in the “final destination” warehouse.
 4. Creates an inventory transaction history record for the pending warehouse.

Determining the “final destination” warehouse: The “final destination” warehouse is the warehouse where the inventory will eventually be placed. The system determines which warehouse is the “final destination” warehouse by looking at:

- the warehouse on the purchase order, *or*
- the warehouse associated with the inventory transaction, *or*
- the *Primary warehouse* for the item/SKU.

Moving stock from a pending warehouse: When you move stock from a pending warehouse, the system performs the following steps.

1. Decreases the quantity of the item in the pending warehouse. If the inventory quantity associated with the pending putaway detail record reaches zero, the system also deletes the pending putaway detail record.
2. Increases the on hand quantity of the item in the “final destination” warehouse.
3. Creates an inventory transaction history record for the pending warehouse and the “final destination” warehouse.
4. Performs vendor item analysis.

Other Async Processing: The Other Async performs updates to inventory placed in a pending warehouse.

- If a pending putaway detail record associated with a purchase order exists, the system keeps the associated PO layering record in an open status until the pending putaway detail record is deleted. The system deletes pending putaway detail records when the associated pending quantity is moved to another warehouse.

In addition, for inventory placed in a *pending putaway* warehouse:

- If enough backorders exist to use up the pending quantity, the system updates the status of the PO layering record to closed.
- If the pending quantity is less than the open quantity on the PO layering record, the system updates the PO layering open quantity to equal the pending quantity.
- If the pending quantity is equal to or greater than the open quantity on the PO layering record, the system does not update the PO layering open quantity.

Print backorder reports (PBOR): The on order quantity on the backorder reports does not include the quantity in a pending putaway warehouse.

Soldout control processing: The calculation the system uses to determine when an item with a soldout control status of 2 should be sold out now includes the on order quantity for pending putaway detail records that are associated with a *pending putaway* warehouse and whose “final destination” warehouse is allocatable. An item with a soldout control status of 2 is sold out when this condition is met:

$$(\text{on order} + \text{on order in pending putaway warehouse} + \text{on-hand}) - \text{reserved} < 0$$

Reset On-Order PO Quantity periodic function: The Reset On-Order PO Quantity periodic function updates the on order quantity in a pending putaway warehouse, regardless if the “final destination” warehouse is allocatable or non-allocatable.

Purchase Order Receipt Transactions

When you receive inventory into a pending warehouse through [Purchase Order Receipts](#), the system looks for an existing pending putaway detail record for this purchase order and item/SKU (indicating the item/SKU on this purchase order has already been partially received).

- If a pending putaway detail record does not already exist for the purchase order and item/SKU, the system creates a pending putaway detail record in the pending warehouse.
- If a pending putaway detail record already exists for the purchase order and item/SKU, the system adds the receipt quantity to the existing pending putaway detail record. The system looks at these fields in the Pending Putaway Detail table to determine if a record already exists for this purchase order and item/SKU:

- Company: the company where you performed the PO receipt.
- Item number: the item you received into the pending putaway warehouse.
- SKU code: the SKU of the item.
- Warehouse: the pending putaway warehouse.
- PO #: the number of the purchase order associated with the item you received.
- Sequence #: the system uses the next available number.
- PO layering warehouse: the “final destination” warehouse; this is the warehouse on the purchase order line.

PO Maintenance: If you cancel a purchase order line after it has been partially received in a pending warehouse, the system keeps the pending putaway detail record until the inventory in the pending warehouse is placed in its “final destination” warehouse.

Warehouse Transfer Transactions

For a warehouse transfer (T) from one pending warehouse to another pending warehouse, the system:

For the “from” warehouse:

- decreases the on order quantity and the on hand quantity on the item warehouse for the “from” warehouse. If the on order quantity and on hand quantity is adjusted to a negative quantity, the quantities are set to 0.
- decreases the pending quantity on the pending putaway detail record with the oldest due date for the “from” warehouse.
 - pending quantity - transfer quantity = new pending quantity.
 - If the pending quantity for the record is reduced to 0, the record is deleted.

For the “to” warehouse:

- increases the on order quantity and the on hand quantity on the item warehouse for the “to” warehouse.
- checks for existing pending putaway detail records in the “to” warehouse from the same item, SKU, PO number, and PO detail sequence number found in the “from” warehouse pending putaway detail record.
 - if a pending putaway detail record is found, then the system increases the pending quantity with the transfer quantity. Pending quantity + transfer quantity = new pending putaway quantity.
 - if a pending putaway detail record does not exist, then the system creates a pending putaway detail record, using the information from the “from” pending putaway detail record. In this case, the pending quantity represents the transfer quantity.
- The system does not adjust PO layering since the PO layering record does not contain the pending putaway warehouse.

Positive Inventory Adjustments Transactions

The system:

- increases the on order quantity and on hand quantity on the item warehouse by the adjustment quantity.
- creates a pending putaway detail record in the pending warehouse. If a pending putaway detail record already exists for the same transaction date and PO # 9999999, the system

adds the adjustment quantity to the pending quantity of the existing pending putaway detail record.

- Item number: the item against which you performed the adjustment.
- SKU code: the SKU of the item.
- Warehouse: this is the pending putaway warehouse.
- PO #: when a pending putaway quantity is not associated with a purchase order, the system displays 9999999.
- PO detail sequence #: the system assigns the next available number.
- PO warehouse: this is the “final destination” warehouse.
- Due date: the system uses this calculation to determine the due date:

$$\text{date the inventory adjustment was performed} + \text{number in the Pending Putaway Due Date Days system control value} = \text{due date}$$
- Pending quantity: the adjustment quantity.
- creates a PO layering record. If a PO layering record exists, the system adds the adjustment quantity to the open quantity on the PO layering record.
 - Company: the company where you performed the adjustment.
 - Item number: the item against which you performed the adjustment.
 - SKU code: the SKU of the item.
 - Warehouse: the “final destination” warehouse.
 - PO #: 9999999
 - Sequence #: the sequence number for the pending putaway detail record.
 - Due date: the due date for the pending putaway detail record.
 - Open quantity: the adjustment quantity.

Note:

When you process an overlay transaction, the system uses the difference between the original on hand quantity and the overlay quantity as the adjustment quantity.

Negative Inventory Adjustments Transactions

The system:

- decreases the on order quantity and on hand quantity on the item warehouse by the adjustment quantity.
- decreases the pending quantity on the pending putaway detail record that has the oldest due date.

$$\text{pending putaway quantity} - \text{adjustment quantity} = \text{new pending putaway quantity}$$
- updates the PO layering record associated with the pending putaway detail record whose pending quantity was decreased.

- Open quantity: reduced by the adjustment quantity. If the open quantity reaches 0, the system updates the PO layering status to closed.

**Note:**

When you process an overlay transaction, the system uses the difference between the original on hand quantity and the overlay quantity as the adjustment quantity.

Display Pending Putaway Details Screen

Purpose: Use this screen to review inventory information for items that have been placed in a pending putaway (PP) warehouse.

How to display this screen: At the [Work with Item Warehouse Screen](#), when accessed through the [Creating and Maintaining Item Warehouses](#) menu option, select **Pend Putaway** for an item warehouse.

Field	Description
Item	The code and description for the item that has inventory in a pending putaway warehouse. <i>Item code: Alphanumeric, 12 positions; display-only.</i> <i>Item description: Alphanumeric, 120 positions; display-only.</i>
SKU	The code and description for the unique attributes of the item that has inventory in a pending putaway warehouse. <i>SKU code: Alphanumeric, three 4-position fields; display-only.</i>
Warehouse	A code and description for the warehouse that represents the pending putaway warehouse. Pending warehouses are areas where you place inventory before the inventory is placed in its final destination, such as a staging area. <i>Warehouse code: Numeric, 3 positions; display-only.</i> <i>Warehouse description: Alphanumeric, 30 positions; display-only.</i>
PO #	The number of the purchase order associated with the inventory that has been placed in a pending putaway warehouse. If the inventory is not associated with a purchase order, for example the inventory is associated with an inventory transaction, the purchase order # is shown as 9999999. <i>Numeric, 7 positions; display-only.</i>
PO dtl (PO detail line number)	The purchase order line number associated with the inventory that has been placed in a pending putaway warehouse. If the inventory is not associated with a purchase order, for example the inventory is associated with an inventory transaction, the purchase order line number is the next available purchase order detail sequence number from the Pending Putaway Detail table. <i>Numeric, 3 positions; display-only.</i>

Field	Description
PO warehouse	<p>The code for the warehouse where the inventory that is located in the pending putaway warehouse will finally be placed.</p> <ul style="list-style-type: none"> This is the warehouse on the purchase order. If the inventory is not associated with a purchase order, this is the warehouse associated with the inventory transaction. If the inventory transaction is not associated with a warehouse; this is the <i>Primary warehouse</i> for the item. <p><i>Numeric, 3 positions; display-only.</i></p>
Due date (Pending putaway due date)	<p>The date inventory in the pending putaway warehouse is due to be received into the “final destination” warehouse. The purchase order has already been received in the pending putaway warehouse, but the system retains this information until the inventory is placed in the <i>PO warehouse</i>.</p> <p>Determining the pending putaway due date when a PO is not associated with the inventory</p> <p>If the inventory is not associated with a purchase order, such as when you perform an inventory transaction, the system determines the due date based on the Pending Putaway Due Date Days (G92).</p> <p>date of inventory transaction + number in SCV G92 = pending putaway due date days.</p> <p>Example: You perform an inventory adjustment for item A123 in the pending putaway warehouse on 6/20. The <i>Pending Putaway Due Date Days</i> system control value is 6.</p> <p>6/20 + 6 = 6/26 (pending putaway due date)</p> <p><i>Numeric, 6 positions (user date format); display-only.</i></p>
Pending qty	<p>The quantity of the item that is currently placed in the pending putaway warehouse for a specific transaction. This is the quantity to place in the <i>PO warehouse</i>.</p> <p><i>Numeric, 7 positions; display-only.</i></p>
Offer	<p>The offer on the purchase order, if any.</p> <p><i>Alphanumeric, 3 positions; display-only.</i></p>

Docking Purchase Orders

Topics in this part: The following topics describe the functions available when using the Dock Purchase Orders function.

