

Oracle® Retail Order Administration Cloud Service Technical Guide

Release 24.1.101.0

F84966-04

March 2024

The Oracle logo, consisting of a solid red square with the word "ORACLE" in white, uppercase, sans-serif font centered within it.

ORACLE®

Copyright © 2024, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Contents

1	Contents	
2	Glossary	
3	System Control Values	
4	Configuration and Administration	
	Document Management (My Docs)	4-2
	Forms Management (My Forms)	4-12
	Job Management (My Jobs)	4-23
5	Accounting Setup	
	Setting Up the Accounting Tables	5-1
6	Customer Service	
	Establishing Customer Service Tables	6-1
	Setting Up Customer Support Tables	6-2
	Creating and Updating Customers	6-3
	Understanding Customer Types	6-4
	Selecting Customers	6-6
	Work with Contract Price Screen	6-13
	Working with Customer Tax Status	6-14
	Working with Pay Type Exclusions	6-20
	Reviewing Customer History	6-22
	Work with User Fields Screen	6-50
	Reviewing Customer Address Changes	6-52
	Working with Customer Email Addresses	6-56
	Working with Customer Ownership	6-75

Working with Alternate Customer Number Cross-References	6-78
Order Inquiry	6-80
Reviewing the Order Inquiry Header Screen	6-80
Reviewing Order Inquiry Detail Information	6-89
Reviewing Order Details	6-104
Options Available in Order Inquiry	6-130
Reviewing Financial Information on an Order	6-134
Reviewing Invoices	6-136
Reviewing Payment Methods	6-174
Display Additional Charges Screen	6-190
Display Refunds for Order Screen	6-191
Display Order Summary Screen	6-193
Displaying Order Totals in Foreign Currency	6-196
Reviewing Order-Level Properties	6-197
Display Order Line History Screen	6-204
Display Order History Screen	6-209
Display Package Information Screen	6-220
Performing Order Maintenance	6-224
Introducing Order Maintenance	6-225
Selecting an Order for Maintenance	6-230
Work with Order Screen in Order Maintenance	6-241
Changing Item Detail Line Information in Order Maintenance	6-251
Adding an Item in Order Maintenance	6-268
Increasing the Quantity Ordered in Order Maintenance	6-269
Canceling an Item in Order Maintenance	6-270
Canceling an Order through Order Maintenance	6-278
Returning and Exchanging Items in Order Maintenance	6-285
Enter Payment Methods Screen in Order Maintenance	6-305
Adding a Recipient Order in Order Maintenance	6-317
Maintaining Quotes in Order Maintenance	6-320
Converting Quotes to Orders	6-334
Managing Declined Authorizations	6-342
Releasing Held Orders	6-342
Introducing Order Hold Reason Codes	6-342
Displaying Order Hold Information	6-359
Performing the Release	6-361
Managing Returns	6-368
Working with Return Authorizations: Standard Process	6-369
Working with Return Authorizations: Streamlined Process	6-393
Issuing Refunds	6-414
Introducing the Refund Process	6-414

Working with Catalog Requests	6-418
Catalog Request History Options	6-418
Managing Soldouts and Backorders	6-418
Purchase Order Layering and Backorder Notifications	6-419
Processing and Purging Subscriptions	6-423
Memberships	6-423
Membership Overview	6-424
Email Repository	6-439
Customer Service Appendices	6-439
Displaying More Options in OIOM	6-439
Purchase Order Layering	6-480
Creating and Updating Ship-to Customers (WCST)	6-483
Creating and Updating Sold-to Customers (WCST)	6-498
Introducing Return Authorizations (WRTA)	6-533
Using the Order Inquiry Scan Screens (OIOM)	6-539
Selecting Orders for Return (WRTA)	6-558
Working with Customer Warranty Information (WCST)	6-564

7 Fulfillment

Supplier Direct Fulfillment Processing	7-1
Shipping Zone Reservation Overview	7-11
Reserving Inventory and Generating Pick Slips	7-23
Reviewing Reservation Types	7-23
Reviewing Other Reservation Conditions	7-29
Preparing Orders for Pick Slip Generation	7-32
Performing Pick Slip Generation	7-62
Confirming and Billing Shipments	7-142
Drop Ship Pick Slip/Invoice	7-143
Order Orchestration Drop Ship Integration	7-153
Setting Up the Fulfillment Tables	7-153
Interface with Order Orchestration's Supplier Direct Fulfillment Module: Overview and Setup	7-154
Shipping Zone Reservation	7-161

8 Installation Setup

Establishing Security	8-1
Security Shell Components	8-1
Using the Menu Driver	8-6
Menu Driver Screen	8-7
Setting Up Application Areas	8-14

9 Marketing

Setting Up Offer Information	9-1
About Discount Promotions	9-1
Promotion Logic and Processing	9-33
Work with Promotions Screen	9-46
Promotion Upload	9-81
Introducing Offer and Source Codes	9-122
About Messaging Promotions	9-134
Setting Up Pricing Information	9-134
Work with Price Codes Screen	9-135
Price Code Upload	9-142
Customer Price Group SKU Exclusion Upload	9-155
Customer Price Group Pricing	9-160
Line Level Customer Price Group Pricing	9-164
Customer Price Group Price Code Pricing	9-174
Customer Price Group Best Price Comparison	9-191
Customer Price Group Pricing in Order Maintenance	9-199
Understanding Promotional Pricing	9-199
Regular Price Code Pricing	9-201
Reviewing Forecasting Information	9-217
Using House List Options	9-217

10 Merchandising

Setting Up the Item Supporting Tables	10-1
Setting Up the Purchasing Tables	10-2
Using Purchase Order Inquiry	10-2
Printing Purchase Orders	10-2
Creating and Working with Items	10-2
Working with SKUs	10-3
Assigning Items to Warehouses	10-7
Entering Additional Item Information	10-10
Copying Items	10-20
Setting up SKUs	10-40
Introducing SKU Setup	10-40
Working with Sets	10-42
Introducing Sets	10-42
Updating Items and SKUs	10-42

Assigning Items/SKUs to Offers	10-43
Maintaining Purchase Orders	10-53
Performing Inventory Analyses	10-53
Retail Integration (External System to Order Administration)	10-54
Retail Integration (External System into Order Administration) Overview and Setup	10-54
Performing Initial Item Entry (MITM)	10-67
Working with Existing Items (MITM)	10-120
Working with Item Ship Via Overrides	10-122

11 Order Entry

Entering Orders	11-1
Introducing Order Entry	11-2
Setting Defaults in Order Entry	11-5
Selecting Customers in Order Entry	11-8
Customer Scan Screen	11-39
Entering Orders	11-52
Work with Order Screen	11-55
Work with Order Lines Screen (Adding Items to the Order)	11-92
Applying Payment to the Order	11-145
Completing Order Entry	11-171
Order Entry Updates	11-188
Working with Items on the Order	11-196
Upselling the Customer in Order Entry	11-249
Expanding the Address in Order Entry	11-265
Using a Permanent Shipping Address in Order Entry	11-273
Assigning an Order Shipping Address	11-285
Adding a Recipient Order in Order Entry	11-291
Assigning a Billing Address in Order Entry	11-301
Defining Order Properties	11-310
Adding Order Messages	11-319
Adding Miscellaneous Charges or Credits in Order Entry	11-326
Displaying More Options in Order Entry	11-335
Entering User Fields	11-338
Working with Order Summary Information	11-339
Posting a Return or Exchange Through Order Entry	11-347
Entering Customer Memberships in Order Entry	11-350
Entering Coupon Promotions on an Order	11-357
Working with an Order-Level Email Address	11-366
Valid Ship Vias for Window	11-370
Tracking Order/Call Disposition Activity	11-372

Entering Pre-Order Quotes	11-378
Customer Engagement Gift Registry and Customer Wish List Integration	11-403
Working with Error Order Batches	11-409
Introducing Order Batches	11-409
Working with an Order Batch	11-410
Performing Batch Order Entry	11-415
Accepting or Rejecting the Order Batch	11-416
Generic Order Interface	11-429
Order Creation Errors	11-429
Order Entry Appendices	11-437

12 System Operations

Oracle Retail Merchandising Foundation Cloud Service (RMFCS) and Oracle Retail Pricing Cloud Service (RPCS) Integration	12-1
Operating Background Jobs	12-11
Using the ASYNC Jobs (MBJC)	12-12
Working With the CNTL_ASYNC Job	12-16
Working With the BILL_ASYNC Jobs	12-28
Working With the EBO ASYNC Job	12-38
Working With the ORDR_ASYNC Job	12-42
Working With the OTHR_ASYNC Job	12-47
Running Period End Processing	12-53
Releasing Orders from Time Hold	12-53
Using the System Utilities	12-55
Working with Inventory Resets	12-56
Working with File Imports	12-56
Setting Up Authorization Services	12-81
Defining Authorization Services (WASV)	12-82
Defining Authorization Service Countries	12-94
Defining Vendor Paytype Codes	12-96
Defining Vendor Response Codes	12-98
Defining Merchant ID Overrides	12-127
Defining Authorization Service Currencies	12-129
Performing Online Credit Card Authorizations	12-131
Processing Authorizations and Deposits Using Point-to-Point Communication	12-144
PayPal Direct Connection Integration	12-145
External Payment Service	12-177
Purging Tables	12-183
Purging Sold To Customers	12-183
Additional Purges	12-186
Flexible Payment Options	12-186

Deferred/Installment Billing Overview	12-187
Deferred/Installment Billing Setup	12-196
Credit Card Net Exchange Billing	12-200
Processing Deposits	12-233
E-Commerce Interface	12-234
Workflow Management	12-234
Workflow Management Overview and Setup	12-235
Event Rule Settings	12-249
Work with Tickler Event Screen	12-253
Create Tickler Event Rule Screen	12-255
BO (Backorders) Event Processing	12-259
CO (Cancelled Orders) Event Processing	12-263
HO (Held Orders) Event Processing	12-267
MN (Manually Created) Event Processing	12-270
NO (New Orders) Event Processing	12-271
OO (Aged Open Orders) Event Processing	12-276
SD (SVC Activation Decline) Event Processing	12-279
SO (Soldout Orders) Event Processing	12-280
SV (SVC Number Assignment) Event Processing	12-284
UP (Unconfirmed Pick Tickets) Event Processing	12-285
VP (Voided Pick Tickets) Event Processing	12-288
WF (Remote Workflow) Event Processing	12-291
Work with Tickler Event Rule Procedure Screen	12-292
Work with Tickler Event Rule Screen	12-292
Change Tickler Event Screen	12-294
Tickler Event Settings	12-298
Point of Sale Integration	12-309
Point of Sale Integration Overview	12-310
Batch Inventory Overlay Upload	12-323
Importing Store Cross Reference Locations through Order Orchestration's Discovery Web Service	12-325
Stored Value Card Integration	12-328
Stored Value Card Overview and Setup	12-328
Stored Value Card Purchase and Activation	12-342
Stored Value Card Authorization Reversal	12-355
Generating Stored Value Card Refunds	12-366
Importing Item/SKU and Set Data	12-370
Integration Layer Processes and Web Services	12-370
Integration with the Sales Audit Module of the Oracle Retail Merchandising Foundation Cloud Service	12-388
Merchandise Locator API	12-405
Brokered Backorders	12-425

Order Orchestration Originating Location, Fulfilling Location, and Pickup Location	12-464
Order Orchestration Status Summary Table	12-467
Retail Pickup (including Ship-for-Pickup) or Delivery Orders	12-471
Ship-for-Pickup Orders	12-490
Store Pickup Orders	12-503
Troubleshooting the Order Orchestration Integration	12-525
Tracking User, Authority, and Password Updates	12-530
Translating Special Characters	12-557

13 Warehousing

Transaction History	13-1
Inventory Transaction Setup	13-1
Item Where Used	13-1
Selecting Purchase Orders for Receipt (PORC)	13-2
Performing Inventory Transactions	13-4
Purchase Order Receipts	13-4
Purchase Order Receiving Overview	13-5
Managing Warehouses	13-14
Creating and Maintaining Item Warehouses	13-15
Pending Putaway Overview	13-26
Docking Purchase Orders	13-32
Warehouse Management Integration	13-33
Warehouse Management System Integration Overview	13-33
Receiving Purchase Orders (PORC)	13-35

Preface

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Customer Support

To contact Oracle Customer Support, access My Oracle Support at the following URL:

<https://support.oracle.com>

When contacting Customer Support, please provide the following:

- Product version and program/module name
- Functional and technical description of the problem (include business impact)
- Detailed step-by-step instructions to re-create
- Exact error message received
- Screen shots of each step you take

Oracle Help Center (docs.oracle.com)

Oracle Retail Product documentation is available on the following website <https://docs.oracle.com/en/industries/retail/html>

Comments and Suggestions

Please give us feedback about Oracle Retail Help and Guides. You can send an e-mail to: retail-doc_us@oracle.com

Oracle Retail Cloud Services and Business Agility

Oracle Retail Order Management System is hosted in the Oracle Cloud with the security features inherent to Oracle technology and a robust data center classification, providing significant uptime. The Oracle Cloud team is responsible for installing, monitoring, patching, and upgrading retail software.

Included in the service is continuous technical support, access to software feature enhancements, hardware upgrades, and disaster recovery. The Cloud Service model helps to free customer IT resources from the need to perform these tasks, giving retailers greater business agility to respond to changing technologies and to perform more value-added tasks focused on business processes and innovation.

Oracle Retail Software Cloud Service is acquired exclusively through a subscription service (SaaS) model. This shifts funding from a capital investment in software to an operational expense. Subscription-based pricing for retail applications offers flexibility and cost effectiveness.

1

Contents

- [Accounting Setup](#): Includes general accounting setup.
- [Customer Service](#): includes customer maintenance, order inquiry, order maintenance, returns, backorder and soldout process, refunds, and memberships.
- [Fulfillment](#): includes pick slip generation, drop ship processing, Order Orchestration Drop Ship Manager integration, and shipment confirmation.
- [Installation Setup](#): includes system control values, number assignment, and secured features.
- [Marketing](#): includes promotions, source code and offer setup, and list management.
- [Merchandising](#): includes item maintenance and purchase order maintenance.
- [Order Entry](#): includes the generic order API.
- [System Operations](#): includes utilities, periodic processing, authorizations and depositions, the e-commerce interface, stored value cards, the point-of-sale integration, and Order Orchestration integration.
- [Warehousing](#): includes purchase order receiving and warehouse management.

See the [Menu Driver Screen](#) for information on the options at this screen.

2

Glossary

Accompanying items are added to the order automatically at no charge or for a set price when the customer orders the originating item, or “trigger item”, in a specific quantity and for a specific offer. This activity is automated, so that the order entry operator does not have to remember to add this item to the order. No pop-up window opens to notify the operator that the system is adding an accompanying item to the order. In addition, certain updates to the originating item in order entry also update the accompanying item. When you ship the order, the system ensures that the originating item and accompanying item ship together.

Additional charges are user-defined types of charges that you can add to an order for any reason. You might establish standard additional charge codes for freight fees, special handling charges or rush shipment fees. You might also establish standard credit types of additional charge codes to reimburse the customer for long-distance telephone calls or postage fees.

Address verification services help to reduce the fraudulent use of credit cards by verifying that the billing address on the credit card is legitimate.

Advanced queuing allows you to send messages between Order Administration and other applications using database-integrated message queuing.

Application areas categorize related functions, such as all functions that relate to the Purchase Order application area, Inventory application area, Order Entry application area, etc.

Application groups further define the functions within an application area. An example of an application area may be O/E (Order Entry); an example of an application group within the O/E application area may be FRE (freight).

Arrival date is the date when the customer wants to receive the order. This date controls whether the system reserves inventory and prints pre-generated picks immediately.

ASync (background) jobs are used to process the non-time sensitive table updates, such as analysis and reporting updates, associated with transactions that are processed throughout the day in the following modules: Order Entry, Order Maintenance, Purchase Order Maintenance, Purchase Order Receiving, and Billing.

Automated inventory transactions allow you to process inventory transactions across companies. This is useful if you use Inventory Sharing (A69) and you wish to move inventory from the sharing company (which uses inventory located in another company) to the shared company (where you actually maintain the inventory). However, you can still process automated inventory transactions without using inventory sharing.

Best way shipping in order entry can either display a window enabling the order entry operator to offer a choice of shipment options to the customer, or have the system automatically select the ship via with the lowest overall shipping charges.

Billing addresses are addresses where you send the invoice for an order.

Bill-to customers are people or businesses that are billed for the order. This type of customer exists when a business order is placed that will be paid “on-account.”

Brokered backorder: Use the brokered backorder integration with Order Orchestration to automatically send backordered lines to the Order Broker module in Order Orchestration for fulfillment.

Buyers are eligible to create purchase orders and may be assigned to purchase specific items. A record must be established on the system for every buyer. The Buyer table is required in order to use the Purchase Order function.

Cache: A store of information that will be required in the future, and can be retrieved quickly. Order Administration uses caching to store recently used information from the Order Administration database in a place where it can be accessed quickly, rather than accessing the database, in order to improve performance. Caching occurs across all Order Administration companies; if you use multiple application servers, you can specify which servers share the same cache. For example, you should have all of your test servers share the same cache and all of your production servers share a cache that is different from the cache assigned to your test servers.

Cancel date is the date when the customer wants to cancel an order if it has not been shipped.

Companies are single, isolated set of tables and data: an organization of financial information, inventory, and customers. Essentially a company has a completely separate database from other companies.

Contact Center is a module of Order Administration where you can review and maintain orders. Contact Center is available in OACS Modern View.

Contact Center: A component of Modern View that provides the ability to create, work with, or review orders.

Credit card authentication services help to reduce fraud and chargeback volume on card not present transactions by requiring the cardholder to enter a card authentication password on the web storefront. The authentication password is sent to an authentication service, such as Visa's Verified by Visa program or MasterCard's SecureCode program, to verify the cardholder's identify and ownership of the credit card during the online purchase.

Credit card net exchange billing allows the system to hold the credit invoice for a return to net it against the debit invoice for the associated exchange in order to reduce the number of transactions that occur for an exchange. The system uses the system-delivered EXC Net Billing for Exchanges deferred payment option to determine how long to delay billing the customer's credit card, based on the invoice date and the # of days for deferral defined for the EXC payment option.

Credit card number formats allow you to specify which digits of a credit card number are masked on Order Administration screens and reports using a special character, such as an asterisk (*). For example, you may wish to mask all but the last 4 digits of a 16-digit credit card number: *****1111.

Credit card security services (CID, CVV2, CVC2) help to reduce the fraudulent use of credit cards by verifying that the credit card is present at the point of sale and to ensure that the credit card security value from the transaction matches the security value stored by the service bureau for that card.

Customer action notes are messages about a customer issue or problem that you need to resolve. You use customer action reason codes to identify and group the issues or problems in customer action notes or track when and how often customers report certain issues or problems.

Customer Engagement Loyalty Integration allows you to register customers in the Oracle Retail Customer Engagement loyalty program. Once a customer is registered in the loyalty program, you can retrieve the customer's loyalty points and awards balances, accrue points from completed purchases, and redeem awards as a pro-rated merchandise discount on an order.

Customer Engagement Stored Value Card integration allows you to process stored value cards between Order Administration and Oracle Retail Customer Engagement using point-to-point communication. Processing of stored value cards remains the same in Order Administration; however, in this integration, Order Administration uses Oracle Retail Customer Engagement APIs to send the stored value card transactions directly to the Oracle Retail Customer Engagement system for processing.

Customer ownership allows you to capture and confirm information about the products a customer currently owns or previously owned. You can use this information to determine trends in the products a customer purchases and recommend related products for purchase.

Customer Price Group Best Price Comparison determines if the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value provides a better price than the customer price group assigned to the sold to customer on the order.

Customer profiles let you define the demographics you want to capture for your customer base and define the valid responses for these categories. You can also establish default codes that represent the most common profile characteristics of your customer base. For example, assume that a profile for marital status includes married, single, divorced, etc., as valid options, and that the majority of people who place orders are single. If you set a profile default for the single option, this value appears on new customer orders. You would then need to perform data entry in the marital status field for new customers only if the customer were not single.

Default messages are standard order or gift messages that you enter on orders on a regular basis. Instead of requiring users to retype a standard message on each eligible order, you can have the user select the message from a list of standard messages to default to the order, allowing you to avoid typographical errors that can occur when the message is manually added to the order. You can create default messages for order level messages and line level messages. When a user selects a default message to add to an order, the message text defined for the default message defaults to the Message field and the print code defined for the default message defaults to the Print field; however, the user can still override the default message text and the print code or add to the default message text. For example, if a user selects to default Happy Birthday, the user may wish to modify the message line to read Happy Birthday, Mom! Love, Alex and Beth.

Deferred payment plans are payment plans that allow a customer to pay at a later date, for example, Payment due on January 1st or can be a rolling date, for example, Payment due in 30 days.

Drop points represent locations to which merchandise will be shipped from your warehouse. Typically, a drop point represents the address of a UPS facility. This drop point prints as the return address on the pick slip and is the destination to which undeliverable packages are returned.

Drop ship items are items that you do not stock in inventory. When a customer places an order for a drop ship item, you order the item from your supplier (vendor). The vendor ships the item directly to your customer.

Dunnage weight is the weight of packing materials. Use the Work with Dunnage Weight menu option to define the weight of dunnage based on the cube of the items on a pick slip.

Experian Data Quality (EDQ) Address Validate API, formerly known as the QAS Pro On Demand Service, allows you to retrieve address information from Experian's Address Validate API to update an Order Administration address during interactive quote or order entry/maintenance, the order API, catalog requests, the customer API, and customer maintenance. The Address Validate API captures, cleans, maintains, and enhances address records and validates the address data against national postal authorities, such as the U.S. Postal Service. This is an on-demand, SaaS solution hosted by Experian Data Quality.

External payment service is a RESTful web service that provides an interface from Order Administration for sending credit card and stored value card transactions and receiving responses. Using this service, you can build a custom payment processor that maps to your payment provider.

Finished goods are items that require assembly prior to picking and packing. A finished good is made up of one or more components. These components are assembled to build the finished good. The finished good is picked and packed, not the individual components. The system tracks the usage of each component and will recommend re-order quantities. The system also determines demand for the finished good item and recommends the number of finished goods to be made up to meet demand.

FOB (freight on board) address is the location where title to merchandise being shipped passes from the seller to the buyer. If the FOB address is an Origin type, ownership of the merchandise passes from seller to buyer at the origin of the shipping route, and the buyer is responsible for transportation costs and risk of loss or damage from that point. If the FOB address is a Destination type, ownership of the merchandise passes from seller to buyer at the receiving point for the merchandise, and the seller is responsible for transportation costs and risk of loss or damage until the merchandise reaches its destination.

Freight by order weight involves calculating the freight charges for an order by evaluating the number of cartons you expect the order will require to ship, and the weight of each carton. The tables you create with this function define the freight charges to add to an order based on the weight of each carton.

Generic retail integration from an external system into Order Administration allows you to keep merchandise information in Order Administration in sync with merchandise information in your external merchandising system. Using this integration, you can provide your customers with a consistent shopping experience across your retail store, catalog, and online channels. You can carry the same merchandise and offer your customers the same merchandise pricing in your retail store, catalog, and online channels. This allows you to maintain the image and service levels customers have come to expect.

Ghost customers are customers whose records have been merged with the records of matching customers when you performed a merge/purge.

Gross profit margin is used to determine the profit of an item on an order based on the item's selling price, or to determine the profit of an entire order. This calculation is helpful if your operators are allowed to negotiate prices and work on a commission basis.

Hazard codes identify hazardous items and indicate if special storage and/or handling is required. You assign a Hazard code to an item in Work with Item/SKUs.

Indicia messages are messages you enter to print on the pick slip, such as shipping instructions or notes to the carrier. The indicia message that displays is determined by

the drop point associated with the ship via for an order. The drop point associated with the ship via for an order depends on whether or not you are using the Zone skipping feature in Pick Slip Generation.

Installment payment plans are payment plans that allow a customer to pay a specific amount of the payment each month. The date of the payment is due can be a fixed day of the month, for example, Installments due on the 25th of each month, or based on a specific interval, for example, Installments due in 30-day intervals.

Item category codes classify and group similar items on a level below Item Class. For example, you can assign a group of items within the same item class an Item category of “printers only” to differentiate printers from the other items under that item class.

Item ship via overrides are the shippers that can be used to deliver a particular item to its destination, even if the other items on the order are delivered by another ship via.

Items are units of inventory that are defined to the system by item codes. The item code consists of the code itself and, optionally, a SKU, which allows you to define the item further by characteristics such as color, size, etc.

Line of business assignments represent the entity, division, or offer, or combination of these three values assigned to a line of business. The assignment determines which line of business the system assigns to an order in order entry. The system uses a line of business assignment to group all orders associated with a specific line of business together.

Lines of business represent clients, or business units, in Order Administration. Each line of business contains assignments that represent a specific entity, division, or offer, or a combination of these three values.

Long Running Jobs Monitor watches the batch jobs running on the Job Management Screen and sends a Long Running Job Email to a specified email address if a job runs without ending longer than a specified time.

Mass Customer Download allows you to download a batch file of new and changed customers to an external system. Note that this option is not currently implemented.

Match codes are unique customer identification codes that consist of selected portions of a customer name, company name, and address information. The system generates a match code for each customer based on positional field contents you include in a match code schematic or algorithm. You can create up to four match codes per customer, including a standard match code and three fraud identification match codes.

Merchandise locator searching: This integration with Order Orchestration provides a way to search for a location across the enterprise where the customer can pick up an item. This option is available in item availability, order entry, and order maintenance. The results are informational only.

Misships are items that were inadvertently shipped to your customer. When you process a misship through return authorizations, you add a record of the item to the order and process other updates, such as receipt into inventory, as required. Misships differ from regular returns, in which you process a return against an item that was already on the order. Misship returns cannot be credited, since they were not billed. However, the system updates the Date credited field in the RA Header table to indicate a pending credit does not exist.

Modern View: OACS Modern View is a separate component of Order Administration and includes the Contact Center. Your user configuration controls whether you advance automatically to Order Administration or Modern View when you first log in.

OAuth is a standard for web service authentication through the use of temporary access tokens rather than passwords. With OAuth authentication:

The requesting system first passes a client ID and a client secret to an authenticating service, such as IDCS (Oracle Identity Cloud Service) or OCI IAM (Oracle Cloud Infrastructure Identity and Access Management).

The authenticating service, such as IDCS or OCI IAM, generates a temporary token.

The requesting system submits the token, along with the client ID, to the destination system, rather than a password and user ID as with basic authentication.

The destination system validates the token and client ID with the authenticating service.

Oracle Retail Customer Engagement Batch Customer and Sales

Integration allows you to send merchandise hierarchy, item, customer, sales and return information from Order Administration to Customer Engagement. Sending this information to Customer Engagement provides a centralized view of the customer's value across your enterprise. You can use this information to perform data analysis, or segmentation, in Customer Engagement.

Oracle Retail Order Orchestration's Supplier Direct Fulfillment is a module of Order Orchestration that provides a collaborative, browser-based environment for retailers and vendors to share order, customer, and shipping information related to drop ship processing, and to automatically process drop ship orders. Order Orchestration is an Oracle application that also provides distributed order fulfillment through its Order Broker module.

Order batching allows you to review, correct, and accept orders received from an external system that are in error.

Order Orchestration: Integration with the Order Broker module in Order Orchestration supports fulfilling orders across the enterprise.

Order line activity codes define the type of activity, such as a shipment or return, performed against an item on an order line. You can review the activity performed against an item on an order line on the Display Order Line History Screen. You can use the Work with Order Line Activity Codes (WOLA) menu option to review system-delivered order line activity codes and to also create user-defined order line activity codes.

Order ship-to addresses are addresses that are attached to orders you are entering, but which are not saved as permanent mailing addresses for customers.

Order/Call Disposition Activity allows you to track the calls that come into Order Administration from an external order call center. In addition, you can track the reason why a call was terminated or an order was rejected. You can use the order/call disposition activity in Order Administration to match the calls taken in Order Administration against the call history in the external order call center.

Outbound interface trigger rules are the criteria a transaction must meet in order for the system to create an IL outbound trigger. For each outbound process, you can create trigger rules for certain tables. For example, you can create trigger rules for the Item table and SKU table to control the Item Outbound job. If you enter more than one criterion, the record must meet all of the criteria in order to generate a trigger.

Pay plans are deferred payment or installment billing options you can offer to your customers. Under a pay plan, you delay billing the customer's credit card for a prearranged interval.

Pending warehouse locations are locations that were created by the Location Generator in a deferred status. These records are created in a deferred status when you want to review and modify location information before updating the permanent Location Table.

Periodic functions are jobs that you need to run periodically, usually on a daily, monthly, or yearly basis. Periodic functions include reports listing or summarizing activity in a particular area of your business, reports providing current status information on your business, periodic resets, and aging operations.

Periodic processes are jobs consisting of one or more periodic functions that run on a daily, weekly, monthly, or yearly basis.

Permanent shipping addresses are address that are kept on file for the sold-to customer. An example of a ship-to address would be the customer's work address. The system adds a separate record to the Ship-to Customer table for this shipping address under the customer number. You can define up to 999 permanent shipping addresses for one customer.

Physical stored value cards are physical cards that you can stock in a warehouse or retail location. Physical stored value cards are reserved on an order based on available inventory and printed on a separate pick slip from the other items on the order. You must assign a number to the physical card before the card can be billed. Once the card receives an approved activation from the service bureau, the system delivers the physical card to the recipient card holder on the order. In addition, an email may be sent to the recipient card holder, notifying the customer that the physical card is in the process of being delivered.

Pick processing days are the number of days it takes your company, on average, to pick, pack, and ship an order. This is your internal lead time. The system uses this number to determine when to generate a pick slip.

Pick Slip Allocation determines the locations where the system pulls stock in order to fulfill the pick slips in the pick slip generation run.

Pick slip preparation prepares an order for fulfillment when you create or change an order, such as creating pre-generated picks in the Pick Control Header and Pick Control Detail tables and defining whether the pre-generated picks require authorization. Preparing the order for pick slip generation in advance reduces the time it takes to run Streamlined Pick Slip Generation (WSPS) to fulfill and print the picking documents.

Pre-generated picks are picks created prior to running pick slip generation for an order. The status of a pre-generated pick is either G Generated No Authorization, indicating the pick requires authorization during pick slip generation, or H Generated Has Authorization, indicating the pick can bypass authorization during pick slip generation. Pick slip generation selects pre-generated picks to fulfill and print based on the pick slip selection criteria specified.

Price codes allow you to define a price discount for items/SKUs in a specified offer or source code when you order a specified quantity. The price code can offer a dollar or percentage off the price of the item, a special price for the item, or a group price for a defined group of items. The system applies price code pricing to an order during repricing and end-of-order pricing.

Price tickets are labels you attach to items that you wish to transfer to a retail store. The ticket contains information such as the item number and SKU, retail price and outlet price. A barcode prints on each label so you can scan the label information automatically into your system.

Pricing Upload Interface allows you to upload Special Pricing by Source records and Quantity Price Matrix Detail records from an external system.

Primary email address: The primary address is the one displayed on most screens, such as in customer inquiry and in catalog requests.

Primary primary: The primary location stored in the Primary location field in the SKU table.

Promotional pricing allows you to specify an item, a group of items, or a dollar amount that a customer must order to receive an incentive item at no charge or at a special price. Promotional pricing is defined for a source code or offer. When the customer meets the eligibility requirements established in the promotional pricing record, a pop-up window appears in Order Entry allowing the customer to select from an incentive group or select an incentive item. The system automatically adds the item to the order.

Properties define system-wide configuration settings for Order Administration.

Protected: the quantity of the item that can be reserved only through Interactive Reservation.

Purchase order layering updates the expected delivery dates for items on backorder, based on records in the PO Layering table. The oldest orders on the system receive stock before new orders.

Quoting allows you to create a pre-order for a customer listing the items the customer wishes to order and the estimated order totals should the customer agree to place the order. The system does not reserve inventory or perform background async updates for the quote until it is converted to an order. Optionally, the system assigns an expiration date to a quote, indicating how long the estimated quote is valid before it expires.

Recipient orders are secondary orders that you add to an order to ship to a different address. For example, you can place an order for yourself and a friend in a single phone call, on a single order. The system assigns the first order an order number, you enter name, address, item, and payment information for this order, and then select Accept/Add Rcpt to accept the current order and add a recipient order.

Recipient orders are secondary orders that you add to an order to ship to different customers or addresses. For example, you can place an order for yourself and a friend in a single phone call, on a single order.

Regionalization is the process of creating software that is able to be translated more easily. Changes to the code are not specific to any particular market. Order Administration supports multiple decimal and thousand separators as well as multiple date formats.

Reserved: the quantity of the item that is already set aside for other orders.

Retail pickup or ship-for-pickup order: The Order Orchestration sends a retail pickup order or ship-for-pickup order to Order Administration for fulfillment when the customer would like to pick up the order at a retail location. The ship-to address on the order sent to Order Administration for fulfillment is the name and address of the pickup store location. If Order Orchestration sends a ship-for-pickup order to Order Administration for fulfillment, the system treats the ship-for-pickup order the same as a retail pickup order.

Sectional Center Facility (SCF) codes represent the first 3 digits of the destination postal (zip) code. The Work with SCF function allows you to enter information specific to the SCF, including the valid states, the preferred method of shipping to this area, and a warehouse list which defines a hierarchy for reserving merchandise in warehouses.

Secured features are procedures or functions that occur within a function, such as the ability to maintain batch totals within Order Entry.

Sets are a group of items which are assembled when the set is picked and packed. Sets can be made up of items which are sold individually. Each of these component items appear on the pick slip and are packed together. Component items might not appear on the same pick slip, but the picks are created at the same time.

Ship via lead days, as defined in the Working with SCF/Ship Via Values (WSHV) menu option, represents the number of days it takes a shipper to deliver the order to its destination. The SCF represents the first 3 positions of the destination postal code. To retrieve the correct ship via lead days, the system uses the ship via on the order line (or order ship if not defined at the line level) and the SCF (first 3 digits of the postal code) and country code defined for the order ship to delivery address.

Ship-for-pickup order: Use the ship-for-pickup integration with Order Orchestration to send the merchandise for an order to a designated store, where the customer can pick it up. The Order Orchestration integration facilitates communication between Order Administration and the designated store location, so the store receives notification that the order is in transit, and sends notification back to Order Administration after the merchandise is received and when the customer picks up the order.

Ship-to customers are people receiving the merchandise. This may be the sold-to customer, the recipient of a gift, the address of a business or an address used for this order only.

SKU Sort Sequence Numbers are sequence numbers assigned to SKUs to determine the order in which the SKUs sort. You can use the sort sequence to display SKUs in a different order, such as by size, rather than alphanumerically by SKU code.

SKUs are codes that further define items by virtue of color, size, width, or any other type of user-defined attribute. Usually, you define SKUs when the majority of your items have 2 or more identifying characteristics.

Sold to customers are people placing orders. The system tables the customer's name and address and other basic information so that a customer main record is available for future use.

Soldout control codes define which calculation the system uses to determine when to sell out an item. When a customer orders a soldout item in order entry or order maintenance, the order line is automatically closed with a status of Soldout. The soldout units and dollars are updated in the Item table, Item/Offer table, Source Code table and order history tables. You can define a soldout control code for an item in the S/O control field on the second item screen in item maintenance, or on the SKU screen if the item has SKUs. If you do not define a soldout control code for an item or SKU, it will never sell out automatically in order entry/maintenance.

Source codes are unique codes used to identify segments of your customer base or a rented list. Each source code is assigned to one offer and one division. Source codes control the freight and pricing method used on an order.

Standard special handling is a set of free-form instructions or notes about how to work on an item, including the charge for the special handling work. Standard special handling is entered on a free-format screen where you can enter any information necessary to explain what needs to be done to the item.

Store pickup order: Use the store pickup integration with Order Orchestration to send orders to an external retail location where the merchandise is already available for pickup. Unlike a ship-for-pickup order, a store pickup order does not require Order Administration to transfer the inventory to the store. The ship-to address on a store pickup order sent from Order Administration to Order Orchestration is the name and address of the originating store location.

Stored value card refunds allow you to generate a credit card credit against the original stored value card on the order or generate a new stored value card for the amount of the refund to send to the customer when you process a refund.

Sub-offers for an offer allow you to analyze how certain pages in an offer perform from the rest of the offer. For example, you may want to create a sub-offer if the main offer contains insert pages, such as a section of items sold at a discounted price.

Tax Jurisdictions define postal code ranges for an area where a special tax structure exists. For example, tax jurisdictions exist for some counties in New York and New Jersey. Standard tax reporting does not identify taxes collected at the jurisdiction level.

Threshold values indicate the numbers and/or dollar values that trigger the system to generate an email when these values are breached.

Tickler event rules are the criteria that must be met by the system action for the system to create a tickler for a user to resolve.

Tickler events are the system actions for which the system may create a workflow task (tickler).

Tickler procedures are the instructions a user follows to complete the tickler task.

Ticklers are tasks automatically created by the system and assigned to a user when a system action meets the criteria defined for a tickler event rule. For each tickler, you can define the procedures, or instructions, the user should follow to complete the task. A tickler can also be created manually.

User classes are logical groupings of users, for example all Order Entry operators. Like the individual user record, a default menu and default company can be assigned so that all users in this user class will sign on to the same menu and work within the same company. Authority to companies, menu options, secured features and user defined functions can also be assigned at the user class level.

User edit points allow the system to pass a hash map of pre-defined values to an external program for validation whenever a certain activity occurs in the Order Administration application and have the external program return a string response so that Order Administration can display any data returned in the string as an error message on the Order Administration screen from where the user edit point was called.

User exit points allow the system to pass parameters to an external program to obtain additional information whenever a certain activity occurs within Order Administration. You might also set up a user exit point as a means of feeding information to an external accounting package, or a service bureau that maintains customer information.

User records allow an individual to sign on and access all or some of the features of the system. A user can be a customer service representative, an order entry operator, or a system administrator. Each user on the system must have both a user profile and a user control record.

Variable sets are lists of items that customers can choose from to make up the set they want to purchase. Like sets, variable sets are assembled when the set variable is picked and packed. The items which make up the variable set might not appear on the same pick slip, but the picks are created at the same time.

VAT is a taxing method that applies in only certain states in countries. When an order is subject to VAT, the customer is charged a tax-inclusive price, and the tax amount is “hidden” on the order detail line for the item, not included in the Tax bucket for the order.

Vendor response codes identify the reasons that the service bureau approves (authorizes) or declines a credit card charge or deposit. The codes are assigned to each transaction by the service bureau when approving or declining the request.

Vendors are companies who supply you with merchandise or services. A record must be established on the system for every vendor from whom you purchase merchandise.

Virtual stored value cards are virtual (non-physical) cards that you do not stock. Virtual stored value cards are automatically reserved on an order and express-billed during pick slip generation. During pick slip generation, the system also assigns a number to the virtual card. Once the card receives an approved activation from the service bureau, an email is sent to the recipient card holder on the order, notifying the customer that a stored value card has been purchased and providing the stored value card number and dollar amount to use as a form of payment.

Warehouse lists are used to more efficiently allocate an order when you ship from more than one warehouse.

Warehouse management systems control inventory movement, such as receiving merchandise, inventory transactions, picking and packing, and shipping merchandise to a customer.

Warranty items are items you can add to an order at no charge. For example, if a customer previously ordered a grill that came with a 2-year warranty and the burner on the grill was defective, you could add the replacement burner to the customer's order free of charge.

Web service authentication allows you to define a valid web service authentication user or client ID for each web service used by Order Administration.

Workflow management allows you to automate system actions, during which tasks (ticklers) are assigned to a user for action, according to a defined set of procedures, until the issues associated with the ticklers are resolved.

XML inclusion defines which elements to include in a download message.

Zone skipping is a method of reducing freight charges by shipping inventory via one carrier to a central drop point, where it is picked up by another carrier and delivered to its final destination. For example, if you are shipping from a Massachusetts warehouse to destinations in California, you might use one carrier to deliver all packages to a UPS center in California, from which they will be shipped to their California destinations. Whether or not you are using zone skipping determines which table the system uses to identify the drop point.

Document Management (My Docs)

Purpose: Use the Document Management screen to work with reports generated by Order Administration.

How are reports different from forms? Reports are listings that present summary or detail information for use by staff, while forms include specific information for a single customer, vendor, or order, and are available for distribution to the customer or vendor. For example, the Pick Unit report lists total single-line and multi-line picks generated, while each generated pick slip form includes the customer's name and address and details about the order that is shipping with the pick.

PDF files: Each report is generated as a PDF (portable document format) file, typically opened through the Adobe Reader or within a separate browser window. Certain reports are also available in spreadsheet format, so you can work with them in a spreadsheet application.

Oracle Business Intelligence Publisher report settings: Order Administration uses an integration with Oracle Business Intelligence Publisher to generate certain forms and reports. See [Oracle Business Intelligence Publisher \(BI Publisher\) Forms and Reports Settings](#) for more information on the required setup.

Custom reports: You can create and generate custom reports through Oracle Analytics Cloud. See the OMS Custom Reporting Guide on [My Oracle Support](#) (ID 2953017.1) for more information.

In this topic:

Document Management Screen

How to display this screen:

- Click the My Docs icon ( in the upper right area of a screen), or select My Docs from an Admin screen (such as the About Application, [Forms Management Screen](#), [Job Management Screen](#), Commands, User Control, or System Messages screens). When you advance to the screen this way, it displays all reports generated through your user ID through any submitted job. See the fields below for information on how to filter the reports listed on this screen.
- Click the report icon () for a submitted job at the [Job Management Screen](#) (My Jobs) to display the reports generated for that particular job only.

Report Listings and Display Options

Default settings for reports available for review: When you first advance to this screen, the most recent reports submitted by your user ID are currently available for review by scrolling up or down with the right-hand scroll bar. The reports are listed in reverse chronological order (newest to oldest).

Available reports updated when you filter: When you enter or select any search criteria and then click Filter, the screen displays reports that match these criteria. A message displays if the search results are greater than 200 records: The maximum number of records was exceeded. Please refine search criteria. Showing records 1-200. Enter additional search criteria to refine your search results.

Example: The screen currently includes the most recent reports available for review in reverse chronological order (newest to oldest): 20 of these reports are in the QPRINT queue, and 5 are in the DOCUMENTS queue. When you select QPRINT from the Queue field and click Filter, the screen displays only the most recent reports in the QPRINT queue.

Available reports restricted by Rank and All job authority:

- If the All job authority option is selected for your user control record, you can review all jobs, regardless of ranking.
- If the All job authority option is not selected for your user control record, you can review forms generated by other users only if their user control Rank does not exceed yours.

Example:

User MSMITH has a Rank of 9, with All job authority selected.

User TBROWN has a Rank of 9, with All job authority unselected.

User JJONES has a Rank of 1, with All job authority selected.

Result:

- MSMITH can review reports generated by TBROWN because their Rank is the same; however, MSMITH cannot review reports generated by JJONES, because a Rank of 1 exceeds a Rank of 9.
- TBROWN cannot review reports generated by any other users, because he does not have All job authority.
- JJONES can review reports generated by all other users based on his Rank and All job authority.

Note:

Different rules control the authority to view forms and reports than the rules that affect the [Job Management Screen](#). The user's Rank does not affect authority to view jobs.

Column sort: You can sort on any column by clicking the column heading name. When you first click, the sort is in ascending alphanumeric (A-Z) or numeric (lowest to highest) order. Click again to change the sort to descending (Z-A) or numeric (highest to lowest) order.

Field	Description
Document	<p>The program that generated the report. Click the document icon to open the report in a separate window. From this window, you can review and optionally print the report, using the standard Windows print options for your PC.</p> <p>Note:</p> <ul style="list-style-type: none"> • The PDF icon () indicates that the report is available in PDF format. Click the icon to open the report in a portable document format application. • The spreadsheet icon () indicates that the report is available in spreadsheet format. Click the icon to open the report in a spreadsheet application. See Reports Available in Spreadsheet Format for more information. • The glasses icon () indicates that the report has already been reviewed in a prior session, by you or another user. If your user ID is assigned a Rank of 1, you can click on this icon to display a log indicating who viewed the report: Viewed By: TBROWN on 05/29/2014 10:57:30 • If you already have a separate browser window open to review another report or a form, the system does not open an additional window; instead, the previous form or report is replaced with the recently-selected report. • If you click on a document that has not yet finished generating, the system displays an unexpected error window. When you close this window, the system displays an Are you sure you want to leave this page window; select leave page to return to the Document Management screen. <p>Filter options:</p> <ul style="list-style-type: none"> • to display reports by document name: enter a full or partial document name and click OK. • to display reports regardless of document name: if you have previously entered a full or partial document name, clear the entry and click OK.
Job name	<p>The job that generated the report.</p> <p>Filter options:</p> <ul style="list-style-type: none"> • to display reports by job name: enter a full or partial job name and click OK. • to display reports regardless of job name: if you have previously entered a full or partial job name, clear the entry and click OK.
Output queue	<p>The output queue where the report is saved. The default output queue is QPRINT for some reports and DOCUMENTS for others. See Reports Troubleshooting for more information.</p> <p>Filter options:</p> <ul style="list-style-type: none"> • to display reports for a single output queue: select the output queue from the drop-down list and click OK to display reports in that queue. • to display reports regardless of output queue: if you have previously selected an output queue, clear the selection and click OK.

Field	Description
Pages/File Size	<p>The size of the report file in kilobytes; for example: 10 KB. Any reports generated using a tool other than Oracle Business Intelligence Publisher display the report's length in pages; for example: 10 Page(s).</p> <p>Note: If you advance to the Document Management screen before the job has finished generating the report, the value indicated here might not be correct until the job completes.</p>
Date	<p>The date and time when the report was generated in MM/DD/YY-HH:MM:SS.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display reports generated on or after a specific date: click the calendar icon () , select a date, and then click OK. to display reports generated on the current date: click the calendar icon, select Today from the bottom of the calendar, and click OK. to display reports regardless of the date generated: if you have previously selected a date, clear the date and click OK.
User name	<p>The user ID of the person who generated the report. Your user ID defaults.</p> <p>Submitted through web service request? When you use the CWProcessIn message or the ProcessIn message to start a periodic process, the report is listed under your default user set up during installation. Contact your cloud administrator or system administrator to confirm the user ID of the default user, and see Using the CWProcessIn Message to Start a Periodic Process or Using the ProcessIn REST Message to Start a Periodic Process in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for background.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display reports generated by another user: enter a complete, valid user ID and click OK. to display reports regardless of the user who generated them: clear the current entry in this field and click OK.
Status	<p>The only status currently implemented is READY (the report is ready for review).</p>
Job	<p>A system-assigned identification number to track the job generating the report. When you use the ProcessIn Message or the CWProcessIn Message to start a job with the wait_for_completion tag set to Y, this is the job number returned in the response message.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display reports for a particular job number: enter a valid job number and click OK. to display reports regardless of job number: if you have previously entered a job number, clear the entry and click OK.

Document Management Screen Options

Option	Procedure
Review, and optionally print, a generated report	<p>Click the document icon to open the report in a separate window. From this window, you can print the report using the printers currently available to your local PC.</p> <p>Note: The system keeps a single additional window open for you to review a report or a form. If you already had a report or form open in the additional window, the system replaces the document previously displayed with the report you have just selected. Reopen the additional window to review the recently selected report.</p>
Change which reports are displayed on the screen	
Restrict or expand the list of displayed reports based on one of the available column headings	See the Report Listings and Display Options for information on how to filter the reports displayed based on various criteria.
Refresh data listed on the screen	Click Refresh. Newly generated reports are added to the screen in READY status as they are generated.
Sort by column	Click the column heading name. When you first click, the sort is in ascending alphanumeric (A-Z) or numeric (lowest to highest) order. Click again to change the sort to descending (Z-A) or numeric (highest to lowest) order.
Delete an individual report	Select the checkbox to the left of a report and click Delete.
Display additional information about a report or advance to a different screen	If you advance to a different screen and then return, your filter entries are not retained. For example, if you are currently filtering on a specific queue, and you advance to the Job Management (My Jobs) screen and return, the Queue column no longer filters on that queue.
Display information about Order Administration	Select About.
Advance to the Forms Management Screen screen	Select My Forms.
Advance to the Job Management Screen	Select My Jobs.
Advance to the Advanced Commands screen	Select Advanced Commands. This option is available only for users that have authority to the Advanced Commands option.
Return to the previous screen	Select Exit.

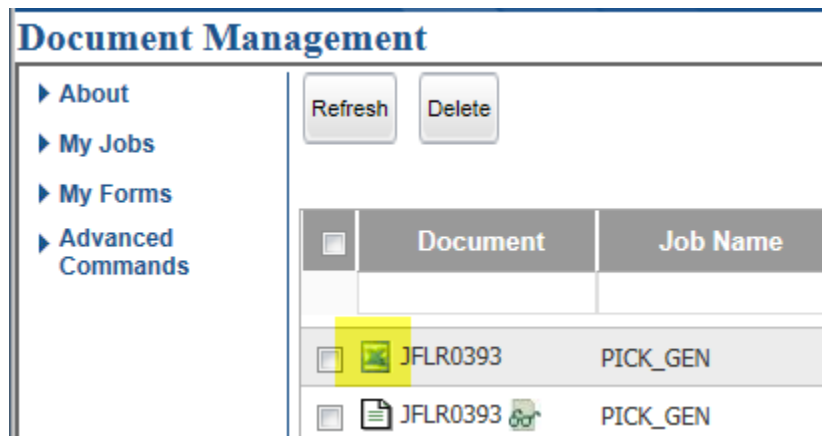

Reports Available in Spreadsheet Format

Purpose: Certain reports are available as spreadsheet files, which you can easily open in a spreadsheet application and then work with the data to suit your business requirements. Reports available in spreadsheet format are:

Report	Fast Path
Item Purchase and Sales Aging Report	LIPS
Item Stock Status Report	MISA
Note: Only the sort by Category \$ Sold Ascending and by Item \$ Sold Ascending are available in spreadsheet format, but you can use your spreadsheet application to sort the data as needed.	
Item Sales Analysis Report	MISS
Note: Only the sort by Item Warehouse is available in spreadsheet format, but you can use your spreadsheet application to sort the data as needed.	
Refund Due List:	MRDU
<ul style="list-style-type: none"> • Refund Due List by Type • Refund Due List by Order # 	
Backorder Report by Descending Dollars by Division/ Warehouse	PBOD
Note: This is the only version of the backorder report by descending dollars that is available in spreadsheet format, but since the data is the same in other versions, you can use your spreadsheet application to sort the data as needed.	
Backorder Report by Item with SKU Details	PBOR
Backorder Report by Warehouse	PBOR
Backorder Report by Warehouse with SKU Details	PBOR

Sales Journal Summary by Order Type	N/A (generated through SLSSMOT periodic function)

Opening the file as a spreadsheet: The spreadsheet icon () next to the report indicates that the report is available in spreadsheet format (such as the FLR0393 report in the image below):

Click the spreadsheet icon to work with the report in your default spreadsheet application. A window opens asking if you would like to open or save the selected file.

Things to note:

- **Formatting:** When you initially open the report in your spreadsheet application, the data might not be formatted to your preferences. For example, certain columns might appear too narrow to display their full contents. Also, alphanumeric fields that can also include numeric values (for example, the item code) might be in cells that are formatted as numeric data. In this situation, changing the cell properties to text can correct the alignment.
- **Decimal and Thousand Separators:** Your spreadsheet application may override any decimal and thousand separator settings for numbers with its own number separators. Change the settings in the spreadsheet application to the separators you wish to use.
- **Totals:** For the most part, totals and subtotals that appear on the PDF version of the report are not included in the spreadsheet file. You can use your spreadsheet application to insert rows for totals or subtotals and perform any required calculations.
- **Blank columns and rows:** Columns and rows that can include data are included in the spreadsheet file, even if there is no relevant information for the column or row in your report results. For example, when a report includes a separate column to flag order lines that have VAT charges, this column is blank in your spreadsheet file if you do not charge VAT in your company.
- **Negative amounts:** For negative amounts and quantities, the minus sign is on the left side in the spreadsheet file (rather than the right side, as it appears in the PDF version) so that your spreadsheet application can correctly render the negative values and include them in calculations.
- **Page breaks and column headings:** Page breaks in the PDF version of the report are not represented in the spreadsheet file as repeated column headings unless they also introduce a new grouping of data. For example, the sales journals are each broken out into separate groupings, such as by invoice date and pay type, so in these reports the column headings repeat for each grouping in the spreadsheet file.
- **Automatic backup of spreadsheet files:** If you leave a spreadsheet file open for a period without saving it, your spreadsheet application may display an error message. This error occurs because the spreadsheet application attempts to back up working files periodically, and the spreadsheet file name includes invalid characters. To avoid seeing this error message, save the spreadsheet file using a logical, valid file name soon after opening it.

- **Deletion of spreadsheet files:** When you remove the report at the Document Management screen, the system deletes the selected spreadsheet file only; when you remove the job at the Job Management screen, the system deletes both the PDF file and the spreadsheet file.

Opening a spreadsheet file for a language other than English: When you use a spreadsheet application such as Microsoft Excel to open a spreadsheet file in a language other than English, the content might not display correctly. To open the file and use language-specific encoding, follow a process such as the following.

Note:

The exact steps vary depending on the spreadsheet application you use and the version of the application.

1. Download and save the CSV file.
2. Open a blank workbook in the spreadsheet application.
3. At the top of the screen, select Data > From Text or Data > Get External Data > From Text.
4. Locate the downloaded file and select Import.
5. In Step 1 of the Text Import wizard, select the Delimited option and in the File origin, select the correct language code. For example, for French, select 65001:Unicode(UTF-8). Click Next.
6. In Step 2, select Comma from the delimiters section. The Text qualifier field should then show a double quote. Click Next.
 - If the wizard prompts for where you want to put the data, click any cell on the blank worksheet to determine where the data should go.
 - If the wizard prompts for a column date format, select General.
 - If the Import Data window prompts for where to import the data, select the Existing worksheet, accept the default entry, and click OK.
7. Click Finish to import the data.

Reports Not Currently Implemented

Order Administration uses an integration with Oracle Business Intelligence Publisher to generate certain forms and reports. As part of the transition to Oracle Business Intelligence Publisher, if a report has not yet been converted to Oracle Business Intelligence Publisher, instead of generating the report the system will generate a generic document with the following information, where REPORT is the name of the generated report:

The requested document is not currently implemented: REPORT

The following reports are not currently implemented.

Report	Fast Path or Function
CPG Item/SKU Exclusions Upload Error Records Report	CPGIXUP periodic function

Report	Fast Path or Function

Reset Audit Log for Quantity Reserved	MRQR
Reset Audit Log for Quantity on Backorder	MRBO
Reset Audit Log for Quantity On Hand	MRIW
Reset Audit Log for SKU Quantities	MRSO
Sales Rep Update Errors Report	SLSUPLD periodic function
Unmatched Email Status Report	EMAILUD periodic function

Reports Troubleshooting

Some possible troubleshooting questions and answers are:

Question	Possible Answer(s)
How is the system determining the date format for dates that display on reports?	<p>Reports and forms generated using Oracle Business Intelligence Publisher display the date in the date format defined in Oracle Business Intelligence Publisher for the locale in the Company table. Since the only locale supported is English, the date format for reports generated using Oracle Business Intelligence Publisher is always MM/DD/YY.</p> <p>Reports and forms that are not generated using Oracle Business Intelligence Publisher, display the date in the date format defined for the company.</p> <p>Note: Reports that are not associated with a company display the date in the date format defined for the DEFAULT_DATE_FORMAT property.</p>
How is the system determining the decimal and thousand separator for numbers that display on reports?	<p>Reports and forms generated using Oracle Business Intelligence Publisher use the number format defined in Oracle Business Intelligence Publisher for the locale in the Company table. Since the only locale supported is English, the decimal separator is always a period (.) and the thousand separator is always a comma (,).</p> <p>Reports and forms that are not generated using Oracle Business Intelligence Publisher display numbers using the characters defined in the DECIMAL_SEPARATOR and THOUSAND_SEPARATOR properties.</p>

Question	Possible Answer(s)
Are reports automatically deleted?	Reports older than the oms.job.purge.retain.days property in Working with Customer Properties (PROP) are deleted, along with the related jobs, when you restart Order Administration.
Why are the outer portions of the page cut off when I print a report?	Make sure that the Page scaling option in the Print dialog box is set to Fit to printer margins or Shrink to fit when printing a form to prevent information on the edge of the page from being cut off.
Why doesn't a new window open when I click the name of a report at the Document Management Screen ?	The system keeps a single additional window open for you to review a form or a report. If you already had a form or report open in the additional window, the system replaces the document previously displayed with the report you have just selected. Reopen the additional window to review the recently selected report.
I removed a job at the Job Management Screen and now I cannot find the report. Why?	Deleting a job automatically deletes the reports generated through that job.
Why wasn't a job deleted when I removed all of its generated reports at the Document Management Screen ?	Deleting all generated reports for a job does not automatically delete the job. Use the Job Management Screen (My Jobs) to delete the job.
How can I find out about the data on a report?	Use the Reports Guide find a description of the report and a report sample.
Why is there a single line of detail information on page two of a report, and then the third page of the report is labelled "Page 2"?	Contact your Order Administration representative if this issue occurs on one of your generated reports.
Why does the Document Management Screen indicate that a report is 1 page long, while the report is actually longer?	If you advance to the Document Management Screen while the report is still being generated, the number of pages indicated at the screen might be incorrect until the job completes.
How can I improve the legibility of reports on the screen?	If some reports are not displayed clearly, you can try setting the Smooth Text option (under Preferences > Page Display in your PDF reader, such as Adobe Acrobat) to For Laptop/LCD screens.

Forms Management (My Forms)

Purpose: Use the Forms Management screen to work with personalized forms generated by Order Administration.

How are forms different from reports? Forms differ from regular reports (available for review through the [Document Management Screen](#)) in that each generated form includes specific information for a single customer, vendor, or order, and is available for distribution to the customer or vendor. For example, each generated pick slip form includes the customer's name and address and details about the items that are

shipping with the pick. Reports are listings that present summary or detail information for use by staff.

PDF files: Each form is generated as a PDF (portable document format) file which you can open in a separate window. Each PDF file can contain one or more individual forms. For example, when you generate pick slips, the system might produce a single PDF file containing all the pick slips generated at that time.

If there are no records eligible for forms when you submit a job, the system generates a blank (empty) PDF file. This might occur if, for example, you generate backorder cards a second time on the same day; in this situation, the first submitted job generated all eligible backorder cards, so the PDF generated the second time is blank.

Graphical or non-graphical? There are standard print programs available for each form. Some forms are available in a graphical format, including field labels and other graphical elements, such as a company logo, as well a simpler, non-graphical format consisting of text only. For example, you might choose a non-graphical format if you use pre-printed forms. The information on the form is the same regardless of whether you use the graphical or non-graphical format.

You can also use a unique print program if you require a form laid out differently from the standard. Contact your Order Administration representative if you need to develop a unique print program for a form.

In this topic:

- [Forms Setup](#)
- [Specify the Maximum Number of Pick Slips Per Spool File](#)
- [Set up Related System Control Values](#)
- [Create Image Files for Company or Entity Logos \(Graphical Forms\)](#)

 - [Forms Management Screen](#)

Forms Setup

Oracle Business Intelligence Publisher (BI Publisher) Forms and Reports Settings

Order Administration uses an integration with Oracle Business Intelligence Publisher to generate certain forms and reports.

In order for the integration to work, you must complete the following setup.

Oracle Business Intelligence Publisher Properties

The following properties are in the [Working with Admin Properties \(CPRP\)](#) menu option.

Property Name	Description
BI_BYPASS_CACHE_ENABLE	Defines whether the system bypasses caching for reports generated using Oracle Business Intelligence Publisher. true = Bypass caching for reports generated using Oracle Business Intelligence Publisher. false = Cache reports generated using Oracle Business Intelligence Publisher.
BI_REST_REPORTS_FOLDER	The location in Oracle Analytics Cloud where Order Administration reports are stored. Should be set to OMSCS/Reports/.
BI_REST_URL	The name of the host where Oracle Business Intelligence Publisher is running. The system uses this property to build the URL for communication with Oracle Business Intelligence Publisher. For example: https://<host>:<port>/xmlpserver/services/rest/reports where: <ul style="list-style-type: none"> • host is the setting in the BI_REST_URL. • port is the setting in the BI_REST_PORT. • xmlpserver/service/rest/reports is the setting in the BI_REST_SERVER_PATH.
BI_REST_PORT	The IP port number where Oracle Business Intelligence Publisher is running. The system uses this property to build the URL for communication with Oracle Business Intelligence Publisher. For example: https://<host>:<port>/xmlpserver/services/rest/reports where: <ul style="list-style-type: none"> • host is the setting in the BI_REST_URL. • port is the setting in the BI_REST_PORT. • xmlpserver/service/rest/reports is the setting in the BI_REST_SERVER_PATH.
BI_REST_SERVER_PATH	The fixed prefix for Oracle Business Intelligence Publisher REST report resource. The system uses this property to build the URL for communication with Oracle Business Intelligence Publisher. For example: https://<host>:<port>/xmlpserver/services/rest/v1/reports where: <ul style="list-style-type: none"> • host is the setting in the BI_REST_URL. • port is the setting in the BI_REST_PORT. • xmlpserver/service/rest/v1/reports is the setting in the BI_REST_SERVER_PATH.
BI_REST_USER	The user ID used to connect to Oracle Business Intelligence Publisher.
BI_REST_PASSWORD	The password for the user ID used to connect to Oracle Business Intelligence Publisher. For security, the system encrypts the password.

Date Format on Reports and Forms

Reports and forms generated using Oracle Business Intelligence Publisher display the date in the date format defined in Oracle Business Intelligence Publisher for the locale in the Company table. Since the only locale supported is English, the date format for reports generated using Oracle Business Intelligence Publisher is always MM/DD/YY.

Reports and forms that are not generated using Oracle Business Intelligence Publisher, display the date in the date format defined for the company.

 **Note:**

Reports that are not associated with a company display the date in the date format defined for the DEFAULT_DATE_FORMAT property.

Decimal and Thousand Separator on Reports and Forms

Reports and forms generated using Oracle Business Intelligence Publisher use the number format defined in Oracle Business Intelligence Publisher for the locale in the Company table. Since the only locale supported is English, the decimal separator is always a period (.) and the thousand separator is always a comma (,).

Reports and forms that are not generated using Oracle Business Intelligence Publisher display numbers using the characters defined in the DECIMAL_SEPARATOR and THOUSAND_SEPARATOR properties.

Specify the Maximum Number of Pick Slips Per Spool File

The PICKS_IN_SPOOL_FILE setting in [Working with Admin Properties \(CPRP\)](#) indicates the maximum number of pick slips in a single PDF document. The system continues to break pick slips into separate PDF documents using the criteria outlined under [Sorting Pick Slips into Separate PDF Documents](#); however, if the number of pick slips in a PDF document reaches the number defined in the PICKS_IN_SPOOL_FILE setting, the system creates a new PDF document.

 **Note:**

The system uses the PICKS_IN_SPOOL_FILE setting when printing pick slips through [Streamlined Pick Slip Generation \(WSPS\)](#) and [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#). Also, the system uses this setting when printing [Gift Acknowledgements](#).

Working with the pick slip form: Once the system finishes processing one pick slip PDF document, you can open and print the pick slips in the document using the [Forms Management Screen](#); you do not have to wait until all of the PDF documents for the pick slip generation run have generated.

When printing pick slips, the system includes a PDF document sort number in the name of the document generated for the pick slip. For example, if the system generates two pick slip PDF documents for warehouse 1, ship via priority 5, the system names the documents PICKG.ALINCOLN.20110804.103001456_001.PDF and PICKG.ALINCOLN.20110804.103001456_002.PDF, where PICKG is the name of the print program, ALINCOLN is the

user ID of the person who generated the pick slips, 20110804.103001456 is the date and time stamp, and 001 and 002 is the PDF document sort number. See [Form Naming Conventions](#) for more information.

Recommended setting: The recommended setting is 250 picks. The system also uses 250 as the default value if this setting is blank in [Working with Customer Properties \(PROP\)](#).

Example: When the PICKS_IN_SPOOL_FILE setting is 600, the system creates the following PDF documents for a pick slip generation run:

- 50 pick slips for warehouse 1, ship via priority 1
(PICKG.ALINCOLN.20110804.103000123_001.PDF)
- 300 pick slips for warehouse 1, ship via priority 5
(PICKG.ALINCOLN.20110804.103001456_001.PDF)
- 510 pick slips for warehouse 1, ship via priority 9
(PICKG.ALINCOLN.20110804.103003789_001.PDF)
- 75 pick slips for warehouse 2, ship via priority 1
(PICKG.ALINCOLN.20110804.103006912_001.PDF)
- 225 pick slips for warehouse 2, ship via priority 5
(PICKG.ALINCOLN.20110804.103007134_001.PDF)
- 25 pick slips for warehouse 2, ship via priority 9
(PICKG.ALINCOLN.20110804.103008112_001.PDF)

When the PICKS_IN_SPOOL_FILE setting is 250, the system creates the following PDF documents for the same pick slip generation run:

- 50 pick slips for warehouse 1, ship via priority 1
(PICKG.ALINCOLN.20110804.103000123_001.PDF)
- 250 pick slips for warehouse 1, ship via priority 5
(PICKG.ALINCOLN.20110804.103001456_001.PDF)
- 50 pick slips for warehouse 1, ship via priority 5
(PICKG.ALINCOLN.20110804.103001456_002.PDF)
- 250 pick slips for warehouse 1, ship via priority 9
(PICKG.ALINCOLN.20110804.103003789_001.PDF)
- 250 pick slips for warehouse 1, ship via priority 9
(PICKG.ALINCOLN.20110804.103003789_002.PDF)
- 10 pick slips for warehouse 1, ship via priority 9
(PICKG.ALINCOLN.20110804.103003789_003.PDF)
- 75 pick slips for warehouse 2, ship via priority 1
(PICKG.ALINCOLN.20110804.103006912_001.PDF)
- 225 pick slips for warehouse 2, ship via priority 5
(PICKG.ALINCOLN.20110804.103007134_001.PDF)
- 25 pick slips for warehouse 2, ship via priority 9
(PICKG.ALINCOLN.20110804.103008112_001.PDF)

Notice that the system creates multiple PDF documents for pick slips in warehouse 1, ship via priority 5 and for pick slips in warehouse 1, ship via priority 9, based on 250 in the PICKS_IN_SPOOL_FILE setting.

Set up Related System Control Values

You need to specify the program name for each form in order to generate the form. See the [Forms Summary Table](#) for a listing of forms and the standard print programs for each.

You can also use a unique print program if you require a form laid out differently from the standard. Contact your Order Administration representative if you need to develop a unique print program for a form.

Create Image Files for Company or Entity Logos (Graphical Forms)

Note:

Important: Company and entity logos on forms are not currently implemented.

If you use a standard graphical print program for a form, you can point to an image of your company logo to include on the form. The image must be in JPG format, and you need to set up a separate image for each form in each company. Optionally, you can set up images at the entity logo instead of the company level, which prints on selected forms. See [Setting Up Company Logos for Forms](#) for configuration instructions.

Forms Properties

The properties assigned to the Forms group in [Working with Customer Properties \(PROP\)](#) control whether certain information prints on certain forms.

For example, these settings control whether to print a barcode on the pick slip. See [Forms Property Settings](#) for more information.

Form Naming Conventions

The system uses the print program, job date and time stamp, and the user ID of the person who generates the forms to name the PDF files.

For example, a file named PURCHORDG.SBROWN.20110214.123456.pdf indicates that the file:

- contains graphical purchase orders (PURCHORDG)
- was generated by the user SBROWN
- was generated on June 30, 2011, at 12:34:56 (20110630.123456)

Additional form naming information: Certain print programs include additional parameters in the naming conventions:

- Backorder notices: File names for backorder notices indicate which notices are included in the file. For example, a file named BOCARDSSECOND.SBROWN.20110214.123456.pdf contains second notices.
- Soldout notices: File names for soldout notifications include the three-letter country code for the sold-to customer's address. For example, a file named SOLDOUTCAN.SBROWN.20110214.123456.pdf contains soldout notifications for sold-to customers who live in Canada.
- Gift Acknowledgements: The system uses the print program, the user ID of the person who started the background jobs, the job date and time stamp, and the document sort number as the name the gift acknowledgement PDF file. For example, a file named GIFTACKG.SBROWN.20110828.163639681_002.pdf indicates this is a gift acknowledgement PDF document generated by user SBROWN on August 28, 2011 and

the document is the second document for a specific gift acknowledgement sort. Note: The user ID of the person who started the background jobs may not be the user ID of the person who generated pick slips or billed the order associated with the gift acknowledgement.

- Order Receipts: The system uses the print program, the order number and ship-to number (separated by a hyphen), the user ID of the person who generated the receipt, and a date and time stamp. For example, a file named ORDERRECG-10204-1.TBROWN.20110506.164303184.pdf indicates that this is an order receipt generated with the [Order Receipt Print Program \(L46\)](#) set to ORDERRECG, for order 10204, ship-to 1, by user TBROWN, on May 6, 2011, at approximately 4:43 p.m.
- Pick slips: The system uses the print program, the user ID of the person who generated pick slips, the job date and time stamp, and the document sort number as the name of the pick slip PDF document. For example, a file named PICKG.TBROWN.20110804.103001456_002.PDF indicates this is a pick slip PDF document generated by user TBROWN on August 4, 2011 and the document is the second document for a specific pick sort, such as pick slips for warehouse 1 and ship via priority 5. See [Sorting Pick Slips into Separate PDF Documents](#) for more information on how the system breaks pick slips into separate pool files. See [Specify the Maximum Number of Pick Slips Per Pool File](#) for more information on how the system determines the maximum number of pick slips in a pool file.

Forms Troubleshooting

Some possible troubleshooting questions and answers are:

Question	Possible Answer(s)
How is the system determining the date format for dates that display on forms?	<p>Reports and forms generated using Oracle Business Intelligence Publisher display the date in the date format defined in Oracle Business Intelligence Publisher for the locale in the Company table. Since the only locale supported is English, the date format for reports generated using Oracle Business Intelligence Publisher is always MM/DD/YY.</p> <p>Reports and forms that are not generated using Oracle Business Intelligence Publisher, display the date in the date format defined for the company.</p> <p>Note: Reports that are not associated with a company display the date in the date format defined for the DEFAULT_DATE_FORMAT property.</p>
How is the system determining the decimal and thousand separator for numbers that display on forms?	<p>Reports and forms generated using Oracle Business Intelligence Publisher use the number format defined in Oracle Business Intelligence Publisher for the locale in the Company table. Since the only locale supported is English, the decimal separator is always a period (.) and the thousand separator is always a comma (,).</p> <p>Reports and forms that are not generated using Oracle Business Intelligence Publisher display numbers using the characters defined in the DECIMAL_SEPARATOR and THOUSAND_SEPARATOR properties.</p>

Question	Possible Answer(s)
Why is the system generating a blank (empty) PDF file?	If there are no records eligible for forms when you submit a job, the system generates a blank (empty) PDF file. This might occur if, for example, you generate backorder cards a second time on the same day; in this situation, the first submitted job generated all eligible backorder cards so the PDF generated the second time is blank.
Are forms automatically deleted?	Forms older than the <code>oms.job.purge.retain.days</code> property in Working with Admin Properties (CPRP) are deleted when you restart Order Administration.
Why are the outer portions of the page cut off when I print a form?	<ul style="list-style-type: none"> Set the page magnification to 100%. You can change the page magnification by clicking the arrow next to the Zoom percent or by selecting View > Zoom To. When you select to print, make sure that the Page scaling option in the Print window is set to None. <p>All other forms: Make sure that the Page scaling option in the Print dialog box is set to Fit to printer margins when printing a form to prevent information on the edge of the page from being cut off.</p>
Why isn't the company logo printing on the form?	Confirm that the image has been set up using the correct size, file name, and location, as described under Create Image Files for Company or Entity Logos (Graphical Forms) . Also, if you have specified to print the entity logo rather than the company logo, then you must create and name an entity logo for each entity in order for any logo to print on a graphical form that uses the logo. See Setting Up Company Logos for Forms for more information.
How can I verify where the data on the form is coming from?	The data comes from the related files for the customer, order, vendor, or bill-to account.
Why doesn't a new window open when I click the name of a form at the Forms Management Screen ?	The system keeps a single additional window open for you to review a form or a report. If you already had a form or report open in the additional window, the system replaces the document previously displayed with the form you have just selected. Reopen the additional window to review the recently selected form.

Forms Summary Table

You use a system control value to indicate the print program to use for each form type. For each form type, the following table lists each of these system control values and the standard print program(s), and provides links to form samples and descriptions.

Form	System Control Value	Standard Print Program(s)	Form Description and Sample(s)
Backorder Cards	Backorder Card Print Program (D04)	BOCARDS	Backorder Card
Customer Invoices	Order Receipt Print Program (L46)	ORDERRECG (graphical)	Order Receipt
Drop Ship Documents	Drop Ship Pick Print Program (E92)	PICKG (graphical)	Drop Ship Pick Slip/Invoice

Form	System Control Value	Standard Print Program(s)	Form Description and Sample(s)
Gift Acknowledgements	Gift Order Acknowledgement Print Program (B90)	GIFTACKG (graphical)	Gift Acknowledgement
Order Receipt	Order Receipt Print Program (L46)	ORDERRECG (graphical)	Order Receipt
Pick Documents	Pick Printing Program (C37)	PICKG or PICKDBG (graphical)	Pick Slip
Purchase Orders	PO Print Program (C64) and PO Print Program for PO Print in PO Sequence (C76)	PURCHORDG (graphical)	Purchase Order
Refund Checks	Refund Check Print Program (D23)	REFCHECK (non-graphical) REFCHECKG (graphical)	Refund Check
Soldout Notices	Soldout Notification Print Program (E75)	SOLDOUT	Soldout Notification Card
Quotes	Quote Printing Program (K73)	QUOTE (graphical) QUOTE (non-graphical)	Quote Form

Forms Management Screen

How to display this screen: Click the My Forms icon ( in the upper right area of a screen), or select My Forms from an Admin screen (such as the About Application, [Document Management Screen](#), [Job Management Screen](#), Commands, User Control, or System Messages screens)

Information on this screen:

- Form: Click the document icon next to the form to open the form in a separate window. From this window, you can review and print the form, using the standard Windows print options for your PC. Once someone has viewed the form, or the form was automatically sent to a printer, the screen displays an eyeglass icon () next to the form name. If you click on this icon, the system displays a log indicating who viewed the report: Viewed By: TBROWN on 11/29/2015 10:57:30

Note:

If you already have a separate browser window open to review another form or a report, the system does not open an additional window; instead, the previous form or report is replaced with the recently-selected form.

For more information: See [Form Naming Conventions](#) for additional information on form names.

If no forms display on the screen: Forms older than the `oms.job.purge.retain.days` property in [Working with Admin Properties \(CPRP\)](#) are deleted when you restart Order Administration.

Form Listings and Display Options

Default settings for forms available for review: When you first advance to this screen, up to 200 forms submitted by your user ID are currently available for review by scrolling up or down with the right-hand scroll bar. The forms are listed in reverse chronological order (newest to oldest). A message displays if more than 200 records are available for review: The maximum number of records was exceeded. Please refine search criteria. Showing records 1-200.

Available forms updated when you filter: When you enter or select any search criteria and then click OK, the screen displays up to 200 forms that match these criteria.

Example: The screen currently includes 200 forms available for review in reverse chronological order (newest to oldest): 180 of these forms are in the Pick Documents folder, and 20 are in the Drop Ship Documents folder. When you select Pick Documents from the Output folder field and click Filter, the screen displays up to 200 forms in the Pick Documents folder.

Available forms restricted by Rank and All job authority:

- If the All job authority option is selected for your user control record, you can review all jobs, regardless of ranking.
- If the All job authority option is not selected for your user control record, you can review forms generated by other users only if their user control Rank does not exceed yours.

Example:

Users JJONES has a Rank of 9, with All job authority selected.

User TBROWN has a Rank of 9, with All job authority unselected.

User BWILLIAMS has a Rank of 1, with All job authority selected.

Result:

- JJONES can review forms generated by WBLAKE because their Rank is the same; however, JKEATS cannot review forms generated by RBROWNING, because a Rank of 1 exceeds a Rank of 9.
- TBROWN cannot review forms generated by any other users, because he does not have All job authority.
- BWILLIAMS can review forms generated by all other users based on his Rank and All job authority.

Note:

Different rules control the authority to view forms and reports than the rules that affect the [Job Management Screen](#). The user's Rank does not affect authority to view jobs.

Column sort: You can sort on any column by clicking the column heading name. When you first click, the sort is in ascending alphanumeric (A-Z) or numeric (lowest to highest) order. Click again to change the sort to descending (Z-A) or numeric (highest to lowest) order.

Field	Description
Form	<p>The name of the file containing the form. See Form Naming Conventions for a discussion.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display forms based on form name: enter a full or partial form name and click OK. to display forms regardless of name: if you have previously entered a form name, clear the entry and click OK.
File size	The size, in bytes, of the PDF file containing the form. Display-only.
Date	<p>The date and time when the form was generated.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display forms generated on or after a specific date: click the calendar icon () , select a date, and then click OK. to display forms generated on the current date: click the calendar icon, select Today from the bottom of the calendar, and click OK. to display forms regardless of the date generated: if you have previously selected a date, clear the date and click OK.
User name	<p>The user ID of the person who generated the form. Your user ID defaults.</p> <p>Submitted through web service request? When you use the CWProcessIn message or the ProcessIn message to start a periodic process, the form is listed under the default user set up during installation. Contact your cloud administrator or system administrator to confirm the user ID of the default user, and see Using the CWProcessIn Message to Start a Periodic Process or Using the ProcessIn REST Message to Start a Periodic Process for background.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display forms generated by another user: enter a complete, valid user ID and click OK. to display forms regardless of the user who generated them: clear the current entry in this field and click OK.

Form Management Screen Options

Option	Procedure
Review, and optionally print, a generated form	Click the document icon next to the file name to open the form in a separate window. From this window, you can print the form using the standard Windows options and printers currently available to your local PC. Note: The system keeps a single additional window open for you to review a form or a report. If you already had a form or report open in the additional window, the system replaces the document previously displayed with the form you have just selected. Reopen the additional window to review the recently selected form.
Change which forms are displayed on the screen	
Restrict or expand the list of displayed forms based on one of the available column headings	See the Form Listings and Display Options for information on how to filter the forms displayed based on various criteria.
Refresh data listed on the screen	Click Refresh. Newly generated forms are added to the screen as they are generated.
Sort by column	Click the column heading name. When you first click, the sort is in ascending alphanumeric (A-Z) or numeric (lowest to highest) order. Click again to change the sort to descending (Z-A) or numeric (highest to lowest) order.
Delete an individual form	Select the checkbox to the left of a form and click Delete.
Display additional information about a form or advance to a different screen	If you advance to a different screen and then return, your filter entries are not retained. For example, if you are currently filtering on a specific output folder, and you advance to the Job Management (My Jobs) screen and return, the Output folder column no longer filters on that folder.
Display information about Order Administration	Select About.
Advance to the Document Management Screen screen	Select My Docs.
Advance to the Job Management Screen	Select My Jobs.
Advance to the Advanced Commands screen	Select Advanced commands. This option is available only for users that have authority to the Advanced Commands option.
Return to the previous screen	Select Exit.

Job Management (My Jobs)

Purpose: Use the Job Management screen to work with submitted jobs that have been processed, are currently processing, or are waiting to be processed. The jobs listed at this screen include each interactive session for the user.

This topic also discusses options you can use to review the jobs currently running and correct a job's status if it is inconsistent.

In this topic:

- [Job Management Screen](#)
- [Job Management Screen Options](#)
- [Jobs Troubleshooting](#)

For more information: See:

- [Display Active Batch Jobs \(DABJ\)](#)
- [Which Jobs are Active Batch Jobs?](#)
- [If a Batch Job is not on the Display Active Batch Jobs Screen](#)
- [Display Active Batch Jobs Screen](#)
- [Display Job History \(DJHY\)](#)
- [Display Job History Screen](#)

Job Management Screen

How to display this screen: Click the My Jobs icon () in the upper right area of a screen), or select My Jobs from an Admin screen (such as the About Application, [Forms Management Screen](#), [Document Management Screen](#), Commands, User Control, or System Messages screens). When you advance to the screen this way, it displays all jobs generated through your user ID. See the field descriptions and screen options below for information on how to filter the jobs listed on this screen.

Column sort: You can sort on any column by clicking the column heading name. When you first click, the sort is in ascending alphanumeric (A-Z) or numeric (lowest to highest) order. Click again to change the sort to descending (Z-A) or numeric (highest to lowest) order.

Information on this screen:

Field	Description
Output Queue	<p>Provides the option for you to switch the job queue where one or more jobs should run.</p> <p>The system-delivered job queues are:</p> <ul style="list-style-type: none"> • QBATCH (default) = The default job queue for most submitted jobs, such as reports and batch updates and processing. Processes one job at a time (single-threaded queue). • QSYSNOMAX = The default job queue for Generating Membership Orders (EGMO) and jobs submitted through Working with Integration Layer Processes (IJCT). Can process multiple jobs at the same time (multi-threaded queue). • oms.job.queue.interactive = The job queue where interactive user sessions run. This job queue processes multiple jobs at the same time. • ASYNC = The job queue where background processes, submitted through Using the ASYNC Jobs (MBJC), run. Can process multiple jobs at the same time. • ECOMMERCE = The job queue where the ECOMM_CANC job and the ORDER_EDIT job (generated through the ORDER_IN job in Working with Integration Layer Processes (IJCT)) run automatically. Can process multiple jobs at the same time. • PICKGEN = The default job queue for Streamlined Pick Slip Generation (WSPS), Reprocess Authorizations Screen (RPAA), and Processing Auto Deposits (SDEP). Processes one job at a time. • AUTODEP = The default job queue for deposit processing. Processes one job at a time.
<- Route Job	<p>Use this button to route a job to the queue selected in the Queue field, described above:</p> <ul style="list-style-type: none"> • Select one or more jobs from the Job listings area, below. • Select a queue from the Output Queue field. • Click this button to move the job to the selected queue. <p>You can select a different route only if the job has not yet started to run (RDY status).</p>

Field	Description
Job Listings	<p>Default settings for jobs available for review: When you first advance to this screen, up to 200 jobs submitted by your user ID are currently available for review by scrolling up or down with the right-hand scroll bar. The jobs are listed in reverse chronological order (newest to oldest). A message displays if more than 200 jobs are available for review: The maximum number of records was exceeded. Please refine search criteria. Showing records 1-200.</p> <p>Available jobs updated when you filter: When you enter or select any search criteria and then click Filter, the screen displays up to 200 jobs that match these criteria.</p> <p>Example: The screen currently includes 200 jobs available for review in reverse chronological order (newest to oldest): 180 of these jobs run in QBATCH, and 20 run in ASYNC. When you select QBATCH from the Queue field and click OK, the screen displays up to 200 jobs that run in QBATCH.</p> <p>Available jobs restricted: If your user control record does not have All job authority selected, you cannot review jobs submitted by other users.</p> <p>Example: If you do not have All job authority, when you filter on a Job name of PICK_GEN, pick slip generation jobs submitted by other users are not displayed.</p>
Action	<p>An arrow in this field indicates an action can be performed against the job.</p> <p>Valid actions are:</p> <ul style="list-style-type: none"> • Hold = Available if the job's status is Ready. • Release = Available if the job's status is Hold. • End = Available if the job's status is Message. • Delete = Available if the job's status is Ready, Hold, Finished, Error, or End. If you attempt to delete a job that is actually running, the screen displays an error message. <p>See the Job Management Screen Options.</p>

Field	Description
User name	<p>The user name of the person who submitted the job, or who is using an interactive session. Defaults to your user ID.</p> <p>Submitted through web service request? When you use the CWProcessIn message or the ProcessIn message to start a periodic process, if the message did not indicate to wait for completion, the job is listed under the default user set up during installation; otherwise, if the message indicated to wait for completion, the job is not listed on this screen.</p> <p>Contact your cloud administrator or system administrator to confirm the user ID of the default user, and see Using the CWProcessIn Message to Start a Periodic Process or Using the ProcessIn REST Message to Start a Periodic Process for background. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Filter options: The following options are available only for users whose All Job Authority setting is selected:</p> <ul style="list-style-type: none"> to display jobs submitted by another user: enter a complete, valid user ID and click OK. to display jobs regardless of the user who submitted them: clear the current entry in this field and click OK. <p>See the Administration guide for more information on setting up users.</p>
Job name	<p>A code identifying the job. The job name for an interactive session has a name starting with QPADEV (for example, QPADEV0B9A). Defaults to blank.</p> <p>Note: The reports icon () indicates that the job has generated one or more reports. Once the job status is Finished, select the icon to advance to the Document Management (My Docs) screen, where you can review the reports generated by that job.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display jobs based on job name: enter a full or partial job name and click OK. to display jobs regardless of name: if you have previously entered a job name, clear the entry and click OK. <p>No report? If there was no information matching the selection criteria for the report, the system may not generate a blank report; instead, you see the reports icon () indicating that a report is available, but when you advance to the Document Management (My Docs) screen, there is no report available to review.</p>
Job	<p>A system-assigned identification number to track the job. Defaults to blank.</p>

Field	Description
Status	<p>The current status of the job. Defaults to all jobs regardless of status. Possible statuses are:</p> <ul style="list-style-type: none"> • blank (default) = Select this option to display all jobs regardless of status. • Ready = The job is currently waiting in the indicated job queue for processing because another job is currently active in that job queue, and the queue is single-threaded (processes only one job at a time). Optionally, you can expedite processing by routing the job to a different job queue that does not currently have a job running, or that is multi-threaded: Select the job, select the Output Queue at the top of the screen, and click <- Route Job. • Held = The job is held. Optionally, you can release the job by selecting the Action checkbox to the left of the job and selecting Release. • Run = The job is currently running normally. It is not possible to hold the job or change its job queue. • Finished = The job has finished running normally. If there is a reports icon () next to the job, you can click the icon to advance to the Document Management Screen and review or print the generated reports. Note: Generated forms (such as pick slips, purchase orders, or checks) are available at the Forms Management (My Forms) screen, not the Document Management (My Docs) screen. • Message = Possible explanations: <ul style="list-style-type: none"> • Order Administration has written a message to a log file, and the job cannot continue processing. • Someone restarted Order Administration while the job was active. In this situation, you should end the job at the Job Management screen and then start it again the usual way. • Occasionally, the async jobs go into Message status even though they are continuing to process records. See Troubleshooting the Async Jobs for more information. • End = Someone has manually ended a job whose status was Run, but was not running normally (perhaps because the server rebooted while the job was running). In this case, use the JOBCLN periodic function. See Using the JOBCLN Function to Resolve Job Status Across Servers for more information. • Error = Someone has manually ended a job that was not running normally. <p>Integration layer jobs</p> <p>Jobs you start through the Working with Integration Layer Processes (IJCT) option might not display the current, correct status if they receive inbound messages and have not yet received any messages to process.</p>

Field	Description
	<p>Async jobs</p> <p>When the async jobs in the Background Job Control (MBJC) menu option are active, the system periodically checks the status of each async job, and changes the status to Run, if necessary. For example, if the ORDR_ASYNC job is active and you end it at this screen, the system automatically changes the status of the job back to Run. To start or stop the async jobs, use the Background Job Control (MBJC) menu option. See Working with the CNTL_ASYNC Job.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display jobs by status: select a status from the drop-down list and click OK. to display jobs regardless of status: if you have previously selected a status, clear the entry and click OK.
Started	<p>The date and time when the job started. Defaults to blank. NONE indicates the job has not yet finished (the status is Ready, Hold, or Run).</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display jobs started on or after a specific date: click the calendar icon () , select a date, and then click OK. to display jobs started on the current date: click the calendar icon, select Today from the bottom of the calendar, and click OK. to display jobs regardless of start date: if you have previously selected a date, clear the date and click OK.
Ended	<p>The date and time when the job finished. Defaults to blank. NONE indicates the job has not yet finished (the status is Ready, Hold, or Run).</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display jobs ended on or before a specific date: click the calendar icon () , select a date, and then click OK. to display jobs ended on the current date: click the calendar icon, select Today from the bottom of the calendar, and click OK. to display jobs regardless of end date: if you have previously selected a date, clear the date and click OK.
Runtime	<p>The amount of time, in seconds, that the job took to run. Set to 0 if the job has not yet completed. Display-only.</p>
Output Queue	<p>The job queue where the job will run, is running, or ran. Defaults to blank. See the Output Queue field above for a listing of system-delivered queues.</p> <p>Filter options:</p> <ul style="list-style-type: none"> to display jobs by queue: select a queue from the drop-down list and click OK. to display jobs regardless of queue: if you have previously selected a queue, clear the queue and click OK.
Log	<p>A link to a brief log file for the job; available if the job has finished running and your user ID is assigned to Rank 1. This log provides just a list of the programs called in order to complete the job. See Logs for additional logs you can use for troubleshooting.</p>

Job Management Screen Options

Option	Procedure
Restrict or expand the list of displayed jobs based on one of the available column headings	See the Job Listings for information on how to filter the jobs displayed based on various criteria.
Refresh data listed on the screen	Click Refresh. Newly submitted jobs are added to the screen in RDY status as they are submitted, and the status of existing jobs is updated.
Sort by column	Click the column heading name. When you first click, the sort is in ascending alphanumeric (A-Z) or numeric (lowest to highest) order. Click again to change the sort to descending (Z-A) or numeric (highest to lowest) order.
Change a job's status or queue	
Hold a job	If the job has not yet processed (its status is Ready), you can hold it by selecting Hold in the Action field for the job.
Release a job	If the job is currently held (its status is Hold), you can release it by selecting Release in the Action field for the job.
End a job that is currently running	<p>If the job's status is Message, you can end the job by selecting End in the Action field for the job.</p> <p>A window opens if you have selected to end an active job: Warning! You have chosen to end one or more active jobs. PRESS OK TO END JOB, or PRESS CANCEL TO LEAVE JOB RUNNING. At this window, select OK to end the job and update its status to End.</p> <p>If a job is currently running but you suspect that the job is not running normally, use the JOBCLN periodic function. See Using the JOBCLN Function to Resolve Job Status Across Servers for more information.</p> <p>Note: Sometimes when you select to end a job, the job does not end and remains running. In this case, you can use the JOBCLN periodic function.</p>
Delete an individual job	<p>If the job's status is Ready, Hold, Finished, Error, or End, and is not actually running, you can delete the job by selecting Delete in the Action field for the job.</p> <p>Note: Deleting a job also automatically deletes all generated reports for that job that would also be available under the Document Management (My Docs) screen; however, it does not delete forms that are available at the Forms Management (My Forms) screen.</p>

Option	Procedure
Delete selected jobs	<p>Select the check box to the left of each job you wish to delete and select Delete at the top of the screen.</p> <p>Note:</p> <ul style="list-style-type: none"> You can delete a job only if its status is Ready, Hold, Finished, Error, or End and it is not actually running. Do not select delete for a job that is currently running. If you attempt to delete any jobs that are currently running, the screen displays an error message. Deleting a job also automatically deletes all generated reports for that job that would also be available under the Document Management (My Docs) screen; however, it does not delete forms that are available at the Forms Management (My Forms) screen.
Route one or more jobs to a different queue	<p>If the job is currently ready for processing (its status is Ready) or is hold (its status is Hold) you can route it to a different queue by:</p> <ul style="list-style-type: none"> Selecting the checkbox to the left of the job. Selecting a different queue from the Output Queue drop-down list at the top of the screen. Selecting <- Route Job at the top of the screen. <p>Why route? You might want to route a job to a different queue to expedite processing (for example, if another job is currently running in the job's default queue, and the queue is single-threaded, meaning that only one job at a time can run in that queue at a time).</p>
Display additional information about a job or advance to a different screen	<p>Note: If you advance to a different screen and then return, your filter entries are not retained. For example, if you are currently filtering on a specific queue, and you advance to the Document Management (My Docs) screen and return, the Queue column no longer filters on that queue.</p>
Review the log for a job	<p>Click Log file for a job to display its log.</p> <p>Note: A User Rank of 1 is required in order for the user to display the contents in log contents, including the logs written for the user's own submitted jobs. Otherwise, the window displays a message: Not Available.</p>

Option	Procedure
Display the server where a user is logged in, or display the command used to execute a job	<p>Move your cursor over the Action icon to the left of the job entry. The Command field displays:</p> <ul style="list-style-type: none"> User interactive sessions: the name and IP address of the server where the user is logged in. For example, a Command of OMS-srv/123.456.789.123 indicates that the user is logged into Order Administration on the OMS-srv server, which has an IP address of 123.456.789.123. Batch or submitted jobs: the command executed for the job, such as CALL PGM(flr2012) PARM(' ' x'003F' x'00055F' 'N').
Review, and optionally print, reports generated by a job	<p>Click the reports icon  next to a job to advance to the Document Management Screen, where the reports generated by the selected job are listed. From this screen, you can print the report using the printers currently available to your local PC.</p> <p>Note: Forms, such as pick slips, purchase orders, or checks, are available from the Forms Management Screen rather than the Document Management Screen.</p>
Display information about Order Administration	Select About.
Advance to the Forms Management Screen	Select My Forms.
Advance to the Document Management Screen	Select My Docs.
Advance to the Advanced Commands screen.	Select Advanced commands. This option is available only for users that have authority to the Advanced Commands option.
Return to the previous Order Administration screen	Select Exit.

Jobs Troubleshooting

Question	Possible Answer(s)
Why are the background async jobs not starting correctly?	See Troubleshooting the Async Jobs .

Question	Possible Answer(s)
Why can't I change the status of an async job?	When the async jobs in the Background Job Control (MBC) menu option are active, the system periodically checks the status of each async job, and changes the status to RUN, if necessary. For example, if the ORDR_ASYNC job is active and you end it at this screen, the system automatically changes the status of the job back to RUN. To start or stop the async jobs, use the Background Job Control (MBC) menu option. See Working with the CNTL_ASYNC Job . Also, to correct jobs whose statuses are incorrect, use the JOBCLN periodic function. See Using the JOBCLN Function to Resolve Job Status Across Servers for more information.
Why do I receive the error Function key not allowed when I press F5 to refresh the Job Management screen?	To refresh the Job Management screen, click Refresh.
Why does a submitted job go into Message status?	<p>Typically, this occurs because someone has stopped and restarted Order Administration. In this case, use the JOBCLN periodic function to resolve. If this is not the reason, check the following logs to determine other possible reasons, looking for messages that were written to the log at the time when the job went into Message status. For example, an error such as <code>out of memory</code>, <code>program not found</code>, or <code>null pointer</code> might help you determine the cause of the problem. The jobs and the activities they track are:</p> <ul style="list-style-type: none"> • CWDirect Log: General application processing. • MQ Log: XML and transactional message processing and message contents. • Application Log: Order Administration application processing. • Response Log: Jobs that require user intervention in order to proceed, such as authorizations and deposits, and stored value card activations, balance inquiries and authorization reversals. • Trace Log: Internal activity related to Order Administration application processing. • Manifest Log: Manifest processing.
Are job entries automatically deleted?	<p>To Reset the Job Status Use the Display Active Batch Jobs Screen to determine if the job is actively running. To fix: If the job status is inconsistent, run the JOBCLN periodic function. See Using the JOBCLN Function to Resolve Job Status Across Servers for more information.</p> <p>Jobs older than the <code>oms.job.purge.retain.days</code> property in Working with Admin Properties (CPRP) are deleted when you restart Order Administration.</p>

Question	Possible Answer(s)
How can I delete a job if it's not actually running, regardless of the displayed status?	If the screen displays an error message when you attempt to delete a job, but the job is not actually running, use the JOBCLN function, as described above.
After I deleted all of the documents for a submitted job, why does the job remain on the My Jobs screen?	Deleting all of the output for a submitted job does not delete the submitted job. You need to use the Remove option to remove the job. Note: You should remove a submitted job if it is in finished (FIN) status. Evaluate the status of a job that is in an error (ERR) or message (MSG) status before removing it.
Does deleting a job entry delete its associated documents?	Deleting a job entry automatically deletes all generated reports for that job that would also be available under the Document Management (My Docs) screen; however, it does not delete forms that are available at the Forms Management (My Forms) screen.
How can I review all of the jobs for a particular job queue?	On the Job Management screen, clear the User Name field, select the job queue from the Queue drop down box and click Filter. Note: This option is available only if you have the required authority based on your user control record. Contact your Order Administration representative if you need information on configuring user control records.
Why can't I see jobs submitted by all users?	If your user control record does not have All job authority selected, you cannot review jobs submitted by other users. Contact your Order Administration representative if you need information on configuring user control records.
Can I choose the job queue the system uses to process a job?	When a job is first submitted to the job queue, the system automatically chooses which job queue to use to process the job, based on the type of job submitted. However, if the job has not yet processed (its status is Ready), you can route it to a different job queue by: <ul style="list-style-type: none"> • Selecting the checkbox to the left of the job. • Selecting the job queue from the drop-down box next to the <- Route Job button. • Selecting Route Job. This option is useful if, for example, a large job is currently active in QBATCH, and you would like to run a report job in a separate job queue so it will process quickly.

Question	Possible Answer(s)
How can I review and query batch jobs that have run?	<p data-bbox="808 275 1062 302">Reviewing Job History</p> <p data-bbox="808 310 1370 426">The Display Job History (DJHY) screen displays the Job History table. You can review the data and search by server, date range, job queue, and/or job name.</p> <p data-bbox="808 434 1378 606">The Job History table in the Order Administration database lists batch jobs that have run, including batch jobs that have been removed from the Job Management Screen. These records remain in this table up to the specified purge days.</p> <p data-bbox="808 615 1110 642">The fields in this table are:</p> <ul data-bbox="808 651 1385 1171" style="list-style-type: none"><li data-bbox="808 651 1321 709">• Job #: The system-assigned identification number to track the job.<li data-bbox="808 718 1305 772">• Job Name: The name of the job, such as PICK_OUT or BILL_ASYNC.<li data-bbox="808 781 1305 808">• Start Date: The date the job was started.<li data-bbox="808 816 1317 844">• Start Time: The time the job was started.<li data-bbox="808 852 1370 907">• End Date: The date the job finished. Set to 0 if the job did not end.<li data-bbox="808 915 1370 970">• End Time: The time the job finished. Set to 0 if the job did not end.<li data-bbox="808 978 1370 1033">• Submitted By: The user ID of the person who submitted the job.<li data-bbox="808 1041 1370 1096">• Job Queue: The job queue where the job ran, such as QSYSNOMAX or ASYNC.<li data-bbox="808 1104 1370 1171">• Server: The name and IP address of the Order Administration application server where the job ran. <p data-bbox="808 1180 1273 1207">Purging Records in the Job History Table</p> <p data-bbox="808 1215 1370 1388">The JOB_HISTORY_PURGE_DAYS setting in Working with Admin Properties (CPRP) defines how long to retain a batch job in the Job History table before the system purges it automatically based on the job's End date. The default setting is 30 days.</p> <p data-bbox="808 1396 1370 1539">The system submits the Job History purge process each time you start the application server. Job History records that do not have an End Date (indicating the job did not end) are not purged.</p>
Why can't I see the contents of the log for a job I submitted?	<p data-bbox="808 1556 1370 1667">A User Rank of 1 is required in order to display the contents in the Log column, including the logs written for your own submitted jobs. Otherwise, the window displays a message: Not Available.</p>

Accounting Setup

- [Setting Up the Accounting Tables](#)

Setting Up the Accounting Tables

This part describes how to access the accounting tables, how to create and maintain records within the tables, and how to change, delete or display the records within the tables.

- [Working with Entities \(WENT\)](#) describes creating, changing, deleting, and displaying entity codes.
- [Working with Divisions \(WDIV\)](#) tells you how to create, change, delete, and display divisions, how to assign a division to an entity, and how to display divisional history (summary statistics of a division's sales performance).
- [Working with Pay Types \(WPAY\)](#) explains how to create, change, delete, and display cash/check or stored value card (gift card) pay types. This topic also includes information about specifying the financial conditions under which an order will go on hold and describing the characteristics of the stored value cards you honor (for example, length of card number, leading digits, authorization and deposit services).
- [Working with Banks \(WBNK\)](#) discusses how to create, change, delete, and display bank information including bank codes and their descriptions and the transit number associated with a bank.
- [Working with Accounting Periods \(WACP\)](#) explains how to create, change, delete, display and close accounting period information including specifying year, start date, and end date for the period.
- [Working with Currency \(WCUR\)](#) includes how to create, change, delete, and display currency information.
- [Working with Sales Representatives \(WSLS\)](#) describes how to create, change, delete, and display sales representative information. This topic includes information about your sales representatives, the center to which they are assigned, and their commission and bonus structure.
- [Salesman Associate Upload](#) describes how to upload salesman information from an external system to create or update records the Salesman table.

Establishing Customer Service Tables

Topics in this part: The following topics describe how to create and maintain customer support tables that work in conjunction with Order Entry, Order Maintenance, and other Customer Service functions.

- [Establishing Order Types \(WOTY\)](#) presents the screens you work with to create and maintain order types required for Order Entry.
- [Establishing Price Override Reason Codes \(WPOR\)](#) presents the screens you work with to create and maintain price override reason codes needed for entering item prices at no charge and for overriding prices in Order Entry and Order Maintenance.
- [Establishing Additional Charge Codes \(WADC\)](#) describes how to create and maintain codes that let you add additional charges or credits to an order.
- [Establishing Order Hold Reason Codes \(WOHR\)](#) describes how to create and maintain user-defined reason codes that you apply when you want to place an order on hold.
- [Establishing Cancel Reason Codes \(WCNR\)](#) describes the screens you work with to create and maintain reason codes for canceling items from an order.
- [Establishing Return Reason Codes \(WRTR\)](#) describes the screens you work with to create and maintain reason codes for returning items.

- [Establishing Exchange Reason Codes \(WEXR\)](#) describes the screens you work with to create and maintain reason codes for exchanging items.
- [Establishing Return Disposition Values \(WRDV\)](#) describes the screens you work with to establish codes that you use to direct returned merchandise to the warehouses and warehouse locations that you have designated to receive returns.
- [Establishing Custom Special Handling Formats \(WSHF\)](#) describes the screens you work with to design the format of the special handling screen that you use in Order Entry.
- [Establishing Add Reason Codes \(WADR\)](#) describes the screens you work with to establish codes for tracking the reasons for adding items to orders in Order Maintenance.
- [Working with Order Inquiry Reason Codes \(WORC\)](#) describes the screens you use to create and maintain reason codes for advancing to order inquiry or order maintenance from the CTI Customer Selection screen.
- [Working with Order/Call Disposition Reject Reason Codes \(WWRR\)](#) describes the screens you work with to create or maintain order and call disposition reject reason codes.
- [Working with Default Messages \(WMSG\)](#) describes the screens you use to create and maintain default messages, used to default message text to an order message or order line message on an order.
- [Working with Order Line Activity Codes \(WOLA\)](#) describes the screens you use to create and maintain order line activity codes.

Setting Up Customer Support Tables

The following topics describe how to create and maintain tables that support Order Entry and Customer Service activities:

- [Setting Up the Country Table \(WCTY\)](#) describes the screens you use to create, change, delete, and display country codes.
- [Setting Up the Zip/City/State \(Postal Code\) Table \(WZIP\)](#) describes the screens you work with to create tables that support address and tax information associated with postal and zip codes.
- [Setting Up Customer Profiles \(WPFL\)](#) describes the screens you use to define demographics categories and their data options for profiling your customer base.
- [Setting Up the Customer Class Table \(WCCL\)](#) describes the Work with Customer Class screens you use to establish codes to group customers for reporting and other purposes.
- [Setting Up Match Codes \(MMCH\)](#) describes how to view or change the match code structure.
- [Setting Up User-Defined Fields \(WUDF\)](#) describes how you can “design” a screen with user-defined numeric, text or date fields, which you can link to another table (such as the Customer table).
- [Working with Postal Code Formats \(WPCF\)](#) describes how to define the formats of zip and postal codes, so that they will print correctly on pick slips and gift acknowledgments.
- [Working with Mail/Call Codes \(WMCC\)](#) describes how to create codes that define when and under what circumstances you call or send mail to your customers.

- [Working with Customer Action Reason Codes \(WCAR\)](#) describes how to create codes that allow you to define and track the types of issues your customers raise.
- [Working with Customer Note Types \(WNTY\)](#) describes how to create codes that allow you to flag certain types of customer notes to appear automatically in order entry, or define text to default into the note field.
- [Working with Language Codes \(WLAN\)](#) describes the screens you use to create, change and delete language codes.

Creating and Updating Customers

Topics in this part: The following topics describe how to create and maintain customer information on the system through the Customer Maintenance module:

- [Understanding Customer Types](#) describes the three types of customers you work with throughout the Customer Maintenance module.
- [Selecting Customers](#) explains how to use the Customer Maintenance Selection Screen to search for existing customer records.
- [Creating and Updating Sold-to Customers \(WCST\)](#) describes the Work with Customers screens you use when creating and updating sold-to customers.
- [Creating and Updating Ship-to Customers \(WCST\)](#) describes the screens you use when creating and updating ship-to customers.
- [Creating and Updating Bill-to Customers \(WCBT\)](#) describes the screens you work with when creating and updating bill-to customers.
- [Work with Contract Price Screen](#) describes how to establish special contract pricing opportunities for a customer.
- [Working with Customer Tax Status](#) describes the tax status that you can apply to customers, including standard taxes and exemptions.
- [Working with Pay Type Exclusions](#) describes how to apply payment method exclusion codes to a customer.
- [Reviewing Customer History](#) describes how to view a customer's mail history, item history, and order summary and detail history.
- [Work with User Fields Screen](#) describes how to change, delete, or display information for user-defined fields.
- [Reviewing Customer Address Changes](#) describes how to display address changes that you enter for your customers.
- [Printing the Customer Exposure Report \(PCER\)](#) describes how to print a report listing customer action notes entered and customer action reason codes used on each.
- [Printing the Customer Detail Exposure Report \(PCAR\)](#) describes how to print a report listing customer action notes, including details on the customer.
- [Working with Customer Warranty Information \(WCST\)](#) describes the screens you use to review and work with items you shipped to customers at no charge, in fulfillment of a warranty.
- [Working with Customer Email Addresses](#) describes how the system stores and validates email addresses for sold-to customers, and presents the screens you use to work with email addresses.

- [Working with Customer Ownership](#) describes how to create and update information about the products a customer owns.
- [Working with Alternate Customer Number Cross-References](#) describes the screens you use to work with additional alternate customer numbers assigned to a customer.
- [Generic Customer API](#) describes how to create or update customers through a generic XML message. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- [Customer Engagement Customer Integration](#) describes how to keep customer information in sync with Oracle Retail Customer Engagement when Oracle Retail Customer Engagement is the system of record for customer data.

Understanding Customer Types

Purpose: Use the Customer Maintenance programs to maintain existing customer information and create new customer records without creating orders. You use the Customer Maintenance programs when you need to:

- Enter customer address changes
- Construct a demographics profile
- Create a contract price for a short-term sale
- Change a customer's tax status, payment type, etc.
- Add a customer service action note
- Review a customer's ordering history

In this topic:

- [Defining Customer Types](#)
- [Customer Type Relationships](#)

Defining Customer Types

Purpose: There are four customer types:

- Sold-to
- Ship-to
- Bill-to

You need to understand the customer types in order to work with Customer table maintenance.

Sold-to customers: A sold-to customer is a person who places an order. Name, address, and mailing information for sold-to customers is in the Customer Sold-to table only.

 **Note:**

The [Customer Engagement Customer Integration](#) includes only sold-to customers.

Ship-to customers: A ship-to customer is a person who receives an order. The system generates a temporary ship-to record for every sold-to customer when you enter an order. You can create permanent ship-to customers through Customer Ship-to when you enter an order.

- *Permanent ship-to customers* are customers who request a ship-to address different from their sold-to address. The Customer Ship-to table stores permanent ship-to customer information.
- *Temporary ship-to customers* are customers who receive the shipped order but do not place the order or pay for the order (for example, gift recipients). The Order Ship-to Address table stores temporary ship-to customer information.

Bill-to customers: A bill-to customer is a person who pays for an order. A bill-to customer record is required when the person who pays for the order is different than the sold-to customer.

You can assign bill-to customer addresses through Order Entry if the system control values [Create/Assign Bill To Customers in Order Entry \(A76\)](#) is *selected*.

The system generates bill-to records for business-to-business customers. Business-to-business customers are customers who ship to a consistent address, have a permanent account, and are commercial in nature.

You can define a business-to-business customer by *selecting* the Commercial flag for a customer. Once you have established a bill-to customer account, the account remains permanently in the Bill-to customer table.

Customer Type Relationships

The figure below illustrates the relationships between the customer types.

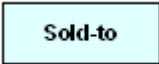

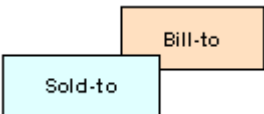

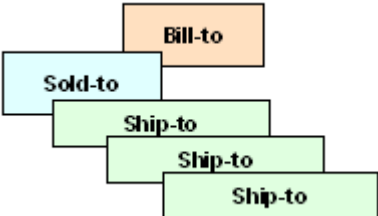

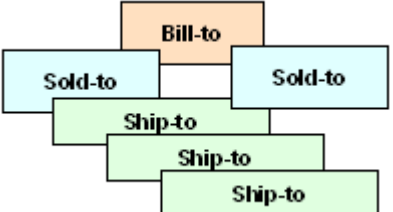

Illustration	Customer Type and Payment Methods
	(Sold-to) customer places, receives, and pays for order. Payment methods: Cash, Check, Credit Card
	(Sold-to) customer places and receives order, but someone else receives the bill. Payment methods: Credit Card
	(Sold-to) customer places and pays for order, but directs shipment to another (Temporary Ship-to) person. Payment methods: Cash, Check, Credit Card
	(Sold-to) customer orders for one or more (Permanent Ship-to) locations, and directs bill to a separate (Bill-to) accounting function. Payment methods: Credit Card

Illustration	Customer Type and Payment Methods
	<p>One or more (Sold-to) customer orders for one or more (Permanent Ship-to) receiving locations, but each Sold-to directs their bills to a single (Bill-to) accounting function. Payment methods: Credit Card</p>

Rules to remember: The following is a list of guidelines to keep in mind when working with the different customer types.

- Every order has at least a sold-to customer
- The system creates a bill-to record if the person paying for the order is different from the person placing the order
- More than one permanent ship-to record can exist under a single sold-to, if the sold-to regularly places orders to be shipped to different locations

For more information: See [Creating and Updating Customers](#) for options related to creating and working with each customer type.

Selecting Customers

Introduction: You can select existing sold-to customers by entering information in any of the fields on the Customer Maintenance Scan screen. You can use this function to locate and view a particular customer record or to display a list of customer records that match the information you enter.

Purpose of this topic: This topic shows you how to use the system's scanning functions to search for and locate customer records.

In this topic:

- [Scanning for Customers](#)
- [Select Customer Sold To Screen](#)
- [Work with Customers Screens \(Selecting a Customer\)](#)

Scanning for Customers

How scanning works: When scanning, the system searches the Sold To Customer table for customers with information that closely matches the information you enter, then lists these customers on a scan screen. You select the customer record you want to work with from the scan screen.

There are some general principles to keep in mind as you scan for a customer:

1. If you enter information in any numeric field (other than the Customer field), the system displays a list of possible matches in ascending numerical order (1, 2, 3..., etc.), beginning with the number you typed and continuing to the end of the table
2. If you enter information in any alphanumeric field, the system displays a list of customers in ascending alphabetical order (a, b, c..., etc.), then in ascending

numerical order (1,2,3..., etc.), beginning with the text you typed and continuing to the end of the table.

3. When you position the cursor on any scannable field on a scan screen, and select *Scan* without typing anything in the field, the system displays a list of all records from the table in ascending order for the field you selected.
4. If no customers match the criteria you enter, the system displays a list of all possible matches in ascending order beginning with the text you entered and continuing to the end of the table. For example, if you type *Smith* in the Last name field, but this name is not found in the customer database, your screen displays customer records starting with the first name closest alphabetically to "Smith" through the end of the alphabet.

Oracle Retail Customer Engagement Customer Integration: If the [ORCE Customer Integration \(L37\)](#) system control value is set to *INTERACT*, you use the [Customer Scan Screen](#) instead of the [Select Customer Sold To Screen](#) to search for customers, and the system searches for customers in Oracle Retail Customer Engagement rather than in Order Administration. See the [Customer Scan Screen](#) for more information.

Select Customer Sold To Screen

Purpose: Use this screen to search for customers in the Customer Maintenance table; see [Selecting Customers](#).

How to display this screen: If the [ORCE Customer Integration \(L37\)](#) system control value is set to blank, enter *WCST* in the Fast path field at the top of any menu or select *Work with Customers* from a menu; otherwise, if the system control value is set to *INTERACT*, you advance to the [Customer Scan Screen](#).

Field	Description
Customer	<p>A unique number to identify a customer. The system assigns a customer number automatically whenever you add a new customer (either when you enter an order for a new customer or when you Select <i>Create</i> to add the customer record manually through the Sold To Customer table).</p> <p>You can scan on just the customer number, or on a combination of the customer number and ship-to number.</p> <p>When you enter an invalid customer number, you advance to the <i>Work with Customers by Number</i> screen. This screen lists customer records in ascending numerical sequence, beginning with the number you typed and continuing to the end of the table. You also advance to this screen if you enter an unassigned customer number.</p> <p>When you enter a valid customer number, you advance to the <i>Change Customer</i> screen. See Creating and Updating Sold-to Customers (WCST).</p> <p>Numeric, 9 positions; optional.</p>

Field	Description
Ship-to number (Unlabeled field to the right of the Customer field)	<p>Identifies the number of shipping addresses on the order. You can scan on the ship-to number alone, or the complete customer ship-to number (which is the customer number and the ship-to number).</p> <p>If you enter a customer ship-to number that identifies a permanent ship-to record, you advance to the Change Ship To screen for the ship-to record you selected.</p> <p>If you enter only a ship-to number, you advance to the Work with Customers by Number screen, which list customers in ascending numerical sequence, beginning with the number you typed and continuing to the end of the table.</p> <p>Numeric, 3 positions; optional.</p>
Match code	<p>A unique customer code the system assigns to each customer to identify duplicate customer records.</p> <p>Match codes is a user-defined algorithm, which consists of portions of the customer's name, address, and postal code.</p> <p>When you enter a full or partial match code, you advance to the Work with Customers by Match Code screen, which lists customers in ascending match code sequence, beginning with the code you typed and continuing to the end of the table.</p> <p>Alphanumeric, 15 positions; optional.</p>
Postal code	<p>The postal or zip code for this customer.</p> <p>Enter a full or partial code to advance to the Customers by Postal Code/Company screen. This screen lists all customers by postal code in ascending (lowest to highest) numeric sequence, beginning with the code you entered.</p> <p><i>Scan length:</i> The Postal Code Scan Length (F61) system control value controls how many characters of the postal code to use when searching for a customer. See that system control value for a discussion.</p> <p>If you enter a postal code and last name, you advance to the Customers by Postal Code/Last Name screen, which lists all customers alphabetically beginning with the postal code you entered.</p> <p>Alphanumeric, 10 positions; optional.</p>
Last name	<p>The sold-to customer's last name.</p> <p>When you enter all or part of a customer's last name, you advance to the Work with Customers by Last Name screen, which lists customers by last name, beginning with the letters you entered and continuing to the end of the table.</p> <p>The Last name field is indented beneath the Postal code field. You can enter information in both fields to scan for a particular customer.</p> <p>Alphanumeric, 25 positions; optional.</p>

Field	Description
Company	<p>The company name associated with the customer.</p> <p>When you enter a full or partial company name, you advance to the Work with Customers by Company Name screen, which lists customers by company name, beginning with the letters you entered and continuing forward to the end of the table.</p> <p>Notice that the Company field is indented beneath the Postal code field. You can enter information in both of these fields for scanning purposes.</p> <p>Alphanumeric, 30 positions; optional.</p>
Telephone#	<p>The customer's telephone number.</p> <p>When you enter a full or partial telephone number, you advance to the Work with Customers by Phone Number screen, which lists customers by telephone number.</p> <p>You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY), for more information.</p> <p>Note: Your entry should include any formatting specified by the telephone number format for the country; for example, if the telephone number format for the United States is (111) 111-111, your entry should include the parentheses and hyphen.</p> <p>Alphanumeric, 14 positions; optional.</p>
Alternate customer number	<p>An additional number to identify the customer on the system. This might be a customer number carried over from a system conversion.</p> <p>Enter an alternate customer number to advance to a subsequent scan screen that lists customers by alternate customer number. See Display Alternate Customer Cross Reference Window (I84) for more information.</p> <p>Alternate Customer Number Label Description The field label on this screen is based on the name you enter in the Alternate Customer Number Label Description (H95) system control value; if you do not enter a name in this system control value, the field label is Alt cust.</p> <p><i>Example:</i> If you enter the field label name <i>MEMBER#</i> in the system control value, the field label on this screen is <i>MEMBER#</i>.</p> <p>Alphanumeric, 15 positions; optional.</p>
E-mail Address	<p>An e-mail address for the customer.</p> <p>When you enter a full or partial email address, you advance to the Scan Customer by E-mail Address screen, where you can scan by any email address on file for a customer. This field is not case-sensitive; an email address of <i>abc@example.com</i> matches an entry of <i>ABC@example.COM</i>, and vice versa.</p> <p>Alphanumeric, 50 positions; optional.</p>
Screen Option	Procedure
Create a new customer	Select <i>Create</i> . See Creating and Updating Sold-to Customers (WCST) .

Work with Customers Screens (Selecting a Customer)

Purpose: Whenever you enter information in a field at the Select Customer Sold To Scan screen, you advance to a screen that lists customers in ascending numerical or alphabetical order, beginning with the first customer that matches the information you entered.

The customer number is an exception to this rule. When you enter a valid customer number, you advance directly to the Change Customer screen for the specified customer.

You can use the Work with Customer screen to narrow down your search, or to select and work with a specific customer.

About this screen: Work with Customer screens display different information, depending on the information you entered on the initial selection screen.

The Work with Customer screen, for example, displays the company name and street address, and lists customers in ascending alphabetical order by company name.

Field	Description
Information on Line 1:	
Company name	The name of the company. Alphanumeric, 30 positions; optional.
Customer	A unique number to identify a customer. Numeric, 9 positions; display-only, assigned by the system.
Cls (Customer class)	A user-defined code that categorizes customers at a high level for reporting purposes. You can use customer class codes to: <ul style="list-style-type: none"> • mail offers to a limited group • restrict items from being sold • bypass normal item reservation Class codes are defined in and validated against the Customer Class table. See Setting Up the Customer Class Table (WCCL) . Numeric, 2 positions; display-only.
Source (Source code)	A unique code assigned to a list of customer names to whom you target an offer (catalog, newspaper or television advertisement). See Working with Source Codes (WSRC) . The customer's current source code displays. Alphanumeric, 7 positions; display-only.

Field	Description
Mail type	<p>A code to classify the “type” of customer. Valid values are:</p> <ul style="list-style-type: none"> • <i>B = Buyer</i>: A customer who places an order (also known as the “Sold To” customer). • <i>R = Recipient</i>: A customer who receives the order (also known as the “Ship To” customer). • <i>C = Catalog requester</i>: A person to whom you send a catalog (added automatically to the Sold To Customer table because they are a prospect for a future sale). • <i>L = List rental</i>: A customer whose name you purchased from a another company. • <i>S = Suspect/Prospect</i>: A customer whose name you have acquired by a telemarketing effort or a public or industry listing. <p>Alphanumeric, 1 position; display-only.</p>
Information on Line 2:	
Street	<p>The customer's or company's street address. Alphanumeric, 32 positions; display-only.</p>
City	<p>The name of the customer's city. Alphanumeric, 25 positions; display-only.</p>
State or Province	<p>The code for the customer's state or province. Alphanumeric, 2 positions; display-only.</p>
Postal code	<p>The customer's postal (or ZIP) code. Alphanumeric, 10 positions; display-only.</p>

Screen Option	Procedure
Create a new customer	Select <i>Create</i> . See the First Create Sold To Customer Screen .
Change information about the customer	Select <i>Change</i> for a customer. See Changing Sold To Customers .
Delete a customer	Select <i>Delete</i> for a customer. The system does not allow you to delete a customer record if you have taken orders for the customer. The screen displays a message such as: Orders exist for customer (xxxx) - cannot delete.
Display information about the customer	Select <i>Display</i> for a customer. You advance to the first Display Customer screen. You cannot change any information on this screen. See the First Create Sold To Customer Screen for field descriptions.
Work with ship-to customers	Select <i>Ship To</i> for a customer to advance to the Work with Customer Ship Tos Screen .

Screen Option	Procedure
Work with bill-to customers	<p>Select <i>Bill To</i> for a customer. If the customer:</p> <ol style="list-style-type: none"> 1. already has a bill-to customer and you: 2. have authority to the Work with Bill To menu option, you advance to the Work with Bill To Customers Screen. 3. do not have authority to the Work with Bill To menu option, you advance to the Display Customer Bill To screen. See the Create Bill-to Customer Screen for field descriptions. 4. does not already have a bill-to customer and you: 5. have authority to the Work with Bill To menu option, you advance to the Create Bill-to Customer Screen. 6. do not have authority to the Work with Bill To menu option, the screen displays an error message.
Work with subscriptions for a customer	Select <i>Subscriptions</i> for a customer to advance to the Work with Subscriptions Screen .
Work with contract pricing for a customer	Select <i>Contract Pricing</i> for a customer to advance to the Work with Contract Price Screen .
Work with state-specific tax exemptions for a customer	Select <i>Tax</i> for a customer to advance to the Work with Customer Tax Screen . See Working with Customer Tax Status for an overview.
Review mail history for a customer	Select <i>Mail History</i> for a customer to advance to the Display Customer Mail History Screen . See Reviewing Customer History for an overview of customer history.
Work with actions for a customer	Select <i>Actions</i> for a customer to advance to the Edit Customer Actions Window .
Work with the profile for a customer	Select <i>Profile</i> for a customer to advance to the Work with Customer Profile Screen .
Review item ordering history for a customer	Select <i>Item History</i> for a customer to advance to the Customer Sold To Item History Screen . See Reviewing Customer History for an overview of customer history.
Display customer order history	Select <i>Order History</i> for a customer to advance to the Display Customer Order History Screen . See Reviewing Customer History for an overview of customer history.
Exclude pay types for a customer	Select <i>Pay Type Exclusion</i> for a customer to advance to the Exclude Pay Types By Customer Screen .
Enter information in the user-defined fields for a customer	Select <i>User Fields</i> for a customer to advance to the Work with User Fields Screen .
Work with notes about a customer	Select <i>Notes</i> for a customer to advance to the Edit Customer Notes Screen .
Review address changes for a customer	Select <i>Previous Address</i> for a customer to advance to the Display Address Changes Screen . See Reviewing Customer Address Changes for an overview.
Work with warranty information for a customer	Select <i>Warranty Info</i> for a customer to advance to the Work with Customer Warranty Information Screen .

Work with Contract Price Screen

Purpose: Use this screen to establish special pricing you are offering to a customer on selected items for a specific time period.

How to display this screen: Select *Contract pricing* for a customer at a Work with Customer scan screen (see [Selecting Customers](#)). You can also advance to this screen by selecting *Contract Pricing* from a create, change, or display sold-to customer screen (see [Creating and Updating Sold-to Customers \(WCST\)](#)).

Field	Description
Item #/SKU	<p>Item Represents a unit of inventory. Alphanumeric, 12 positions, optional.</p> <p>SKU Represents an item's special characteristics, such as size, color, width, etc. Note: Scanning on this field is not currently implemented. Alphanumeric, three 4-position fields; optional.</p>
Start date	<p>The date when the contract price first becomes effective for this item. Numeric, 6 positions (in user date format); optional.</p>
End date	<p>The final date the contract price is effective for this item. Numeric, 6 positions (in user date format); optional.</p>
Price	<p>The price you are offering the customer for this item during the term of the contract. Numeric, 13 positions with a 2-place decimal; optional.</p>
Tax incl (Tax-inclusive price)	<p>The price you are offering the customer for this item during the term of the contract on orders subject to VAT. This field displays only if the Tax Included in Price (E70) system control value is <i>selected</i>. Numeric, 13 positions with a 2-place decimal; display-only.</p>

Screen Option	Procedure
Create a contract price	Select <i>Create</i> to advance to the Create Contract Price Screen .
Change a contract price	Select <i>Change</i> for an item to advance to the Change Contract Price screen. At this screen, you can change the ending date or the contract price. See Create Contract Price Screen for field descriptions.
Delete a contract price	Select <i>Delete</i> for an item to delete it.
Display a contract price	Select <i>Display</i> for an item to advance to the Display Contract Price screen. You cannot change any information on this screen. See Create Contract Price Screen for field descriptions.

Create Contract Price Screen

Create a contract price: Select *Create* at the [Work with Contract Price Screen](#) to create a contract price for an item you specify for the customer with whom you are working.

Field	Description
Customer	The customer's number, followed by the customer's name and company, if any. Numeric, 9 positions; display-only.
Item #/SKU	Item Represents a unit of inventory. Item codes are defined in and validated against the Item table. Alphanumeric, 12 positions. Create screen: required. Change screen: display-only. SKU Represents an item's special characteristics, such as size, color, width, etc. Alphanumeric, three 4-position fields. Create screen: required if the item has SKUs. Change screen: display-only.
Start date	The date when the contract price first becomes effective for this item. Numeric, 6 positions (in user date format). Create screen: required. Change screen: display-only.
Ending date	The date the contract price for the item expires. Numeric, 6 positions (in user date format); required.
Contract price	The price you are offering the customer for this item during the term of the contract. Numeric, 13 positions with a 2-place decimal; required.
Tax inclusive price	The price you are offering the customer for this item during the term of the contract if the order is subject to VAT. This field displays only if the <i>Tax Included in Price (E70)</i> system control value is <i>selected</i> . Numeric, 13 positions with a 2-place decimal; optional.

Working with Customer Tax Status

Purpose: The tax exemptions you can assign to a customer include tax identification numbers, exemptions for nonprofit organizations, and exemption from VAT.

Exemption information set up in customer maintenance defaults in order entry and to orders you create through the order API, although you can override the information in order entry.

Web orders: Regardless of the tax status of the sold to customer, you can pass exemption/resale information on an order received through the *Generic Order Interface (Order API)* by entering *E* (Exempt) or *R* (Resale) in the *tax_exempt* attribute and defining a tax identification number in the *resale_exempt_id* attribute. In this

situation, the exemption/resale information applies to the order ship to only and does not update the exemption/resale information for the sold to customer on the order.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Exemption/reseller options: You can set up:

- a customer-level exemption if the customer always qualifies regardless of shipping address
- resale or exemption numbers in the Customer Tax table for individual states
- VAT exemption at the customer level, if the customer might be subject to VAT

Expiration date? Optionally, you can specify an expiration date for customer tax exemptions at either the customer level, or at the state or province level. If the expiration date at the customer level has passed, the customer is not eligible for a tax exemption set up at either the customer or state/province level.

GST or PST: For Canadian taxing, you can define exemptions from either Goods and Services taxes, Provincial Services taxes, or both.

If you use an external tax system: You can set up tax exemptions for specific customers if you use an external tax system. You can also use a customer class to flag customers who are exempt. See [Vertex Setup](#) or [Avalara AvaTax Setup](#) for more information.

In this topic:

- [Customer Tax Overview](#)
- [First Level: Customer Exemption](#)
- [Second Level: VAT](#)
- [Third Level: State Exemptions](#)
- [Work with Customer Tax Screen](#)
- [Create Customer Tax Screen](#)

Customer Tax Overview

You can set up three levels of tax exemption information to default for a customer in order entry:

- Use the [First Level: Customer Exemption](#) if the customer is always:
 - tax exempt
 - not subject to tax as a reseller
 - subject to GST or PST only
- Use the [Second Level: VAT](#) if the customer is always exempt from VAT on orders subject to VAT.
- Use the [Third Level: State Exemptions](#) if the customer does not have a customer-level tax exemption or reseller tax identification number, but is exempt or a reseller in specific states or provinces.

First Level: Customer Exemption

Tax code and tax identification number specified for the customer: If the customer is always tax exempt regardless of shipping address, set up the [Tax code](#) code and [Tax](#)

identification field for the customer. Any reseller or exempt information in these fields defaults into the Tax code and Tax identification fields in order entry and, as long as the *Expiration date (Tax identification expiration date)* is blank or specifies a future date, the reseller or exempt information remains on the order header when you select OK and the customer-level tax information applies.

Exempt tax identification number but no Tax code specified for the customer: If the customer has an Tax identification number but no Tax code, the tax identification number defaults in order entry, but the operator will need to complete the Tax code field. Setting up a customer record this way might be useful if you want to prompt the operator to evaluate the customer's tax status on an order-by-order basis.

Canadian tax exemptions for customers: If there is a Tax code of *GST only* or *PST only* for a Canadian customer, this information defaults in order entry, regardless of the value in the Expiration date field. These customers do not need to specify an Tax identification number.

Overrides state-specific settings from the Customer Tax table: If you specify tax-related information at the customer level, this information overrides the information set up through the *Work with Customer Tax Screen* for specific states or provinces. For example, if the customer has an *Expiration date (Tax identification expiration date)* in the future, but the state-level *Expiration date* for the customer's address is in the past, the customer is still eligible for a tax exemption, provided there is a *Tax identification* set up for the customer or a *Tax identification* set up for the state.

If you would like the customer to qualify for tax exemptions in particular states only, the tax-related fields at the customer level (*Tax code* code, *Tax identification*, and *Expiration date (Tax identification expiration date)*) should be blank.

Second Level: VAT

Vat number for the customer: If an order is subject to VAT, the system checks the *VAT number* field for the customer. An entry indicates that the customer is exempt from VAT, a taxing method that applies in only certain states in certain countries. When an order is subject to VAT, the customer is charged a tax-inclusive price, and the tax amount is "hidden" on the order detail line for the item, not included in the Tax bucket for the order. If the order is exempt from VAT, then the regular (tax-exclusive) pricing applies, and there is no hidden tax.

Note:

A customer who has a regular or reseller tax exemption is also exempt from VAT: the customer pays the regular (tax-exclusive) price, and neither hidden tax nor regular tax is added to the order.

The system applies the VAT exemption only if:

1. the customer has a *VAT number* defined, and the order is subject to VAT because:
2. the *Tax Included in Price (E70)* system control value is *selected*, and
3. the sold-to customer is located in a country that is different from the country for your company, as defined through the Work with Companies menu option (fast path = *WCMP*).

If a VAT exemption applies to the order, the setting of the Tax code field changes to *Exempt*, and the words *VAT EXEMPT* default into the Tax identification field for the order. In this case, you cannot override the tax status of the order to make it taxable.

**Note:**

You cannot set up a VAT exemption at the state level. VAT exemption information is at the customer level only.

Third Level: State Exemptions

You use the Customer Tax table, available by selecting *Customer Tax* in customer maintenance, to set up exemption or reseller records at the state or province level. State-specific information you have set up through the *Work with Customer Tax Screen* defaults in order entry only if:

1. there is no applicable *Tax code* code and *Tax identification* set up at the customer level, or you have cleared the fields in order entry, and
2. *Expiration date (Tax identification expiration date)* is specified at the customer level, or the date specified is in the future, and
3. *Expiration date* date is specified for the state of the shipping address; or the date specified is in the future, and
4. a VAT exemption has not defaulted on the order, and
5. the state-level record includes exemption (*E*) or reseller (*R*) information. No other type of state-level tax information defaults in order entry.

If you have tax information set up in the Customer Tax table, you need to clear the tax fields in order entry whenever you make any changes to the order that might affect its taxability.

Example: A customer has a reseller exemption in Massachusetts but not in Rhode Island, and the sold-to address is in Massachusetts. When you first advance to the order header screen in order entry, the Massachusetts tax identification number defaults. To override the customer's default tax status, clear the Tax code and Tax identification fields, and then enter the Rhode Island shipping address. In the case of a one-time ship-to address, you need to enter the ship-to address and then clear the related fields. This step enables the system to default the tax information, if any, for the Rhode Island address, and prevents the Massachusetts information from applying incorrectly.

Work with Customer Tax Screen

Purpose: Use this screen to create, change, delete, or display tax exemption information for a customer that is specific to a state or province. See *Working with Customer Tax Status* for a discussion.

How to display this screen: From any Work with Customer screen, select *Customer Tax* for a customer (see *Selecting Customers*). You can also advance to this screen by selecting *Customer Tax* at a Create, Change, or Display Customer screen (see *Creating and Updating Sold-to Customers (WCST)*).

Field	Description
Customer	<p>A unique number assigned to each customer who places an order, and the customer's name or company name.</p> <p>Customer number: numeric, 9 positions; display-only, assigned by the system.</p> <p>Customer last name: alphanumeric, 25 positions; display-only.</p> <p>Customer first name: alphanumeric, 15 positions; display-only.</p> <p>Customer middle initial: alphanumeric, 1 position; display-only.</p> <p>Customer company name: alphanumeric, 30 positions; display-only.</p>
Cty (Country)	<p>The country where the customer has a reseller or other tax exemption.</p> <p>Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY).</p> <p>Alphanumeric, 3 positions; optional.</p>
State	<p>The state or province where the customer has a reseller or other tax exemption.</p> <p>State codes are defined in and validated against the State table, which is accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY).</p> <p>Alphanumeric, 2 positions; optional.</p>
Tax (Tax code)	<p>The tax status of the customer in the state shown.</p> <p>Enter a valid tax code to display tax records that match your entry.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Exempt</i> = The customer is exempt from paying any taxes, including VAT, in this state or province. • <i>GST Only</i> = Not currently implemented at the state or province level. To flag a customer as eligible for Goods and Services tax only, use the <i>Tax code</i> setting at the customer level. • <i>Non-Tax</i> = Not currently implemented. • <i>PST Only</i> = Not currently implemented at the state or province level. To flag a customer as eligible for Provincial Sales Tax only, use the <i>Tax code</i> setting at the customer level. • <i>Resale</i> = The customer is a reseller and exempt from paying any taxes, including VAT, in this state or province. • <i>Standard</i> = The customer is subject to tax. <p>Although you can create tax records using any of the codes above, retrieving tax status for any tax code but <i>Resale</i> or <i>Exempt</i> is not currently implemented.</p> <p>Optional.</p>
Tax identification	<p>The customer's tax identification number, typically the resale or exempt certificate number assigned to a customer who is identified as tax exempt (<i>E</i>) or as a reseller (<i>R</i>) otherwise, the tax identification number does not control taxability. Any combination of letters, numbers, or special characters is accepted.</p> <p>Alphanumeric, 30 positions; optional or required based on Tax code.</p>

Field	Description
Expiration date	The date the customer's exempt or reseller tax identification number expires in this state. This expiration date applies only if there is not an Expiration date (Tax identification expiration date) specified at the customer level. Numeric, 6 positions (in user date format); optional.

Screen Option	Procedure
Create customer tax status	Select <i>Create</i> to advance to the Create Customer Tax Screen .
Change customer tax status	Select <i>Change</i> for a tax record to advance to the Change Customer Tax screen. At this screen, you can change the tax code or the resale/exempt number. See Create Customer Tax Screen for field descriptions.

Create Customer Tax Screen

To create: At the [Work with Customer Tax Screen](#), Select *Create* to create a tax record for a state or province.

Note:

You should set up Customer Tax records for exemptions or reseller tax identification numbers at the state level only if the customer does not have an exemption or reseller tax identification number at the customer level. See [Customer Tax Overview](#) for a discussion.

Field	Description
Customer	A unique number assigned to each customer who places an order, and the customer's name or company name. Customer number: numeric, 9 positions; display-only, assigned by the system. Customer last name: alphanumeric, 25 positions; display-only. Customer first name: alphanumeric, 15 positions; display-only. Customer middle initial: alphanumeric, 1 position; display-only. Customer company name: alphanumeric, 30 positions; display-only.
Country	The country where the customer has a special tax status. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY) . Alphanumeric, 3 positions, Create screen: required. Change screen: display-only.

Field	Description
State	<p>The state or province where the customer has a special tax status. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY).</p> <p>Alphanumeric, 2 positions. Create screen: required. Change screen: display-only.</p>
Tax (Tax code)	<p>The tax status of the customer in the state shown. The tax status of the customer in the state shown. Enter a valid tax code to display tax records that match your entry. Valid values are:</p> <ul style="list-style-type: none"> • <i>Exempt</i> = The customer is exempt from paying any taxes, including VAT, in this state or province. • <i>GST Only</i> = Not currently implemented at the state or province level. To flag a customer as eligible for Goods and Services tax only, use the Tax code setting at the customer level. • <i>Non-Tax</i> = Not currently implemented. • <i>PST Only</i> = Not currently implemented at the state or province level. To flag a customer as eligible for Provincial Sales Tax only, use the Tax code setting at the customer level. • <i>Resale</i> = The customer is a reseller and exempt from paying any taxes, including VAT, in this state or province. • <i>Standard</i> = The customer is subject to tax. <p>Although you can create tax records using any of the codes above, retrieving tax status for any tax code but <i>Resale</i> or <i>Exempt</i> is not currently implemented.</p> <p>If you enter a tax code of <i>Resale</i> or <i>Exempt</i>, a Resale/Exempt number is also required.</p> <p>Alphanumeric, 1 position; required.</p>
Tax identification	<p>The customer's tax identification number, typically the resale or exempt certificate number assigned to a customer who is identified as tax exempt (<i>E</i>) or as a reseller (<i>R</i>); otherwise, the tax identification number does not control taxability. Any combination of letters, numbers, or special characters is accepted.</p> <p>Alphanumeric, 30 positions; required if customer is defined as tax exempt or as a reseller; optional or required based on Tax code.</p>
Expiration date	<p>The date the customer's exempt or reseller tax identification number expires in this state. This expiration date applies only if there is not an Expiration date (Tax identification expiration date) specified at the customer level.</p> <p>Numeric, 6 positions (in user date format); optional.</p>

Working with Pay Type Exclusions

Purpose: You assign pay type exclusions on a customer-by-customer basis to restrict a customer from using a specific payment method, such as a credit card or check.

In this topic:

- [Exclude Pay Types By Customer Screen](#)

- [Create Pay Type Exclusion/Customer Screen](#)

Exclude Pay Types By Customer Screen

How to display this screen: At any Work with Customers screen, select *Pay type excl.* for a customer. See [Selecting Customers](#). You can also display this screen by selecting *Pay Type Excl.* at a Create/Change/Display Customer screen; see [Creating and Updating Sold-to Customers \(WCST\)](#).

Field	Description
Pay type	<p>A user-defined code that represents the method of payment on an order. Pay type must conform to one of the following categories:</p> <ul style="list-style-type: none"> • Cash/Check • Credit card <p>The pay type description appears on the right, and is display-only. See Working with Pay Types (WPAY). Numeric, 2 positions; optional.</p>

Screen Option	Procedure
Create a pay type exclusion	Select <i>Create</i> to advance to the Create Pay Type Exclusion/Customer Screen .
Delete a pay type exclusion	Select <i>Delete</i> for a pay type exclusion to delete it. When you delete a pay type listed on this screen, the customer may immediately use the payment method that was previously excluded.

Create Pay Type Exclusion/Customer Screen

Create a pay type exclusion: At the [Exclude Pay Types By Customer Screen](#), select *Create* to advance to this screen.

Field	Description
Customer (Sold-to customer number)	<p>A unique number the system assigns to each customer who places an order. You cannot change this number. Numeric, 9 positions; display-only, assigned by the system.</p>
Customer name (Unlabeled field to the right of the customer number)	<p>The last and first names, and middle initial of the sold-to customer.</p> <p>Last name The customer's last name. Alphanumeric, 25 positions; display-only.</p> <p>First name The customer's first name. Alphanumeric, 15 positions; display-only.</p> <p>Initial The initial of the customer's middle name. Alphanumeric, 1 position; display-only.</p>

Field	Description
Pay type	<p>A user-defined code that represents the method of payment on an order. Pay type must conform to one of the following categories:</p> <ul style="list-style-type: none"> • Cash/Check • Credit card <p>See Working with Pay Types (WPAY).</p> <p>Numeric, 2 positions; required.</p>

Reviewing Customer History

Purpose: Through the Customer Maintenance option, you can review a customer's mail, item, item class, and order history, which the system collects automatically as updates occur. History for both the sold-to and ship-to customers is available.

In this topic:

- [Related System Control Values](#)

- [Display Ship To Order/Entity History Screen](#)
- [Display Ship To Entity History Screen \(Order History Details by Entity\)](#)

Related System Control Values

Overview: The following system control values affect how the system updates demand for orders.

If using multiple currencies: If you process orders in multiple currencies based on the offer (the [Multi Currency by Offer \(E03\)](#) system control value is *selected*), each of the dollar values that display on these screens will be converted into your local currency.

If using VAT and tax-inclusive pricing: If the [Tax Included in Price \(E70\)](#) system control value is *selected*, certain orders may be subject to tax-inclusive pricing and VAT. In this case, you charge the customer the tax-inclusive price for items on an order, and include a hidden tax amount on the order detail line for the item rather than including tax in the Tax bucket on the order. The hidden tax may be calculated as a percentage of the item price, or may be a fixed amount.

If you use VAT and tax-inclusive pricing, the dollar value that appears on most fields described in this topic will be net of any hidden tax for the item. In other words:

Total = (Tax-inclusive price - Hidden tax) * Quantity

In cases where you have defined the hidden tax to charge for an item as a fixed amount, it is possible for the order total to represent a credit if the hidden tax amount exceeds the item price -- for example, if you offer the item as an incentive or free gift.

Demand for order maintenance: [Update Demand for Order Maintenance Transactions \(C72\)](#): Possible settings are:

- *Y*: The system increases the customer's demand history (in the Orders buckets) for items you add or quantities you increase in order maintenance.
- *N*: Demand does not update for additions in order maintenance; however, all other order history updates, such as for shipments (in the Sales buckets), returns, exchanges, cancellations, and soldouts, will still take place. In this situation, the customer's life-to-date sales (or other activity) may be greater than the customer's order (demand) history.

Demand for non-inventory items: Possible settings are:

- *ALL*: All updates take place for non-inventory items in the same way as for inventory items.
- *ITEM*: The Order/Billing History record updates. Also, you will be able to review order records for non-inventory items at the [Customer Sold To Item History Screen](#), [Display Customer Item Class Screen](#), [Display Customer Item Class History Screen \(Reviewing Detail\)](#), and [Customer Sold To Order History Screen \(Reviewing Detail\)](#) in the same way as you review records for inventory items. However, the Customer Sold To Order History screen will not reflect orders for non-inventory items in the Life-to-date order total fields or the Last order amount.
- *NONE*: There are no demand updates for non-inventory items.

Track at entity level: The [Track Customer History at Entity Level \(F89\)](#) system control value controls whether a customer's order, item, and item class history is broken out based on the entity associated with each order. The system determines the entity associated with an order based on the source code on the order header.

If this system control value is *selected*, you can advance to additional screens to review entity-level history. If this system control value is *unselected*, these screens are not available, and all customer history is consolidated at the customer level.

Displaying Customer History Screens

Access: You can display the Main History, Item History, or Order History screens from any Work with Customers screen, such as from the Work with Customers by Last Name screen. See [Selecting Customers](#).

You can also display these screens by selecting the Mail History, Item History, or Order History options at any Create, Change, or Display Customer screen in customer maintenance. See [Creating and Updating Sold-to Customers \(WCST\)](#).

Display Customer Mail History Screen

Purpose: Use this screen to review the offers sent to the customer. This screen lists the source codes associated with each offer mailed to that customer. The source codes are listed in reverse chronological order (most recent to oldest).

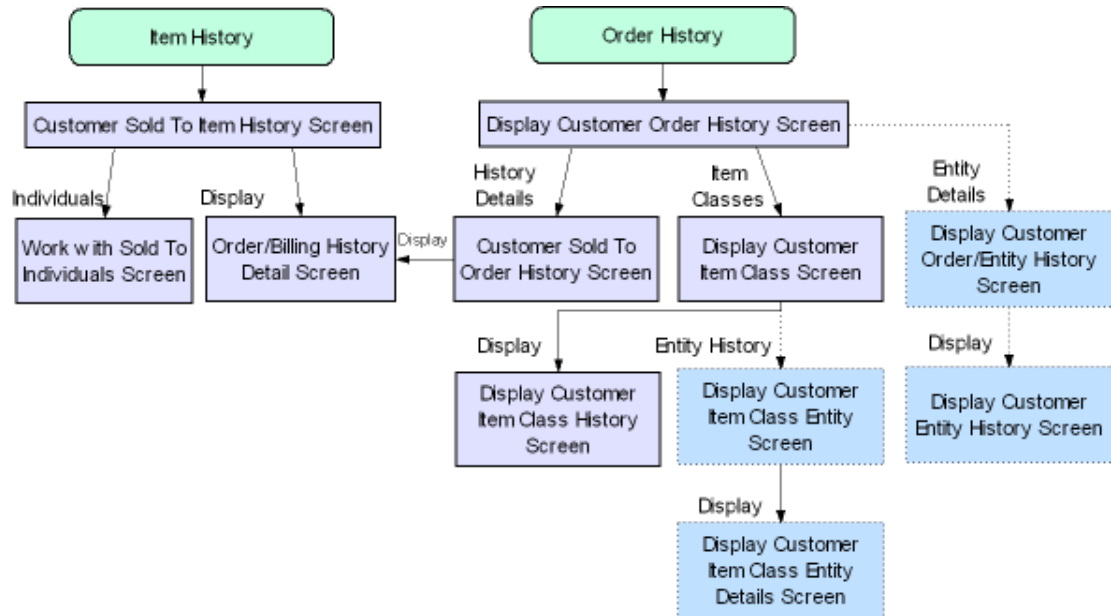

You generate customer mail history by processing a catalog request for a customer. See [Processing Catalog Requests \(PCAT\)](#).

How to display this screen: At a Work with Customers scan screen, select *Mail History* for a customer; see [Selecting Customers](#). You can also display this screen by selecting *Mail History* at a Create, Change, or Display Customer Sold To screen; see [Creating and Updating Sold-to Customers \(WCST\)](#).

Field	Description
Customer #	A unique number to identify a customer. Numeric, 9 positions; display-only, assigned by the system.
Customer name (Unlabeled field to the right of the customer number)	The name of a customer and/or the business associated with the customer. Alphanumeric, 41 positions; display-only.
Source	A code used to identify the segment of your customer base for a particular offer. Alphanumeric, 7 positions; optional.
Description	The description of the mailing. Alphanumeric, 30 positions; display-only.
Mail date	The date you mailed the offer (catalog) to the customer. Numeric, 6 positions (in user date format); display-only.

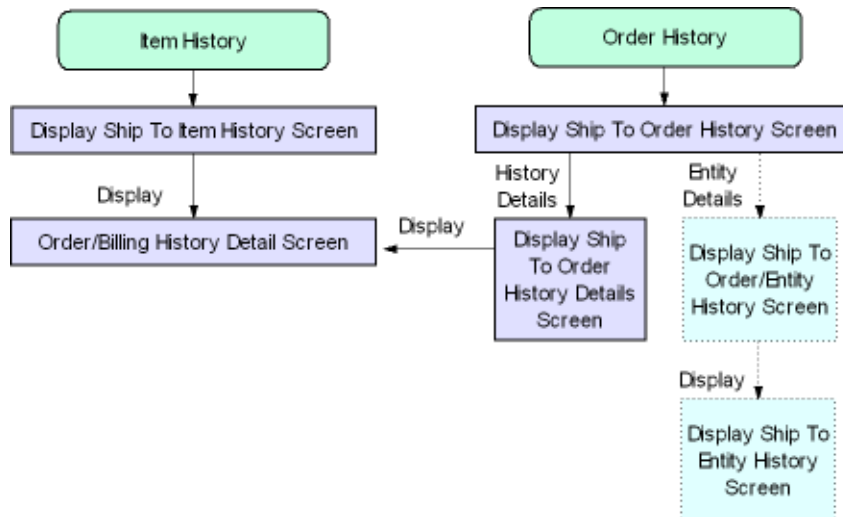

Item, Item Class, and Order History Screen Flow

Purpose: This chart presents the order of the screens you use to review item, item class, and order history for a sold-to customer.

Ship-to Customer History Screen Flow

Purpose: The chart below presents the order of the screens you use to review item and order history for a ship-to customer.

Customer Sold To Item History Screen

Purpose: Use this screen to review the items ordered by the customer. This screen displays the records in the Order/Billing History table for each type of transaction involving the item, such as a shipment, return, or exchange.

Quotes: This screen does not include items included on quotes for the customer; see [Entering Pre-Order Quotes](#).

You can advance to this screen only if the [Track item history](#) field for the sold-to customer is set to 2 (track sold-to item history) or 3 (track sold-to and ship-to item history); however, the system continues to track item history regardless of this setting.

How to display this screen: At a Work with Customer screen, select *Item history* for a customer (see [Selecting Customers](#)) or select *Item History* at a Create, Change, or Display Customer Sold To screen (see [Creating and Updating Sold-to Customers \(WCST\)](#)).

Field	Description
Customer #	A unique number to identify a customer. Numeric, 9 positions; display-only, assigned by the system.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer and/or the company associated with the customer. Alphanumeric, 41 positions; display-only.
Item	The item involved in the transaction. There are separate records for each transaction. Transactions listed on this screen include entering, canceling, selling out, shipping, returning, exchanging, or changing item quantity or price. The system lists items in alphanumeric order, and transactions for each item in reverse chronological order. The item description appears below the item code. Alphanumeric, 12 positions; optional.
SKU (Stock keeping unit)	The item's unique characteristics, such as its color or size. The SKU description appears below the Quantity ordered. Alphanumeric, three 4-position fields; optional.
Date	The date of the transaction. Numeric, 6 positions (in user date format); optional.
Qty ord (Quantity ordered)	The quantity of the item ordered by the customer. If the transaction does not represent an order (for example, a return or shipment), no quantity displays. Numeric, 5 positions; optional.
Order total	The total merchandise dollar amount of the item ordered by the customer on this date. This total does not include freight, tax, handling, or other additional charges, and displays only if the transaction represents an order (as opposed to a return or a shipment, for example). If the Update Demand for Order Maintenance Transactions (C72) system control value is not <i>selected</i> , an order total appears only next to items entered through order entry. Numeric, 13 positions with a 2-place decimal; optional.
Con (Consolidated?)	This flag indicates if the order billing history record for the item has been consolidated. Valid values are: <ul style="list-style-type: none"> <i>Selected</i> = This item's history has been consolidated <i>Unselected</i> = This item's history has not been consolidated. You can consolidate order billing history records to save space on your system and improve performance. When you consolidate order billing history, you select one or more fields to retain; for example, if you retain customer sold-to number only, all activity for all items for the customer is consolidated into one record, and the amounts are added or netted together. Consolidated records appear on this screen only if you selected to retain the item information. See Consolidating Order Billing History (MOBH) .

Screen Option	Procedure
Review detail information about the item transaction	Select <i>Display</i> for a record to advance to the Order Billing History Detail Screen .

Order Billing History Detail Screen

Purpose: Use this screen to review detailed history for each transaction against an item on an order. The system creates order/billing history records through transactions you enter in order entry, order maintenance, billing, processing auto soldouts, processing item substitutions, or any other transaction against an item on an order. The order and billing asynchronous jobs process most of these updates; see [Working with the ORDR_ASYNC Job](#).

Quotes: This screen does not include items included on quotes for the customer; see [Entering Pre-Order Quotes](#).

How to display this screen: At the [Customer Sold To Item History Screen](#), select *Display* for the item you want to review, or select *Display* for a record at the [Customer Sold To Order History Screen \(Reviewing Detail\)](#).

Field	Description
Customer number	A unique number to identify a customer. Numeric, 9 positions; display-only.
Customer name (Unlabeled field to the right of the customer number)	The customer's name and/or the company associated with the customer. Alphanumeric, 41 positions; display-only.
Ship to #	The number assigned to each shipping address on the order. Numeric, 3 positions; display-only.
Salesman #	A number that identifies the sales representative credited for the order. See Working with Sales Representatives (WSLS) . Numeric, 7 positions; display-only.
Offer number	The code for the catalog, space, or television advertisement from which the customer ordered the item. See Working with Offers (WOFR) . Alphanumeric, 3 positions; display-only.
Description (Unlabeled field to the right of the)	The description associated with the offer. Alphanumeric, 30 positions; display-only.
Source code	A code that identifies a segment of your customer base. The source code from the order header appears here, unless you overrode the source code at the order entry detail line. See Working with Source Codes (WSRC) . Alphanumeric, 7 positions; display-only.
Description (Unlabeled field to the right of the)	The description associated with the source code. Alphanumeric, 30 positions; display-only.
Item number	A code representing a unit of inventory. Alphanumeric, 12 positions; display-only.
Description (Unlabeled field to the right of the)	The description associated with the item. Alphanumeric, 120 positions; display-only.

Field	Description
SKU code (Stock keeping unit)	The item's unique characteristics, such as its size or color. Alphanumeric, three 4-position fields; display-only.
Description (Unlabeled field to the right of the)	The description associated with the SKU. The item description appears here for non SKU'ed items. Alphanumeric, 120 positions (item) or 40 positions (SKU); display-only.
Item class	The item class assigned to the item. See Working with Item Classes (WICL) . Numeric, 3 positions; display-only.
Description (Unlabeled field to the right of the)	The description associated with the item class. Alphanumeric, 40 positions; display-only.
Ship via code	A code for the carrier to deliver the item to the customer. See Working with Ship Via Codes (WVIA) . Numeric, 2 positions; display-only.
Description (Unlabeled field to the right of the)	The description associated with the ship via code. Alphanumeric, 40 positions; display-only.
Long SKU dpt/cls	Two fields used to group items for reporting purposes. Long SKU Department A code, typically used in a retail environment, which represents a department code for this SKU. You can assign this code at both the item and the SKU level; the code assigned to the SKU overrides the item-level code. Department codes are defined in and validated against the Long SKU Department table; see Working with Long SKU Departments (WLSD) . Numeric, 4 positions; display-only. Long SKU Class A code, typically used in a retail environment, that represents a class code for this SKU. You can assign this code at both the item and the SKU level; the code assigned to the SKU overrides the item-level code. Long SKU class codes are defined in and validated against the Long SKU Class table; see Working with Long SKU Classes (WLSC) . Numeric, 4 positions; display-only.
Descriptions (Long SKU department description/Long SKU class description)	The first 20 positions of the descriptions associated with the long SKU department and long SKU class codes assigned to the SKU. Alphanumeric, 20 positions; display-only.
Order number	The number of the order on which the customer ordered the item. Numeric, 8 positions; display-only.
Entry/Maintenance code	A code indicating the type of transaction performed on this item. Valid values are: <ul style="list-style-type: none"> • <i>B</i> = Billing (can include sales, exchanges, and returns, including returns you enter through order entry) • <i>M</i> = Maintenance (can include orders, changes, cancellations, and sellouts) • <i>E</i> = Entry (can include orders and sellouts) See About Entry/Maintenance Codes . Alphanumeric, 1 positions; display-only.

Field	Description
Entity	<p>The code representing the entity associated with the source code on order header. Each source code is associated with an entity through its division.</p> <p>Entities are defined in and validated against the Entity table. See Working with Entities (WENT).</p> <p>Numeric, 3 positions; display-only.</p>
Transaction date	<p>The date when the transaction occurred.</p> <p>Note: Transactions that take place on the same day may be consolidated into the same Order/Billing History record if the key fields to the transactions are the same. For example, if a customer adds an item to the order and then cancels it the same day, both transactions will appear on the same Order/Billing History record.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Consolidated from...	<p>The date of the earliest record that was used to derive the totals for the consolidated record. If a record has been consolidated, any fields not retained in the consolidation appear blank. This information appears only for consolidated records; see Consolidating Order Billing History (MOBH).</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Consolidated to...	<p>The date of the latest record that was used to derive the totals for the consolidated record.</p> <p>Numeric, 6 positions (in user date format); display-only.</p> <p>Note: Each of the Total amount fields below represents the merchandise amount net of hidden tax if you use VAT and tax-inclusive pricing. In addition, if you process orders in multiple currencies based on offer, each amount has been converted into your local currency. See the beginning of this topic for more information. If the record has been consolidated, the totals represent the net for all records used to derive the consolidated record.</p>
Quantity ordered	<p>Total quantity of the item added to the order on the date shown.</p>

 **Note:**

If this field is blank, but there is an order amount, the transaction represents changing the price of an item.

Numeric, 5 positions; display-only.

Field	Description
\$ ordered	<p>The merchandise dollar amount ordered for this item on the date shown. This does not include tax, freight, or additional charges.</p> <p><i>When does this field update?</i> The orders amount and quantity fields update for transactions that represent adding an item to the order for any reason, including free gifts, incentive or promotional items, or replacement items when you process an exchange.</p> <p><i>If this field is blank:</i> This field will be blank if:</p> <ul style="list-style-type: none"> the Update Demand for Order Maintenance Transactions (C72) system control value is <i>unselected</i> and the transaction represents adding an item in order maintenance the items is free of charge for items that you return through order entry (using a negative quantity); there will be both an entry and a billing transaction for such an item the transaction does not represent adding an item to an order <p>Cancel: If the cancel reason used to cancel the item is set to update demand (Reduce demand? = <i>Selected</i>), the cancellation total for the item appears here as a credit (CR), and the number of units canceled appears in the Quantity ordered field. Additionally, the Canceled fields will not be updated for the item. If you use a cancel reason that is not set to update demand, the totals appear in the Canceled fields rather than the Orders fields, and the dollar total will be a positive number. See Establishing Cancel Reason Codes (WCNR).</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Cancel total #	<p>Total quantity of the item canceled. A quantity indicates that the cancel reason used on the order did not update demand. See Establishing Return Reason Codes (WRTR).</p> <p>Methods for canceling items include order maintenance, Processing Item Substitutions (PSUB), and Working with Backorders Pending Cancellation (WBPC).</p> <p>Numeric, 5 positions; display-only.</p>
\$ canceled	<p>The total merchandise value of canceled units, not including tax, freight, or additional charges. An amount indicates that the cancel reason used on the order did not update demand.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Quantity sold out	<p>Total quantity of the item sold out on the date shown.</p> <p>Numeric, 5 positions; display-only.</p>
\$ sold out	<p>The total merchandise value of soldout units, not including tax, freight, or additional charges. These fields are updated on the transaction that represents:</p> <ul style="list-style-type: none"> adding a soldout item in order entry or order maintenance. In this situation, the order total amount and dollars update as well as the soldout amount and dollars. However, if the Update Demand for Order Maintenance Transactions (C72) system control value is not <i>selected</i>, only the soldout fields will update for items you add in order maintenance. processing auto soldouts. See Processing Auto Soldout Cancellations (MASO). <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Field	Description
Quantity sold	Total quantity of this item shipped on the date shown. Numeric, 5 positions; display-only.
\$ shipped	Total merchandise dollar amount of the item you are reviewing shipped to the customer on the date shown. Numeric, 20 positions with a 2-place decimal; display-only.
# sales	The total number of shipments to this customer for this date and item. Numeric, 5 positions; display-only.
Quantity returned	Total quantity of this item returned on the date and for the order shown. See Order/Billing History for an Order for additional information. Numeric, 5 positions; display-only.
\$ returned	The total merchandise value of returned units, not including tax, freight, or additional charges. See Order/Billing History for an Order for additional information. Numeric, 20 positions with a 2-place decimal; display-only.
# ret (Number of returns)	Total number of orders related to the return transaction. This number will never be more than one. See Order/Billing History for an Order for additional information. Numeric, 5 positions; display-only.
Quantity exchanged (Exchanges total quantity)	Total quantity of this item exchanged on the date shown. This field is updated for the billing transaction that represents returning the original item for exchange. Numeric, 5 positions; display-only.
\$ exchanged	The total merchandise value of exchanged units, not including tax, freight, or additional charges, based on the price of the original item. This field is updated on the billing transaction that represents returning the original item for exchange. There will also be a maintenance transaction for both the original and the replacement item of the exchange; however, these maintenance transactions will not have any total quantities or dollar amounts. Numeric, 20 positions with a 2-place decimal; display-only.

For more information: See [Order/Billing History for an Order](#) for samples of the order/billing history records produced by a typical order.

About Entry/Maintenance Codes

The Entry/Maintenance code indicates the type of transaction performed on an item. The codes are:

- *B* = Billing
- *M* = Maintenance
- *E* = Entry

Examples: Examples of each type of transaction code are described in the table below.