- [Docking Purchase Orders \(MDPO\)](#) shows you how to record a purchase order as “docked” before you receive it.
- [Printing the Purchase Orders in Docked Status Report \(PDPO\)](#) shows you how to print the Docked Purchase Order Report and describes the information on the report.
- [Printing the Docked but Past Due Purchase Order Report \(PDPD\)](#) shows you how to create and print the Past Due Docked Purchase Order Report and describes the information on the report.

Warehouse Management Integration

In this part: This part includes the following topics:

- [Warehouse Management System Integration Overview](#): Provides an overview of the Warehouse Management Integration.
- *Generic Outbound Purchase Order API*: Describes how to send purchase order information to an external system.
- *Purchase Order Receipt In API*: Describes how to process PO receipts received through the generic API.
- *Generic Pick In API (Shipments, Voids, and Backorders)*: Describes how to confirm shipments or void pick slips through the generic API.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Warehouse Management System Integration Overview

Warehouse management systems control inventory movement, such as receiving merchandise, inventory transactions, picking and packing, and shipping merchandise to a customer.

The Warehouse Management System integration allows Order Administration and a warehouse management system (WMS) to pass inventory information in order to keep inventory information in both systems accurate. The WMS is where the actual inventory is located, but Order Administration needs to keep track of the changes to inventory that occur in the WMS so that the data in Order Administration remains accurate. For example, if the WMS adjusts the inventory for an item and does not notify Order Administration, orders placed in Order Administration may reserve items that do not have enough inventory in the warehouse.

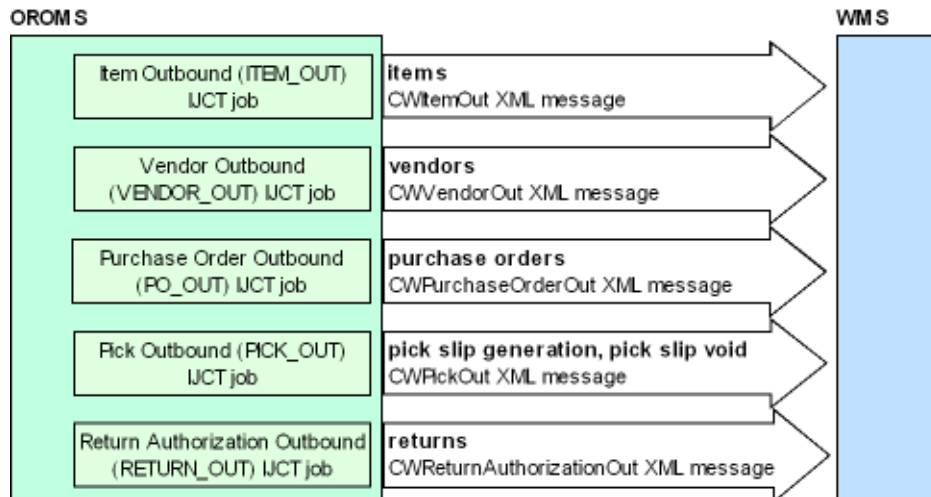

The warehouse management system integration creates a bridge between Order Administration and a WMS. This bridge allows Order Administration and a WMS to pass data between the two systems using XML messages transmitted via a queue or web service.

In this topic:

- [What Does Order Administration Send to the Warehouse Management System?](#)
- [What Does the Warehouse Management System Send to Order Administration?](#)
- [Warehouse Integration Summary](#)

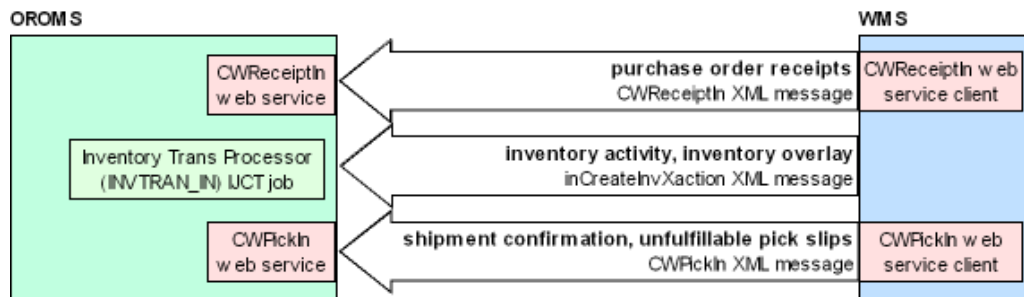

What Does Order Administration Send to the Warehouse Management System?

Order Administration controls item information, vendor information, purchase order information, pick slip information, and return information. Any time you create or modify information in these areas, Order Administration sends the information to the warehouse management system.

What Does the Warehouse Management System Send to Order Administration?

The warehouse management system controls changes to inventory, such as purchase order receipts, inventory transactions, and shipping merchandise to customers. Any time the warehouse management system adds or removes inventory in a warehouse, the WMS sends the information to Order Administration.

Warehouse Integration Summary

Function	Performed By:
Items: Order Administration sends new or changed items to the warehouse management system (WMS)	<i>Generic Item Download API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Vendors: Order Administration sends new or changed vendors to the WMS	<i>Generic Vendor Download API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Purchase orders: Order Administration sends new or changed purchase orders to the WMS	<i>Generic Outbound Purchase Order API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

Function	Performed By:
Purchase order receipts: Order Administration receives information on purchase order receipts sent from the WMS	<i>Purchase Order Receipt In API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Inventory activity: Order Administration receives information on inventory activity, such as transfers or adjustments, from the WMS	<i>Generic Inventory Transaction Upload</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Inventory overlay: Order Administration receives updated inventory information from the WMS	<i>Generic Inventory Transaction Upload</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Pick slip generation: Order Administration sends information on generated pick slips to the WMS	<i>Generic Pick Out API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Pick slip void: Order Administration sends information on voided pick slips to the WMS	<i>Generic Pick Out API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Shipment confirmation: Order Administration receives information on full or partial shipments; information on carton contents can also be included	<i>Generic Pick In API (Shipments, Voids, and Backorders)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Unfulfillable pick slips: Order Administration receives information on pick slip voids from the WMS	<i>Generic Pick In API (Shipments, Voids, and Backorders)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Returns: Order Administration sends updates on customer returns to the WMS	NA

Receiving Purchase Orders (PORC)

Purpose: Use the Purchase Order Receiving function to update the system when you receive inventory from open purchase orders from your vendors. When you receive inventory, you can:

- receive the entire purchase order in one step, or you can receive the items one line at a time.
- receive items directly into your on-hand inventory, or into suspense for placement at a later time.
- place items in more than one location or warehouse.
- have the system suggest where to place the items.

- add items to the purchase order if the vendor shipped you merchandise you did not order. This addition allows you to record the receipt for tracking purposes, and process a return-to-vendor transaction on the system at a later time.

If you are receiving a serial numbered item, you will need to enter the serial number of each unit at the time you place the merchandise in the warehouse. See [Enter Serial Numbers Screen](#).

If you are receiving a drop ship purchase order, you can also print a drop ship invoice if the [Print Drop Ship Invoice at time of Purchase Order Receiving \(F10\)](#) system control value is selected.

 **Note:**

You should not confirm shipment through this menu option of a drop ship purchase order processed automatically through the [Order Orchestration Drop Ship Integration](#). This updates the status of the purchase order in Order Administration to X (Closed) but does not affect the Order Orchestration status of a purchase order. The item is still displayed on your Order Orchestration Vendor Portal screens, and your Order Orchestration functionality is not affected; however, vendor actions subsequent to receiving the purchase order are not recorded in Order Administration.

Purchase Order Receipt In API: You can use the Purchase Order Receipt In API to process PO receipts received from another system, such as a warehouse management system. See the *Purchase Order Receipt In API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for an overview and the required setup.

PO download triggers: The setting of the [Create Generic PO Download Trigger for PO Receipt \(K27\)](#) system control value determines whether the system creates a purchase order download (POH) trigger when a purchase order line is received. See *Generic Outbound Purchase Order API* for an overview.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Work with P/O Receipt Detail Screen

Purpose: This screen displays each open line on the purchase order you have selected and is used to enter the receipt information for the purchase order or to view information from prior receipts against the purchase order for lines that are still open.

From this screen you can also advance to the following functions: add lines to the purchase order, work with additional PO charges, work with PO messages, and work with vendor notes.

How to display this screen: Enter a purchase order number on the [Select P/O For Receipt Screen](#) or select a purchase order from the Select P/O To Receive screen.

Field	Description
Ln# (Line number)	The purchase order line number. There can be up to 999 lines on one purchase order; if you try to enter more than 999 lines on a purchase order, the system displays an error message: PO cannot exceed 999 lines.

 **Note:**

It is necessary to Clear the entry in the Ln # field, if any, so that the field is blank, before you accept your entries in purchase order receiving.