Transaction Example	Order/Billing History Update
You enter an order for an item in order entry.	The ORDR_ASYNC job creates an entry (<i>E</i>) transaction with the merchandise totals reflected in the Orders fields (<i>\$ ordered</i> and <i>Quantity ordered</i>).
You cancel an item and add another item	The ORDR_ASYNC job creates a maintenance (<i>M</i>) transaction with the merchandise total for the cancel reflected in the Cancels fields (<i>\$ canceled</i> and <i>Cancels total #</i> , and another <i>M</i> transaction for the new item with the merchandise total reflected in the Orders fields (<i>\$ ordered</i> and <i>Quantity ordered</i>).

 **Note:**

The *Quantity ordered* and *\$ ordered* fields update for units added in order maintenance only if the Update Demand for Order Maintenance Transactions (*C72*) system control value is *selected*; otherwise, the *M* transaction will appear with these fields blank. However, the total amount and quantity billed still increase when you ship and bill these items.

You then ship that item to the customer.	The BILL_ASYNC job creates a billing (<i>B</i>) transaction with the merchandise total for the shipment reflected in the Sales fields (<i># sales</i> , <i>Quantity ordered</i> and <i>\$ ordered</i>).
--	---

See [Using the ASYNC Jobs \(MBJC\)](#) for more information on the asynchronous (ASYNC) jobs.

Order/Billing History for an Order

There are two transactions for the return:

- a maintenance transaction for entering the return in order maintenance
- a billing transaction for crediting the return.

 **Note:**

For returns created as a new order line for a negative quantity, the system creates a billing transaction for the return only.

Regarding order/billing transactions:

- *Transactions on the same day:* Transactions for the same order, item, and of the same type (i.e., entry, maintenance, or billing) that take place on the same day are consolidated into one record.
- *Adding items in order maintenance:* If the [Update Demand for Order Maintenance Transactions \(C72\)](#) system control value is *unselected*, the order totals fields will

not increase for any items you add in order maintenance. The maintenance transactions created in this situation will have no order quantities or amounts.

- *Changing an item price:* If you change the price of an item in order maintenance, you create a maintenance transaction with an order amount equal to the price change but no order quantity if the Update Demand for Order Maintenance Transactions (C72) system control value is *selected*; however, if this system control value is *unselected*, you create a maintenance transaction with no order quantity or amount.
- *Exchanges:* Entering an exchange in order maintenance produces three order/billing transactions:
 - a maintenance transaction to reflect the change to the original item (with no quantity or dollar total);
 - a maintenance transaction to add the replacement item (with order quantity and dollar total if you update demand for order maintenance);
 - a billing transaction to credit the return of the original item (with exchange quantity and total).
- *Item substitution:* Processing a substitution through [Processing Item Substitutions \(PSUB\)](#) produces two maintenance transactions: a cancel for the original item, and an order for the replacement item.

Display Customer Order History Screen

Purpose: Use this screen below to review cumulative and current ordering information for a sold-to customer.

Note:

Depending on the user's authority to credit card information, the system writes a record to the Credit Card Audit table when this screen is displayed.

Quotes: This screen does not include quote information for the sold to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: At a Work with Customers screen, select *Order History* for a customer; see [Selecting Customers](#). Or select *Order History* at a Create, Change or Display Customer Sold To screen (see [Creating and Updating Sold-to Customers \(WCST\)](#)).

Field	Description
Customer #	A unique number used to identify the customer you are reviewing. Numeric, 9 positions; display-only.
Customer name (Unlabeled field to the right of the customer number)	The name of the sold-to customer you are reviewing. Alphanumeric, 41 positions; display-only.

Field	Description
On order	<p>The total dollar value of all open, unshipped orders for this customer, <i>including</i> charges for merchandise, freight, tax, special handling, and shipping.</p> <p><i>Cancel:</i> This field subtracts the value of a canceled order/item.</p> <p><i>Soldouts:</i> This field does not include the amount of soldout items on an order.</p> <p><i>Exchanges:</i> This field includes the amount of exchange items on an order and is decreased once the exchange item ships.</p> <p><i>Negative order entry returns:</i> The system includes the dollar amount associated with returns entered as a negative order quantity in Order Entry if the order total is a positive amount; in this situation, the system updates the On order with the positive order total. When the system ships the regular items on the order, the system reduces the On order amount by the shipped order amount. If the order total is a negative amount, the system does not update the On order amount. When the system ships the regular items on the order, the system reduces the On order amount by the shipped order amount.</p> <p><i>Example 1:</i> If an order contains a return entered as a negative quantity for \$30.00 and a regular item to ship for \$50.00, the system updates the On order for the customer to \$20.00 (\$50.00 to ship - \$30.00 for return = \$20.00). Once the regular item ships, the system decreases the On order by the shipped order amount (\$50.00).</p> <p><i>Example 2:</i> If an order contains a return entered as a negative quantity for \$60.00 and a regular item to ship for \$50.00, the system does not update the On order for the customer (\$50.00 to ship - \$60.00 for return = -\$10.00). When the regular item ships, the system decreases the On order by the shipped order amount (\$50.00).</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The On Order amount is not net of hidden tax; see Related System Control Values for more information on VAT.</p> </div>
Active since	<p>If you suspect the on order amount is incorrect, you can use the Resetting Customer Sold To Amount On Order (RONO) menu option to reset the on order amount.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p> <p>The date of the customer's first order. The system uses the value in the Order date field in Order Entry.</p> <p>Numeric, 6 positions (in user date format); display-only, updated by the system.</p>

Field	Description
-------	-------------

 **Note:**

Each of the Amount fields described below represents the actual purchase price of merchandise only after applying any discounts, price overrides, or other repricing. However, if you use tax-inclusive pricing and VAT, amounts described below are net of hidden tax. In addition, if you process orders by multiple currencies based on offer, each amount has been converted into your local currency. See the beginning of this topic for more information.

Life-to-date Orders quantity

The BILL_ASYNC and ORDR_ASYNC background jobs update order history; see [Operating the Background Jobs](#) for more information.

Non-inventory items: The [Demand Update for Non-Inventoried Items \(E59\)](#) system control value controls whether the following totals are updated for non-inventory items.

The gross number of orders placed by this customer.

Updates:

If the Update Demand for Order Maintenance Transactions (C72) system control value is *selected*, this field increases when you add a detail line(s) to an order in Order Maintenance.

If the Update Demand for Order Maintenance Transactions (C72) system control value is *unselected*, this field does not update when you add a detail line(s) to an order in Order Maintenance.

Cancellations: This total reduces when you cancel an order only if you enter a cancel reason set to update demand; otherwise, the orders quantity remains the same and the [Cancels quantity](#) total increases.

The total does not increase when you enter a return through order entry or enter an exchange item on an order that is already open or held.

Numeric, 5 positions; display-only.

Field	Description
Orders amount	<p>The total merchandise value of the orders placed by the customer, including any backordered or soldout items. This total does not reflect returns created through order entry.</p> <p>Updates: If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>selected</i>, this field updates when you add a detail line(s) to an order in Order Maintenance. When you enter an exchange, the price of the exchange (replacement) item is added. If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>N</i>, this field does not update when you add a detail line(s) to an order in Order Maintenance, including an exchange item.</p> <p><i>Cancellations:</i> This total reduces when you cancel an order only if you enter a cancel reason set to update demand; otherwise, the orders amount remains the same and the <i>Cancel amount</i> increases.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Sales quantity	<p>The number of shipments to the customer. This total may be larger than the orders quantity if the Update Demand for Order Maintenance Transactions (C72) system control value is <i>unselected</i>, and you have added any items to this customer's orders in order maintenance.</p> <p>If an order has partial shipments on different days, each shipment updates the sales quantity; however, if two shipments occur on the same day, the sales quantity is increased just by 1.</p> <p>Numeric, 5 positions; display-only.</p>
Sales amount	<p>The total merchandise dollar value of orders shipped to the customer. This total may be larger than the orders amount if the Update Demand for Order Maintenance Transactions (C72) system control value is <i>unselected</i>, and you have added any items to this customer's orders in order maintenance.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Returns quantity	<p>The number of returns processed for the customer, including returns you process by entering a negative quantity in order entry or crediting a return through the return authorizations suite of functions (see <i>Managing Returns</i>). If you enter multiple returns during a single order entry, order maintenance, or return authorizations session, the quantity is increased just 1.</p>

 **Note:**

If you use the return authorizations suite, this total is updated when you credit the return.

Numeric, 5 positions; display-only.

Field	Description
Returns amount	The total merchandise dollar value of items returned by the customer, including returns you process by entering a negative quantity in order entry or through the return authorizations suite of functions (see Managing Returns).
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If you use the return authorizations suite, this total is updated when you credit the return.</p> </div>
Cancel quantity	<p>Numeric, 20 positions with a 2-place decimal; display-only.</p> <p>The number of orders or order lines canceled by the customer. If you cancel multiple items on an order in a single session or cancel the whole order, this total is increased just 1.</p> <p>This total does not include cancellations using a cancel reason whose Update demand field is <i>selected</i>.</p> <p>Methods for canceling items include order maintenance, Processing Item Substitutions (PSUB), and Working with Backorders Pending Cancellation (WBPC).</p> <p>Numeric, 5 positions; display-only.</p>
Cancel amount	<p>The total merchandise dollar value of items canceled by the customer.</p> <p>This total does not include cancellations using a cancel reason whose Update demand field is <i>selected</i>.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Exchange quantity	<p>The number of exchanges processed for the customer. If you exchange multiple items on an order in a single session, this total is increased just 1.</p> <p>Numeric, 5 positions; display-only.</p>
Exchange amount	<p>The total merchandise dollar amount of items exchanged by the customer. This amount represents the returned items, not the replacement items.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Soldout quantity	<p>The number of soldout items ordered by the customer. This includes items sold out automatically during order entry, backordered items sold out through Sell Out, and items sold out automatically through Processing Auto Soldout Cancellations (MASO).</p> <p>Numeric, 5 positions; display-only.</p>
Soldout amount	<p>Total merchandise dollar amount of soldout items ordered by the customer.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Warranty shipped dollar amount	<p>The total cost of warranty items shipped to the customer.</p> <p>Since warranty items are added to an order at no charge, the system uses the cost defined for the item. If the cost was overridden on the order detail line, the system uses the cost override.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Field	Description
Warranty returned dollar amount	<p>The total cost of warranty items returned or exchanged by the customer.</p> <p>Since warranty items are added to an order at no charge, the system uses the cost defined for the item to determine the warranty returned amount. If the cost was overridden on the order detail line, the system uses the cost override.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Last credit card	This field is not currently implemented.
Exp (Expiration date)	This field is not currently implemented.
Last order type	<p>A code that identifies how the order was received, such as a telephone, mail, fax, etc.</p> <p>Order types are defined in and validated against the Order Type table. See Establishing Order Types (WOTY).</p> <p>Alphanumeric, 1 position; display-only.</p>
Last order date	<p>The date of the most recent order for the customer. The system uses the value in the Order date field in order entry.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Last pay type	<p>The payment method used by the customer on the most recent order. If there was more than one pay type on the order, the last payment method entered appears.</p> <p>Pay type codes are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>Numeric, 2 positions; display-only.</p>
Last order amt	<p>The original dollar value of merchandise on the customer's most recent order. This field does not update to reflect subsequent transactions against the order that changed the order total, such as cancellations, soldouts, or adding items. Zero if the most recent order for the customer was a return through order entry.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Last source	<p>The source code used on the header of the customer's most recent order (even if the order was a return through order entry) or catalog request. The source code identifies a segment of your customer base. You can analyze sales by source code. Additionally, the source code determines the method to calculate freight and pricing on an order. See Working with Source Codes (WSRC).</p> <p>Alphanumeric, 7 positions; display-only.</p>
Last mail date	<p>The most recent date when you mailed an offer (catalog) to the customer. The system updates this field when you print catalog mailing labels through Processing Catalog Requests (PCAT).</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Ref/Bal due write off	<p>The total amount eligible to be written off (or applied as an additional charge/credit) for the customer from short-paying (balance dues) or over-paying (refunds) orders.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Screen Option	Procedure
Review customer item class history	Select <i>Item Classes</i> to advance to the Display Customer Item Class Screen .
Review customer order history detail	Select <i>History Details</i> . See Customer Sold To Order History Screen (Reviewing Detail) .
Review order history by entity	Select <i>Entity Details</i> to advance to the Display Customer Order/Entity History Screen .

 **Note:**

This option is available only if the [Track Customer History at Entity Level \(F89\)](#) system control value is *selected*.

Display Customer Item Class Screen

Purpose: Use this screen to review item classes assigned to an item the customer ordered.

Quotes: This screen does not include items included on quotes for the customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Item Classes* at the [Display Customer Order History Screen](#).

Field	Description
Customer #	A unique number to identify a customer. Numeric, 9 positions; display-only.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer placing the order and/or the company associated with that customer. Alphanumeric, 41 positions; display-only.
Class (Item class)	A code used to group similar items for reporting, merchandising, customer service information, and demand tracking. Item class codes are defined in and validated against the Item Class table. You assign an item class to an item at the first Create or Change Item screen. See Working with Item Classes (WICL) for more information on working with item class; see Working with Existing Items (MITM) for more information on assigning an item to an item class. Alphanumeric, 40 positions; display-only.
Description (Item class description)	The description of the item class. Alphanumeric, 40 positions; display-only.
# of orders	The total number of orders the customer has placed for items in this item class. Numeric, 5 positions; display-only.
# of units	The total number of units the customer has ordered for items in this item class. Numeric, 5 positions; display-only.

Field	Description
LTD total (Life-to-date total)	The dollar total of all merchandise the customer has ordered from this item class to date. Numeric, 20 positions with a 2-place decimal; display-only.
Date of last order	The date when the customer last placed an order for an item from this class, or added an item from this class in order maintenance. Numeric, 6 positions (in user date format); display-only.

Screen Option	Procedure
Review item class history detail	Select <i>Display</i> for an item class to advance to the Display Customer Item Class History Screen (Reviewing Detail) .
Review item class history by entity	Select <i>Entity History</i> for an item class to advance to the Display Customer Item Class Entity Screen (Reviewing History) .

 **Note:**

This option is available only if the [Track Customer History at Entity Level \(F89\)](#) system control value is *selected*.

Display Customer Item Class History Screen (Reviewing Detail)

Purpose: Use this screen to review the sold-to customer's order and sales history for a particular item class.

Quotes: This screen does not include items included on quotes for the customer; see [Entering Pre-Order Quotes](#).

 **Note:**

See [Display Customer Order History Screen](#) for more information on how the system calculates order activity totals.

How to display this screen: Select *Display* for an item class at the [Display Customer Item Class Entity Screen \(Reviewing History\)](#).

Field	Description
Customer #	A unique number to identify a customer. Numeric, 9 positions; display-only.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer placing the order and/or the company associated with that customer. Alphanumeric, 41 positions; display-only.

Field	Description
Cls (Item class)	A code used to group similar items for reporting, merchandising, customer service information, and demand tracking. Item class codes are defined in and validated against the Item Class table. You assign an item class to an item at the first Create or Change Item screen. See Working with Item Classes (WICL) for more information on working with item class; see Working with Existing Items (MITM) for more information on assigning an item to an item class. Alphanumeric, 40 positions; display-only.
Description (Item class description)	The description of the item class. Alphanumeric, 40 positions; display-only.
# of orders	The total number of orders the customer has placed for items in this item class. Numeric, 5 positions; display-only.
# of units	The total number of units the customer has ordered for items in this item class. Numeric, 5 positions; display-only.
LTD total (Life-to-date total)	The dollar total of all merchandise the customer has ordered from this item class to date. Numeric, 20 positions with a 2-place decimal; display-only.
Date of last order	The date when the customer last placed an order for an item from this class, or added an item from this class in order maintenance. Numeric, 6 positions (in user date format); display-only.
Life-to-date totals:	
Sales	The total units and merchandise total shipped to the sold-to customer for this item class. Quantity: numeric, 5 positions; display-only. Amount: numeric, 20 positions with a 2-place decimal; display-only.
Returns	The total units and merchandise total returned by the sold-to customer for this item class. Quantity: numeric, 5 positions; display-only. Amount: numeric, 20 positions with a 2-place decimal; display-only.
Cancel	The total units and merchandise total canceled by the sold-to customer for this item class. Quantity: numeric, 5 positions; display-only. Amount: numeric, 20 positions with a 2-place decimal; display-only.
Exchanges	The total units and merchandise total exchanged by (that is, returned for exchange by) the sold-to customer for this item class. Quantity: numeric, 5 positions; display-only. Amount: numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Sold outs	<p>The total units and merchandise total sold out, either in order entry/maintenance or through process auto soldouts, the sold-to customer for this item class.</p> <p>Quantity: numeric, 5 positions; display-only.</p> <p>Amount: numeric, 20 positions with a 2-place decimal; display-only.</p>

Customer Sold To Order History Screen (Reviewing Detail)

Purpose: This screen displays sales history associated with each order placed by the customer. Each entry on this screen represents an order/billing history transaction; see [Order Billing History Detail Screen](#).

Quotes: This screen does not include quote information for the sold to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *History Details* at the [Display Customer Order History Screen](#).

Field	Description
Tran date (Transaction date)	<p>The date when order or sales activity occurred for the customer. The system lists order or sales activity by date starting with the most recent date. Each entry on this screen represents an order/billing history transaction for an item on an order.</p> <p>The transaction date does not appear for consolidated records. See the following fields.</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Consolidated from	<p>The date of the earliest record that was used to derive the totals for the consolidated record. If a record has been consolidated, any fields not retained in the consolidation appear blank. This information appears only for consolidated records; see Consolidating Order Billing History (MOBH).</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Consolidated to	<p>The date of the latest record that was used to derive the totals for the consolidated record. See above for more information.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Qty (Order quantity)	<p>The total unit quantity of the item ordered.</p> <p>If blank: If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>selected</i>, transactions you enter in order maintenance will appear on this screen.</p> <p>This field and the Amount field are blank for cancellations, returns, exchanges, and sellouts. However, if a cancel reason code whose Update demand field is <i>selected</i> was used, the amount for this field will display.</p> <p>Numeric, 5 positions; optional.</p>

Field	Description
Amount	<p>The total merchandise dollar amount ordered on the date shown. This total does not include freight, handling, or other charges.</p> <p>If blank: If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>selected</i>, transactions you enter in order maintenance will appear on this screen.</p> <p>This field and the <i>Qty (Order quantity)</i> field are blank for cancellations, returns, exchanges, and sellouts. However, if a cancel reason code whose Update demand field is <i>selected</i> was used, the amount for this field will display.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Sales Qty (Quantity)	<p>The total number of units shipped on the date shown.</p> <p>Numeric, 5 positions; optional.</p>
Amount	<p>Total merchandise dollar value of shipments for the date shown.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Entity	<p>The code representing the entity associated with the source code on order header. Each source code is associated with an entity through its division.</p> <p>Entities are defined in and validated against the Entity table. See Working with Entities (WENT).</p> <p>Numeric, 3 positions; display-only.</p>

Screen Option	Procedure
Display order history detail	Select <i>Display</i> for a record to advance to the Order Billing History Detail Screen .

Display Customer Order/Entity History Screen

Purpose: Use this screen to review the entities in which the customer has placed orders, and to select an entity for further inquiry.

The system tracks entity history for a customer even if there has not been any order activity (for example, if the customer has requested a catalog); however, the order totals and date of last order will be blank.

Quotes: This screen does not include quote information for the sold to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Entity Details* at the [Display Customer Order History Screen](#).

Note:

This screen is available only if the Track Customer History at Entity Level (F89) system control value is *selected*.

See [Order Billing History Detail Screen](#) for remaining fields.

Field	Description
Ent (Entity)	<p>A code representing the entity for which the order activity took place. An order is associated with an entity through the source code on the order header; each source code is assigned to a division, and each division points to an entity.</p> <p>Entities are defined in and validated against the Entity table. See Working with Entities (WENT).</p> <p>Numeric, 3 positions; optional.</p>
Entity description (Unlabeled field to the right of the entity code)	<p>The description of the entity.</p> <p>Alphanumeric, 25 positions; display-only.</p>
LTD order...# of	<p>The gross number of orders placed by this customer in this entity.</p> <p>Updates: If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>selected</i>, this field increases when you add a detail line(s) to an order in Order Maintenance. If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>unselected</i>, this field does not update when you add a detail line(s) to an order in Order Maintenance.</p> <p><i>Cancellations:</i> This total reduces when you cancel an order only if you enter a cancel reason set to update demand; otherwise, the orders quantity remains the same and the Cancels total increases.</p> <p><i>Preexisting orders:</i> Orders you entered before the Track Customer History at Entity Level (F89) Level system control value was <i>selected</i> are not included in this total; however, items you added in order maintenance are included if the Update Demand for Order Maintenance Transactions (C72) system control value is <i>selected</i>.</p> <p>Numeric, 5 positions; display-only.</p>

Field	Description
LTD order...amount (Life-to-date order amount)	<p>The merchandise dollar total of orders placed by this customer in this entity.</p> <p>Updates: If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>selected</i>, this field increases when you add a detail line(s) to an order in Order Maintenance. If the Update Demand for Order Maintenance Transactions (C72) system control value is <i>unselected</i>, this field does not update when you add a detail line(s) to an order in Order Maintenance.</p> <p>Cancellations: This total reduces when you cancel an order only if you enter a cancel reason set to update demand; otherwise, the orders quantity remains the same and the Cancels total increases.</p> <p>Preexisting orders: Orders you entered before the Track Customer History at Entity Level (F89) Level system control value was <i>selected</i> are not included in this total; however, items you added in order maintenance are included if the Update Demand for Order Maintenance Transactions (C72) system control value is <i>selected</i>.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Date of last order	<p>The most recent date when you entered an order for this customer in this entity.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Screen Option	Procedure
Review customer entity history details	Select <i>Display</i> for an entity to advance to the Display Customer Entity History Screen (Reviewing Order Detail) .

Display Customer Entity History Screen (Reviewing Order Detail)

Purpose: Use this screen to review details about a customer's order history for a particular entity.

The system tracks entity history for a customer even if there has not been any order activity (for example, if the customer has requested a catalog); however, the order totals and date of last order will be blank.

Quotes: This screen does not include quote information for the sold to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Display* for an entity at the [Display Ship To Order/Entity History Screen](#).

Note:

This screen is available only if the [Track Customer History at Entity Level \(F89\)](#) system control value is *selected*.

See [Display Customer Order History Screen](#) and [Display Customer Order/Entity History Screen](#) for additional field descriptions.

Note:

Each field on this screen represents history for this customer within this entity only.

Field	Description
Entered date	The date that the first activity for this customer within the entity took place. This activity might be something other than entering an order, such as a return or exchange. Numeric, 6 positions (in user date format); display-only.

Display Customer Item Class Entity Screen (Reviewing History)

Purpose: Use this screen to review customer item class history broken out by entity, or to select an entity for further inquiry.

Quotes: This screen does not include quote information for the sold to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Item Class Entity* for an item class at the [Display Customer Item Class Screen](#).

Note:

This screen is available only if the Track Customer History at Entity Level (F89) system control value is *selected*.

See [Display Customer Item Class Screen](#) and [Display Customer Order/Entity History Screen](#) for field descriptions.

Note:

Each field on this screen represents history for this customer within this entity and item class only.

Screen Option	Procedure
Display details about the customer's order history for this item class and entity	Select <i>Display</i> for an entity to advance to the Display Customer Item Class Entity Details Screen (Reviewing History) .

Display Customer Item Class Entity Details Screen (Reviewing History)

Purpose: Use this screen to review detailed information about a customer's order history for a particular item class and entity.

Quotes: This screen does not include quote information for the sold to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Display* for an entity at the [Display Customer Item Class Entity Screen \(Reviewing History\)](#).

Note:

This screen is available only if the Track Customer History at Entity Level (F89) system control value is *selected*.

See [Display Customer Item Class History Screen \(Reviewing Detail\)](#) and [Display Customer Order/Entity History Screen](#) for field descriptions.

Note:

Each field on this screen represents history for this customer within this entity and item class only.

Display Ship To Item History Screen

Purpose: Use this screen, to review item history for a ship-to customer associated with a sold-to customer.

You can advance to this screen and subsequent screens only if the [Track item history](#) field for the sold-to customer is set to *Sold To + Ship To Track*; however, the system continues to track item history regardless of this setting.

Quotes: This screen does not include quote information for the ship to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Item History* for a ship to customer at the [Work with Customer Ship Tos Screen](#), which is available by selecting *Item History* at any Create/Change/Display Customer screen in customer maintenance, or by selecting *Item History* for a sold to customer at a customer maintenance scan screen.

Although it includes ship-to item history only, the Display Ship To Item History screen resembles the [Customer Sold To Item History Screen](#); see this screen for remaining field descriptions.

Field	Description
Ship to #	A unique number to identify the ship-to customer for the sold-to customer. There can be up to 999 ship-to customers for a sold-to customer. The customer's name appears to the right of the ship-to number. If there is a company name, this information is included before the name, followed by the word <i>ATTN</i> . Ship-to number: numeric, 3 positions; display-only. Name: alphanumeric, 41 positions; display-only.

Screen Option	Procedure
Display order billing history detail	Select <i>Display</i> for an item to advance to the <i>Order Billing History Detail Screen</i> .

 **Note:**

The same information is available by selecting the ship to customer's order billing history as by selecting the sold to customer's history.

Display Ship To Order History Screen

Purpose: Use this screen to review order totals for a ship to customer.

Quotes: This screen does not include quote information for the ship to customer; see *Entering Pre-Order Quotes*.

How to display this screen: Select *Order History* for a ship to customer at the *Work with Customer Ship Tos Screen*, which is available by selecting *Order History* at any Create/Change/Display Customer screen in customer maintenance, or by selecting *Ship To's* for a sold to customer at a customer maintenance scan screen. See *Creating and Updating Sold-to Customers (WCST)*.

 **Note:**

You can advance to this screen only if the *Track item history* field for the sold-to customer is set to track sold-to and ship-to item history; however, the system continues to track item history regardless of this setting.

Although it includes ship-to customer history only, this screen resembles the *Display Customer Order History Screen*. See this screen and the *Display Ship To Item History Screen* for field descriptions.

 **Note:**

Each field on this screen represents history for this ship-to customer only.

Display Ship To Order History Details Screen

Purpose: Use this screen to review order detail for a ship to customer, or to select an order detail line for further inquiry. Each entry on this screen represents an order/billing history transaction; see *Order Billing History Detail Screen*.

Quotes: This screen does not include quote information for the ship to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *History Details* at the [Display Ship To Order History Screen](#).

 **Note:**

You can advance to this screen only if the [Track item history](#) field for the sold-to customer is set to 3 (track sold-to and ship-to item history); however, the system continues to track item history regardless of this setting.

Although it includes ship-to customer order history details only, this screen resembles the [Customer Sold To Order History Screen \(Reviewing Detail\)](#); see this screen for field descriptions.

 **Note:**

Each field on this screen represents history for this ship-to customer only.

Display Ship To Order/Entity History Screen

Purpose: Use this screen to review the entities in which a ship to customer has had order activity, and to select an entity for further inquiry.

Quotes: This screen does not include quote information for the ship to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Entity Details* at the [Display Ship To Order History Screen](#).

 **Note:**

This screen is available only if the Track Customer History at Entity Level (F89) system control value is *selected*. Also, you can advance to this screen only if the [Track item history](#) field for the sold-to customer is set to *Sold To + Ship To Track* (track sold-to and ship-to item history); however, the system continues to track item history regardless of this setting.

Although it includes ship-to customer order/entity history only, this screen resembles the [Display Customer Order/Entity History Screen](#); see this screen for field descriptions.

 **Note:**

Each field on this screen represents history for this ship-to customer only.

Display Ship To Entity History Screen (Order History Details by Entity)

Purpose: Use this screen to review order history for a particular ship to customer within a particular entity.

Quotes: This screen does not include quote information for the ship to customer; see [Entering Pre-Order Quotes](#).

How to display this screen: Select *Display* for an entity at the [Display Ship To Order/Entity History Screen](#).

 **Note:**

You can advance to this screen only if the [Track item history](#) field for the sold-to customer is set to *Sold To + Ship To Track* (track sold-to and ship-to item history); however, the system continues to track item history regardless of this setting.

Although it includes ship-to customer entity history only, this screen resembles the [Display Customer Entity History Screen \(Reviewing Order Detail\)](#); see this screen for field descriptions.

 **Note:**

Each field on this screen represents history for this ship-to customer only.

Work with User Fields Screen

Purpose: Use the Work with User Fields screen to enter, change, delete or display information in user-defined fields.

The user-defined fields are created through [Setting Up User-Defined Fields \(WUDF\)](#). You can create fields for whatever type of additional information you want to add to the available tables.

How to display this screen:

- Select *User Defined Opt.* for a record at each of the “Work with” screens where user-defined fields are available (see [Setting Up User-Defined Fields \(WUDF\)](#) for a listing), or
- Select *Customer User Defined Fields* at the [More Customer Sold To Options Screen](#) (see [Creating and Updating Sold-to Customers \(WCST\)](#))

Also, this screen may appear automatically when you enter an order for a new customer through Order Entry. See [Setting Up User-Defined Fields \(WUDF\)](#) for more information.

You can enter user-defined fields for customers at this screen in customer maintenance only if the user-defined File Code is *CST* for Customer Sold To.

Note:

Only fields identified as “input” fields appear during Order Entry; however, you can display all fields (“input” and “output”) wherever else this screen is available.

Field	Description
Customer #	A unique number to identify the customer who placed the order. Customer numbers are assigned automatically by the system.

Note:

This field varies, depending on the type of user-defined field you are working with. See [Setting Up User-Defined Fields \(WUDF\)](#).

**Customer name
(Unlabeled field to the
right of the Customer#
field)**

Numeric, 9 positions; display-only.

The name or company name associated with the customer number.

Note:

This field varies, depending on the type of user-defined field you are working with. See [Setting Up User-Defined Fields \(WUDF\)](#).

Field

Alphanumeric, 41 positions; display-only.

The label associated with the user-defined field, which may be a field for you to enter a date, text, or a number. The corresponding entry, if any, displays to the right of the field.

Numeric Fields

Numeric fields appear on the left side of the screen.

Numeric, 16 positions.

Text Fields

Text fields appear in the center of the screen.

Alphanumeric, 30 positions.

Date Fields

Date fields appear on the right side of the screen.

Numeric, 6 positions; in user date format.

Screen Option	Procedure
Change a user-defined field	Select <i>Change</i> for a field to advance to the Change User Field Screen .
Delete a user-defined field	Select <i>Delete</i> for a field to delete it.

Screen Option	Procedure
Display a user-defined field	Select <i>Display</i> for a field to advance to the Display User Field screen. You cannot update any information on this screen. See Work with User Fields Screen and Change User Field Screen for field descriptions.

Change User Field Screen

To change: Select *Change* for a user field at the *Work with User Fields Screen* to advance to the Change User Field screen. At this screen, you can:

- enter information in the field, or
- change information in the field, or
- delete information in the field

About this screen: This screen and the Display User Field screen each contain a Key field. This field indicates the sequence number assigned to the field through the [Work with User Defined Field Detail Screen \(Defining the Fields\)](#). This field varies, depending on the type of user-defined field you are working with. See [Setting Up User-Defined Fields \(WUDF\)](#).

Because each field on a User Fields Screen is user-defined, the Key field helps you identify the specific field you want to use. This is necessary, for example, if you are writing your own program or Query that includes a specific field.

See [Work with User Fields Screen](#) for remaining field descriptions.

Reviewing Customer Address Changes

Purpose: When you update a sold-to or ship-to customer name or address, the system records this information in the Customer Address Change table (*CSCACP*). The system also writes a message line to the Customer Notes table. You can review address changes through the Work with Customers function.

Which changes does the system capture? The system captures name, address and phone number changes to sold-to and ship-to customer records. However, the system does not capture changes to the prefix, suffix, company, and country for sold-to customers in the Customer Address Change table unless other name or address fields are changed at the same time. The system does record changes to these fields for ship-to customers.

Deleted customers: There is no way to review deleted customer records. The system does, however, record customer record deletions in the Customer Address Change table. These records have a status of *D* (unlike other address changes, which have a status of *C*). This information may be useful if you extract information from this table for an outside service who works with your customer list.

In this topic:

- [Display Address Changes Screen](#)
- [Display Previous Address Screen \(Comparing Current and Previous Addresses\)](#)
- [Edit Customer Notes \(Reviewing Address Change Messages\)](#)

Display Address Changes Screen

How to display this screen:

- Select *Previous Addr* for a sold-to customer at a Work with Customer screen, or next to a ship-to customer at the Work with Customer Ship To screen. See [Selecting Customers](#) or [Creating and Updating Ship-to Customers \(WCST\)](#).
- Select Customer Address Change History at the [More Customer Sold To Options Screen](#).

Note:

The name and address that display on this screen are the customer's previous address, before applying the update.

The information on this screen is from the customer's previous address, before applying the update. All of the fields on this screen are display-only.

Field	Description
Name	The last and first name of the customer, separated by a comma. The customer name also displays below. Alphanumeric, 25 positions (last name) and 15 positions (first name).
Customer number	A unique number to identify the sold-to customer. Numeric, 9 position; assigned by the system.
Company	The name of the customer's company. The company name also displays below. Alphanumeric, 30 positions.
Date	The date you updated the address. Numeric, 6 positions (in user date format).
Ship to number	The number of a ship-to customer that is associated with the sold-to customer. A zero displays if you are reviewing sold-to customer address changes. Numeric, 3 positions.
Address (Unlabeled fields below the customer or company name)	The customer's address, consisting of: Street address (alphanumeric, 32 positions) City (alphanumeric, 25 positions) State (alphanumeric, 2 positions) Postal code (alphanumeric, 10 positions)

Screen Option	Procedure
Display an address change	Select <i>Display</i> for an address change record to advance to the Display Previous Address Screen (Comparing Current and Previous Addresses) .

Display Previous Address Screen (Comparing Current and Previous Addresses)

Purpose: Use this screen to compare a sold-to or ship-to customer's current address with the customer's address before you updated it.

How to display this screen: Select *Display* for an address change record at the [Display Address Changes Screen](#).

How to use this screen: This screen displays the customer's current name and address on the top portion of the screen, and the customer's name and address before the change on the bottom portion. If the address update on the screen is the most recent one you have taken for the customer, you can determine what information was changed by comparing the top and bottom portions of the screen. (If you have taken additional updates since the date of the update on the screen, it will not be obvious what information you changed with this update, since the customer's current name and address displays on the top portion of the screen.)

All fields on this screen are display-only.

Field	Description
Current address:	
Customer (Customer number)	A unique number to identify a sold-to customer. Numeric, 9 positions.
Match code	A unique code, composed of portions of the customer's name and address, used for duplicate or fraud checking. See Setting Up Match Codes (MMCH) . Alphanumeric, up to 15 positions.
Entered	The date you added the customer to your customer base. Numeric, 6 positions (in user date format).
Name	The customer's name, consisting of: Prefix The customer's title, such as Ms. or Dr. Alphanumeric, 3 positions. First name The customer's first name. Alphanumeric, 15 positions. Middle initial The customer's middle initial. Alphanumeric, 1 position. Last name The customer's last name. Alphanumeric, 25 positions. Suffix The customer's suffix, such as Junior or III. Alphanumeric, 3 positions.
Company	The name of the customer's company. Alphanumeric, 30 positions.
Street	The customer's street address. Alphanumeric, 32 positions.
Apt/suite	The customer's apartment or suite number. Alphanumeric, 10 positions.
Address	Additional address information. Alphanumeric, three lines of 32 positions each.
Postal code	The customer's postal or zip code. Alphanumeric, 10 positions.

Field	Description
City	The customer's city. Alphanumeric, 25 positions.
St (State)	The customer's state or province. Alphanumeric, 2 positions.
Country	The customer's country. Country codes are defined in and validated against the Country table. See Setting Up the Country Table (WCTY) . Alphanumeric, 3 positions.
Phone numbers	The customer's day, evening, and third (fax or mobile) phone numbers and extensions.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the Fax or Mbl (mobile) number.</p> </div>
	<p>You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY).</p> <p>Alphanumeric, one 14-position field (phone number) and one 4-position field (phone extension); optional.</p>
Previous address:	The fields on the previous address portion of the screen that are not described above are:
Change date	The date and time the address was updated. Date: numeric, 6 positions (in user date format). Time: numeric, 6 positions (HHMMSS format).
User	The identification of the user who processed the address change. In the case of an update through an integration layer process (such as the ORDER_IN job), this field identifies the user who started the process. Alphanumeric, 10 positions.
Update	The source of the update. Valid values are: <ul style="list-style-type: none"> • WCST = Work with Customers • OEOM = Order Entry or Order Maintenance (includes creating orders through the order API) • NCOA = NCOA update • CONV = Conversion • PHON = Updates of phone numbers only, regardless of the source (the system uses this value for sold-to customers only) Alphanumeric, 4 positions; assigned by the system.

Field	Description
Type	The type of customer record. Valid values are: <ul style="list-style-type: none"> • O = sold-to customer • I = ship-to customer Alphanumeric, 1 position; assigned by the system.

Edit Customer Notes (Reviewing Address Change Messages)

Purpose: The system writes a message to customer notes every time it creates an address update record. The system writes messages for ship-to customers to the related sold-to customer notes, as there are no separate customer notes records for ship-to customers.

You can use customer notes to check when customer address updates were applied, and which operators applied them.

Customer notes have additional uses. See [Edit Customer Notes Screen](#).

How to display this screen:

- select *Notes* for a customer at a Work with Customer screen scan screen; see [Work with Customers Screens \(Selecting a Customer\)](#)
- select *Notes* at the first or second Create or Change Cust Sold To screen (see [Creating and Updating Sold-to Customers \(WCST\)](#))
- in Order Entry, select *Options*, and then select *Notes* for Customer Messages.

Update messages: For most address updates that you process, the system writes the following message to customer notes:

Customer Address Change Was Made

When you update an address through cross-company maintenance, the system writes the following message:

Address Updated - by User Submitted Process

Working with Customer Email Addresses

Purpose: Use the Work with Customer Email Address screen to review and work with the email addresses on record for a sold-to customer, including the one flagged as the primary email address.

Primary email address: The primary address is the one displayed on most screens, such as in customer inquiry and in catalog requests.

The primary address also defaults to the order email address. When you first create an email address for a customer, it is flagged as the primary email address, which is stored both at the customer level and in the Customer Sold To Email Address table. Other email addresses on record for the customer are also retained in the Customer Sold To Email Address table.

 **Note:**

The ability to store multiple email addresses is available only for sold-to customers. Ship-to customers and bill-to customers can have only one email address on table.

Creating email addresses: You can create an email address for a customer by:

- entering the email address at any screen where the field is enterable, such as order entry, customer maintenance, and catalog requests. The address you enter in customer maintenance is flagged as the customer's primary email address.
- using the [Create Email Address Screen](#) or the [Select Customer Email Address Screen](#). You have the option of flagging the email address as primary.
- loading an order through the generic order interface, and specifying an *order_email*, or in certain situations an *ind_email_address* or a *sold_to_email*. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

For more information: See [Working with an Order-Level Email Address](#) for more information on how the system updates the Customer Sold To Email Address table, and other email addresses, when creating orders through various methods.

Email Address Validation

When you enter or receive an email address, the system verifies that:

- there is an @ sign and a period (.)
- there is some text:
 - before the @ sign
 - between the @ sign and the period
 - after the period

If the email address does not meet these criteria, the system does not let you create it.

For example, the system would not let you create an email address such as:

- @example.com
- sbrown@example
- sbrown@.org
- www.example.com

Any additional validation? The system does not confirm that your entry represents a valid email address, or that the domain name (such as “example” in example.com) even exists. However, when you work with email addresses at the [Create Email Address Screen](#) or [Select Customer Email Address Screen](#) only, the system does display a warning message if the extension of the email address does not match one of the following:

- .com
- .net
- .gov
- .org

- .mil
- .edu
- .us
- .can
- .uk

You can still create the email address even if it does not use one of the extensions listed above.

In this topic:

- [Work with Customer Email Address Screen](#)
- [Create Email Address Screen](#)
- [Select Customer Email Address Screen](#)
- [Receiving Customer Email Status Updates From an External System](#)
 - [Customer Email Status Updates Setup](#)

 - [Customer Email Update Examples](#)
 - [Unmatched Email Status Report](#)

Work with Customer Email Address Screen

Purpose: Use this screen to review or work with the email addresses on file for a sold-to customer. See [Working with Customer Email Addresses](#) for an overview.

How to display this screen: [Select Customer Email Addresses](#) at the [More Customer Sold To Options Screen](#) or the [Display More Options Screen](#).

Field	Description
Customer #	A unique number to identify the customer you are currently working with. Numeric, 9 positions; display-only, assigned by the system.
Customer name	The customer's name or company name. Alphanumeric, 41 positions; display-only.
Email address	An email address for the customer, stored in the Customer Sold To Email table. Fraud checking: An order goes on <i>EC</i> hold if this email address matches an email address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF) . Alphanumeric, 50 positions; optional.

Field	Description
Opt in/out	<p>Indicates the preferred method of correspondence.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>O1</i> (Email): Email is the preferred method of correspondence. • <i>O2</i> (Order-only email): Use email for order-related correspondence only; generate a document for other correspondence. • <i>O3</i> (No email): Do not use email for any correspondence; generate a document instead. • <i>O4</i> (Do not ask the customer): Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>Defaults from the Default Opt In/Opt Out Flag (G97) system control value, but you can override it.</p> <div style="border-left: 2px solid #0070C0; padding-left: 10px; margin-top: 10px;"> <p> Note:</p> <p>The above values use the letter O, not the number 0 (zero).</p> </div> <p>The system updates this field for the primary email address when you change the setting of the Opt in/Opt out value at other screens, such as order maintenance, or catalog requests. The opt-in/out setting is updated when you override the setting in order entry only if the email address for the order defaulted from the customer's primary email address.</p> <p>Email notifications: See When Does the System Generate an Email Notification? for an overview.</p> <p>Outbound email API: The opt in/opt out settings controls the generation of the <i>Outbound Email XML Message (CWEmailOut)</i> using the same logic as the generation of outbound emails. See <i>Outbound Email API</i> in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for an overview.</p> <p>Updating from an external system: See Receiving Customer Email Status Updates From an External System for an overview and the required setup.</p> <p>Alphanumeric, 2 positions; required.</p>
Format	<p>Indicates the customer's preference regarding email format.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>T</i> = plain text • <i>H</i> = HTML <p>This field is informational only.</p> <p>Alphanumeric, 1 position; display-only.</p>
Primary	<p>An asterisk (*) indicates that this is the customer's primary email address, and this email address is highlighted. The primary address is the one that defaults in order entry.</p> <p>Alphanumeric, 1 position; display-only.</p>

Option	Procedure
Create a new email address for the customer	Select <i>Create</i> to advance to the Create Email Address Screen .
Change an existing email address for the customer	Select <i>Change</i> for an email address to advance to the Change Email Address Screen. You can change the Email address, Display name, Opt in/out field, or the Format. See Create Email Address Screen for field descriptions.
Delete an email address	Select <i>Delete</i> for an email address to delete the email address. You cannot delete the primary email address.
Display an email address	Select <i>Display</i> for an email address to advance to the Display Email Address Screen. You cannot change any information on this screen. See Create Email Address Screen for field descriptions.
Mark an email address as the customer's primary email address	Select <i>Mark as primary</i> for an email address to identify it as the customer's primary address. The primary email address is highlighted on this screen, and is the one that defaults in order entry.

 **Note:**

The system does not validate that the email address is correctly formatted. You can use the [Select Customer Email Address Screen](#) to correct the email address if it is incorrectly formatted.

Create Email Address Screen

Purpose: Use this screen to create an email address for a customer. You can also create an email address by entering the address at any screen where the field is enterable; in this situation, the previous email address is retained in the Customer Sold To Email table.

The system does not automatically flag an email address as primary when you create it at this screen. If the email address is not flagged as primary, you can still delete it, even if it is the only email address for the customer.

How to display this screen: Select *Create* at the [Work with Customer Email Address Screen](#).

Field	Description
Customer number	<p>A unique number to identify the customer you are currently working with. The customer's name or company name displays to the right.</p> <p>Customer number: numeric, 9 positions; display-only, assigned by the system.</p> <p>Customer name: alphanumeric, 41 positions; display-only.</p>
Email address	<p>An address that you can use to send emails to the customer.</p> <p>See Email Address Validation for a discussion of how the system validates email addresses for a customer at this screen and at other screens.</p> <p>Change screen: You can change this field on an existing email address; however, the system does not allow you to create two email address records for a customer if they have identical Email address fields.</p> <p>Alphanumeric, 50 positions; required.</p>
Display name	<p>The name of the customer as displayed in email correspondence. This field is informational only.</p> <p>Alphanumeric, 50 positions; optional.</p>
Opt in/out	<p>Indicates the preferred method of correspondence.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>All Emails</i> = Email is the preferred method of correspondence. • <i>Order Emails Only</i> = Use email for order-related correspondence only; generate a document for other correspondence. • <i>No Emails</i> = Do not use email for any correspondence; generate a document instead. • <i>Do Not Ask</i> = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>Defaults from the <i>Default Opt In/Opt Out Flag (G97)</i> system control value, but you can override it.</p>

 **Note:**

The above values use the letter O, not the number 0 (zero).

The system updates this field when you change the setting of the Opt in/Opt out value at any other screen, such as order entry, order maintenance, or catalog requests.

Email notifications: See [When Does the System Generate an Email Notification?](#) for an overview.

Required.

Field	Description
Format	<p>Indicates the customer's preference regarding email format. Valid values are:</p> <ul style="list-style-type: none"> • <i>Text</i> • <i>HTML</i> <p>This field is informational only. Optional.</p>
Source	<p>Indicates how you obtained the email address. Valid values are:</p> <ul style="list-style-type: none"> • <i>Customer API</i>: You received the email address through the <i>Generic Customer API</i>. • <i>Customer email</i>: You entered the address at this screen. • <i>Order entry</i>: You received the email while processing a new order (including orders created through the order API), through an e-commerce address update, or entered it for a customer membership recipient. • <i>Customer maintenance</i>: You entered the address at a screen in customer maintenance or received it through a catalog request. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 20 positions; display-only.</p>
Create date	<p>The date when the email address record was created. Numeric, 6 positions (in user date format format); display-only.</p>
Create time	<p>The time when the email address record was created. Numeric, 6 positions (HH:MM:SS format); display-only.</p>
Change date	<p>The most recent date when you changed the Email address, Display name, Opt in/out field, or Format. Numeric, 6 positions (in user date format); display-only.</p>
Change time	<p>The most recent time when you changed the Email address, Display name, Opt in/out field, or Format. Numeric, 6 positions (HH:MM:SS format); display-only.</p>
Last primary	<p>The most recent date when the email address was flagged as the primary address. The system flags an email address as the primary address when it is created through customer maintenance or a catalog request, or if it is the first email address for the customer. Numeric, 6 positions (in user date format); display-only.</p>

Field	Description
Last used/customer	<p>The last date when this email address was used by the customer. The system updates this field for the primary email address when you:</p> <ul style="list-style-type: none"> • create an order for the customer • create a catalog request for the customer • maintain an order for the customer <p>The above updates take place regardless of how the information was received. For example, the system updates this field if you receive an order through the order API or create it through Generating Membership Orders (EGMO).</p> <p>The system also updates this field when you:</p> <ul style="list-style-type: none"> • receive an email from the customer • assign an unrouted email to the customer (if the email address on the unrouted email matched this email address for the customer) <p>Numeric, 6 positions (in user date format); display-only.</p>
Last used/system	<p>The last date when the system generated an email to this address. The system updates this field for the primary email address when you generate a notice such as a:</p> <ul style="list-style-type: none"> • backorder notice email through • soldout notification email through Generating Soldout Notifications (MSON) • shipment confirmation email through Generate Backorder Notices (GBOC)/Sending Internet Order Ship Confirmation (ESCF) • credit card credit email through Processing Refunds (MREF) <p>See When Does the System Generate an Email Notification? for a listing of system-generated emails.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Select Customer Email Address Screen

Purpose: Use this screen to review existing email addresses for the customer, to select an existing email address as the primary address, or to create a new email address.

Note:

Recipient or gift orders: When you advance to this screen from the order header screen in order entry or order maintenance, the email addresses are associated with the customer who places the order, not the customer receiving the order. To review or work with the recipient's email address or opt-in/out setting, you must advance to the [Expand Name/Address Screen](#).

How to display this screen: You can display this screen by prompting on the email address at various screens, including the:

- [Expand Name/Address Screen](#)
- [Work with Order Screen](#)
- [Create Catalog Request Screen](#)

Field	Description
Customer	<p>A unique number to identify the customer you are currently working with. The customer's name or company name displays to the right.</p> <p>Customer number: numeric, 9 positions; display-only, assigned by the system.</p> <p>Customer name: alphanumeric, 41 positions; display-only.</p>
Email address	<p>An email address for the customer, stored in the Customer Sold To Email table.</p> <p>Alphanumeric, 50 positions; optional.</p>
Opt in/out	<p>Indicates the preferred method of correspondence.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>O1</i> = Email is the preferred method of correspondence. • <i>O2</i> = Use email for order-related correspondence only; generate a document for other correspondence. • <i>O3</i> = Do not use email for any correspondence; generate a document instead. • <i>O4</i> = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>Defaults from the <i>Default Opt In/Opt Out Flag (G97)</i> system control value, but you can override it.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The above values use the letter O, not the number 0 (zero).</p> </div>
	<p>The system updates this field when you change the setting of the Opt in/Opt out value at any other screen, such as order entry, order maintenance, or catalog requests.</p> <p>Email notifications: See When Does the System Generate an Email Notification? for an overview.</p> <p>Updating from an external system: See Receiving Customer Email Status Updates From an External System for an overview and the required setup.</p> <p>Alphanumeric, 2 positions; required.</p>
Fmt (Format)	<p>Indicates the customer's preference regarding email format.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>T</i> = plain text • <i>H</i> = HTML <p>This field is informational only.</p> <p>Alphanumeric, 1 position; display-only.</p>

Field	Description
Last primary	The most recent date when the email address was flagged as the primary address. The system flags an email address as the primary address when it is created through customer maintenance or a catalog request, or if it is the first email address for the customer. Numeric, 6 positions (in user date format); display-only.
Current primary	An asterisk (*) indicates that this is the customer's primary email address, and this email address is highlighted. The primary address is the one that defaults in order entry and displays on other screens, such as in customer maintenance. Fraud checking: An order goes on <i>EC</i> hold if this email address matches an email address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF) . Alphanumeric, 1 position; display-only.

Option	Procedure
Create a new email address	Select <i>Create</i> to advance to the Create Email Address Screen .
Select an email address	<i>Select</i> an email address to flag it as the primary email address. See the Current primary field above for more information.
Change an email address	Select Change for an email address to advance to the Select Customer Email Address Screen .
Delete an email address	Select <i>Delete</i> for an email address to delete it. You cannot delete the primary email address.
Flag an email address as primary	Select <i>Mark as primary</i> for an email address to flag it as the primary.

Receiving Customer Email Status Updates From an External System

Overview: Use the Customer Email Status Updates process to match a record in the [Customer Email Updates Table](#) to a sold to customer and update the sold to customer's Opt in/opt out field with the opt in/opt out value defined for the customer email update record.

Note:

The Customer Email Status Updates process allows you to update the Opt in/opt out setting for a sold to customer at the customer sold to level (Customer Sold To table) and/or customer sold to email level (Customer Sold To Email table). See [Determining the Opt-in/out Setting](#) for more information on the hierarchy the system uses to determine the opt-in/out setting to use when generating emails.

For more information:

- [Customer Email Status Updates Setup](#): provides the setup you must complete before you can use the Customer Email Updates process.

- [Customer Email Status Updates Process](#): describes the steps the system performs during the Customer Email Status Updates process.
- [Customer Email Update Examples](#): provides examples of the Customer Email Status Updates process.

Customer Email Status Updates Setup

Before you can run the [Customer Email Status Updates Process](#), you must complete the required setup.

- [Process Email Status Updates Periodic Function](#)
- [Customer Email Updates Table](#)

Process Email Status Updates Periodic Function

Use the [Working with Periodic Functions \(WPER\)](#) menu option to create a periodic function for the Customer Email Status Updates process.

Setting	Example
Function	<i>EMAILUD</i>
Description	<i>PROCESS EMAIL UPDATE</i>
Company parameter	<i>Selected</i>
Appl Area	<i>ALL</i>
Program Name	<i>PFR0089</i>

Once you have created the periodic function:

- Use the [Working with Periodic Processes \(WPPR\)](#) menu option to assign the periodic function to a periodic process.
- Use the Execute Periodic Process screen (located in the [Working with Periodic Processes \(WPPR\)](#) or [Executing Periodic Processes \(EPRO\)](#) menu option) to define a schedule for the process.

Customer Email Updates Table

Use this table to update an existing sold to customer's Opt in/opt out field from an external system. You must populate this table before running the [Customer Email Status Updates Process](#) in order to match a sold to customer to a record in the Customer Email Updates table.

Creating a record: When you initially populate this table from an external system, each record should contain the following information:

- [Company](#): Required; used to match the record to a sold to customer.
- [Email Addr](#): Required; used to match the record to a sold to customer.
- [Customer Nbr](#): Leave blank; the Customer Email Status Updates Process updates this field when it finds an exact match to a sold to customer.
- [Profile ID](#): Optional.
- [First Name](#): Required; used to match the record to a sold to customer.
- [Last Name](#): Required; used to match the record to a sold to customer.

- **Email Status:** Required; the Customer Email Status Updates Process updates the sold to customer's Opt in/opt out field for the associated email address with this value.
- **Submit Date:** Required.
- **Process Status:** Leave blank; the Customer Email Status Updates Process updates this field after the record has been processed.

Field	Description
Company	<p>A code for the company where the sold to customer whose Opt in/opt out field you wish to update is located.</p> <p>Company codes are defined in and validated against the Company table.</p> <p>Numeric, 3 positions; Required.</p>
Email Addr	<p>The sold to customer's email address.</p> <p>The email address should contain the following formatting:</p> <ul style="list-style-type: none"> • there is an @ sign and a period (.) • there is some text: • before the @ sign • between the @ sign and the period • after the period <p>For example: kbrown@EXAMPLE.com.</p> <p>The system uses this field to match a sold to customer to a Customer Email Update record. In order to match, one of the following email addresses must exactly match the Email Addr value for a Customer Email Update record:</p> <ul style="list-style-type: none"> • CST E-mail address value in the Customer Sold To table. • CEM Email Address value in the Customer Sold To Email table. <p>You can review the sold to customer's email address on the following screens:</p> <ul style="list-style-type: none"> • Second Create Customer Sold To Screen (the customer's primary email address) • Work with Customer Email Address Screen (the customer's primary email address and secondary email addresses) <p>Alphanumeric, 50 positions; Required.</p>
Customer Nbr	<p>The sold to customer number.</p> <p>The Customer Email Status Updates process updates this field when it finds a sold to customer that matches the Customer Email Updates record.</p>
Profile ID	<p>Numeric, 9 positions; Updated by the system.</p> <p>A unique code to identify the sold to customer in an external system. Informational only.</p> <p>Alphanumeric, 15 positions; Optional.</p>

Note:

If a Customer Nbr is already defined for a customer email updates record when you run the Customer Email Status Updates process, the system ignores this value.

Field	Description
First Name	<p>The first name of the sold to customer.</p> <p>The system uses this field to match a sold to customer to a Customer Email Update record. In order to match, the NAM First Name value in the Customer Sold To table must exactly match the First name value for a Customer Email Update record. You can review the sold to customer's name on the first Change or Display Customer screen; see First Create Sold To Customer Screen.</p> <p>Alphanumeric, 15 positions; Required.</p>
Last Name	<p>The last name of the sold to customer.</p> <p>The system uses this field to match a sold to customer to a Customer Email Update record. In order to match, the NAM Last Name value in the Customer Sold To table must exactly match the Last name value for a Customer Email Update record. You can review the sold to customer's name on the first Change or Display Customer screen; see First Create Sold To Customer Screen.</p> <p>Alphanumeric, 25 positions; Required.</p>

Field	Description
Email Status	<p>Indicates the preferred method of correspondence for the sold to customer's email address.</p> <p>If the Customer Email Status Updates program finds a match between a sold to customer and a Customer Email Updates record, the system updates the sold to customer's Opt in/opt out field with this value.</p> <ul style="list-style-type: none"> • If the match is found to the sold to customer's email address in the Customer Sold To table, the system updates the CST E-mail Status value in the Customer Sold To table. You can review the updated Opt in/opt out value on the first Change or Display Customer screen; see First Create Sold To Customer Screen. • If the match is found to the sold to customer's email address in the Customer Sold To Email table, the system updates the CEM Email Status value in the Customer Sold To Email table. You can review the Opt in/opt out value on the Work with Customer Email Address Screen. • If the match is found to the sold to customer's email address in the Customer Sold To table and Customer Sold To Email table, the system updates the Email Status value in the Customer Sold To table and Customer Sold To Email table. <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>O1</i> (Email) = Email is the preferred method of correspondence. • <i>O2</i> (Order-only email) = Use email for order-related correspondence only; generate a document for other correspondence. • <i>O3</i> (No email) = Do not use email for any correspondence; generate a document instead. • <i>O4</i> (Do not ask the customer) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <div data-bbox="873 1276 1458 1451" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>The above values use the letter O, not the number 0 (zero).</p> </div>
Submit Date	<p>Alphanumeric, 2 positions; Required.</p> <p>The date the external system added this record to the Customer Email Updates table, in CYYMMDD format. For example, October 8, 2009 displays as 1091008.</p> <div data-bbox="873 1654 1458 1829" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>The system does not validate that the date is in the correct format.</p> </div>
	<p>Numeric, 7 positions; Required.</p>

Field	Description
Process Status	<p>Indicates whether the Customer Email Updates record has been processed.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>blank</i> = The Customer Email Status Updates process has not yet processed the Customer Email Updates record. <i>I</i> = The Customer Email Status Updates process is currently processing the record. <i>P</i> = The Customer Email Status Updates process has processed the Customer Email Updates record. <p>The setting of the Clear Processed Records from Customer Email Updates Table (K70) system control value controls whether the system retains records in the Customer Email Updates table after the Customer Email Status Updates process is run.</p> <p>Alphanumeric, 1 position; Updated by the system.</p>

Customer Email Status Updates Process

When you submit the Customer Email Status Updates process, the system performs the following steps.

#	Step
1.	<p>Looks at records in the Customer Email Updates Table whose Company matches the company where you submitted the Process Email Status Updates Periodic Function.</p> <p>The system does not process records in the Customer Email Updates table whose Company does not match the company where you submitted the Customer Email Status Updates process.</p>
2.	<p>Determines if the Email Status for a Customer Email Updates record is a valid status.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>O1</i> (Email) = Email is the preferred method of correspondence. <i>O2</i> (Order-only email) = Use email for order-related correspondence only; generate a document for other correspondence. <i>O3</i> (No email) = Do not use email for any correspondence; generate a document instead. <i>O4</i> (Do not ask the customer) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>If the Email Status for a Customer Email Updates record is not a valid status, the system does not process the record.</p>

#	Step
3.	<p>Tries to match the <i>Email Addr</i>, <i>First Name</i>, and <i>Last Name</i> for the Customer Email Updates record to a sold to customer. See Customer Email Update Examples for examples.</p> <p>Exact match:</p> <ul style="list-style-type: none"> • If the match is found to the sold to customer's email address in the Customer Sold To table, the system updates the CST E-mail Status value in the Customer Sold To table with the <i>Email Status</i> value from the Customer Email Update table. You can review the updated Opt in/opt out value on the first Change or Display Customer screen; see First Create Sold To Customer Screen. • If the match is found to the sold to customer's email address in the Customer Sold To Email table, the system updates the CEM Email Status value in the Customer Sold To Email table with the <i>Email Status</i> value from the Customer Email Update table. You can review the Opt in/opt out value on the Work with Customer Email Address Screen. • If the match is found to the sold to customer's email address in the Customer Sold To table and Customer Sold To Email table, the system updates the Email Status value in the Customer Sold To table and Customer Sold To Email table. <p>In addition, the system updates the Customer Email Updates record:</p> <ul style="list-style-type: none"> • Customer Nbr field: Updates with the matched sold to customer number. • Process Status field: Updates to <i>P</i> (Processed). <p>More than one exact match: If more than one sold to customer matches a Customer Email Updates record, the system updates the Opt in/Opt out field for the first sold to customer in numeric order that matches the Customer Email Updates record. For example, if customer 2 and customer 45 match a Customer Email Updates record, the system updates the opt in/opt out setting for customer 2 and not customer 45.</p> <p>No exact match: If an exact match is not found, the system updates the Process Status field for the Customer Email Updates record to <i>P</i> (Processed). The Customer Nbr field for the record remains blank since an exact match was not found and a sold to customer was not updated.</p>
4.	<p>Generates the <i>Unmatched Email Status Report</i>. This report displays all records in the Customer Email Updates table that were processed, but were not matched to a sold to customer. You can use this report to review which sold to customers require an update to the Opt in/opt out field.</p>
5.	<p>Looks at the setting of the <i>Clear Processed Records from Customer Email Updates Table (K70)</i> system control value to determine whether to clear the records in the Customer Email Updates Table once the Customer Email Status Updates process completes.</p> <ul style="list-style-type: none"> • If <i>selected</i>, the system clears all records in the Customer Email Updates table. • If <i>unselected</i>, the system retains all records in the Customer Email Updates table. Processed records remain in the table with a <i>P</i> (Processed) status. The Customer Email Status Updates Process does not look at records in a <i>P</i> status; in order to reprocess these records, you must update the Process Status field for the record to blank.

Customer Email Update Examples

- [Example 1 - Match at Customer Sold To Level](#)
- [Example 2 - Match at Customer Sold To Email Level](#)
- [Example 3 - Match at Customer Sold To and Customer Sold To Email Level](#)
- [Example 4 - No Match Found](#)

Example 1 - Match at Customer Sold To Level

The following record exists in the Customer Email Updates table for company 7.

Email Address	First Name	Last Name	Email Status
BROBERTS@EXAMPLE.COM	BERNADETTE	ROBERTS	01

The following records exist in the Customer Sold To table for company 7.

Cust#	Email Address	First Name	Last Name	Opt in/out
2	BROBERTS@EXAMPLE.CO M	BERNADETTE	ROBERTS	02
4	BROBERTS@EXAMPLE.CO M	BETHANY	ROBERTS	02
6	BROBERTS@EXAMPLE.CO M	BERNADETTE	ROBERTS	02

When you run the [Customer Email Status Updates Process](#), the system finds an exact match between the Customer Email Updates record and a Customer Sold To record.

The system:

- Updates the Customer Email Updates record with the sold to customer number:

Email Address	Cust Nbr	First Name	Last Name	Email Status	Process Status
BROBERTS@EXAMPLE.CO M	6	BERNADETTE	ROBERTS	01	P

- Updates the Sold To Customer record with the Email Status from the matched Customer Email Updates record.

Cust#	Email Address	First Name	Last Name	Opt in/out
6	BROBERTS@EXAMPLE.CO M	BERNADETTE	ROBERTS	01

Example 2 - Match at Customer Sold To Email Level

The following record exists in the Customer Email Updates table for company 7.

Email Addr	First Name	Last Name	Email Status
SJONES@EXAMPLE.COM	SHELDON	JONES	01

The following records exist in the Customer Sold To table for company 7.

Cust#	Email Address	First Name	Last Name	Opt in/out
8	SJONES@EXAMPLE.COM	SHELDON	JONES	02
10	SJONES@EXAMPLE2.COM	SAMANTHA	JONES	02

The following records exist in the Customer Sold To Email table for company 7.

Cust#	Email Address	Opt in/out	Primary
8	SJONES@EXAMPLE.COM	02	Y
8	SJONES@EXAMPLE3.COM	03	N
10	SJONES@MXAMPLE4.COM	02	Y
10	SJONES@EXAMPLE2.COM	03	N

When you run the [Customer Email Status Updates Process](#), the system finds an exact match between the Customer Email Updates record and a Customer Sold To Email record.

The system:

- Updates the Customer Email Updates record with the sold to customer number:

Email Address	Cust Nbr	First Name	Last Name	Email Status	Process Status
SJONES@EXAMPLE.COM	8	SHELDON	JONES	O1	P

Updates the Sold To Customer Email record with the Email Status from the matched Customer Email Updates record.

Cust#	Email Address	Opt in/out	Primary
8	SJONES@EXAMPLE.COM	02	Y
8	SJONES@EXAMPLE2.COM	01	N

 **Note:**

The system does not update the Opt in/opt out defined for the sold to customer in the Customer Sold To table because the email address defined at that level does not match the email address defined for the Customer Email Updates record. The Opt in/opt out for the sold to customer in the Customer Sold To table remains at O2.

Example 3 - Match at Customer Sold To and Customer Sold To Email Level

The following record exists in the Customer Email Updates table for company 7.

Email Address	First Name	Last Name	Email Status
TJOHNSON@EXAMPLE.COM	TINA	JOHNSON	O1

The following records exist in the Customer Sold To table for company 7.

Cust#	Email Address	First Name	Last Name	Opt in/out
8	TJOHNSON@EXAMPLE.COM	TINA	JOHNSON	02
10	TJOHNSONS@EXAMPLE2.COM	TYLER	JOHNSON	02

The following records exist in the Customer Sold To Email table for company 7.

Cust#	Email Address	Opt in/out	Primary
8	TJOHNSON@SAMPLE.COM	02	Y
8	TJOHNSON@EXAMPLE.COM	04	N
10	TJOHNSON@SAMPLE2.COM	02	Y
10	TJOHNSON@EXAMPLE2.COM	03	N

When you run the [Customer Email Status Updates Process](#), the system finds an exact match between the Customer Email Updates record and a Customer Sold To record and its associated Customer Sold To Email record.

The system:

- Updates the Customer Email Updates record with the sold to customer number:

Email Address	Cust Nbr	First Name	Last Name	Email Status	Process Status
TJOHNSON@EXAMPLE.COM	8	TINA	JOHNSON	O1	P

Updates the Sold To Customer record and Sold To Customer Email record with the Email Status from the matched Customer Email Updates record.

Sold To Customer record:

Cust#	Email Address	First Name	Last Name	Opt in/out
8	TJOHNSON@SAMPLE.COM	TINA	JOHNSON	01

Sold To Customer Email record:

Cust#	Email Address	Opt in/out	Primary
8	TJOHNSON@SAMPLE2.COM	O1	Y

Example 4 - No Match Found

The following record exists in the Customer Email Updates table for company 7.

Email Address	First Name	Last Name	Email Status
NSMITH@EXAMPLE.COM	NONA	SMITH	O1

The following records exist in the Customer Sold To table for company 7.

Cust#	Email Address	First Name	Last Name	Opt in/out
12	NSMITH@EXAMPLE2.COM	NONA	SMITH	02
14	NSMITH@EXAMPLE3.COM	NED	SMITH	02

The following records exist in the Customer Sold To Email table for company 7.

Cust#	Email Address	Opt in/out	Primary
12	NSMITH@EXAMPLE2.COM	02	Y
12	NSMITH@EXAMPLE3.COM	03	N
14	NSMITH@EXAMPLE.COM	02	Y
14	NSMITH@EXAMPLE4.COM	03	N

In this situation, the system does not find an exact match between the Customer Email Updates record and a Customer Sold To record or Customer Sold To Email record.

The system updates the Customer Email Updates record:

Email Address	Cust Nbr	First Name	Last Name	Email Status	Process Status
NSMITH@EXAMPLE.COM		NONA	SMITH	01	P

The system does not update a Sold To Customer record or Sold To Customer Email record because a match was not found. The Customer Email Updates record prints on the *Unmatched Email Status Report*.

Working with Customer Ownership

Customer ownership allows you to capture and confirm information about the products a customer currently owns or previously owned. You can use this information to determine trends in the products a customer purchases and recommend related products for purchase.

In this topic:

- [Remote Entry of Customer Ownership](#)
- [Work with Customer Ownership Screen](#)
- [Create Customer Ownership Screen](#)

Remote Entry of Customer Ownership

You can include customer ownership information in orders from the Order API, catalog requests from e-commerce, and customer updates from e-commerce.

The system looks at the Company, Customer #, and Ownership ID fields in the Customer Ownership table to determine if the customer ownership information is a new record or an updated record.

- If the company, customer number, and ownership ID values match a record in the Customer Ownership table, the system updates the Active flag, Entry date, Confirm date, and Description fields for the existing customer ownership record.
- If the company, customer number, and ownership ID values do not match a record in the Customer Ownership table, the system creates a new customer ownership record for the sold to customer.

 **Note:**

If the Active flag, Description, Entry date and Confirm date are passed blank, the system creates/updates the customer ownership record with a blank active flag, description, entry date, and confirm date.

If the remote entry does not include an ownership ID, the system does not create or update a customer ownership record and instead creates a customer note for the sold to customer: `Missing Ownership ID: Ownership Description`.

If an e-commerce catalog request includes errors, the system places the catalog request in the Catalog Request Interface table. You will need to correct the errors in the [Working with the Catalog Request Interface \(WCRU\)](#) menu option. If this happens, the system does not retain any customer ownership information that you defined for the sold to customer in the catalog request.

Work with Customer Ownership Screen

Use this screen to view and update the products a customer currently owns or previously owned.

Customer ownership records display in confirm date sequence with the most recent confirm date at the top of the screen.

This screen displays if customer ownership records currently exist for the sold to customer; if the sold to customer is not associated with any customer ownership records, the system automatically advances you to the [Create Customer Ownership Screen](#).

How to display this screen:

- Select Customer Ownership at the [More Customer Sold To Options Screen](#).
- Select Customer Ownership at the [Display More Options Screen](#).
- Select *Cust Ownership* at the [Create Catalog Request Screen](#).

Field	Description
Customer #	The number for the sold to customer that owns the customer ownership products. Numeric, 9 positions; display-only.
ID	Represents a product the customer owns or previously owned. Alphanumeric, 10 positions; display-only.
Description	A description of the product. Alphanumeric, 120 positions; display-only.
Act? (Active?)	Indicates if the customer currently owns the product. <ul style="list-style-type: none"> • <i>selected</i> = The customer currently owns the product. • <i>unselected</i> = The customer previously owned the product.
Entry date	The date the customer ownership record was created. Numeric, 6 positions (in user date format); display-only.

Field	Description
Confirm date	The most recent date when the customer confirmed ownership of the product. You can confirm a customer ownership record by selecting <i>Confirm</i> for a customer ownership record. The system also updates this field when you update the Active flag. Numeric, 6 positions (in user date format); display-only.

Screen Option	Procedure
Create a customer ownership record	Select <i>Create</i> to advance to the Create Customer Ownership Screen .
Delete a customer ownership record	Select <i>Delete</i> for a customer ownership record to delete it.
Confirm the customer ownership information with the customer	Select <i>Confirm</i> for a customer ownership record. The system updates the Confirm date field to the current date.
Update the status of the customer ownership flag to active or inactive	Select <i>Active/Inactive</i> for a customer ownership record. <ul style="list-style-type: none"> If the Active? flag was N, the system updates the flag to Y. If the Active? flag was Y, the system updates the flag to N. The system updates the Confirm date field to the current date.

Create Customer Ownership Screen

Purpose: Use this screen to create a customer ownership record.

When you create a customer ownership record at this screen, the system defaults the current date to the Entry date and Confirm date fields.

How to display this screen: Select *Create* at the [Work with Customer Ownership Screen](#).

In addition, the system displays this screen if the sold to customer is currently not associated with any customer ownership records:

- Select Customer Ownership at the [More Customer Sold To Options Screen](#).
- Select Customer Ownership at the [Display More Options Screen](#).
- Select *Cust Ownership* at the [Create Catalog Request Screen](#).

Field	Description
Customer #	The number for the sold to customer that owns the product. Numeric, 9 positions; display-only.
Ownership ID	Represents a product the customer owns or previously owned. Alphanumeric, 10 positions; required.
Description	A description of the product. Alphanumeric, 120 positions; required.

Field	Description
Active flag	Indicates if the customer currently owns the product. <ul style="list-style-type: none">• <i>Selected</i> (default) = The customer currently owns the product.• <i>Unselected</i> = The customer previously owned the product.

Working with Alternate Customer Number Cross-References

Purpose: Alternate customer number cross-references allow you to identify a customer record in Order Administration with the same customer's record in a different system.

How are alternate customer number cross-references created? The system creates an alternate customer number cross-reference when you:

- add or change the [Alternate customer number](#) in customer maintenance. If the customer already had an alternate customer number, the previous number is retained in the Alternate Customer Number Cross Reference table.
- create or update a customer through an integration with a remote system, such as through the *Generic Order Interface (Order API)* or *Generic Customer API*, if an alternate customer number is specified
For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- create a customer by any means, if the [Assign Alternate Customer # \(I88\)](#) system control value is *selected*
- add an alternate customer number cross-reference through the [Create Alternate Customer # Screen](#)

How many alternate customer number cross-references does a customer normally have? The system automatically creates an alternate customer number cross-reference each time you or the system create or change the Alternate customer number; however, the system does not automatically delete alternate customer number cross-references when you change the Alternate customer number.

Scanning by alternate customer number cross-reference: The [Display Alternate Customer Cross Reference Window \(I84\)](#) system control value determines how to use the Alternate Customer Number Cross Reference table for selecting customers at screens and through interfaces. See that system control value for a complete discussion of scanning by alternate customer number.

In this topic:

- [Work with Alternate Customer # Screen](#)
- [Create Alternate Customer # Screen](#)

Work with Alternate Customer # Screen

How to display this screen: Select [Work with Alternate Customer # Cross Reference](#) at the [More Customer Sold To Options Screen](#).

Field	Description
Customer #	A unique number to identify the customer. Numeric, 9 positions; display-only.
Customer name (unlabeled field to the right of the customer number)	The name or company name of the customer. Alphanumeric, 41 positions; display-only.
Alternate customer #	An alternate customer number cross-reference to identify the customer. Alternate Customer Number Label Description The field label name on this screen is based on the name you enter in the Alternate Customer Number Label Description (H95) system control value; if you do not enter a name in this system control value, the field label is Alt cust. Alphanumeric, 15 positions; optional.

Option	Procedure
Create a new alternate customer number cross reference	Select <i>Create</i> to advance to the Create Alternate Customer # Screen .
Delete an alternate customer number cross reference	Select <i>Delete</i> for an alternate customer number cross reference to delete it.

 **Note:**

You cannot delete an alternate customer number cross reference if it matches the [Alternate customer number](#). If the [Display Alternate Customer Cross Reference Window \(I84\)](#) system control value is *selected*, you cannot delete the [Alternate customer number](#).

Create Alternate Customer # Screen

Purpose: Use this screen to create a new alternate customer number cross-reference to identify the customer for searching and scanning purposes.

How to display this screen: Select *Create* at the [Work with Alternate Customer # Screen](#).

Completing this screen: Enter the cross-reference number to use when searching for a customer at scan screens or through interfaces. This is a 15-position, alphanumeric field.

Alternate customer number label: The field label name on this screen is based on the name you enter in the [Alternate Customer Number Label Description \(H95\)](#) system control value; if you do not enter a name in this system control value, the field label is Alt cust.

**Note:**

Creating an alternate customer number cross-reference at this screen does not automatically create a matching *Alternate customer number*.

Order Inquiry

In this part: Order inquiry spans the breadth of the system's functions, giving you access to customer, order, line, and item summary and detail information. This part presents the screens you use to review this information.

- [Using the Order Inquiry Scan Screens \(OIOM\)](#) shows you how to find an order based on the information available to you.
- [Reviewing the Order Inquiry Header Screen](#) presents the Order Inquiry screen, which contains information about the customer, such as name, address, phone number and source code.
- [Reviewing Order Inquiry Detail Information](#) presents the Order Inquiry screen containing information on the items the customer has ordered.
- [Reviewing Order Details](#) presents the screens you use to review detail related to a specific item on an order.
- [Options Available in Order Inquiry](#) presents a table of the functions available from the Order Inquiry Header or Detail screens, and refers you to topics containing more information on the use of these functions.
- [Reviewing Financial Information on an Order](#) presents screens that display information pertaining to charges and credits, such as invoices, refunds, and order totals. The topic also includes a discussion of order payment methods.
- [Reviewing Order-Level Properties](#) explains how to review order properties.
- [Display Order Line History Screen](#) explains how to review all activity performed on a particular item on an order.
- [Display Order History Screen](#) explains how to review all activity performed on an entire order.
- [Display Package Information Screen](#) describes the screen that lists all tracking numbers associated with shipments for the order and provides live links to shipment tracking pages when available.
- [Streamlined Order Inquiry \(DORI\)](#) describes a consolidated order inquiry option with simplified search options.
- [Customer Engagement Purchase History Integration](#) presents the Display Purchase History screen, which contains a customer's completed sales and return transactions across multiple channels, such as retail, call center, and e-commerce. This purchase history information is from Oracle Retail Customer Engagement.

Reviewing the Order Inquiry Header Screen

Purpose: Depending on how the [Default Version for Order Inquiry \(C34\)](#) system control value is set, you advance to the [Order Inquiry Header Screen](#) or [Order Inquiry Detail Screen](#) when you select a quote or order to review.

This topic assumes that you advance first to the *HEADER* screen for Order Inquiry; however, you can advance to this screen from the detail screen by selecting *Sold To*.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including order header information.

In this topic: This topic describes the [Order Inquiry Header Screen](#).

Order Inquiry Header Screen

Purpose: This screen provides a snapshot of the sold-to and ship-to addresses on the quote or order, as well as totals. You cannot update any fields on this screen; instead, you must select *Maintain Order* to use Order Maintenance. See [Performing Order Maintenance](#) and [Maintaining Quotes in Order Maintenance](#).

Customer Workflow Management window: The [Customer Workflow Management Window](#) automatically displays when you first advance to the Order Inquiry Header screen if open or in use ticklers exist for the sold to customer on the order. Select *Ticklers* at this window to advance to the [Work with Ticklers Screen \(sold to customer view\)](#) where you can review and work with ticklers associated with the sold to customer.

How to display this screen:

- Select a quote or order at an order inquiry scan screen; [Using the Order Inquiry Scan Screens \(OIOM\)](#)
- Select *Sold To* at the [Order Inquiry Detail Screen](#)
- Select *Release* for a held order at a [Release Held Orders Screen \(Working with Releases\)](#)
- Select *Order Inquiry* at the [Work with Returns for Order Screen](#) in Work with Return Authorizations (streamlined version)
- Select *Ord Inq* for a refund at the [Work with Refunds Screen](#)
- Select *Order Inquiry* at the [Work with Order Broker Screen](#)
- Select an order for review at the [Pending Order Details Screen](#)

Originating order message: If the E-Commerce order number in the Order Header Extended table begins with the text `ORIG#:`, indicating the originating system for a retail pickup or delivery order is Order Administration, the message `This order is fulfilling another order: 9999-001` displays for the sourcing order, where 9999 is the originating order number in Order Administration, and 001 is the ship to number. See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information.