Item	<p><i>Numeric, 3 positions; optional.</i></p> <p>A code that represents a unit of inventory. The field length for non-inventory entry is 60 positions; so if your entry exceeds 56 positions, it is truncated.</p> <p><i>Item: Alphanumeric, 12 positions; optional.</i></p> <p><i>Description: Alphanumeric, 120 positions; display-only.</i></p>
-------------	--

Field	Description
SKU	The item's unique characteristics, such as its color or size. <i>Alphanumeric, three 4-position fields; optional.</i>
Qty due (Quantity due)	The amount remaining to be received for this line item, in the retailer's unit of measure. <i>Numeric, 7 positions; display-only.</i>
U/M (Unit of measure)	A code that represents the unit of measure in which an item is purchased/stocked, such as EA (for a single unit), or DZ (for dozens). This field represents your unit of measure, which may differ from the vendor's unit of measure. See Working with Units of Measure (WUOM) . <i>Alphanumeric, 3 positions; optional.</i>
Vendor Item	The vendor's item number for the item. See Working with Vendor Items (WVNI) . <i>Alphanumeric, 20 positions; optional.</i>
Qty rec (Quantity received)	The number of units of the item being received. The Over Receipt % (A61) system control value allows you to receive more than the quantity ordered, up to a user-defined percentage limit. This allows you to receive merchandise if the vendor over-ships. The Under Receipt % (A62) system control value allows you to close a purchase order line when most of the merchandise has been received, if the quantity received is within a user-defined tolerance percentage. This allows you to close a purchase order line automatically if the vendor under-ships. The PO Receiving Overage Warning Window opens if you enter a receipt quantity that is greater than the quantity ordered and the Display Purchase Order Receiving Overage Warning Message (F29) system control value is selected. See Receiving Overages and Underages . <i>Numeric, 7 positions; required.</i>

Field	Description
Locat (Location)	<p>The warehouse location where the item quantity received will be placed. The location code entered is validated against the Location table. The location type must be compatible with the item and the location cannot be frozen. If more than one location has been specified to receive an item, the location field is blank and a plus (+) sign is shown.</p> <p>Leave this field blank if you are using the Suggest Location Placement function and you want the system to suggest the locations where the merchandise should be placed. The Suggest Location Placement (A27) system control value determines whether this function is being used.</p> <p>Leave this field blank to have the merchandise placed in the primary location from the Item/SKU table or in a primary location for the item in the receiving warehouse. The following system control values determine which location will default:</p> <ul style="list-style-type: none"> • Default Primary Location - Suspense Placement and PO Receipts (C08): determines whether the primary location from the SKU table defaults. • Default Primary Location from an Item Warehouse (G06): defines whether a primary location for the item in the receiving warehouse defaults; in this case the system will default the first primary location, in alphanumeric order, for the item in the receiving warehouse. • If both system control values are selected, the item warehouse location for the receiving warehouse will override the item's primary location from the SKU table. <p>If the system cannot find a primary location for an item in the specified warehouse, an error message similar to the following indicates:</p> <p>No Default Location was found. Please enter a Location.</p> <p>The Confirm Location Creation pop-up window indicates that you entered a new primary location for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM.</p> <p>The system may update the item's primary location in the SKU table (the primary primary) depending on the setting of the Update Primary Primary Location for Item During Receiving (I35) system control value. See that system control value for more information.</p> <p>If the Default Primary Location from an Item Warehouse (G06) value in the System Control table is selected, a prompt window will display location information for item locations in the warehouse specified on the purchase order detail line.</p> <p><i>Alphanumeric, 7 positions; optional.</i></p>

Screen Option	Procedure
Change a line item	Select Change for a detail line to advance to the P/O Receipt Detail Screen , where you can change the receipt information for a particular item. See Using the Change Purchase Order Details Method .

Screen Option	Procedure
View prior receipts for a line item	Select Prior Receipts for a detail line to advance to the Display Current Receipts Screen .
Suggest warehouse locations for an item, place the item in more than one location, or override the warehouse	Select Locations for a detail line to have the system suggest where the item should be placed, to place the item in more than one location, or to override the warehouse. You advance to the Work with PO Receipt Locations Screen .
Receive an entire line	Select Receive for a detail line to receive the entire line. See Receiving Methods .
Turn Suspend Receiving on or off for one line item	Select Suspend On/Off for a detail line to turn Suspend receiving on or off. If the suspend flag is on, all quantities received for the line will be placed in suspense. If the suspend flag is off, all quantities will be received directly into on-hand inventory. The word <i>Suspend</i> appears next to the Location field when the Suspend flag is on. See Receiving into Suspend .

 **Note:**

This option is available only if the [Allow Receipt to Suspend \(A59\)](#) system control value is selected.

View messages for one line item	Select Messages for a detail line to advance to the Work with PO Messages Screen .
Enter serial numbers for an item	Select Serial # for a detail line to advance to the Enter Serial Numbers Screen . This option is available only if you have already entered a receipt quantity and if the <i>Serial number</i> field in the Item table is selected. If the item is set up for serial numbers, you advance automatically to this screen when you accept the purchase order.
Add a line to the Purchase Order	Select Add Line to advance to the Create PO Detail Standard Screen (Adding Lines To A Purchase Order) to add a line to the purchase order.
Display purchase order summary	Select Summary to advance to the Display Current Receipts Screen .
Receive the entire purchase order	Select Receive P/O to receive the entire purchase order. The quantity due for each line will be updated as received. See Receiving an Entire Purchase Order Into Suspend .

 **Note:**

This option is available only if you have authority to the [Receive All Permission \(B21\)](#) secured feature.

Screen Option	Procedure
Accept the purchase order receipts	After clearing the entry in the <i>Ln #</i> field, if any, select Accept to accept the receipt information you entered. The system will be updated with the quantities received in the designated locations. If all lines have been received, this closes the purchase order, even if you have placed items into Suspense.
Reject the entries	Select Reject to return to the Select P/O For Receipt Screen . The system rejects any entries that you have made to the purchase order during the session. A pop-up window opens for you to confirm or cancel the reject request.
Work with additional purchase order charges	Select Add'l Charges to enter additional charges for the purchase order.
Receive the entire purchase order into suspense	Select Receive Suspense to receive the entire balance of the purchase order into suspense. The quantity due for each item on the purchase order is placed into suspense and the purchase order is closed. See Receiving an Entire Purchase Order Into Suspense .
<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;">  Note: This option is available only if the Allow Receipt to Suspense (A59) system control value is selected. </div>	
View purchase order messages	Select P/O Messages to advance to the Work with PO Messages Screen .
Change the exchange rate for the purchase order	Select Rate to enter a different exchange rate for the purchase order. See Changing the Exchange Rate .
View the vendor notes for the purchase order	Select Vendor Notes to advance to the Work with Vendor Notes Screen .

Receiving Methods

Available methods: Inventory on a purchase order can be received on a line-by-line basis, or the entire purchase order can be received in one step. Individual items can be received into suspense, or the entire purchase order can be received into suspense. Additional receiving information can also be entered for any line item on a purchase order, regardless of the receiving method used. There are three ways to receive lines individually and two ways to receive an entire purchase order.

Use this method . . .	When . . .
Direct entry	the quantity received is different from the quantity due.
Receive option	the quantity due is the same as the quantity received.
Change PO details	you need to do any of the following: override the cost, override the unit of measure, change the warehouse code, change the receipt date, change the customs date, change currency rate, enter a disposition code, or force the line complete.

Use this method . . .	When . . .
Receive an entire PO into inventory	all or most of the purchase order is being received and you are placing the merchandise into inventory.
Receive an entire PO into suspense	all or most of the purchase order is being received and you are placing the merchandise into suspense.

You can use any combination of receiving methods on a purchase order. For example:

- If there are many line items on the purchase order that need individual attention, you can receive the items one line at a time.
- If most or all of the items are received, you can receive the entire purchase order and change individual line information to minimize data entry.
- You can enter override information for a receipt in addition to indicating the quantity received and the placement locations.

Note:

It is important to clear the entry in the *Ln #* field, if any, before you select Accept.

For more information:

- [Using the Direct Entry Method](#)
- [Using the Receive Option Method](#)
- [Using the Change Purchase Order Details Method](#)

Using the Direct Entry Method

Why use this method? The Direct Entry method allows you to type the receipt quantity and the location, if applicable, directly into fields on the [Work with P/O Receipt Detail Screen](#). Use this method when the quantity received is *different* from the quantity due. You can use any of the following options to enter the location where the merchandise will be placed:

- default the item/SKU's primary location as the placement location (if the [Default Primary Location - Suspense Placement and PO Receipts \(C08\)](#) system control value is selected)
- default a primary location for the item in the receiving warehouse (if the [Default Primary Location from an Item Warehouse \(G06\)](#) system control value is selected this default location overrides the item/SKU's primary location)
- enter the location code in the [Locat \(Location\)](#) field if the merchandise is only being placed in one location, or if it is not being placed in the primary location
- use the *Locs* option to have the system suggest the location where the merchandise should be placed if using Suggest Location Placement
- use the *Locs* option to place the merchandise in more than one location or warehouse
- place a line item into suspense; see [Receiving into Suspense](#)

You can use the Direct Entry method to enter the quantity and location and also use the Change PO Details method to enter additional information about the receipt, if necessary.

You can also use the Direct Entry method to maintain individual purchase order lines when the entire purchase order is received into inventory or into suspense, if necessary.

Instructions: Use the following steps at the [Work with P/O Receipt Detail Screen](#) to receive items line-by-line *when the quantity received is different from the quantity due*, and you need to enter the receipt quantity.

1. Enter the quantity received in the *Qty rec* field. See [Receiving Overages and Underages](#).
2. Select OK to display the location if the Default Primary Location - Suspense Placement and PO Receipts (C08) system control value is selected. The primary location from the Item/SKU table is indicated, *or*:
3. Select OK to display a primary location for the receiving warehouse if the *Default Primary Location from an Item Warehouse (G06)* system control value is selected; this location will override the location from the Item/SKU table, *or*:
4. Enter the location code where the merchandise is being placed in the *Location* field if the primary location is not displayed and you are placing the merchandise in only one location, or if the merchandise is not being placed in the displayed location. The following message indicates if an invalid location code is entered: `Location (XXXXXXX) does not exist.`
5. The Confirm Location Creation pop-up window opens if you or the system enters a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM. Select OK to accept the multiple primary location or Select Exit to cancel.
6. Select Locations for an item and select OK to advance to the [Work with PO Receipt Locations Screen](#) to have the system recommend the locations for placement if you are using the Suggest Location Placement feature or if you are placing the merchandise in more than one location or warehouse. The *Location* field should be left blank when selecting Locations.
7. Select Suspense On/Off for an item to change the suspense receiving status of a line. The word *Suspense* displays next to the *Location* field and indicates the line item will be placed into suspense when the purchase order is accepted. If the word *Suspense* is not displayed, the quantity received for the line will be placed into inventory. A *Location* is not required if you are placing the item into suspense.
8. Continue with the above steps until all receipts and placements have been entered.
9. Clear the entry in the *Ln #* field, if any, so that the field is blank.
10. Select Accept to accept your receipt entries. The system validates your entries and highlights any fields you need to correct or gives you an error message. Correct any fields again.
11. Select Reject to reject your receipt and placement entries. A pop-up window opens for you to confirm or cancel the reject request.

Using the Receive Option Method

Why use this method? The Receive Option method allows you to default the quantity due as the receipt quantity to minimize data entry. Use this method when the quantity received is *the same* as the quantity due. You can use any of the following options to enter the location where the merchandise will be placed:

- default the primary location as the placement location (if the Default Primary Location - Suspense Placement and PO Receipts (C08) system control value is selected)
- default a primary location for the item in the receiving warehouse (if the *Default Primary Location from an Item Warehouse (G06)* system control value is selected; this default location overrides the item/SKU's primary location)
- enter the location code in the **Locat (Location)** field if the merchandise is being placed in only one location or if it is not being placed in a primary location
- use the *Locs* option to have the system suggest the location where the merchandise should be placed if using Suggest Location Placement
- use the *Locs* option to place the merchandise in more than one location or warehouse

You can use the Receive Option method to enter the quantity and location, and also use the Change PO Details method to enter additional information about the receipt, if necessary.

Instructions: Use the following steps to receive items line-by-line *when the quantity received is the same as the quantity due*.

1. Select Receive for the first line item for as many items as you are receiving at the [Work with P/O Receipt Detail Screen](#). The amount in the *Qty due* field is shown in the *Qty Rec* field.
2. If the Default Primary Location - Suspense Placement and PO Receipts (C08) system control value is selected, the primary location for the item in the SKU table is shown in the *Location* field, *or*:
3. If the *Default Primary Location from an Item Warehouse (G06)* system control value is selected, a primary location for the item in the receiving warehouse is shown in the *Location* field; this location overrides the location for the item in the SKU table, *or*:
4. Enter the location code where the merchandise is being placed in the *Location* field if the primary location is not displayed and you are placing the merchandise in only one location, or if the merchandise is not being placed in the primary location. The following message indicates if an invalid location code is entered: `Location (XXXXXXX) does not exist.`
5. The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM. Select OK to accept the multiple primary location or select Exit to cancel.
6. Select Locations for an item to have the system suggest the locations for placement if you are using the Suggest Location Placement function or if you are placing the merchandise in more than one location or warehouse. If you have selected Locations in multiple fields, the [Work with PO Receipt Locations Screen](#) cycles you from one entry to the next.
7. Select Suspense On/Off for an item to change the suspense receiving status of a line. The word *Suspense* displays next to the *Location* field and indicates the line item will be placed into suspense when the purchase order is accepted. If the word *Suspense* is not displayed, the quantity received for the line will be placed into inventory. A *Location* is not required if you are placing the item into suspense. See [Receiving into Suspense](#).

8. Continue with the above steps until all receipts and placements have been entered.
9. Clear the entry in the *Ln #* field, if any, so that the field is blank.
10. Select Accept to accept your receipt entries. The system validates your entries and highlights any fields you need to correct or gives you an error message. Correct any fields as needed.
11. Select Reject to reject your receipt and placement entries. A pop-up window opens for you to confirm or cancel the reject request.

Using the Change Purchase Order Details Method

Why use this method? The Change Purchase Order Details method allows you to display the [P/O Receipt Detail Screen](#), where you can enter the quantity received and the location where the merchandise will be placed, add or change additional receipt information for the item or force the line complete. Use this method when you need to override any of the following information for a receipt, or to force the line complete:

- unit of measure
- purchase cost
- warehouse/location
- receipt date
- customs date
- currency rate

You can use any of the following options to enter the quantity received and the location where the merchandise will be placed when this receiving method is used:

- enter the location code in the *Location* field on the [P/O Receipt Detail Screen](#) if the merchandise is being placed in only one location.
- use the *Location* option to have the system suggest the location where the merchandise should be placed if using Suggest Location Placement.
- use the *Location* option to place the merchandise in more than one location or warehouse.

Note:

You can use any of the other receiving methods to record the receipt quantities and location placements and then use the Change Purchase Order Details function to enter or change any additional information about a receipt. For example, you can receive the entire purchase order using the default primary location option, and then use Change PO Details to override the cost of a particular item.

P/O Receipt Detail Screen

How to display this screen: Select Change for a detail line on the [Work with P/O Receipt Detail Screen](#).

Field	Description
Receipt qty (Receipt quantity)	<p>Enter the number of units received, in your (retailer's) unit of measure; the number remaining to be received is displayed above the data entry portion of this screen. The Over Receipt % (A61) system control value allows you to receive more than the quantity ordered, up to a user-defined percentage limit. This allows you to receive merchandise if the vendor over-ships.</p> <p>The Under Receipt % (A62) system control value allows you to close a purchase order line when most of the merchandise has been received. This allows you to close a purchase order line automatically if the vendor under-ships.</p> <p>The PO Receiving Overage Warning Window opens when the quantity received is greater than the quantity ordered and the Display Purchase Order Receiving Overage Warning Message (F29) system control value is selected. See Receiving Overages and Underages.</p> <p><i>Numeric, 7 positions; required.</i></p>
UoM (Unit of measure)	<p>A code that represents a purchase order unit of measure for an item, such as EA (for a single unit) or DZ (for dozens). This field represents your own, not the vendor's, unit of measure. See Working with Units of Measure (WUOM).</p> <p><i>Alphanumeric, 3 positions; required.</i></p>
Gross cost	<p>Enter in the gross cost (per retailer's unit of measure) at receiving time; the system displays the projected cost (from the purchase order) for comparison.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The Display Cost in Inventory (A38) secured feature controls the display of this field.</p> </div>
Discount	<p><i>Numeric, 10 positions; optional.</i></p> <p>The total combined amount of all discounts applied towards this detail line. This includes:</p> <p><i>Primary discount:</i> The primary discount percentage the system applies towards all items purchased from this vendor. Primary discounts are defined in the Vendor table.</p> <p><i>Percentage/Unit discounts:</i> The three discounts defined in the Vendor Discount table that the system applies towards all items purchased from this vendor. These discounts are defined as either a percentage or unit discount.</p> <p>If you change the amount in the <i>Gross cost</i> field, the system recalculates all discounts for this detail line and displays the new net cost in the <i>Net cost</i> field.</p> <p><i>Numeric, 13 positions with a 2-place decimal; display-only.</i></p>

Field	Description
Net cost	<p>The cost of this detail line, which is calculated by multiplying the quantity ordered and the price, adding the surcharge and subtracting the discount.</p> <p>The system applies the discount from the <i>Terms</i> field in Working with Vendors (WVEN) to the cost of each item you receive if the Vendor Discount % to Costing at Receiving (D76) system control value is selected.</p> <div data-bbox="878 527 1377 726" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>The Display Cost in Inventory (A38) secured feature controls the display of this field.</p> </div>
Whse (Warehouse)	<p><i>Numeric, 13 positions with a 4-place decimal; display-only.</i></p> <p>The code that identifies the warehouse where the merchandise will be placed. The code of the warehouse for which the merchandise was ordered defaults and can be overridden. The code is validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS). Override the code only if the entire receipt quantity for the line is being placed in the same warehouse.</p> <p>If the quantity received is being placed in more than one warehouse, select Location to display the Work with PO Receipt Locations Screen, which allows you to place the merchandise in more than one location or warehouse.</p>
Location	<p><i>Numeric, 3 positions, required.</i></p> <p>The warehouse location where the merchandise is being placed. The location code entered is validated against the Location table. The warehouse location from the Work with P/O Receipt Detail Screen defaults in this field, but you can override it. Enter a location only if the entire receipt quantity is being placed in one location.</p> <p>The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM.</p> <p>Select Location and click the arrow in the location field to display a list of locations or to create a new temporary location in which to place the item.</p> <p>If the quantity received is being placed in more than one location, select Location to display the Work with PO Receipt Locations Screen, which allows you to place the merchandise in more than one location or warehouse.</p> <p>The system may update the item's primary location in the SKU table (the primary primary) depending on the setting of the Update Primary Primary Location for Item During Receiving (I35) system control value. See that system control value for more information.</p> <p><i>Alphanumeric, 7 positions; required.</i></p>

Field	Description
Receipt date	The date of the receipt. If you leave this field blank, the system defaults to today's date. <i>Numeric, 6 positions (user date format); optional.</i>
Customs date	The date the receipt was received in customs or consolidation center for international orders. <i>Numeric, 6 positions (user date format); optional.</i>
Currency rate	The currency conversion rate at the time of the receipt. This is the rate of cost against the base currency. You can enter this at receiving time for each item. <i>Numeric, 12 positions with a 7-place decimal; optional.</i>

Screen Option	Procedure
Work with PO receipt locations	Select Location to have the system suggest where the merchandise should be placed, or to place the merchandise in more than one location or warehouse. See Work with PO Receipt Locations Screen .
View messages for a line item	Select P/O Detail Msg to advance to the Work with PO Messages Screen .
View purchase order messages	Select P/O Messages to advance to the Work with PO Messages Screen .
View the vendor notes	Select Vendor Notes to advance to the Work with Vendor Notes Screen .

Instructions: Use the following steps to receive items one at a time if you have to add or change some of the information about the receipt, or to force the line complete.

1. Enter the quantity received in the *Qty rec* field. See [Receiving Overages and Underages](#) for instructions on processing receiving overages and underages.
2. Enter the location code where the merchandise is being placed in the *Location* field if a primary location is not displayed and you are placing the merchandise in only one location, or if the merchandise is not being placed in the displayed location. The following message indicates if an invalid location code is entered: Location (XXXXXXX) does not exist.
3. The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM. Select OK to accept the multiple primary location or select Exit to cancel.
4. To display a list of valid locations, or to create a new temporary location in which to place the item, select Location and click on the arrow in the location field to display the [Select Location Screen](#).
5. Complete all other applicable fields. Refer to the field descriptions for instructions on completing the fields.
6. Select OK when you have completed all applicable fields.
7. Select Location to place the merchandise in more than one location or warehouse. See [Work with PO Receipt Locations Screen](#).