Field	Description
Entity	<p>The entity associated with the source code on the order header is in reverse video if the Display Entity Description (F84) system control value is <i>selected</i>. If this system control value is <i>unselected</i>, the entity does not display.</p> <p>A source code is associated with an entity through its division. Each division is associated with an entity. You might use entities to identify different catalogs or groups of catalogs within your company.</p> <p>See Working with Divisions (WDIV) for more information on setting up divisions and entities.</p> <p>Alphanumeric, 20 positions; display-only.</p>

Field	Description
Multi-pay	This field appears when there is more than one pay type on the quote or order. When this field appears, you can check all pay types by pressing <i>F15</i> . See Display Order Payment Methods Screen for details. If there is only one pay type on the quote or order, the Pay type field appears instead. Alphanumeric, 9 positions; display-only.
Order	A unique number the system assigns to identify a quote or order. Numeric, 8 positions; display-only, assigned by the system.
Ship-to (Unlabeled field to the right of the order number)	A sequential, numeric value the system assigns to each shipping address on a quote or order. The ship-to number appears as a suffix to the quote or order number separated by a hyphen (-). Numeric, 3 positions; display-only, assigned by the system.
Number of shipments (Unlabeled field to the right of the ship-to number)	Indicates the number of shipments made to each ship-to address. A number appears in this field only if items on the order have been picked and billed; no number appears for express billed orders. This number appears as a suffix to the ship-to number separated by a hyphen (-). Numeric, 3 positions; display-only, assigned by the system.
Date	The date when the quote or order was created. Numeric, 6 positions (in user date format); display-only.
Payment plan type (Unlabeled field to the right of the Date field)	Informational text indicating whether a deferred or installment payment plan has been assigned to the quote or order. <i>DEFERRED</i> displays if the quote or order includes a deferred payment plan; <i>INSTALLMENT</i> displays if the quote or order includes an installment payment plan. Alphanumeric, 12 positions; display-only.
Status	Indicates the current state of a quote or order. The order status is open (i.e., active) unless the status field is set to one of the following values: <ul style="list-style-type: none"> • <i>Held</i> = An order is held when the system applies some type of hold on the order or the order entry operator places an order on hold by typing a user-defined hold reason code in the Hold reason field in Order Entry. The hold reason code and description appear beneath the status when the order is on hold. See the Hold rsn (Hold reason) field. • <i>Open</i> = An order that is not on hold, closed, canceled, or suspended. • <i>Closed</i> = An order is closed when all the items on the order are shipped or canceled. • <i>Cancelled</i> = An order is canceled when you have canceled each item individually or the entire order. • <i>Quote</i> = The order represents a pre-order quote that has not yet been converted to a standard order; see Entering Pre-Order Quotes. • <i>Suspended</i> = An order is suspended during Order Entry while it is being entered on the system. • <i>Express Bill</i> = The order has been submitted to the background job for billing, but processing is not yet complete. Display-only.
Type (Order type)	A code that identifies how the quote or order was received, such as over the telephone, through the mail (a mail order) by fax, etc. Order types are defined in and validated against the Order Type table. See Establishing Order Types (WOTY) . Alphanumeric, 1 position; display-only.

Field	Description
Pay type	<p>A code for the form of payment used on the quote or order. Pay types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>Numeric, 2 positions; display-only.</p>
Hold rsrn (Hold reason)	<p>The reason the quote or order is on hold. Either the system or a user can place a quote or order on hold. You can create user hold reason codes; see Establishing Order Hold Reason Codes (WOHR).</p> <p>System holds include:</p> <p>Header level system holds</p> <ul style="list-style-type: none"> • <i>AT</i> = Declined Credit Card Authorization • <i>AV</i> = Address Verification • <i>BD</i> = Balance Due • <i>BF</i> = Bill To Fraud • <i>BU</i> = Bill To Unconditional Hold • <i>DH</i> = Dollar Hold • <i>EB</i> = Bill-to Email Address • <i>EC</i> = Sold-to Customer Email Address • <i>EH</i> = E-Commerce Dollar Hold • <i>EO</i> = Order Email Address • <i>PT</i> = Pay Type • <i>SF</i> = Sold To Fraud • <i>SH</i> = Ship To Hold • <i>SM</i> = Ship To Mismatch • <i>SU</i> = Sold To Unconditional • <i>UB</i> = Unreferenced Bill To • <i>VD</i> = Pick Was Voided through Void All/Hold Order • <i>ZB</i> = Bill To Zip Fraud • <i>ZS</i> = Sold To Zip Code Fraud <p>Ship to holds</p> <ul style="list-style-type: none"> • <i>ES</i> = Ship-to Email Address • <i>HF</i> = Ship To Fraud • <i>HS</i> = Ship To/Sold To Fraud • <i>ZH</i> = Ship To Zip Fraud <p>Pay type holds</p> <ul style="list-style-type: none"> • <i>TM</i> = Time Hold • <i>KF</i> = Check Fraud • <i>CF</i> = Credit Card Fraud • <i>CW</i> = Waiting for Credit Card Authorization • <i>PV</i> = Pay Plan Velocity Hold • <i>P\$</i> = Pay Plan Dollar Threshold <p>See Introducing Order Hold Reason Codes for a discussion of each system-assigned hold reason code.</p> <p>Display-only.</p>
Ship via	<p>The code for the shipper who delivers the merchandise to your customer. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA).</p> <p>Numeric, 2 positions; display-only.</p>
Sold to number	<p>A unique number to identify the customer who placed the quote or order.</p> <p>Numeric, 9 positions; display-only.</p>

Field	Description
Emails	<p>Indicates whether there is any correspondence history related to the quote or order:</p> <ul style="list-style-type: none"> • <i>selected</i> = There is correspondence history related to the quote or order • <i>unselected</i> = There is no correspondence history related to the quote or order; however, it is possible that there is correspondence history related to the customer <p>You can review correspondence history for an order at the Work with Email by Order Number Screen. See Email Repository Overview for more information.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>
Refunds	<p>Indicates whether a refund record exists for this order, regardless of the refund status. If a refund record exists, you can view the refund record and refund status by pressing <i>F17</i>. See Display Refunds for Order Screen.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = Refunds exist for this order. • <i>unselected</i> = No refunds exist for this order.
Msgs (Messages)	<p>Indicates whether there are order messages. You can view order messages by selecting Order Messages. See Work with Order Messages Screen.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = Messages exist for this quote or order. • <i>unselected</i> = No messages exist for this quote or order.
Recips (Recipients)	<p>The total number of shipping addresses for the order. An order may have up to 999 recipients. A quote can have one recipient. If there is more than one recipient, you can display additional recipients by selecting Recipients. See Displaying Order Hold Information.</p> <p>Numeric, 3 positions; display-only.</p>
Tickler	<p>Indicates whether open or in use ticklers exist that are associated with the order or customer on the quote or order. You can view the ticklers by selecting the Ticklers option at the Displaying More Options in OIOM screen.</p> <ul style="list-style-type: none"> • <i>selected</i> = Open ticklers exist for the order or customer on the quote or order. • <i>unselected</i> = Open ticklers do not exist for the order or customer on the quote or order. <p>See Workflow Management Overview and Setup for an overview on workflow management processing.</p>

Field	Description
Sold-to/ship-to	The name and address of the buyer (Sold To customer) and the recipient (Ship To Customer): Name The customer's name in last name, first name order. Company The name of the company.

 **Note:**

A plus sign (+) appears next to the company name if the complete customer record includes additional address information in the third or fourth address lines. However, the plus sign does not display if there is additional address information in other fields, such as a third phone number.

Street

The customer's primary delivery address.

Apt./Suite

The apartment or suite number.

Expanded address

Additional lines containing additional address information, such as the post office box or special delivery information such as "Deliver to 7th floor" or "Contact customer before delivery."

City

The city in which the customer receives mail or shipments.

St

The state or province in which the customer receives mail or shipments. See [Setting Up the Country Table \(WCTY\)](#).

Country

The code for the customer's country. Country codes are defined in and validated against the Country table. See [Setting Up the Country Table \(WCTY\)](#).

Field	Description
Phone	<p>The daytime and evening or third (mobile or fax) phone numbers and extensions for the sold-to and ship-to customers. The fields here are based on the following system control values:</p> <ol style="list-style-type: none"> 1. The Phone Numbers (D15) system control value determines whether the third phone number (fax or mobile) or the evening phone number is listed after the day phone number. 2. If the <i>Phone Numbers (D15)</i> system control value is set to <i>DAY/FAX</i>, the Third Phone Number Type (L53) system control value determines whether the third phone number is labeled the Fax or Mobile number. <p>See the <i>Phone Numbers (D15)</i> and <i>Third Phone Number Type (L53)</i> system control values for more information.</p> <p>Phone number format: You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY).</p> <p>One-time ship to customer: If you define a one-time ship to address for the order (see Assigning an Order Shipping Address), the phone number from the order ship to address defaults as the ship to day phone number.</p> <p>Alphanumeric, 14 positions; display-only.</p>
Merch (Merchandise)	<p>The total value of the items on the quote or order, excluding freight, additional charges, service charges, tax (but including hidden tax; see the Tax field), handling, and duty. The merchandise total does not include items that are canceled, soldout, or returned.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Freight	<p>The total charge for shipping the quote or order, not including additional freight charges. You can define additional freight charges for a carrier to include standard freight; in this case, this field is blank. See the Add'l freight (Additional freight charges) field.</p> <p>This field also includes service charges by ship via, if any.</p> <p>This field also includes order weight charges based on the ship via defined for each ship to customer on the order. See Working with Ship Via Codes (WVIA).</p> <p>The system calculates freight charges based on the freight method defined for the source code. If the system calculates freight as a percentage of the merchandise charges, there might be a penny variation in total freight amount due to rounding differences.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Add'l freight (Additional freight charges)	<p>The total dollar amount for freight charges, in addition to the base freight charge for the quote or order. Additional freight charges are set for the carrier, as defined in the Ship Via table. If the additional freight charges include the standard freight charges, the Freight field is blank.</p> <p>Examples of additional freight charges are overnight shipping, second day delivery, etc.</p> <p>The Add'l freight field in Order Inquiry corresponds to the Frt+ field in Order Entry.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Tax	<p>The total sales tax for the quote or order, based on the value of the merchandise and, optionally, freight and special handling charges. If the order is subject to VAT, tax will generally be included in the item prices rather than in the Tax field; in this case, you can review the hidden tax for an item by Reviewing Order Details.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Field	Description
Handling (Handling charge)	<p>The cost of any special handling on the quote or order, such as personalizing, monogramming, or engraving, and any gift wrapping charges.</p> <p>If there are any duty charges on the order, they are included in the Handling total. See Work with Duty Rates Screen.</p> <p>You can review the handling and detail charges for each item on the Display Order Detail Screen (Reviewing Order Line Detail).</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Add'l charges	<p>This field can include charges or credits. Additional charges might include:</p> <p>Additional source code charge An additional charge for services that apply to the source code or offer. The system applies the additional charge to the quote or order based on the total dollar value of the merchandise.</p> <p>Credits A credit you apply to the customer's order, such as reimbursement for long distance telephone charges.</p> <p>Additional shipper/item charge An additional charge that applies to the item based on the shipper. Such charges may apply when the item exceeds established shipping rates, such as for oversized items.</p> <p>Dollar discounts A credit that is applied based on the total dollar value of the merchandise. You can define dollar discounts by source code or offer. If the Prorate Dollar Discounts and Coupons (D90) system control value is <i>selected</i>, the dollar discounts will be applied to the detail lines on the quote or order rather than appearing as a negative additional charge.</p> <p>The Add'l charges field in Order Inquiry corresponds to the Chg field in Order Entry.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Total (Order total)	<p>The total amount the customer owes for the quote or order, including:</p> <ul style="list-style-type: none"> • Merchandise • Freight • Additional freight charges • Taxes • Handling • Duty • Additional charges <p>The total does not include charges for canceled, returned or sold out items.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Total cash paid	<p>The amount of money the customer has paid you on the order to date with all prepaid and check pay types.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Balance open	<p>The portion of the quote or order dollar total that you have not shipped to the customer or billed. Billing occurs after shipment confirmation.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Field	Description
Ref/balance due (Refund or balance due)	<p>The customer's overpayment or underpayment on a single pay type order. <i>Overpayments</i> occur when the customer's payment exceeds the balance owed on the order. A positive number in this field reflects an overpayment (the amount you owe the customer).</p> <p><i>Underpayments</i> occur when the customer's payment is less than the outstanding balance of the order. A negative number in this field reflects an underpayment (The amount the customer still owes to you).</p> <p>Numeric, 20 positions with a 2-place decimal.</p>
Cash refunded	<p>The total amount returned to the customer in the form of a refund check.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Discount	<p>The total discount applied to the order shipping address. The total discount is calculated by comparing the selling price with the item/SKU offer price. If you use a price override on any of the detail lines:</p> <ul style="list-style-type: none"> • If the price override reason code's <i>Override item offer price</i> field is <i>selected</i>, the Ord discount includes any discounts that reduce the selling price from the price override amount you entered for the detail line. • If the price override reason code's <i>Override item offer price</i> field is <i>unselected</i>, and: • you override an existing item/SKU offer price for the item: the Ord discount includes the difference between the original item/SKU offer price and the final selling price, including the price override and any other discounts. When the system adds an item to the order at no charge (for example, an accompanying item) and the price override reason code defaults from the Default Price Override Reason (B35) system control value, then the regular offer price of the item is not included in the discount amount. • there is no item/SKU offer price for the item: the detail line does not affect the Ord discount total.

 **Note:**

The setting of the *Override item offer price* field has no effect on orders you receive through the e-commerce interface. If there is a price override reason code in the new order message, the system always processes these orders as if the field is *unselected*.

See [Overriding the Item/SKU Offer Price](#) for an overview of the *Override item offer price* field.

Field	Description
	<div data-bbox="787 338 912 373"> Note:</div> <p>This field is included only if the Display Discount on Order Recap Screen (D38) system control value is <i>selected</i>.</p>
	<p>Any dollar discounts by source code or offer will appear as a negative additional charge if the <i>Prorate Dollar Discounts and Coupons (D90)</i> system control value is <i>selected</i>.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Currency	<p>The currency used on the order. Currency codes are defined in and validated against the Currency table. See Working with Currency (WCUR).</p> <div data-bbox="787 814 912 850"> Note:</div> <p>This field appears only if the Multi Currency by Offer (E03) system control value is <i>selected</i>.</p>
	<p>Alphanumeric, 3 positions; display-only.</p>

Reviewing Order Inquiry Detail Information

Purpose: Depending on how the [Default Version for Order Inquiry \(C34\)](#) system control value is set, you advance to the [Order Inquiry Header Screen](#) or [Order Inquiry Detail Screen](#) when you select a quote or order to review.

This topic assumes that you advance first to the *DETAIL* screen for Order Inquiry; however, you can also advance to this screen from the [Order Inquiry Header Screen](#) by selecting *OK*.

The Order Inquiry Detail screen gives you access to quote or order information at the item level. Use this screen when you need to review individual items, their reservation status, order messages, history, and other information on a specific item.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including information on the order details.

In this topic:

- [Order Inquiry Detail Screen](#)
- [Scan Order Detail Screen](#)
- [Display Order Broker Details Screen](#)

Not in this topic: This topic does not discuss the function keys displayed at the side of this screen. These options, common to both the Order Inquiry header and detail screens, are described in [Options Available in Order Inquiry](#).

Order Inquiry Detail Screen

Purpose: This screen highlights the items on the quote or order. You cannot modify any fields on this screen.

How to display this screen:

- Select a quote or order at an order inquiry scan screen; [Using the Order Inquiry Scan Screens \(OIOM\)](#)
- Select *Order Inquiry* for a held order at a [Release Held Orders Screen \(Working with Releases\)](#)
- Select *Order Inquiry* at the [Work with Returns for Order Screen](#) in Work with Return Authorizations (streamlined version)
- Select *Ord Inq* for a refund at the [Work with Refunds Screen](#)
- Select *Order Inquiry* at the [Work with Order Broker Screen](#)
- Select an order for review at the [Pending Order Details Screen](#)

Originating order message: If the E-Commerce order number in the Order Header Extended table begins with the text `ORIG# :`, indicating the originating system for a retail pickup or delivery order is Order Administration, the message `This order is fulfilling another order: 9999-001` displays for the sourcing order, where 9999 is the originating order number in Order Administration, and 001 is the ship to number. See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information.

Additional fields: See [Reviewing the Order Inquiry Header Screen](#) for descriptions of the additional fields on this screen.

Field	Description
Whse (Warehouse)	<p>The code for the warehouse this item shipped from, if the order entry operator selected a warehouse other than the one the system assigned; otherwise, the warehouse code is zero.</p> <p>You can review the actual warehouse code on the Display Order Detail Screen (Reviewing Order Line Detail); however, the warehouse code does not appear on this screen either until the order has been shipped.</p> <p>Numeric, 3 positions; display-only.</p>
Ln #	<p>A number the system assigns to each item as it is added to the order. The Order Inquiry detail screen displays lines in descending numeric sequence by line number so that the most recently entered item appears first. A quote or order can have up to 999 lines.</p> <ul style="list-style-type: none"> • The code <i>RTN</i> appears below the line number if there has been a return against the order line. • The code <i>EXC</i> appears below the line number if there has been an exchange against the order line. The system identifies an order detail line as containing an exchange item if an associated Order Line History record contains an exchange reason code. You can review order line history on the Display Order Line History Screen. <p>Numeric, 3 positions; display-only.</p>

Field	Description
S (Status)	<p>A one-position code indicating the current status of the item on the order. Possible statuses are:</p> <ul style="list-style-type: none"> • <i>blank</i> = The order line is currently open. • <i>Express Bill</i> = You have entered the order using an express-bill ship via, but the BILL_ASYNC process has not yet processed the invoice. See Working with the BILL_ASYNC Job for background. • <i>Cancelled</i> = You have canceled the item using a cancel reason code that is not flagged to reduce demand. See Establishing Cancel Reason Codes (WCNR) for background on cancel reason codes. • <i>Error</i> = The order line is currently flagged with an error, and the order is suspended in an order batch. See Order Creation Errors for background. • <i>Held</i> = The order line is currently held. You can hold a line on an open order to prevent it from printing on a pick slip, even if it is available. • <i>Soldout</i> = The item has been sold out. An order line can be sold out: <ul style="list-style-type: none"> • manually in order entry or maintenance through the <i>Sell Out</i> option • automatically in order entry or maintenance, based on the soldout control code assigned to the item • through the Process Auto Soldouts option See Managing Soldouts and Backorders for background. • <i>Closed</i> = The item has been shipped, canceled with a cancel reason flagged to reduce demand, or partially shipped and the remainder of ordered quantity canceled. <p>Display-only.</p>
Item #	<p>A code that identifies a unit of inventory. Item codes are defined in and validated against the Item table.</p>
	<div style="border: 1px solid #0070c0; padding: 10px; background-color: #e6f2ff;"> <p> Note:</p> <p>An item alias is displayed if the customer ordered using an alias and the Display Item Alias (D56) system control value is <i>selected</i>.</p> </div>
	<p>Alphanumeric, 12 positions; display-only.</p>
SKU (Stock keeping unit)	<p>An item's unique characteristics, such as its size and color. The first 14 positions of the SKU description defined at the Create SKU 1 of 2 (With Overrides) Screen are displayed in place of the SKU elements if the Display SKU Description in place of SKU Element (F25) system control value is <i>selected</i>.</p> <p>Alphanumeric, three 4-position fields; display-only.</p>
H (Handling)	<p>Represents the type of special handling for the item. Handling codes are defined in and validated against the Additional Charge Codes table. See Establishing Additional Charge Codes (WADC).</p> <p>Alphanumeric, 2 positions; display-only.</p>

Field	Description
Ord (Ordered)	The number of units of an item the customer ordered. Numeric, 5 positions; display-only.
Rsv (Reserved)	The quantity of the item that the system has reserved from stock. The system does not reserve stock on quotes until they are converted to standard orders; see Converting Quotes to Orders . The reserved quantity is reduced when an item is canceled, confirmed for shipment, or unreserved using Interactive Reservation. The system updates this quantity at billing. Numeric, 5 positions; display-only.
Shp (Ship)	The number of units that have shipped. The system updates this quantity at billing. If an item has shipped, the shipping date displays below this number. Numeric, 5 positions; display-only.
Prt (Print)	The number of units included on a printed pick slip. <i>Pre-generated picks:</i> The system does not update this field when you create a pre-generated pick for the order line during pick slip preparation; the system updates this quantity when you generate a pick slip. See Applying Pick Slip Preparation to an Order and Performing Pick Slip Generation . <i>Voiding a pick slip:</i> The system reduces the printed quantity if you void the pick slip and don't reprint, or when shipment of the item is confirmed. <i>Order Orchestration?</i> For a brokered backorder or a store pickup order line that has been selected for fulfillment through integration with Order Orchestration, the print quantity is equal to the ordered quantity unless a shipment or pickup has already taken place, the order line has been canceled, or a partial quantity of the line is unfulfillable through Order Orchestration (brokered backorders only). See Brokered Backorders or Store Pickup Orders for an overview. Numeric, 5 positions; display-only.

Field	Description
Price	<p>The unit price of the line.</p> <p>The item price is highlighted in a different color if the price represents a discount over the regular offer price for the item, and if the Display Order Line Discount Messages (F01) system control value is <i>selected</i>. However, the system does not highlight the price if the price was overridden on the detail line, and:</p> <ul style="list-style-type: none">• no item/SKU offer price exists, or• the price override reason code's Override item offer price is <i>selected</i>. <p>See Overriding the Item/SKU Offer Price for more information on the effects of the Override item offer price field.</p>

 **Note:**

The setting of the [Override item offer price](#) field has no effect on orders you receive through the e-commerce interface. If there is a price override reason code in the new order message, the system always processes these orders as if the field is *unselected*.

Numeric, 13 positions with a 2-place decimal; display-only.

Field	Description
Brokered? (unlabeled field below the Ln#)	<p><i>Order Orchestration?</i> The line is flagged as:</p> <ul style="list-style-type: none">• <i>OBR</i> if the order line:<ul style="list-style-type: none">– has been assigned to Order Orchestration for fulfillment (brokered backorder)– has been assigned to Order Administration for fulfillment by the Order– Broker (retail pickup or delivery)– ships to a store location, where the customer picks it up (ship-for-pickup)– a return or exchange has not been processed against the line; in this situation, <i>RTN</i> or <i>EXC</i> displays instead• <i>SPU</i> if the customer is picking up the order at a retail store location where the inventory is already available (store pickup) and a return or exchange has not been processed against the line (in this situation, <i>RTN</i> or <i>EXC</i> displays instead)

 **Note:**

The *OBR* or *SPU* flag remains on the order line even if the line has been fulfilled, canceled, or rejected by the fulfilling store location.

- For a brokered backorder or a store pickup order line that has been selected for fulfillment through integration with Order Orchestration:
- the print quantity is equal to the ordered quantity unless a shipment or pickup has already taken place, or a partial quantity of the line is unfulfillable through Order Orchestration (brokered backorders only)
- if the order line has not yet been fulfilled, the Drop ship flag for the order line is set to *D*

Field	Description
	<p><i>Reviewing Order Orchestration details:</i> You can select <i>D/S Status</i> for the item to advance to the Display Order Broker Details Screen and review information about a brokered backorder line, or a line on a retail pickup, delivery, ship-for-pickup, or store pickup order. This option is available whenever there is a related Order Orchestration record in Order Administration, regardless of whether the line has been fulfilled or canceled, or rejected by the fulfilling store location.</p>
	<div data-bbox="824 541 1377 982" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If the order line on a retail pickup, delivery, or ship-for-pickup order is also fulfilled through integration with Order Orchestration's Supplier Direct Fulfillment module, and the drop ship information has already been sent to Order Orchestration, you advance first to the Display P/O Drop Ship Screen. From that screen, you have the option to advance to the Display Order Broker Details Screen.</p> </div> <p>See Order Orchestration Integration for background.</p> <p>Alphanumeric, 3 positions; display-only.</p>
Item description (unlabeled field below the item code)	<p>The description of the item.</p> <p>Alphanumeric, 120 positions; display-only.</p>
Expected ship date	<p><i>Backordered item:</i> the date a purchase order for this backordered item is expected.</p>
	<div data-bbox="824 1318 1377 1514" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This field is not displayed for a reserved item, or if there are no open purchase orders for the item.</p> </div>
Invoice date	<p><i>Drop ship item, including brokered item:</i> This date is displayed for drop ship items if the Assign Drop Ship Expected Ship Date (159) system control value is <i>selected</i>. See that system control value for more information.</p> <p>Numeric, 6 positions (in user date format); display-only.</p> <p>The most recent date when you billed for shipment on this order detail line. This field is blank for order detail lines that have not yet shipped.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Field	Description
Extended price	The extended price of the line, calculated as: Unit price x Order quantity = Extended price Numeric, 20 positions with a 2-place decimal; display-only.

See [Options Available in Order Inquiry](#) for a listing of all functions and options available.

Screen Option	Procedure
Review line details	Select <i>Display</i> for an item to advance to the Display Order Detail Screen (Reviewing Order Line Detail) .
Review a page or document associated with an order detail line	Select <i>Attached Link</i> for an item to advance to the Display Hyperlink Screen . This screen is available only if a link for the order detail line was passed in the <i>Inbound Order XML Message (CWORDERIN)</i> . For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).
Review coupon discounts	Select <i>Coupons</i> for an item to advance to the Coupon Discount Window . You cannot change any information on this screen.
View Order Orchestration drop ship status information about a purchase order detail line	Select <i>D/S Status</i> for an item to advance to the Display P/O Drop Ship Screen , if: <ul style="list-style-type: none"> the item is a drop ship item, and you use the Order Orchestration interface to process drop ship items for this vendor (see Drop ship output), and you have already sent the drop ship purchase order to Order Orchestration's Supplier Direct Fulfillment module <p>Both drop ship and fulfilled through Order Orchestration? If this is a delivery, retail pickup, or ship-for-pickup order and the item is fulfilled through drop ship integration with Order Orchestration as described above, you advance first to the Display P/O Drop Ship Screen, with an option to advance to the Display Order Broker Details Screen.</p>

Screen Option	Procedure
Review the Order Orchestration information for any order line being fulfilled through the integration with the Order Orchestration Integration	<p>Select <i>D/S Status</i> for an item to advance to the Display Order Broker Details Screen, if:</p> <ul style="list-style-type: none"> the item has been submitted to Order Orchestration for fulfillment (brokered backorder), or the customer picks up the order up at a retail location where the inventory is available (store pickup), or the order was assigned to Order Administration for fulfillment (retail pickup or delivery), or the order ships to a store location, where the customer picks it up (ship-for-pickup), and a pick slip or drop ship pick slip or purchase order has already been generated for the order line <p>See Order Orchestration Integration.</p> <p>Both fulfilled through Order Orchestration and drop ship? If this is a delivery, retail pickup, or ship-for-pickup order and the item is fulfilled through integration with Order Orchestration's Supplier Direct Fulfillment module, you advance first to the Display P/O Drop Ship Screen, with an option to advance to the Display Order Broker Details Screen.</p>
Review stored value cards	<p>Select <i>SVC</i> for an item to advance to the Display Stored Value Cards Screen if the item is a stored value card item (SVC type is <i>P</i>, <i>E</i>, or <i>V</i>).</p> <p>An error message indicates if the item on the order line is not a stored value card or the stored value card has not yet been billed: SVC do not exist for this item/SKU.</p>
Review history	Select <i>History</i> for an item to advance to the Display Order Line History Screen .
Review order line messages	Select <i>Messages</i> for an item to advance to the Work with Order Line Messages Screen .
Review reserved lines	Select <i>Reserved lines</i> for an item to advance to the Display Reserved Order Lines Screen .
Review special handling	Select <i>Special Handling</i> for an item to advance to the Display Special Handling Screen or the Display Custom Special Handling Screen .
Review zone reservation dates	Select <i>Zone Resv</i> for an item to view the Display Zone Reservation Dates Window .

Scan Order Detail Screen

Purpose: Use this screen to review detail information in a simple tabular format. This format allows more items to display on the screen at one time, and can make it easier for you to scan certain types of information quickly.

How to display this screen: Select *Scan Lines* at the [Order Inquiry Detail Screen](#). Also, if the [Default Version for Order Inquiry \(C34\)](#) system control value is blank, you advance to this screen when you:

- Select a quote or order at an order inquiry scan screen; [Using the Order Inquiry Scan Screens \(OIOM\)](#)
- Select *Sold To* at the [Order Inquiry Detail Screen](#)
- Select *Release* for a held order at a [Release Held Orders Screen \(Working with Releases\)](#)
- Select *Order Inquiry* at the [Work with Returns for Order Screen](#) in Work with Return Authorizations (streamlined version)
- Select *Ord Inq* for a refund at the [Work with Refunds Screen](#)
- Select *Order Inquiry* at the [Work with Order Broker Screen](#)
- Select an order for review at the [Pending Order Details Screen](#)

Field descriptions: See [Order Inquiry Detail Screen](#) and [Reviewing the Order Inquiry Header Screen](#) for each field not described.

Field	Description
Inv dt (Invoice date)	The date when the item was billed. Numeric, 6 positions (in user date format); display-only.
Rtn (Returned quantity)	The quantity of the item that has been returned. Numeric, 5 positions; display-only.

Available options: Select *Detail* at this screen to display the [Order Inquiry Detail Screen](#). See [Options Available in Order Inquiry](#) for information on the remaining function keys.

Display Order Broker Details Screen

Purpose: Use this screen to review the details of an order line that:

- was backordered and submitted to Order Orchestration for fulfillment (*brokered backorder*), even if the line was not fulfilled through Order Orchestration and has returned to standard warehouse processing or has shipped, or is on an order that:
 - originated in Order Administration, and the customer picks up at a store location where the merchandise is already available (*store pickup* order), or
 - originated in Order Administration, and ships to a store location where the customer picks it up (*ship-for-pickup* order), or
 - Order Orchestration sent to Order Administration for shipment directly to the customer (*delivery* order), or
 - Order Orchestration sent to Order Administration for shipment to the originating store location, where the customer picks it up (*retail pickup* order)

Each field on this screen is display-only.

 **Note:**

This screen does not display activity related to changing the setting of the order's Under Review flag in Order Orchestration based on the order's hold status in Order Administration, although the [Display Order History Screen](#) does display a related message. This activity can occur if the [Send Held Orders to OROB \(M18\)](#) system control value is selected; see that system control value for a discussion.

For more information: See the [Order Orchestration Integration](#) for background on different types of orders fulfilled through integration with Order Orchestration's Order Orchestration module.

How to display this screen: Select *D/S Status* for an order line at the [Order Inquiry Detail Screen](#). This option is available only for items fulfilled through integration with Order Orchestration (flagged on the [Order Inquiry Detail Screen](#) as *OBR* or *SPU*).

If the order line is fulfilled through integration with Order Orchestration's Supplier Direct Fulfillment module: You advance first to the [Display P/O Drop Ship Screen](#), with an option to advance to the Display Order Broker Details screen, if:

- this is a delivery, retail pickup, or ship-for-pickup order, and
- the item is fulfilled through integration with Order Orchestration's Supplier Direct Fulfillment module, and
- Order Administration has already sent the purchase order information to Order Orchestration

To display this screen from the [Display P/O Drop Ship Screen](#), select *Order Broker Detail*.

 **Note:**

If you advance to this screen by selecting *Order Broker Detail* at the Display P/O Drop Ship screen, you return to the Display P/O Drop Ship screen when you exit this screen.

Field	Description
Order #	A unique number the system assigns to identify the order. The ship-to number is to the right, separated by a hyphen. Order number: numeric, 8 positions. Ship-to number: numeric, 3 positions.
Line #	A number the system assigns to each item as it is added to the order. Numeric, 3 positions.

Field	Description
Broker delivery type	<p>Indicates the type of order:</p> <ul style="list-style-type: none"> • blank = brokered backorder. See Brokered Backorders for background. • DELIVERY: See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for background. • RETAIL PICKUP: See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for background. • SHIP FOR PICKUP: See Ship-for-Pickup Orders for background. • STORE PICKUP: See Store Pickup Orders for background.
Originating Location	<p>The location originally assigned to fulfill the order.</p> <p>From the cross-reference record set up through Work with Store Cross Reference (WSCR). The description of the location is separated from the location code by a hyphen (-).</p> <p>See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion, including information on when the location field is blank.</p> <p>The location description is truncated if it exceeds the allotted space.</p> <p>Location code: alphanumeric, 10 positions.</p> <p>Location description: alphanumeric, 40 positions.</p>
Pickup Location	<p>The location where the customer has selected to pick up the order.</p> <p>From the cross-reference record set up through Work with Store Cross Reference (WSCR). The description of the location is separated from the location code by a hyphen (-).</p> <p>See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion, including information on when the location field is blank.</p> <p>The location description is truncated if it exceeds the allotted space.</p> <p>Location code: alphanumeric, 10 positions.</p> <p>Location description: alphanumeric, 40 positions.</p>
Item/SKU	<p>A code that identifies a unit of inventory. Item codes are defined in and validated against the Item table.</p>
	<p>Alphanumeric, 12 positions.</p>
Order qty	<p>The number of units of the item that the customer ordered.</p> <p>Numeric, 5 positions.</p>

 **Note:**

The regular item code is displayed, regardless of whether the customer ordered using an alias and the [Display Item Alias \(D56\)](#) system control value is selected.

Field	Description
Details tab	<p>Multiple locations?</p> <ul style="list-style-type: none"> If you use the split order and split line options and Order Orchestration cannot find a single location to fulfill a brokered backorder line, it might split the across multiple fulfilling locations; splitting can occur either when Order Orchestration initially receives the order, or if the first assigned location rejects the line and Order Orchestration “reshops” it. The Use Split Order (L56) system control value controls this option in Order Administration, while the Allow Split Order and Allow Split Line settings at Order Orchestration’s Preferences screen control these options in Order Orchestration. In this situation, there is a single request ID assigned by Order Orchestration. If the Create Separate Picks for Ship for Pickup Orders (L89) system control value is selected and a line on a ship-for-pickup order splits across multiple warehouses for shipment, Order Administration creates a separate SubmitOrder request to Order Orchestration for each warehouse. In this situation, each SubmitOrder request creates a separate request ID assigned by Order Orchestration.
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>It is not possible to have a split line on other types of Order Orchestration orders.</p> </div>
Fulfilling Location	<p>The location where:</p> <ul style="list-style-type: none"> the item is currently assigned for fulfillment, which might be a store location (brokered backorder) or the Order Administration warehouse (retail pickup or delivery order) the customer picks up the order (store pickup or ship-for-pickup order) <p>From the cross-reference record set up through Work with Store Cross Reference (WSCR). The description of the location is separated from the location code by a hyphen (-).</p> <p>See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion, including information on when the location field is blank.</p> <p>The location description is truncated if it exceeds the allotted space.</p> <p>Location code: alphanumeric, 10 positions.</p> <p>Location description: alphanumeric, 40 positions.</p>
Status	<p>The current status of the Order Orchestration request. Possible statuses are described at the Order Orchestration Status Summary Table.</p>
Qty	<p>The quantity currently assigned to the fulfilling location. Might be less than the ordered quantity if this is a brokered backorder, the Use Split Order (L56) system control value is selected, and the Allow Split Order and Allow Split Line preferences in Order Orchestration are also selected.</p> <p>Numeric, 5 positions.</p>

Field	Description
Created date/time	<p>The date and time when the Order Orchestration request was created.</p> <p>Date: Numeric, 6 positions (in user date format). Time: Numeric, 6 positions (HH:MM:SS format).</p>
Polled date/time	<p>The most recent date and time when the BROKER job evaluated whether to request a status update for the order line.</p> <p>The job uses the Order Broker Status Update Interval (K10) system control value to determine how often to check on status.</p> <p>Not used for retail pickup or delivery orders, which do not originate in Order Administration.</p> <p>Date: Numeric, 6 positions (in user date format). Time: Numeric, 6 positions (HH:MM:SS format).</p>
Request ID	<p>A unique ID number assigned by Order Orchestration to identify the order line or order:</p> <ul style="list-style-type: none"> • If you do not split orders, each individual brokered backorder item submitted to Order Orchestration receives a unique request ID, and Order Orchestration treats it as a separate order; otherwise, lines on an order create a single request ID in Order Orchestration when the system submits the lines to Order Orchestration in the same request message. • If the Create Separate Picks for Ship for Pickup Orders (L89) system control value is selected, Order Administration submits each order line to Order Orchestration as a separate order, and Order Orchestration assigns each its own request ID. • Store pickup orders cannot be split. <p>The request ID is blank for requests whose status is:</p> <ul style="list-style-type: none"> • <i>Z: Canceled</i> • <i>C: Closed</i> • <i>J: Rejected</i> • <i>R: Ready</i> • <i>W: Waiting</i> <p>The field might also be blank for requests in <i>E: Error</i> status, depending on the nature of the error. For example, requests that Order Orchestration did not receive and create successfully are not assigned request ID's.</p> <p>Although the field in Order Administration is up to 25 positions, Order Orchestration does not support a request ID longer than 10 positions.</p> <p>Numeric, 25 positions.</p>
History tab	<p>History records sort by the line number assigned in Order Orchestration, and then by date and time within line number.</p> <p>The most recent 101 history records are displayed.</p>
Date	<p>The date when the request was sent to Order Orchestration, or when the response was received in Order Administration.</p> <p>Numeric, 6 positions (in user date format).</p>
Time	<p>The time when the request was sent to Order Orchestration, or when the response was received in Order Administration.</p> <p>Numeric, 6 positions (HH:MM:SS format).</p>

Field	Description
OROB Ln#	<p>The line number currently assigned in Order Orchestration at the time the response was sent or received. The line number is blank for history that occurs before Order Orchestration sends a response message indicating the current line number. If the order line is initially split at creation in Order Orchestration, the first few history records might have blank line numbers.</p> <p>Numeric, 5 positions.</p>
Transaction type	<p>The type of activity that occurred. Possible transaction types are:</p> <p><i>C - Send Status Request</i> = Order Administration sent an request to Order Orchestration to inquire about the order's current status.</p> <p><i>D - Receive Status Response</i> = Order Administration received the status inquiry response message from Order Orchestration.</p> <div data-bbox="873 688 1458 947" style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>Once the order line is in Accepted status, Order Administration does not write a history record for the status inquiry response as long as the record remains in this status.</p> </div> <p><i>M - Maintenance Transaction</i> = You canceled the brokered backorder or store pickup request. You can cancel a brokered backorder either through order maintenance, or by canceling the Order Orchestration request itself (but not the order line) at the Work with Order Broker Screen; however, you can only cancel a store pickup request through order maintenance.</p> <p><i>E - Send Update Request</i> = Order Administration sent a status update request message to Order Orchestration.</p> <p><i>F - Receive Update Response</i> = Order Administration received the status update response message from Order Orchestration.</p> <p>See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for examples of the different messages generated or received by Order Administration as part of the Order Orchestration integration.</p> <p>Alphanumeric, 25 positions.</p>
Status	<p>The status of the Order Orchestration line at the time of the activity. Possible statuses are described at the Order Orchestration Status Summary Table.</p>
Fulfilling Location	<p>The location where the item was assigned for fulfillment (brokered backorder, retail pickup, or delivery) or pickup (store pickup, ship-for-pickup) at the time the activity occurred. The description of the location is separated from the location code by a hyphen (-). If there is no Store Cross Reference record for the location, no description is displayed. See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion.</p> <p>The location description is truncated if it exceeds the allotted space.</p> <p>Location code: alphanumeric, 10 positions.</p> <p>Location description: alphanumeric, 40 positions.</p>

Field	Description
Qty	The quantity of the Order Orchestration line at the time of the activity. Might be less than the ordered quantity if this is a brokered backorder, the Use Split Order (L56) system control value is selected, and the Allow Split Order and Allow Split Line preferences in Order Orchestration are also selected. Numeric, 5 positions.
Error	The error, if any, received from Order Orchestration. The error message is truncated if it exceeds 30 positions. An error of Null response from OROB indicates that the OROB Account (K49) system control value is not set correctly. See Troubleshooting the Order Orchestration Integration and the <i>Order Orchestration Web Services Guide</i> https://support.oracle.com (ID 2953017.1) for more information on possible errors. Alphanumeric, 30 positions; display-only.

Reviewing Order Details

Purpose: From the [Order Inquiry Detail Screen](#) you can display information about a specific item purchased on a quote or order. Order line detail provides you with information you may need to respond to a customer's inquiry.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including information on the order details.

In this topic: This topic presents the screens and pop-up windows available from the [Order Inquiry Detail Screen](#) and the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#):

- [Display Order Detail Screen \(Reviewing Order Line Detail\)](#)
- [Display Hyperlink Screen](#)
- [Display Special Handling Screen](#)
- [Display Custom Special Handling Screen](#)
- [Display Reserved Order Lines Screen](#)
- [Display Zone Reservation Dates Window](#)
- [Item Availability Screen](#)
- [Order Pricing Window](#)
- [Order Quantities Window](#)
- [Order Dates Window](#)
- [Work with Item/SKU Comments Window](#)
- [Display P/O Drop Ship Screen](#)
 - [Submit Cancel Request Pop-up Window](#)

For more information:

- item history (*History*): [Display Order Line History Screen](#)

- zone reservation process (*Zone Res*): [Shipping Zone Reservation Overview](#)

Display Order Detail Screen (Reviewing Order Line Detail)

Purpose: Use this screen to review information related to a specific item on the quote or order. The information at the top of this screen identifies both order and line information.

How to display this screen: At the [Order Inquiry Detail Screen](#) or at the [Scan Order Detail Screen](#), select *Details* for an item.

Field descriptions: See [Order Inquiry Detail Screen](#) and [Order Inquiry Header Screen](#) for each field on this screen not described.

Field	Description
B/O (Back order)	<p>A brief explanation of the reason an item is on backorder or unavailable for shipment.</p> <p>Order Orchestration? If the detail line has been assigned to Order Orchestration for fulfillment, the detail line is flagged as backordered and has a Printed quantity that is equal to the ordered quantity. In this case, the Drop ship flag for the order line is set to <i>D</i>. The backorder reason remains on the order line even after the line is fulfilled through Order Orchestration. See Brokered Backorders for an overview.</p> <p>Alphanumeric, 25 positions; display-only.</p>
Ofr (Offer)	<p>A code for the catalog, space or television advertisement from which you accept quotes and orders.</p> <p>The offer defined for the quote or order controls how to calculate shipping and price items. However, if you override the offer for an item (if the customer is ordering from more than one catalog, for example), demand for the item is attributed to the offer associated with the item rather than the order. Demand represents the number and dollar value of orders placed against an offer.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The system automatically overrides the offer for an item if Override Offer on Order Detail Line (D49) system control value is <i>selected</i> and the item is not sold in the offer used on the order.</p> </div>
	<p>Offers are defined in and validated against the Offer table. See Working with Offers (WOFR).</p> <p>Alphanumeric, 3 positions; display-only.</p>
Price	<p>The per unit price of this item, after applying all discounts and repricing. This price reflects any coupon discount amount or dollar discount by offer or source if the Prorate Dollar Discounts and Coupons (D90) system control value is <i>selected</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>

Field	Description
Pricing method (Unlabeled field directly below the Price field)	<p>The method the system used to calculate the price of an item, such as special source pricing, quantity break by item (item/offer pricing), or price codes. See the Order Pricing Window for a listing of pricing methods.</p> <p>Alphanumeric, 25 positions; display-only.</p>
N/C (No charge)	<p>This flag indicates whether the customer will be charged for the item.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <i>No Charge</i> = The customer is not charged for the item. <i>Priced</i> = The customer is charged for the item.
Ovr (Price override reason code)	<p>Represents the reason that the price of an item was changed or the customer was given the item at no charge. The system assigns a price override reason code when a free gift or promotional item is added to the order.</p> <p>For quotes, the system assigns the price override reason code defined in the Price Override Reason for Quotes (K75) system control value to each detail line.</p> <p>Price override reason codes are defined in and validated against the Price Override Reason Code table. See Establishing Additional Charge Codes (WADC).</p> <p>Several system control values are available for the system to assign a price override reason code for different types of price overrides; see Setting Up Order Entry Values.</p> <p>Numeric, 1 position; display-only.</p>
Offer price	<p>The item price as defined for the offer. If the order was subject to VAT and tax-inclusive pricing, in which any tax is included in the Hidden tax field rather than the Tax bucket on the order, the offer price presented here is the tax-inclusive offer price.</p>

 **Note:**

When a price override reason applies to the order line (whether you enter an override reason manually, or if the system applies the override automatically), the override reason's [Override item offer price](#) setting controls whether to use the regular offer price. See [Overriding the Item/SKU Offer Price](#) for a discussion.

Customer price group pricing: If you use [Customer Price Group Pricing](#), the offer price represents the initial price of the item, based on the [Price Type](#) defined for the customer price group.

Numeric, 13 positions with a 2-place decimal; display-only.

Field	Description
Pre-disc price (Pre-discount price)	<p>The item price before applying any coupons or dollar discounts by source or offer, if the Prorate Dollar Discounts and Coupons (D90) system control value is <i>selected</i>, but after applying other discounts and repricing.</p> <p>The system does not update this field if you change the customer's tax status at any point after entering the item. If you use tax-inclusive pricing, there may be cases where the system reprices items due to changes in a customer's tax exemption status, changing the shipping address to a VAT-exempt state, etc. In these cases, the pre-discount price may not correspond to the way the actual price was derived.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
Duty	<p>The amount of duty, if any, charged for the item. The system calculates duty based on the duty rates defined for the country of the ship-to address and the harmonize code defined for the item. See Setting Up the Country Table (WCTY).</p> <p>Duty is included in the Handling bucket for the order.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
Ship via	<p>A code that identifies the carrier who delivers the merchandise. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA).</p> <p>A ship via code appears here only if the ship via for the item is different from the ship via on the quote or order.</p> <p>Numeric, 2 positions; display-only.</p>
Extension	<p>The total dollar amount for the item. Calculation is: <code>Order Quantity x Item Price = Extension</code></p> <p>The extension is based on the item selling price, after applying all discounts and repricing.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Discount method (Unlabeled field below the duty field)	<p>The method, such as source code discount or order discount, that the system used to apply any discounting to the item price after applying any other pricing methods (but before applying a coupon amount or dollar discount by source or offer, if the Prorate Dollar Discounts and Coupons (D90) system control value is <i>selected</i>).</p> <p>Alphanumeric, 25 positions; display-only.</p>
Arr date (Arrival date)	<p>The date the customer requested delivery of the item. The order date defaults in order entry.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Field	Description
Source	<p>The source code assigned to the detail line. A source code appears here only if:</p> <ul style="list-style-type: none"> the Order Entry operator entered a source code at the line level, or the Use Source Code from Order Header When Creating Order Lines (D73) system control value is <i>selected</i>, or the Load Source from Mailing History (D20) system control value is <i>selected</i> and the offer entered on the detail line is not associated with the source code on the order header, and the system found an associated source code in the customer's mail history. <p>The source code at the line level controls demand and sales information/posting for that item, whereas the source code on the order controls how items are priced and freight is calculated.</p> <p>Alphanumeric, 9 positions; display-only.</p>
Exp ship date (Expected ship date)	<p><i>For a backordered item:</i> the date a purchase order containing this backordered item is expected.</p> <p><i>For drop ship items, including brokered items:</i> This date is displayed for drop ship items only if the Assign Drop Ship Expected Ship Date (I59) system control value is <i>selected</i>. See that system control value for more information.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
C/G (Coordinate group)	<p>A number assigned to two or more items to ensure that they ship together.</p> <p>Numeric, 2 positions; display-only.</p>
Freight	<p>The charge for shipping the item. This total does not include additional freight charges, and is blank if the freight is calculated for the entire order instead of item-by-item.</p> <p>The system calculates freight charges based on the freight method defined for the source code on the order.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
B/O whs (Backorder warehouse)	<p>A code that identifies the warehouse assigned to ship a backordered item.</p>

 **Note:**

This field appears only if there is a backordered quantity of the item, or if the order line has been assigned to Order Orchestration for fulfillment as a brokered backorder. If the line is fulfilled through Order Orchestration as a brokered backorder, the backorder warehouse remains on the order line. See [Brokered Backorders](#) for an overview.

Numeric, 3 positions; display-only.

Field	Description
G/W (Gift wrap)	<p>A flag that identifies whether the item is gift wrapped.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Gift wrap the item. <i>Unselected</i> = Do not gift wrap the item.
S/H code (Special handling code)	<p>Represents the type of special handling to be performed on the item. Special handling refers to any type of item personalization, such as monogramming, alterations, engraving, etc.</p> <p>The item/SKU offer controls whether you can apply special handling to an item/SKU. See Special Handling Overview for more information.</p> <p>Alphanumeric, 2 positions; display-only.</p>
S/H charge (Special handling charge)	<p>The dollar amount for special handling of the item. See Special Handling Overview for more information.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
Future order	<p>This flag indicates that the arrival date for the item is too far in the future to reserve stock. The item is reserved when the current date reaches the requested arrival date minus lead days for picking and shipping.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = This is a future order; do not reserve inventory. <i>Unselected</i> = This is not a future order and is eligible for inventory reservation.
Warehouse	<p>The warehouse shipping the item. Typically set to 0. Some reasons why an order line might be assigned to a specific warehouse:</p> <ul style="list-style-type: none"> this is a retail pickup or delivery order assigned to a warehouse by Order Orchestration the order line is a return created by entering a negative quantity in order entry the order line was express-billed you specified a warehouse override for the order or line when creating the order, either in interactive order entry or through the order API <p>Numeric, 3 positions; display-only.</p>
Cancel date	<p>The last date when the customer will accept receipt of this item. For quotes, this is the date the quote expires.</p> <p>Items that have not shipped by the cancel date are included in the Order Cancellation List by Item; however, they are not canceled automatically. This gives you the opportunity to contact the customer and extend the delivery time.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Affect inv (Affect inventory)	<p>If this flag is selected, it indicates that the system reserves the item and reduces inventory after a shipment.</p> <p>Valid conditions are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Reserve the item and reduce inventory. <i>Unselected</i> = Do not affect inventory. This flag is unselected if the item is flagged as a non-inventory item.

Field	Description
Drop ship	<p>A code that identifies the item as one that you do not typically stock in inventory, and which you must order from your vendor, who then ships the item(s) directly to the customer.</p> <p>An item is defined as a drop ship item in the Item table, or can be identified as a drop ship item in order entry or maintenance.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>D</i> = Drop ship item. • blank = Regular item. <p>Order Orchestration? If the order line has been assigned to Order Orchestration for fulfillment (brokered backorder) or if the customer is picking up the order at a store location where the inventory is already available (store pickup), the Drop ship flag for the order line is set to <i>D</i>. In this case, the order line is flagged as B/O and it has a Printed quantity that is equal to the ordered quantity. See Brokered Backorders or Store Pickup Orders for an overview.</p> <p>Alphanumeric, 1 position; display-only.</p>
Priority	<p>A number that controls the priority of order fulfillment on a backordered item. Priority codes range from 0-9, where:</p> <ul style="list-style-type: none"> • 0 = lowest priority • 9 = highest priority <p>A value defaults to this field if a priority was entered or defaulted into the <i>Pty (Priority)</i> on the order header; and this field, in turn, defaults from the <i>B/O priority (Backorder priority)</i> field for the source code.</p> <p>Numeric, 1 position; display-only.</p>
Bypass rsv (Bypass reservation)	<p>This flag controls whether the system reserves this item during Order Entry.</p> <ul style="list-style-type: none"> • If the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system selects this flag for each order line sent to Order Orchestration for fulfillment assignment. See Brokered Backorders. • If the Use OROB for Fulfillment Assignment (M31) system control value is unselected, items that bypass immediate reservation must be reserved using Interactive Reservation. See Working with Interactive Reservation (MIRV). You can define an item to bypass reservation in the Item table. <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Bypass immediate reservation. • <i>Unselected</i> = Do not bypass immediate reservation. <p>Regardless of the setting of this field, the system does not reserve items on quotes.</p>
Page letter	<p>Indicates the item was ordered by page/letter rather than item number. The page letter code consists of the page of the catalog where the item appears and its position on the page. Page/letter entry format is possible only if you have selected this format for Order Entry. The page/letter assignment is defined in the Item/Offer table. See Performing Initial Item Entry (MITM).</p> <p><i>Example:</i> Item C100 appears on page 52 of the winter preview catalog. It is the first item on the page. If using page/letter entry, you can select it as item W52A in Order Entry; however, the item appears as C100 on the order and prints as C100 on the pick slip.</p> <p>Alphanumeric, 6 positions; display-only.</p>

Field	Description
Cost override	<p>The override to the item's cost, from order entry or order maintenance. You can override the cost of an item to manage the gross profit margin calculation. Gross profit margin is that amount of the price that exceeds your cost for the item.</p> <p>A common application of cost override in order entry is when you receive cost information from a drop ship vendor, and you calculate a gross profit margin based on the vendor's statement of cost; the new cost information appears in this field.</p> <p>Numeric, 13 positions with a 4-place decimal; display-only.</p>
G/W \$ (Gift wrap price)	<p>The dollar amount charged for gift wrapping an item, as defined in the Item/Offer or SKU/Offer record.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
Add'l frt (Additional freight)	<p>The dollar amount of shipper/item charges, as defined for the shipper and item at the Work with Ship Via/Item Screen.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
Tax	<p>Sales tax charged for the item, as calculated by the system. This is the extended tax amount; that is, the total tax for the entire quantity.</p> <p>The total in the Tax bucket on the order may not equal the totals for each item if, for example the order is subject to tax on handling and/or freight, or due to rounding up or down to the nearest penny.</p> <p>On orders subject to VAT and tax-inclusive pricing, any tax appears in the Hidden tax field. This amount is not included in the Tax bucket on the order totals.</p> <p>Numeric, 13 positions with a 5-place decimal; display-only.</p>
Tax override %	<p>The tax rate for the tax.</p>

**Note:**

This field displays only if a Tax override rate is defined in the Order Detail table.

The system uses the following calculation to determine the tax override rate:

$$(\text{tax amount} / \text{extended amount}) \times 100 = \text{tax override rate}$$

The system stores the tax rate for the tax override in the ODT Tax Override Rate field in the Order Detail table; the system uses the tax rate during Order Maintenance if you use the Discount Price window to apply a discount to a shipped item. Billing also uses this tax rate to create the credit invoice and calculate the tax credit amount using the new tax amount. See [Discount Price Window \(Applying a Discount to an Item\)](#) for an example.

Numeric, 7 positions with a 5-place decimal; display-only.

Field	Description
Hidden tax	<p>The amount of any hidden tax attributed to the item. This field appears only if the Tax Included in Price (E70) system control value is <i>selected</i>, and a hidden tax amount appears only for orders and items subject to VAT and tax-inclusive pricing.</p> <p>On orders using tax-inclusive pricing, you charge a different, higher price for an item than an orders subject to conventional tax. Also, any tax amount is not calculated in the standard way and included in the Tax bucket on the order; instead, a hidden tax amount is calculated based on the information you have defined for the customer's country or the item itself, and this amount is "hidden" on the order detail line; this tax is not visible to the customer. Unlike the item tax included in the Tax field, described above, the hidden tax is a unit amount, not an extended amount; you must multiply the hidden tax amount by the item quantity to arrive at the extended hidden tax amount for the order line.</p> <p>In tracking sales figures, such as in the Order Billing History table and on marketing reports, the system subtracts the hidden tax amount from the item price to determine sales dollars. For example, if the customer pays \$10.00 for an item, but the hidden tax amount is \$1.50, the system posts the sale as \$8.50.</p> <p>It is possible for the hidden tax for an item to exceed the price you charge the customer if you have defined hidden tax for the item as an amount rather than a percentage of the item price, and you sell the item at a considerable discount or as a free gift.</p> <p>An item may be exempt from tax, hidden tax, or both based on exemptions defined for the order, customer, state, or item. See Working with Customer Tax Status for more information on tax exemptions. See Setting Up the Zip/City/State (Postal Code) Table (WZIP) for more information on how the system determines how to apply tax or hidden tax to an order.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>

Field	Description
Quantity	<p>A series of item status fields updated by the system. Valid values are:</p> <p>Reserved Quantity The number of units for which stock has been reserved. This number is reduced when items are canceled, confirmed, or unreserved using Interactive Reservation.</p> <p>Reserved Date The date when the units were reserved. This date remains blank for items flagged as a non-inventory item.</p> <p>Printed Quantity The number of units for which pick slips have been printed. This number is reduced if the pick ticket is voided or when shipment of the item is confirmed.</p> <p>Printed Date The date when the pick slip was printed.</p> <p>Shipped The number of units that have shipped. This quantity is negative for returns created by entering a negative quantity in order entry.</p> <p>Returned The number of units that the customer has returned. This quantity is zero for returns created by entering a negative quantity in order entry.</p> <p>Canceled The number of units that have been canceled.</p> <p>Sold Out The number of units that are sold out. Number: numeric, 5 positions, display-only.</p> <p>Order Orchestration? If the order line has been assigned to Order Orchestration for fulfillment (brokered backorder) or if the customer is picking up the order at a retail location where the inventory is already available (store pickup), the order line is flagged as backordered and has a Printed quantity here that is equal to the ordered quantity. In this case, the Drop ship flag for the order line is set to <i>D</i> until the order line is fulfilled and the Printed quantity is reduced. See Brokered Backorders or Store Pickup Orders for an overview.</p>

Screen Option	Procedure
Review special handling	Select <i>S/H</i> to advance to the Display Special Handling Screen or Display Custom Special Handling Screen .
Review item availability	Select <i>Availability</i> to advance to the Item Availability Screen .
Review item pricing information	Select <i>Pricing</i> to display the Order Pricing Window .
Review quantities	Select <i>Qtys</i> to display the Order Quantities Window .
Review dates	Select <i>Dates</i> to display the Order Dates Window .
Display item or SKU comments	Select <i>Comments</i> to display the Work with Item/SKU Comments Window .
Review order line messages	Select <i>Msgs</i> to advance to the Item Availability Screen .

Screen Option	Procedure
Review order transaction history	Select <i>History</i> to advance to the Display Order Line History Screen .

Display Hyperlink Screen

Purpose: Use this screen to advance to a linked web page or file for an item.

How to display this screen: Select *Attached Link* for an order detail line at the [Order Inquiry Detail Screen](#). This screen is available only if the link was passed in the `line_hyperlink` attribute of the *Inbound Order XML Message (CWORDERIN)*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Following the link: Click on *Click here to view attached link* to open the link target in a new browser window.

Note:

If the link was passed in upper and lower case, the case is retained.

Troubleshooting the hyperlink for an item:

- The system does not validate that the link passed in the inbound message points to an existing page or file; if the page or file is not available when you click the link, the browser window displays an error.
- If the link does not begin with `http`, then when you click the link, Order Administration appends the same path as the current screen. For example, if the link passed was `images/IMG1234.PDF`, and the screen is located in `http://server:port/oms/`, then Order Administration attempts to open the link at `http://server:port/oms/images/IMG1234.PDF`.
- In order for certain special characters to be created correctly through the *Inbound Order XML Message (CWORDERIN)*, they must be passed as described under [Translating Special Characters](#). For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- Depending on your browser settings, you might be able to display the link by positioning your mouse over the words *Click here to view attached link*, or by right-clicking and selecting *Properties*.
- There is no screen you can use to change or update the Hyperlink field for an item once the order has been created.

Field	Description
Order #	The order number and ship to number associated with the hyperlink. Order#: Numeric, 8 positions; display-only. Ship to#: Numeric, 3 positions; display-only.

Field	Description
Line #	A number the system assigns to each item as it is added to the order. Numeric, 3 positions; display-only.
Item-SKU\description	The item and SKU code, followed by the description of the item and SKU. The description field displays up to 52 positions; however, if the SKU description is truncated, you can display the rest by putting your cursor in the field and advancing it to the right. Item: alphanumeric, 12 positions; display-only. SKU: alphanumeric, three 4-position fields; display-only. Item description: alphanumeric, 120 positions; display-only. SKU description: alphanumeric, 40 positions; display-only.

Display Special Handling Screen

Purpose: This screen depicts the special handling code and charge that apply to an item if it uses regular (that is, not custom) special handling.

How to display this screen: Select *Special Handling* for an item at the [Order Inquiry Detail Screen](#) or at the [Scan Order Detail Screen](#), or select *Special Handling* at the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#).

Note:

If the item has custom special handling, you advance to the [Display Custom Special Handling Screen](#) instead.

Field	Description
Special handling	Represents the type of special handling that applies to an item. Special handling refers to any type of item personalization, such as monogramming, alterations, engraving, etc. The item/SKU offer controls whether the item is eligible for special handling. See Special Handling Overview for more information. The information is defined in the Additional Charges Code table. See Establishing Additional Charge Codes (WADC) . Numeric, 2 positions; display-only.
Charge	The charge for special handling of an item. See Special Handling Overview for more information. Numeric, 13 positions with a 2-place decimal; display-only.
Handling information	Free-form instructions about how to customize the item. These fields might be blank if, for example, you use the special handling format only to add a charge to the Handling bucket on the order. The Suppress S/H window field for the additional charge code allows you to suppress the automatic display of the special handling screen in order entry if you use a special handling code for this purpose. Alphanumeric, 30 positions each line; display-only.

Display Custom Special Handling Screen

Purpose: This screen depicts the special handling code and charge that apply to an item that uses custom special handling. The fields on your screen will differ based on how you set up the special handling format detail at the [Create Special Handling Format Detail Screen](#).

For more information on custom special handling information, see:

- [Special Handling Overview](#)
- [Establishing Custom Special Handling Formats \(WSHF\)](#) on how to set up special format detail
- [Working with Items on the Order](#) on how to enter custom special handling information on an order

How to display this screen: Select *Special Handling* for an item at the [Order Inquiry Detail Screen](#) or at the [Scan Order Detail Screen](#), or select *Special Handling* at the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#).

How to display this screen: If the item has regular special handling, you advance to the [Display Special Handling Screen](#) instead.

Field	Description
Special format	Represents the type of special handling that applies to an item. Special handling refers to any type of item personalization, such as monogramming, alterations and emblems. Special handling codes are defined in and validated against the Additional Charge Code table. See Special Handling Overview for more information. Numeric, 2 positions; display-only.
Charge	The charge associated with the special handling applied to this item. See Special Handling Overview for more information. Numeric, 13 positions with a 2-place decimal; display-only.
Label	A special handling option defined for this custom special handling format. Alphanumeric, 15 positions; display-only.
Input	The response selected for each special handling option available in the custom special handling format. These fields might be blank if, for example, you use the special handling format only to add a charge to the Handling bucket on the order. The Suppress S/H window field for the additional charge code allows you to suppress the automatic display of the special handling screen in order entry if you use a special handling code for this purpose. Alphanumeric, 45 positions; display-only.
Charge (Optional charge)	The charge associated with an option in the custom special handling format. This charge is added to the Handling bucket of the order totals. Numeric, 13 positions with a 2-place decimal; display-only.

Display Reserved Order Lines Screen

Purpose: Use this screen to identify reserved, open, and printed quantities for an item on an order.

Pick slip preparation: When the system applies pick slip preparation to an order, the system updates the Reserved Order Line table for each order line included on a pre-generated pick:

- Increments the Qty printed by the quantity on the Pick Control Detail.
- Decrements the Qty remaining by the quantity on the Pick Control Detail.

Note:

The system does not update the Qty printed in the Order Detail table during pick slip preparation; this update occurs during pick slip generation. You can review the quantity printed for an order detail line on the [Order Inquiry Detail Screen](#).

See [Applying Pick Slip Preparation to an Order](#) for more information on the updates that are performed.

How to display this screen: Select *Reserved Lines* for an item on the [Order Inquiry Detail Screen](#).

Field	Description
Order line	This field includes the customer number, ship-to number, and the order detail line number, each separated by a hyphen (-). Numeric, 3 positions; display-only.
Qty ordered (Quantity ordered)	The total number of units ordered of the item. Numeric, 5 positions; display-only.
Qty reserved (Quantity reserved)	The total number of units the system has reserved for this item. Reservation may occur immediately at Order Entry or in batch mode at designated intervals. When reviewing item reservation fields, you may need to be aware that these conditions may prevent or delay reservation: <ul style="list-style-type: none"> • Arrival date, when compared to today's date, is greater than the number of days specified in the Reservation Lead Days (B27) system control value. • The item has been assigned a zone reservation code. Zone reservation coded items are not reserved in order entry; instead they are given a backorder status of Z and are reserved during pick generation. • Bypass res (Bypass reservation) field in the Customer table or for the customer class (see Setting Up the Customer Class Table (WCCL)) is selected. • Quantity ordered is greater than the quantity available to sell. • Quantity ordered is greater than the Reserve quantity maximum value in the Item table • Reservation freeze field in the item/SKU warehouse record is selected. Numeric, 5 positions; display-only.

Field	Description
Cmp (Company)	The code for the company from which the item was reserved. Numeric, 3 positions; display-only.
Whs (Warehouse)	The warehouse shipping the item. An item may be reserved across more than one warehouse if the Split Line Over Multi Whse (B19) system control value is <i>selected</i> . Alphanumeric, 3 positions; display-only.
Reserved	The quantity reserved of the item. Numeric, 5 positions; display-only.
Printed	The number of units for which a pick slip has been printed. The system updates this field when it creates a pre-generated pick for the order line, incrementing this number by the quantity on the Pick Control Detail; see Applying Pick Slip Preparation to an Order . Numeric, 5 positions; display-only.
Remaining (Quantity remaining)	The difference between the quantity reserved and the quantity printed. The system updates this field when it creates a pre-generated pick for the order line, decreasing this number by the quantity on the Pick Control Detail; see Applying Pick Slip Preparation to an Order . Numeric, 5 positions; display-only.
Date	The date the item was reserved. Numeric, 6 positions (in user date format); display-only.
Time	The time the item was reserved. Numeric, 6 positions (HHMMSS format); display-only.

Display Zone Reservation Dates Window

Purpose: You can display shipping zone reservation date information for zone reservation coded items. The zone reservation process is used to restrict order reservation and shipping dates for weather-sensitive items such as plant stock; the Display Zone Reservation Dates pop-up window gives information about the reservation/shipping dates you have set up for this item. See [Shipping Zone Reservation Overview](#).

How to display this window: Select *Zone Resv* for an item at the [Order Inquiry Detail Screen](#).

Note:

If the item/SKU you have selected has no zone reservation code, the window does not open; instead, the system displays a message.

Zone dates do not exist for this item/SKU (XXXXXXXXXXXX/XXXXXXXXXXXX)

Field	Description
Zone start date	<p>The shipping start date for the zone date window; the date you intend to begin shipping this item to the geographic zone in which the ship-to address on this order is located.</p> <p>Numeric, 6 positions, in user date format; display-only.</p>
Zone end date	<p>The shipping end date for the zone window; the last day you specify for shipping this item to this ship-to address.</p> <p>Numeric, 6 positions, in user date format; display-only.</p>
Arrival date	<p>The date this item is scheduled to be shipped to the customer. This date is:</p> <ul style="list-style-type: none"> the zone start date if the item was ordered prior to the zone season start date. the order date if the item was ordered between the zone season start date and zone end date, provided that: <ul style="list-style-type: none"> if you use Standard Zone Reservation Rules, the item was available or you took the order before the zone's deferred cutoff date if you use Alternate Zone Reservation Rules, the item was available or had an open PO quantity otherwise, this date is the next season's zone start date from the zone reservation dates. <p>See Shipping Zone Reservation Overview for a complete discussion.</p> <p>You can use an order line's Arrival date as a selection criterion in pick slip generation. For zone reservation coded inventory such as plant stock, this selection insures that the item will ship at a date suitable for planting at its destination.</p> <p>Alphanumeric, 6 positions, in user date format; display-only.</p>
Priority	<p>Determines the sequence in which orders receive inventory in the Evaluate Backorders program and the Batch Reservation program. Zone reservation orders are reserved in one of these two programs. Valid values are numbers in the range 0 - 9, where:</p> <ul style="list-style-type: none"> 0 = Lowest priority 9 = Highest priority <p>If you have entered an override to the default Arrival date in order entry (other than the date of the order), the order Priority is 9 (Highest priority). Overriding the Arrival date for zone reservation orders insures that these orders are fulfilled before lower priority orders.</p> <p>You can use an order's Priority as a selection criterion in pick slip generation.</p> <p>Numeric, 1 position; display-only.</p>
Season	<p>A code identifying the season to which the date window applies.</p> <p>Alphanumeric, 3 positions; optional.</p>
Geo. zone (Geographic zone)	<p>A code identifying the geographic zone to which the date window applies.</p> <p>The country is divided into geographic zones which relate to relative weather conditions. Each of these zones have a different date window during which this item can be shipped.</p> <p>See Creating and Maintaining Geographic Zones (WGZN).</p> <p>Alphanumeric, 3 positions; optional.</p>

Item Availability Screen

Purpose: Use this screen to review the warehouse location and availability of an item.

How to display this screen: Select *Availability* at the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#).

Field	Description
Whse (Warehouse)	A code representing a warehouse containing the item. Numeric, 3 positions; display-only.
Description	The description of the warehouse. Alphanumeric, 30 positions; display-only.
Total avail (Total availability)	The quantity of the item available to sell. Numeric, 7 positions; display-only.
Avail (Available)	The quantity of the item available in the designated warehouse. Numeric, 7 positions; display-only.
B/O (Backorder)	The number of units that customers have ordered that are not available to be shipped. Numeric, 7 positions; display-only.
Open PO (Open purchase orders)	The quantity of the item due for receipt on open purchase orders in the designated warehouse. Numeric, 7 positions; display-only.

Order Pricing Window

Purpose: Use this window to review how the item was priced and any discounts and tax that were applied to the item.

**Note:**

This pop-up window does not include any *Hidden tax* for the item.

How to display this window: Select *Pricing* at the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#).

Field	Description
Price method	<p>The method the system used to calculate the price of an item, but before applying an order-level discount, such as a source code discount percentage.</p> <p>Valid values, and the corresponding code stored in the Order Detail table, are:</p> <ul style="list-style-type: none"> • 1 Coupon item price • 2 Customer discount% • 3 Contract price • 4 Special source price • 5 Column price • 6 Quantity break price • 7 Offer price • A Repriced-prorated discount • B Quantity Price Matrix Customer Override • C Use item cost • E Price code • F Customer Price Group • G BOGO • I Repriced-qty break/item • J Repriced Customer Price Group Best Price • K Price table default • L Price Table Level Ovr • N No charge (with cost tracking; source code definition) • O No charge/no cost (source code definition) • R Price override (includes entering as no charge in Order Entry) • T Price table premium • U Upsell Item • V Repriced-volume discount • Y Price table • X Qty Price Matrix • Z Repriced-item category promotion <p>Alphanumeric, 1 position; display-only, assigned by the system.</p>
No charge	<p>This flag indicates if you <i>selected</i> the No charge field in Order Entry. Valid value:</p> <p><i>Selected</i> = Item price was overridden to no charge in Order Entry.</p>
Add'l chg code (Additional charge code)	<p>A code for the additional charge added to the item. Additional charges may be added because of the source code, the offer, special handling of an item, or for shipping a special item.</p> <p>Additional charges are defined in and validated against the Additional Charges table. See Establishing Additional Charge Codes (WADC).</p> <p>Alphanumeric, 1 position; display-only.</p>
Original price	<p>The offer price of the item before any discount is applied.</p> <p>Customer price group pricing: If you use Customer Price Group Pricing, this price represents the initial price of the item, based on the Price Type defined for the customer price group.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>

Field	Description
Price	The price the customer is charged for a single unit of the item. This price differs from the original price if any discount or repricing applied. Numeric, 13 positions with a 2-place decimal; display-only.
Discount	The amount of the discount applied to the item. This field is not currently implemented. Numeric, 13 positions with a 2-place decimal; display-only.
Disc applied?	This code identifies whether a discount was applied to the order. Valid values are: <ul style="list-style-type: none"> • <i>A</i> = A discount percentage was entered on the order header screen, or a discount percentage was defined for the customer. • <i>B</i> = A discount percentage was defined for the source code. Alphanumeric, 1 position; display-only.
Freight charge	The freight override, if any, entered for this item on the order. Numeric, 13 positions with a 2-place decimal; display-only.
Spec handling (Special handling)	The special handling charge, if any, for the item. Numeric, 13 positions with a 2-place decimal; display-only.
Tax	The tax amount that applies to the item. See Tax . Numeric, 13 positions with a 2-place decimal; display-only.
GST (Goods and Services Tax)	The Canadian goods and services tax (GST) that applies to items shipping to Canada. If GST applies, the tax includes this amount. Numeric, 13 positions with a 2-place decimal; display-only.
PST (Provincial Services Tax)	The Provincial Services tax (PST) that applies to items shipping to Canada. If PST applies, the tax includes this amount. Numeric, 13 positions with a 2-place decimal; display-only.
Hidden tax	The amount of hidden tax for the each unit of the item. Numeric, 13 positions with a 2-place decimal; display-only.
Extension	The extended price of the item, calculated as: $\text{Item Price} \times \text{Order quantity} = \text{Extended Price}$ An extended price does not appear for canceled items. Numeric, 20 positions with a 2-place decimal; display-only.

Order Quantities Window

Purpose: Use this window to review various quantity information for the item.

How to display this window: Select *Qtys* at the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#).

Field	Description
Affect Inv (Affect inventory)	A flag that determines whether the system reduces inventory when you sell the item. Values are: <ul style="list-style-type: none"> • <i>Selected</i> = Reduce inventory. • <i>Unselected</i> = Do not affect inventory.

Field	Description
Bypass res (Bypass reservation)	<p>A flag that determines whether the item bypasses immediate reservation, which means the item is not reserved during order entry.</p> <ul style="list-style-type: none"> If the Use OROB for Fulfillment Assignment (M31) system control value is selected, the system selects this flag for each order line sent to Order Orchestration for fulfillment assignment. See <i>Brokered Backorders</i>. If the Use OROB for Fulfillment Assignment (M31) system control value is unselected, items that bypass immediate reservation must be reserved using Interactive Reservation. See <i>Working with Interactive Reservation (MIRV)</i>. You can define an item to bypass reservation in the Item table. <p>Values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Bypass immediate reservation. <i>Unselected</i> = Do not bypass reservation.
Canceled	<p>The quantity of the item that has been canceled. Numeric, 5 positions; display-only.</p>
Ordered	<p>The quantity of this item originally ordered. Numeric, 5 positions; display-only.</p>
Printed	<p>The quantity of this item printed on a pick slip. This quantity is updated during pick slip generation and reduced when shipment is confirmed. Numeric, 5 positions; display-only.</p>
Reserved	<p>The quantity of this item reserved currently. Numeric, 5 positions; display-only.</p>
Shipped	<p>The quantity of this item shipped. Numeric, 5 positions; display-only.</p>
Sold out	<p>The quantity of this item sold out. Numeric, 5 positions; display-only.</p>
Returned	<p>The quantity of this item that the customer has returned. Numeric, 5 positions; display-only.</p>
Confirmed	<p>The quantity of this item confirmed for shipment. Numeric, 5 positions; display-only.</p>

Order Dates Window

Purpose: Use this window to review various important dates associated with an item on the order. This may help you respond to a customer's questions.

How to display this window: Select *Dates* at the *Display Order Detail Screen (Reviewing Order Line Detail)*.

All of the dates shown in the window appear in user date format.

Field	Description
Arrival date	<p>The date the customer wants to receive the item. Numeric, 6 positions; display-only.</p>

Field	Description
Cancel date	The date when the customer wants to cancel the item if it has not shipped. Numeric, 6 positions; display-only.
Date printed	The date the last pick slip was printed for this item. Numeric, 6 positions; display-only.
Date reserved	The date that inventory was reserved for the item. Numeric, 6 positions; display-only.
Expected ship	The date the backordered item is expected to be available to ship. The expected ship date is cleared once you receive the item in Purchase Order Receiving. Numeric, 6 positions; display-only.
Last BO date (Last backorder date)	The most recent date the system generated a backorder notice. A backorder notice is sent to the customer regarding a shipment delay on an item. Numeric, 6 positions; display-only.
Entered date	The date the item was ordered. Numeric, 6 positions; display-only.
Entered time	The time that the item was ordered. Numeric, 6 positions (HHMMSS format); display-only.

Work with Item/SKU Comments Window

Purpose: Use this window to review any comments for an item or SKU that have the Print code is set to *Window*. Any comments entered at the SKU level display for a SKU'd item; if there are no SKU-level comments, the item-level comments display.

How to display this window: Select *Comments* at the *Display Order Detail Screen (Reviewing Order Line Detail)*. This window also opens automatically if you add an item to the order that is associated with any item/SKU comments whose Print code is set to *Window*; see the [Work with Item/SKU Comments Screen](#) for more information.

Fields	Description
Item	The item you are reviewing or adding to the order. The actual item code is listed, even if you ordered by alias. Alphanumeric, 12 positions; display-only.
Item description (Unlabeled field to the right of the item code)	The first 30 positions of the description of the item. Alphanumeric, 30 positions; display-only.
SKU code	The item's unique characteristics, such as its color or size. The SKU is listed, even for a SKU'd item, only if the item comments that display are associated with the SKU itself rather than the base item. Alphanumeric, three 4-position fields; display-only.
SKU description (Unlabeled field to the right of the SKU)	The first 30 positions of the description of the SKU. Alphanumeric, 30 positions; display-only.

Fields	Description
Comments	<p>The comments associated with the item or SKU. If there are any comments associated with the SKU ordered, the window displays these comments; otherwise, it displays any comments entered for the base item. The window displays only item comments whose Print code is set to <i>Window</i>.</p> <p>The window displays up to 10 lines. A plus sign (+) indicates that there are additional lines. To review additional comment lines, select <i>Next</i>.</p> <p>Alphanumeric, 50 positions each line; display-only.</p>

Display P/O Drop Ship Screen

Purpose: Use this screen to track the status of drop ship orders fulfilled through integration with Order Orchestration's Supplier Direct Fulfillment module, or to send a cancel request for a drop ship order to the integrated system.

How to display this screen: At the [Order Inquiry Detail Screen](#) or the [First Display Purchase Order Detail Screen](#), select *D/S Status* next to a drop ship item you fulfill through Order Orchestration's Supplier Direct Fulfillment module, provided you have already sent the purchase order information to the integrated system.

For more information: See [Supplier Direct Fulfillment Processing](#) for background.

Field	Description
All fields on this screen are display-only.	
Order #	<p>The order number and ship-to number.</p> <p>Order number: numeric, 8 positions.</p> <p>Ship-to number: numeric, 3 positions.</p>
Line #	<p>The line number on the order. There can be up to 999 detail lines on an order.</p> <p>Numeric, 3 positions.</p>
PO #	<p>The purchase order number assigned by Order Administration when you process drop ship purchase orders.</p> <p>Numeric, 7 positions.</p>
Line #	<p>The purchase order detail line number. There can be up to 999 detail lines on a purchase order.</p> <p>Numeric, 3 positions.</p>
Item	<p>The item code and SKU code, if any.</p> <p>Item code: alphanumeric, 12 positions.</p> <p>SKU code: alphanumeric, three 4-position fields.</p>
Description	<p>The first 30 positions of the item description. The SKU description does not display.</p> <p>Alphanumeric, 30 positions.</p>

Field	Description
Orig exp ship date(Original expected ship date)	<p>The original due date on the purchase order.</p> <p>The original expected ship date is calculated by adding the Lead days for the vendor item and the Drop Ship Lead Days (H36) to the order date; however, if the Arrival date on the order is later than this date, the Arrival date is used as the Original expected ship date.</p> <p>A drop ship purchase order is not eligible for creation through the Selecting Vendors for Drop Ship Processing (MDSP) menu option until the current date plus the number of Lead days in the vendor item table equals or exceeds its due date.</p> <p>Numeric, 6 positions, in user date format.</p>
Revised exp ship date	<p>The date, if any, sent by the vendor indicating when the merchandise will ship. If the vendor has not revised the Original expected ship date, the Revised expected ship date field is blank. If the vendor has revised the due date more than once, the most recent date sent is displayed here.</p> <p>If the vendor revises the expected ship date, Order Administration adds a message to the detail history fields, below and displays the message in the Additional info field.</p> <p>If the vendor subsequently removes the revised expected ship date from the PO line, the revised expected ship date is removed from this field, and Order Administration replaces the message entry.</p>

 **Note:**

The revised expected ship date on a drop ship purchase order does not update the expected ship date on the order detail line. As a result, the expected ship date shown on the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#) may differ from the revised expected ship date displayed in this field. The Expected ship date on the order detail line is updated by backorder card processing only. See [Purchase Order Layering and Backorder Notifications](#).

Numeric, 6 positions, in user date format.