8. Select Exit to return to the [Work with P/O Receipt Detail Screen](#). The receipt quantity and location display if you are placing the merchandise in one location.
9. Select Suspend On/Off for a detail line at the [Work with P/O Receipt Detail Screen](#) to change the suspense receiving status of a line. The word *Suspense* displays next to the *Location* field and indicates the line item will be placed into suspense when the purchase order is accepted. If the word *Suspense* is not displayed, the quantity received for the line will be placed into inventory. A *Location* is not required if you are placing the item into suspense. See [Receiving into Suspense](#).
10. Select Accept to accept your receipt entries. The system validates your entries and highlights any fields you need to correct or gives you an error message. Correct any fields as needed.
11. Select Reject to reject your receipt and placement entries. A pop-up window opens for you to confirm or cancel the reject request.

Receiving an Entire Purchase Order into Inventory

Why use this method? An entire purchase order is received in one transaction to minimize data entry when *all or most of* the item quantities on the purchase order are received. If most or all of the items received will be placed into inventory, you can select Receive P/O to mark each line on the purchase order as received. The system will update the quantity received field for each line with the remaining quantity due for the item.

Secured feature: The Receive P/O option is available only if you have authority to the [Receive All Permission \(B21\)](#) secured feature.

Adjustments prior to receipt: You can make any necessary adjustments to individual lines before the receipt transactions are accepted, if necessary. You can:

- change the quantity received
- un-receive the line if none of the items were received
- add or override the purchase order receipt details
- place the items in more than one location or warehouse
- place individual line items into suspense.

For example, if you received 10 line items on a 12 line purchase order, you can receive the entire purchase order and then un-receive the two line items that were not shipped.

Placement location: You can use any of the following options to enter the location where the merchandise will be placed:

- default the item/SKU's primary location as the placement location (if the Default Primary Location - Suspense Placement and PO Receipts (C08) system control value is selected)
- default a primary location for the item in the receiving warehouse (if the *Default Primary Location from an Item Warehouse (G06)* system control value is selected this default location overrides item/SKU's primary location)
- type the location code in the *Location* field if the merchandise is being placed in only one location, or if it is not being placed in the default location
- use the *Locs* option to have the system suggest the location where the merchandise should be placed if using Suggest Location Placement
- use the *Locs* option to place the merchandise in more than one location or warehouse

Instructions: Use the following steps to receive an entire purchase order into inventory and make adjustments to individual line items. See [Using the Direct Entry Method](#) or [Using the](#)

[Change Purchase Order Details Method](#) for more detailed information about working with individual line items if necessary.

1. Select Receive P/O at the [Work with P/O Receipt Detail Screen](#) to receive the entire purchase order into inventory. The *Qty rec* field for each line is updated with the amount in the *Qty due* field.
2. The primary location defined for the item in the Item/SKU table defaults in the *Location* field if the Default Primary Location - Suspense Placement and PO Receipts (C08) system control value is selected, *or*:
3. The first primary location (in alphanumeric order) for the item in the receiving warehouse defaults if the *Default Primary Location from an Item Warehouse (G06)* system control value is selected; this location overrides the item/SKU's primary location, *or*:
4. Enter the code of the location where the received items will be placed in the *Location* field if you are placing the item in only one location, or if a primary location defaults and you are not placing the item in the displayed location.
5. The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM.
6. To display a list of valid locations, or to create a new temporary location in which to place the item, position the cursor on the *Location* field, prompt and select Create Temp to display the [Creating Temporary Locations at Receiving](#).
7. Leave the *Location* field blank if you are using the Suggest Location Placement feature, if you are placing the item in multiple locations or warehouses, or if you are placing the item in suspense.
8. Make any changes to the quantity received for a line by typing the correct quantity directly over the value in the *Qty rec* field. See [Receiving Overages and Underages](#) for instructions on receiving overages and underages.
9. Make any changes to the location where the item will be placed for a line by typing the correct location directly over the value in the *Location* field if the item is being placed in only one location.
10. Select Locations for a detail line to display the [Work with PO Receipt Locations Screen](#) to have the system suggest the locations where the item should be placed if you are using the Suggest Location Placement feature, or to place the item in more than one location or warehouse.
11. Select Change for a detail line to change the purchase order details. See [Using the Change Purchase Order Details Method](#).
12. Select Suspense On/Off for a detail line to change the suspense receiving status of a line. The word *Suspense* displays next to the *Location* field and indicates the line item will be placed into suspense when the purchase order is accepted. If the word *Suspense* is not displayed, the quantity received for the line will be placed into inventory. A *Location* is not required if you are placing the item into suspense. See [Receiving into Suspense](#).
13. To un-receive a line, position the cursor at the *Qty rec* and *Location* fields and delete the values.
14. Select Accept to accept your receipts. Any errors will be highlighted on the screen. Make any necessary corrections and select Accept again.

15. Select Reject to reject all receipts. A pop-up window opens allowing you to confirm or cancel the reject request.

Receiving an Entire Purchase Order Into Suspense

Why use this method? An entire purchase order is received in one transaction to minimize data entry when *all or most of* the item quantities on the purchase order are received. If most or all of the items received will be placed into suspense, you can select Receive Suspense to mark each line on the purchase order as received into suspense. The system will update the quantity received field for each line with the remaining quantity due for the item.

Merchandise is placed into suspense when you want to record the receipt, but you do not want to place the merchandise immediately into your on-hand inventory.

You can make any necessary corrections to individual line items as necessary. You can:

- change the quantity received
- un-receive the line if none of the items were received
- add or override purchase order receipt details
- place the items into inventory

Instructions: Use the following steps to receive an entire purchase order into suspense and make adjustments to individual line items. See [Using the Direct Entry Method](#) or [Using the Change Purchase Order Details Method](#) for more detailed information about working with individual line items if necessary.

1. Select Receive Suspense at the [Work with P/O Receipt Detail Screen](#) to receive the entire purchase order into suspense.
2. Make any changes to the quantity received for a line by typing the correct quantity directly over the value in the *Qty rec* field. See [Receiving Overages and Underages](#) for instructions on processing receiving overages and underages.
3. Select Suspense On/Off for a detail line to change the suspense receiving status of a line. The word *Suspense* displays next to the *Location* field and indicates the line item will be placed into suspense when the purchase order is accepted. If the word *Suspense* is not displayed, the quantity received for the line will be placed into inventory when the purchase order is accepted. A *Location* is not required if you are placing items into suspense.
4. If you are receiving a line into inventory, type the code of the location where the item will be placed in the *Location* field if you are placing the item in only one location. To display a list of valid locations, or to create a new temporary location in which to place the item, position the cursor on the *Location* field and prompt to display the [Select Location Screen](#).
5. If you are receiving a line into inventory, select Locations for a detail line to display the [Work with PO Receipt Locations Screen](#) to have the system suggest the locations where the item should be placed if you are using the Suggest Location Placement feature, or to place the item in more than one location or warehouse.
6. To un-receive a line, position the cursor at the *Qty rec* and *Location* fields and delete the values.
7. Select Accept to accept your receipts. Any errors will be highlighted on the screen. Make any necessary corrections and select Accept again.
8. Select Reject to reject all receipts. A pop-up window opens for you to confirm or cancel the reject request.

Suspense updates: The system performs the following updates when merchandise is received into suspense:

- Creates a record in the PO Suspense table for each purchase order line indicating the quantity received into suspense.
- Creates a record in the PO Receipt table for each purchase order line, with the *Suspense* flag set to Y.
- Updates the *Received quantity* for each purchase order line on the [Purchase Receipts History Screen](#) by the quantity received into suspense.
- Decreases the *Quantity Due* for each purchase order line on the First Display Purchase Order Detail Screen by the quantity received into suspense.
- Updates the *Suspense quantity* on the [Display Item/Warehouse Information Screen](#) by the quantity received into suspense.

The following updates *do not occur* when merchandise is received into suspense:

- The on-hand quantity for the item is not changed.
- The costing calculation is not performed.
- Vendor Item analysis is not performed.

These updates occur when the merchandise is transferred from suspense to inventory using the Placing Suspended Stock (SUSP) menu option.

Changing the Exchange Rate

Purpose: The currency exchange rate for the entire purchase order can be changed at receiving if the exchange rate has changed. Enter the new currency rate on the [Work with P/O Receipt Detail Screen](#).

Instructions:

1. Select Rate at the [Work with P/O Receipt Detail Screen](#) to make the *Rate* field enterable.
2. Enter the new exchange rate in the *Rate* field.
3. The new rate will be applied to the entire purchase order unless the rate has been overridden for a particular line item. See [Using the Change Purchase Order Details Method](#) for instructions on overriding the exchange rate for an individual purchase order line.

Receiving Overages and Underages

Overages: At times, a vendor can overship an item. The Over Receipt % (A61) system control value allows you to receive more than the quantity ordered for an item if the quantity received is within the percentage.

If a vendor ships you more merchandise than you ordered, the system allows you to record the receipt if the overage is within an acceptable tolerance limit. For example, if you set the Over Receipt % (A61) system control value to 10%, you can receive a quantity up to ten percent above the amount that was ordered. If the overage exceeds the tolerance amount, the following error message indicates:

```
Invalid over receipt quantity
```

You can then override the Over Receipt % (A61) if the [Override Tolerance \(A18\)](#) secured feature is set to *ALLOW. If the Override Tolerance (A18) secured

feature is set to *EXCLUDE, the system continues to use the Over Receipt % (A61) system control value to determine whether an overage can be received.

Overage Warning pop-up window: If the [Display Purchase Order Receiving Overage Warning Message \(F29\)](#) system control value is selected, the [PO Receiving Overage Warning Window](#) opens when the quantity received is greater than the quantity ordered.

When the pop-up window opens: The system determines when to display this window based on the Over Receipt % (A61) system control value and the Override Tolerance (A18) secured feature.

If the Override Tolerance (A18) secured feature authority is set to *ALLOW, the system:

- Allows you to enter a receipt quantity that is greater than the Over Receipt % (A61).
- Displays the window each time the quantity received is greater than the quantity ordered.

If the Override Tolerance (A18) secured feature authority is set to *EXCLUDE, the system:

- Does not allow you to enter a receipt quantity that is greater than the Over Receipt % (A61).
- Displays the window only when the quantity received is greater than the quantity ordered and less than the Over Receipt % (A61).
- Displays the `Invalid over receipt quantity` error message if you select OK on the [PO Receiving Overage Warning Window](#) without changing the receipt quantity to a quantity that does not exceed the Over Receipt % (A61).