Field	Description
Drop ship status	<p>The current status of the drop ship purchase order detail line.</p> <p>Valid statuses are:</p> <ul style="list-style-type: none">• <i>Blank</i> - the drop ship purchase order is not flagged to be processed by an integrated system. The Supplier Direct Fulfillment integration does not use a blank status.• <i>Sent</i> - the drop ship purchase order has been created in Order Administration and sent to Order Orchestration's Supplier Direct Fulfillment module, but the integrating system has not yet acknowledged the purchase order. A purchase order line fulfilled through the Supplier Direct Fulfillment module might also be in this status if you have sent a cost change to Order Orchestration.• <i>Open</i> - the drop ship purchase order line has been created in the Order Orchestration module but not yet selected by the vendor for fulfillment. A purchase order line fulfilled through the Order Orchestration module might also be in this status if there have been updates to the purchase order, such as if the vendor has held and then released the line.• <i>In Process</i> - the drop ship purchase order line has been selected (pulled or printed) by the vendor for fulfillment.• <i>Held</i> - the drop ship purchase order line has been held by the vendor.• <i>Cancelled</i> - the drop ship purchase order line has been cancelled.• <i>Shipped</i> - the drop ship purchase order line has been shipped by the vendor, closing the purchase order line and order line.• <i>RA Sent</i> - a return authorization has been created for the purchase order line and sent to an integrated system. Returns are not currently implemented through Order Orchestration's Supplier Direct Fulfillment module.• <i>RA Cancelled</i> - the RA has been cancelled. Returns are not currently implemented through Order Orchestration's Supplier Direct Fulfillment module.• <i>Returned</i> - the drop ship purchase order returned merchandise has been received and posted by the vendor. When the vendor posts a return, the return is received and credited (if not already credited) in Order Administration. Returns are not currently implemented through Order Orchestration's Supplier Direct Fulfillment module.• <i>Invoiced</i> - the vendor has submitted an invoice for the shipment. <p>Not changed when you send address change information to Order Orchestration's Supplier Direct Fulfillment module.</p> <p>Alphanumeric, 10 positions.</p>

Field	Description
Additional info	<p>The most recent text message sent from the vendor regarding the drop ship purchase order line. The vendor enters this message in Order Orchestration's Vendor Portal.</p> <div data-bbox="873 394 1458 567" style="border-left: 2px solid #0070C0; padding-left: 10px;"><p> Note:</p><p>The message entry is required in Order Orchestration's Vendor Portal.</p></div>
Date	<p>Alphanumeric, 50 positions.</p> <p>The date the transaction was sent either from Order Orchestration to Order Administration, or from Order Administration to Order Orchestration.</p>
Time	<p>Numeric, 6 positions, in user date format.</p> <p>The time the transaction was sent either from Order Orchestration to Order Administration, or from Order Administration to Order Orchestration.</p>
Status	<p>Numeric, 6 positions, HH:MM:SS format.</p> <p>The status of the transaction when it was performed. This status is usually identical to the <i>Drop ship status</i> of the transaction when it was performed except in the case of PO cost updates or PO address changes, in which case the status is listed as:</p> <ul style="list-style-type: none">• <i>Change</i> - for PO address changes sent to Order Orchestration.• <i>Cost Chg</i> - for PO cost changes sent to Order Orchestration. This status and accompanying message displays only when you access this screen from PO Inquiry (<i>MPOI</i>). <p>Alphanumeric, 10 positions.</p>

Field	Description
Description	<p>The description of the transaction. System-generated descriptions are:</p> <ul style="list-style-type: none">• Drop Ship PO created• PO available to vendor• Vendor selected PO for processing• Vendor released PO• Cancel request sent• Cancel request confirmed• Cancel request rejected• Address change sent to vendor• Cost change sent to vendor (displays only in PO Inquiry)• Drop Ship PO confirmed on XX/XX/XX (date when the update was received in Order Administration; not necessarily the shipment date indicated by the vendor) <p><i>Vendor messages?</i> In addition to system-generated messages, this field displays messages the vendor enters when updating the status of an order line in Order Orchestration's Vendor Portal: The vendor is required to enter a reason message when putting an item on hold or revising the expected delivery date. The vendor can also enter a reason when releasing a line from hold, or independently of any of these changes. The screen displays the reason entered by the vendor for these activities.</p> <p><i>No history?</i> No history message is recorded when the vendor accepts or declines an address change, voids and reprints a pack slip, or enters a reason description in Order Orchestration without making any additional changes to the purchase order line.</p>

 **Note:**

You can confirm shipment of an Order Orchestration drop ship purchase order through the [Receiving Purchase Orders \(PORC\)](#) menu option; however, this option is not recommended. Receiving the drop ship purchase order this way updates the status of the purchase order in Order Administration to X (Closed) but does not affect the status of the purchase order in Order Orchestration, and subsequent vendor actions for the purchase order are not recorded in Order Administration.

Alphanumeric, 33 positions.

Screen Option	Procedure
Request to cancel the drop ship purchase order line	Select <i>Cancel request</i> to send a cancel request to Order Orchestration. When you select this option, the Submit Cancel Request Pop-up Window opens. See Cancelling Order Orchestration Drop Ship Order Lines for processing details.
Review Order Orchestration history and detail	Select Order Broker Detail to advance to the Display Order Broker Details Screen . This option is available only for a line on a retail pickup, delivery, or ship-for-pickup order.

Submit Cancel Request Pop-up Window

How to display this screen: Select *Cancel request* at the [Display P/O Drop Ship Screen](#).

Field	Description
Enter cancel reason	Enter the reason for cancelling the drop ship purchase order and click <i>OK</i> to submit a cancellation request. Cancel reason codes are defined in and validated against the Cancel Reason table. See Establishing Cancel Reason Codes (WCNR) . The cancel reason code is saved in the P/O Detail Drop Ship Order table (<i>PODTDS</i>); if the cancellation is confirmed by the vendor, the system uses this reason code on the order detail line and the drop ship purchase order. Numeric, 2 positions; required.

Options Available in Order Inquiry

Purpose: You can use the function (command) keys on the [Order Inquiry Header Screen](#) and [Order Inquiry Detail Screen](#) to display more information about the quote or order or the customers on the quote or order.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including some of the information available from the options listed below.

Note:

The table describes an option twice if it is used in different ways on the header and detail screens.

Screen Option	Procedure
Review additional charges	Select Additional Charges to advance to the Display Additional Charges Screen .

Screen Option	Procedure
Review bill-to customer Information	Select Bill To to advance to the Work with Bill To Phone Numbers Screen .
Display the Order Inquiry header or detail screen	Select Detail to toggle between the Order Inquiry Header Screen and Order Inquiry Detail Screen .
Display invoices	Select Display Invoices to advance to the Display Invoices Screen .
Maintain the quote or order	Select Maintain to advance to the Work with Order Screen in Order Maintenance . If the order is locked because, for example, a user's session ended unexpectedly when maintaining it, you can use Unlocking a Stranded Order or Batch (MULO) to unlock the order.
Review order messages	Select Messages to advance to the Work with Order Messages Screen .
Review pick slips, send customer letters, review demographic information, work with customer notes or customer action notes, review order totals across all recipients, work with subscriptions, or display invoice information	Select More Options to advance to the Display More Options Screen screen, where you can select the individual option.
Review order history	Select Order History to advance to the Display Order History Screen .
Display a summary screen that lists the items ordered for the current order plus all recipient orders; optionally, display the order totals expressed in the customer's currency	Select Order Totals to advance to the Display Order Summary Screen .
Review order payment methods	Select Pay Methods to advance to the Display Order Payment Methods Screen .
Display order properties	Select Properties to advance to the Display Order Properties Screen .
Review refund information	Select Refunds to advance to the Display Refunds for Order Screen .
View multiple ship-to recipients	Select Recipients to advance to the First Display Customer Screen if there is more than one recipient on the order.
Scan order detail	Select Scan Lines to advance to return to the Scan Order Detail Screen .

Screen Option	Procedure
Review ship-to customer Information	<p>Select Ship To.</p> <ul style="list-style-type: none"> If you define a One Time Ship To address for the order, the system advances you to the Display Alternate Address Screen. See Assigning an Order Shipping Address for information on assigning a one-time ship-to address. If a ship to is not defined for the order, the system advances you to the Display Customer (1 of 2) screen for the sold to customer on the order. See Creating and Updating Sold-to Customers (WCST). If a ship to recipient is defined for the order, the system advances you to the Display Customer (1 of 2) screen for the recipient customer on the order. See Creating and Updating Sold-to Customers (WCST). If a permanent ship to is defined for the order, the system advances you to the Display Ship To screen. See Creating and Updating Sold-to Customers (WCST) for information on permanent ship-to addresses.
Review sold-to customer Information	<p>Select Sold To at the Order Inquiry header screen to advance to the Display Customer screens. See Creating and Updating Sold-to Customers (WCST).</p>

Display Alternate Address Screen

Purpose: Use this screen to review the one-time shipping address for the order that will be linked to the current order only; no secondary customer record is filed with this address to use on future orders.

See [Assigning an Order Shipping Address](#) for more information on assigning a one-time ship-to address.

How to display this screen: Select Ship To at the Order Inquiry Header Screen or the Order Inquiry Detail Screen.

Field	Description
Order#	<p>A unique number assigned by the system to identify an order. Every order on the system is assigned an order number. This number is used in Order Inquiry to review information for the order. This number is also used throughout the system to access information on an order.</p> <p>You cannot update this number.</p> <p>Numeric, 8 positions; display-only, assigned by the system.</p>
Ship-to number (unlabeled field)	<p>A hyphen (-) separates this field from the Order# field. The system assigns a sequential ship-to number to every shipping address on an order, even if the shipping address and the sold-to address are the same. The first ship-to address is assigned the number 1.</p> <p>You cannot update this number.</p> <p>Numeric, 3 positions; display-only, assigned by the system.</p>

Field	Description
Store#	<p>The store number and description of the store location selected for a ship-for-pickup order, if selected at the Store. In this case, the description also defaults to the Company field. If the store description exceeds 35 positions, it is truncated.</p> <p>Store number: alphanumeric, 10 positions; display-only. Store description: alphanumeric, 35 positions; display-only.</p>
Ship To Name	<p>The company name, last name, first name, and middle initial of the one-time ship to customer.</p> <p>Company: Alphanumeric, 30 positions; display-only. Last name: Alphanumeric, 25 positions; display-only. First name: Alphanumeric, 15 positions; display-only. Initial: Alphanumeric, 1 position; display-only.</p>
Address	<p>Four address fields are available:</p> <p>Address line #1 The customer's street address. Alphanumeric, 32 positions; display-only.</p> <p>Address lines #2-#4 (unlabeled fields under initial Address field): Additional address fields for international or business addresses. Alphanumeric, 32 positions; display-only.</p>
Apt/Suite (Apartment/Suite)	<p>The customer's apartment, suite, rural route, or floor number. Alphanumeric, 10 positions; display-only.</p>
City	<p>The city where the customer receives mail the shipment. Alphanumeric, 25 positions; display-only.</p>
State	<p>The state or province where the customer receives the shipment. Alphanumeric, 2 positions; display-only.</p>
Zip	<p>The postal code or zip code for this customer. Alphanumeric, 10 positions; display-only.</p>
Country	<p>The code for the customer's country. Alphanumeric, 3 positions; display-only.</p>
Delivery code	<p>Identifies a business (commercial) or residential address. Used when you ship an order by a carrier that uses business or consumer rate tables (such as UPS).</p> <ul style="list-style-type: none"> • B =Business rate table will be used to determine shipping charges. • R =Residential rate table will be used to determine shipping charges. <p>Alphanumeric, 1 position; display-only.</p>
E-mail address	<p>The email address associated with the ship-to mailing address. The email address is upper and lower case. Alphanumeric, 50 positions; optional.</p>

Field	Description
Phone	<p>The phone number for the one-time shipping address. Where does this phone number come from? If the shipping address was added to the order through:</p> <ul style="list-style-type: none"> order entry or order maintenance: the phone number entered at the Create One Time Ship To Address Screen or the Change One Time Ship To Address screen. the order API: the <code>ship_to_day_phone</code> passed in the <code>CWOrderIn</code> message if the <code>ship_to_type</code> is 1. If no <code>ship_to_day_phone</code> is passed, the system uses the <code>ship_to_eve_phone</code>. Otherwise, if neither the <code>ship_to_day_phone</code> or the <code>ship_to_eve_phone</code> is passed, the ship-to phone number is left blank; the <code>ship_to_fax_phone</code> is not used. See <i>Generic Order Interface (Order API)</i> for background. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <ul style="list-style-type: none"> the Order Orchestration integration (retail pickup or delivery order): From the <code>phone1</code>, if any, passed from Order Orchestration for the ship-to address for the first item. If no <code>phone1</code> is passed for the first item, then the <code>phone2</code> for the first item is used. Otherwise, if neither the <code>phone1</code> or <code>phone2</code> is passed for the first item, the ship-to phone number is left blank; the phone numbers for any additional item(s) are not used. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for background. <p>Note: Creating a ship-for-pickup or store pickup order does not automatically update the phone number field, because the Store Cross Reference information for the selected store defaults to the Order Ship To Address, and a phone number is not part of the Store Cross Reference table.</p> <p>Telephone number format: You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator. See Work with Telephone Number Format Screen form more information.</p> <p>Alphanumeric, 14 positions.</p>

Reviewing Financial Information on an Order

Purpose: From the [Order Inquiry Header Screen](#) and [Order Inquiry Detail Screen](#), you can advance to screens that display financial information for an order.

You can use these screens to review and evaluate invoices, refunds, additional charges, order totals and items ordered, as well as order payment methods, credit card authorization history, deposit history and order payment history.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including certain information on payment methods, invoices, refunds, and additional charges.

In this topic:

for information on	select	to advance to
Invoices	<i>Display Invoices</i>	<p>Display Invoices Screen</p> <ul style="list-style-type: none"> • Order Receipt <p>Display Invoice Header Screen</p> <p>Display Invoice Pay Methods Screen</p> <p>Display Invoice Payment Method Screen (Reviewing Detail)</p> <p>First Display Invoice Detail Screen</p> <ul style="list-style-type: none"> • Second Display Invoice Detail Screen <p>Second Display Invoice Detail Screen</p> <p>Display Invoice Detail Pay Methods Screen</p> <p>Invoice Detail Charges Screen</p> <p>Invoice Pay Summary Screen</p> <p>Change Invoice Pay Method Screen</p> <ul style="list-style-type: none"> • Working with Rejected Deposits • Changing Credit Card Information for an Invoice Payment Method <p>Display Invoice Pay Method Screen (Reviewing Deposit Information)</p> <p>Display Invoice Address Screen (Billing Address)</p> <p>Display Invoice Address Screen (Shipping Address)</p>

Reviewing Invoices

Display Invoices Screen

Purpose: Use the invoice function from within standard Order Inquiry to review and print invoice detail on shipments. As you build an order, the system keeps a record of each shipment you make against the order. Similarly, the system creates a record of each credit against the order for returns, cancellations, and overpayments.

The Display Invoices screen lists the invoices or credits the system has generated for the order you are reviewing and provides access to each additional invoice-related screen.

Consolidate invoice? The [Consolidated Invoice \(B49\)](#) system control value indicates whether to consolidate multiple shipments for an order on the same system date under the same Invoice Header number. The [Invoice Consolidation Method \(E29\)](#) controls whether the system consolidates invoices for each separate ship-to for an order, or for the order as a whole.

Invoice consolidation does not apply when you express-bill an order or create a credit invoice.

Important:

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

Also, if a billing or shipping address changes between shipments and the [Capture Addresses for Invoice \(J24\)](#) system control value is *selected*, this can prevent the invoice from consolidating. Even if the invoice is consolidated, there is a separate entry at this screen for each unique billing address/shipping address combination if the [Capture Addresses for Invoice \(J24\)](#) system control value is *selected*.

For more information: See the [Invoice Consolidation Method \(E29\)](#) system control value for a discussion.

Note:

On orders subject to VAT and tax-inclusive pricing, the invoice screens described in this section display the tax-inclusive price that the customer sees; in other words, the hidden tax amount is not visible. You can review the hidden tax amount for an item by advancing to the [Invoice Detail Charges Screen](#).

Invoice creation for ship-for-pickup orders: If the Invoice Ship For Pickup Order Once Intransit (M73) system control value is selected, the invoice is created for an item on a ship-for-pickup order once the system receives notification from Order

Broker that the order line is in transit from the sourcing location to the pickup location, has been received at the pickup location, or has been fulfilled. See that system control value for more information.

How to display this screen: Select *Display Invoices* at the [Order Inquiry Header Screen](#) or [Order Inquiry Detail Screen](#).

Field	Description
Order #	The number the system has assigned to this order. Numeric, 7 positions, display-only.
Ship-to	The number of the ship-to address on the order. The number of the ship-to you were displaying when you selected <i>Invoices</i> defaults in this field, but you can also review invoices for the other ship-to records on the order from this screen. Numeric, 3 positions; optional.

Field	Description
Invoice #	<p>The number the system assigns to a customer's bill or credit. The system generates an invoice during billing. The <i>Consolidated Invoice (B49)</i> system control value <i>selected</i> controls whether two shipments to the same billing and shipping addresses on the same billing date are consolidated into the same Invoice Ship To record, producing a single entry on this screen.</p> <p><i>Multiple entries for same invoice:</i> The system uses the same invoice number for separate shipments that occur on the same billing date if the Consolidated Invoice system is <i>selected</i>, and,</p> <ul style="list-style-type: none"> the <i>Invoice Consolidation Method (E29)</i> is set to <i>ORDER</i>, and the shipments were made for separate order ship-to's, or, the <i>Invoice Consolidation Method (E29)</i> is set to <i>ORDER SHIP</i>, and the shipments were made for the same order ship-to, and the billing and shipping addresses were the same for the shipments. <p>When consolidating invoices as described above, the system creates a single Invoice Header record (and a single invoice number), but separate Invoice Ship To records.</p> <p>See the <i>Invoice Consolidation Method (E29)</i> for a discussion and examples.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.</p> </div>
	<p><i>Assigned when?</i> If the Generate Invoice Number at Pick Gen (H80) or Generate Invoice # at Pick Gen without Address Match (K81) system control value is selected, the system assigns the invoice number at pick slip generation if the order is eligible; otherwise, it assigns the invoice number at billing.</p> <p><i>Invoice address?</i> If the <i>Capture Addresses for Invoice (J24)</i> system control value is <i>selected</i>, the shipping and billing addresses for each Invoice Ship To are stored in the Invoice Address table; you can use the Display Invoice Address Screen (Billing Address) and Display Invoice Address Screen (Shipping Address) to review them.</p> <p>Numeric, 7 positions; optional.</p>
Date	<p>The date the invoice record was created by billing. This is the Start date for the billing async job.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Field	Description
Type (Invoice type)	<p>Indicates the type of invoice:</p> <ul style="list-style-type: none"> • C = Credit memo. Generated when you process a return. Credit and return amounts appear as negative numbers when you review invoice information. • I = Invoice. Generated when you bill a shipment. <p>The system does not consolidate credit invoices with other credits or with debit invoices.</p> <p>Alphanumeric, 1 position; display-only.</p>
Total	<p>The total of the invoice. Credit invoice amounts include a minus sign.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Net Bill	<p>Indicates whether the invoice is currently pending Credit Card Net Exchange Billing.</p> <ul style="list-style-type: none"> • * = the invoice is currently pending credit card net exchange billing. The system considers an invoice pending for credit card net exchange billing if the Invoice Payment Method record contains the <i>EXC</i> flexible payment option code in the IPM FPO Payment Code and the invoice has not yet been deposited (the IPM Deposit created date is blank). • blank = the invoice is not pending credit card net exchange billing.
Date Printed	<p>The date the invoice was printed.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Screen Option	Procedure
Display invoice header	Select <i>Invoice</i> for an invoice to advance to the Display Invoice Header Screen .
Display payment methods records	Select <i>Pay Methods</i> for an invoice to advance to the Display Invoice Pay Methods Screen .
Display invoice details for particular items	Select <i>Details</i> for an invoice to advance to the First Display Invoice Detail Screen .
Display the billing address for an invoice	Select <i>Billing Address</i> for an invoice to advance to the Display Invoice Address Screen (Billing Address) .
Display the shipping address for an invoice	Select <i>Shipping Address</i> for an invoice to advance to the Display Invoice Address Screen (Shipping Address) .
Display invoice payment summary information	Select <i>Invoice Pay Summary</i> to advance to the Invoice Pay Summary Screen .

Screen Option	Procedure
Print an order receipt for each ship-to on the order	<p>Select <i>Order Receipt</i>. See the Order Receipt for more information.</p> <ul style="list-style-type: none"> This option is available only if the Order Receipt Print Program (L46) specifies a program and there are any invoices currently displayed on the screen. For example, if there is an invoice for the first ship-to, but you have positioned to the second ship-to, the option is not displayed. Selecting this option for a multi-recipient order generates a receipt for each ship-to that has had any shipments. The screen displays an error message when you select this option if the only invoices on the order are credits: No eligible invoices found to print on Order Receipt.

Display Invoice Header Screen

Purpose: Use this screen to review the basic elements of the invoice, such as the tax, handling, additional charges, hidden freight and gross profit.

How to display this screen: At the [Display Invoices Screen](#), select *Invoice* for an invoice.

Field	Description
Order #	<p>The number the system has assigned to this order. The ship-to number is separated from the order number by a hyphen.</p> <p>Order number: numeric, 7 positions, display-only.</p> <p>Ship-to number: numeric, 3 positions; display-only.</p>
Invoice #	<p>The number the system assigns to a customer's bill.</p> <p><i>Assigned when?</i> If the Generate Invoice Number at Pick Gen (H80) or Generate Invoice # at Pick Gen without Address Match (K81) system control value is selected, the system assigns the invoice number at pick slip generation if the order is eligible; otherwise, it assigns the invoice number at billing.</p> <p>Numeric, 7 positions; display-only.</p>
Type (Invoice type)	<p>Represents the type of invoice.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Credit memo</i> = The system generates a credit memo whenever you process a return through Order Maintenance, Order Entry (by entering a negative order quantity), or through Return Authorizations. <i>Invoice</i> = The system generates an invoice when you confirm shipment of an item. <p>Display-only.</p>
Invoice print date	<p>The date you printed the invoice or credit memo.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Merchandise	<p>The total value of the merchandise. Merchandise amount does not include tax, handling, additional charges, or freight.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Field	Description
Cost	The actual cost of the merchandise billed on this invoice.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The secured feature <i>Display Invoice Cost in O/I (A36)</i> controls whether this screen displays the cost.</p> </div>
	Numeric, 20 positions with a 2-place decimal; display-only.
Freight	The freight charges for the invoice. This amount may not be equal to the total of all the line-level freight charges.
	Numeric, 20 positions with a 2-place decimal; display-only.
G/M (Gross profit margin)	The amount of the merchandise price that exceeds the total cost. You can use gross margin to determine the profit of an order based on each item's selling price. See Determining Gross Profit for more information.
	The <i>Display Gross Margin (A65)</i> secured feature controls whether this field displays in order entry, maintenance, inquiry and item availability.
	Numeric, 20 positions with a 2-place decimal; display-only.
G/M% (Gross profit margin percentage)	The percentage of the merchandise price that exceeds the total cost. You can use gross margin to determine the profit of an order based on each item's selling price. See Determining Gross Profit for more information.
	The <i>Display Gross Margin (A65)</i> secured feature controls whether this field displays in order entry, maintenance, inquiry and item availability.
	Numeric, 5 positions with a 2-place decimal; display-only.
Tax	The sales tax for the invoice. This field includes GST and PST, if any. This field does not include hidden tax; see the Invoice Detail Charges Screen .
	Numeric, 20 positions with a 2-place decimal; display-only.
GST	The Canadian Goods and Services Tax, if any. This field displays only if there is a GST charge or credit on the invoice.
	Numeric, 20 positions with a 2-place decimal; display-only.
PST	The Canadian Provincial Services Tax, if any. This field displays only if there is a PST charge or credit on the invoice.
	Numeric, 20 positions with a 2-place decimal; display-only.
Handling (Handling charge)	The cost of any special handling on the order, such as personalizing, monogramming, or engraving, and any gift wrapping charges. Any duty charges on the invoice are included in this total. See First Display Invoice Detail Screen for information on duty charges on an invoice.
	Numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Add'l charges (Additional charges)	<p>The total charges exceeding standard charges on the current order. The system validates additional charges, which are entered manually or automatically assigned against the Additional Charges table during Order Entry. Additional charges may include:</p> <p><i>Additional source code charge:</i> An additional charge for services that apply to the source code or offer. These charges apply if you have set up a service charges table for the source code or offer. The system applies the additional charge to the order based on the total value of the merchandise.</p> <p><i>Additional shipper/item charge:</i> An additional charge that applies to the item, depending on the shipper you select to deliver the item. Such charges may apply when the item exceeds established shipping rate charges. For example, delivery of an oversized item may incur an additional shipper/item charge. Additional shipper/item charges apply when defined for the shipper.</p> <p><i>Ad hoc charge:</i> An additional charge, such as a charge for a gift box, that you assign at order entry. You initially define ad hoc charges in the Additional Charges table.</p> <p><i>Dollar discount:</i> An additional charge (credit) that is applied based on the total value of the merchandise.</p>

 **Note:**

The Add'l charges field in standard Order Inquiry corresponds to the Chg field on Order Entry.

Add'l freight (Additional freight charges)	<p>Numeric, 20 positions with a 2-place decimal; display-only.</p> <p>The total amount for freight charges exceeding the order's base freight charge. This is a shipper-level charge directly associated with the order, as opposed to the line item. Additional freight is defined for the shipper in the Ship Via table.</p> <p>Examples of additional freight charges that might apply include charges for overnight shipping, second day delivery, padded van, etc.</p> <p>Additional freight charges may include the standard freight charges, depending on how you have set up the shipper. In this case, the Freight field is blank.</p>
---	---

 **Note:**

The Add'l freight field in standard Order Inquiry corresponds to the Frt+ field in Order Entry.

Numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Total	<p>The total amount billed or credited, including all related merchandise charges, freight, tax, handling, additional charges, and additional freight.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Discount amount	<p>The difference between the actual price charged for items and the offer prices. Comparing this amount to the original offer price gives you an indication of the amount that the order varied from the original offer price.</p> <p>A negative amount in Indicates a charge greater than the original offer price.</p> <p><i>Price overrides:</i> When you override the price of an item, the system uses the following rules in determining what portion of the selling price constitutes a discount:</p> <ul style="list-style-type: none"> • If the price override reason code's <i>Override item offer price</i> field is <i>selected</i>, the discount amount equals the difference between the override price entered and the final selling price; in other words, it equals any additional discounts applied after the price override. <p><i>Example:</i> The price override amount entered was \$10.00 and an additional discount coupon of \$1.00 was applied; the discount amount is \$1.00.</p> <ul style="list-style-type: none"> • If the price override reason code's <i>Override item offer price</i> field is <i>unselected</i> and an item/SKU offer price exists, the discount amount equals the difference between the offer price and the selling price. <p><i>Example:</i> The item offer price is \$15.00, the price override amount entered was \$10.00, and an additional coupon discount of \$1.00 was applied; the discount amount is \$6.00.</p> <ul style="list-style-type: none"> • If the price override reason code's <i>Override item offer price</i> field is <i>unselected</i> and an item/SKU offer price does not exist, the discount amount equals the selling price of the item, presented as a negative number. <p><i>Example:</i> The price override amount entered was \$10.00 and an additional coupon discount of \$1.00 was applied; the discount amount is -\$9.00.</p>

See [Overriding the Item/SKU Offer Price](#) for an overview.

 **Note:**

The setting of the *Override item offer price* field has no effect on orders you receive through the order API. If there is a price override reason code in the inbound order message, the system always processes these orders as if the field is *unselected*.

Numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Hidden freight	The amount of the merchandise charge that represents hidden freight. Hidden freight, defined at the Item Offer level, is a freight charge that you want to track but not reveal to the customer.

 **Note:**

Hidden freight will not appear on this screen if you override an item price in Order Entry.

Numeric, 13 positions with a 2-place decimal; display-only.

Display Invoice Pay Methods Screen

Purpose: Use this screen to review the distribution of payment methods on an order invoice, and to select a specific payment method for detailed review.

How to display this screen: At the [Display Invoices Screen](#), select *Pay Methods* for an invoice.

How to use this screen: Use this screen to review summary information on invoice payment method records; in addition, you can review a payment method by selecting *Display* for it.

See [Display Invoice Payment Method Screen \(Reviewing Detail\)](#) for field descriptions.

Display Invoice Payment Method Screen (Reviewing Detail)

Purpose: Use this screen to review detailed information, including unpaid balances, for a specific payment method used on the order.

How to display this screen: At the [Display Invoice Pay Methods Screen](#), select *Display* for a payment method.

Field	Description
Order #	A number the system assigns to uniquely identify an order. Numeric, 8 positions; display-only.
Invoice #	A number the system assigns to uniquely identify an invoice. Numeric, 7 positions; display-only.
Pay method	Represents the method of payment on the order. Pay method codes are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY) . Numeric, 2 positions; display-only.
Description	The description of the payment method code. Alphanumeric, 30 positions; display-only.
Merchandise	The total value of the merchandise. Merchandise amount does not include tax, handling, additional charges, duty or freight. Numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Merchandise balance	The unpaid portion of the merchandise total. Numeric, 20 positions with a 2-place decimal; display-only.
Freight	The freight charges for the invoice assigned to the payment method. Numeric, 20 positions with a 2-place decimal; display-only.
Freight balance	The unpaid portion of the freight. Numeric, 20 positions with a 2-place decimal; display-only.
Add'l freight (Additional freight charges)	The total amount for freight charges exceeding the order's base freight charge. Additional freight reflects charges that are specific to the carrier, as defined for the shipper in the Ship Via table. See Working with Ship Via Codes (WVIA) . <i>Example:</i> Additional freight charges that might apply include charges for overnight shipping, second day delivery, padded van, etc. Additional freight charges may include the standard freight charges, depending on how you have set up the shipper. Numeric, 20 positions with a 2-place decimal; display-only.
Additional freight balance	The unpaid portion of the additional freight balance charge. Numeric, 20 positions with a 2-place decimal; display-only.
Add'l charges (Additional charges)	The total charges exceeding standard charges on the current order. The system validates additional charges against the Additional Charges table during Order Entry. See Establishing Additional Charge Codes (WADC) . Numeric, 20 positions with a 2-place decimal; display-only.
Additional charges balance	The unpaid portion of the additional charges. Numeric, 20 positions with a 2-place decimal; display-only.
Handling (Handling charge)	The cost of any special handling on the order, such as personalizing, monogramming, or engraving, and any gift wrapping charges. This field includes the duty charges, if any, for the payment method. Numeric, 20 positions with a 2-place decimal; display-only.
Handling balance	The unpaid portion of the handling charge and/or duty charge, if any. Numeric, 20 positions with a 2-place decimal; display-only.
Tax	The total sales tax that applies to the shipment on this payment method. This total does not include any hidden tax. Numeric, 20 positions with a 2-place decimal; display-only.
Tax balance	The unpaid portion of the taxes on the shipment on this payment method, excluding hidden tax. Numeric, 20 positions with a 2-place decimal; display-only.
Total	The total for the pay method, including merchandise, freight, additional freight, additional charges, handling and tax. Numeric, 20 positions with a 2-place decimal; display-only.
GST (Goods and Services tax)	The Canadian federal Goods and Services tax that applies to the shipment on this payment method. Numeric, 20 positions with a 2-place decimal; display-only.
GST balance	The unpaid portion of the Canadian federal Goods and Services tax on the shipment on this payment method. Numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
PST (Provincial Services Tax)	A Canadian provincial services tax that applies to the shipment on this payment method. Numeric, 20 positions with a 2-place decimal; display-only.
PST balance	The unpaid portion of the Canadian provincial services tax. Numeric, 20 positions with a 2-place decimal; display-only.
Order level freight	Freight charges that apply to the total shipment. Numeric, 20 positions with a 2-place decimal; display-only.
Order level freight	The unpaid portion of the order level freight balance charged on the shipment. Numeric, 20 positions with a 2-place decimal; display-only.
Order level freight tax	The total freight tax on the shipment, excluding hidden tax. Numeric, 20 positions with a 2-place decimal; display-only.
Order level freight tax balance	The unpaid portion of the order level tax charged on the shipment, excluding hidden tax. Numeric, 20 positions with a 2-place decimal; display-only.
Deposit created	The date the deposit was created. Numeric, 6 positions (in user date format); display-only.
Adjusted Amt	The adjusted deposit amount after performing Credit Card Net Exchange Billing . Numeric, 20 positions with a 2-place decimal; display-only.
Deposit To Date	The total amount deposited for the pay method, including merchandise, freight, additional freight, additional charges, handling and tax. Numeric, 20 positions with a 2-place decimal; display-only.
Suppress deposit	Indicates whether the system will include this invoice payment method when you run Processing Auto Deposits (SDEP) . Valid values are: <ul style="list-style-type: none"> <i>Selected</i> = The system will not attempt to deposit this payment method. <i>Unselected</i> = This payment method will be included when you process deposits. The system determines how to set this flag based on the setting of the Suppress deposit flag at the Display Order Pay Type Screen (1 of 2) . This field can be <i>selected</i> if: <ul style="list-style-type: none"> you create the order through the Generic Order Interface (Order API); see Suppressing Deposits and Refunds for an overview. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). this is a ship-for-pickup order, and the Payment at POS for Ship for Pickup Orders (L60) system control value is selected. See that system control value for background. Only credit card payment methods can have this flag <i>selected</i> . This flag is <i>selected</i> only for the first time that you bill against the payment method; afterward, the system resets the flag for the payment method to <i>Unselected</i> .

First Display Invoice Detail Screen

Purpose: Use this screen to review the invoice details for each item on the order that has been billed, and to select a detail for review.

How to display this screen: At the [Display Invoices Screen](#), select *Details* for an invoice.

Field	Description
Ln # (Line number)	The number of the invoice line on which the item appears. Numeric, 3 positions; display-only.
Item # (Item code)	Represents a unit of inventory. Item codes are defined in and validated against the Item table. See Performing Initial Item Entry (MITM) . Alphanumeric, 12 positions; display-only.
SKU (Stock keeping unit)	A code that defines an item's special characteristics, such as size and color. SKU codes are defined in and validated against the SKU table. Alphanumeric, three 4-position fields; display-only.
Ship qty (Shipped quantity)	The shipped quantity of the invoiced item. The quantity is negative in the case of a return. Numeric 5 positions; display-only.
Price	The actual unit price of the shipped or returned item. Numeric, 13 positions with a 2-place decimal; display-only.
Ship date	The date the invoice line shipped or the return was processed. This is the Start date from the billing async job. Numeric, 6 positions (in user date format); display-only.
Return qty (Return quantity)	The quantity of the item billed on this invoice that the customer has returned. Numeric, 5 positions; display-only.
Return date	The most recent date when the customer returned any quantity of the item billed on this invoice. Numeric, 6 positions (in user date format); display-only.

Option	Procedure
Display invoice detail for an item	Select <i>Display</i> for an item to advance to the Second Display Invoice Detail Screen .
Display payment methods for an item	Select <i>Display pay methods</i> for an item to advance to the Display Invoice Detail Pay Methods Screen .
Display invoice detail charges for an item, such as duty	Select <i>Detail charges</i> for an item to advance to the Invoice Detail Charges Screen .

Second Display Invoice Detail Screen

Purpose: Use this screen to review the charges for particular items on the invoice.

How to display this screen: Select *Display* for an invoice at the [First Display Invoice Detail Screen](#).

Field	Description
Pick control #	A number the system assigns to uniquely identify a pick slip. Numeric, 7 positions; display-only.
Qty shipped (Quantity shipped)	The total quantity of the item you have shipped to the customer. The shipment date appears to the right. Quantity: numeric, 5 positions; display-only. Date: numeric, 6 positions (in user date format); display-only.
Qty returned (Quantity returned)	The total quantity of the item returned by the customer. The return date appears to the right. Quantity: numeric, 5 positions; display-only. Date: numeric, 6 positions (in user date format); display-only.
Qty credited (Quantity credited)	The total quantity of the item for which you have credited the customer. The system does not track the credit date. Quantity: numeric, 5 positions; display-only.
Price	The unit price of the item. Numeric, 13 positions with a 2-place decimal; display-only.
Cost	The unit cost of the item. Numeric, 13 positions with a 4-place decimal; display-only.
Freight	The total extended freight charge for all units of this item. Only line-level freight charges appear on this screen. Numeric, 20 positions with a 2-place decimal; display-only.
Discount	<p>The total extended discount amount applied to all units of this item.</p> <p><i>Price overrides:</i> When you override the price of an item, the system uses the following rules in determining what portion of the selling price constitutes a discount:</p> <ul style="list-style-type: none"> If the price override reason code's <i>Override item offer price</i> field is <i>selected</i>, the discount amount equals the difference between the override price entered and the final selling price; in other words, it equals any additional discounts applied after the price override. <i>Example:</i> The price override amount entered was \$10.00 and an additional discount coupon of \$1.00 was applied; the discount amount is \$1.00. If the price override reason code's <i>Override item offer price</i> field is <i>unselected</i> and an item/SKU offer price exists, the discount amount equals the difference between the offer price and the selling price. <i>Example:</i> The item offer price is \$15.00, the price override amount entered was \$10.00, and an additional coupon discount of \$1.00 was applied; the discount amount is \$6.00. If the price override reason code's <i>Override item offer price</i> field is <i>unselected</i> and an item/SKU offer price does not exist, the discount amount equals the selling price of the item, presented as a negative number. The price override amount entered was \$10.00 and an additional coupon discount of \$1.00 was applied; the discount amount is -\$9.00. <p>See Overriding the Item/SKU Offer Price for an overview.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>

Field	Description
Tax	<p>The tax amount for the units of the item on the invoice.</p> <p>If a tax override amount is defined for the order line and you process multiple shipments against the line, the system prorates the tax override amount across the units shipped on the order line to determine the new tax override amount and the tax amount to apply to each shipment. <i>Example:</i> If the tax override amount for the order line is 9.00 and the order quantity is 3, the system charges 3.00 if you ship 1 unit of the item and then charges 6.00 if you ship the remaining 2 units of the item.</p> <p>Numeric, 20 positions with a 5-place decimal; display-only.</p>
Handling	<p>The total extended handling charges for all units of this item.</p>

 **Note:**

This handling total does not include any duty charges for the item.

Numeric, 20 positions with a 2-place decimal; display-only.

Display Invoice Detail Pay Methods Screen

Purpose: Use this screen to review information about the payment methods associated with the item shipment/invoice. This information differs from the [Display Invoice Payment Method Screen \(Reviewing Detail\)](#) in that it shows how payment types are applied to shipments of individual items on the order.

 **Note:**

The system does not create invoice detail pay method records for returns that you process through Order Maintenance; it creates these records only for returns that you process by entering a negative quantity in Order Entry.

How to display this screen: Select *Display pay methods* for an invoice at the [First Display Invoice Detail Screen](#).

About this screen: This screen displays how a payment method was charged for the shipment of an item.

See [Display Invoice Payment Method Screen \(Reviewing Detail\)](#) for descriptions of the fields on this screen.

 **Note:**

The Handling field on this screen includes any duty charges for the item and payment method.

Invoice Detail Charges Screen

Purpose: Use this screen to review any duty, shipper/item, or hidden tax charges for an item.

How to display this screen: Select *Detail charges* for an item at the [First Display Invoice Detail Screen](#).

Field	Description
Charge type	<p>The type of charge on the invoice detail. The description of each charge appears to the right.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Duty</i> = The system determines whether to charge duty by comparing the harmonize codes for the item and the duty rates defined for the ship-to country. The duty calculation is described to the right. See Setting Up the Country Table (WCTY). <i>Shipper/Item</i> = This charge is added to the order if you have set up a shipper/item charge for the item with the shipper used Working with Ship Via Codes (WVIA). <i>Vat/Hidden Tax</i> = This charge is included in the item price if the order was subject to tax-inclusive pricing. See Setting Up Order Entry Values for more information on VAT and tax-inclusive pricing. <p>Display-only.</p>
Amount	<p>The amount of the charge for the item. The method for calculating duty charges is indicated in the fields to the right.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>
Duty rate percent	<p>The percentage the system used to calculate the duty amount. The system multiplies this percentage by the extended item price.</p> <p>Numeric, 5 positions with a 2-place decimal; display-only.</p>
Duty rate amount	<p>The flat rate the system used to calculate the duty amount. The system multiplies this amount by the total unit quantity.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Note:

The Invoice Cost Detail screen is not currently implemented.

Display Invoice Address Screen (Billing Address)

Purpose: Use this screen to review the billing address associated with an invoice.

Where does the billing address come from? Depending on how you create the order, the billing address can be:

- the name and address from the Customer Bill to table, if there is a bill-to account associated with the order; otherwise,
- the name and address of the Customer Sold To who placed the order. This customer might differ from a Customer Sold To who receives the order.

How to display this screen: Select *Billing address* for an invoice at the [Display Invoices Screen](#).

 **Note:**

This screen is available only if the *Capture Addresses for Invoice (J24)* system control value was *selected* at the time that the system generated the invoice. See that system control value for more information.

Field	Description
Order #	A number the system assigns to uniquely identify an order. Numeric, 8 positions; display-only.
Invoice #	A number the system assigns to uniquely identify an invoice. Numeric, 7 positions; display-only.
Type	Set to <i>Billing Address</i> . Alphanumeric, 15 positions; display-only.
Name	The company name and name for the billing address. Alphanumeric, 41 positions; display-only.
Address	Up to four lines of address information. Alphanumeric, 32 positions each; display-only.
Apt/Suite	The apartment, suite, rural route, or floor number for the billing address. Alphanumeric, 10 positions; display-only.
City/State/Zip	The city, state code, and zip or postal code for the billing address. City: 25 positions; display-only. State: 2 positions; display-only. Zip: 10 positions; display-only.

Display Invoice Address Screen (Shipping Address)

Purpose: Use this screen to review the shipping address associated with an invoice.

Where does the shipping address come from? Depending on how you create the order, the shipping address can be:

- the order-level shipping address, as set up through [Assigning an Order Shipping Address](#)
- a permanent shipping address for the customer, as set up through [Using a Permanent Shipping Address in Order Entry](#)
- a recipient customer, as set up through [Adding a Recipient Order in Order Entry](#)
- the name and address of the Customer Sold To who placed the order

How to display this screen: Select *Shipping address* for an invoice at the [Display Invoices Screen](#).

 **Note:**

This screen is available only if the *Capture Addresses for Invoice (J24)* system control value was *selected* at the time that the system generated the invoice. See that system control value for more information.

Field	Description
Order #	A number the system assigns to uniquely identify an order. Numeric, 8 positions; display-only.
Invoice #	A number the system assigns to uniquely identify an invoice. Numeric, 7 positions; display-only.
Type	Set to <i>Shipping Address</i> . Alphanumeric, 15 positions; display-only.
Name	The company name and name for the shipping address. Alphanumeric, 41 positions; display-only.
Address	Up to four lines of address information. Alphanumeric, 32 positions each; display-only.
Apt/Suite	The apartment, suite, rural route, or floor number for the shipping address. Alphanumeric, 10 positions; display-only.
City/State/Zip	The city, state code, and zip or postal code for the shipping address. City: 25 positions; display-only. State: 2 positions; display-only. Zip: 10 positions; display-only.
Delivery code	A code representing the type of delivery address for a postal code. Valid values are: <ul style="list-style-type: none"> • <i>B</i> = Business address. • <i>R</i> = Residence. • <i>N</i> = No distinction. • Blank = Delivery code not defined. Some shippers, such as UPS, charge different rates based on the type of delivery address on an order. For example, shipping to a business address is cheaper than shipping to a residential address. You can define the delivery code for a postal area to insure that the best possible rate is charged for shipping an order. Alphanumeric, 1 positions; display-only.

Invoice Pay Summary Screen

Purpose: Use this screen to review invoice payment information, such as:

- the payment plan associated with the invoice, if any
- the total amount deposited to date for each invoice
- the total amount to deposit for each invoice
- the date the deposit is available for processing

How to display this screen: Select *Invoice Pay Summary* at the [Display Invoices Screen](#).

An error message indicates if the [Deferred and Installment Billing \(F51\)](#) system control value is *unselected*:

Deferred/Installment Billing feature required for this function

Field	Description
Order #	A number the system assigns to uniquely identify the order. Numeric, 8 positions; display-only.
Invoice #	The number the system assigns to a customer's bill or credit. Numeric, 7 positions; optional.
Pay type	Represents the method of payment on the order. Pay methods are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY) . Numeric, 2 positions; display-only.
Date (Invoice date)	The date you billed the merchandise. Numeric, 6 positions; display-only.
I/D (Payment plan type)	A value that identifies whether the invoice payment method is associated with a deferred or installment payment plan. Valid values are: <ul style="list-style-type: none">• <i>I</i> = The invoice payment method is associated with an installment payment plan. An installment payment plan allows you to break payments into installment amounts, for example, 3 installments of \$30.00 each month.• <i>D</i> = The invoice payment method is associated with a deferred payment plan or the <i>EXC</i> Net Billing for Exchanges plan. A deferred payment plan allows you to defer the payment until a later date, for example, don't pay until January 2007. See Credit Card Net Exchange Billing for more information on the <i>EXC</i> plan.• blank = The invoice payment method is not associated with a payment plan. Alphanumeric, 1 position; display-only.
CC/C status (Credit card credit status)	A value that indicates the credit status of the return. A value only displays in this field if the invoice payment method is associated with a return or exchange. The system does not process a credit card credit against an installment or deferred billing order before the deposit has been processed. This ensures that you do not credit the customer's credit card before the card has been charged. Valid values are: <ul style="list-style-type: none">• <i>P</i> = Refund pending. The system updates the status to pending when you perform a return or exchange in order entry, order maintenance or through Work with Return Authorizations and have not yet processed the refund.• <i>R</i> = Refund processed/ready. The system updates the status to processed/ready when you process the refund in Process Refunds. blank = Refund deposited. This field is also blank if the invoice payment method is not associated with a return or exchange. Alphanumeric, 1 position; display-only.

Field	Description
To date (Deposit to date)	<p>The total amount deposited to date. When you process a deposit for an installment payment plan, the system updates this field by the deposit amount.</p> <p><i>Example:</i> You have an installment payment plan assigned to the order for 3 installments of \$30.00 on the 15th of every month.</p> <ul style="list-style-type: none"> • The first installment updates this field to \$30.00. • The second installment updates this field to \$60.00. • The third installment updates this field to \$90.00. <p>Numeric, 20 positions with a 4-place decimal; display-only.</p>
Total (Total amount to deposit)	<p>The total amount that needs to be deposited in order for the invoice to be completely deposited.</p> <p>An error message indicates if you try to change an invoice payment method that has been completely deposited: Invoice (399) has been completely deposited and cannot be changed.</p> <p>Numeric, 20 positions with a 4-place decimal; display-only.</p>
Rel date (Deposit release date)	<p>This date indicates when the invoice is eligible for deposit. If this date is equal to or prior to the current date, the invoice payment is eligible for deposit.</p> <p>The system updates this field when a deposit is confirmed with the next deposit release date if there is a remaining amount to deposit, for example, in installment billing.</p> <p><i>Regular (non-payment plan) Orders:</i> For regular orders, the deposit release date is the same as the invoice date. The deposit is eligible for processing immediately after billing.</p> <p><i>Deferred Orders:</i> For orders containing a deferred payment plan, the deposit release date is either a fixed date or is based on a specific interval. If the date is based on an interval, the interval can be calculated based on order date or invoice date.</p> <p>If the deposit release date is a fixed date, the system compares the fixed date against the invoice date:</p> <ul style="list-style-type: none"> • If the fixed date is greater than the invoice date, the system will populate the deposit release date with the fixed date. • If the fixed date is less or equal to the invoice date, the system will populate the deposit release date with the invoice date. <p>If the deposit release date is based on an interval and is calculated based on invoice date, the system adds the interval number of days to the invoice date and compares this date against the expiration date:</p> <ul style="list-style-type: none"> • If the resulting date is less than the expiration date, the system updates the deposit release date with this date. • If the resulting date is equal to or greater than the expiration date, the system will use the expiration date as the deposit release date. • If the expiration date is less than the invoice date, the system will use the invoice date as the deposit release date.

Field	Description
	<p><i>Installment Orders:</i> For orders using an installment payment plan, the deposit release date is either the next fixed day of the month or is based on a specific interval.</p> <p>If the deposit release date is based on an interval, the system calculates the next installment interval by adding the interval number of days to the current date.</p> <p>If the deposit release date is a fixed date:</p> <ul style="list-style-type: none"> • If the fixed day of the month has not been reached, the deposit release date is the fixed day of the current month. • If the fixed day of the month is today or in the past, the deposit release date is the fixed day of the next month. • If the expiration date is earlier than the invoice date, the system uses the invoice date as the deposit release date. <p><i>Credit Invoices:</i> For a credit invoice payment method, the deposit release date associated with the original invoice is used as long as that date is on or after the current date. If the deposit release date of the original invoice is earlier than the current date, the deposit release date of the credit invoice is updated with the current date. This ensures that the customer is not credited until he has been billed; but if the customer has been billed, the credit is released immediately.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Screen Option	Procedure
Change Invoice Pay Method	<p>Select <i>Change</i> for an invoice payment method to advance to the Change Invoice Pay Method Screen.</p> <p><i>Error messages:</i> The Change Invoice Pay Method screen might display these error messages when you Select <i>Change</i> for an invoice payment method:</p> <p>Pay category must be credit card. This message indicates that the invoice payment is not a credit card payment type.</p> <p>Invoice (397) has been completely deposited and cannot be changed. This message indicates that the invoice payment associated with a deferred or installment payment plan has been completely deposited.</p> <p>Not authorized to change invoice payment information. This error message indicates that you do not have authority to the Change Invoice Payment Information (A82) secured feature.</p>
Display Invoice Pay Method	Select <i>Display</i> for an invoice payment method to advance to the Display Invoice Pay Method Screen (Reviewing Deposit Information) .
Display Deposit History	Select <i>Deposit History</i> for an invoice payment method to advance to the Display Deposit History Screen .
Display Order Payment History	Select <i>Payment History</i> for an invoice payment method to advance to the Display Order Payment History Screen .

Change Invoice Pay Method Screen

Purpose: Use this screen to:

- Review deposit information, such as the total amount to deposit, the amount already deposited and the amount remaining to deposit.
- Review or change the deposit release date, installment information or credit card information.
- Apply a prepaid check or cash payment.

Typically, you use this screen when you receive a rejected deposit for an invoice associated with a deferred or installment payment plan, and you need to change the credit card information before resending the deposit to the service bureau.

How to display this screen: Select *Change* for an invoice payment method at the [Invoice Pay Summary Screen](#). You can also advance to this screen by selecting *Change* for a rejected deposit in Submit Rejected Deposits. See [Processing Auto Deposits \(SDEP\)](#).

Field	Description
Order #	A number the system assigns to uniquely identify the order. Numeric, 8 positions; display-only.
Invoice #	The number the system assigns to a customer's bill or credit. Numeric, 7 positions; display-only.
Pay method	The code and description that represents the method of payment on the order. You can change the payment method associated with this invoice payment method by selecting <i>Change Card Number</i> at the Change Invoice Pay Method screen, for example, the customer's credit card was stolen or the credit card was declined. See Changing Credit Card Information for an Invoice Payment Method . Pay methods are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY) . Numeric, 2 positions; display-only.
Invoice date	The date you shipped and billed the merchandise. Numeric, 6 positions; display-only.
Total amount (Total amount to deposit)	The total amount to deposit in order for the invoice to be completely deposited. Numeric, 20 positions with a 2-place decimal.
Adjustment (Deposit adjustment amount)	The amount of the deposit that has been changed or is in transition. The system updates the deposit adjustment amount with this information: <ul style="list-style-type: none"> • written off deposits • debit and credit netting amounts • deposits pending Numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Amount deposited (Deposit to date)	<p>The total amount deposited to date. When a deposit is confirmed, the system updates this field by the deposit amount.</p> <p><i>Example:</i></p> <p>You have an installment payment plan assigned to the order for 3 installments of \$30.00 on the 15th of every month.</p> <p>The first installment updates this field to \$30.00.</p> <p>The second installment updates this field to \$60.00.</p> <p>The third installment updates this field to \$90.00.</p> <p>When a deposit is confirmed, the system updates this field with the amount deposited.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Remaining (Deposit remaining amount)	<p>The amount remaining to deposit.</p> <p>The system uses this calculation to determine the deposit remaining amount:</p> <pre>deposit amount - amount deposited to date - prepaid amount - adjustment amount = deposit remaining amount</pre> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Card Number	<p>The credit card number the customer used on the order. Information will be provided by Oracle at a later date.</p> <p>You can change the credit card number on the Change Credit Card window. See Changing Credit Card Information for an Invoice Payment Method.</p> <p>Alphanumeric, 20 positions; display-only.</p>
Authorization #	<p>The number used to authorize the credit card payment.</p> <p>The original authorization number from pick slip generation is retained and displays for a payment plan order, even after you receive a full authorization for the deposit.</p> <p>You can change the authorization number on the Change Credit Card window. See Changing Credit Card Information for an Invoice Payment Method.</p> <p>Numeric, 16 positions; display-only.</p>
Expiration date	<p>The date the credit card is no longer active. Information will be provided by Oracle at a later date.</p> <p>Numeric, 4 positions (MMYY format); display-only.</p>
Authorization date	<p>The date you manually authorize a payment method, or the date the payment method receives an authorization from the authorization service.</p> <p>You can change the authorization date on the Change Credit Card window. See Changing Credit Card Information for an Invoice Payment Method.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Field	Description
Issue #	<p>An incremental issue number, assigned by some banks when they replace a card because it is lost or stolen. Debit cards might require a start date, an issue number, both, or neither. The <i>Require issue #</i> flag for the pay type controls whether an issue number is required or optional.</p> <p>You can change the issue number at the Change Credit Card for window. See <i>Changing Credit Card Information for an Invoice Payment Method</i>.</p> <p>Alphanumeric, 2 positions; display-only.</p>
Start date	<p>The first date when the card is effective. The <i>Require start date</i> flag for the pay type controls whether the start date is required or optional. Numeric, 4 positions; display-only.</p>
Deposit release date	<p>This date indicates when the invoice is eligible for deposit. If this date is on or earlier than the current date, the invoice payment is eligible for deposit.</p> <p>The system updates this field when a deposit is confirmed with the next deposit release date if there is a remaining amount to deposit, for example, in installment billing.</p> <p>Regular (non-payment plan) Orders For regular orders, the deposit release date is the same as the invoice date. The deposit is eligible for processing immediately after billing.</p> <p><i>Deferred Orders:</i> For orders using a deferred payment plan, the deposit release date is either a fixed date or is based on a specific interval. If the date is based on an interval, the interval can be calculated based on order date or invoice date.</p> <p>If the deposit release date is a fixed date, the system compares the fixed date against the invoice date:</p> <ul style="list-style-type: none"> • If the fixed date is later than the invoice date, the system populates the deposit release date with the fixed date. • If the fixed date is on or earlier than the invoice date, the system populates the deposit release date with the invoice date. • If the expiration date is earlier than the invoice date, the system populates the deposit release date with the invoice date. • If the deposit release date is based on an interval and is calculated based on invoice date, the system adds the interval number of days to the invoice date and compares this date against the expiration date: • If the resulting date is earlier than the expiration date, the system updates the deposit release date with this date. • If the resulting date is on or later than the expiration date, the system uses the expiration date as the deposit release date. • If the expiration date is earlier than the invoice date, the system populates the deposit release date with the invoice date.

Field	Description
	<p><i>Installment Orders:</i> For orders containing an installment payment plan, the deposit release date is either the next fixed day of the month or is based on a specific interval.</p> <ul style="list-style-type: none"> • If the deposit release date is based on an interval, the system calculates the next installment interval by adding the interval number of days to the current date. • If the deposit release date is a fixed date: • If the fixed day of the month is in the future, the deposit release date is the fixed day of the current month. • If the fixed day of the month is on or earlier than today, the deposit release date is the fixed day of the next month. <p><i>Credit Invoices:</i> For a credit invoice payment method, the deposit release date associated with the original invoice is used as long as that date is on or after the current date. If the deposit release date of the original invoice is earlier than the current date, the deposit release date of the credit invoice is updated with the current date. You might want to change the deposit release date associated with a credit invoice to allow the credit invoice to process before the debit invoice. This ensures that the customer is not credited until he has been billed.</p> <p><i>Error Messages:</i> An error message indicates if you enter a date that is later than the expiration date associated with the credit card: Deposit Release Date 110199 greater than Expiration Date 599.</p> <p>An error message indicates if you enter a date that is earlier than today's date: Date entered must not be less than today's date</p> <p>Numeric, 6 positions (in user date format); required.</p>
Rejected deposit (Rejected deposit pending)	<p>An informational message informing you a deposit amount has been rejected by the authorization service.</p> <p>When a deposit amount is rejected, the system:</p> <ul style="list-style-type: none"> • writes an order payment history message • writes a deposit history record <p>Alphanumeric, 25 positions; display-only.</p>
Rejected (Rejected amount)	<p>The deposit amount that has been rejected by the authorization service.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Resubmit	<p>Indicates whether you wish to resubmit the rejected deposit amount for authorization and deposit.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Resubmit the deposit to the authorization service. The next time you process deposits, the system includes the rejected deposit amount. • <i>Unselected</i> = Do not resubmit the deposit to the authorization service.

Field	Description
Write off	<p>This flag indicates whether you wish to write-off the total amount to deposit for this invoice payment method, for example, there is no chance of collecting the money from the customer.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Write off the total amount to deposit for this invoice payment method. <i>Unselected</i> = Do not write off the total amount to deposit for this invoice payment method.
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When you write-off a deposit amount, the amount is written off immediately.</p> </div>
Amt (Write off deposit amount)	<p>The rejected deposit amount you wish to write off.</p> <p>The system removes the invoice payment method from the Resubmit Reject Deposits screen in Submit Rejected Deposits when you write off a rejected deposit. See Processing Auto Deposits (SDEP).</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When you select <i>OK</i> to write off a rejected deposit, the write off occurs immediately.</p> </div>
Delete	<p>Numeric, 20 positions with a 2-place decimal; optional.</p> <p>This flag indicates whether you wish to delete the rejected deposit.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Delete the rejected deposit amount. <i>Unselected</i> = Do not delete the rejected deposit amount.
# of installments	<p>The total number of installments assigned to this invoice payment method. Installment billing allows you to break the payment evenly into installments (for example, 3 payments on the 1st of each month).</p> <p>This field is used with an installment payment plan only.</p> <p>Numeric, 3 positions; display-only.</p>
# remaining installment	<p>The number of installments remaining. This number is the same as the number of installments when the invoice payment method record is first created and reduces by one each time an installment is sent for deposit.</p> <p>This field is used with an installment payment plan only.</p> <p>Numeric, 3 positions; display-only.</p>

Field	Description
Installment interval	<p>The number of days between installments. The system uses this interval number to determine the next deposit release date if you are basing installment dates on intervals, for example, 3 installments in 30 day intervals. The system determines the installment dates based on the order date. For example, if the order date is 09/01/06, the first installment date would be 09/01/06. The system would determine the next installment date by adding 30 days to the first installment date: 09/01/06 + 30 = 10/01/06.</p> <p>Numeric, 3 positions; display-only.</p>
Fixed installment day	<p>The day of the month when an installment is billed. The system uses the fixed installment date if you have defined a fixed date for each installment. For example, if 15 is defined here, each installment would be due on the 15th of every month.</p> <p>Numeric, 2 positions; display-only.</p>
Pay type	<p>Represents a method of payment on the order.</p> <p>You can enter a prepaid amount by entering a cash/check pay type in this field and entering the amount you wish to prepay in the Prepaid amount field.</p> <p>An error message indicates if you enter a pay type other than pay type 1 (cash/check): Pay category must be '1' Cash/Check.</p> <p>Pay types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>Numeric, 2 positions; optional.</p>
Prepaid amount	<p>The amount you wish to prepay for this pay method, for example, the customer's credit card was rejected and the customer decides to send you a check instead. If you enter an amount in this field, the system subtracts the amount from the Deposit amount remaining field.</p> <p><i>Example:</i></p> <p>Deposit amount remaining = 130.75 Prepaid amount = 5.00 130.75 - 5.00 = 125.75 (this is the remaining amount to deposit)</p> <p>Numeric, 14 positions; optional.</p>
Prepaid to date	<p>The total amount prepaid to date.</p> <p>Numeric, 20 positions with a 2-place decimal.</p>

Screen Option	Procedure
Work with rejected deposits	See Working with Rejected Deposits .
Change credit card information	Select <i>Change Card Number</i> . See Changing Credit Card Information for an Invoice Payment Method .

Working with Rejected Deposits

From the [Change Invoice Pay Method Screen](#) you can also resubmit, write off or delete a rejected deposit amount.

To resubmit a rejected deposit:

Select the Resubmit field and select *OK*. The system sends the rejected deposit amount back to the authorization service for reauthorization. The Rejected amount, Resubmit, Write off, Write off amount and Delete fields are cleared from the screen.

The Change Invoice Payment Method screen displays this error message if you try to reenter the screen and the deposit amount that you have resubmitted completely deposits the amount for the invoice payment:

Invoice has been completely deposited and cannot be changed.

This message displays even if the submitted deposit amount has not been confirmed by the authorization service.

The system also writes an order payment history record indicating the deposit amount was resubmitted.

 **Note:**

When you select *OK* to resubmit, the deposit amount is resubmitted the next time you process deposits.

To write off a rejected deposit:

Select the Write off field and:

- If you wish to write off the remaining amount to deposit for this invoice payment method, select *OK*. You return to the Invoice Pay Summary screen.
- If you wish to write off a specific amount, enter this amount in the Write off amount field and select *OK*. The Confirm Accept window prompts you for confirmation.

When you write off a deposit amount:

- The system updates the Adjustment field with the rejected deposit amount. If you did not enter a specific write off amount, this is the amount remaining to deposit. If you entered a specific write off amount, this is the amount you entered in the Write off amount field.
- The system updates the Remaining field with the amount remaining to deposit. The system determines the remaining amount to deposit using this calculation:

total amount to deposit - write off amount = remaining amount to deposit

For a deferred payment plan:

If the invoice payment method is associated with a deferred payment plan, the system updates the Adjustment field with the write off amount and updates the Remaining field with the remaining amount to deposit, if any.

Example:

Total amount to deposit = 69.00

Rejected deposit amount = 69.00

Write off amount = 30.00

In this situation, the system updates the Adjustment amount field to 30.00 (the write off amount) and updates the Remaining field with 39.00 using this calculation:

total amount to deposit (69.00) - write off amount (30.00) = remaining amount to deposit (39.00)

When you receive an authorization for the deposit, the system updates:

- the Amount deposited field to 39.00
- the Remaining field to .00
- the Adjustment field remains at 30.00 (this is the write off amount)

For an installment payment plan:

If the invoice payment method is associated with an installment payment plan, the system updates the Adjustment field with the write off amount and updates the Remaining field with the remaining amount to deposit, if any. If there is a remaining amount to deposit, the system redistributes the amount remaining across the remaining installment intervals.

Example:

Total amount to deposit = 69.00

Number of installments = 3

Installment amount = 23.00

Rejected deposit amount = 23.00

Write off amount = 30.00

In this situation, the system updates the Adjustment amount field to 30.00 (the write off amount) and updates the Remaining field with 39.00 using this calculation:

total amount to deposit (69.00) - write off amount (30.00) = remaining amount to deposit (39.00)

The system also updates the Installment amount for the remaining installment intervals to 19.50 using this calculation:

remaining amount to deposit (39.00) / the number of remaining installments (2) = installment amount (19.50)

When you receive an authorization for the deposit, the system:

- updates the Amount deposited field to 19.50
- updates the Remaining field to 19.50 (this is the amount of the next installment)
- decreases the Number of remaining installments field by 1
- leaves the Adjustment field at 30.00 (this is the write off amount)

 **Note:**

If you write off the remaining amount to deposit for this invoice payment method, the system updates the Adjustment field with the amount remaining to deposit plus the rejected deposit amount and updates the Remaining field with the rejected deposit amount.

To delete a rejected deposit:

Select the Delete field. The system deletes the rejected deposit amount and displays the message Deleted. No further deposits. at the Change Invoice Pay Method screen.

Changing Credit Card Information for an Invoice Payment Method

Purpose: You can change credit card information at the Change Credit Card window. A history message is written, indicating Card Number has been changed. You can review this history at the [Display Order Payment History Screen](#).

How to display this window: Select *Change Card Number* at the [Change Invoice Pay Method Screen](#). Additional information will be provided by Oracle at later date.

Field	Description
Pay method	<p>The code and description that represents the method of payment on the order.</p> <p><i>Error messages:</i></p> <p>If you entered a payment method other than a credit card: Pay category must by credit card.</p> <p>If you entered a pay method that is associated with a credit card authorization and deposit service different from the original credit card: Auth Service Code must match Original Service Code.</p> <p>Pay methods are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>Numeric, 2 positions; required.</p>
Card Number	<p>The credit card number the customer used on the order. Information will be provided by Oracle at a later date.</p> <p>Alphanumeric, 20 positions; required.</p>
Expiration date	<p>The date the credit card is no longer active. The Require expiration date flag for the pay type controls whether an expiration date is required. For example, a stored value card credit card type typically does not require an expiration date. See Types of Credit Cards for more information.</p> <p>Numeric, 4 positions (MMYY format); required or optional.</p>

Field	Description
Issue #	<p>An incremental issue number, assigned by some banks when they replace a card because it is lost or stolen. Debit cards might require a start date, an issue number, both, or neither. The <i>Require issue #</i> flag for the pay type controls whether an issue number is required or optional.</p> <p>It is important to enter the issue number exactly as it appears on the card. For example, an issue number of <i>1</i> is different from an issue number of <i>01</i>; also, an issue number of <i>0</i> is different from a blank issue number. Each bank has its own requirements and conventions regarding issue number.</p> <p>If an issue number is required but not entered in order entry or order maintenance, the system displays an error message: Credit card issue# () is not valid.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px; margin-top: 10px;"> <p> Note: An entry of <i>00</i> (two zeros) is not considered a valid issue number.</p> </div>
Start date	<p>Alphanumeric, 2 positions; required or optional.</p> <p>The first date when the card is effective. The <i>Require start date</i> flag for the pay type controls whether the start date is required or optional. You might use a start date for a debit card to indicate the first date when the card is effective. If a start date is required but not entered, the system displays an error message in order entry or maintenance: Credit card start date (0) is not valid.</p> <ul style="list-style-type: none"> • Even if you require a start date for a pay type, the system does not validate the credit card based on whether the start date is before or after the current date. Typically, if your authorization service requires a start date for this pay type, the service would validate the start date provided against the current date. • Debit cards might require a start date, an issue number, both, or neither. Even if a start date or an issue date are not required, you can still enter this information in order entry if it is available.
Authorization #	<p>Numeric, 4 positions; required or optional.</p> <p>The number used to authorize the credit card payment. The original authorization number from pick slip generation is retained and displays for a payment plan order, even after you receive a full authorization for the deposit.</p>
Authorization date	<p>Numeric, 16 positions; optional.</p> <p>The date you manually authorize a payment method, or the date the payment method receives an authorization from the authorization service.</p> <p>Numeric, 6 positions (in user date format); optional.</p>

Display Invoice Pay Method Screen (Reviewing Deposit Information)

Purpose: Use this screen to review:

- deposit information, such as the total amount to deposit, the amount already deposited and the amount remaining to deposit
- the deposit release date, installment information or credit card information
- the prepaid check or cash payment

How to display this screen: Select *Display* for an invoice payment method at the [Invoice Pay Summary Screen](#).

Field descriptions: See [Change Invoice Pay Method Screen](#) for a description of the other fields on this screen.

Field	Description
Installment (Installment amount)	The amount due for the next installment. This field displays only for invoice payment methods associated with an installment payment plan. Numeric, 20 positions with a 2-place decimal; display-only.
Schedule (Installment scheduled date)	The deposit date for the next installment. This date indicates when the invoice is eligible for deposit. If this date is equal to or prior to the current date, the invoice payment is eligible for deposit. The system updates this field when a deposit is confirmed with the next deposit date if there is a remaining amount to deposit. The system updates this field to 99/99/99 when a deposit amount is rejected. This field displays only for invoice payment methods associated with an installment payment plan. Numeric, 6 positions (in user date format); display-only.

Display Deposit History Screen

Purpose: Use this screen to review invoice deposit attempts and responses.

How to display this screen: Select *Deposit History* for an invoice payment method at the [Invoice Pay Summary Screen](#) or the [Display Order Payment Methods Screen](#).

Field	Description
Order #	A number the system assigns to uniquely identify an order. Numeric, 8 positions; display-only.
Pay type	Represents the method of payment on the order. Pay methods are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY) . Numeric, 2 positions; display-only.

Field	Description
Issue #	<p>An incremental issue number, assigned by some banks when they replace a card because it is lost or stolen. Debit cards might require a start date, an issue number, both, or neither. The Require issue # flag for the pay type controls whether an issue number is required or optional.</p> <p>It is important to enter the issue number exactly as it appears on the card. For example, an issue number of <i>1</i> is different from an issue number of <i>01</i>; also, an issue number of <i>0</i> is different from a blank issue number. Each bank has its own requirements and conventions regarding issue number.</p> <p>If an issue number is required but not entered in order entry or order maintenance, the system displays an error message: Credit card issue# () is not valid.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Debit cards might require a start date, an issue number, both, or neither. Even if a start date or an issue date are not required, you can still enter this information in order entry if it is available.</p> </div>
Start date	<p>Alphanumeric, 2 positions; display-only.</p> <p>The first date when the card is effective. The Require start date flag for the pay type controls whether the start date is required or optional. You might use a start date for a debit card to indicate the first date when the card is effective.</p>
Card Number	<p>Numeric, 4 positions; display-only.</p> <p>The credit card number the customer used on the order. Information will be provided by Oracle at a later date.</p>
Exp date	<p>Alphanumeric, 20 positions; display-only.</p> <p>The date the credit card is no longer active. The expiration date may be zero, depending on the setting of the Require expiration date flag for the pay type.</p> <p>For example, a stored value card credit card type typically does not require an expiration date. See Types of Credit Cards for more information.</p> <p>You can change the expiration date on the Change Credit Card window. See Changing Credit Card Information for an Invoice Payment Method.</p>
Invoice #	<p>Numeric, 4 positions (MMYY format); display-only.</p> <p>The number the system assigns to a customer's bill or credit. The system generates an invoice during billing.</p> <p>Numeric, 7 positions; display-only.</p>

Field	Description
Type (Transaction type)	<p>Indicates the type of deposit.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> *PURCH = Purchase deposit, indicating a debit. *RETURN = Return deposit, indicating a credit. <p>Alphanumeric, 10 positions; display-only.</p>
Date (Deposit created date)	<p>The date when this deposit history record was created. This is the date when the invoice pay method was deposited. The deposit created date ensures that the deposit is not sent again.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Amount (Deposit amount)	<p>The amount deposited. The system uses this calculation to determine the amount to deposit:</p> <p><i>For deferred payment plans:</i> prepaid amount - adjustment amount - total amount deposited to date = deposit amount</p> <p><i>For installment payment plans:</i> prepaid amount - adjustment amount - total amount deposited to date / intervals remaining = deposit amount</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Status (Deposit status)	<p>The status of this deposit:</p> <ul style="list-style-type: none"> <i>Confirmed</i> = The service bureau confirmed the deposit. <i>Deleted</i> = The user deleted a rejected deposit. <i>Forced</i> = The deposit was rejected, but was forced through deposit (the Forced deposit field for the authorization service is <i>selected</i>). <i>Manual Confirmed</i> = The user manually confirmed the deposit through Submit Rejected Deposits. <i>Prepaid</i> = The user entered a prepaid adjustment amount. <i>Resubmitted</i> = The deposit was resubmitted for deposit. <i>Sent</i> = The deposit is in the process of being sent to the service bureau. <i>Unconfirmed</i> = The deposit is unconfirmed by the service bureau. <i>Written Off</i> = The user wrote off a rejected deposit. blank = The deposit has not yet been sent to the service bureau. <p>Display-only.</p>
Response (Vendor response code)	<p>A code assigned by the authorization service that identifies whether the credit card deposit was authorized and approved or declined, and the reason for the authorization decline.</p> <p>Vendor response codes are defined in and validated against the Authorization Service Vendor Response table. See Defining Vendor Response Codes.</p> <p>Alphanumeric, 10 positions; display-only.</p>

Field	Description
Bill mthd (Flexible payment bill method)	<p>A code that identifies whether this deposit is related to a deferred or installment payment plan.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • blank = This is a regular deposit; no payment plans are associated with this deposit. • <i>D</i> = This is a deferred billing deposit. • <i>I</i> = This is an installment billing deposit. <p>The system uses this code to sort deposit records.</p> <p>Alphanumeric, 1 position; display-only.</p>

Screen Option	Procedure
Display deposit history detail	Select <i>Details</i> for a deposit to advance to the Display Deposit History Detail Screen .

Display Deposit History Detail Screen

Purpose: Use this screen to review the deposit history details, such as the action code and the deposit service associated with this deposit. Additional information will be provided by Oracle at a later date.

How to display this screen: Select *Details* for a deposit at the [Display Deposit History Screen](#).

Field	Description
Order #	A number the system assigns to uniquely identify an order. Numeric, 8 positions; display-only.
Invoice #	The number the system assigns to a customer's bill or credit. Numeric, 7 positions; display-only.
Merchant ID (Merchant identification code)	The account number assigned by the service bureau to identify transmissions to and from your company. Alphanumeric, 20 positions; display-only.

Field	Description
Issue #	<p>An incremental issue number, assigned by some banks when they replace a card because it is lost or stolen. Debit cards might require a start date, an issue number, both, or neither. The Require issue # flag for the pay type controls whether an issue number is required or optional.</p> <p>It is important to enter the issue number exactly as it appears on the card. For example, an issue number of <i>1</i> is different from an issue number of <i>01</i>; also, an issue number of <i>0</i> is different from a blank issue number. Each bank has its own requirements and conventions regarding issue number.</p> <p>If an issue number is required but not entered in order entry or order maintenance, the system displays an error message: Credit card issue# () is not valid.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Debit cards might require a start date, an issue number, both, or neither. Even if a start date or an issue date are not required, you can still enter this information in order entry if it is available.</p> </div>
Start date	<p>Alphanumeric, 2 positions; display-only.</p> <p>The first date when the card is effective. The Require start date flag for the pay type controls whether the start date is required or optional. You might use a start date for a debit card to indicate the first date when the card is effective.</p>
Card Number	<p>Numeric, 4 positions; display-only.</p> <p>The credit card number sent to be deposited. Additional information will be provided by Oracle at a later date.</p> <p>You can change the credit card number on the Change Credit Card window. See Changing Credit Card Information for an Invoice Payment Method.</p>
Exp date	<p>Alphanumeric, 20 positions; display-only.</p> <p>The date the credit card is no longer active. The expiration date may be zero, depending on the setting of the Require expiration date flag for the pay type. For example, a stored value card credit card type typically does not require an expiration date. See Types of Credit Cards for more information.</p> <p>You can change the expiration date on the Change Credit Card window. See Changing Credit Card Information for an Invoice Payment Method.</p> <p>Numeric, 4 positions (MMYY format); display-only.</p>

Field	Description
Deposit amount (Deposit amount)	<p>The amount deposited or the amount sent to be deposited. The system uses this calculation to determine the amount to deposit:</p> <p><i>For deferred payment plans:</i> prepaid amount - adjustment amount - total amount deposited to date = deposit amount</p> <p><i>For installment payment plans:</i> prepaid amount - adjustment amount - total amount deposited to date / intervals remaining = deposit amount</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Deposit date (Deposit created date)	<p>The date when this deposit history was created. This is the date when the invoice pay method was deposited. The deposit created date ensures that the deposit is not sent again.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Transaction type (Transaction type)	<p>Indicates the type of deposit.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> *PURCH = Purchase deposit *RETURN = Return deposit <p>Alphanumeric, 10 positions; display-only.</p>
Response code (Vendor response code)	<p>A code assigned by the authorization service that identifies whether the credit card deposit was authorized and approved or declined, and the reason for the authorization decline.</p> <p>Vendor response code are defined in and validated against the Authorization Service Vendor Response table. See Defining Vendor Response Codes.</p>

 **Note:**

In order to see the full vendor response code description, a [Description](#) must be defined for the response code on the [Work with Vendor Response Screen](#).

Alphanumeric, 10 positions; display-only.

Field	Description
Action code	<p>A code set to the deposit service indicating the action to take for reauthorization.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• <i>Authorize and Deposit</i> = The deposit requires an authorization before it can be processed. The system sends a code of <i>B</i> (Authorize and Deposit) for:• all payment plan deposits except for the first deposit of an installment plan, when a code of <i>D</i> is sent.• any regular (non-pay plan) deposit whose authorization has expired. You can review the authorization expiration date at the Authorization History Details Window. Additionally, the system updates the Authorization History record with the new authorization number.• <i>Deposit</i> = The deposit does not require authorization and can be processed. The system sends a code of <i>D</i> for all regular deposits, assuming there is an authorization number in the Invoice Pay Method table and the authorization has not expired. If there is no authorization number, the system sends a code of <i>B</i> (Authorize and Deposit). <p>Alphanumeric, 1 position; display-only.</p>
Authorization code	<p>The authorization code sent with this deposit. This code indicates that the amount to charge for this credit card has been authorized manually or through a credit card authorization service.</p> <p>Alphanumeric, 16 positions; display-only.</p>
Billing method (Flexible payment bill method)	<p>A code that identifies whether this deposit is related to a deferred or installment payment plan.</p> <p>Valid values:</p> <ul style="list-style-type: none">• blank = This is a regular deposit; no payment plans are associated with this deposit.• <i>Deferred</i> = This is a deferred billing deposit.• <i>Installment</i> = This is an installment billing deposit. <p>The system uses this code to sort deposit records.</p> <p>Display-only.</p>
Deposit service	<p>A code for the service bureau that performs credit card deposits for this pay type.</p> <p>Alphanumeric, 3 positions; display-only.</p>

Field	Description
Deposit status	<p>The status of this deposit.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Confirmed</i> = The service bureau confirmed the deposit. • <i>Deleted</i> = The user deleted a rejected deposit. • <i>Forced</i> = The deposit was rejected, but was forced through deposit (the Forced deposit field for the authorization service is <i>selected</i>). • <i>Manual Confirmed</i> = The user manually confirmed the deposit through Submit Rejected Deposits. • <i>Prepaid</i> = The user entered a prepaid adjustment amount. • <i>Resubmitted</i> = The deposit was resubmitted for deposit. • <i>Sent</i> = The deposit is in the process of being sent to the service bureau. • <i>Unconfirmed</i> = The deposit is unconfirmed by the service bureau. • <i>Written Off</i> = The user wrote off a rejected deposit. • blank = The deposit has not yet been sent to the service bureau. <p>Display-only.</p>

Display Order Payment History Screen

Purpose: Use this screen to review messages written by the system describing changes in payment and invoice activity for the order. The system records all activity associated with the order payment method or invoice payment method defined for the order on this screen, such as:

- deposits made
- invoices netted against each other
- changes made by users
- deactivation of a pay type
- adding, changing, or deleting the payment plan associated with the payment type on the order

Additional information will be provided by Oracle at a later date.

How to display this screen: Select *Payment History* for a payment at the [Invoice Pay Summary Screen](#) or the [Display Order Payment Methods Screen](#).

Field	Description
Order #	<p>A number the system assigns to uniquely identify an order.</p> <p>Numeric, 8 positions; display-only.</p>
Invoice #	<p>The number the system assigns to a customer's bill or credit. This is the invoice number associated with an invoice payment method that has been updated.</p> <p>Numeric, 7 positions; display-only.</p>

Field	Description
Pay type	The code and description of the pay type assigned to this order. Pay type codes are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY) . Pay type code: numeric, 2 positions; display-only. Pay type description: alphanumeric, 30 position; display-only.
Date	The date when the transaction occurred. Numeric, 6 positions (in user date format); display-only.
Typ (Transaction type)	Indicates the type of transaction that occurred. Valid values are: <ul style="list-style-type: none"> • <i>A</i> = Card number has been changed. You can change the credit card number at the Change Invoice Pay Method Screen or the Enter Credit Card Pop-Up window. • <i>B</i> = billing • <i>C</i> = credit check • <i>D</i> = deposit • <i>M</i> = maintenance • <i>N</i> = net Alphanumeric, 1 position; display-only.
Note (Transaction note)	A system-generated description of the transaction. Alphanumeric, 40 positions; display-only.
Invoice	The invoice number associated with an updated invoice payment method. Numeric, 7 positions; display-only.
User	The user ID of the operator responsible for the transaction. Alphanumeric, 10 positions; display-only.

Screen Option	Description
Switch views between order and invoice payment history and invoice payment history only	Select <i>Payment History</i> . The system displays order and invoice payment history records or invoice payment history records only. When you review invoice history records only, the system displays a message to the right of the Invoice number field: Invoice Notes Only.

Reviewing Payment Methods

Display Order Payment Methods Screen

Purpose: This screen lists all of the methods of payment used on the order. Payment methods apply across recipients. The screen does not display refunds or balance due pay types.

How to display this screen: Select *Pay Methods* from the [Order Inquiry Header Screen](#) or [Order Inquiry Detail Screen](#).

Field	Description
Order #	A unique number the system assigns to the order. You will not see a ship-to suffix with the order number on this screen because payment methods apply across all recipients. Numeric, 8 positions; display-only.
Sold to	The name of the customer or company who placed the order. Alphanumeric, 41 positions; display-only.
Ship to	The name of the customer or company to receive the order. Alphanumeric, 41 positions; display-only.
Payment method (unlabeled)	Represents the method of payment on an order. Pay types codes are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY) . Numeric, 2 positions; display-only.
Payment method	A description of the pay type, and information such as the credit card number and expiration date, that is associated with the payment type. If you use credit card tokenization, the credit card number may be a token rather than the actual credit card number. Alphanumeric, 30 characters; display-only.
Amount	Three fields that identify the: Amount to charge The total value charged to the payment method. If no value appears, then this payment type serves as a “catch-all,” meaning any amount not assigned to another payment method applies to this one. Amount billed The amount that applies to the payment method that has been billed to the customer. For credit card payments, this is the total amount billed to the credit card. The system updates this amount as soon as the card is billed even before you process deposits. If you are using deferred or installment billing, the total amount to charge the card displays, even if the total amount has not yet been billed.
	<div data-bbox="906 1346 946 1381" style="display: inline-block; vertical-align: middle;"></div> Note: <p>If this is a prepay amount, and part of the prepayment total was applied to a membership program, only the remaining amount appears as the amount to charge or amount billed. For example, if the customer sent a check for \$100.00 and \$80.00 was applied to the membership program, \$20.00 appears here. See Membership Overview.</p>
	Amount credited The amount that has been credited to the payment method in the event of a return, overpayment, cancellation, or sellout. Numeric, 20 positions with a 2-place decimal; display-only.

Field	Description
Chg seq (Charge sequence)	A number that designates the order of use for the payment method, from zero to 99. The catch-all account must have the highest charge sequence. A charge sequence of 99 indicates that the payment method has been deactivated on the order; see Enter Payment Methods Screen in Order Maintenance . Numeric, 2 positions; display-only.
Pay plan (Payment plan code)	A code that identifies the payment plan associated with the payment method on this order. Payment plan codes are defined in and validated against the Flexible Payment Options table. See Working with Flexible Payment Options (WFPO) . Alphanumeric, 6 positions; display-only.
CC Last 4	The last four positions of the credit card number. From the CC Last 4 field in the Order Payment Method table. If you use credit card encryption, the system does not encrypt the value in this field. Alphanumeric, 4 positions; display-only.

Screen Option	Procedure
Review order pay type detail	Select <i>Display Detail</i> to advance to the Display Order Pay Type Screen (1 of 2) .
Review credit authorization history	Select <i>Display authorization history</i> to advance to the Display Authorization History Screen .
Review contributions	This option is not currently implemented.
Display deposit history	Select <i>Display Deposit History</i> to advance to the Display Deposit History Screen .
Display payment history	Select <i>Display payment history</i> to advance to the Display Order Payment History Screen .

Display Order Pay Type Screen (1 of 2)

Purpose: Use this screen to view order pay type detail. This screen displays the specific properties or characteristics that comprise the order payment method you selected.

Additional order pay type information: Select *OK* to advance to the [Display Order Pay Type Screen \(2 of 2\)](#).

How to display this screen: Select *Details* for a payment method at the [Display Order Payment Methods Screen](#).

Field	Description
Order #	A unique number assigned to the order. Numeric, 7 positions; display-only.

Field	Description
Sold to	<p>The sold to customer defined for this order.</p> <p>Last name: Alphanumeric, 25 positions; display-only.</p> <p>First name: Alphanumeric, 15 positions; display-only.</p> <p>Middle initial: Alphanumeric, 1 position; display-only.</p>
Pay type	<p>The pay type code and description associated with this order.</p> <p>Pay type codes are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>All payment methods including PayPal and wallets are shown. As PayPal orders are created via the CWOOrderIn API and not directly through the user interface, hence these pay types should not be selected here. Order Administration does not support authorization integration with PayPal.</p> <p>Pay type code: Numeric, 2 positions; display-only.</p> <p>Pay type description: Alphanumeric, 30 positions; display-only.</p>
Amount to charge	<p>The total amount that applies as a charge to the payment method shown. If this field is blank, the balance of the charge for the order applies to the payment method. The balance charge occurs after charges to all other pay types on the order have reached their defined limit.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Amount authorized	<p>The amount authorized for the credit card payment. The system updates this field:</p> <ul style="list-style-type: none">• when the system creates a pre-generated pick for the order in an <i>H Generated Has Authorization</i> status. <p>This field remains blank:</p> <ul style="list-style-type: none">• if the payment is not a pay category 2 <i>credit card</i> pay type.• if a pre-generated pick is not created for the order.• when the system creates a pre-generated pick for the order in a <i>G Generated No Authorization</i> status; in this situation, the system updates this field when you print the pick slip. <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>

Field	Description
Amount billed	<p>The amount that has already been billed against this pay method.</p> <p>For credit card payments, this is the total amount billed to the credit card. The system updates this amount as soon as the card is billed even before you process deposits. If you are using deferred or installment billing, the total amount to charge the card displays, even if the total amount has not yet been billed.</p> <div data-bbox="857 516 1380 919" style="border: 1px solid #0070C0; padding: 10px;"><p> Note:</p><p>If this is a prepay amount, and part of the prepayment total was applied to a membership program, only the remaining amount appears as the amount to charge or amount billed. For example, if the customer sent a check for \$100.00 and \$80.00 was applied to the membership program, \$20.00 appears here. See Membership Overview.</p></div>
Amount collected	<p>Numeric, 20 positions with a 2-place decimal; display-only.</p> <p>The amount you have received from the customer. An amount is collected when:</p> <ul style="list-style-type: none">• A shipment is billed using a credit card payment type (Note: This field is updated before you process deposits, and the update occurs regardless of whether the credit card uses a deferred or installment payment plan or is set up for immediate deposit)• Cash amount is entered for a prepaid order <p>Check and cash amounts are collected immediately, while credit card amount will not be visible until billing occurs.</p>

Field	Description
	For credit card payments, the system updates this amount as soon as the card is billed even before you process deposits. If you are using deferred or installment billing, the total amount to charge the card displays, even if the total amount has not yet been collected.
	<div style="border: 1px solid #0070c0; padding: 10px; background-color: #e6f2ff;"> <p> Note:</p> <p>If this is a prepay amount, and part of the prepayment total was applied to a membership program, only the remaining amount appears as the amount to charge or amount billed. For example, if the customer sent a check for \$100.00 and \$80.00 was applied to the membership program, \$20.00 appears here. See Membership Overview.</p> </div>
Amount credited	Numeric, 20 positions with a 2-place decimal; display-only. The amount from this payment type that the customer has received as credit or refund, represented by the creation of a refund in the Refund table. This information is updated when the refund is processed or the refund check is cut.
Charge sequence	Numeric, 20 positions with a 2-place decimal; display-only. A number that designates the order in which a payment method is used.
Cash applied date	Numeric, 1 position; display-only. The month, day, and year you applied a cash (prepaid) payment to the order.
Routing # (Routing number)	Numeric, 6 positions; display-only. Informational.
Acct # (Checking account number)	Alphanumeric, 9 positions; display-only. Informational.
Check # (Check number)	Alphanumeric, 20 positions; display-only. Informational.
Check download date (Check interface download date)	Numeric, 6 positions; display-only. Not implemented.
Card Number	Numeric, 6 positions; display-only. Information will be provided by Oracle at a later date.
Authorization date	Alphanumeric, 20 positions; display-only. The month, day, and year that your credit card authorization service confirmed or authorized the customer's credit card for the order, or you manually authorized the credit card.
	Numeric, 6 positions; display-only.

Field	Description
Expiration date	The date the credit card is no longer active. Information will be provided by Oracle at a later date. Numeric, 4 positions (MMYY format); display-only.
Card Last 4	The last four positions of the credit card number. From the CC Last 4 field in the Order Payment Method table. If you use credit card encryption, the system does not encrypt the value in this field. Alphanumeric, 4 positions; display-only.
Authorization number	The number you used when you manually authorized the credit card, or the authorization service assigned when authorizing the credit card. The number can be overridden for manual or authorization service updates, and clears when the order is purged. For orders using a payment plan, the system retains the original authorization number from pick slip generation, even after you receive a full authorization for deposit. Alphanumeric, 16 positions; display-only.
Authorization amount	The amount for this payment method that your authorization service has approved. This field is updated by the Auto Authorization function, and clears when the order is purged. Numeric, 20 positions with a 2-place decimal; display-only.
Issuing bank	The description of the bank issuing the credit card. This field is not currently implemented. Alphanumeric, 10 positions; display-only.
Issue #	An incremental issue number, assigned by some banks when they replace a card because it is lost or stolen. Debit cards might require a start date, an issue number, both, or neither. The <i>Require issue #</i> flag for the pay type controls whether an issue number is required or optional. Alphanumeric, 2 positions; display-only.
Start date	The first date when the card is effective. The <i>Require start date</i> flag for the pay type controls whether the start date is required or optional. You might use a start date for a debit card to indicate the first date when the card is effective. Numeric, 4 positions; display-only.
Hold reason	Represents why the pay type is on hold. Pay type holds include: <ul style="list-style-type: none"> <i>PT</i> = Pay Type hold is a hold reason code that the system displays when the order is on pay type hold and no other hold exists. Prepaid order holds: <i>TM</i> = Time hold. The system assigns this hold when you specify a check hold time period in the Pay Type table. The hold remains in effect until the time period lapses or you manually release the hold through the Release Held Orders program, whichever occurs first. <i>KF</i> = Check fraud. A hold that the system assigns when the micra number on a check meets a fraud condition that you defined in the Miscellaneous Fraud table.

Field	Description
	<ul style="list-style-type: none"> <i>BD</i> = Balance due. A hold that refers to an outstanding balance or amount unpaid that exceeds an amount limit or percentage you established in the Pay Type table. This hold applies when the only pay type on the order is cash. <p>Credit card holds:</p> <ul style="list-style-type: none"> <i>AV</i> = AVS hold. A credit card pay type hold that the system assigns when the credit card fails address verification. <i>CF</i> = Credit card fraud. A credit card pay type hold that applies when you have entered the credit card number in the Miscellaneous Fraud <i>PV</i> = Pay Plan Velocity Hold. A hold that the system assigns when a credit card has been used too many times within a specified period for an order containing a deferred or installment payment plan. <i>P\$</i> = Pay Plan Dollar Threshold. A hold that the system assigns when the total amount and invoice amount outstanding for a sold to customer on orders containing a deferred or installment payment plan exceeds the Dollar Threshold for Sold To Customer Orders with Flexible Payments (F54) system control value. <i>W</i> = Waiting for credit authorization. A hold that applies to an order waiting for authorization from a credit checking service bureau from the Pay Type table. CW hold will not prevent the order from processing. See Releasing Held Orders. <p><i>User-defined holds:</i> A user-defined hold reason displays here if, for example, the pay type was declined by the authorization service and you associated the vendor response with a unique pay type hold reason. See the Hold date field.</p> <p>Alphanumeric, 2 positions; display-only.</p>
Hold until	<p>The date when the order is eligible for release through the Release Orders on Time Hold Periodic Function. You can assign a number of days for the system to add when calculating the hold date to each response code you receive from an authorization service. See Defining Vendor Response Codes for more information on setting up vendor responses for authorization services, and releasing orders from time hold.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Display Order Pay Type Screen (2 of 2)

Purpose: Use this screen to review order pay type detail related to deferred or installment pay plans.

How to display this screen: Select *OK* at the [Display Order Pay Type Screen \(1 of 2\)](#).

Field	Description
Order #	A unique number assigned to the order. Numeric, 7 positions; display-only.

Field	Description
Sold to	<p>The sold to customer defined for this order.</p> <p>Last name: Alphanumeric, 25 positions; display-only.</p> <p>First name: Alphanumeric, 15 positions; display-only.</p> <p>Middle initial: Alphanumeric, 1 position; display-only.</p>
Pay type	<p>The pay type code and description associated with this order.</p> <p>Pay type codes are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>Pay type code: Numeric, 2 positions; display-only.</p> <p>Pay type description: Alphanumeric, 30 positions; display-only.</p>
Pay plan code	<p>The payment plan code and description associated with the pay type on this order.</p> <p>Payment plan codes are defined in and validated against the Flexible Payment Options table. See Working with Flexible Payment Options (WFPO).</p> <p>Pay plan code: Alphanumeric, 5 positions; display-only.</p> <p>Pay plan description: Alphanumeric, 40 positions; display-only.</p>
Suppress deposit	<p>Indicates whether the system will include this invoice payment method when you run Processing Auto Deposits (SDEP).</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = The system will not attempt to deposit this payment method. <i>Unselected</i> = This payment method will be included when you process deposits. <p>The system determines how to set this flag based on the setting of the Suppress deposit flag at the Display Order Pay Type Screen (1 of 2). This field can be <i>selected</i> if:</p> <ul style="list-style-type: none"> you create the order through the <i>Generic Order Interface (Order API)</i>; see <i>Suppressing Deposits and Refunds</i> in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for an overview. this is a ship-for-pickup order, and the Payment at POS for Ship for Pickup Orders (L60) system control value is selected. See that system control value for background. <p>For more information see</p> <p>Only credit card payment methods can have this flag <i>selected</i>.</p> <p>This flag is <i>selected</i> only for the first time that you bill against the payment method; afterward, the system resets the flag for the payment method to <i>Unselected</i>.</p> <p>Once you bill this payment method, the system resets this flag to <i>Unselected</i>.</p>

Field	Description
Suppress refund	<p>Indicates whether the system will ever generate a refund for this payment method.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = The system will never generate a refund to the customer for this payment method; instead, any refund will be created in a cancel pending status, and canceled when you process refunds. In addition, if the return disposition code assigned to the return matches the return disposition code defined in the Return Disposition Code to Exclude in ORCE Sales Feed (M22) system control value, the system excludes the return (credit) invoice from the Customer Engagement Sales Feed and does not generate a return confirmation for the return. <i>unselected</i> = Refunds will be created if appropriate based on normal processing. <p>This flag can be <i>selected</i> if:</p> <ul style="list-style-type: none"> you create the order through the Generic Order Interface (Order API); see Suppressing Deposits and Refunds for an overview. this is a ship-for-pickup order, and the Payment at POS for Ship for Pickup Orders (L60) system control value is selected. See that system control value for background. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Additionally, this flag can be changed when you create a return through the Inbound Return API; see Suppressing Refunds in the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for an overview for an overview.</p>
# days for deferral	<p>The number of days the payment is deferred. This field is used with deferred payment plans only.</p> <p>Numeric, 3 positions; display-only.</p>
Fix date for deferral	<p>The day of the month when payment for this order is due. This field is used with deferred payment plans only.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
# of installments	<p>The number of installments for this order. This field is used with installment payment plans only.</p> <p>Numeric, 2 positions; display-only.</p>
Installment interval	<p>The amount of days between each installment. This field is used with installment payment plans only.</p> <p>Numeric, 3 positions; display-only.</p>
Fixed installment date	<p>The day of the month when each installment is due. This field is used with installment payment plans only.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Expiration date	<p>The date when this payment plan expires.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Display Authorization History Screen

Purpose: Use this screen to review the authorization transactions that occurred for the customer's credit card.

Creating authorization history for orders authorized on the web: Order Administration creates an authorization history record with a status of *A Approved* for an order that received

an approved credit card authorization on the web storefront if an *auth_number* and *auth_amount* are defined for the credit card payment.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

How to display this screen: Select *Display authorization history* for a payment method at the [Display Order Payment Methods Screen](#).

For more information: See [Display Order Payment Methods Screen](#) for a description of the fields at the top of this screen.

Field	Description
Currency code	The currency of the Authorization amount and Deposit amount. Displayed only if you use the <i>Alternate Currency</i> option to toggle between displaying the Authorization amount and Deposit amount in the local currency and alternate currency. This option is available only if the Multi Currency by Offer (E03) system control value is <i>selected</i> . Alphanumeric, 3 positions; display-only.
Sts (Status)	The status of the authorization as updated by the system. Valid values are: <ul style="list-style-type: none"> • blank = Not sent yet • S = Sent, but not received • A = Authorized • D = Declined • E = Expired; updated to this status by Pick Slip Generation only • O = Authorized, but not used • M = Mismatch Auth/Deposit (created for authorizations during deposits) Alphanumeric, 1 position; display-only.
Auth amt (Authorized amount)	The amount the service bureau authorized to be charged on the credit card. You can toggle between viewing the authorization amount in the local currency and the alternate currency by selecting <i>Alternate Currency</i> if the Multi Currency by Offer (E03) system control value is <i>selected</i> and the order is associated with an alternate currency. Numeric, 20 positions with a 2-place decimal; display-only.
Auth# (Authorization number)	A number for the authorization transaction assigned by the authorization service. Alphanumeric, 16 positions; display-only.
Auth date (Authorization date)	The date the authorization service approved the amount to be charged. Numeric, 6 positions (in user date format); display-only.
Send date	The date you transmitted the authorization to the authorization service. Numeric, 6 positions; display-only.

Field	Description
Deposit amt (Deposit amount)	The amount deposited to the bank for the charge. You can toggle between viewing the deposit amount in the local currency and the alternate currency by selecting <i>Alternate Currency</i> if the Multi Currency by Offer (E03) system control value is <i>selected</i> and the order is associated with an alternate currency. Numeric, 20 positions with a 2-place decimal; display-only.
Response 1	A code representing the response of the authorization service. The vendor response code is from the Vendor response 1 field in the Authorization History table. Alphanumeric, 10 positions; display-only.

Screen Option	Procedure
Display details	Select <i>Details</i> for an authorization to advance to the Authorization History Details Window .
Work with card authorization reversals	Select <i>Auth Reversals</i> for a pay category 2 <i>Credit Card</i> payment method to advance to the Display Authorization Reversals Screen .
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>For all other payment methods, the screen displays an error message: Option not valid for this pay type.</p> </div>
Toggle between displaying the Authorization amount and Deposit amount in the local currency and the alternate currency	Select <i>Alternate Currency</i> . The system toggles the Authorization amount and Deposit amount between the local currency and alternate currency. Additionally, when viewing the amounts in the alternate currency, the Currency code field displays in the upper right corner of the screen indicating the currency of the alternate amounts. This option is available only if the Multi Currency by Offer (E03) system control value is <i>selected</i> .

Authorization History Details Window

Purpose: Use this pop-up window to review the history of an authorization, such as the vendor response code and when the authorization was submitted and deposited.

How to display this screen: Select *Details* for an authorization at the [Display Authorization History Screen](#).

Field	Description
Vendor response	A code representing the response of the authorization service. See Defining Vendor Response Codes for more information on vendor responses. Alphanumeric, 10 positions; display-only.
Vendor response description (unlabeled field)	The description of the vendor response code. Alphanumeric, two 30-position fields; display-only.
Vendor response 2	A code representing the credit card security response (CID, CVV2, CVC2) for the credit card authorization. If a card security value and card security presence were not provided for the credit card, this field is blank. The card security response code is from the Vendor response 2 field in the Authorization History table. Alphanumeric, 10 positions; display-only.
Vendor response 2 description (unlabeled field)	The description of the vendor response code used for card security identification. Alphanumeric, two 30-position fields; display-only.
AVS response	A code representing the address verification response for the credit card authorization if AVS is used. If AVS is not used, this field is blank. The AVS response code is from the AVS response field in the Authorization History table. Alphanumeric, 10 positions; display-only.
AVS response description (unlabeled field)	The description of the AVS response code. Alphanumeric, two 40-position fields; display-only.
Auth # (Authorization number)	A number assigned by the authorization service for the authorization transaction. Alphanumeric, 16 positions; display-only.
Status (unlabeled field to the right of the Auth #)	A description of the status of the authorization as updated by the system. Possible statuses are: <ul style="list-style-type: none"> • Sent for authorization • Authorized • Not yet sent • Declined • Expired • Authorized but not used • Mismatch Auth/Deposit (created for authorizations during deposits) • Voided
Auth date (Authorization date)	The date the authorization service approved the amount to be charged. Numeric, 6 positions (in user date format); display-only.

Field	Description
Auth expires (Authorization expires)	<p>The date the authorization expires.</p> <p>The system uses the following calculation to determine if an authorization has expired: <code>authorization date (from Authorization History table) + reauthorization days (from Pay Type table) = authorization expiration date</code>.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Auth time Authorization time	<p>The time when the credit card payment was authorized. The system uses this time to determine if the authorization is eligible for reversal. Also, this information is used through the REAUTH process. Information will be provided by Oracle at a later date.</p> <p>Numeric, 6 positions (HH:MM:SS format); display-only.</p>
Amount submitted	<p>The amount submitted for authorization and approved by the credit card authorization service.</p> <p>You can toggle between viewing the amount submitted in the local currency and the alternate currency by selecting <i>Alt Currency</i> if the Multi Currency by Offer (E03) system control value is <i>selected</i> and the order is associated with an alternate currency.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Amount available	<p>The amount remaining that requires authorization.</p> <p>You can toggle between viewing the amount available in the local currency and the alternate currency by selecting <i>Alt Currency</i> if the Multi Currency by Offer (E03) system control value is <i>selected</i> and the order is associated with an alternate currency. Numeric, 20 positions with a 2-place decimal; display-only.</p>
Amount deposited	<p>The total amount deposited.</p> <p>You can toggle between viewing the amount available in the local currency and the alternate currency by selecting <i>Alt Currency</i> if the Multi Currency by Offer (E03) system control value is <i>selected</i> and the order is associated with an alternate currency.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Auth request ID	<p>The transaction ID, or reference number, associated with the authorization transaction for the credit card payment.</p> <p>Alphanumeric, 40 positions; display-only.</p>

Screen Option	Procedure
Toggle between displaying the Amount submitted, Amount available, and the Amount deposited in the local currency and the alternate currency	Select <i>Alt Currency</i> . The system toggles the Amount submitted, Amount available, and the Amount deposited between the local currency and alternate currency. Additionally, when viewing the amounts in the alternate currency, the Currency code field displays in the upper right corner of the screen indicating the currency of the alternate amounts.

Display Authorization Reversals Screen

Purpose: Use this screen to review authorization reversals applied against a card payment.

This screen is helpful in determining if the authorization reversal was approved or declined:

- Approved authorization reversals have a Response and Approval date and time.
- Declined authorization reversals have a Response, but a blank Approval date and time.

The system processes an authorization reversal against a card payment when a cancellation amount is applied against the card or the card is deactivated and an open, unused authorization amount exists. Authorization reversals allow you to reimburse the card the amount that was initially charged against the card so the customer can use the amount to pay for future purchases. Information will be provided by Oracle at a later date.

Note:

- This screen is available for stored value card and credit card payment methods only.
 - Stored value card payments have a Pay category of Credit Card and a Card type of Stored Value.
 - Credit card payments have a Pay category of Credit Card and a Card type of Credit.

If you try to advance to this screen for any other pay type, an error message indicates: Option not valid for this pay type.

How to display this screen: Select *Auth Reversals* for an authorization history record related to a stored value card or credit card at the [Display Authorization History Screen](#).

Field	Description
Order #	The order number containing the card payment method. Numeric, 8 positions; display-only.
Pay type	A description of the card payment method. Alphanumeric, 30 positions; display-only.
Card Number	The number assigned to the card payment method. <i>Masking:</i> This number displays in the format specified at the Card Number Layout Screen for the associated pay type. For example, *****1443 may display instead of the entire number. See Card Number Format for an overview. Alphanumeric, 20 positions; display-only.
Exp date	The date when the card expires. Numeric, 4 positions (MMDD format); display-only.

Field	Description
Seq #	The authorization history sequence number associated with the card authorization reversal. Numeric, 3 positions; display-only.
Auth amount	The original authorization amount applied against the card. Numeric, 20 positions with a 2-place decimal; display-only.
Auth date	The date the card was originally authorized. Numeric, 6 positions (in user date format); display-only.
Create date	The date the authorization reversal was created against the card payment. This is the date when a cancellation was processed against the card payment or when the card was deactivated. Numeric, 6 positions (in user date format); display-only.
Create time	The time the authorization reversal was created against the card payment. Numeric, 6 positions (HH:MM:SS format); display-only.
Approval date	The date when the authorization reversal was approved by the service bureau. Numeric, 6 positions (in user date format); display-only.
Approval time	The time when the authorization reversal was approved by the service bureau. Numeric, 6 positions (HH:MM:SS format); display-only.
Reversal amount	The authorization amount to reimburse to the card. Numeric, 20 positions with a 2-place decimal; display-only.
Response	The response received from the service bureau, indicating if the authorization reversal was approved or declined.

 **Note:**

The response received from the service bureau does not display in this field unless it is set up as a vendor response for the service bureau in Work with Authorization Services (WASV).

Alphanumeric, 40 positions; display-only.

Screen Option	Procedure
Toggle between displaying the Authorization amount and Reversal amount in the local currency and the alternate currency	Select <i>Toggle Alternate Currency</i> . The system toggles the Authorization amount and Reversal amount between the local currency and alternate currency. Additionally, when viewing the amounts in the alternate currency, the Currency code field displays in the upper right corner of the screen indicating the currency of the alternate amounts.

Display Additional Charges Screen

Purpose: Use this screen to review the miscellaneous charges and credits that were added to the order through Order Entry or Order Maintenance.

How to display this screen: Select *Charges* at the [Order Inquiry Header Screen](#) or the [Order Inquiry Detail Screen](#).

Field	Description
Order #	The number assigned by the system to identify this order. Numeric, 8 positions; display-only, assigned by the system.
Ship to number (Unlabeled field to the right of the Order number field)	A number to identify the shipping address on the order. Numeric, 3 positions; display-only, assigned by the system.
Sold to (Sold-to customer name)	The name of the sold-to customer. Alphanumeric, 40 positions; display-only.
Ship to (Ship-to customer name)	The name of the ship-to customer. Alphanumeric, 40 positions; display-only.
Code	A value that represents the additional charges code. Additional charges are defined in and validated against the Additional Charge Code table. See Establishing Additional Charge Codes (WADC) . Alphanumeric, 2 positions; display-only.
Description	The description of the additional charge code. Alphanumeric, 30 positions; display-only.
Amount	The amount of the additional charge. A negative amount identifies an additional charge credit. Additional charges are billed through the billing function. You can limit the total amount of negative additional charges applied to an order by entering a value in the Negative Additional Charge Limit (E49) system control value. You cannot override this value unless you have authority to the Override Negative Additional Charge Limit (A60) secured feature. Numeric, 13 positions with a 2-place decimal; display-only.
Billed	Indicates whether or not the additional charge has been billed yet. If it has been billed, you cannot modify the charge. Values are: <ul style="list-style-type: none"> <i>Selected</i> = The additional charge has been billed. <i>Unselected</i> = The additional charge has not been billed.
Invoice	The number assigned to uniquely identify the invoice. Numeric, 7 positions; display-only.
Inv date (Invoice date)	The date the invoice was billed. Alphanumeric, 6 positions (in user date format); display-only.

Field	Description
Entered by	The user name of the person who entered the additional charge. In the case of a membership order, this is the user ID of the person who submitted the membership generation job through Generating Membership Orders (EGMO) . See the <i>entered_by_user</i> field for information on how this field is populated through the order API (e-commerce order). For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). Alphanumeric, 12 positions; display-only.
Date	The date the additional charge was entered. Numeric, 6 positions (in user date format); display-only.
System generated	Determines whether the additional charge was generated by the system or was manually entered. Valid values are: <ul style="list-style-type: none"> <i>Selected</i> = This additional charge was generated by the system. <i>Unselected</i> = This additional charge was manually entered.
Maintained by	The user name of the person who made any changes to the additional charge. Alphanumeric, 12 positions; display-only.
Date	The date the additional charge was changed. Numeric, 6 positions (in user date format); display-only.

Display Refunds for Order Screen

Purpose: Use this screen to review refund activity for an order.

How to display this screen: Select *Refunds* at the [Order Inquiry Header Screen](#) or the [Order Inquiry Detail Screen](#).

Field	Description
Pay type	A code that identifies the payment type associated with the refund. Pay types are defined in and validated against the Pay Type table, and must fall into one of the valid pay categories (cash/check or credit card). See Working with Pay Types (WPAY) . Numeric, 2 positions; display-only.
Sts (Status)	A code that identifies the current status of the refund. Valid values include: <ul style="list-style-type: none"> <i>C</i> = Canceled <i>H</i> = Held <i>N</i> = Cancellation pending; the refund will be canceled when refunds are processed <i>O</i> = Open <i>P</i> = Processed <i>T</i> = Written off <i>W</i> = Write-off pending; the refund will be written off when write-offs are processed Alphanumeric, 1 position; display-only.

Field	Description
Dp (Deposit)	<p>Indicates whether the refund has been deposited.</p> <p>A deferred or installment payment plan can prevent the system from depositing a refund in order to offset the deferred or installment amount. For example, if the order payment amount of 60.00 is deferred for 30 days and the customer receives a refund for 20.00, instead of refunding the customer 20.00, the system subtracts the refund amount from the order payment amount. The customer will then pay 40.00 at the end of the 30 days.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = The refund has been deposited (there is a Deposit created date for the Invoice Payment Method). • <i>Unselected</i> = The refund has not been deposited.
Current category	<p>A code that identifies the current pay category associated with the refund.</p> <p>Valid categories are:</p> <ul style="list-style-type: none"> • <i>Cash/check</i> • <i>Credit card</i> <p>Display-only.</p>
Original category	<p>A code that identifies the original pay category associated with the refund.</p> <p>Valid categories are:</p> <ul style="list-style-type: none"> • <i>Cash/check</i> • <i>Credit card</i> <p>Display-only.</p>
Amount	<p>The amount you are refunding to the customer. This is the amount that has actually been deposited.</p> <p>This amount can be different from the amount of the original refund if the credit was netted against a debit deposit.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Date created	<p>The date the refund was generated.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Date processed	<p>The date, if any, when the refund was processed, written off, or canceled.</p> <p>If the pay type on the order is a credit card, this date represents the deposit date, and might be either the actual deposit date or the future release date if the deposit has not yet been processed.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Man hld (Manual hold)	<p>Indicates whether the amount of the refund exceeds the maximum refund amount specified in the Pay Type or if you placed the refund on hold manually through the Work with Refunds Screen. To issue the refund, you must first release it from hold using the Work with Refunds function.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = The refund is on manual hold. • <i>Unselected</i> = The refund is not on manual hold.
Hold until (Hold until date)	<p>The date when the refund is eligible for processing.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Display Order Summary Screen

Purpose: Use this option to review all items ordered, including items ordered for the current order plus any recipient orders. This screen lists each item ordered for each shipping address so you can verify or confirm the items ordered. You can also use this screen to view the order totals in the customer's currency.

Alternate currency order totals: The screen displays the order totals on this screen in the local currency. You can review the order totals in an alternate currency if the order is associated with an alternate currency.

How to display this screen: Select *Order Totals* at the [Order Inquiry Header Screen](#) or the [Order Inquiry Detail Screen](#).

Field	Description
Order #	The number of the order you are currently working with. Numeric, 9 positions; display-only, assigned by the system.
# Rcp (Number of recipients)	The number of recipients on this order. This is the number of shipping addresses on the order. Numeric, 3 positions; display-only, assigned by the system.
Prepaid	The total amount prepaid on this order using checks. Numeric, 20 positions with a 2-place decimal; display-only, calculated by the system.
Balance	The balance due on the order, calculated by subtracting the order total (current order plus all recipient orders) from the prepaid amount. If the balance is 0, this means that the customer prepaid the entire order. If the balance is negative, there is a balance due that will be charged to the customer. Numeric, 20 positions with a 2-place decimal; display-only, calculated by the system.
Current recip (Current recipient)	The ship-to number indicating the recipient you are currently working with. Numeric, 3 positions; display-only.
Merch (Merchandise)	The total value of merchandise on this order, which is calculated by multiplying the quantity ordered by the item's price. This amount does not include charges for freight (shipping), sales tax (except for hidden tax), or handling. Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.
Frt (Freight)	The total charge for shipping the current order plus any recipient orders. Shipping charges are based on the freight method defined for the source code used on the order. This amount does not include any additional shipping charges. This field is blank if no freight is charged on the order (Calc freight = N). Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.

Field	Description
Frt+ (Additional freight)	<p>The total additional freight charges on the current order plus any recipient orders.</p> <p>Additional freight charges can be defined for a shipper in the Ship Via table. For example, a shipper can charge a premium for overnight or Federal Express deliveries. See Working with Ship Via Codes (WVIA).</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Chg (Additional charges)	<p>The total extra charges added to the current order and any recipient orders.</p> <p>This can be an additional service charge defined for the source code or offer used on the order, an additional shipping charge for an item on the order, a guaranteed service charge defined for the offer, or any type of miscellaneous charge or credit added to the order.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Tax	<p>The total sales tax on the current order and any recipient orders, based on the merchandise value of the order and, optionally, freight and special handling. This total does not include hidden tax.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Hnd	<p>The total charge, on the current order and any recipient orders, for special handling or gift wrapping.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only, updated by the system.</p>
Total	<p>The grand total of all charges on the current order and any recipient orders. This includes merchandise, freight, additional freight, additional charges, tax, and handling.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Shp (Ship To number)	<p>The number of the shipping address on the order.</p> <p>Numeric, 3 positions; display-only, assigned by the system.</p>
Name	<p>The initial and last name or company name of the customer the order is shipping to. The customer or company name only displays next to the first detail line for each customer.</p> <p>Alphanumeric, 10 positions; display-only.</p>
Ln#	<p>The line number of this item on the order.</p> <p>Numeric, 3 positions; display-only.</p>
Qty (Quantity)	<p>The number of units ordered of the item.</p> <p>Numeric, 5 positions; display-only.</p>
Item	<p>A code for a unit of inventory that you sell.</p> <p>Enter a valid item to display items that match your entry.</p> <p>Alphanumeric, 12 positions; display-only.</p>
SKU	<p>The style of the item, such as its color or size.</p> <p>Alphanumeric, three 4-position fields.</p>

Field	Description
Via	A code for the carrier or service that will deliver the order. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA) . Numeric, 2 positions; display-only.
Price	The selling price of a single unit of this item. The system calculates the price by taking into account any price breaks, source or order discounts, and using the pricing hierarchy in the System Control table. Numeric, 13 positions with a 2 place decimal; display-only, calculated by the system.
Whs (Warehouse)	A code for the warehouse this item will ship from. Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS) . Numeric, 3 positions; display-only.
SA (Ship alone code)	Identifies whether the item can ship with other items. Valid values are: <ul style="list-style-type: none"> • <i>S</i> = Ship alone; item cannot be shipped with other items. A pick slip prints for each unit ordered. • <i>M</i> = Multi-ship; item can ship with other items. • <i>L</i> = Picks print in location code sequence. • <i>U</i> = User-defined. This information is taken from the Ship alone field in the Item table. Alphanumeric, 1 position; display-only.
Item description (Unlabeled field below the Shp field)	The description of the item being ordered. Alphanumeric, 120 positions; display-only.
SKU description (Unlabeled field below the SKU field)	The description of the SKU for the item. Alphanumeric, 25 positions; display-only.
Extended price (Unlabeled field below the Whs field)	The total charge for this item, which is calculated by multiplying the price of the item by the quantity ordered. Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.

Screen Option	Procedure
Accept the order information for the recipient you are currently working with and switch to another recipient	Select <i>recipient and accept current</i> for a recipient. You can select this option only during order entry. A message displays if you select <i>Select recipient and accept current</i> for a recipient during order maintenance/inquiry: Subfile option (1) is not valid for current processing mode (Display).

Screen Option	Procedure
Copy an item to the recipient you are currently work with	Select <i>Copy item to current recipient</i> for a recipient. You can select this option only during order entry. A message displays if you Select <i>Copy item to current recipient</i> for a recipient during order maintenance/inquiry: Subfile option (3) is not valid for current processing mode (Display).
Display the order totals at the top of the screen in the customer's currency or in the system currency (from the Local Currency Code (A55) system control value).	Select <i>Foreign Currency</i> . See Displaying Order Totals in Foreign Currency .
Review the items selected to copy	Select <i>Items Selected</i> . You can select this option only during order entry.
Accept the order information for the recipient you are currently working with and advance to the Select Order Recipient screen	Select <i>Accept/Switch Recipient</i> . You can select this option only during order entry.

Displaying Order Totals in Foreign Currency

Purpose: Use this function to convert, then display the order totals in the customer's currency.

Using this feature: Select *Foreign Currency* at the [Display Order Summary Screen](#) to convert the order totals to the customer's currency.

About currency conversion: When you select *Foreign Currency*, the system gets the country code for the sold-to customer (the customer who placed the order), then checks the Currency table (fast path = *WCUR*).

If a currency code has been defined for this country, the system multiplies each order total bucket by the conversion rate, and displays the order totals in the customer's own currency. This way, the order total is more meaningful to the customer.

! Important:

The figures on this screen will not be correct if the [Multi Currency by Offer \(E03\)](#) system control value is *selected*; in this case, the figures displayed at the other standard order inquiry screen, and in order entry and order maintenance, are already in the customer's currency.

Example: The customer calls from Italy to inquire on the charges and items on an order. You select *Order Summary* to review the order totals.

Next, you select *Foreign Currency* to display the totals expressed in the customer's own currency. The system performs the currency conversion immediately, using the current conversion rate from the Currency table, and updates the order totals appropriately.

If no Currency is Defined for the Country

The system issues a message if there is no currency defined for the customer's country in the Currency table, and you will not be able to view the order totals in the customer's currency when you select *System Currency Display*:

No currency match found for country XXX.

- The value in the Total field is the sum of all other order totals fields (Merch, Frt, Frt+, Chg, Tax, and Hnd); no conversion is performed on this field.
- Currency values extending beyond 2 decimal places are rounded up or down to the nearest integer value, such as a dollar value.
- The country code and the currency code must be the same for order totals conversion.
- The order totals are converted using the current currency rate. This means that the order totals you see on this screen may be different from the order totals at shipping time.
- Selecting *System Currency Display* toggles between displaying the order totals in the customer's (foreign) currency or in the system currency.

Reviewing Order-Level Properties

Purpose: In addition to reviewing detailed information, you can use Order Inquiry to review information that pertains to the overall order, including:

- Conditions that affect the order, such as ship complete, gift order, etc.
- History of order transactions
- Messages added to the order during Order Entry, Order Maintenance, or Order Inquiry

For more information: See [Display Order History Screen](#) for a discussion of the *Order History* option that is also available from the Order Inquiry screens, and see [Work with Order Messages Screen](#) for a discussion of working with or reviewing order messages.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including some of the order-level properties fields.

Display Order Properties Screen

Purpose: Use this screen to obtain additional information about the order. This screen displays extra fields that do not appear on the header screen. Also, this screen identifies the representative or operator who took the order and the time when the order was accepted on the system.

How to display this screen: Select *Properties* at the [Order Inquiry Header Screen](#) or [Order Inquiry Detail Screen](#).

Field	Description
Batch #	The system-assigned number for a group of orders. Orders you receive through the order API are assigned to the Default Batch for E-Commerce Orders in Error (G41) if they are in error; similarly, retail pickup or delivery orders that are in error are assigned to the Order Broker Error Batch Number (K90) . The system removes the batch number when you accept the batch if the order is error-free. Numeric, 5 positions; display-only.
Entered by	The user ID of the person or process who entered the order; otherwise, your default user. Alphanumeric, 10 positions; display-only.
Time	The time of day the order was originally entered. Numeric, 6 positions (HH:MM:SS format); display-only.
Order #	A unique number assigned by the system to identify an order. The order ship-to number is separated from the order number by a hyphen. Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only.
Alt ord	The order number, if any, that was passed through the <i>Generic Order Interface (Order API)</i> and used to identify the order in an external system. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). In the case of a retail pickup or delivery order assigned through the Order Orchestration Integration , this is the order number in the system originating the order. If the originating system is Order Administration, the system prefaces the originating order number with the text ORIG#: . For example: ORIG#: 9999-001, where ORIG#: indicates the order originated in Order Administration, 9999 is the original order number in Order Administration, and 001 is the ship to number. See Retail Pickup (including Ship-for-Pickup) or Delivery Orders for more information. Created in order entry: If the Alternate Order Number Prefix for Order Creation (M76) system control value specifies a prefix and the order was created in Classic View or Modern View order entry or through Generate Customer Membership Orders (EGMO), this is the specified prefix followed by the order number. The order number is zero-filled, for example, ABC00000123, where ABC is the prefix code and 123 is the order number. Alphanumeric, 35 positions; display-only.
Sold to name	The name of the customer who placed the order, including the company name, if any. Alphanumeric, 41 positions; display-only.

Field	Description
Mbr ID (Membership ID)	<p>The code identifying the membership program that generated the order. Customers can purchase memberships in order to generate orders for selected items on a periodic basis. Blank if the order was not generated through a membership program.</p> <p>The sequence number to the right of the membership ID uniquely identifies the orders generated for the same customer and membership program at the same time. For example, a customer creates a customer membership to receive coffee at his home address, and another to send coffee to a different recipient, both through the same membership program. When you generate the membership orders, the generation program assigns a sequence number of <i>001</i> to the first order and a sequence number of <i>002</i> to the second order. The sequence number is <i>00</i> if the order was not generated through a membership program.</p> <p>See Membership Overview for background on membership programs, customer memberships, and membership order generation.</p> <p>Mbr ID: alphanumeric, 12 positions; display-only. Sequence number: numeric, 3 positions; display-only.</p>
Ship to name	<p>The name of the customer to receive the order, including the company name, if any. In the case of a retail pickup or ship-for-pickup order, this is the name of the store location where the customer picks up the order; see the Order Orchestration Integration for an overview.</p> <p>Alphanumeric, 41 positions; display-only.</p>
Source code	<p>The source code from the order header. Source codes are unique codes used to identify segments of your customer base or a rented list. Each source code is assigned to one offer and one division. Source codes control the freight and pricing method used on an order.</p> <p>Alphanumeric, 7 positions; display-only.</p>
Weight	<p>The total shipping weight of the items on the order, excluding soldout, cancelled, and returned items.</p> <p>Numeric, 20 positions with a 3-place decimal; display-only.</p>
Gift	<p>If this field is selected, this is a gift order, which means:</p> <ol style="list-style-type: none"> 1. item prices do not print on the pick slip. 2. the system generates a gift acknowledgment to notify the sold-to customer who placed the order that the order has shipped.
Ship via	<p>A code for the shipper. A different ship via may also exist at the item level.</p> <p>Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA).</p> <p>Numeric, 2 positions; display-only.</p>
Ship via description (Unlabeled field to the right of the ship via field)	<p>The description of the shipper.</p> <p>Alphanumeric, 30 positions; display-only.</p>

Field	Description
Arrival date	The date the customer requests to receive the order. The arrival date defaults to the order date, but you can override this default. Numeric, 6 positions (in user date format); display-only.
Order date	The processing date for the order. Defaults to the current date, but you can override it to date-stamp orders you received on an earlier date but did not enter. However, if you change the order date to a date which falls within a closed accounting period, the following error message indicates: Order date falls within the closed accounting period. The order date determines which orders the system reserves first, if using Batch Reservation or running the Evaluate Backorders program. Numeric, 6 positions (in user date format); display-only.
Enter date	The date when the order was created. Numeric, 6 positions (in user date format); display-only.
Ship complete	Determines whether all the items on an order must ship together. Valid values are: <ul style="list-style-type: none">• <i>Selected</i> = Ship all items on the order in one shipment; delay performing pick slip preparation and printing pick slips until all items are available in the requested quantities.• <i>Unselected</i> = (default): Ship the items on the order as soon as they are reserved.
Quote Origin	If this field is selected, the order originated from a pre-order quote. See Entering Pre-Order Quotes for an overview and the required setup.
B/O priority (Backorder priority)	A code that determines the priority for order fulfillment on a backordered item. A value defaults to this field if you entered a priority in the B/O priority (Backorder priority) field for the source code; in this case, the header-level value defaults to the Priority field on the order detail line. Priority codes range from 0-9, where: 0 = Low priority. 9 = High priority. Numeric, 1 position; display-only.
Cancel BO (Cancel backorder)	Identifies whether to automatically cancel items that are unavailable (backordered) with the first shipment on the order. Valid values are: <ul style="list-style-type: none">• <i>Selected</i> = Cancel backordered items with first shipment.• <i>Unselected</i> = (default): Do not cancel backordered items. If this field is <i>selected</i> , any unshipped line on an order is canceled during billing using the Auto Soldout Cancel Reason (C20) , provided this system control value specifies a valid cancel reason code.

Field	Description
Freight override	<p>Indicates the amount of a freight override, if you entered an override amount for the order.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>If a freight override exists, the system does not apply any additional freight, item charges, weight charges, or service charges to the order.</p> </div>
Calculate freight	<p>Numeric, 13 positions with a 2-place decimal; display-only.</p> <p>Indicates whether the system will calculate and add freight charges to the order.</p> <ul style="list-style-type: none"> • <i>Selected</i> = Freight will be calculated. • <i>Unselected</i> = Freight will not be calculated; the freight method for the source is ignored. <p>To change this setting for the order, use the Calculate freight field at the Work with Order Screen.</p>
Freight tax override	<p>The tax override amount on freight for the order ship to.</p> <p>If defined, the system does not calculate tax on freight. Used only if a freight override amount is defined.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>You can define a tax override amount on freight only on orders received through the <i>Generic Order Interface (Order API)</i>.</p> </div>
Freight tax rate unlabeled field next to Freight tax override	<p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Selected for orders received from Order Orchestration. See Tax on Freight (B14) for a discussion.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p> <p>The tax rate for the freight tax override. The system uses the following calculation to determine the freight tax rate:</p> $\left(\frac{\text{freight override amount}}{\text{freight tax override}}\right) \times 100 = \text{freight tax rate}$ <p><i>Example:</i> If the freight override amount is 6.00 and the freight tax override amount is 3.00, the freight tax rate is 50.00.</p> <p>The system uses the freight tax rate during return and cancellation processing when calculating the amount of tax on freight that should be returned or deducted during cancellation. See Tax on Freight (B14) for a discussion of how the freight tax rate is determined for orders received from Order Orchestration.</p> <p>Numeric, 13 positions with a 2-place decimal; display-only.</p>

Field	Description
Carrier #	<p>The number of the customer's account with the carrier. When a number is present in this field, the customer doesn't pay for shipment of orders via the carrier. Instead, the carrier receives the bill for shipment.</p> <p>Alphanumeric, 10 positions; display-only.</p>
Purchase order	<p>The purchase order number under which the order was placed. From the <code>ref_transaction_no</code> if the order is a retail pickup or delivery order received from Order Orchestration. See Building the Retail Pickup (including Ship-for-Pickup) or Delivery Order for more information.</p> <p>Alphanumeric, 15 positions; display-only.</p>
Tax code	<p>The code and description of the tax status on the order.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>T = Standard tax.</i> The customer is subject to all applicable state sales tax on merchandise. • <i>N = Non taxable.</i> The customer is not taxed on purchases. • <i>R = Resale:</i> The customer purchases goods for resale, and is, therefore, exempt from tax. A valid resale number must exist in the customer record or be entered during Order Entry. • <i>E = Exempt.</i> The customer is a school, or charity, and, therefore, is exempt from tax. A valid tax exempt number must exist in the customer record or be entered during Order Entry. • <i>G = GST only.</i> The customer is subject to the Canadian Goods and Services Tax (GST) because the order is shipping to a Canadian province. • <i>P = PST only.</i> The customer is subject to the Canadian Provincial Services Tax (PST), but exempt from the GST. <p>See Working with Customer Tax Status for more information.</p>
Tax identification	<p>The customer's tax identification number, typically the resale or exempt certificate number assigned to a customer who is identified as tax exempt (<i>E</i>) or as a reseller (<i>R</i>); otherwise, the tax identification number does not control taxability. Any combination of letters, numbers, or special characters is accepted.</p> <p>Alphanumeric, 30 positions.</p>
Master label (Master carton label)	<p>Indicates whether the system prints a master pick slip for this order. The master pick slip displays the sold to customer's name and address and the order totals across all ship to customers on the order.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = The system prints a master pick slip for this order. • <i>Unselected</i> = The system does not print a master pick slip for this order. <p>See Performing Pick Slip Generation, for more information on printing a master pick slip for an order.</p>
Cancel date	<p>The date the customer wants the order canceled if it has not been shipped. The order is not canceled automatically, but is listed on the Order Cancellation List. You can cancel the order manually or contact the customer to extend the deadline.</p> <p>Numeric, 6 positions (in user date format); display-only.</p>

Field	Description
IP address	<p>The ip_addr, if any, in the <i>Inbound Order XML Message (CWORDERIN)</i> for an order received through the generic order API.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p><i>IP address validation:</i> If the IP address received was invalid, the system writes an Order Transaction History message such as INVALID IP ADDRESS: 1.2.3 where 1.2.3 represents the invalid IP address received, and does not update this field. The IP address is made up of a series of four numbers separated by three periods (for example, 192.168.255.255). Each number between the periods must be from 1 to 255. The IP address must:</p> <ul style="list-style-type: none">• not include any non-numeric characters besides the periods• not include any blank spaces• start with and end with a numeral• include all three periods• include all four numbers, each from 1 to 255 <p><i>Fraud checking:</i> If the IP address received matches an entry in the Miscellaneous Fraud table, the system puts the order on <i>IP</i> (IP address) hold and writes a message reading SYS HLD---IP ADDRESS HOLD to the Order Transaction History table. See Working with Miscellaneous Frauds (WMFF) for more information on IP addresses and fraud checking.</p> <p>Alphanumeric, 15 positions; display-only.</p>
Warehouse	<p>A code that identifies the warehouse from which merchandise on the order ships. A value appears in this field only if it was entered during order entry or order maintenance or was passed through the Order Orchestration Integration for a retail pickup or delivery order. The warehouse description is to the right.</p> <p>Warehouse code: numeric, 3 positions; display-only. Warehouse description: alphanumeric, 30 positions; display-only.</p>

Field	Description
Broker delivery type	<p>Indicates whether the order is being fulfilled through the Order Orchestration Integration. Possible settings are:</p> <ul style="list-style-type: none"> • <i>Retail Pickup</i> = The order originated in an external system and Order Administration ships the order to the originating retail store location, where the customer picks it up • <i>Delivery</i> = The order originated in an external system, and Order Administration ships the order directly to the customer • <i>Ship for Pickup</i> = The order originated in Order Administration, and Order Administration ships the order to a designated retail store location, where the customer picks it up • <i>Store Pickup</i> = The order originated in Order Administration, and the customer picks up the order in a designated retail store location where the inventory is currently available

 **Note:**

If the order includes any brokered backorder lines (in which Order Administration assigns backordered items to Order Orchestration for fulfillment), this is not indicated here.

See the [Order Orchestration Integration](#) for an overview.

Sales Rep Store	<p>The store number assigned to the order.</p> <p>Store numbers are defined in and validated against the Store Cross Reference table; see Work with Store Cross Reference (WSCR).</p>
------------------------	---

 **Note:**

The store number defined here does not have to be associated with the salesrep from the Order Header.

Included in CWEmailOut: If the order is not fulfilled through the Order Orchestration integration, the *OriginatingStore* element in the *Outbound Email XML Message (CWEmailOut)* specifies the sales rep store and the description and address information from its Store Cross Reference record. See the *OriginatingStore* element for more information.

Alphanumeric, 10 positions; display-only.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Display Order Line History Screen

Purpose: Use this option to review any type of activity that has occurred since this item was entered.

The system logs all item history automatically for inquiry purposes, including order line activity received through the *Order Line History In API*, and displays this information on the Display Order Line History screen.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including a pop-up window whose contents include order line history.

How to display this screen: Select *History* for an item at the [Order Inquiry Detail Screen](#) or at the Work with Order Lines screen in order entry.

Field	Description
Order #	A unique number to identify an order. Numeric, 9 positions; display-only, assigned by the system.
Ship to number (unlabeled field)	A hyphen (-) separates this field from the Order# field. Indicates the number of shipping addresses for the order. The system assigns a ship-to suffix of 1 to a single recipient order. Numeric, 3 positions; display-only, assigned by the system.
Line #	The detail line number of this item on the order. Numeric, 3 positions; display-only.
Item	A code for a unit of inventory. Item codes are defined in and validated against the Item table. See Performing Initial Item Entry (MITM) . Alphanumeric, 12 positions; display-only.
SKU (Stock keeping unit; unlabeled fields to the right of the item number)	The item's special characteristics, such as its size or color. SKUs are defined in and validated against the SKU table. Alphanumeric, three 4-position fields; display-only.

Field	Description
Activity	<p data-bbox="675 275 1458 365">Indicates the type of update performed for the order line. Order line activity codes are defined in the Order Line Activity table; see Working with Order Line Activity Codes (WOLA).</p> <p data-bbox="675 375 1192 403"><i>System Delivered Order Line Activity Codes</i> are:</p> <ul data-bbox="675 415 1458 1312" style="list-style-type: none"><li data-bbox="675 415 1458 499">• <i>Add (A)</i>: Includes adding an order line through an maintenance or exchange, or through a system process, such as Process Item Substitutions (PSUB). The quantity added is listed.<li data-bbox="675 510 1458 646">• <i>Cancel (C)</i>: A quantity of the item on the order line is cancelled during order maintenance or through a system process, such as Process Item Substitutions (PSUB). This includes canceling using a cancel reason code not flagged to reduce demand. The quantity canceled is displayed as a negative number.<li data-bbox="675 657 1458 684">• <i>Change (G)</i>: Changes to the order line, including:<li data-bbox="675 695 1458 743">• increasing the quantity. An increase in quantity is displayed as a positive number.<li data-bbox="675 753 1458 947">• decreasing the quantity when the cancel reason code used had the Reduce demand flag selected, regardless of whether you used the Cancel or Change option. A canceled quantity is displayed as a negative number, and the cancel reason code is listed. Canceling a partial quantity with a cancel reason code that had the Reduce demand flag unselected creates an <i>Item Partially Cancelled</i> entry, described below.<li data-bbox="675 957 1458 1041">• changing the price or other information for the order line. When the change does not affect the quantity, no quantity is displayed.<li data-bbox="675 1052 1458 1100">• <i>Discount (D)</i>: A discount was applied to the order line after shipment. The quantity of the item discounted is displayed.<li data-bbox="675 1110 1458 1194">• <i>Exchange (E)</i>: The exchanged quantity is displayed as a positive number. The exchange reason code description is also displayed.<li data-bbox="675 1205 1458 1253">• <i>Express Bill (B)</i>: The quantity express billed and the ID of the user who started the async jobs are indicated.<li data-bbox="675 1264 1458 1312">• <i>Item Hold (J)</i>: The order line was put on hold. The open quantity on the line when it is held is displayed.

Field	Description
	<ul style="list-style-type: none"> <li data-bbox="675 275 1458 472">• <i>Item Partially Cancelled</i> (#): A partial quantity was canceled, either through the Cancel option or through the Change option, if the cancel reason code's Reduce demand flag was unselected. A partial cancel can also occur when a partial quantity of the line was shipped, and then the remaining quantity or the entire order was canceled. The quantity canceled is displayed as a negative number, and the cancel reason code is also listed. <div data-bbox="878 510 1458 737" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; margin: 10px 0;"> <p data-bbox="911 548 1032 579"> Note:</p> <p data-bbox="959 606 1422 716">If the cancel reason code had the Reduce demand flag selected, the activity is listed as a Change rather than as Item Partially Cancelled.</p> </div> <ul style="list-style-type: none"> <li data-bbox="675 779 1458 863">• <i>Item Partially Shipped</i> (P): A partial quantity of the item was shipped. The quantity shipped and the ID of the user who started the async jobs are indicated. <li data-bbox="675 869 1458 953">• <i>Item Released from Hold</i> (+): The line was released from held status. The quantity on the order line when it was released is indicated. <li data-bbox="675 959 1458 1186">• <i>Item Unreserved</i> (9): The item was unreserved through Work with Void/Reprint Picks, Interactive Reservation, or the PickIn message. This message is also written when you create a store pickup order through the order API or through Modern View order entry. When the line is unreserved through the PickIn message, the default user ID is displayed. This record is not created through the Void Pick Batch option. The unreserved quantity is displayed as a negative number. <li data-bbox="675 1192 1458 1333">• <i>Order Line Message Added</i> (8): An order line message was added. The order line quantity when the order line message was added is displayed. A single order line history entry is created each time you accept your entries, regardless of whether you create a single order line message or multiple message lines. <li data-bbox="675 1339 1458 1367">• <i>Return</i> (R): Displays the quantity returned as a negative number. <li data-bbox="675 1373 1458 1430">• <i>Shipment</i> (S): Displays the quantity shipped. Also, the user ID displayed is for the user who started the async jobs. <li data-bbox="675 1436 1458 1633">• <i>Sold Out</i> (O): When an item sells out automatically in order entry or creation, the quantity displayed is a positive number. If the item was sold out through Sell Out, the quantity is negative and the name of the user who sold out the item is listed. When an item sells out through Process Auto Soldouts, the quantity displayed is negative; also, in this case, the user ID displayed is for the user who submitted Process Auto Soldouts. <p data-bbox="675 1640 1089 1667">Display-only, updated by the system.</p>
Date	<p data-bbox="675 1682 1097 1709">The date when this activity occurred.</p> <p data-bbox="675 1715 1458 1768">Numeric, 6 positions (in user date format); display-only, updated by the system.</p>

Field	Description
Quantity	<p>The quantity of the item affected by this activity. For example, 3- indicates that three units of the item were canceled. Activities that do not affect the order quantity, such as changing the pricing of the order line, do not display a quantity here.</p> <p>This quantity is displayed differently depending on how the item was sold out; see Processing Auto Soldout Cancellations (MASO). Also, see each individual Activity, above, for more information.</p> <p>Numeric, 5 positions; display-only, updated by the system.</p>
Exc reason (Exchange reason code)	<p>Represents a reason for the customer to exchange one item for another.</p> <p>Exchange reasons are defined in and validated against the Exchange Reasons table; see Establishing Exchange Reason Codes (WEXR).</p> <p>Numeric, 3 positions; display-only.</p>
Can reason (Cancel reason code)	<p>The reason for canceling the units or reducing the quantity. A cancel reason code is not stored for soldout cancellations, whether you sell out the item by selecting <i>Sold-out</i> in order entry or order maintenance, or through Processing Auto Soldout Cancellations (MASO); however, the <i>Auto Soldout Cancel Reason (C20)</i> is displayed here if a backordered line was canceled at billing because the <i>Canc B/O (Automatically cancel backorders)</i> flag for the order was selected.</p> <p>Cancel reason codes are defined in and validated against the Cancel Reason table; see Establishing Cancel Reason Codes (WCNR).</p> <p>Numeric, 2 positions; display-only.</p>
Rtn reason (Return reason code)	<p>Represents a reason for the customer to return an item.</p> <p>Return reasons are defined in and validated against the Return Reason table; see Establishing Return Reason Codes (WRTR).</p> <p>Numeric, 3 positions; display-only.</p>
Add reason (Add reason code)	<p>Represents a reason for adding an item to the order. The system requires an add reason code if:</p> <ul style="list-style-type: none"> the Require Reason for Lines Added in Order Maintenance (D75) system control value is <i>selected</i>, or the Required reason code field for the item offer or SKU offer is <i>selected</i>. <p>Add reason codes are defined in and validated against the Add Reason table; see Establishing Add Reason Codes (WADR).</p> <p>Alphanumeric, 5 positions; display-only.</p>
User	<p>The user ID of the person who performed this activity. Your default user ID defaults for some activities. In most cases, the ID of the user who maintained the order is displayed; however, activities that show the ID of the user who started the async jobs are indicated in the description of the Activity, above.</p> <p>The user ID does not display if you sell out an item through Processing Auto Soldout Cancellations (MASO) rather than order entry or order maintenance.</p> <p>Alphanumeric, 10 positions; display-only, updated by the system.</p>

Display Order History Screen

Purpose: Use this option to review any type of activity that occurred since the order was entered, including order activity received through the *Generic Order Transaction History API*. The system logs all order history automatically for inquiry purposes, including when the order was:

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- Authorized, reauthorized, or declined
- Canceled
- Held
- Maintained
- Released
- Logged as a sale (when the invoice was generated)
- Shipped
- Sold out

The system records these activities against the order on the Display Order History screen. The system can record up to 999 transactions for each order. This information remains on the system for inquiry purposes until the order is purged.

Subscriptions: The system also records order history for each subscription generation. This occurs when you are [Generating the Subscription Extract Table \(WGSE\)](#) for items identified as subscriptions (if the Subscription field for the Item is *selected*). For example, six entries would be logged to the Order History for a 6-month subscription, reflecting each time another issue of the subscription item is included in the Subscription Extract file.

Information captured: The system captures the following information on the Display Order History screen:

- Date and time of activity
- Type of activity
- Transaction note
- Amount
- User ID

Tracking packages: Use the *Package Info* option to advance to the [Display Package Information Screen](#), where you can review shipment tracking numbers and, depending on the ship via, advance to the shipper's web site to review tracking history. The *Package Info* option is available if you have received any tracking numbers related to shipments on the order.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including a pop-up window displaying order history.

Special characters? If there are any special characters in the Order Transaction History message, the system replaces the first special character, excluding any underscores, with a space when you advance to this screen.

How to display this screen: Select *Order History* at the:

- [Work with Order Lines Screen](#) in order maintenance
- [Order Inquiry Header Screen](#) or [Order Inquiry Detail Screen](#)

Field	Description
Order #	A unique number to identify an order. Numeric, 9 positions; display-only, assigned by the system.
Sold to (Sold to customer name)	The name of the customer who placed the order. Last name The customer's last name. Alphanumeric, 25 positions; display-only. First name The customer's first name. Alphanumeric, 15 positions; display-only. Initial The initial of the customer's middle name. Alphanumeric, 1 position; display-only.
Ship to (Ship to customer name)	The name of the customer to receive the order. These fields are blank if the Sold To Customer receives the order. Last name The customer's last name. Alphanumeric, 25 positions; display-only. First name The customer's first name. Alphanumeric, 15 positions; display-only. Initial The initial of the customer's middle name. Alphanumeric, 1 position; display-only.
Date	The date when the order activity occurred. Numeric, 6 positions (in user date format); display-only, updated by the system.

Field	Description
Type	<p>A code for a type of update against the order. The OTH_TRANSACTION_TYPE code in the ORDER_TRANSACTION_HISTORY table is indicated in parentheses. Valid values are described below. Related Transaction Notes are also described if they add additional information. If an Amount is specified for the entry, it is mentioned below as well; otherwise, the Amount is blank.</p> <ul style="list-style-type: none">• <i>Assignment Updated</i> (T) = Workflow task assignment creation or update. Examples of Transaction Notes include Task Created/Resolved, or the rule applied.• <i>Auth</i> (A) = Manual authorization applied for credit card or other activity, such as an authorization reversal. The Transaction Notes provide further details, for example: MANUAL AUTH# DETECTED - ABC1234. The letter A is displayed as the transaction Type. The amount authorized is listed in the Amount field.• <i>BO Cards</i> (K) = Backorder card evaluation and update to the Order Detail record. The Transaction Note provides further details, for example: 1st B/O-line 2, ship date 18/11/19. See Purchase Order Layering and Backorder Notifications for an overview.• <i>Call Tag</i> = Call tag printed. This option is not currently implemented.• <i>Cancel</i> (C) = A customer membership was canceled. The Transaction Note indicates the membership that was canceled, for example: Membership MEMB01 cancelled.• <i>D/S PO</i> (D) = Drop ship purchase order generated. The Transaction Note indicates the purchase order number generated, for example: DROP SHIP PO# 0000102 CREATED.• <i>Hold</i> (H) = Hold applied through order maintenance or as a result of credit checking. The Transaction Note indicates the hold reason, for example: SYS HLD---SYSTEM HOLD MISC FRAUD.

Field	Description
	<ul style="list-style-type: none"> • <i>Letter</i> (L) = Notification (card, email, or <i>Outbound Email XML Message (CWEmailOut)</i>) generated for the customer or vendor related to the order. The Transaction Note provides information on the notification type and customer address, for example: Ord Conf to e.johnson@example.com. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Narvar notices: When you use the Narvar Integration, the <i>Letter</i> notification type for a shipment email can be:</p> <ul style="list-style-type: none"> • Order sent to Narvar: The Narvar Order Request Message was generated, even if the email address specified was the Narvar Non-Deliverable Email Address for Shipment Confirmations (M59). See that system control value for more information. • Failure sending order to Narvar: The Narvar Order Request Message could not be generated. For example, this message could mean that the Narvar Integration Setup was not correct. • Order not eligible to be sent to Narvar: This message can indicate: <ul style="list-style-type: none"> – f – This is a store pickup order. – This is a fulfilling order for an order assigned back from Order Orchestration if the Use OROB for Fulfillment Assignment (M31) system control value is selected. – This is a retail pickup order that is a fulfilling order for a ship-for-pickup order, and the merchandise was shipped to the store location for customer pickup. – The user ID and password specified for Narvar Service are not valid. See Work with Outbound Web Service Authentication Screen for more information. <p>For more information: See Narvar Troubleshooting.</p> <ul style="list-style-type: none"> • Registry order: A Letter (L) history record is also created when you create an order line for a registry item. • <i>Maint</i> (M) = Maintenance through Order Maintenance. The system also uses this code when it applies a prorated discount, when activity takes place related to the Order Orchestration Integration, when an order is released from hold through a screen, when an order is accepted in batch order entry, when an item is re-reserved, or when the arrival date on a line is updated through the Order Maintenance API. The Amount indicates the order total at the time of maintenance. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

 **Note:**

Starting with release 18.0, the system no longer creates Maintenance records for activity updates from Order Orchestration. See above for the individual records created when an order is accepted, shipped, picked, or picked up.

Field	Description
-------	-------------

 **Note:**

A separate Order Canceled record is created when an order is canceled in maintenance only if no items have shipped for the order.

- *Order Accepted (3)* = Store Accepted Order. Order Orchestration indicated that the fulfilling store location accepted the order or line. The line number is indicated in the Transaction Note.
- *Order Cancelled (X)* = Order Cancelled. The non-quote order was canceled before any items were shipped. A few things to note:
- This entry does not indicate whether the cancel reason used was flagged to update demand.
- The Amount indicates the total amount of the order including freight, regardless of whether the Recalculate freight option was selected at order cancellation.
- This entry is created separately for each ship-to on the order.
- A Maintenance record is also written in addition to the Order Canceled record.

Field	Description
	<ul style="list-style-type: none"> • <i>Order Message (7)</i> = Order Message Added. An order message was written for the order. • <i>Order Picked (4)</i> = Store Picked Order. Order Orchestration indicated that the assigned fulfilling location picked the order. • <i>Order Picked Up (6)</i> - Customer Picked Up Order. Order Orchestration indicated that the customer has picked up the order from the store location. The line number is indicated in the Transaction Note, for example: Ln#: 2 Customer Picked Up Order. • <i>Order Shipped (5)</i> = Store Shipped Order. Order Orchestration indicated that the fulfilling location shipped the order. The line number is indicated in the Transaction Note. • <i>Pick Gen Error (!)</i> = Problem Generating Pick. A stock allocation error occurred. The line number is indicated in the Transaction Note, for example: Problem Generating Pick - Order line 2. • <i>Pick Generated (P)</i> = Pick Gen. A pick slip was generated. This message is written when you use cart/bin picking. The Transaction Note indicates the pick control number, warehouse, and cart/bin, for example: Pk 212 Whs 1 Ct/Bn 111/108/2.

 **Note:**

Starting with release 18.0, the system no longer creates a Pick Gen (P) record when a stock allocation error occurs.

- *Price Override (W)* = Price override. The price of an item was overridden. The system does not write a price override history message here when it applies the [Default Price Override Reason \(B35\)](#). The Transaction Note indicates the order line updated; for example, User price override - Order line 1. The Amount indicates the unit price of the item after applying the override.
- *Quote Maintenance (@)* = Quote was maintained. The Amount indicates the order total when the quote was maintained.

 **Note:**

If the quote was canceled during maintenance, a maintenance (M) record is also created, indicating the cancel reason.

- *R/A Maintenance (*)* = A return authorization was created, received, or credited through Working with Return Authorizations. The Transaction Note indicates Order was maintained through R/A. The Amount is the refund amount.
- *Refund (F)* = Refund processed or changed. The Transaction Note indicates the type of update; for example, Refund has been released or CC Crd for inv#101 processed.
- *Release (R)* = The order was released from hold. The Transaction Note indicates the hold reason code and part of the user ID or process that released the order, for example: Order 131 released

Field	Description
	<p>from ER HOLD EK. When a user hold is released through the <i>Order Maintenance API</i>, the message indicates RELEASED FROM USER HOLD (API).</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

Field	Description
	<ul style="list-style-type: none"> • <i>ROL Error (2)</i> = The system did not print a pick slip for the specified order line because the Qty remaining or Qty printed in the Reserved Order Line table does not tie correctly to the Qty reserved or Qty printed in the Order Detail table. The system also prints the order line on the <i>Unmatched Reserved/Remaining Qty Report</i>. The Transaction Note indicates the line number; for example, Pick not printed Ln # 001 qty mismatch. The Amount is the extended price of the order line. <div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>Contact Center does not display the ROL Error under Order Activity.</p> </div> <ul style="list-style-type: none"> • <i>Rtn Auth (N)</i> = R/A Credit pending processing. A return or exchange was created for the order or an order line. The Amount indicates the total amount of the credit. • <i>Shipment (S)</i> = A shipment or credit bills. Multiple entries are written when a pick slip is confirmed and processes in billing. Sample Transaction Notes might be: <ul style="list-style-type: none"> • Pick slip confirmation: Pick# 212 Mtr 0.00 Wgt 0.00, Via 1 T#, Via 1 T#ABCD1234, and Pick# 0000212 Billed on Invoice# 000012. The shipment total is the Amount indicated for the entry related to the invoice creation; for example, Pick# 0000212 Billed on Invoice# 000012. • Express-billed shipment or return: EXPRESS BILLED ON INVOICE # 0000127. • <i>Sold Out (O)</i> = Item sold out automatically based on the value in the S/O field for the item, and a soldout notification generated. The Transaction Note indicates the line number, for example: S/O card generated-line 3. • <i>Subscription (B)</i> = An issue for the subscription was generated. The Transaction Note indicates the issue number and subscription code, for example: Issue# 002 sent for SUBSCRIPTION. • <i>System Update (Y)</i> = Can be written with the following Transaction Notes: <ul style="list-style-type: none"> – Suppress refund updated to on p/t 4 (no Amount indicated) – Award amt not redeemed-card number not found (Amount indicated) – Pick BO cancel failed - Invalid Reason (no Amount indicated; written when a backorder cancellation reason passed in the CWPickIn XML Message was not numeric) – Pick BO cancel reason was truncated (no Amount indicated; written when the backorder cancellation reason passed in the CWPickIn XML messages was a number longer than 2 positions) – Loyalty Award Redemption Failed! (loyalty award Amount indicated; written when communication fails after applying a loyalty award to an order, but before final order acceptance) – Total Prorated Order Level Discount (indicates the loyalty Award amount; written when a loyalty award is applied to the order)

Field	Description
	<ul style="list-style-type: none"><li data-bbox="553 275 1378 449">• <i>Unreserved (U)</i> = Interactive reservation. Indicates that an item was reserved or unreserved manually, such as through Working with Interactive Reservation (MIRV) or Reprinting and Voiding Pick Slips (WVRP or WSVP). The Transaction Note indicates the line number that was unreserved, for example: Order Line 1 unrsv'd w/BO qty of 1.<li data-bbox="553 457 1378 632">• <i>Upsell Promo (E)</i> = Promotion discount applied. The Transaction Notes indicate both the type of discount, and the promotion name and description, for example: Total Prorated Order Level Discount and 10%OFF - 10% OFF ORDER, where 10%OFF is the promotion name and 10% OFF ORDER is the promotion description. The Amount indicates the discount amount applied.<li data-bbox="553 640 1378 772">• <i>User Defined (Z)</i> = The order activity was received through the <i>Generic Order Transaction History API</i>. The Transaction Note and Amount are from the inbound message. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).<li data-bbox="553 781 1378 913">• <i>Void/Reprint (V)</i> = Pick ticket voided through Working with Interactive Reservation (MIRV) or Reprinting and Voiding Pick Slips (WVRP or WSVP). The Transaction Note indicates the original and new pick control number; for example, Pick 166 reprinted as pick 184. <p data-bbox="553 909 967 932">Display-only, updated by the system.</p>

Field	Description
Transaction note	<p>The description of the activity related to the transaction, such as:</p> <ul style="list-style-type: none">• Authorization• Flag for cancellation due to declined authorization• Backorder notification evaluation and Order Detail update• Backorder notice generated (for example. BO 1st Ntf for a first backorder notification)• Cancel• Cancel request for a drop ship item• Cancel confirm or reject for a drop ship item• Drop ship• Hold• Ln#: 2 Submitted To Broker (or other activity related to Order Orchestration; see Order Orchestration Integration for more information)• Ord Conf to ssmith@example.com (Order confirmation email or <i>Outbound Email XML Message (CWEmailOut)</i>) For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).• Order Line 1 Updated Arrival Date = the arrival date was updated through the <i>Order Maintenance API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).• Pk 1234567 Whs 1 Ct/Bn 12345/123/1 if you performed pick slip generation and the Use Cart/Bin Picking? (B38) system control value is selected and the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is unselected• Pk 1234567 Whs 1 Batch # 12345 if you performed pick slip generation and:<ul style="list-style-type: none">• the Use Cart/Bin Picking? (B38) system control value is unselected, or• the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected• Promotion (PROMO1) not applied• Maintenance

Field	Description
	<ul style="list-style-type: none"> • Release • RELEASED FROM USER HOLD (API) = A user hold was released through the <i>Order Maintenance API</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • Request ID: 12345 Under Review: N = Order Administration has send an order update message to Order Orchestration when an order including any brokered backorder items has changed from held to open. Order Administration sends these updates only if the Send Held Orders to OROB (M18) system control value is selected. If the order changed from open to held, the message indicates Under Review: Y. • Retrn conf (Return confirmation email or <i>Outbound Email XML Message (CWEmailOut)</i>) For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • Shipment • Ship conf (Shipment confirmation email or <i>Outbound Email XML Message (CWEmailOut)</i>) For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). • Shipment Confirmed for drop ship PO # XXXX. For confirmed shipment of a drop ship item, the transaction notes also include item code, meter charge, weight, ship via and description, and tracking number. • Sold out • Subscription generation • Pick not printed Ln # 001 qty mismatch • User price override - Order line 2 Note: • The line number in this message refers to the sequence number in the Order Detail table, which may differ from the current line number. • The system does not write a price override history message here when it applies the Default Price Override Reason (B35). <p>Alphanumeric, 40 positions; display-only, updated by the system.</p>
Amount	<p>The total order amount following the order activity, including merchandise, freight, tax, handling, etc.</p> <p>No amount is associated with issuing a subscription, as the system bills the customer for the entire amount of the subscription when billing the order.</p> <p>For an order cancellation (before any items have shipped), the dollar amount listed includes freight, regardless of whether the Recalculate freight option was selected at order cancellation.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>

Field	Description
User	<p>The user ID of the person who performed this activity against the order.</p> <ul style="list-style-type: none"> If the system performs the activity automatically, such as releasing prepaid orders on time hold, the user ID is the name of the person who started the ASYNC processing program (background jobs). If the activity took place through a system process or an API, the user ID indicates the process, API, or your default user. <i>EXTERNAL</i> defaults for order transaction history created through the <i>Generic Order Transaction History API</i>. <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Alphanumeric, 10 positions; display-only, updated by the system.</p>

Option	Procedure
Display the time when the order activity occurred	Select <i>Display Time</i> for an order activity to advance to a window that displays the <i>Transaction note</i> , <i>Date</i> , and time, in HH:MM:SS format, when the order activity occurred.
Track packages or display carton contents	<p>Select <i>Package Info</i> to advance to the <i>Display Package Information Screen</i>, where you can review shipment tracking numbers and, depending on the ship via, advance to the shipper's web site to review tracking history. The <i>Package Info</i> option is available if you have received tracking numbers or carton contents information through the <i>Generic Pick In API (Shipments, Voids, and Backorders)</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

Display Package Information Screen

Purpose: Use this screen to review shipment tracking information for an order. This information can come from the *Generic Pick In API (Shipments, Voids, and Backorders)* and from *Manually Confirming Shipments (MCON)*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Links to tracking page at shipper's web site: This screen displays the shipment tracking number for each shipment on the order. If shipment tracking is available on the shipper's web site, the shipment tracking number is also a live link to the shipper's shipment tracking web page, where you can review shipment history.

If using Narvar: If you are using the *Narvar Integration*, the *Tracking #* is a live link enabling you to track the shipment, provided:

- You have completed setup of the related system control values, including the *Narvar Track URL Prefix (M60)*.
- You have specified the *Narvar Carrier Name* for the ship via.

- You specified a tracking number when confirming the shipment.
- All other configuration was completed for Narvar, as described under [Narvar Integration Setup](#).
- After you enable Narvar, tracking number links that were created previously do not work automatically when you click on them at this screen.
- The tracking number link can still be available if all the above requirements are met, even if the customer did not receive a shipment confirmation when, for example, the customer has opted out of email communication.
- The tracking link is not supported for drop ship purchase orders or shipments made for originating orders through Order Orchestration integration. The tracking link is supported for drop ship picks, and for fulfilling orders received through Order Orchestration integration.
- If carton details were not provided for the tracking numbers, which is possible when you use the generic pick in API, it might not be possible to identify the order lines shipped with each tracking number.

Required for tracking: The [Narvar Track URL Prefix \(M60\)](#) is required for a valid tracking number link to be enabled in emails or on screens. If you are using the Narvar integration and submit an order request to Narvar while the tracking URL prefix is not defined, the Narvar.log file contains errors such as:

```
Shipment tracking is disable for company 123
```

```
Unable to construct shipment tracking URL for order 456
```

Where 123 is the company number and 456 is the order number.

Error displayed: Also, if the tracking URL is not defined, when you click on the tracking number link at the screens mentioned above, an error window indicates: `Tracking information not available. Check Narvar Order Error Export screen for failures.`

If not using Narvar: Otherwise, if you are not using the Narvar integration:

- *Supported ship via types:* Live links to shipment tracking web pages for shippers are available if the ship via type is:
 - UPS
 - Federal Express
 - Parcel Post (*not* Parcel Post Class 1, 2, 3, or 4)
- If the ship via type is anything other than UPS, Federal Express, or Parcel Post, you can still advance to the Display Tracking Numbers screen; however, the tracking number is not a live link.

See [Working with Ship Via Codes \(WVIA\)](#) for information on setting up ship vias, including how to specify the ship via type.

Carton contents: If you have received carton content information through the *Generic Pick In API (Shipments, Voids, and Backorders)*, a carton icon displays for the shipment. You can expand the carton icon for a shipment to display the items included in the carton.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

 **Note:**

When you use the generic Pick In API, the system does not verify that the reported carton contents match the information on the pick slip.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides a consolidated, one-page view of the order, including tracking numbers for shipped packages.

How to display this screen: Select *Track Packages* at the [Display Order History Screen](#). This option is available only if:

- there are one or more shipped items on the order, and
- you have entered a tracking number when using [Manually Confirming Shipments \(MCON\)](#), or
- you have processed a shipment through the generic Pick In API.

Field	Description
Scan date	<p>The date when the package was scanned for shipment, as reported through the <i>Generic Pick In API (Shipments, Voids, and Backorders)</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Numeric, 6 positions (in user date format); display-only.</p>
Scan time	<p>The time when the package was scanned for shipment, as reported by through manual confirmation or through the <i>Generic Pick In API (Shipments, Voids, and Backorders)</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Numeric, 6 positions (HH:MM:SS format); display-only.</p>
Tracking #	<p>The shipping tracking number, as reported through manual confirmation or through the <i>Generic Pick In API (Shipments, Voids, and Backorders)</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Live link? The tracking number is a live link if you use Narvar or if the ship via type is UPS, Federal Express, or Parcel Post (<i>not</i> Parcel Post Class 1, 2, 3, or 4). If the link is live, you can click it to advance to the shipper's web site and review shipment history.</p> <p>Alphanumeric, 30 positions; display-only.</p>

Field	Description
Ship via	The description of the shipper who delivers the package. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA) for more information.