PO Receiving Overage Warning Window

Field	Description
Qty received is xx.xx % greater than the quantity ordered)	<p>Defines the percentage the receipt quantity is over the order quantity. The system uses the following calculation to determine the percentage over:</p> $[(\text{quantity received} - \text{quantity ordered}) / \text{quantity ordered}] \times 100 = \text{percentage the receipt quantity is over the quantity ordered}$ <p><i>Numeric, 7 positions; display-only.</i></p>
PO ln. # (Purchase order line number)	<p>The purchase order line number that contains the over receipt quantity.</p> <p><i>Numeric, 3 positions; display-only.</i></p>
Qty rec (Quantity received)	<p>The receipt quantity (in your unit of measure, not the vendor's) for this purchase order line. The quantity you entered defaults in this field, but can be overridden.</p> <p><i>Numeric, 7 positions; optional.</i></p>

Instructions: Use the following steps to enter a receipt quantity that meets the receipt overage requirements defined.

1. Enter a receipt quantity in the *Quantity received* field if you wish to override the quantity you previously entered.
2. The system returns you to the [Work with P/O Receipt Detail Screen](#) or the [P/O Receipt Detail Screen](#) with the receipt quantity you entered defaulting in the *Quantity received* field for the purchase order line.

3. The system accepts the quantity you entered or redisplay the pop-up window if the quantity you entered still exceeds the overage requirements.
4. If the purchase order line meets the overage requirements, the system will display a pop-up window for the next purchase order line that exceeds the overage requirements.

 **Note:**

The system displays a window for each purchase order line that contains a receipt quantity that is greater than the ordered quantity each time you select an option or click OK.

Underages: At times, a vendor can under-ship an item and can not fulfill the entire purchase request. The [Under Receipt % \(A62\)](#) system control value allows the system to close a purchase order line if only a certain percentage of the order quantity is received.

If a vendor short-ships an item and the quantity received is within the defined tolerance, the purchase order line will be closed even if the full order quantity was not received. This allows you to close purchase order lines when vendors short-ship merchandise and are unable to complete the shipment.

For example, if you define the Under Receipt % (A62) at 10%, a purchase order line will be closed when at least 90% of the merchandise is received. If you order 100 units and receive 92 units, the line will be closed when the receipt for 92 units is accepted.

Enter Serial Numbers Screen

Purpose: Use this screen to specify the serial number of each unit of an item you are receiving. You use serial numbers to track inventory activity, such as returns or shipments, after the units have been received into the warehouse. If the Serial number flag is selected in the Item table, the system records the item's additional inventory activity, such as confirmations, by prompting you for the serial numbers of units affected by that activity. See [Assigning Items to Warehouses](#).

How to display this screen: Select Serial # for a serial numbered item at the [Work with P/O Receipt Detail Screen](#) (provided you have already entered the receipt quantity). You also advance to this screen automatically when you accept the purchase order if you have not already entered serial numbers for a serial numbered item.

Field	Description
Serial #s	The serial number(s) of each unit of the item or SKU you are receiving on this purchase order. This screen provides a field for entry of a serial number for each unit. <i>Alphanumeric, 20 positions each field; required.</i>

Instructions:

1. Enter the serial number for each unit of the item you are receiving in each field provided. When you have completed each serial number field on the screen, select OK.

- The system highlights any serial number fields that are not complete, or that contain serial numbers that already exist for the item (Note: it does not check the status of the serial number). Complete or correct any fields as needed.
- Select Submit to submit the serial number entry; otherwise, select Reject to reject and return to the [Work with P/O Receipt Detail Screen](#).

Note:

You will not be able to accept the purchase order until you complete each serial number field on this screen.

Display Current Receipts Screen

Purpose: Use this screen to review receipt information for each item on the purchase order, such as quantity ordered and price.

How to display this screen: Select Summary on the [Work with P/O Receipt Detail Screen](#).

Field	Description
P/O #	The number of the purchase order you are reviewing. <i>Numeric, 7 positions; display-only.</i>
Ln#	The purchase order line number. <i>Numeric, 3 positions; optional.</i>
Item	An item on the purchase order you are reviewing. <i>Alphanumeric, 12 positions; optional.</i>
Colr size othr	The SKU elements which further define the item. <i>Alphanumeric, 14 positions; optional.</i>
Ordered	The amount ordered for this line item, in your unit of measure, not the vendor's. <i>Numeric, 7 positions; display-only.</i>
Price	The price of this item as defined in Working with Vendor Items (WVNI). This price represents the price per unit in your own unit of measure, not the vendor's. For example, if the vendor sells an item in pairs, and defines the price in the vendor item table as \$12.00, but you sell the item in single units (eaches), the price displayed in this field would be \$6.00. If a price does not exist in the Vendor Item table, the system uses the cost from Work with Item/SKUs (fast path = MITM).
Balance	<i>Numeric, 13 positions with a 4-place decimal; display-only.</i> The quantity of the item remaining to receive. <i>Numeric, 7 positions; display-only.</i>

Note:

The Display Cost in Inventory (A38) secured feature controls the display of this field.

Field	Description
Extension	The extended price of this item. The system uses the following calculation to determine the extended price: $\text{quantity received} \times \text{the vendor price} = \text{extended cost.}$ <i>Numeric, 20 positions with a 2-place decimal; display-only.</i>

Work with PO Receipt Locations Screen

Purpose: Use this screen to place the merchandise in more than one location or warehouse or to have the system suggest the locations where the merchandise should be placed.

This screen is used during purchase order receipts when you are placing merchandise into inventory, a pending putaway warehouse, or a staging warehouse. It is also used during Placing Suspended Stock (SUSP) when you are transferring merchandise from suspense to inventory, and in [Suggest Location Placement \(MSLO\)](#).

Suggest location placement: When you use [Suggest Warehouse/Location Placement](#), the system checks the system control values related to suggesting location placement to determine which locations to suggest.

When you use Standard warehouse/location placement, the system checks:

- Suggest Location Placement (A27), which controls whether the function is used.
- Type of Location to Search First during Suggest Location Placement (C40), which defines the location type that will be searched first.
- Type of Location to Search Second during Suggest Location Placement (C41), which defines the location type that will be searched second.
- Type of Location to Search Third during Suggest Location Placement (C42), which defines the location type that will be searched last.
- Suggest Multiple Items in a Location during Suggest Location Placement (C43), which determines whether the merchandise can be placed in a location the contains other merchandise when the system is searching for any available location.
- [Location Capacity Method \(A31\)](#), which determines how the system determines when a location is full.

See [Standard Warehouse/Location Placement](#) for more information.

To default the primary primary location: If you wish to default the item's primary primary location, or a primary location for the item in the receiving warehouse, select Receive for the item on the [Work with P/O Receipt Detail Screen](#). See [Receiving Methods](#) for more information on the system control values that control the default location.

How to display this screen: Select Locations for a purchase order line on the [Work with P/O Receipt Detail Screen](#). You can also display this screen by selecting Prior Receipts for a suspended item at the [Suspense Placement By Item Screen](#), [Suspense Placement By PO Screen](#), or [Suspense Placement By PO Control # Screen](#). You must also enter the quantity to place.

Field	Description
P/O	The number assigned to the purchase order you are working with. <i>Numeric, 7 positions; display-only.</i>
Ln.	The purchase order detail line number. <i>Numeric, 3 positions; display-only.</i>
Item	An item and SKU on the purchase order. <i>Item: Alphanumeric, 12 positions; display-only.</i> <i>SKU: Alphanumeric, three 4-position fields; display-only.</i>
Qty received	The number of units, in your unit of measure, not the vendor's, of the item being received. <i>Numeric, 7 positions; display-only.</i>
Qty placed:	The total quantity to be placed across all locations and warehouses. <i>Numeric, 7 positions; display-only.</i>
Qty	The quantity to be placed in the associated location. <ul style="list-style-type: none"> • The quantity is recommended by the system when using Suggest Location Placement (MSLO). The quantity can be changed and additional quantities and locations can be added. • A quantity must be entered if you are not using Suggest Location Placement. • The total quantity entered for all locations must be equal to the <i>Total receipt qty</i>. <i>Numeric, 7 positions; required.</i>
Whs (Warehouse)	The code of the warehouse where the items will be placed. The warehouse code on the purchase order defaults. You can enter a warehouse code when you select Override Whse to override the warehouse. The warehouse code is validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS) . <i>Numeric, 3 positions; display-only.</i>

Field	Description
Location	<p>The location where the associated quantity will be placed.</p> <ul style="list-style-type: none"> The location is recommended by the system when using the Suggest Location Placement function. The location can be changed and additional quantities and locations can be added. A location must be entered if you are not using the Suggest Location Placement function. The location will be validated against the Location table. The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM.

 **Note:**

This screen will not display any quantities and locations if the system cannot place the inventory (e.g., if all available locations are full, frozen, etc.)

See [Creating and Maintaining Locations \(WLOC\)](#).

The system may update the item's primary location in the SKU table (the primary primary) depending on the setting of the Update Primary Primary Location for Item During Receiving (I35) system control value. See that system control value for more information.

Alphanumeric, 7 positions; required.

Screen Option	Procedure
Change a receipt location	Select Change for the location to change it.
Delete a receipt location	Select Delete for a location to delete it.
Override the warehouse	Select Override Whse to place the quantity in another warehouse. The system toggles between making the <i>Whs</i> field an enterable or display-only field.
Accept the locations	Select Accept to accept the locations and quantities for the item.
Reject the locations	Select Reject to reject the locations and quantities for the item. The Confirm Reject Request pop-up window opens, allowing you to confirm or cancel the reject request.

Instructions:

1. Review the system suggested locations if there are any.
2. Enter the number of items that you want to place in the *Qty* field.
3. In the *Location* field, enter the location code where the quantity will be placed. A valid warehouse location for the item must be entered. The following message indicates if the location is invalid: `Location XXXXXXXX does not exist.`

4. The Confirm Location Creation pop-up window opens if you enter a new primary location code for an item and the Allow Multiple Primary Item Locations (D12) system control value is set to CONFIRM. Select OK to accept the multiple primary location or select Exit to cancel.
5. To display a list of valid locations or to create a new temporary location in which to place the item, position the cursor on the *Location* field and prompt to display the [Select Location Screen](#).
6. To override the warehouse, select Override Whse to gain access to the *Warehouse* field where you can enter a new warehouse code for the placement. A valid warehouse for the item must be entered. The following message indicates if the warehouse is invalid:
Warehouse XXX does not exist.
7. Select OK. The system validates your entries and highlights any fields you need to correct. Correct the fields and select OK again. The system displays the quantity, warehouse and location at the bottom of the screen and increases the amount in the *Qty placed* field in the header of this screen.
8. Select Accept to accept the placements you have made. The system verifies that the total quantity placed equals the quantity received. The following message indicates if the quantities are not the same: Total units placed must equal the amount requested.
9. Select Reject to reject the placements for the item. The Confirm Reject Request pop-up window opens for you to confirm or cancel the reject request. The system returns you to previous screen.

Creating Temporary Locations at Receiving

Purpose: Use the [Create Temporary Location Screen](#) to create a temporary location in which to place the merchandise. Locations are used to identify where merchandise is stored in the warehouse. Temporary locations are used to place merchandise that you want recognized as received, before a permanent location is assigned.

A temporary location cannot exist without at least one item/location record associated with it. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system will delete the location and the item/location record.

Allocating stock: Order Administration will not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location.

Location codes identify a specific storage unit in the warehouse, and usually consist of a combination of the warehouse zone, aisle, shelf and bin number where the location is situated. The system provides two methods of defining your location codes:

- You can segregate your location codes into zone, aisle, shelf and bin identifiers with a separate field for each value. This method provides for inventory reporting by warehouse zone.
- You can define your location codes using one free-form field with each location code containing from one to seven characters. This method is used when your warehouse is not organized by zones, aisles, shelves and bins.

Select Location Screen

Purpose: Use this screen to review a list of existing locations. You can select the location where the merchandise will be placed from the list or you can create a temporary location for the placement.

How to display this screen: Position the cursor on the *Location* field and prompt on the [Work with P/O Receipt Detail Screen](#), or select Change on the [Work with P/O Receipt Detail Screen](#), then select Location on the [P/O Receipt Detail Screen](#) and click on the arrow in the *Location* field at the [Work with PO Receipt Locations Screen](#). Position the cursor on the *Location* field and prompt on the:

- [Work with P/O Receipt Detail Screen](#)
- [P/O Receipt Detail Screen](#)
- [Work with PO Receipt Locations Screen](#)

Screen Option	Procedure
Create a temporary location	Select Create Temp to advance to the Create Temporary Location Screen .

Create Temporary Location Screen

Purpose: Use this screen to create a temporary location for an item during Purchase Order Receipts. Temporary locations are used to place merchandise that you want recognized as received, before a permanent location is assigned.

[Streamlined Pick Slip Generation \(WSPS\)](#) will not allocate merchandise from temporary locations even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location. Temporary locations are deleted from the system when the quantity on-hand reaches zero.

How to display this screen: Select Create Temp on the [Select Location Screen](#).

Field	Description
Whs/desc (Warehouse/description)	A code that identifies the warehouse where the location will be created. The code of the warehouse where the merchandise is being placed and the warehouse name display. <i>Numeric, 3 positions; display-only.</i>

Field	Description
Location	<p>A user-defined code that represents a warehouse location where merchandise is stored. The warehouse location code can consist of a zone/aisle/shelf/bin combination, or it can be any user-defined code. The location code prints on pick slips and reports.</p> <p>See Creating and Maintaining Locations (WLOC).</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If your warehouse locations consist of a warehouse zone, aisle, bin number and shelf number combination, separate fields are provided for these values. The zone/aisle/shelf/bin combination must still be entered in this field.</p> </div>
Type	<p><i>Alphanumeric, 7 positions; required.</i></p> <p>The location type, which determines whether inventory can be allocated from the location, whether the location is permanent or temporary, and whether merchandise will be replenished to or from the location. Only temporary locations can be created using this function. This field is set to T.</p>
Zone	<p><i>Alphanumeric, 1 position; display-only.</i></p> <p>A user-defined code to identify the warehouse zone where the location is situated. Assigning zone codes provides for inventory analysis reporting by zone. Zone codes are also used to sort pick slips when the Cart Bin Picking method is used.</p>
Aisle	<p><i>Alphanumeric, 1 position; optional.</i></p> <p>A user-defined code to identify the warehouse aisle of the location.</p>
Shelf	<p><i>Numeric, 2 positions; optional.</i></p> <p>A user-defined code to identify the location's shelf number within the aisle.</p>
Bin	<p><i>Numeric, 2 positions; optional.</i></p> <p>A user-defined code to identify the location's bin number on the shelf.</p>
Hang/flat	<p><i>Numeric, 2 positions; optional.</i></p> <p>A code indicating how inventory is stored in the location. This code is informational only.</p> <ul style="list-style-type: none"> • H = indicates that inventory in the location is hung. • F = indicates that inventory in the location is laid flat, or is stored in a conventional manner. • O = indicates that inventory in stored in the location in some other manner. <p><i>Alphanumeric, 1 position; required.</i></p>

Field	Description
Picking sequence	<p>A user-defined sequence number which is used during Pick Slip Generation to determine the sort of the Batch Pick Sheet. When picking sequence numbers are not assigned, the system sorts the locations alphabetically by Location code. The picking sequence code is used by all pick slip generation methods.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Bar code #	<p>A system generated sequence number assigned to the location when it is created. The sequence number prints in bar code format on the bin location labels.</p> <p><i>Numeric, 7 positions; display-only.</i></p>
Fill factor	<p>A user-defined percentage value that is used during Suggest Location Placement (MSLO) to determine when the location is stocked to capacity. The system evaluates the location capacity entered in the <i>cubic</i> field against the fill factor to determine location's true item capacity.</p> <p>Example: A location can be considered filled to capacity when 80% of its cubic volume is consumed because of the shape of the items that are stored in it. The cubic volume of a location may be 100 cubic feet, but can hold only eight items that are 10 cubic feet each because the items are spherical in shape.</p>

 **Note:**

The system assumes the fill factor is 100% if this field is left blank.

Pickable location	<p><i>Alphanumeric, 5 positions with 2-place decimal; optional.</i></p> <p>A code indicating whether inventory can be picked from the location.</p> <ul style="list-style-type: none"> • Selected - indicates that inventory can be picked from the location. • Unselected - indicates that inventory cannot be picked from the location. Bulk locations, or locations where defective merchandise is kept might be defined as non-pickable.
--------------------------	--

 **Note:**

Inventory Inquiry in Order Entry includes quantities in pickable locations only; all other inventory inquiries display pickable and non-pickable quantities.

Field	Description
Freeze	<p>Indicates whether the location and its merchandise are frozen. Valid values are:</p> <ul style="list-style-type: none"> Selected = The location is frozen. Unselected = The location is not frozen. <p>If a location is frozen:</p> <ul style="list-style-type: none"> Pick Slip Generation ignores the location when determining where inventory should be picked to fulfill an order. See Performing Pick Slip Generation. Suggest Location Placement (MSLO) ignores the location when suggesting where to place stock.
Stock type	<p>A user-defined code that describes the type of merchandise that can be found in the location. Examples include DEF (Defective), or RTV (Return to Vendor). This field is informational only.</p> <p><i>Alphanumeric, 3 positions; optional.</i></p>
Frequency code	<p>A user-defined code that represents the frequency with which inventory is picked from the location. Informational only.</p> <p><i>Alphanumeric, 1 position; optional.</i></p>
Class (Location class)	<p>A user-defined code that identifies the type of merchandise that will be placed in the location.</p> <p>This code is used to restrict the placement of certain item types to specific locations. For example, if the location is defined as a 'Jewelry' location, only items that contain the item type code for 'Jewelry' can be placed in the location. The class code entered is validated against the Location Class table. See Creating and Maintaining Location Classes (WLCL).</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If this field is left blank, only items that have a blank location class can be stored in the location.</p> </div>
Capacity units	<p><i>Alphanumeric, 2 positions; optional.</i></p> <p>The total number of units that can fit in the location.</p> <p><i>Numeric, 7 positions; optional.</i></p>
Capacity weight	<p>The total weight the location can hold, expressed in whole pounds.</p> <p><i>Numeric, 7 positions with a 3-place decimal; optional.</i></p>

Field	Description
Capacity: cubic	<p>The total cubic volume of the location.</p> <p>The cubic volume can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the <i>height</i>, <i>length</i>, <i>weight</i>, and <i>cubic</i> fields. The system calculates the cubic capacity if values are entered in the <i>height</i>, <i>length</i>, and <i>weight</i> fields.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The value in the <i>fill factor</i> field works in conjunction with this field.</p> </div>
Dimensions: Height	<p><i>Numeric, 7 positions; optional.</i></p> <p>The total height (the distance from the top to the bottom) of the location. The height can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in all <i>height</i>, <i>length</i>, <i>weight</i>, and <i>cubic</i> fields.</p>
Dimensions: Length	<p><i>Numeric, 3 positions; optional.</i></p> <p>The total length (the distance from one side to the other) of the location. The length can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in all <i>height</i>, <i>length</i>, <i>weight</i>, and <i>cubic</i> fields.</p>
Dimensions: Width	<p><i>Numeric, 3 positions; optional.</i></p> <p>The total width (the distance from the front to the back) of the location. The width can be expressed in any measurement you wish (e.g., inches, feet, meters, etc.) as long as the same measurement is used throughout the system in the <i>height</i>, <i>length</i>, <i>weight</i>, and <i>cubic</i> fields.</p>
Comment	<p>A user-defined comment about the location.</p> <p><i>Alphanumeric, 20 positions; optional.</i></p>

Create PO Detail Standard Screen (Adding Lines To A Purchase Order)

Purpose: Item lines can be added to a purchase order during Purchase Order Receipts when a vendor ships you merchandise and you do not have an open quantity for the merchandise on the purchase order.

For example, a vendor may send the wrong color or size of an item, may send you merchandise that you did not order, or may send you the balance of an item after you forced the line complete.