 **Note:**

The description is truncated if it exceeds 30 positions.

Alphanumeric, 30 positions; display-only.

Carton icon: If you have received carton content information through the *Generic Pick In API (Shipments, Voids, and Backorders)*, a carton icon displays to the left of the scan date for the shipment. Open the carton by clicking it to display the items packed in the carton:

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- **Closed carton:**

- **Open carton:**

Carton contents: If you open the carton to display the carton contents, the additional fields are:

Field	Description
Items	The item or SKU reported as packed in the carton. The <i>Generic Pick In API (Shipments, Voids, and Backorders)</i> identifies a packed item or SKU as part of a shipment confirmation for a pick slip by specifying the pick control detail line. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).

 **Note:**

The system does not validate that all items that are confirmed as shipped are also reported as packed in a carton.

Item: 12 positions, alphanumeric; display-only.

SKU: three 4-position fields, alphanumeric; display-only.

Field	Description
Qty	The quantity of the item reported as packed in the carton. When you receive information through the Pick In API, the system does not validate whether the quantity reported as packed matches the quantity confirmed as shipped. Numeric, 5 positions; display-only.
Description	The description of the item and SKU. If the item has SKU's, the item and SKU descriptions are separated by a space. Item description: alphanumeric, 120 positions; display-only. SKU description: alphanumeric, 40 positions; display-only.

Performing Order Maintenance

In this part: These topics describe how to update an existing order on the system:

- [Introducing Order Maintenance](#) describes how to access Order Maintenance to update an existing order and lists the features and restrictions of this program.
- [Selecting an Order for Maintenance](#) describes how to identify the order you wish to update or how to locate a particular order from a scan of orders.
- [Work with Order Screen in Order Maintenance](#) lists the fields you can update on the Work With Order screen, describes the results of your updates, and identifies any conditions or restrictions for updating each field.
- [Changing Item Detail Line Information in Order Maintenance](#) lists the fields you can update on the Work With Order Line screen, describes the results of your updates, and identifies any conditions or restrictions for updating each field for a specific item on the order.
- [Adding an Item in Order Maintenance](#) describes how to add an item to an existing order or how to reopen a closed or canceled order when you add an item.
- [Increasing the Quantity Ordered in Order Maintenance](#) describes how to increase or decrease the number of units ordered of an item and describes how to account for the item cancellation when you reduce the quantity ordered.
- [Canceling an Item in Order Maintenance](#) describes how to cancel a single, unshipped order detail line on an existing order and describes how to account for the item cancellation from the order.
- [Canceling an Order through Order Maintenance](#) describes how to cancel an entire order and describes how to account for the item cancellations resulting from the order cancellation.
- [Returning and Exchanging Items in Order Maintenance](#) describes how to perform an item return or exchange by first creating a return authorization, receiving the merchandise return, and crediting the customer.
- [Enter Payment Methods Screen in Order Maintenance](#) describes how to add a payment method to the order to release it from hold or how to change or delete payment information already defined for the order.
- [Adding a Recipient Order in Order Maintenance](#) describes how to enter an additional order to an existing order that will ship to a different address.
- [Maintaining Quotes in Order Maintenance](#) describes the updates you can apply to a pre-order quote before converting it to a regular order.

- [Converting Quotes to Orders](#) describes how to convert a pre-order quote to a regular order and the updates that the system performs.
- [Order Line History In API](#) allows you to receive order line history from an external system.
- [Order Maintenance API](#) allows you to remove a user hold or update the arrival date for an order line.
- [Order Maintenance API](#) allows you to update the arrival date, remove a user hold, or both.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Introducing Order Maintenance

Purpose: Use the Order Maintenance function to update an existing order by:

- Changing customer, order, item, or payment information
- Adding a recipient order
- Adding a payment type
- Adding an item
- Canceling an item
- Canceling an order
- Returning an item
- Returning an order
- Exchanging a line
- Holding a line
- Releasing a line

Additionally, you can select this option to review order history.

You can maintain orders only if they have been accepted (and processed).

Quotes: You use the same order maintenance screens to maintain a quote. However, the system displays the screens for a quote in Review mode. See [Maintaining Quotes in Order Maintenance](#) for more information on maintaining quotes.

Pick slip preparation: When you advance to order maintenance, the system removes any pick slip preparation that may exist for the order; see [Removing Pick Slip Preparation from an Order](#).

In this topic:

- [Order Maintenance Features](#)
- [Order Maintenance Restrictions](#)
- [Order Maintenance Processing](#)
- [Secured Features Controlling Access to Order Maintenance](#)

Order Maintenance Features

Order Maintenance allows you to perform most Order Entry functions and offers these features:

- Uses a similar screen layout as Order Entry, and provides the function keys to cancel, return, review order history, etc.
- Enables you to accept or reject your changes to an order; if rejected, the system resets the order to the same condition prior to Order Maintenance
- User or user class security controls Order Maintenance access; see the [Order Maintenance Access \(A22\)](#) field in the Security table.
- Logs all order updates by date, time, maintenance activity, and user ID
- Lets you reopen a closed order by adding new items to the order
- Lets you perform a return on a shipped order line
- Lets you change the source code on the order only if the new source code uses the same freight and pricing methods as the original source code
- Prohibits more than one user from maintaining an order
- Lets you place an order on hold
- Automatically updates order status if the order becomes eligible for release or hold following maintenance
- Automatically generates a refund or credit if maintenance activity changes order totals appropriately
- Displays unresolved action messages for a customer
- Reprices items on the order if you use price table pricing (see [Changing Item Detail Line Information in Order Maintenance](#))
- Advances automatically to the [Work with Customer Profile Screen](#) if you need to obtain mandatory demographic information for a customer, if the [Prompt for Mandatory Demographics in Order Maintenance \(E60\)](#) system control value is selected.

Order Maintenance Restrictions

Order Maintenance does not:

- Display Promotional pricing pop-up windows
- Perform end-of-order repricing unless you use price table pricing; see [Changing Item Detail Line Information in Order Maintenance](#))
- Add free gifts (except through price tables; see [Changing Item Detail Line Information in Order Maintenance](#))
- Perform promotional pricing to add incentive items or discounts to the order unless you use customer price group pricing
- Let you cancel a quantity of an item if a pick slip has been printed (you must select the Void/Reprint Pick Slips option; see [Manually Confirming Shipments \(MCON\)](#)).
- Let you change an item detail line in any way if a pick slip has been printed (you must select the Void/Reprint Pick Slips option; see [Manually Confirming Shipments \(MCON\)](#)).
- Let you change an item detail line if shipments have been made against the line or if the line has been canceled
- Let you change a payment method if it has been charged
- Let you change a source code to a source code for a different offer

- Let you change the source code on the order or the item detail line if shipments have been made for the order
- Let you change the customer sold-to or ship-to number
- Let you release an order except by applying a payment (see [Releasing Held Orders](#))
- Let you maintain an order until the system has completed processing a return, exchange, cancellation or shipment (order is being billed). The system displays a message such as:

Order #xxx in use by RA/Billing.

For more information: See [Secured Features Controlling Access to Order Maintenance](#) for more information on the secured features that control order maintenance for different types of orders.

Order Maintenance Processing

In general, after you maintain an order the system:

- recalculates the order totals and adjusts demand totals (number of orders) appropriately
- performs credit checking to place the maintained order on hold, if the maintenance results in some type of hold condition
- submits the order for credit card authorization if you change or add credit card pay type information; this ensures that the new order total is authorized
- submits any newly eligible backordered lines to Order Orchestration for fulfillment; see [Brokered Backorders](#) for more information.
- submits an update message to Order Orchestration if you sell out or cancel an item on a retail pickup or delivery order; see [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information.
- captures the date, time, maintenance activity, and user ID in the Order Transaction History table to keep an on-line history of all order updates; see [Display Order History Screen](#).
- evaluates the order to determine if it qualifies for pick slip preparation; see [Preparing Orders for Pick Slip Generation](#) and [Applying Pick Slip Preparation to an Order](#).

Web Services Supporting Order Maintenance

Optionally, you can update orders through the following:

- *Order Maintenance API* enables you to release a user hold or update the arrival date for an order line.
- *Generic Pick In API (Shipments, Voids, and Backorders)* enables you to apply a user hold reason.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Secured Features Controlling Access to Order Maintenance

Overview: The following table lists the secured features that control access to maintenance or cancellation of orders, including those fulfilled through the [Order Orchestration Integration](#):

Secured Feature

Controls the Ability To:

[Order Maintenance Access \(A22\)](#)

maintain any order, subject to the additional secured features listed below

[Maintain Order with Printed Quantity \(J05\)](#)

maintain an order, including a ship-for-pickup order or a brokered backorder, with a printed quantity on any order line

 **Note:**

Does not control access to retail pickup or delivery orders or prevent you from canceling a store pickup order.

[Maintain Brokered Fulfillment Orders \(B20\)](#)

maintain a retail pickup or delivery order

 **Note:**

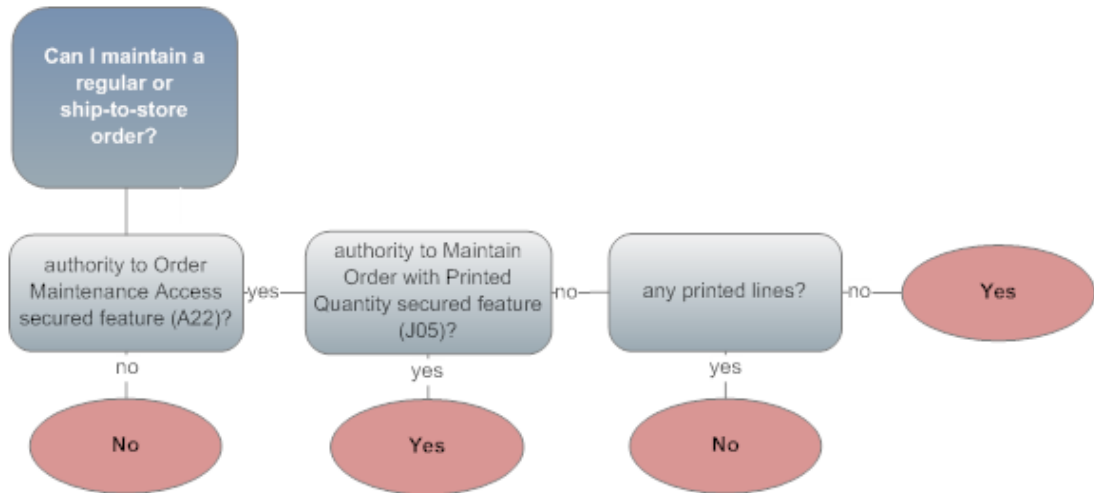

If you have authority, you can process a sellout or return, or add a payment method to a retail pickup or delivery order sent from Order Orchestration . However, you cannot perform any other updates to a retail pickup or delivery order regardless of your authority.

[Cancel Order Broker Lines \(B19\)](#)

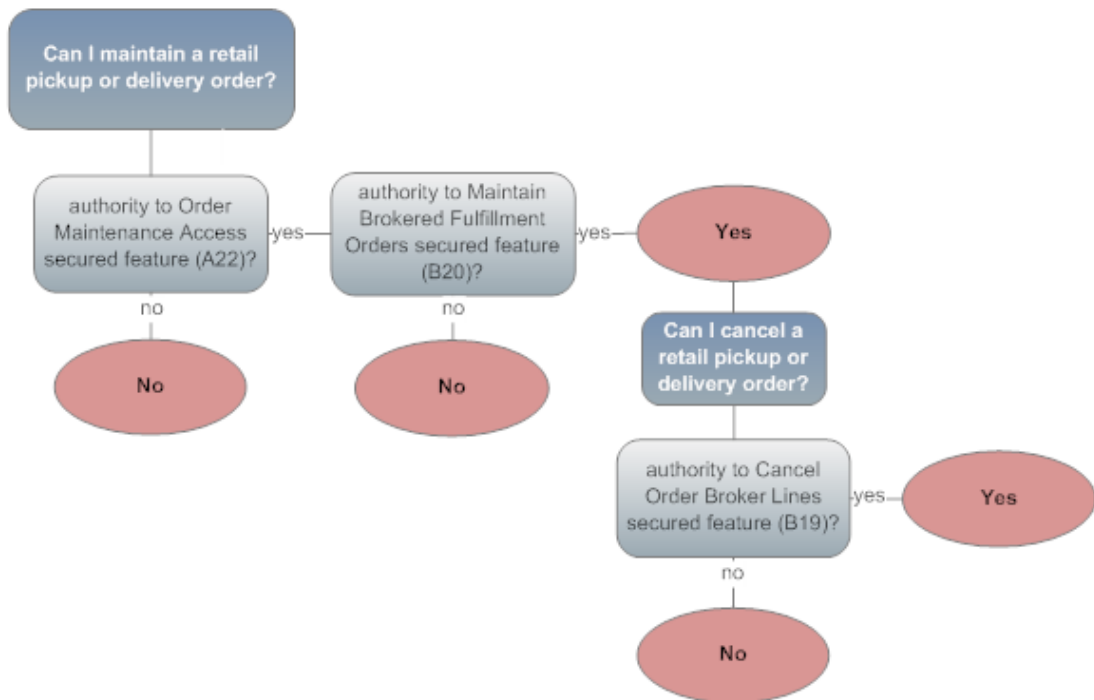

cancel a retail pickup, delivery, or store pickup order, or a brokered backorder

The authority required to maintain or cancel different orders based on whether they are fulfilled through the *Order Orchestration Integration* is illustrated in the following flow charts.

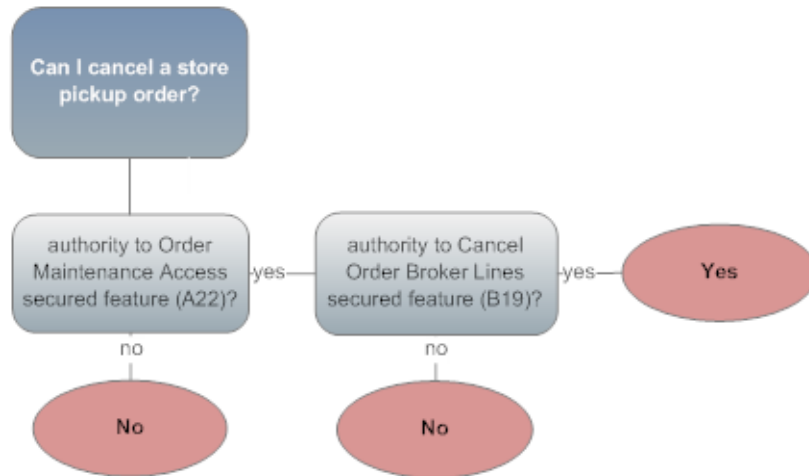

Maintaining a regular or ship-for-pickup order: The following chart summarizes the authority required to maintain a regular or ship-for-pickup order:

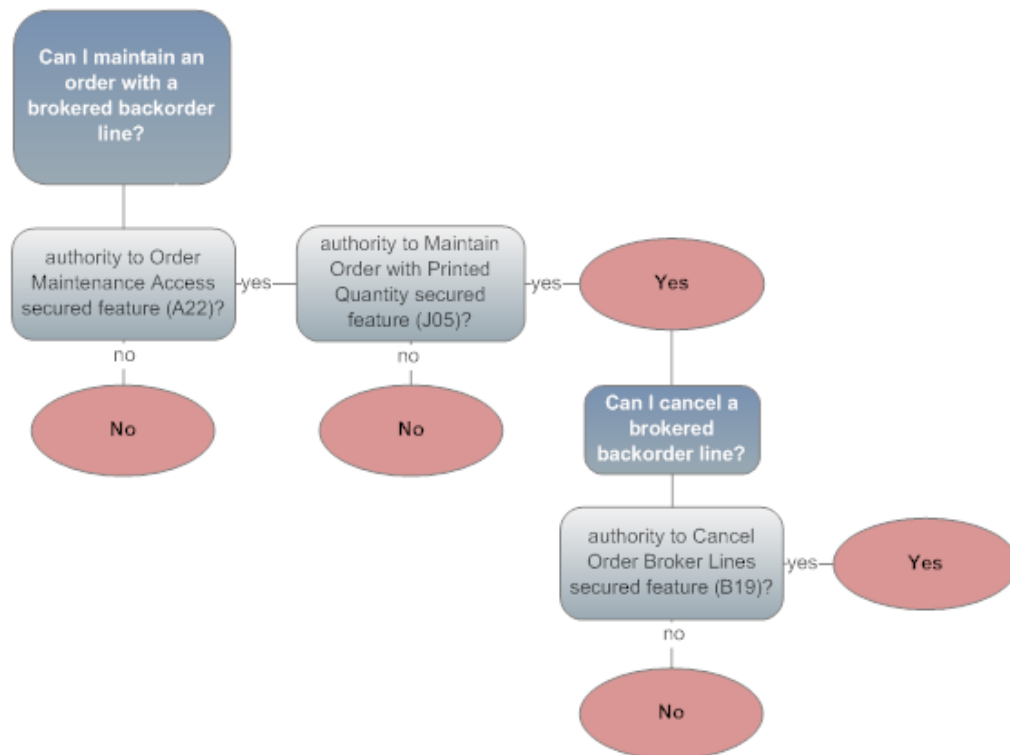

Maintaining a retail pickup or delivery order: The following chart summarizes the authority required to maintain or cancel a retail pickup or delivery order:

Canceling a store pickup order: The only possible maintenance of a store pickup order is to cancel it. The following chart summarizes the required authority.

Maintaining an order that includes any brokered backorder lines: The following chart summarizes the authority required to maintain an order that includes any brokered backorder lines:

For more information: See:

- [Setting Up Secured Features](#) for information on additional secured features that control specific options within order maintenance
- [Order Orchestration Integration](#)

Selecting an Order for Maintenance

Purpose: Use the Order Maintenance selection screen to find the order you wish to maintain, using information you have about either the order or the customer.

In this topic:

- [Order Maintenance Selection Screen](#)
 - [Cross-company Scanning](#)
- [Advancing from Customer and Order Scan Fields](#)
 - [Customer Scan Screens in Order Maintenance](#)
 - [Order Scan Screens in Order Maintenance](#)
 - [Customer Note Window](#)
 - [PayPal Warning Window](#)
 - [Warning: Order Locked Window](#)
 - [Maintaining Retail Pickup or Delivery Orders from Order Orchestration](#)
 - [Maintaining a Ship-for-Pickup Order](#)
 - [ChannelAdvisor Warning Window](#)

Order Maintenance Selection Screen

Purpose: Use this screen to find an order for maintenance, or to advance to additional scan screens where you can select the order.

Customer Workflow Management window: The [Customer Workflow Management Window](#) automatically displays when you first advance to the Order Maintenance selection screen if open or in use ticklers exist for the sold to customer on the order. Select [Ticklers](#) at this window to advance to the [Work with Ticklers Screen \(sold to customer view\)](#) where you can review and work with ticklers associated with the sold to customer.

How to display this screen: Enter *OEOM* in the Fast path field on any menu or select Order Entry/Order Maintenance from a menu; then select *Maintain Orders* at the [Default Values for Orders screen](#), the [Select Customer Sold To For Order Screen](#), or the [Customer Selection Screen](#).

Cross-company Scanning

If you are working within a company set up for cross-company scanning, you can scan for customers in any other company that has a similar setup in the Company table. See [Working with Companies \(WCMP\)](#) for more information on working with companies.

You can scan for customers across companies with the following fields:

- Postal code
- Match code
- Postal code, restricted by Company name
- Postal code, restricted by Customer name

When you scan on any of these fields, you advance to a subsequent customer scan screen displaying information, including the company code, for customers that match your entry. You cannot scan by Company name or Customer name alone; however, you can restrict your scan on Postal code by your entry in either field.

If you advance to Order Maintenance for a customer from a different company, all of the system control values from the new company will be in effect. When you exit the order, you will return to your default company.

Field descriptions: It is common to enter information in several fields when scanning for a specific order. For example, you might enter values in the Item, Order status, and Order date fields to review open orders entered prior to a certain date that contain a certain item.

Field	Description
Order scans	
Order #	<p>A combination of the order and ship-to record number. The system assigns a unique number to every order created through Order Entry.</p> <p>You advance directly to the Work with Order Screen in Order Maintenance if you enter a valid order number. The system, however, displays a message if you enter a nonexistent order number: Order Ship-to not found.</p> <p>Numeric, 8 positions; optional.</p>
Sold-to customer	<p>A system-assigned code that identifies the customer who placed the order. Use this field to advance to the Scan Orders by Customer screen. See Order Scan Screens in Order Maintenance.</p> <p>Ghost customers: If you enter the customer number of a ghost customer, the scan screen does not display any orders; this is because a merge/purge has assigned any orders using that customer number to the “target” customer. You can identify a ghost customer by the setting of the Ghost flag.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Even if you use the Customer Engagement Customer Integration, you do not use the Customer Scan Screen in order maintenance when searching for a customer; see the Customer scans for information on scanning based on customer information in order maintenance.</p> </div>
Recipient customer	<p>Numeric, 9 positions; optional.</p> <p>A system-assigned code that identifies the customer who receives the order. This number consists of the 9-digit sold-to customer number and the 3-digit ship-to suffix. Use this field to advance to the Scan Orders by Customer Ship To screen. See Order Scan Screens in Order Maintenance.</p> <p>Recipient customer number: numeric, 9 positions; optional.</p> <p>Recipient customer ship-to number: numeric, 3 positions; optional.</p>

Field	Description
Item/SKU	<p>A code representing a unit of inventory.</p> <p><i>SKU code</i> (separated from the item code by a slash): The item's unique characteristics, such as its size, color, and width.</p> <p>Use these fields to advance to the Scan Orders by Item screen. See Order Scan Screens in Order Maintenance.</p> <p>Item code: alphanumeric, 12 positions; optional (required if you also enter SKU information).</p> <p>SKU code: alphanumeric, three 4-position fields; optional).</p>
Order status	<p>Indicates the condition of the order on the system. The order status is open (active) unless the status field is set to one of the following values:</p> <ul style="list-style-type: none">• blank (all orders, including open; however, if you leave this field blank, you must also select another scan option)• Cancelled• Error• Held• Shipped• Purged• Quote• Suspended <p>Use this field to advance to the Scan Orders by Order Status screen. See Order Scan Screens in Order Maintenance.</p>
	<div data-bbox="857 1031 1378 1289"><p> Note:</p><p>Suspended or Error orders are not eligible for maintenance; use batch order entry to work with these orders. See Introducing Order Batches for more information.</p></div>
Order date	<p>Optional.</p> <p>The date that the order was entered on the system. Use this field to advance to the Scan Orders by Date screen. See Order Scan Screens in Order Maintenance.</p> <p>Numeric, 8 positions (in user date format); optional.</p>

Field	Description
Order cross ref #	<p>The order number, if any, that was passed through the <i>Generic Order Interface (Order API)</i> and used to identify the order in an external system. For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>This is the Alt ord displayed at the Display Order Properties Screen.</p> <p>In the case of a retail pickup or delivery order assigned through the Order Orchestration Integration, this is the order number in the system originating the order. If the originating system is Order Administration, the system prefaces the originating order number with the text <code>ORIG# :</code>. For example: <code>ORIG# : 9999-001</code>, where <code>ORIG# :</code> indicates the order originated in Order Administration, <code>9999</code> is the original order number in Order Administration, and <code>001</code> is the ship to number.</p> <p>Enter a full or partial order cross reference number to advance to the Scan by Order Cross Reference # screen.</p> <p>If you wish to review all retail pickup and delivery orders whose originating system is Order Administration, enter <code>ORIG# :</code> in the Order cross ref # field and select <i>OK</i> to advance to the Scan by Order Cross Reference # screen where all orders whose E-Commerce order number in the Order Header Extended table begin with <code>ORIG# :</code> display.</p> <p>See Order Scan Screens in Order Maintenance.</p> <p>Alphanumeric, 35 positions; optional.</p>

Field	Description
Alternate customer #	<p>The alternate customer number defined for the customer who placed the order. Alternate customer number is an additional number to identify the customer on the system, such as a customer number carried over from a system conversion.</p> <p>Enter an alternate customer number to advance to a subsequent scan screen that lists customers by alternate customer number. See Display Alternate Customer Cross Reference Window (I84) for more information.</p> <p>Alternate Customer Number Label Description The field label on this screen is based on the name you enter in the Alternate Customer Number Label Description (H95) system control value; if you do not enter a name in this system control value, the field label is Alt cust.</p> <p><i>Example:</i> If you enter the field label name <i>MEMBER#</i> in the system control value, the field label on this screen is <i>MEMBER#</i>.</p> <div data-bbox="857 768 1380 1056" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Scanning by the alternate customer number of a ghost customer is not currently implemented if the Display Alternate Customer Cross Reference Window (I84) system control value is <i>selected</i>.</p> </div>
Purchase order #	<p>Alphanumeric, 15 positions; optional.</p> <p>The customer's purchase order number. Use this field to advance to the Scan Orders by Purchase Order Number screen. See Order Scan Screens in Order Maintenance.</p>
Tracking #	<p>Alphanumeric, 15 positions; optional.</p> <p>The number assigned by the shipper to track the shipment. This number is stored in the Manifest Upload Audit table.</p> <p>Enter a full or partial tracking number to advance to the Scan by Tracking # screen. If your entry is an exact match to a tracking number for an order, you advance directly to the order. See Order Scan Screens in Order Maintenance.</p>
Customer scans	
Match code	<p>Alphanumeric, 30 positions; optional.</p> <p>A code the system assigns to each customer, based on elements of the customer's name and address. The system uses the match code to identify duplicate or fraud customers on the system. Use this field to advance to the Scan Orders by Match Code screen. See Order Scan Screens in Order Maintenance.</p> <p>You can scan for customers across companies with the match code field if cross-company scanning is set up. See Cross-company Scanning.</p> <p>Alphanumeric, 15 positions; optional.</p>

Field	Description
Postal code	<p>The postal or zip code for the customer's address. Enter a full or partial code to advance to the Scan Sold To by Postal Code/ Company screen. This screen lists all customers by postal code in ascending (lowest to highest) numeric sequence, beginning with the code you entered.</p> <p>If you enter a postal code, last name, and first name, you advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered.</p> <p>See Customer Scan Screens in Order Maintenance.</p> <p><i>Scan length:</i> The Postal Code Scan Length (F61) system control value controls how many characters of the postal code to use when searching for a customer. See that system control value for a discussion.</p> <p>You can scan for customers across companies with the postal code field if cross-company scanning is set up. See Cross-company Scanning.</p> <p>Alphanumeric, 10 positions; optional.</p>
Last name	<p>The sold-to customer's last name. Enter a full or partial name to advance to a Scan Cust Sold To By Last Name screen, which lists all customers alphabetically beginning with the name you entered. You can also include a full or partial first name along with a full (not partial) last name to restrict the scan further. See Customer Scan Screens in Order Maintenance.</p> <p>Alphanumeric, 25 positions; optional.</p>
First name	<p>The sold-to customer's first name.</p> <p>Enter the last name, first name, and postal code to advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered. You can also enter just the full (not partial) last name and full or partial first name to advance to the Scan Cust Sold To By Last Name screen. See Customer Scan Screens in Order Maintenance.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>First name must be used in conjunction with Postal code, Last name or with just Last name for scanning. You cannot scan on first name alone.</p> </div>
Company name	<p>Alphanumeric, 25 positions.</p> <p>The name of the company placing the order. Use this field to advance to the Scan Customer Sold To by Company Name screen. See Customer Scan Screens in Order Maintenance.</p> <p>Alphanumeric, 30 positions; optional.</p>

Field	Description
Phone number	<p>The customer's daytime, evening, or third (fax or mobile) telephone number. Use these fields to advance to the Scan Customer Sold To by Phone Number screen. Customer Scan Screens in Order Maintenance.</p> <p>You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY).</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Your entry should include any formatting specified by the telephone number format for the country; for example, if the telephone number format for the United States is (111) 111-111, your entry should include the parentheses and hyphen.</p> </div>
E-mail Address	<p>Alphanumeric, 14 positions; optional.</p> <p>An email address for the customer.</p> <p>When you enter a full or partial email address, you advance to the Scan Customer by E-mail Address screen, where you can scan by any email address on file for a customer. This field is not case sensitive; an email address of <i>abc@example.com</i> matches an entry of <i>ABC@EXAMPLE.COM</i>, and vice versa. See Customer Scan Screens in Order Maintenance.</p> <p>Alphanumeric, 50 positions; optional.</p>
Other scans	
Salesrep # (Sales representative number)	<p>A code that identifies a sales representative from your company who entered or obtained the order.</p> <p>Numeric, 7 positions; optional.</p>
Batch #	<p>A number that identifies a group of orders within an order batch.</p> <p>Use this field to advance to the Scan Orders by Batch Number screen. Order Scan Screens in Order Maintenance.</p> <p>Numeric, 5 positions; optional.</p>
Invoice #	<p>The number assigned by the system to the customer's bill. Use this field to advance directly to the Work with Order Screen in Order Maintenance.</p> <p>Numeric, 7 positions; optional.</p>
Country	<p>The code representing the customer's country. Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY).</p> <p>Use this field to advance to the Scan Customer Sold To by Country screen. See Customer Scan Screens in Order Maintenance.</p> <p>Alphanumeric, 3 positions; optional.</p>

Screen Option	Procedure
Enter orders	Select <i>Enter Orders</i> to advance to the order entry Select Customer Sold To For Order Screen .
Check item availability	Select <i>Item Availability</i> . See Inquiring into Item Availability (DIAV) .

Advancing from Customer and Order Scan Fields

Process: Depending on the field(s) you use for scanning at the [Order Maintenance Selection Screen](#), you advance to a subsequent customer or order scan screen.

You advance directly to the [Work with Order Screen in Order Maintenance](#) when you scan from the [Order #](#) or [Invoice #](#) fields, or from the [Tracking #](#) if your entry is an exact match.

Orders that are not eligible for maintenance: You cannot maintain an order if its status is *Suspended* or *Error*, if it is a canceled pre-order quote, or if it is a store pickup order:

- Use batch order entry to work with orders in *Suspended* or *Error* status. See [Introducing Order Batches](#) for more information.
- If you select a store pickup order, the only available option is to cancel the entire order, provided you have sufficient authority. See [Store Pickup Orders](#) for an overview, and see [Canceling a Store Pickup Order](#) for details.

Customer Scan Screens in Order Maintenance

Customer scan screens display a list of customers matching your search criteria from the [Order Maintenance Selection Screen](#). For example, if you entered a [Postal code](#) at the initial screen, you advance to a customer scan screen displaying customers sorted alphanumerically by postal code, starting with your entry. You can select a customer at customer scan screen in order to advance to an order scan screen.

Note:

Customer scan screens do not display ghost customers, identified by the setting of the [Ghost](#) flag. These are customers who were merged during a merge/purge process.

How to advance from a customer scan field: *Select* a record to advance to an [Order Scan Screens in Order Maintenance](#), where you can select an order for maintenance.

Order Scan Screens in Order Maintenance

Order scan screens display a list of orders matching the search criteria you entered at the [Order Maintenance Selection Screen](#). For example, if you entered an [Order cross ref #](#) at the initial screen, you advance to a scan screen displaying orders sorted alphanumerically by order cross reference number, starting with your entry.

Ghost customers: If you enter the customer number of a ghost customer, the scan screen does not display any orders; this is because a merge/purge has assigned any

orders using that customer number to the “target” customer. You can identify a ghost customer by the setting of the *Ghost* flag.

Choose an order by selecting *Select* for it. You advance to the *Work with Order Screen in Order Maintenance*.

Customer Note Window

A customer note pop-up window may open when you select an order for maintenance.

About this window: This window opens because of information you entered in a customer note for the sold-to customer on the order (*not* a recipient on the order). Specifically, you have entered a customer note that was flagged to display automatically when you select the customer for order entry or order maintenance.

Window contents: This window includes:

- *Sold-to customer*
- customer name or *Company name*
- customer note text

For more information:

- setting up a customer note type that will display automatically when you select a customer for order entry or maintenance: *Working with Customer Note Types (WNTY)*
- working with customer notes: *Edit Customer Notes Screen*

PayPal Warning Window

A PayPal Warning window opens when you select an order for maintenance that contains a pay type with *PPL* (PayPal) defined as the authorization service and deposit service.

This window indicates that you should not make any changes to the order that would increase the order total. When you generate a pick slip for an order that contains a PayPal payment, the system validates that the amount required to generate the pick slip does not exceed 115% or \$75.00 of the original authorization amount that was received from PayPal during web storefront processing.

Order contains a PayPal pay type. Activities that will increase the order total - adding a line, increasing a price, should not be performed.

Select *Exit* at this window to continue to order maintenance.

Warning: Order Locked Window

When a user is entering an order or selects an order for maintenance, or when a function is updating an order, Order Administration locks the order by entering the user’s login ID or the function name in the User field in the Order Header table. If the User field is not cleared afterward, the order remains locked. For example, an order might be locked because the user’s session ended unexpectedly.

- If the order is locked, the system displays the Warning: Order Locked window. This window indicates the name of the user or process using the order, based on the current entry in the User field in the Order Header table.

To unlock the order, use the *Unlocking a Stranded Order or Batch (MULO)* menu option.

Cannot Maintain Order Window

This window opens if you select to maintain an order that is in a suspended or error status or whose order type identifies the order as a canceled pre-order quote. In any of these situations, you cannot maintain the order.

See [Entering Pre-Order Quotes](#) and [Maintaining Quotes in Order Maintenance](#) for more information about pre-order quotes.

Maintaining Retail Pickup or Delivery Orders from Order Orchestration

If you have authority under the [Maintain Brokered Fulfillment Orders \(B20\)](#) secured feature, a window displays a warning message when you select an open or held delivery or retail pickup order for maintenance, indicating that maintenance options are limited.

Secured feature: If you do not have authority under the [Maintain Brokered Fulfillment Orders \(B20\)](#) secured feature, you cannot maintain a delivery or retail pickup order received from Order Orchestration.

Possible updates: You might need to maintain a retail pickup or delivery order to:

- Sell out an item that is no longer available: Order Administration sends a reject request to Order Orchestration. Order Orchestration then attempts to find another location to fulfill the order unless the order has already reached the Search retries maximum specified in Order Orchestration.
- Cancel an item that the customer no longer wants: Order Administration sends a cancel request to Order Orchestration, indicating that the order should not be fulfilled. Order Orchestration does not reassign a canceled order to another fulfilling location.

Caution: Certain updates are not appropriate for these orders, such as:

- changing payment information. When the system creates retail pickup or delivery orders, it uses the [Order Broker Payment Type \(K98\)](#). This is typically a “dummy” payment type if the order is fully paid in the originating retail location.
- changing the shipping address:
 - A retail pickup order ships to the originating store location, so you should update the shipping address only if the address for the originating store changes.
 - A delivery order ships to the customer. You should change the shipping address only after communicating with the originating location, so that the shipping address recorded for the order is consistent.

Returns: If the [Suppress Returns for Retail Pickup/Delivery \(L88\)](#) system control value is:

- selected, you cannot process a return against a retail pickup or delivery order or add a negative additional charge
- unselected, you can process a return against a retail pickup or delivery order; however, the [Order Broker Payment Type \(K98\)](#) is deactivated after shipment, so you would then need to enter a new payment method in order to process the related refund.

 **Note:**

Regardless of the setting of the *Suppress Returns for Retail Pickup/Delivery (L88)* system control value, you cannot enter a line with a negative quantity or apply a discount against a shipped order line on a retail pickup or delivery order.

Prohibited updates: Other updates are not allowed, such as:

- adding an item
- changing the ordered quantity

See the [Order Orchestration Integration](#) for background.

Maintaining a Ship-for-Pickup Order

If the *Payment at POS for Ship for Pickup Orders (L60)* system control value is selected and you are maintaining a ship-for-pickup order, you cannot:

- process a return against an entire ship-for-pickup order or a line on a ship-for-pickup order
- enter a negative additional charge
- enter a line with a negative quantity
- apply a discount to a closed order line

These restrictions apply regardless of whether the order type matches the *Order Type for Special Orders (L15)*.

See the [Order Orchestration Integration](#) for background.

ChannelAdvisor Warning Window

An error message window opens when you select an order for maintenance if its order type matches the *ChannelAdvisor Order Type (L90)*. Changes to orders you process through the ChannelAdvisor integration are not sent to ChannelAdvisor. See [ChannelAdvisor Integration Overview](#) for background.

Work with Order Screen in Order Maintenance

Purpose: You use this screen in both order entry and order maintenance. The updates you can perform in order maintenance, including any conditions or restrictions, are described in [Field Updates](#). See [Entering Orders](#) for field descriptions.

Quote maintenance activities: See [Maintaining Quotes in Order Maintenance](#) for more information on the maintenance activities you can perform on a pre-order quote.

Retail pickup or delivery orders: See [Maintaining Retail Pickup or Delivery Orders from Order Orchestration](#) for a discussion on maintaining these orders.

Oracle Retail Customer Engagement customer integration: When you use the Oracle Retail Customer Engagement customer integration, if you update the customer's name or address information in order maintenance, Order Administration sends an update to Oracle Retail Customer Engagement so that the customer records in the two systems are synchronized. See the [Customer Engagement Customer Integration](#) for more information.

How to display this screen:

- Select an order through the [Order Maintenance Selection Screen](#) or a subsequent scan screen.
- Select *Maintain* at the [Order Inquiry Header Screen](#) or [Order Inquiry Detail Screen](#).
- Select *Maintain* on the [Third Streamlined Order Inquiry Screen \(Order Summary\)](#) in [Streamlined Order Inquiry \(DORI\)](#).

Field Updates

This table identifies the fields on the Work with Order screen that you can change, and discusses the conditions and restrictions for updating these fields, if any. A restriction is an action that the program allows or does not allow. A condition is a situation under which a certain action is allowed. The condition or restriction column is blank for a field if you can update the field under any condition.

Field Update	Result	Condition or Restriction
Hold reason	The system places the entire order on hold; the order is not eligible for pick slip preparation when you enter a user-defined hold code.	You can set authority to release an order from hold at the user or user class level. This can be a blanket authority for all order hold reasons, or can be specific to individual reason codes. See Establishing Order Hold Reason Codes (WOHR) . You cannot set authority on placing on order on hold, only releasing.
Calc freight	The system suppresses all freight charges for new items (including freight and additional freight) when you deselect this field. If service charges by ship via would normally apply, the system suppresses these as well.	Conditions: The system does not calculate freight for new items you add to the order when this field is <i>unselected</i> ; the system charges the customer any freight previously calculated for existing order detail lines if using a line-level freight method. The Recalculate Freight Default (F62) system control value controls the default setting of this field.
Attention	The system prints/does not print an attention line on the pick slip when you enter or delete a name in this field.	Changes to this field are not sent to Order Orchestration.
Mail	The system updates the Sold-to Customer record automatically when you change this value. A value of <i>N</i> indicates that the customer does not want to receive catalog mailings; use this to exclude this customer from any house lists you generate.	

Field Update	Result	Condition or Restriction
Rent	The system updates the Sold-to Customer record automatically when you change this value. A value of <i>N</i> indicates that the customer does not want you to sell his or her name to other companies for their mailing lists; use this to exclude this customer from any house lists you generate.	
Name and Address	The system updates the Sold-to Customer record automatically when you change any customer address information, including: the prefix or suffix, first, middle, or last name, company name, street address, postal code, city, state, country, delivery code, day or third (fax or mobile) telephone number. The system revises the Sold-to customer's match code based on the changes to the name and address.	<p>Sold To/Bill To Link A pop-up window displays when the Sold-to customer is linked to a permanent Bill-to account. The window allows you to apply the changes made to the Sold-to address to the Bill-to address as well. See Display/Update Bill to Screen.</p> <p>Tax and Freight Recalculates the tax and freight on the order.</p> <p>VAT and Tax-Inclusive Pricing If changing the shipping address on the order affects whether the order is subject to VAT and tax-inclusive pricing, the system will reprice any open lines based on this change. For example, if you have set up an offer price for an item of \$1.00, and a tax-inclusive offer price of \$1.50, this item will be repriced from \$1.00 to \$1.50 if you change the shipping address from a VAT-exempt state to a non-VAT-exempt state.</p> <p>This repricing does not take place automatically for any line with a price override reason code, including incentive items, promotional items., etc. See Setting Up Order Entry Values for more information on VAT and tax-inclusive pricing.</p> <p>Order Orchestration Interface If you change these fields in the shipping address for an order which includes an open drop ship PO line processed through the Order Orchestration Drop Ship Manager interface, Order Administration sends the updated address information to Order Orchestration. See Order Orchestration Drop Ship Integration.</p>

Field Update	Result	Condition or Restriction
		<p>Shipping restrictions: If one or more items on the order is restricted from being shipped to the state or country of the ship to address, a message indicates:</p> <p>One or more items on the order line are restricted to new Shipping country/state.</p> <p>See Entering Additional Item Information , for information on item/state restrictions.</p>
M/F	The system updates the Sold-to Customer record automatically when you change this value. A value of <i>M</i> indicates that the customer is male; a value of <i>F</i> indicates that the customer is female.	
Delivery	<p>The system uses a different rate table to calculate shipping charges if U.P.S. is the shipper when you change this value to/from business) or residence. A third value, no distinction is valid only for shippers other than U.P.S.</p> <p>The system updates the Sold-to Customer record automatically when you change this value.</p>	<p>Condition: The value in the Delivery field applies only to shippers that use rate tables to calculate shipping charges, such as UPS.</p> <p>Restrictions: You cannot change this value to <i>No Distinction</i> if U.P.S. is the shipper. (The system identifies the shipper as U.P.S. if the Type field in the Ship Via table is <i>unselected</i>. See Working with Ship Via Codes (WVIA) for more information.)</p>
Phone numbers	The system updates the Sold-to Customer record automatically when you change these values.	<p>Restriction: You cannot delete all phone numbers if the system control value Require Phone Number in Order Entry/Order Maintenance (H01) is <i>selected</i>.</p> <p>Order Orchestration Interface If you change the Day or Primary phone field for a sold to or ship to address on an order which includes an open drop ship PO line processed through the Order Orchestration Drop Ship Integration, Order Administration sends the updated address information to the integrated system.</p>
Email address OptIn	See Email Address Updates through Order Maintenance .	

Field Update	Result	Condition or Restriction
Customer class	The system updates the Sold-to Customer record automatically when you change this value.	<p>Conditions: <i>Required?</i> The Require Customer Class in OE, WCAT, and WCST (H85) system control value defines whether this field is required.</p> <p>Restrictions: <i>Secured?</i> The Maintenance of Customer Class Field (B07) secured feature defines whether you can enter or maintain the customer class field at this screen.</p>
		<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If the Require Customer Class in OE, WCAT, and WCST (H85) is selected and the customer does not have a customer class code assigned, a user who does not have authority based on the Maintenance of Customer Class Field (B07) secured feature will not be able to maintain the order.</p> </div>
Source	The system deletes the dollars and number of units posted to the original source code and posts this information to the new source code.	<p>Conditions: You cannot change the source code if any shipments have been made on the order.</p> <p>Restrictions: The source code override at the order header level must use the same freight and pricing methods.</p> <p>The system does not update the source code at the detail line level when you update the source code on the order header.</p>
Salesrep#	The system updates sales reports based on your entry of a different sales representative number. New items are booked to the new sales representative number.	<p>Sales representatives are defined in and validated against the Salesman table. See Working with Sales Representatives (WLSL).</p> <p>Restrictions: The Maintain Sales Rep # During Order Maintenance (B22) secured feature controls whether you can update the Salesrep field on the Work with Order screen in Order Maintenance. If you do not have authority to this secured feature, the Salesrep field is display-only.</p>

Field Update	Result	Condition or Restriction
Ship via	<p>All open (unshipped) items ship by the new shipper. A pop-up window opens confirming whether you want to recalculate freight charges for the order.</p>	<p>Condition: All open (unshipped) items ship by the new shipper.</p> <p>Restrictions: The shipper update on the order header screen affects all items except those with a ship via override.</p> <p>Express bill: You cannot change the ship via to an express bill shipper if any order lines are reserved, or if there is a printed drop ship item.</p> <p>Item ship via override: If item ship via overrides exist, the system verifies that the new shipper is eligible to ship the open items remaining on the order. If the new shipper is not eligible to ship an item on the order, the Ship Via Overrides for Item Window displays, requiring you to select a valid shipper for that item. See Working with Item Ship Via Overrides for more information on defining item ship via overrides.</p> <p>Best way shipper: If you change the ship via to the Best Way Ship Via for Auto-Assignment (J67) and the Display Alternate Shipping Charges by Via Window in OM (102) system control value is set to <i>Y</i>, the system assigns the “best way” ship via with the lowest overall shipping charges to the order. See the Best Way Ship Via for Auto-Assignment (J67) system control value for more information.</p>

Notes
This document contains notes that describe how to use the software. Notes are identified by a pencil icon that appears at the beginning of the section. Notes are used to provide additional information or to clarify a particular step, screen, or concept. Note that some notes refer to specific screens or functions that may not be present in all versions of the software.

**Reviewing eligible ship
vias and optionally
selecting an override**
 You can prompt on this
 field to advance to the *Valid
 Ship Vias for Window*, where
 you can review valid ship
 vias for the order,
 including their overall

Field Update	Result	Condition or Restriction
	shipping charges and expected delivery dates; optionally, you can select an override ship via.	
Gift	<p>When you select this field, you are prompted to enter the shipping address of the gift recipient.</p> <p>The system suppresses prices on the pick slip for open (unshipped) items and prints a Gift Acknowledgment Card for the Sold-to customer when the gift order ships.</p>	<p>Condition: The prices for all open (unshipped) items do not print on the pick slip if this field is selected.</p>
Priority	<p>Entry of a different reservation priority changes the priority of open (unshipped) items on this order for backorder or order reservation.</p>	<p>Condition: All open (unshipped) items are assigned this reservation priority. The reservation priority is used only by the Evaluate Backorders program and does not affect the Immediate Reservation program.</p>
Warehouse	<p>If you <i>add</i> or <i>change</i> the warehouse, the system:</p> <ol style="list-style-type: none"> 1. Applies the new warehouse code to each open line on the order. 2. Removes the existing inventory reservations for the open order lines on the order that do not contain a printed quantity. 3. Attempts to reserve the items on the order in the new warehouse specified. If an item is not available in the warehouse specified, the system assigns this warehouse as the backorder warehouse for the unreserved quantity of the item on the order line. 	

Field Update	Result	Condition or Restriction
	<p>If you <i>remove</i> the warehouse, the system:</p> <ol style="list-style-type: none"> 1. Removes the warehouse code assigned to each open line on the order. 2. Removes any existing inventory reservations for the open order lines on the order that do not contain a printed quantity. 3. Attempts to reserve the items on the order using regular reservation logic. 	
Associate	<p>Updating to Controls whether the customer is eligible for associate (member) pricing discounts on new items on the order.</p> <p>The system updates the Sold-to Customer record automatically when you change this value.</p>	<p>Condition: If you select this value, only new items are eligible for associate pricing.</p> <p>Restrictions: The Change Associate Customer Flag (B10) secured feature controls whether you can change this setting; if you prohibit access to this feature, the system displays an error message if you try to change the value: Not authorized to change Associate Customer.</p>
Discount %	<p>Entering a discount percentage instructs the system to apply a merchandise discount against discountable items that you add to the order. The discount is not applied to existing items.</p>	<p>Condition: Only new items are eligible for the discount percentage.</p>
Est frt	<p>You can enter an estimated freight charge for inquiry purposes only if you change the source code to one that uses the Actual (A) freight method.</p>	
Auto can B/O	<p>Indicates whether the system automatically cancels any backordered items after the first shipment. The system cancels any unshipped lines during Confirmation.</p>	<p>Condition: If you select this field, all open (unshipped) items will be canceled.</p>

Field Update	Result	Condition or Restriction
Cancel date	This is the last date on which the customer will accept receipt of this order. Orders still open on this date are printed on the Order Cancellation list; Customer Service uses this list to contact the customer and, if necessary, cancels the order through Order Maintenance.	Condition: If you enter a date in this field, only open (unshipped) items will be affected by the cancel date.
Arrival date	This is the date on which the customer wants to receive this order.	Restrictions: The system updates each open (unshipped) item on the order automatically with the new arrival date.
Tax code	This code controls the taxable status of the order.	Conditions: The new tax code controls how the system calculates tax only for new item additions to the order.
Tax identification	The system requires a tax identification number if the Tax code is set to reseller (R) or exempt (E); otherwise, optional.	
PO#		

Screen Option	Procedure
Work with items on the order	Select <i>Detail</i> to advance to the Work with Order Lines Screen .
Work with payment methods on the order	Select <i>Pay Methods</i> to advance to the Enter Payment Methods Screen in Order Maintenance .
Add or change a customer ship to for the order	Select <i>Ship To</i> to advance to the Change Customer Ship To Screen (Using, Changing, or Excluding a Shipping Address) , the Select Customer Ship To Window (Scanning for a Shipping Address) , or the Create Customer Ship To Screen , depending on whether a ship-to customer already exists for the sold-to customer or the order.
Work with the bill-to customer for the order	Select <i>Bill To</i> to advance to the Select Customer Bill To Window , Create Customer Bill To Screen , or the Change Customer Bill To Screen (Selecting, Changing, or Excluding a Billing Account) , depending on whether a bill-to customer already exists for the sold-to customer or the order.
Review or work with order messages	Select <i>Messages</i> to advance to the Work with Order Messages Screen .

Screen Option	Procedure
Accept or reject your changes to the order	Select <i>Accept Order</i> to accept your changes to the order, or select <i>Reject Order</i> to exit the order without saving your changes. See Order Maintenance Processing for information on the updates the system performs when you Select <i>Accept Order</i> .
Accept the changes to the order and add a recipient customer	Select <i>Add Recipient</i> to accept the changes to the order and enter or select a new order recipient. See Adding a Recipient Order in Order Maintenance .
Review or work with an order-level ship-to address	Select <i>One Time Ship To</i> to advance to the Change or Create One Time Ship To Address Screen .
Alternate between the sold-to customer's and the recipient's name and address	Select <i>Sold To/Recipient</i> to clear the current customer's information from the screen and display the recipient's information. See Alternating Display of Sold-to/Recipient Addresses .
Cancel the entire order	Select <i>Cancel Order</i> to display the Enter Cancel Reason Window . For regular orders, see Canceling an Order through Order Maintenance . For quotes, see Cancelling a Quote through Order Maintenance .
Work with or review order-level additional charges	Select <i>Additional Charges</i> to advance to the Change Additional Charges Screen .
Work with or review an expanded address	Select <i>Expand Address</i> to advance to the Expand Name/Address Screen .
Review additional order options	Select <i>More Options</i> to advance to the Display More Options Screen .
Review or work with additional order properties	Select <i>Properties</i> to advance to the Work with Order Ship to Properties Screen .
Display a summary of items and order totals	Select <i>Summary</i> to advance to the Display Order Summary Screen .

Changing Item Detail Line Information in Order Maintenance

Purpose: Use this screen to:

- review information about items on an order
- make changes and additions
- cancel a line
- process returns or exchanges
- review order line history

Restrictions on changing an order line: You cannot:

- Update an item in any way if a pick slip has been printed. You must void and reprint the pick; see [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#).
- Change an item if shipments have been made against the line or the line has been canceled.

- Change, cancel, delete, or sell out a set component item if you do not have the required authority under the [Set Component Maintenance \(J01\)](#) secured feature. See that secured feature for more information.
- Change an item on a retail pickup or delivery order from the Order Broker. See the [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information.
- Change the Drop ship setting for an existing order line.

See [Working with Items on the Order](#) for field descriptions.

Quote maintenance activities: See [Maintaining Quotes in Order Maintenance](#) for more information on the maintenance activities you can perform on a pre-order quote.

Work with Order Lines Screen

How to display this screen: Select *OK* at the [Work with Order Screen in Order Maintenance](#).

About this screen: See the [Work with Order Lines Screen \(Adding Items to the Order\)](#) for information about this screen, including field descriptions. See this table for options and directions on where to go for more information.

Screen Option	Procedure
Change a line	<p>Select <i>Change</i> for an item to advance to the Work with Order Line Screen, where you can change detail line information. This option is available only if the line is in open or held status and does not have a printed quantity.</p> <div data-bbox="917 430 1464 829" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Selecting <i>Change</i> for a set component item is controlled by the <i>Set Component Maintenance (J01)</i> secured feature. If you do not have the required authority, the system displays an error message: Not authorized to change, delete, cancel, or sell out a set component.</p> </div>
Cancel a line	<p>Select <i>Cancel</i> for an item to advance to the Enter Cancel Reason Window.</p> <div data-bbox="917 955 1464 1354" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Selecting <i>Cancel</i> for a set component item is controlled by the <i>Set Component Maintenance (J01)</i> secured feature. If you do not have the required authority, the system displays an error message: Not authorized to change, delete, cancel, or sell out a set component.</p> </div>
Review open purchase orders	<p>Select <i>POs</i> for an item to advance to the Display Open Purchase Orders Screen.</p>
Review availability	<p>Select <i>Availability</i> for an item to advance to the Item Availability Screen.</p>
Review additional items coordinated with the item for cross-selling purposes	<p>Select <i>Coordinates</i> for the item to advance to the Display Coordinate Items Window if any coordinates are linked with the ordered item.</p>
Apply, delete, or review coupon discounts	<p>Select <i>Coupons</i> for an item to advance to the Coupon Discount Window. You can add or delete a coupon only if none of the items on the order have printed pick slips or are in closed status.</p>

Screen Option	Procedure
Apply a discount to an item	Select <i>Discount</i> for an item to display the Discount Price Window (Applying a Discount to an Item) . You can use this window to apply a discount to an item in a dollar amount or discount percentage. Only shipped, unreturned items are eligible for these discounts.
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>To ensure the background async jobs update order related tables correctly, do not use this option against a shipped, unreturned order line in the same session that you add a new order line.</p> </div>
Review item history	Select <i>History</i> for an item to advance to the Display Order Line History Screen .
Place the item on hold	Select <i>Hold</i> for an item to place it on hold. Only open, unprinted order lines are eligible to be held. The line status changes to held (<i>H</i>) and the item will not be eligible for pick slip preparation until you release the line. Access to this option is controlled by the O/E Hold, Release Order Lines (A46) secured feature.
Search for the item across warehouses and stores in external systems	Select <i>Merchandise Locator</i> for an item to advance to the Merchandise Locator Search Window (Searching for an Item) . See Merchandise Locator Process Overview for more information.
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option is available only if the Use Merchandise Locator (I38) system control value is <i>selected</i>. Otherwise, the screen displays an error message: Merchandise Locator is not enabled.</p> </div>
Work with order line messages	Select <i>Messages</i> for an item to add, change or display order line messages. See Work with Order Line Messages Screen for more information.
Review quantity pricing	Select <i>Prices</i> for an item to advance to the Display Quantity Pricing Window .

Screen Option	Procedure
Release a held item	<p>Select <i>Release</i> for an item to release it from hold. Only held items (status = <i>H</i>) are eligible to be released. The line status changes to open (blank) and the item is now eligible for pick slip preparation. If the item was placed on hold through Processing Auto Soldout Cancellations (MASO), the system deletes the item record from the Order Hold Detail table; see Working with Held Detail Lines (WOHD). Access to this option is controlled by the <i>O/E Hold, Release Order Lines (A46)</i> secured feature.</p>
Return an item	<p>Select <i>Return</i> for a shipped item to return or exchange it. See Returning and Exchanging Items in Order Maintenance.</p>
Sell out an item	<p>Select <i>Sell Out</i> for an item to sell it out. The status of the line changes to <i>S</i> and the system recalculates the tax on the order. Only open or held, unreserved lines are eligible to be soldout.</p>
Add or change special handling information	<p>Select <i>Special Handling</i> for an item to advance to the Work with Special Handling Screen or Work with Special Handling Screen. This option is available only for open or held items without a printed quantity</p> <ol style="list-style-type: none"> 1. This option is not available if the additional charge code used for the special handling format is suppressed; see Special Handling Overview for a discussion. 2. If you add a special handling format flagged to hold the order line, the system changes the order line status to held; similarly, if you remove a special handling format flagged for hold, the system releases the order line from hold. See Putting a Line on Hold through a Special Handling Format for more information.

 **Note:**

Order lines can also be put in hold status because of a special handling format. See [Putting a Line on Hold through a Special Handling Format](#) for a discussion.

 **Note:**

Selecting *Sell Out* for a set component item is controlled by the *Set Component Maintenance (J01)* secured feature. If you do not have the required authority, the system displays an error message: Not authorized to change, delete, cancel, or sell out a set component.

Screen Option	Procedure
Accept the changes to the order	Select <i>Accept Order</i> . See Order Maintenance Processing for information on the updates the system performs when you select <i>Accept</i> .
Reject the changes to the order	Select <i>Reject Order</i> . When you reject an order, the system evaluates the order to determine if it qualifies for pick slip preparation; see Preparing Orders for Pick Slip Generation and Applying Pick Slip Preparation to an Order .
Accept the order and add a recipient	Select <i>Add Recipient</i> . See Entering Orders .
Add an item	Select <i>Add Line</i> to advance to the Work with Order Line Screen to add an item. You can also add an item by entering the item information in the empty order line. See Adding an Item in Order Maintenance .
Add or change additional charges	Select <i>Additional Charges</i> to display the Enter Additional Charges Window .
Cancel the order	Select <i>Cancel Order</i> . See Canceling an Order through Order Maintenance .
Enter or work with messages about the order detail line to optionally print on the pick slip and/or invoice or use for internal reference	Select <i>Messages</i> for the item to advance to the Work with Order Line Messages Screen .
Display additional options	Select <i>More Options</i> to advance to the Display More Options Screen .
View or work with order header information	Select <i>Order Header</i> to return to the Work with Order Screen in Order Maintenance .
Review order history	Select <i>Order History</i> to advance to the Display Order History Screen .
Work with payment information	Select <i>Pay Methods</i> to advance to the Enter Payment Methods Screen in Order Maintenance .
Review item relationships	Select <i>Relationships</i> . See Working with Items on the Order .
Reprice the order and review premium items	Select <i>Reprice</i> . This option is available: <ul style="list-style-type: none"> • If You Use Price Tables. • If you are maintaining a quote; see Maintaining Quotes in Order Maintenance. <p>Otherwise, an error message displays when you select <i>Reprice</i>: Selected function is not valid for current processing mode (Maintain).</p>
Process returns	Select <i>Return Order</i> to advance to the Return/Exchange Item screen. See Starting the Return Process .
Scan order lines	Select <i>Scan Order Lines</i> to advance to the Scan Order Lines Screen .

Work with Order Line Screen

Purpose: Use this screen to review or change detail information about an item on an order, including pricing and status.

How to display this screen: Select *Change* for an item at the [Work with Order Lines Screen](#). This option is available only for open or held order lines without a printed quantity.

Note:

Selecting *Change* for a set component item is controlled by the *Set Component Maintenance (J01)* secured feature. If you do not have the required authority, the system displays an error message: Not authorized to change, delete, cancel, or sell out a set component.

See [Adding Different Types of Items to the Order](#) for more information on the processing the system performs for different types of items.

Field updates: This table identifies the fields on the Work with Order Line screen that you can change, and discusses the conditions and restrictions for updating these fields, if any.

A restriction is an action that the program allows or does not allow. A condition is a situation under which a certain action is allowed. The condition or restriction column is blank for a field if you can update the field under any condition.

Field Update	Result	Condition or Restriction
Offer	When you update the offer, the system may reprice the item, determine whether the item is eligible for special handling or gift wrapping, validate the type of special handling, and update the special handling and gift wrapping charges, if any. The system ensures that the source code assigned to the item is valid for the new offer.	Conditions: You cannot change the offer if any shipments have been made on the line. Restrictions: The offer override at the line level must use the same freight and pricing methods.
Qty	Increases or decreases the number of units ordered.	Condition: The system displays a pop-up window for you to enter a cancel reason code if you decrease the quantity ordered of an item. Additionally, you must specify whether to recalculate freight and refund the customer the freight difference resulting from the refund. You cannot change a positive quantity to a negative quantity on this screen, or vice versa. See Increasing the Quantity Ordered in Order Maintenance , and Canceling an Item in Order Maintenance .

Field Update	Result	Condition or Restriction
Price	<p>An update to this field results in a price override to the item.</p> <p>If the <i>Display Order Line Discount Messages (F01)</i> system control value is <i>selected</i>, a message displays describing the discount for each item sold at less than the offer price, and the price itself is highlighted in reverse color. Any type of price override or repricing method that produces a price lower than the regular offer price is considered a discount.</p>	<p>Restriction: The <i>Price Overrides (A23)</i> secured feature controls whether you can update the price defined for the order line; if you do not have authority to this secured feature, the Price field is display-only.</p> <p>User and user class security determine whether you can perform a price override. You can also define a maximum percentage operators can discount an item by entering a percentage in the <i>Price Override Limit Percent (E55)</i> system control value.</p> <p>The <i>Allow Negative Prices in Order Entry (E97)</i> system control value controls whether you can enter a negative item price in order maintenance as well.</p>
N/C	<p>The system does not charge for this item when you <i>select</i> this field.</p>	<p>Restriction: The <i>Price Overrides (A23)</i> secured feature controls whether you can update the no charge flag for the order line; if you do not have authority to this secured feature, the No charge field is display-only.</p> <p>User and user class security determine whether you can sell an item at “no charge.”</p> <p>Condition: You must enter a price override reason code in the Ovr field if you give the item to the customer at no charge.</p>
Ovr	<p>The system tracks who performed the price override or who sold the item at “no charge” when you enter an override reason code.</p>	<p>Restriction: The <i>Price Overrides (A23)</i> secured feature controls whether you can override the item price; if you do not have authority to this secured feature, the Price override reason code field is display-only.</p>
Frt	<p>Controls whether the system recalculates freight for the item based on changes to its quantity or price.</p>	<p>Condition: The <i>Recalculate Freight Default (F62)</i> system control value controls the default setting of this field, but you can override this default.</p>
Offer price	<p>The price of the item in the catalog, before applying any additional discounts or repricing. If the order was subject to VAT and tax-inclusive pricing, in which any tax is included in the Hidden tax field rather than the Tax bucket on the order, the offer price presented here is the tax-inclusive offer price. Updating this field does not change the selling price of the item.</p>	<p>Restriction: The <i>Price Overrides (A23)</i> secured feature controls whether you can update the offer price for the order line; if you do not have authority to this secured feature, the Offer price field is display-only.</p>

Field Update	Result	Condition or Restriction
Ship via	The item will ship by the new shipper.	<p>Conditions: You can change an item on an order to express bill by entering an express bill ship via code. When you express bill an item, the item immediately goes through billing. A pick slip does not print and no shipments occur for the item.</p> <p>Restrictions: An error message indicates if you change an item on an express bill order to a non-express bill shipper: Ship Via must be an Express Bill.</p>
Arr date	This is the date when the customer wants to receive the order.	
Source	The system deletes the dollars and number of units posted to the original source code and books this information to the new source code.	<p>Conditions: You cannot change the source code if any shipments have been made on the item.</p> <p>Restrictions: The source code override at the line level does not affect the freight and pricing methods, which are defined by the original source code.</p>
C/G	The system does not perform pick slip preparation for items on the order with the same coordinate group number unless inventory is available for all of the items.	
Freight	The system uses this freight charge for the item.	<p>Conditions: The system allows you to perform a freight override for the item only if the source code for the item uses a line level freight method of: <i>Flat Rate/Item</i>, <i>Flat Rate/Quantity</i>, <i>Flat Rate/Item</i>, or <i>Weight</i>.</p>
G/W	<i>Selected</i> indicates that the item should be gift wrapped.	<p>Condition: The item/offer or SKU/offer record determines whether the item is eligible for gift wrapping.</p>

Field Update	Result	Condition or Restriction
S/H code	This code determines the type of personalization that must be performed on the item, such as monogramming, engraving, altering, etc. See Special Handling Overview for more information.	<p>Condition: The item/offer or SKU/offer record determines whether the item is eligible for special handling.</p> <p><i>Adding special handling for an existing order line:</i> You advance to the Work with Special Handling Screen or the Work with Custom Special Handling Screen if you add a special handling code unless the display of the special handling screen is suppressed, based on the setting of the Suppress S/H window for the additional charge code.</p> <p>Adding special handling also puts the order line on hold if the special handling format is flagged to do so.</p> <p><i>Changing the special handling for an existing order line:</i> Enter a different special handling code to advance to the Work with Special Handling Screen or the Work with Custom Special Handling Screen, where you enter the new special handling instructions. If the new code is flagged to hold the order line, this puts the order line on hold; similarly, if the previous code was flagged to hold the order line but the new code is not, this releases the line from hold.</p>

Field Update	Result	Condition or Restriction
		<p><i>Removing special handling from an existing order line:</i> Select <i>Special Handling</i> to advance to the <i>Work with Special Handling Screen</i> or the <i>Work with Custom Special Handling Screen</i>, where you can select <i>Delete All</i> to remove the special handling from the order line.</p>

 **Note:**

If the line is currently held because of the special handling format, using the steps described above does *not* release the line from hold. You must use the Special Handling option from the *Work with Order Lines Screen* to remove the hold.

See *Putting a Line on Hold through a Special Handling Format* for background.

Field Update	Result	Condition or Restriction
S/H charge	This is the price for the special handling.	<p>Restriction: If you are adding special handling to an order line, you advance to the related special handling screen as described above. The special handling charge is specified there, either by default from the item/SKU offer or special handling format, or through your entry if you have the required authority. If display of the special handling screen is suppressed as described above, a default special handling charge is added to the order automatically.</p> <p>This field is display-only if there is already special handling assigned to the order line, unless the special handling is standard format and you have authority under the Enter or Override S/H Price (B12) secured feature.</p>
Warehouse	The item will ship from this warehouse.	<p>When you update the warehouse defined for an order line, the system:</p> <ul style="list-style-type: none"> • Removes any existing inventory reservations for the order line. • Attempts to reserve the item on the order line in the new warehouse specified. If the item is not available in the warehouse specified, the system assigns this warehouse as the backorder warehouse for the unreserved quantity of the item on the order line.
Cancel date	The date when the item will be canceled if it has not shipped.	

Field Update	Result	Condition or Restriction
Affect inv	Determines whether the system reduces inventory for the item during order entry and when you ship the item.	<p>Condition: The <i>Non/inv (Non inventory)</i> field in the Item table determines which value defaults in this field.</p> <div data-bbox="1182 453 1458 1314" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If this field is <i>unselected</i>, the system will not perform pick slip preparation for the item if all other items on the order are backordered; when one or more backordered items are available, the system will perform pick slip preparation for the non-inventory item as well as for the available item(s).</p> </div> <p>Restriction: You cannot change the Affect inventory flag to <i>N</i> for a drop ship item: <i>Affect Inventory</i> flag must be <i>Y</i> for Drop Ship Items.</p>
Priority	Controls the priority of this item for backorder or order reservation.	<p>Condition: The reservation priority is used only by the Batch Reservation or Evaluate Backorders programs and does not affect the Immediate Reservation program.</p>
Cost override	Represents an override to the base cost of the item from the Item record. This override ensures that your gross margin is accurate when you place a special order from your vendor for the customer.	

Discount Price Window (Applying a Discount to an Item)

Purpose: Use this window to apply a discount dollar amount or a discount percentage to a shipped item.

How to display this screen: Select *Discount* for an item at the [Work with Order Lines Screen](#).

A message displays if the item is not eligible for a discount:

Line cannot be discounted -- not shipped or already returned

**Note:**

To ensure the background async jobs update order related tables correctly, do not a discount against a shipped, unreturned order line in the same session that you add a new order line.

Field	Description
Order #	The number assigned by the system to identify this order. Numeric, 9 positions; display-only.
Ln # (Line number)	The detail line where the item you are applying the discount to is located. Numeric, 3 positions; display-only.
Sts (Status)	The status of the order. Alphanumeric, 9 positions; display-only.
Item and SKU	The name of the item and its associated SKU code. Item: Alphanumeric, 12 positions; display-only. SKU: Alphanumeric, three 4-position fields; display-only.
Quantity (Quantity ordered)	The number of units of the item being ordered. Numeric, 5 positions; display-only.
Extension (Extended price)	The total unit price for this order line. The system uses this calculation to determine the extended price: $\text{unit price} \times \text{quantity ordered} - (\text{units returned} + \text{units canceled}) = \text{extended price}$ The extended price reflects the price of the order line in merchandise dollars before any charges, such as freight, have been applied. Numeric, 20 positions with a 2-place decimal; display-only.
Price	The price of a single unit of the item. The selling price of this item defaults. Enter a different price in this field to apply a price override. Numeric, 13 positions with a 2-place decimal; optional.
Discount % (Discount percent off price)	The discount percentage you are applying to this item. Enter a percentage in this field to apply a percent discount. The percent discount is taken from the dollar amount in the Price field. Numeric, 5 positions with a 2-place decimal; optional.

Field	Description
N/C ("No charge" indicator)	Indicates whether the customer will be charged for this item. Valid values are: <ul style="list-style-type: none"> <i>No Charge</i> = Item is sold at no charge to the customer. <i>Priced</i> = (Default): Customer will be charged for the item. Optional.
Ovr (Price override reason code)	Represents the reason for overriding the item price or selling the item at no charge. The system uses this code for an audit trail that links the operator who performed the price override or who sold the item at no charge to the order. <i>Secured feature:</i> User and user class security control access to this field. Override reason codes are defined in and validated against the Price Override Reason table. See Establishing Price Override Reason Codes (WPOR) . Numeric, 1 position; required if performing a price override or selling item at no charge; otherwise, optional.

Instructions:

- Optionally, enter a dollar amount in the Price field to change the price of the item.
- Optionally, enter a percentage in the Discount percent field to apply a discount percentage to the price of the item. The discount percentage is applied to the dollar amount from the Price field.
- Optionally, select *No Charge* in the No charge field to sell this item at no charge.
- Enter a price override reason code in the Override field if you have changed the price of the item, applied a discount percentage or are selling the item at no charge.
- Select **OK**. You return to the [Work with Order Lines Screen](#) with any changes you have entered applied to the item.

The system reduces the order total based on the discount amount applied. In addition, if a tax override exists, the system uses the tax override rate (the Tax override % field on the [Display Order Detail Screen \(Reviewing Order Line Detail\)](#) to calculate the tax credit amount.

Example: An order is received through the Order API with the following item:

- item quantity = 2
- actual price = 15.00
- extended price = 30.00
- price override = Y
- tax override = Y
- tax amount = 2.00
- GST amount = .50
- PST amount = 1.50

When the order is received, the system calculates the Tax override rate, GST tax override rate, and PST tax override rate in the Order Detail table using the following calculation:

$$(\text{tax amount} / \text{extended amount}) \times 100 = \text{tax override rate}$$

tax override rate: (tax amount 2.00 / 30.00 extended amount) x 100 = 6.67 tax override rate; this rate displays in the Tax override % field on the Display Order Detail screen in Order Inquiry

GST tax override rate: (GST tax amount .50 / 30.00 extended amount) x 100 = 1.67 GST tax override rate

PST tax override rate: (PST tax amount 1.50 / 30.00 extended amount) x 100 = 5 PST tax override rate

In Order Maintenance, you apply a 10% discount to the order line using the Discount Price window after the item has already shipped to the customer. The system calculates the new item totals.

- new price = original price 15.00 - 10% discount = 13.50 new price
- new extended price = new price 13.50 x 2 quantity = 27.00 new extended price
- new tax amount = new extended price 27.00 - 6.67% tax override rate = 1.80 new tax amount
- new GST amount = new extended price 27.00 - 1.67% GST tax override rate = .45 new GST tax amount
- new PST amount = new extended price 27.00 - 5% PST tax override rate = 1.35 new PST tax amount

Billing creates the credit invoice using the new tax amounts. In this example, the credit invoice includes the following tax credits:

- tax credit = .20
- GST tax credit = .05
- PST tax credit = .15

If You Use Price Tables

Purpose: Unlike other pricing methods, price table repricing is effective in Order Maintenance as well as Order Entry. As a result, if you add, cancel, or change the quantity of an item in Order Maintenance, items on the order may be eligible for repricing, or there may be a change in the premium items earned by the order.

Note:

If you have printed a pick slip for any items on the order, the order is no longer eligible for any repricing or additional premium items.

Setting up price breaks for items or groups of items is described in [Working with Price Tables \(WPTB\)](#). The Display Premium screen opens in Order Entry or Order Maintenance if the order qualifies for one or more premiums.

Differences Between Order Entry and Order Maintenance

Price table repricing and premium items function differently in Order Maintenance from Order Entry in these respects:

Adding premium items: The system does not increase the quantity of a premium item in Order Maintenance, although it does add new premium items if they are earned

by a different item or group of items. For example, if the order formerly qualified for a premium of two of item AB100 because of a group dollar total of \$200 (in which you add one item for each \$100 ordered from the group), and you add group items to the order in Order Maintenance to bring that total to \$300, the system will *not* add an additional AB100 to the order. However, the system *will* add item CC200 if this is a premium earned by a different group of items.

Ineligible Premiums Window

You should select *Premium Items* to review any changes to premium items in Order Maintenance. If the order is no longer eligible for one or more premium items as a result of changes you have just entered, a pop-up window displays the related item(s).

The reason you should select *Premium Items* rather than *Accept* when you use price table pricing is so that you will have the opportunity to remove the premium item from the order, if necessary, before you accept it.

Maximum Order Line Quantity/Value

You can define a maximum quantity or dollar total for individual order lines using these system control values:

- [Maximum Order Quantity \(C60\)](#)
- [Maximum Order Line Value \(E98\)](#)

For example, if you set the Maximum Order Quantity (C60) system control value to 10, the system would validate that you do not enter a single order line with a greater quantity. This might help prevent inaccurate orders due to user error, such as entering 100 instead of 10.

If you set either of these values to 0, the system does not validate whether order lines exceed the maximum.

Secured features: These secured features control the ability to exceed these limits:

- [Allow Maximum Order Line Value Override \(A69\)](#)
- [Allow Maximum Order Quantity Override \(A70\)](#)

Confirm Quantity/Line Value Window

If you have the proper authority, a pop-up window indicates that you have exceeded the maximum quantity or dollar value, and prompts you to accept or cancel.

Select *Accept* at this window to confirm the quantity and add the line to the order or process the change; otherwise, select *Exit* to cancel. If you cancel, the screen displays an error message:

Order Qty of 50 exceeds the maximum allowed in SCV C60.

An error message indicates an excess order line total dollar value:

Order line value of 1000.00 exceeds maximum allowed in SCV E98.

If you do not have the proper authority, the pop-up window does not open and you will not be able to override the maximum.

Adding an Item in Order Maintenance

Purpose: Use the [Work with Order Line Screen](#) to add another item to an existing order and enter item-level overrides. You can also add an item by entering the information on the blank order line in the center of the [Work with Order Lines Screen](#).

Ordering a warranty item: If you enter a warranty item (the Warranty field for the item offer or SKU offer is *selected*), the system:

- adds the item to the order at no charge
- if the [Default Price Override Reason for Warranty Items \(G01\)](#) system control value is *selected*, the system defaults the code to the Price override code field; otherwise the operator must enter a code
- displays an error message if the operator entered a price for the item in the Price field: Warranty Item - price not allowed

See [Working with Customer Warranty Information \(WCST\)](#).

Ordering a virtual stored value card item: If you order a virtual stored value card item (the SVC type field for the item is V), the system requires you to define an email address in order to send a [Stored Value Card Notification Email](#) to the recipient of the stored value card. If an email address is not defined, the screen displays an error message and you cannot accept the order: Invalid e-mail address/opt in for order containing virtual SVC item. See [Stored Value Card Email Hierarchy](#) for more information on the hierarchy the system uses to send a Stored Value Card Notification to the recipient of the stored value card.

Retail pickup or delivery orders: You cannot add an item to a retail pickup or delivery order from Order Orchestration. See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information.

Enter Add Reason Window

The Enter Add Reason prompts for an add reason code when you add an item if the [Require Reason for Lines Added in Order Maintenance \(D75\)](#) system control value is selected or the Require reason code field for the item offer or SKU offer is selected.

Enter the add reason code that describes your reason for adding this line to the order. The add reason code is a 5-position, numeric field used to define the reason for adding an item to an order in order entry or order maintenance. See [Establishing Add Reason Codes \(WADR\)](#).

The system assigns the next available line number to the item you are adding to the order. The system performs the same item validations as in Order Entry, such as:

- Reserving the item (if using Immediate Reservation)
- Sending the order for credit card authorization, if applicable
- Performing credit checking to ensure the order has valid customer and payment information

If the credit card on the order has an elapsed expiration date, the system advances you to the [Confirm Invalid Expiration Date Screen](#) where you can change the expiration date or enter a different payment method.

If you use price table pricing, you can review any resulting repricing or new premium items on the order by selecting [Premium Items](#).

See [Changing Item Detail Line Information in Order Maintenance](#), for field descriptions and more information on how price tables work in Order Maintenance.

Maximum line quantity/value: See [Confirm Quantity/Line Value Window](#) for more information on how the system validates these maximums.

Item/SKU comments window: The [Work with Item/SKU Comments Window](#) opens if there are comments associated with the item or SKU added to the order.

Cursor position: If the [Position Cursor on Offer Field in OE/OM \(F91\)](#) system control value is *selected*, the cursor will be positioned in the Offer field at the [Work with Order Lines Screen](#) or [Work with Order Line Screen](#); also, the Offer field will be blank.

Accompanying item: The system adds an accompanying item to the order if the selected item has been associated with one through the [Work with Accompanying Item Screen](#), and if the [Add Accompanying Items in Order Maintenance \(H28\)](#) system control value is *selected*.

 **Note:**

If you update the originating item in order maintenance, the system does not update the accompanying item. For example, if you sell out the originating item in order maintenance, the system does not also sell out the accompanying item.

Increasing the Quantity Ordered in Order Maintenance

Purpose: You can use the [Work with Order Line Screen](#) to increase the quantity ordered of an item on an existing order.

Retail pickup or delivery orders: You cannot increase the quantity on a retail pickup or delivery order from Order Orchestration. See the [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for more information.

For more information:

- decreasing the quantity ordered of an item: [Canceling an Item in Order Maintenance](#)
- how price table repricing and premium items function in Order Maintenance: [Changing Item Detail Line Information in Order Maintenance](#)

Instructions:

1. At the [Work with Order Lines Screen](#), Select *Change* for an item. You advance to the [Work with Order Line Screen](#) with your cursor in the Qty field.
2. Enter the amount of the item that the customer wants to order.
3. Select *OK* to accept and validate the new quantity ordered and return to the [Work with Order Lines Screen](#).
4. The system updates the quantity ordered immediately. Notice the quantity in the Rsv (reserved) field if you are using Immediate Reservation.

Note:

- This option is available only for open or held order lines without a printed quantity.
- When you change the quantity ordered of a main set item, the change is also reflected in its component items.

- Selecting *Change* for a set component item is controlled by the [Set Component Maintenance \(J01\)](#) secured feature. If you do not have the required authority, the system displays an error message: `Not authorized to change, delete, cancel, or sell out a set component.`

Canceling an Item in Order Maintenance

Purpose: In order maintenance, select *Cancel* for an item at the [Work with Order Lines Screen](#) to cancel it from an order. You can cancel the entire open (unshipped) quantity of the item or lower the quantity (for example, to correct a keying error).

Restrictions:

- You cannot cancel an item if a pick slip has been printed for that item. Instead, you must first void the pick slip. See [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#).
- Selecting *Cancel* for a set component item is controlled by the [Set Component Maintenance \(J01\)](#) secured feature. If you do not have the required authority, the system displays an error message: `Not authorized to change, delete, cancel, or sell out a set component.`

If the quantity you cancel is reserved, it will now be available for other orders.

To cancel an entire order: See [Canceling an Order through Order Maintenance](#).

Price tables: If you use price table pricing, canceling an item may affect pricing and premium items. See [Changing Item Detail Line Information in Order Maintenance](#).

Membership items: If you cancel a membership item, the system also cancels the customer membership if possible. See [Canceling a Membership Item](#) for a discussion.

Order status: See [Order Updates for Cancellation](#).

Order line status: See [Item Cancellation Results](#).

Brokered backorder: If the order line is currently assigned to Order Orchestration for fulfillment, you advance to the [Confirm Order Orchestration Cancel Window](#) when you select a line for cancellation. See [Canceling a Brokered Backorder Request](#) for more information.