By adding lines to the purchase order, you can record receipt of the merchandise for tracking purposes. You can then do any of the following:

- place the merchandise into suspense until you decide what to do with it.
- place the merchandise into inventory if you decide to keep it.

- place the merchandise in a non-reservable warehouse and process a return-to-vendor inventory transaction if you will be returning it to the vendor.

The [Add PO Detail Line during PO Receipts \(A21\)](#) secured feature controls whether this function can be used.

For more information: See [Maintaining Purchase Orders \(MPOE\)](#) for a complete description of the fields on this screen and step-by-step instructions on adding lines to a purchase order.

How to display this screen: Select Add Line at the [Work with P/O Receipt Detail Screen](#).

Printing Purchase Order Labels

Purpose: You can print bar-coded labels to identify the receipt quantity and the location where the merchandise is placed. Labels can be printed at the following times:

- during [Receiving Purchase Orders \(PORC\)](#) when the merchandise is being placed into inventory.
- when using Placing Suspended Stock (SUSP) to transfer merchandise from suspense to inventory.

Labels cannot be printed for merchandise being placed into suspense during Purchase Order Receipts.

The [Labels at PO Receipts \(C16\)](#) system control value determines whether the labels are printed. You can print one label for each item or you can print as many labels as you want. When you print multiple labels, the same quantity prints on each label.

The Print Labels window opens only when the [Labels at PO Receipts \(C16\)](#) system control value indicates to prompt for user-entry of label information. The window does not open if this value indicates to print only one label per receipt; one label automatically prints for each receipt or suspense transfer when the transaction is accepted.

Print Labels Window

Purpose: Use this window to enter the number of labels you want to print and the item quantity to print on each label. When the window opens, a quantity of 1 defaults in the *Number of labels* field and the quantity being placed in the location is indicated in the *Quantity per label* field. You can change this information if necessary.

Note:

If you are placing the merchandise in more than one location, this window opens for each location where you are placing the item.

How to display this window:

- Select Accept at the [Work with P/O Receipt Detail Screen](#) when using the Receive Purchase Orders function.
- Select Accept at the Suspense Placement By Item Screen, Suspense Placement By PO Screen, or [Suspense Placement By PO Control # Screen](#) when using the Place Suspended Stock function.

Field	Description
# of labels	The number of labels you want to print for the item/location. Up to 999 labels can be printed per location. You must print at least one label. <i>Numeric, 3 positions; required.</i>
Qty per label	The number of units you want to print on each label for the item/location. The quantity you enter does not have to be the same as the receipt or transfer quantity; you can enter any quantity to print on the label. When printing multiple labels for an item/location, the quantity entered will print on each label. <i>Numeric, 7 positions; required.</i>

Instructions:

1. Review the default *# of labels* and *Qty per label*. Change the information if necessary, using the steps described below.
2. Enter the number of labels you want to print for the item/ location in the *# of labels* field.
3. Enter the item quantity to print on each label in the *Qty per label* field.
4. Select OK to accept your entries. The Print Labels window opens for the next item.

Display Prior P/O Receipts Screen

Purpose: This screen lets you view all previous receipts for a purchase order line during Purchase Order Receipts, if the line is open. Each receipt for line can be viewed.

The following information is displayed for each receipt:

- P/O #
- Control#
- Vendor #
- Vendor name
- Line #
- Item/SKU
- Receipt quantity
- Placement type
- Receipt date
- Currency rate
- Customs date

How to display this screen: Select Prior Receipts for a purchase order line on the [Work with P/O Receipt Detail Screen](#).

Field	Description
Received	The date the items were received. When you enter a date all items received on or after the date entered display in ascending order by date. <i>Numeric, 6 positions; optional.</i>
Qty	The quantity of the Item/SKU (in retailer's unit of measure) that was received on the date shown in the previous field. <i>Numeric, 7 positions; display-only.</i>
Cost	The receiving cost of the Item/SKU for the receipt shown. <i>Numeric, 13 positions with a 4-place decimal; display-only.</i>
Type	A description indicating whether the items were received into inventory or into suspense. Valid values are: <ul style="list-style-type: none"> Whse/Location = indicates the receipt was placed into inventory. Suspense = indicates the receipt was placed into suspense. <i>Display-only.</i>
Control#	A number assigned to a group of Purchase Orders during Purchase Order Receipts to batch multiple purchase orders together. When you enter a control number, only receipts with that control number display. <i>Numeric, 6 positions; optional.</i>

Screen Option	Procedure
View receipt details	Select Display for the receipt to advance to the Display P/O Receipts Screen .

Display P/O Receipts Screen

Purpose: This screen displays the detail information for the selected receipt. The receipt date, quantity received, placement type (inventory or suspense), currency rate, and customs date for the receipt are shown.

How to display this screen: Select Display for a receipt on the [Display Prior P/O Receipts Screen](#).

Field	Description
Control #	A number assigned to a group of purchase orders during Purchase Order Receipts to batch multiple purchase orders together. The control number indicates the batch in which the receipt was posted. <i>Numeric, 6 positions; display-only.</i>
PO #	The number of the purchase order you are working with. <i>Numeric, 7 positions; display-only.</i>
Vendor	The number of the vendor from whom the items on the purchase order were purchased. <i>Numeric, 7 positions; display-only.</i>

Field	Description
Line #	The purchase order line number the receipt was posted against. <i>Numeric, 3 positions; display-only.</i>
Item	The item number/SKU that was received. <i>(Item #): Alphanumeric, 12 positions; display-only.</i> <i>(SKU): Alphanumeric; 4 positions each; display-only.</i>
Receipt	The number of units of the item received. <i>Numeric, 7 positions; display-only.</i>
Whse/Location	The description WHSE/LOCATION indicates the receipt was placed into inventory. <i>Alphanumeric, 13 positions; display-only.</i>
Suspense	The description SUSPENSE indicates the receipt was placed into inventory. <i>Alphanumeric, 13 positions; display-only.</i>
Receipt Date	The date the merchandise was received. <i>Numeric, 6 positions; display-only.</i>
Currency Rate	The currency exchange rate at which the merchandise was received. The cost at receiving are calculated using the converted rate. <i>Numeric, 11 positions with a 7-place decimal; display-only.</i>

Work with PO Messages Screen

Purpose: Use this screen to add, view or change messages that apply to the entire purchase order. Messages that were entered using the Enter/Maintain POs function can be viewed or changed during Purchase Order Receipts. In addition, new messages can be added during Purchase Order Receipts.

Optionally, you can print any of the messages on the purchase order form and the receiver's worksheet.

How to display this screen: Select Messages at the [Work with P/O Receipt Detail Screen](#) or select P/O Messages at the [P/O Receipt Detail Screen](#).

Field	Description
Message	The message text for this purchase order. Previously entered messages display when you access the screen. Additional lines are available to enter new messages. Select Next to view additional messages or to access additional lines. <i>Alphanumeric, 60 positions each line; optional.</i>

Field	Description
Print	<p>Indicates whether this message text will print, and the form on which it will print. You can choose to print none, some, or all message lines, and you can also define the forms on which each line will print.</p> <p>The valid values are:</p> <ul style="list-style-type: none"> • Blank = Do not print • Print on Both = Print on both the purchase order and the receiver's worksheet • Print on PO = Print on purchase order only • Print on RCV Worksheet = Print on receiver's worksheet only <p><i>Optional.</i></p>

Adding a new message:

1. Enter the information you want on the first available line in the message section.
2. Use Tab to move to or click on the *Print* field. Enter a print code, if applicable.
3. When you finish the note, select OK. The system accepts the entry.

Changing a message:

1. Select Add/Change. The existing messages can now be changed.
2. Make the changes and select OK. The system accepts the entry.

Work with P/O Detail Messages Screen

Purpose: Messages that apply to an item on an individual purchase order line can be added, changed or viewed during Purchase Order Receipts. Optionally, you can print any of the messages on the purchase order form and the receiver's worksheet.

Messages can also be entered, changed, or viewed using the Maintain PO's function. See Maintaining Purchase Orders (MPOE).

How to display this screen: Select Messages for an item at the [Work with P/O Receipt Detail Screen](#) or select P/O Messages at the [P/O Receipt Detail Screen](#).

Field	Description
Message	<p>The message text for this purchase order detail line. Previously entered messages display when you access the screen. Additional lines are available to enter new messages. Select Next to view additional messages or to access additional lines.</p> <p><i>Alphanumeric, 60 positions each line; optional.</i></p>

Field	Description
Print	<p>Indicates whether this message text will print, and the form on which it will print. You can choose to print none, some, or all message lines, and you can also define the forms on which each line will print.</p> <p>The valid values are:</p> <ul style="list-style-type: none"> • Blank = Do not print • Print on Both = Print on both the purchase order and the receiver's worksheet • Print on PO = Print on purchase order only • Print on RCV Worksheet = Print on receiver's worksheet only <p><i>Optional.</i></p>

Adding a new line message:

1. Enter the information you want on the first available line in the message section.
2. Use Tab to move to or click on the *Print* field. Enter a print code, if applicable.
3. When you finish the note, select OK. The system accepts the entry.

Changing a line message:

1. Select Add/Change. The existing messages can now be changed.
2. Enter the changes as needed. The system accepts the entry.

Closing the Purchase Order

Closing PO lines: When the total quantity due on a line is received, or if the quantity received is within the *Under receipt %* tolerance limit from the System Control table, the purchase order line is closed. When all lines on a purchase order are closed, the purchase order is closed.

You cannot reopen a purchase order line that is closed. You can add a line to the purchase order during receiving if the vendor ships additional merchandise. For example, if a vendor short-ships an item, and the received quantity is within the Under Receipt % (A62), the purchase order line will be closed when the receipt is accepted. If the vendor subsequently ships the remaining balance, a new line must be added to the purchase order to record the additional receipt. See [Create PO Detail Standard Screen \(Adding Lines To A Purchase Order\)](#).

Closing the PO: When all lines on the purchase order are closed, the purchase order is closed. Closed purchase orders cannot be reopened during Receiving. You can reopen a closed purchase order with Maintaining Purchase Orders (MPOE).