Retail pickup and delivery orders: If you cancel an item on a retail pickup or delivery order, the system changes the Order Orchestration record's status to *Canceled* and sends a status inquiry request to Order Orchestration. If the order's status in Order Orchestration is:

- *Canceled*: the system does not send a status update to Order Orchestration; otherwise,
- If the order's status in Order Orchestration is anything but *Canceled*, the system sends a status update to Order Orchestration indicating the status is *Rejected*. In this situation, Order Orchestration then changes the order status to *New_order*.

! Important:

If Order Orchestration is configured to “reshop” (the Search retries setting at the Preferences screen is not set to 0), then in this situation Order Orchestration attempts to assign the order to another location for fulfillment.

See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview.

Cancellation email: The system generates an order or order line cancellation email or the *Outbound Email XML Message (CWEmailOut)* to the customer if:

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1)

- you have specified an:
- [Order Line Cancellation Email Program \(K79\)](#), if there is still at least one open line on the order or if there have been any shipments, or
- [Order Cancellation Email Program \(K78\)](#), if you are canceling the last open line on the order and there have not been any shipments, and
- the cancel reason code you use does not match the [Cancel Reason Code to Suppress Email \(L08\)](#), and
- the customer is eligible to receive email notifications; see [When Does the System Generate an Email Notification?](#)

If you cancel a full or partial order line using more than one cancel reason code, the order line cancellation email lists the entire quantity canceled during the current session. For example, the customer indicates that there was a keying error that resulted in reducing the order line quantity from 50 to 15; also, the customer wants to now reduce the order line quantity to 10. The email indicates a cancel quantity of 40, even though quantities of 35 and 5 were canceled using different cancel reason codes.

If you generate the *Outbound Email XML Message (CWEmailOut)*, the cancel reason code indicated is the last one used to cancel a quantity of the order line.

See the [Order Cancellation Confirmation Email Sample and Contents](#) and the [Order Line Cancellation Confirmation Email Sample and Contents](#) for more information.

In this topic:

- [Enter Cancel Reason Window](#)
- [Item Cancellation Results](#)
- [Canceling a Membership Item](#)
 - [Customer Membership Cancellation Window](#)
 - [Order Warning Message Window](#)
 - [Membership in Process Window](#)

For more information: See [Canceling an Order through Order Maintenance](#).

Enter Cancel Reason Window

To cancel: Select *Cancel* for an item at the [Work with Order Lines Screen](#) to cancel it. You advance to the Enter Cancel Reason pop-up window.

Field	Description
Order #	A unique number to identify an order. Numeric, 9 positions; display-only, assigned by the system.
Ship to number (unlabeled field to the right of the order number)	Indicates the number of shipping addresses on the order. Numeric, 3 positions; display-only, assigned by the system.
Item	A code for a unit of inventory. Item numbers are defined in and validated against the Item table. See Performing Initial Item Entry (MITM) . Alphanumeric, 12 positions; display-only.
SKU (Unlabeled fields to the right of the item number)	The unique characteristics of an item, such as its color and size. Alphanumeric, three 4-position fields; display-only.
Description (Unlabeled field below Item field)	The description associated with the item. Alphanumeric, 25 positions; display-only.
Current quantity ord (Quantity ordered)	The number of units of this item originally ordered.
	<div data-bbox="885 903 1339 1144" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If you have previously canceled units of this item with a cancel reason code set to reduce demand, the quantity in this field is reduced by the quantity canceled. See Item Cancellation Results.</p> </div>
	Numeric, 5 positions; display-only.
Current quantity can (Quantity canceled)	The quantity of this item that has been canceled previously.
	<div data-bbox="885 1333 1339 1554" style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If you have previously canceled any units with a cancel reason code set to reduce demand, that quantity is not included in this field. See Item Cancellation Results.</p> </div>
	Numeric, 5 positions; display-only, updated by the system.
Current quantity S/O (Current quantity sold out)	The quantity of this item that has been sold out. Numeric, 5 positions; display-only, updated by the system.
Current quantity shp (Current quantity shipped)	The quantity of the item that has shipped. Numeric, 5 positions; display-only, updated by the system.

Field	Description
Cancel qty (Quantity to cancel)	<p>The quantity of the item to cancel. This field defaults to the quantity remaining on the line, calculated as:</p> $\text{Quantity ordered} - (\text{quantity canceled} + \text{quantity sold out} + \text{quantity shipped}) = \text{Quantity to cancel}$ <p>Select <i>Full/Line</i> to change this value, if necessary.</p> <p>A message appears if you try to cancel more units than are currently open (unshipped):</p> <p>Quantity to be canceled (xx) exceeds remaining open quantity (xx).</p> <p>Quantity for membership items: Ordinarily you would always enter membership items with a quantity of 1, since each membership item ordered creates a single customer membership, regardless of order quantity. The system does not let you cancel a partial quantity on an order line for a membership item. See Canceling a Membership Item for more information on canceling memberships.</p> <p>Numeric, 5 positions; display-only, updated by the system.</p>
Cancel rsn (Cancel reason code)	<p>The reason for canceling the line.</p> <p>Cancel reason codes are defined in and validated against the Cancel Reason table. See Establishing Cancel Reason Codes (WCNR).</p> <p>Select <i>Chg Cancel Qty</i> to change this value, if necessary.</p> <p>Numeric, 2 positions; required.</p>
Recalculate freight	<p>Determines whether the system refunds the freight charge to the customer for the canceled items.</p> <p>Valid values are:</p> <p><i>Selected</i> = Recalculate and refund freight. If a Freight override amount is defined for the order and the Calculate freight field for the order ship to is selected, the system advances you to the Enter Freight Refund Window.</p> <p><i>Unselected</i> (default) = Do not recalculate and refund freight.</p> <p>The Recalculate Freight Default (F62) system control value controls the default setting of this field, but you can override this default.</p> <p>Tax: The system recalculates tax regardless of the setting of this field.</p>

1. Enter a valid cancel reason code in the Rsn field.
2. Optionally, select *Full/Line* to change the quantity of the item to cancel and enter the new quantity in the Qty field. (**Note:** This option is not available for a retail pickup or delivery order received from Order Orchestration; see [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for background.)
3. Optionally, select *Chg Cancel Qty* to change the cancel reason code and enter a new cancel reason code in the Cancel rsn field.
4. Optionally, change the value in the Recalculate freight field. If selected, and a [Freight override](#) amount is defined for the order, the system advances you to the [Enter Freight Refund Window](#).

- Select *OK*.

Instructions:

Enter Freight Refund Window

Use this window to enter the freight amount to refund.

How to display this screen: This window displays if you select the Recalculate freight field on the *Enter Cancel Reason Window*, a *Freight override* amount is defined for the order, and the Calculate freight field for the order ship to is selected.

Field	Description
Current freight amount	The current freight amount for the order, based on the <i>Freight override</i> amount on the <i>Display Order Properties Screen</i> . Numeric, 20 positions with a 2-place decimal; display-only.
Freight refund	The amount of freight to refund. Freight tax override: If a <i>Freight tax override</i> is defined for the order, the system uses the <i>Freight tax rate</i> to calculate the amount of tax on freight to refund. Numeric, 13 positions with a 2-place decimal; required.

Instructions:

- Enter the amount of freight to refund in the Freight refund field.
- Select *OK*. The system subtracts the freight refund amount from the current freight amount and updates the *Freight override* amount on the *Display Order Properties Screen* with the new *Freight override* amount. If a *Freight tax override* is defined for the order, the system uses the *Freight tax rate* to determine the new freight tax amount.

Example: You cancel a line on an order whose freight override amount is \$10.00 and freight tax override amount is \$2.50. The freight tax rate is 25%. At the Enter Freight Refund window, you enter \$4.00 as the freight refund amount. Based on the freight refund amount, the system:

- Refunds \$4.00 freight and \$1.00 freight on tax.
- Updates the freight override amount to \$6.00.
- Updates the freight tax override amount to \$1.50.

Item Cancellation Results

The effect of canceling an item depends on:

- whether you cancel the entire open quantity, and
- whether you reduce demand.

You reduce demand if you use a cancel reason code with the *Reduce demand* field selected. One reason to reduce demand is if the quantity ordered was keyed incorrectly (10 units instead of 1).

The results of the different types of item cancellations are described in the table:

Type of Cancellation	Line Status	Quantity Ordered	Canceled Quantity
Cancel entire quantity and reduce demand	<i>Closed</i>	reduced to zero	not affected
Cancel entire quantity and don't reduce demand	<i>Cancelled</i>	not affected	increased (by entire quantity ordered)
Cancel partial quantity and reduce demand	not affected	reduced (by quantity being canceled)	not affected
Cancel partial quantity and don't reduce demand	not affected	reduced (by quantity being canceled)	increased (by quantity being canceled)

Canceling a Membership Item

Overview: When you use order maintenance to cancel a membership item that created a customer membership, the system also cancels the customer membership if possible.

When is a customer membership eligible for cancellation? In order for the system to cancel the customer membership created by the membership item:

- the membership item must be eligible for cancellation; that is, it cannot yet be billed.
- the customer membership must be in *Active* or *Inactive* status.

Also, the customer membership must be a standard (non-loyalty) membership. You cannot cancel loyalty memberships through order maintenance, because you do not create these memberships by selling a membership item; instead, the system creates loyalty memberships based on the customer's order or sales activity. Only customer memberships you sell in order to generate orders or provide a discount are eligible for cancellation through cancellation of the related membership item.

What if the customer membership has already been canceled? If you have already canceled the customer membership through [Working with Customer Memberships \(WWCM\)](#) and you then cancel the membership item, the system simply cancels the membership item on the order like any other item.

Canceling a single membership on an order that created multiple customer memberships: It is possible to create more than one customer membership on an order by adding multiple membership items. If the system cannot determine which customer membership was created as the result of the membership item being cancelled, the [Customer Membership Cancellation Window](#) opens so you can select the correct membership to cancel. This situation can occur if you use a generic membership item to create different types of customer memberships, or if the customer has ordered two of the same membership item (for example, one for himself and one for a friend). You can use the Customer Membership Cancellation window to select the correct customer membership to cancel.

Canceling multiple memberships or the entire order: If you cancel multiple membership items or an entire order and the system cannot determine which customer membership was created for each membership item, the [Customer Membership Cancellation Window](#) opens so you can select a membership to cancel until each customer membership is accounted for. For example, you enter an order that creates a COFFEECLUB membership and a DISCOUNT membership, both created with the generic MEMBPGM item. If you cancel the entire order, the Customer Membership Cancellation window opens, displaying the COFFEECLUB and DISCOUNT memberships. Select either membership at this window. Once there is only one remaining customer membership left to cancel (for example, you cancel the COFFEECLUB membership, so only the DISCOUNT membership remains), the

system does not need to display the window and can cancel the remaining membership automatically.

Situations in which you cannot identify the correct membership to cancel: There might be situations in which you cannot determine the differences between the customer memberships created through an order and displayed at the [Customer Membership Cancellation Window](#), described below. For example, you have created two customer memberships on the same order: one to ship to the sold-to customer, and one where you specify an alternate shipping address for the customer membership. In this situation, both the membership item and the membership program name are the same, so you cannot distinguish them at the Work with Order Lines screen or the Customer Membership Cancellation window.

In any situation where you might not be able to determine the correct order line or customer membership to cancel based on the information displayed in order maintenance, you should first cancel the correct customer membership through [Working with Customer Memberships \(WWCM\)](#) and then cancel the related membership item in order maintenance.

What if you have already generated orders for the customer membership? You can still cancel the membership item and prevent the customer membership from generating any subsequent orders, even if you have already used the [Generating Membership Orders \(EGMO\)](#) option to generate an order for the membership. In this situation, the [Order Warning Message Window](#), described below, indicates that you need to cancel the generated order(s) if the customer does not want to receive shipments.

If the membership generation is currently in process, or if the customer membership is in *In process* status because the generated order is suspended in batch, the [Membership in Process Window](#), described below, indicates that you need to cancel the customer membership through the [Working with Customer Memberships \(WWCM\)](#) option.

When do these windows open? If the system determines that it needs to display any of the windows described below, it does so at the end of your order maintenance session, after you have entered a cancel reason and clicked *Accept* to accept your changes. At this point, the maintenance accept process is already underway, and you can no longer reject your maintenance changes in order to prevent the customer membership(s) from being canceled.

Does the system cancel customer memberships automatically in any other situations? When you use the *Void/Cancel* option in [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#), the system also cancels the related customer membership if the order includes a membership item. In this situation, the system uses the same logic as in order maintenance to determine whether to display the windows described below.

The system does not automatically cancel customer memberships through any other screen or process. For example, if you cancel an order or membership item through the e-commerce interface, you need to use [Working with Customer Memberships \(WWCM\)](#) to cancel the related customer membership.

No membership cancellation email generated: When you cancel the membership item in order maintenance, the system does not generate the membership cancellation confirmation email regardless of the setting of the [Membership Cancellation Email Program \(K77\)](#). See [Membership Cancellations](#) for a discussion.

For more information: See [Membership Overview](#) for background, and see [Working with Customer Memberships \(WWCM\)](#) for details on customer memberships.

Customer Membership Cancellation Window

This window opens when you cancel one or more order lines for membership items, and the system cannot determine which customer membership(s) should be canceled as a result.

For example, you use a generic item called MEMBPGM to create customer memberships in order entry, and then select the correct membership program at the [Enter Membership ID Window \(Selecting a Membership Program\)](#). You have recently entered an order for a customer to create two customer memberships:

- COFFEECLUB, to generate a shipment of coffee every month for 12 months; and
- DISCOUNT10, to provide the customer with a 10% discount on all orders for the next 12 months.

The customer decides to cancel the COFFEECLUB membership. In this situation, when you cancel the MEMBPGM item in order maintenance, you need to select the COFFEECLUB membership at the Customer Membership Cancellation window in order to cancel the correct customer membership.

For more information: See the discussion above under [Canceling a Membership Item](#).

Field	Description
Item	<p>The membership item selected for cancellation. If you are canceling multiple membership items or an entire order that includes multiple membership items, then this window opens for each membership item until the system has accounted for each customer membership it needs to cancel. If there is only one remaining membership created by the order that is eligible for cancellation, then the system does not need to display the window for you to select the membership.</p> <p>The description of the membership item is to the right. Item: alphanumeric, 12 positions; display-only. Description: alphanumeric, 120 positions; display-only.</p>
Membership ID	<p>The code that identifies the membership program that serves as the template for the customer membership. The customer memberships displayed at this window can serve to generate membership orders, provide a discount percentage, or both.</p> <p><i>Selecting a membership to cancel:</i> Click the membership ID in order to cancel this customer membership. Alphanumeric, 12 positions; optional.</p>
Description	<p>The description of the membership program. Alphanumeric, 30 positions; display-only.</p>

Completing this window: Click the membership ID of the customer membership you want to cancel. See the discussion above for more information.

Cautions:

- If you are canceling multiple membership items, or an entire order that includes multiple membership items, the Customer Membership Cancellation window opens repeatedly until each customer membership that needs to be canceled is accounted for. If there is only one remaining membership created by the order that is eligible for cancellation, then the system does not need to display the window for you to select the membership.

- Once you select a customer membership at this window by clicking the Membership ID, the system continues to cancel the customer membership and closes your maintenance session. You do not have an opportunity to reject your selection.

Order Warning Message Window

This window opens if a customer membership selected for cancellation has already generated one or more membership orders. The window lists the membership item and item description related to the customer membership selected for cancellation. The system will complete the cancellation of the order line and the customer membership, so that it does not generate any additional orders; however, it cannot automatically cancel orders that you have already generated.

In order to identify and cancel the generated order(s), you can use the *Orders for Customer* option at the [Work with Customer Memberships Screen](#) in [Working with Customer Memberships \(WWCM\)](#).

For more information: See the discussion above under [Canceling a Membership Item](#).

Membership in Process Window

This window opens if a customer membership selected for cancellation is in *In Process* status. This status indicates the membership generation is currently running, or that the membership generation has completed but the generated order is still suspended in batch. The generated order might be suspended if there is an error requiring resolution, such as a ship via that is not valid for the shipping address. The window indicates the membership item and item description related to the customer membership selected for cancellation.

In this situation, the system still completes the cancellation of the order line for the membership item, but you need to use the [Working with Customer Memberships \(WWCM\)](#) option to cancel the customer membership, and use batch order entry to reject the suspended order.

For more information: See the discussion above under [Canceling a Membership Item](#).

Canceling an Order through Order Maintenance

Purpose: You can cancel an entire order by selecting *Cancel Order* on the [Work with Order Screen in Order Maintenance](#) or the [Work with Order Lines Screen](#) in order maintenance. The system frees up any reserved inventory on the canceled order and makes it available to other orders.

To cancel an order line: See [Canceling an Item in Order Maintenance](#).

What if the order includes a membership item? See [Canceling a Membership Item](#) for information.

Canceling brokered orders: You need authority under the [Cancel Order Broker Lines \(B19\)](#) secured feature to cancel a retail pickup, delivery, or store pickup order, or an order that includes a brokered backorder line. For an overview, see [Order Orchestration Integration](#), including:

- [Canceling a Brokered Backorder Request](#)

- [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#)
- [Canceling a Store Pickup Order](#)

Canceling a retail pickup or delivery order: If you cancel a retail pickup or delivery order, the system changes the Order Orchestration record's status to *Canceled* and sends a status inquiry request to Order Orchestration. If the order's status in Order Orchestration is:

- *Canceled*: the system does not send a status update to Order Orchestration; otherwise,
- If the order's status in Order Orchestration is anything but *Canceled*, the system sends a status update to Order Orchestration indicating the status is *Rejected*. In this situation, Order Orchestration then changes the order status to *New_order*.

! Important:

If Order Orchestration is configured to "reshop" (the Search retries setting at the Preferences screen is not set to 0), then in this situation Order Orchestration attempts to assign the order to another location for fulfillment.

Canceling a quote through order maintenance: See [Cancelling a Quote through Order Maintenance](#) for information.

Cancellation email: The system generates an order cancellation email or *Outbound Email XML Message (CWEmailOut)* to the customer if:

- you have specified an [Order Cancellation Email Program \(K78\)](#), and
- there have not been any shipments on the order, and
- the cancel reason code you use does not match the [Cancel Reason Code to Suppress Email \(L08\)](#), and
- the customer is eligible to receive email notifications; see [When Does the System Generate an Email Notification?](#)

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1)

If there have been any shipments on the order, the system generates the order line cancellation email even if all the remaining order lines are now canceled.

See the [Order Cancellation Confirmation Email Sample and Contents](#) and the [Order Line Cancellation Confirmation Email Sample and Contents](#) for more information.

In this topic:

- [Enter Cancel Reason Window](#)
- [Order Updates for Cancellation](#)
- [Picks Pending Window](#)

Enter Cancel Reason Window

To cancel: Select *Cancel Order* at the [Work with Order Screen in Order Maintenance](#) or [Work with Order Lines Screen](#) to display the Confirm Cancel window. If you select OK at this pop-up window, you advance to the Enter Cancel Reason window.

Field	Description
Order #	The number of the order you wish to cancel. Numeric, 9 positions; display-only, assigned by the system.
Ship to number (Unlabeled field to the right of the order number)	The number of shipping addresses for the order you wish to cancel. Numeric, 3 positions; display-only, assigned by the system.
Cancel reason	The reason for canceling the entire order. Cancel reason codes are defined in and validated against the Cancel Reason table; see Establishing Cancel Reason Codes (WCNR) . Numeric, 2 positions; required.
Cancel all ship to's	Controls whether the system cancels each recipient order or only the current order. A recipient order is an order that is shipping to a different address. Valid values are: <ul style="list-style-type: none">• <i>Selected</i> = Cancel all recipient orders.• <i>Unselected</i> = (default) Cancel only the current order.

 **Note:**

If the [Submit O/M Cancel Asynchronously \(M36\)](#) system control value is selected, the Cancel all ship-tos field does not display on the Enter Cancel Reason window and the setting defaults to selected.

Field	Description
Recalculate freight	<p>Determines whether the system refunds the freight charge to the customer for the canceled items.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> =Recalculate and refund freight. The system will recalculate freight down to zero. • <i>Unselected</i> (default) = Do not recalculate and refund freight. <p>The Submit O/M Cancel Asynchronously (M36) system control value controls the default setting of this field, but you can override this default.</p> <p>Tax: The system recalculates tax regardless of the setting of this field.</p>

 **Note:**

If the [Submit O/M Cancel Asynchronously \(M36\)](#) system control value is selected, the Recalculate freight field does not display on the Enter Cancel Reason window and the setting defaults from the [Recalculate Freight Default \(F62\)](#) system control value.

When you select *OK* at the Enter Cancel Reason window to submit the order cancel, the system looks at the setting of the [Submit O/M Cancel Asynchronously \(M36\)](#) system control value.

- If the [Submit O/M Cancel Asynchronously \(M36\)](#) system control value is selected, the system submits the order cancel asynchronously. The system locks the order until the cancel is complete. In addition, the system writes a message to the TRACE log when an asynchronous order cancel starts and when it ends.
- If the [Submit O/M Cancel Asynchronously \(M36\)](#) system control value is unselected, the system submits the order cancel synchronously.

Order Updates for Cancellation

The system performs these updates when you select *Cancel Order* on the [Work with Order Screen in Order Maintenance](#) or the [Work with Order Lines Screen](#) in order maintenance, based on whether the cancel reason code you use reduces demand:

Reduce Demand?	Order Status	Line Status	Quantity Ordered	Quantity Canceled
no	<p><i>Cancelled</i> if you cancel the entire order.</p> <p><i>Closed</i> if part of the order has already shipped or was soldout.</p>	<p><i>Cancelled</i> if you cancel the entire order line.</p> <p><i>Closed</i> if all or part of the order line has already shipped.</p>	not affected	updated with quantity cancelled

Reduce Demand?	Order Status	Line Status	Quantity Ordered	Quantity Canceled
				S o l d o u t s t a t u s .

See [Establishing Cancel Reason Codes \(WCNR\)](#) for more information about reducing demand.

The order remains on the system for inquiry purposes; you can reopen a canceled order through Order Maintenance by adding a new item to the order.

You cannot update any canceled lines through Order Maintenance.

Picks Pending Window

Purpose: This window opens when you select *Cancel Order* to cancel an order that has printed pick slips.

To complete this window: Select *Void/Reprint* to void the pick slips, or select *OK* or *Exit* to cancel. You cannot cancel the order until pick slips are voided.

If you select *Void/Reprint*, you advance to the [Reprint/Void Pick Slips by Order Screen](#). An error message indicates if you are not authorized to void pick slips:

User (SBROWN) is not authorized to void pick slips.

Returning and Exchanging Items in Order Maintenance

Purpose: Select the return and exchange option in order maintenance to handle customer merchandise returns, by automatically:

- authorizing the return
- processing the return
- returning the item to active or inactive inventory
- crediting the customer for the returned item (the refund is created and ready for processing)
- optionally, adding an exchange item to the order

These processes all take place “behind the scenes” when you process a return or exchange in order maintenance. You can, however, perform the creation, receipt, and credit of the return in separate stages through the following options:

- Work with Return Authorizations; see [Working with Return Authorizations: Standard Process](#) or [Working with Return Authorizations: Streamlined Process](#).
- Work with Return Authorization Receiving; see [Receiving Returns \(WRAR\)](#).
- Work with Return Authorization Credits; see [Crediting Returns \(WRAC\)](#).

Other return options:

- You can also enable customers to create return authorizations at the web storefront. See [Introducing Return Authorizations \(WRTA\)](#) for an overview.
- You can use the *Inbound Return API* to receive a *Return Request Message (CWReturnIn)* from an external system. See *Inbound Return API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for an overview.
- Returns can also be performed by entering a negative quantity on an order in Order Entry. See [Posting a Return or Exchange Through Order Entry](#).

Retail pickup or delivery orders: If the [Suppress Returns for Retail Pickup/Delivery \(L88\)](#) system control value is:

- selected, you cannot process a return against a retail pickup or delivery order or add a negative additional charge
- unselected, you can process a return against a retail pickup or delivery order; however, the [Order Broker Payment Type \(K98\)](#) is deactivated after shipment, so you would then need to enter a new payment method in order to process the related refund.

Note:

Regardless of the setting of the [Suppress Returns for Retail Pickup/Delivery \(L88\)](#) system control value, you cannot enter a line with a negative quantity or apply a discount against a shipped order line on a retail pickup or delivery order.

The system does not send a status update to Order Orchestration when you process a return against a retail pickup or delivery order.

See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview.

Ship-for-pickup orders: You can process a return for a ship-for-pickup order as long as the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value is not selected. This system control value also controls the ability to enter a return through a negative quantity, apply a discount to a closed order line, and apply a negative additional charge in order maintenance. See [Ship-for-Pickup Orders](#) for background.

Store pickup orders: You cannot process a return against a store pickup order. See [Store Pickup Orders](#) for an overview.

In this topic:

- [Starting the Return Process](#)

- [Types of Returns](#)
- [No Primary Location Window](#)
- [Tax Override](#)
- [Return/Exchange Item Screen \(Single Item\)](#)
- [Return/Exchange Item Screen \(Entire Order\)](#)
- [Create RA Detail Screen \(Entering a Misship Return\)](#)
- [Enter Exchange Item Screen](#)
 - [Add Reason Code Window](#)
- [Receiving the Return](#)
 - [Type of Return Updates](#)
- [Completing the Return Process](#)

Starting the Return Process

Purpose: You can process a return against an item or an entire order in order maintenance. The system creates and processes a return authorization automatically, because entering a return through order maintenance indicates that you have physically received the item being returned (or your drop ship vendor has received the item) and you are updating the order to reflect this change in the order status.

Authority: You must have complete authority to create, receive, and credit a return in order to use order maintenance for returns processing. Returns authority is controlled by three secured features:

- [Enter Return Authorization \(A28\)](#)
- [Receive Return Authorization \(A29\)](#)
- [Credit Return Authorization \(A34\)](#)

Overview of the returns process: See [Introducing Return Authorizations \(WRTA\)](#) for an overview of the steps in the return authorization process and the table updates that take place at each step. These steps and updates take place “behind the scenes” when you process a return in order maintenance.

Return authorization download triggers: If the [Create Return Download Triggers \(K28\)](#) system control value is *selected*, the system creates a return authorization download (RAD) trigger when you post a return in order maintenance, based on the trigger rules defined for the Return Authorization Download (RETURN_OUT) integration layer job. The RETURN_OUT integration layer job monitors for return authorization download triggers and generates a Return Authorization Outbound XML Message (CWReturnRAOut) to send the return authorization information to a remote system.

Types of Returns

The Return/Exchange Item screen in order maintenance is your point of access for entering returns, exchanges, and misshipments. Your entries to this screen not only define how the refund will be calculated, but determine which screens you use to process the return:

Type of Return	Comments
Returning a single item	Select <i>Return</i> for an item to specify the quantity to return (which must be equal to or less than the quantity shipped) and indicate whether the item is being exchanged for a new item at the Return/Exchange Item Screen (Single Item) .
Returning the entire order	Select <i>Return</i> to return the entire order using the Return/Exchange Item Screen (Entire Order) . The system assumes that you want to process the return of all shipped quantities on the order. The system also assumes that the customer is not requesting an exchange because you need to identify which returned item is being exchanged for a new item.
Performing a straight return	<p>You can perform a straight return of an item or an order by entering a valid return reason code, return disposition code, and (optionally), the warehouse and location into which you will receive the return. The system will issue the appropriate refund to the customer for the return.</p> <p>The system will perform a return type of inventory transaction for the returned item. Additionally, the system will add a record to the Display Order Line History Screen for the order detail line or the Display Order History Screen (if returning the entire order) to keep an audit trail of activity on the order; see Type of Return Updates and Completing the Return Process.</p>
Performing a return/exchange	<p>You can return an item and send the customer an exchange item by entering a valid exchange reason code, a valid return disposition code, and (optionally), the warehouse and location into which you will receive the return. You advance to the Enter Exchange Item Screen, where you can identify the item that will be sent to the customer in exchange for the returned item.</p> <p>The system will process a return and add a line to the order for the addition of the exchange item. Additionally, a record will be added to the Display Order Line History Screen for the order detail lines being returned and added.</p> <p>In order to perform more than one return and/or exchange against the same order line for the same warehouse and location, you must select <i>Accept</i> for the entered return or exchange before performing a subsequent return or exchange. If not, the system displays the following error message: Multiple returns not allowed for same Item/Whse/Loc.</p> <p>However, you can still perform a return for the same line but to a different warehouse and location, or a return for a different order detail line, before selecting <i>Accept</i>.</p> <p>Credit card net exchange billing: If the Use CC Net Exchange Billing (M23) system control value is selected and the order contains a credit card pay type, the system may hold the credit invoice for the return to net it against the debit invoice for the associated exchange in order to reduce the number of transactions that occur for an exchange; see Credit Card Net Exchange Billing.</p>
Multiple vendors for drop ship items	Managing returns on drop ship items through integration with Order Orchestration is not currently supported.

Type of Return	Comments
Entering a misship return	<p>Optionally, you can select <i>Create Misship Return</i> at the Return/Exchange Item Screen (Single Item) to create a misship return for an item that was mistakenly picked in the warehouse or an item that was shipped along with the requested item.</p> <p>You advance automatically to the Create RA Detail Screen (Entering a Misship Return), where you can enter and return the mis-shipped item in one step.</p>

No Primary Location Window

You might receive returns for items which have no primary location, such as items that you have previously liquidated and sold through an outlet store, or the items are drop ship items shipped directly from the vendor. For these items, if you have *selected* the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value, the system displays a pop-up window indicating that a primary location for the item when you enter and validate the item as a return or a mis-ship.

This window is informational only. You can select *Cancel* to cancel the window, and then, if you wish, change the return disposition code before updating your entries and accepting/processing the return.

This window does not appear when you use the option of returning the entire order by selecting *Return* at the [Work with Order Lines Screen](#).

Tax Override

Order Administration updates the Tax override field for an order line to *Selected* if the order was received from an external system and a tax, GST, or PST amount was defined, indicating the tax amount from the external system should be retained on the order line.

If the Tax override field for the order line you are returning is *selected*, the system does not call the regular tax routine to recalculate the amount of tax remaining on the order line and how much tax to include on the credit invoice. Likewise, if you use an external tax system to calculate tax, the system does not call the tax system to recalculate the tax amount.

Instead, the system prorates the tax override amount across the units ordered on the order line to determine the new tax override amount and the tax amount to return.

Determining the new tax override amount: The system uses the following calculations to determine the new tax override amount assigned to the order line:

Original order quantity - Cumulative return quantity = Net order quantity

Net order quantity / Original order quantity = Return ratio

Return ratio x Original tax override amount = New tax override amount

Example:

Order Line (tax override = Y)	Results
quantity ordered: 3	Net order quantity: 3 - 1 = 2
tax override amount: 3.00	Return ratio: 2 / 3 = .66666
	New tax override amount: .67 x 3.00 = 1.99998

Order Line (tax override = Y)	Results
return quantity: 1	The new tax override amount (2.00) displays in the Tax field for the order line on the Display Order Detail screen.

Determining the tax amount to return: The system uses the following calculations to determine the tax amount to include on the credit invoice created for the return:

Current return quantity / Original order quantity = Return ratio

Return ratio x Original tax override amount = Returned tax amount

Example:

Order Line (tax override = Y)	Results
quantity ordered: 3	Return ratio: 1 / 3 = .33333
tax override amount: 3.00	Returned tax amount: .33333 x 3.00 = .99999
return quantity: 1	The returned tax amount (1.00) displays in the Tax field for the credit invoice on the Display Invoice Detail screen.

Return/Exchange Item Screen (Single Item)

Purpose: Use this screen to return an individual item on an order. See [Starting the Return Process](#).

How to display this screen: Select *Return* for a shipped item at the [Work with Order Lines Screen](#). See *Returning and Exchanging Items in Order Maintenance* for information on whether retail pickup, delivery, store pickup, or ship-for-pickup orders are eligible for returns.

Field	Description
Item/SKU	The code for the item and SKU that is being returned. Items are defined in and validated against the Item table. Alphanumeric, 12 positions; display-only. SKUs are defined in and validated against the SKU table. Alphanumeric, three 4-position fields; display-only.

 **Note:**

These fields display only if you are returning a single item; they do not display if you Selected *Return* to return the entire order.

Field	Description
RA # (Return authorization number)	<p>A code that identifies the return. The return authorization number is comprised of the order number, ship-to number, and return authorization number.</p> <p>Order number A unique number to identify an order. The starting order number and last order number assigned are defined in the Number Assignment table. Numeric, 8 positions; display-only, assigned by the system.</p> <p>Ship-to number (unlabeled field to the right of the Order # field): The number of shipping addresses for the order. The system assigns a ship-to suffix of 1 to a single recipient order. Numeric, 3 positions; display-only, assigned by the system.</p> <p>Return authorization number The number assigned to this return authorization. Numeric, 3 positions; display-only, assigned by the system.</p>
Qty to return (Quantity to return)	<p>The number of units of the item that are being returned. Must be less than or equal to the value in the Unreturned qty field.</p>
	<div style="border-left: 2px solid #0070C0; padding-left: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This field displays only if you are returning a single item by selecting <i>Return</i> for the item line; it does not display if you selected <i>Return</i> to return the entire order.</p> </div>
Unreturned quantity	<p>Numeric, 5 positions; required if returning a single item.</p> <p>The quantity on the order or the order detail line that has been shipped and is eligible to be returned. The system updates this field when shipments and returns occur.</p>
	<div style="border-left: 2px solid #0070C0; padding-left: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This field displays only if you are returning a single item by selecting <i>Return</i> for the item line; it does not display if you selected <i>Return</i> to return the entire order.</p> </div>
Return reason	<p>Numeric, 5 positions; display-only, updated by the system.</p> <p>Indicates the reason that the customer is returning an item. Return reason codes are defined in and validated against the Return Reason table. See Establishing Return Reason Codes (WRTR).</p> <p>Numeric, 3 positions; optional.</p>

Field	Description
Exchange reason code	Indicates the reason that the customer is returning one item and ordering a replacement item. Exchange reason codes are defined in and validated against the Exchange Reasons table; see Establishing Exchange Reason Codes (WEXR) .

 **Note:**

This field is available only if you are returning a single item; it is not available if you selected *Return* to return the entire order. Also, it is not available when you are working with a retail pickup or delivery order. See [Maintaining Retail Pickup or Delivery Orders from Order Orchestration](#) for a discussion.

You advance automatically to the [Enter Exchange Item Screen](#) when you enter a valid exchange reason code after completing this screen.

Numeric, 3 positions; optional.

Return disposition

A code that identifies how a returned item will be handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the item will be returned. You must enter a valid return disposition code when performing any type of return, such as a straight return, entering an exchange item, etc.

Affect inventory? If the return disposition code affects inventory (meaning that the item will be returned into active inventory and update the on-hand quantity in the specified location), you must specify the warehouse and location where the item will be returned. If the disposition code is set up to affect inventory and return to the primary location, the system will check for the primary location for the item. If one is available, the system will return the item automatically to this warehouse location. If one is not available or if the disposition code is not set up to receive returns in the primary location, the system will receive the return in the warehouse and location defined for the return disposition; however, you can override these values to return the item to an alternate location. If the item/location does not exist, the system will create a record in the Item/Location table automatically.

Field	Description
	<div data-bbox="857 302 1377 449" style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px;"> Note: See No Primary Location Window.</div> <p><i>Authority:</i> You can set authority to process a return for a specific return disposition value at the user or user class level. This can be a blanket authority for all disposition values, or can be specific to individual codes. An error message indicates if you do not have authority to the return disposition code specified: User Does not have authority to return disposition code 4A.</p> <p>Return disposition codes are defined in and validated against the Return Disposition Values table; see Establishing Return Disposition Values (WRDV).</p> <p>Alphanumeric, 2 positions; required.</p> <p>Warehouse</p> <p>A code for the warehouse where this item is being returned. Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; required if the return disposition code affects inventory.</p> <p>Location</p> <p>The location in the designated warehouse where the item will be returned.</p> <p>The location code typically consists of 4 different elements: zone, aisle, shelf, and bin. See Creating and Maintaining Locations (WLOC).</p> <p>Alphanumeric, 7 positions; required if the return disposition code affects inventory.</p>

Field	Description
Refund freight	<p>Indicates whether to refund the freight charge for the returned item or returned order for the return.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Refund freight. If a <i>Freight override</i> amount is defined for the order and the Calculate freight field for the order ship to is selected, the system advances you to the <i>Enter Freight Refund Window</i>. <i>Unselected</i> (default) = Do not refund the shipping charges. If you <i>select</i> this field and the source code uses a header level freight method, the system refunds a proportionate amount of freight for the items being returned. If you <i>select</i> this field and the source code uses a line level or flat freight method, the system refunds the freight charge for the returned items on the order. <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Your entry in this field also controls whether the system refunds any service charges by ship via on the order. See <i>Working with Ship Via Codes (WVIA)</i>.</p> </div>
Refund add'l chgs (Refund additional charges)	<p>Indicates whether the system should refund the additional charges on the order.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Refund the additional charges <i>Unselected</i> (default) = Do not refund the additional charges <p>Because an order's additional charges are billed out with the first shipment on the order and a return is always performed against an invoice, when you specify to refund additional charges, the customer may not receive the intended refund if you are performing the refund against a subsequent invoice.</p>
Refund handling	<p>Controls whether the system will credit the customer for handling charges assessed on the item being returned.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = the system will include the charge for special handling in the customer's refund. <i>Unselected</i> = any charges for special handling (item personalization, such as monogramming, etc.), will not be refunded to the customer.

Field	Description
Refund duty charges	<p>Controls whether to refund duty charges assessed on international shipments. The duty charges for an order are generally included in the Handling field, but you can review the duty charge for an individual item by selecting <i>Change</i> for the item in order entry or Maintenance, or <i>Display</i> for an item in standard Order Inquiry.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> (default) = Refund duty charges for the item or order <i>Unselected</i> = Do not refund duty. <p>You can review the actual amount of duty that has been billed or refunded for an item on a particular invoice in standard Order Inquiry on the Invoice Detail Charges Screen. To display this screen, select <i>Invoices</i> to review invoices, select <i>Display Details</i> for an invoice to display details, then select <i>Detail Charges</i> for the invoice detail.</p>

Screen Option	Procedure
Enter and return an order detail line for an item that was mistakenly shipped to the customer	Select <i>Crt Misship Rtrn</i> to advance to the Create RA Detail Screen (Entering a Misship Return) .

Enter Freight Refund Window

Use this window to enter the freight amount to refund.

How to display this screen: This window displays if you select the Refund freight field on the [Return/Exchange Item Screen \(Single Item\)](#), a *Freight override* amount is defined for the order, and the Calculate freight field for the order ship to is selected.

Field	Description
Current freight amount	<p>The current freight amount for the order, based on the <i>Freight override</i> amount on the Display Order Properties Screen.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Freight refund	<p>The amount of freight to refund.</p> <p>Freight tax override: If a <i>Freight tax override</i> is defined for the order, the system uses the <i>Freight tax rate</i> to calculate the amount of tax on freight to refund.</p> <p>Numeric, 13 positions with a 2-place decimal; required.</p>

Instructions:

1. Enter the amount of freight to refund in the Freight refund field.
2. Select *OK*. The system subtracts the freight refund amount from the current freight amount and updates the *Freight override* amount on the [Display Order Properties Screen](#) with the new *Freight override* amount. If a *Freight tax override* is defined for the order, the system uses the *Freight tax rate* to determine the new freight tax amount.

Example: You return a line on an order whose freight override amount is \$10.00 and freight tax override amount is \$2.50. The freight tax rate is 25%. At the Enter Freight Refund

window, you enter \$4.00 as the freight refund amount. Based on the freight refund amount, the system:

- Refunds \$4.00 freight and \$1.00 freight on tax.
- Updates the freight override amount to \$6.00.
- Updates the freight tax override amount to \$1.50.

Return/Exchange Item Screen (Entire Order)

Purpose: Use this screen to return all shipped items on an order. This screen is similar to the [Return/Exchange Item Screen \(Single Item\)](#); however, it does not display item information, the Qty to return or Exchange reason code fields because you are returning all shipped items on the order.

How to display this screen: Select *Return* at the [Work with Order Screen](#) or [Work with Order Lines Screen](#) to return the entire order. See [Return/Exchange Item Screen \(Single Item\)](#) for an explanation of each field on this screen, and see [Returning and Exchanging Items in Order Maintenance](#) for information on whether retail pickup, delivery, store pickup, or ship-for-pickup orders are eligible for returns.

Create RA Detail Screen (Entering a Misship Return)

Purpose: Use this screen to create a misship return, in which you enter information for a returned item that was shipped to the customer by mistake.

When to use this screen: Typically, you create a misship return for an item that was mistakenly picked in the warehouse or an item that was shipped along with the requested item.

Processing the misship: When you complete this screen, the system will enter and return the misshipped item in a single process. The system will add a “no charge” order detail line to the order for the mis-shipped item. Additionally, the system will write a message on the [Display Order Line History Screen](#) for this transaction.

To enter an exchange item: Optionally, you can enter a valid exchange reason code in the Exchange reason field on this screen to advance to the [Enter Exchange Item Screen](#) so you can enter the item that the customer really wants. If you define an exchange item to replace the mis-shipped item, the system will add two lines to the order. The first line adds and returns the mis-shipped item and the second line adds the exchange item to the order. The system will process the exchange item as if it was added through order entry. The usual order processing will be performed, which includes running all credit check routines and reserving the item if using Immediate Reservation. The actual pick slip for the exchange item will be produced when you run the Pick Slip Generation program.

The system will write a message to the [Display Order Line History Screen](#) for this transaction.

How to display this screen: Select *Crt Misship Rtrn* at the [Return/Exchange Item Screen \(Single Item\)](#).

Field	Description
RA number (Return authorization number)	<p>A code that identifies the return. The return authorization number includes the order number, ship-to number, and return authorization number.</p> <p>Order number A unique number assigned by the system to identify an order. Numeric, 8 positions; display-only, assigned by the system.</p> <p>Ship-to number (unlabeled field to the right of the Order # field): Indicates the number of shipping addresses for the order. The system assigns a ship-to suffix of 1 to a single recipient order. Numeric, 3 positions; display-only, assigned by the system.</p> <p>Return authorization number A system-assigned code for a return authorization. Numeric, 3 positions; display-only, assigned by the system.</p>
Line # (Return authorization line number)	<p>The line number on the return authorization. Up to 999 items may be returned on a single return authorization. Numeric, 3 positions; display-only, assigned by the system.</p>
Item	<p>The code for the mis-shipped item that the customer is returning. Item codes are defined in and validated against the Item table. See Performing Initial Item Entry (MITM).</p> <p>You can enter a cross reference code that represents another system's item and SKU code in this field. If you enter a cross reference code, the system searches the SKU Cross Reference table alphanumerically for the first Order Administration item and SKU that is associated with this cross reference code. You can maintain cross reference codes in Maintaining SKU Cross Reference Codes (MSKR).</p>
SKU	<p>Multiple returns not allowed for same item/warehouse/location.</p> <p>Alphanumeric, 12 positions; required.</p> <p>The SKU code for the mis-shipped item (if any), that further defines an item's color, size, width, or any other type of user-defined attribute.</p> <p>SKUs are defined in and validated against the SKU table.</p> <p>Alphanumeric, three 4-position fields; required if the item has SKUs.</p>

 **Note:**

You cannot enter a set item as a misship return or exchange if more than one of the set item components reside in the same item warehouse location. In this case the system will display the following message when you try to process the misship:

Field	Description
Order line#	The line number against which you are processing the return. In the case of a misshipped item, no line number is available because this item was never on the order. Numeric, 3 positions; display-only.
Invoice # (Invoice number)	A unique number to identify the invoice against which the item was shipped and billed. In the case of a mis-shipped item, no invoice number is available because this item was never on the order. Numeric, 7 positions; display-only, assigned by the system.
Invoice line number (Unlabeled field to the right of the Invoice# field)	The line number on the invoice on which the item was shipped and billed. In the case of a misshipped item, no invoice line number is available because this item was never on the order. Numeric, 3 positions; display-only, assigned by the system.
Refund freight	This setting does not affect mis-ship returns. Alphanumeric, 1 position; required.
Refund add'l chgs	This setting does not affect mis-ship returns. Alphanumeric, 1 position; required.
Refund handling	This setting does not affect mis-ship returns. Alphanumeric, 1 position; required.
Refund duty	This setting does not affect mis-ship returns. Alphanumeric, 1 position; required.
Qty to return (Quantity to return)	The quantity of the mis-shipped item that the customer is returning. Numeric, 5 positions; required.
Qty returned (Quantity returned)	The quantity of this item that has actually been returned through the returns function in order maintenance or through the return authorization program. In the case of a mis-shipped item, no quantity returned is available because this item was never on the order. Numeric, 5 positions; display-only; updated by the system.
Qty credited (Quantity credited)	The quantity of the returned item that has been credited (refunded) to the customer. In the case of a mis-shipped item, no quantity credited is available because this item was never on the order. However, the system updates the Date credited field in the RA Header table to indicate a pending credit does not exist. Numeric, 5 positions; display-only, updated by the system.
Return reason	Represents a reason that the customer is returning the mis-shipped item. Return reason codes are defined in and validated against the Return Reason table; see Establishing Return Reason Codes (WRTR) . Numeric, 3 positions; optional -- complete the Return reason or Exchange reason field.

Field	Description
Exchange reason	<p>Represents a reason that the customer is returning one item and ordering a replacement item.</p> <p>In the case of a mis-shipped item, you can enter and return the mis-shipped item and add a new item to the order for the item originally requested by the customer. If you enter a valid exchange reason code, you advance automatically to the Enter Exchange Item Screen where you can define the replacement item.</p>
	<div data-bbox="873 520 1458 779"><p> Note:</p><p>This field is not available when you are working with a retail pickup or delivery order. See Maintaining Retail Pickup or Delivery Orders from Order Orchestration for a discussion.</p></div>
	<p>Exchange reason codes are defined in and validated against the Exchange Reason table; see Establishing Exchange Reason Codes (WEXR).</p> <p>Numeric, 3 positions; optional -- complete the Return reason or Exchange reason field.</p>
Disposition code	<p>A code that identifies how a returned item will be handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the item will be returned. You must enter a valid return disposition code when performing any type of return, such as a straight return, entering an exchange item, etc.</p> <p><i>Affect inventory?</i> If the return disposition code affects inventory (meaning that the item will be returned into active inventory and update the on-hand quantity in the specified location), the system requires the warehouse and location where the item will be returned. If the disposition code is set up to affect inventory and return to the primary location, the system will check for the primary location for the Item. If one is available, the system will return the item automatically to this warehouse location. If one is not available or if the disposition code is not set up to receive returns in the primary location, the system will receive the return in the warehouse and location defined for the Return Disposition; however, you can override these values to return the item to an alternate location. If the item/location does not exist, the system will create a record in the Item/Location table automatically.</p>

Field	Description				
	<div style="border: 1px solid #0070C0; padding: 5px; margin-bottom: 10px;">  Note: See No Primary Location Window. </div> <p><i>Authority:</i> You can set authority to process a return for a specific return disposition value at the user or user class level. This can be a blanket authority for all disposition values, or can be specific to individual codes. An error message indicates if you do not have Return Disposition Code Authority (A83) to the return disposition code specified: User Does not have authority to return disposition code 4A.</p> <p>Return disposition codes are defined in and validated against the Return Disposition Values table; see Establishing Return Disposition Values (WRDV).</p> <p>Alphanumeric, 2 positions; required.</p> <tr> <td>Warehouse</td> <td> <p>The warehouse where the returned item will be received; this value is used only if the disposition code affects inventory.</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; display-only.</p> </td> </tr> <tr> <td>Location</td> <td> <p>The physical location within the warehouse where the returned item will be received, this value is used only if the disposition code affects inventory.</p> <p>Locations are defined in and validated against the Warehouse/Location table. See Creating and Maintaining Locations (WLOC).</p> <p>Alphanumeric, 7 positions; display-only.</p> </td> </tr>	Warehouse	<p>The warehouse where the returned item will be received; this value is used only if the disposition code affects inventory.</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; display-only.</p>	Location	<p>The physical location within the warehouse where the returned item will be received, this value is used only if the disposition code affects inventory.</p> <p>Locations are defined in and validated against the Warehouse/Location table. See Creating and Maintaining Locations (WLOC).</p> <p>Alphanumeric, 7 positions; display-only.</p>
Warehouse	<p>The warehouse where the returned item will be received; this value is used only if the disposition code affects inventory.</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; display-only.</p>				
Location	<p>The physical location within the warehouse where the returned item will be received, this value is used only if the disposition code affects inventory.</p> <p>Locations are defined in and validated against the Warehouse/Location table. See Creating and Maintaining Locations (WLOC).</p> <p>Alphanumeric, 7 positions; display-only.</p>				

Enter Exchange Item Screen

Purpose: Use this screen to identify the item to send to the customer to replace the returned or mis-shipped item.

Pricing the exchange item: You can send the exchange item to the customer at no charge by selecting *No Charge* in the No charge field; if you select *Priced* for this field, the customer will be charged for the item. If you *select* the Use existing price field, the system will apply the price of the returned item to the replacement item, regardless of any discounts applied.

Specifying a warehouse or shipper: You can specify a particular warehouse in which the exchange item should be picked and/or a particular shipper to deliver the item. For example, you can specify an overnight shipper if the customer requests immediate delivery of the exchange item. If you leave the Ship via and Warehouse fields blank, the system uses the ship via and warehouse specified for the order on the Order Header screen.

Processing the exchange: When you complete this screen, the system processes the return receipt and adds a line to the order for the exchange item. The system also writes a message to the [Display Order Line History Screen](#) for the returned item and the exchange item to account for this activity.

When you complete the return/exchange and process the return by selecting *Accept*, the system reruns the credit check routines. If the extended price of the exchange item (units ordered * item price) is greater than the extended price of the returned item, the system may place the order on hold for a balance due. In this case, you must contact the customer and adjust the order payment information through order maintenance to release the order.

Credit card net exchange billing: If the [Use CC Net Exchange Billing \(M23\)](#) system control value is selected and the order contains a credit card pay type, the system may hold the credit invoice for the return to net it against the debit invoice for the associated exchange in order to reduce the number of transactions that occur for an exchange; see [Credit Card Net Exchange Billing](#).

How to display this screen: Enter a valid exchange reason code at the [Return/Exchange Item Screen \(Single Item\)](#). This option is not available for a retail pickup or delivery order. See [Maintaining Retail Pickup or Delivery Orders from Order Orchestration](#) for a discussion.

Field	Description
RA number (Return authorization number)	<p>A code that identifies the return. The return authorization number includes the order number, ship-to number, and return authorization number.</p> <p>Order number A unique number assigned by the system to identify an order. Numeric, 8 positions; display-only, assigned by the system.</p> <p>Ship-to number (unlabeled field to the right of the Order # field): Indicates the number of shipping addresses for the order. The system assigns a ship-to suffix of 1 to a single recipient order. Numeric, 3 positions; display-only, assigned by the system.</p> <p>Return authorization number A system-assigned code for a return authorization. Numeric, 3 positions; display-only, assigned by the system.</p>
RA line # (Return authorization line number)	<p>The line number on the return authorization. Up to 999 items may be returned on a single return authorization. Numeric, 3 positions; display-only, assigned by the system.</p>
Offer	<p>The offer from which you want to add the exchange item. The offer associated with the return order line defaults, but you can override it. Alphanumeric, 3 positions; required.</p>
Item (Item number)	<p>The code for the exchange item that replaces the returned item. You can enter a cross reference code that represents another system's item and SKU code in this field. If you enter a cross reference code, the system searches the SKU Cross Reference table alphanumerically for the first Order Administration item and SKU that is associated with this cross reference code. You can maintain cross reference codes in Maintaining SKU Cross Reference Codes (MSKR). Alphanumeric, 12 positions; required.</p>
SKU	<p>The style of the exchange item, which may include its color, size, width, or any other type of user-defined attribute. Alphanumeric, three 4-position fields; required (depending on item entered).</p>
Qty ordered (Quantity ordered)	<p>The number of units of the exchange item being ordered. Numeric, 5 positions; required.</p>

Field	Description
No charge	<p>Determines whether the exchange item will be given to the customer at no charge.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>No Charge</i> = Customer is not charged for the item • <i>Priced</i> = The customer will be charged the regular item price for the exchange item
Use existing price	<p>Controls whether the system will apply the unit price of the returned item for each unit you ship of the replacement item, resulting in no net increase or decrease in merchandise charge for the exchange. This might be useful if you sold the original item at a discount and want to replace the item without imposing the regular, non-discounted price. However, if you enter Y in this field, the system uses the original item price whether it was higher or lower than the returned item price.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Use the price of the original item for the replacement item. • <i>Unselected</i> (default) = Use the regular price of the replacement item.

 **Note:**

The system requires that you have defined a default price override reason in the [Price Override Reason for Same Price Exchanges \(D92\)](#) system control value if you selected it. If no default has been defined, a message indicates:

Price Override Reason Code not found (SCV=D92).

Override price

The price at which the item will be added to the order. You cannot enter an override price if the Use existing price field is set to *selected*.

 **Note:**

To enter an override price, you must have authority to the secured feature [Price Overrides \(A23\)](#).

Even if you have authority to override prices, the percentage you can discount the existing price may be limited by system control value E55, Price Override Limit Percent, unless you have authority to secured feature [Override Price Override Limit \(A64\)](#), which allows you to override the limit percent from the system control table. Alphanumeric, 13 positions with a 2-place decimal; optional.

Field	Description
Override reason	<p>The reason you enter an override price. Price override reasons are defined in and validated against the Price Override Reason table. See Establishing Price Override Reason Codes (WPOR). Alphanumeric, 1 position; required if you enter a price in the Override price field.</p>
Ship via	<p>The shipper that will deliver the exchange item to the customer. Enter a ship via only if you want to use a shipper other than the one that delivered the order. Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA). Numeric, 2 positions; optional.</p>
Warehouse	<p>The warehouse from which the exchange item will be shipped. Enter a warehouse only if you want to ship from a warehouse other than the one used on the order. Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS). Numeric, 3 positions; optional.</p>

Completing this screen: Complete the required fields and select *OK*.

The table below indicates how the exchange item is priced, based on the setting of the No charge, Use existing price, Override price and Override reason fields.

No charge	Use existing price	Override price and reason	Results
Priced	blank	blank	Add the exchange item to the order using the regular price.
Priced	selected	blank	Add the exchanged item to the order using the existing price of the return item.
Priced	blank	10.00, P	Add the exchange item to the order using the override price of 10.00 and the price override reason P.
No Charge	blank	blank	Add the exchange item to the order for 0.00 using the Default Price
No Charge	selected	blank	Override Reason (B35) system control value.

Add Reason Code Window

The system displays this pop-up window when you add an item through an exchange or a mis-ship if:

- the [Require Reason for Lines Added in Order Maintenance \(D75\)](#) system control value is *selected*, or
- the Require reason code field for the item offer or SKU offer is *selected*.

 **Note:**

If you are using add reason codes, you will need to enter both an exchange reason code and an add reason code when you process an exchange. You might want to use the add reason code differently for exchanges; for example, using the exchange reason code to track the practical reason for an exchange (too big, wrong color, etc.) and the add reason to track customer satisfaction or attitude.

The add reason code is a 5-position, alphanumeric field, defined in the Add Reason table, that defines the reason for adding an item to an order in order maintenance. See [Establishing Add Reason Codes \(WADR\)](#).

The [Work with Item/SKU Comments Window](#) open if there are comments associated with the item or SKU added to the order.

Receiving the Return

Purpose: The system receives the return automatically when you select *Accept* during order maintenance to process the return authorization.

The system checks the disposition code in the return authorization to determine:

1. Whether to increase the on-hand quantity of the item when adding the item back into inventory.
2. The warehouse and location to which the item is being returned, if the item is returned to inventory.

If the item is being returned to inventory, the system performs the necessary inventory transaction automatically to “move” this item on the system to the warehouse and location specified in the return authorization record.

Processing returns through the integration with Order Orchestration’s Drop Ship Manager is not currently implemented.

Type of Return Updates

The [Display Order History Screen](#) is updated with a message when you select *Accept* to accept and process the return transaction in Order Maintenance.

Order History - Line Return

Selecting *Return* to return a single item in order maintenance adds one message line to this screen.

Order History - Order Return

Selecting *Return* to return the entire order adds one message line to this screen for each item being returned on the order.

Select Active Pay Method screen: The system displays the Select Active Pay Method screen when you select *Accept* during order maintenance to process the return authorization if a deactivated payment method exists on the order. Use this screen to select which active payment method will receive the credit.

Reviewing return activity through the Display Order History Screen: Select *Order History* from the [Work with Order Lines Screen](#) in order maintenance or the [Display](#)

[Order Detail Screen \(Reviewing Order Line Detail\)](#) in standard Order Inquiry. You can also review this information in streamlined Order Inquiry by selecting the *Detail* option for the item.

The system adds an Rtn Auth (return authorization) type transaction message to the [Display Order History Screen](#) when you return a single line or entire order. This message also identifies the date when the credit was processed and the user who performed the return.

Select *History* for the item you want to review to advance to the [Display Order Line History Screen](#).

The system adds an R (Return) type activity message, displays the date when the return was performed, the user who performed the return, the quantity returned, and the exchange or return reason code used.

Completing the Return Process

Purpose: The final series of steps in the return process enables you to generate the refund, in which you are crediting the customer for the merchandise return.

Convert a return into a refund: The system automatically adds a refund record, if appropriate, to the Refund table when you accept a return transaction in order maintenance. This update occurs because the system credits the return automatically “behind the scenes” for returns you process in order maintenance, rather than as a separate step as in the return authorizations functions.

Steps: There are a series of steps you can follow to issue a refund to the customer for a return. Briefly listed, they include:

1. Printing the [Refund Due List](#) to determine which customers are eligible for refunds.
2. Selecting the [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#) menu option to update information for a pending refund.
3. Selecting the [Processing Refunds \(MREF\)](#) menu option to issue the refund in the form of a refund check, etc.
4. Optionally, using the [Reprint Refunds Screen \(MREP\)](#) if you encountered a problem printing the refund checks.
5. Selecting the [Reconciling Checks \(MREC\)](#) menu option when you receive the canceled refund checks from the bank.

See [Issuing Refunds](#) for more information on refund processing.

Enter Payment Methods Screen in Order Maintenance

Purpose: Use this screen to apply a payment to the order or to change existing payment information.

Note:

The Enter Payment Methods screen is the only screen where you can enter payment information in Order Maintenance.

Why maintain payments? Some examples of when you would need to maintain payments on an order include:

- adding a payment to an order that is on hold for a balance due (this automatically releases the order from hold)
- manually authorizing a credit card order that you cannot authorize through your regular credit card authorization service
- interactively authorizing a credit card order that was not authorized in order entry
- correcting order entry errors

Restrictions:

- You cannot apply the *Order Broker Payment Type (K98)* to an order or change this payment method on an existing order; instead, the screen displays an error, such as `Pay type (06-BROKER PAY TYPE) is restricted.`
- You cannot delete a credit card payment if it is associated with authorization history; you must deactivate the credit card payment method. The system displays the message: `Order payment method cannot be deleted/activity exists.`

Enter Payment Methods Screen

Screen structure: The Enter Payment Methods screen is divided into three parts:

- top: displays the order number, the name of the customer who placed the order, and the write-off amount that the customer has overpaid on previous orders that you can apply to the current order.
- center: displays the accumulated order total across all recipient orders and includes fields for you to specify payment information.
- bottom: displays the payment methods already defined for the order. You can change or delete existing payment information on this screen.

 **Note:**

Depending on the user's authority to credit card information, the system writes a record to the Credit Card Audit table when this screen is displayed. See Logging Credit Card Data Access in the *Data Security Guide* on My Oracle Support (2953017.1) for more information.

In this topic:

- *Changing a Payment Method*
 - *Change Charge Sequence*
 - *Enter Cash Control Pop-Up*
 - *Enter Credit Card Pop-Up*
- *Deactivating a Payment Method*
 - *Processing a Refund or Exchange Against a Different Payment Method*
- *Adding, Changing and Deleting a Payment Plan on the Order*
 - *Adding a Deferred or Installment Payment Plan*
 - *Changing a Deferred or Installment Payment Plan*

- [Deleting a Deferred or Installment Payment Plan](#)
- [Performing Online Authorization during Order Maintenance](#)

How to display this screen: Select *Payments* on the [Work with Order Screen in Order Maintenance](#) or the [Work with Order Lines Screen](#).

Field	Description
Order	A unique number the system assigns to identify an order. Numeric, 8 positions; display-only, assigned by the system.
Sold to	The last, first and middle initial of the ship-to customer (the customer who will receive the order). If there is a company name, only this information appears. <i>Last name:</i> The customer's last name. Alphanumeric, 25 positions; display-only. <i>First name:</i> The customer's first name. Alphanumeric, 15 positions; display-only. <i>Initial:</i> The initial of the customer's middle name. Alphanumeric, 1 position; display-only. <i>Company name:</i> The company name. Alphanumeric, 30 positions; display-only.
WO\$ (Write-off dollars)	The accumulated amount of write-offs (overpayments minus underpayments) for this customer that you can apply as payment to the current order by selecting <i>Cvt W/O\$-Paymnt</i> . The system issues a message if you select <i>Cvt W/O\$-Paymnt</i> when the write-off balance is 0 or negative: <code>Cannot use as payment; write-off amount is zero or negative.</code> The system applies the <i>entire amount</i> of the refund/balance due write-off as payment on the order, using the Default Cash Pay Type (C07) . If applying the entire amount of the write-off results in an overpayment on the order, the system issues a refund to the customer. Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.
Pay type	A user-defined code for a method of payment on an order. Payment types are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY) . The pay type code and description display on the lower portion of the screen for payment methods that you have already entered. Numeric, 2 positions; required.
CC #	The number of the credit card used on the order. All credit cards must be authorized manually or by a credit card authorization service. The system holds any unauthorized credit card orders. The system releases these orders once they receive an authorization; or, you can release these orders manually by entering an authorization number in the Authorization # field below.

Field	Description
Exp date	<p>The date up until which the credit card is valid. For example, enter 1226 if the credit card expires in December of 2026.</p> <p>The <i>Require expiration date</i> flag for the pay type controls whether this field is a required entry.</p> <p>Numeric, 4 positions (MMYY format); required or optional, based on the <i>Require expiration date</i> flag for the pay type.</p>
Issue #	<p>An incremental issue number which some banks assign when they replace a credit card, such as a debit card, because it is lost or stolen. It is important to enter the issue number exactly as it appears on the card. For example, an issue number of 0 is different from an issue number of 00, and an issue number of 1 is different from an issue number of 01.</p> <p><i>Required?</i> An issue number may be required for a credit card or debit card, based on the setting of the <i>Require issue #</i> field for the pay type. If it is required and you do not enter an issue number, the system displays an error message: Credit card issue# () is not valid.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note: An entry of 00 (two zeros) is not considered a valid issue number.</p> </div>
Start date	<p>The issue number is a valid entry only for a credit card payment method, such as a debit card.</p> <p>Alphanumeric, 2 positions; required or optional based on the <i>Require issue #</i> flag for the pay type.</p> <p>The month and year when a credit or debit card becomes effective.</p> <p><i>Required?</i> The <i>Require start date</i> flag for the pay type controls whether the start date is required for a credit card pay type. If the start date is required but not entered, the system displays an error message: Credit card start date (0) is not valid.</p> <p>The start date is a valid entry only for a credit card payment method, such as a debit card.</p> <p>Even if you require a start date for a pay type, the system does not validate that the start date is on or before the current date. Typically, if your authorization service requires a start date for this pay type, the service would validate that the start date has passed.</p> <p>Numeric, 4 positions (MMYY format); required or optional based on the <i>Require start date</i> flag for the pay type.</p>

Field	Description
Plan (Deferred or installment payment plan code)	<p>Represents the deferred or installment payment plan assigned to the order. An order is eligible for a payment plan only if it uses a credit card whose Card type is Credit Card rather than, for example, a stored value card. See Types of Credit Cards for more information.</p> <p>This field displays only if the Deferred and Installment Billing (F51) system control value is <i>selected</i>.</p> <p>If you do not have authority to the Override Deferred and Installment Billing Options (A81) secured feature, this field is display-only.</p> <p>An error message indicates if you enter a payment plan code and the order is not eligible.</p> <p>Payment Plans are defined in and validated against the Flexible Payment Option table. See Working with Flexible Payment Options (WFPO).</p> <p>Alphanumeric, 5 positions; optional.</p>
Auth #	<p>Indicates that the charge on this credit card has been approved manually or by a credit card authorization service.</p> <p>You can preauthorize a credit card by entering an authorization number in the Authorization # field; however, you must also enter a dollar value in the Amount field and an authorization date in the Authorization date field. You can enter an authorization number in upper and lower case.</p> <p><i>Secured feature:</i> The ability to enter a manual authorization is controlled by the secured feature, C/C Authorization Field Access (A25).</p> <p>If you use an authorization service, the system updates this field automatically when an authorization is received.</p> <p>Alphanumeric, 16 positions; optional.</p>
Authorization date	<p>The date when the charge is authorized for this credit card.</p> <p>You must enter an authorization date if you entered an authorization number in the Authorization # field.</p> <p>If you use an authorization service, the system updates this field when an authorization is received.</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Ord total (Order total)	<p>The sum of all charges on the order, including merchandise, freight, additional freight, tax, handling, and additional charges across all recipients (different shipping addresses) on this order.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Auth amount (Authorization amount)	<p>The amount you wish to manually authorize for the credit card.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Amount	<p>The total dollar amount of this payment type to apply to the order. <i>When to enter an amount?</i> Enter an amount for cash/check payment types, and for a credit card if it is not the only form of payment on the order or the “catch-all” payment type.</p> <p>Leave this field blank when:</p> <ul style="list-style-type: none"> • a credit card (including other card types) is the only form of payment for the order, or • a credit card is the "catch-all" payment type. <p>Numeric, 13 positions with a 2-place decimal; entry requirements depend on payment type.</p>
Charge sequence	<p>The order in which the system should charge each pay type when the customer uses several payment types. Defines when each payment type will be billed by the system as merchandise is shipped. See Determining the Charge Sequence for more information. The charge sequence displays for each entered payment method on the lower portion of the screen, and is enterable.</p> <p>Numeric, 2 positions; optional.</p>
SVC ID #	<p>The ID number for the stored value card payment. Define an ID number only if your stored value card processor supports it. Order Administration stores the ID number in the OPM SVC ID Storage field in the Order Payment Method table and includes it in the authorization request and deposit request sent for the stored value card payment.</p> <p>Numeric, 9 positions; optional.</p>
Pay bal (Payment balance)	<p>The amount remaining to charge on an order. The system uses the following calculation to determine the payment balance:</p> <pre>order total - total order payments = payment balance</pre> <p>This field represents the amount charged to the catch all paytype on a multi-paytype order.</p> <p><i>Example:</i></p> <p>The order total = 100.00 Pay type 1 = 45.00 Pay type 2 = 15.00 Pay type 3 (catch all) = 0.00 100.00 - 60.00 = 40.00 (this is the amount charged to the catch all paytype).</p> <p>This amount is a negative value if the customer overpays or a return or exchange is performed.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
Routing (Routing number)	<p>Informational.</p> <p>An error message indicates if you enter a routing number for a pay type that does not represent pay category Cash/Check: A routing number cannot be entered for this pay type.</p> <p>Alphanumeric, 9 positions; optional.</p>

Field	Description
Acct (Account #)	<p>Informational.</p> <p>An error message indicates if you enter an account number for a pay type that does not represent pay category <i>Cash/Check</i>: A checking account number cannot be entered for this pay type.</p> <p>Alphanumeric, 20 positions; optional.</p>
Check #	<p>Informational.</p> <p>An error message indicates if you enter a check number for a pay type that does not represent pay category <i>Cash/Check</i>: A check number cannot be entered for this pay type.</p> <p>Numeric, 6 positions; optional.</p>
Ord discount (Order discount)	<p>The total discount applied to the order across all ship to customers.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only.</p>
CC Last 4	<p>The last four positions of the credit card number. Updates the CC Last 4 field in the Order Payment Method table.</p> <p>If you use credit card encryption, the system does not encrypt the value in this field.</p> <p>Alphanumeric, 4 positions; display-only.</p>

Screen Option	Procedure
Add a payment method	Complete the fields at the top of the screen as described above and select <i>OK</i> .
Change a payment method	Select <i>Change</i> for a payment method. See Changing a Payment Method .
Delete a payment method	<p>Select <i>Delete</i> for a payment method.</p> <p>If you try to delete a payment method that has already been charged, the system displays a message: <code>Order payment method cannot be deleted/activity exists</code>.</p>
Perform online credit card authorization	Select <i>Auth Online</i> for a credit card payment method that is eligible for online authorization. See Performing Online Authorization during Order Maintenance .
Deactivate a payment method	Select <i>Deactivate</i> for a payment method. See Deactivating a Payment Method .
Review the payment plan assigned to the order	Select <i>Plan Summary</i> for a payment method to advance to the Display Payment Plan Summary Screen .
Review the order payment history for this order	Select <i>History</i> for a payment method to advance to the Display Order Payment History Screen .

Screen Option	Procedure
Perform an interactive balance inquiry against a stored value card payment method	Select <i>Balance Inquiry</i> for a stored value card payment method. The system interactively performs a stored value card balance inquiry; see Stored Value Card Balance Inquiry (MSVB) . An error message indicates if you enter this option next to a payment method other than stored value card: Pay type not eligible for balance inquiry.
Apply the write-off balance in the WO\$ field as payment on the order, using the Default Cash Pay Type (C07) system control value	Select <i>Convert W/O To Payment</i> .
Apply the negative write-off balance in the WO\$ field as an additional charge on the order, using the value in the Default Additional Charge Code (C45) system control value	Select <i>Convert W/O To Charge</i> .
Accept, validate, and process the order	Select <i>Accept Order</i> ; see Entering Orders . The system evaluates the order to determine if it qualifies for pick slip preparation; see Preparing Orders for Pick Slip Generation and Applying Pick Slip Preparation to an Order .
Reject (cancel) the order	Select <i>Reject Order</i> ; see Entering Orders . The system evaluates the order to determine if it qualifies for pick slip preparation; see Preparing Orders for Pick Slip Generation and Applying Pick Slip Preparation to an Order .
Accept, validate, and process the current order and then place an additional order for this customer for a different shipping address	Select <i>Add Recipient.</i> ; see Adding a Recipient Order in Order Maintenance .

Changing a Payment Method

Purpose: You can update an order payment method by selecting *Change* for the payment method at the *Enter Payment Methods Screen in Order Maintenance*. A pop-up window opens automatically, based on the payment category; see below.

Restrictions: You cannot:

- Change the payment to an amount less than what was billed against the pay type.
- Change the expiration date on an existing credit card unless you first deactivate the original credit card and add the new credit card with the new expiration date.
- Change the *Order Broker Payment Type (K98)* on an existing order; instead, the screen displays an error, such as Pay type (06-BROKER PAY TYPE) is restricted.
- Change a payment method that has already billed; instead, the screen displays an error, such as Pay method (9) cannot be changed -- already billed.

- Change a credit card payment whose Tokenized field in the Order Payment Method table is *selected*. You must deactivate or delete the original credit card payment and add the credit card payment with the updated information.
- Delete a credit card payment if it is associated with authorization history; you must deactivate the credit card payment method. The system displays the message: `Order payment method cannot be deleted/activity exists.`

Change Charge Sequence

You can also change the charge sequence for a payment method by entering a new number in the [Charge sequence](#) field next to the payment method at the *Enter Payment Methods Screen in Order Maintenance*. See [Determining the Charge Sequence](#) for an overview.

Enter Cash Control Pop-Up

For information on the fields at this pop-up window, which appears when you change a cash/check payment method, see *Enter Payment Methods Screen in Order Maintenance*.

Enter Credit Card Pop-Up

For information on the fields at this pop-up window, which appears when you change a credit card payment method, see [Enter Credit Card For Window \(Credit Card Payment Type\)](#).

Order Orchestration payment: You cannot apply the *Order Broker Payment Type (K98)* to an order; instead, the screen displays an error, such as `Pay type (06-BROKER PAY TYPE) is restricted.`

Deactivating a Payment Method

Purpose: Use this option to:

- stop any further billing against a credit card used on an order, such as when the credit card is stolen
- add a new payment method for a refund or exchange, so that any credits or charges you process will apply to the new payment method only
- change the expiration date on an existing credit card (you must deactivate the original credit card and add the new credit card with the new expiration date)
- change the credit card number on an existing credit card that has been tokenized (the Tokenized field for the Order Payment Method record is *selected*).
- reimburse a stored value card the charged amount; see [Stored Value Card Authorization Reversal](#)

Select *Deactivate* for the payment method at the *Enter Payment Methods Screen in Order Maintenance* to deactivate it. You receive a message if no payments or authorizations have been applied to the payment method: `Pay method has no activity -- delete instead.`

If the payment method is eligible for deactivation, a pop-up window prompts you to confirm the deactivation. When you select *OK*, the system updates the [Charge sequence](#) (Chg seq) field with a value of 99. You cannot change or reactivate the deactivated payment type.

You receive a message if you deactivate the payment type on a single pay type order, or the “catch-all” payment type on a multiple pay type order: `The only pay method on the order has been deactivated.`

This means that you need to define another method of payment.

You cannot deactivate a credit card with a refund due; instead, you must use the [Work with Refunds Screen](#) to cancel the refund for the order or change the refund type.

Card security value: When you deactivate a credit card that has a card security value and card security presence defined, the system clears the card security value and card security presence from the Order Payment Method table (and Online Authorization table if you performed online credit card authorizations). Otherwise, the system removes the card security value from the order when you accept an order, even if the order has not received an approved online authorization.

Processing a Refund or Exchange Against a Different Payment Method

You can deactivate a payment method at the *Enter Payment Methods Screen in Order Maintenance* in order to:

- process a refund in a different payment type than was used on the order
- charge the customer for an exchange item with a different payment type than was used on the order, if the exchange item costs more than the returned item

For exchanges, the system will process both the refund and the charge for the exchange item in the new payment type.

Instructions:

1. At the *Enter Payment Methods Screen in Order Maintenance*, add the payment method you would like to use for the refund or exchange.
2. Select *Deactivate* for the existing payment method or methods on the order to deactivate. See [Deactivating a Payment Method](#).
3. At the [Work with Order Lines Screen](#), select *Return* for the item you would like to return or exchange or select *Return* to return the entire order. See [Returning and Exchanging Items in Order Maintenance](#).
4. Select *Accept* to accept. If the cost of the exchange item is more than the cost of the returned item, a pop-up window prompts you to select the active pay method for the order.

Select for the active payment method. The system does not allow you to select a deactivated payment method. Select *Accept* to accept the update to the order.

The system will:

- process the return or exchange
- process a refund check or credit in the active payment method
- charge the active payment method, if the exchange item costs more than the returned item.

Adding, Changing and Deleting a Payment Plan on the Order

Purpose: A payment plan is a deferred payment or installment billing option you can offer to your customers. Under a payment plan, you do not bill the customer's credit card until a prearranged interval after you ship the order.

The system allows you to add, change, or delete a payment plan on an order in order maintenance.

Adding a Deferred or Installment Payment Plan

In order to add a payment plan to an order, the system checks to make sure the payment plan is eligible:

- [Deferred and Installment Billing \(F51\)](#) system control value is *selected*.
- order date is within the payment plan's starting and ending date
- order does not contain an item that is excluded from payment plans
- source code on the order is not excluded from payment plans
- order meets the minimum dollar amount requirement
- order meets the pay type requirement
- order includes only one credit card pay type

An error message indicates if you try to add a credit card payment method to an order that already includes a deferred or installment payment plan or if you try to add a credit card associated with a deferred or installment payment plan and the order already includes a credit card: `Multiple credit cards not allowed with payment plan.`

An error message indicates if you try to select a payment plan for the order other than the primary payment plan and you do not have authority to the [Override Deferred and Installment Billing Options \(A81\)](#) secured feature: `Not authorized to override payment plan`

You can add a payment plan by selecting *Change* for a credit card payment method and entering a valid payment plan code in the Pay plan field at the *Enter Payment Methods Screen in Order Maintenance* if no shipments have been made against the order.

If shipments have been made against the order, you must deactivate the original credit card and add a new credit card with a payment plan. The system will use the original credit card for all previous shipments.

See [Entering Orders](#) for more information on how the system assigns a payment plan to the order.

Changing a Deferred or Installment Payment Plan

If no shipments have been made, you can change a payment plan by selecting *Change* for the credit card pay type for the order and entering in a new payment plan code in the Pay plan field at the *Enter Payment Methods Screen in Order Maintenance*.

If shipments have been made, you cannot change the payment plan on the order.

Deleting a Deferred or Installment Payment Plan

If no shipments have been made, you can delete a payment plan from the order by selecting *Change* for the credit card payment method and clearing the payment plan code in the Pay plan field at the *Enter Payment Methods Screen in Order Maintenance*

If shipments have been made, you must deactivate the original credit card on the order and enter a new credit card without a payment plan defined. Previous shipments on the order will continue to use the payment plan for the original credit card unless you change the deposit release date on the [Invoice Pay Summary Screen](#) in standard order inquiry.

Performing Online Authorization during Order Maintenance

Purpose: You can send and receive electronically the information required to authorize a credit card during order maintenance by selecting *Auth Online* for a credit card payment method that is eligible for online credit card authorization. You would use this option if you are setup to perform online authorization and:

- the credit card was not authorized during order entry due to a communication failure.
- the credit card received a declined authorization during order entry and you wish to resend the card for authorization.
- you added items to the order in order maintenance and wish to authorize the card for the added dollar amount.
- you added a credit card payment method to the order in order maintenance.

Credit cards requiring authorizations less than \$1.00: If the credit card amount to authorize is less than \$1.00 and you have defined an authorization number in the [Authorization Number for Authorizations Under \\$1.00 \(108\)](#) system control value, the system does not send the credit card to the service bureau for authorization and instead assigns the authorization number from the system control value to the credit card. If an authorization number is not defined in this system control value, the system sends the credit card to the service bureau for authorization, regardless of the amount that requires authorization.

Performing Online Verification Only: If the [Online Auth Verification Only \(196\)](#) system control value is *selected*, the system processes online authorizations for \$1.00 for the purpose of validating the card. During batch authorizations, the system authorizes the card for the shippable dollar amount and voids the online authorization for \$1.00.

Orders on hold: You can authorize a credit card payment during order maintenance when the order is on hold; regardless of whether the payment is authorized, the order remains on hold.

Authorization messages: A message indicates that a response was received or the payment method you wish to authorize is not eligible for online credit card authorization.

If the message is...	The reason is...
The Pay type must be associated with an online authorization service	The payment method is not a credit card or the credit card payment method is not associated with a service bureau.
Pick Slips Pending - Authorization not possible at this time	Pick slips are pending. If pick slips are pending, you must use the Performing Batch Authorization (SATH) menu option to authorize the credit card.
Authorization delayed by service	Communication failures occurred or you received an undefined response.
Authorization Not Required	The entire dollar amount associated with the card has already received an approved authorization.

If the message is...	The reason is...
Authorization Received	You received an authorization response that does not display the Select Authorization Response Option Window .

For more information: See [Performing Online Credit Card Authorizations](#) for an overview and required setup.

Adding a Recipient Order in Order Maintenance

Purpose: Select this option during order maintenance to add a recipient order for a different address to an existing order.

Retail pickup or delivery orders: You cannot complete entry of a new recipient on a retail pickup or delivery order from Order Orchestration, because you cannot add any items to the order. See the [Order Orchestration Integration](#) for more information.

How to display this screen: Select *Add Recipient* on any of these screens to add a recipient order during order maintenance:

- [Work with Order Screen](#)
- [Work with Order Lines Screen](#)
- [Enter Payment Method Screen](#)

Recipient orders are secondary orders that you add to an order to ship to a different address. For example, you can place an order for yourself and a friend in a single phone call, on a single order. The system assigns the first order an order number, you enter name, address, item, and payment information for this order, and then select *Accept/Add Rcpt* to accept the current order and add a recipient order.

In this topic:

- [Adding a Ship-to Suffix to the Order Number](#)
- [Adding a Sold-to Record](#)
- [Linking Orders](#)
- [About Gift Orders](#)
- [Alternating Display of Sold-to/Recipient Addresses](#)
- [Confirm Missing Recipient Window](#)
- [Entering a Recipient Customer](#)

Adding a Ship-to Suffix to the Order Number

When you enter the second order, the system views this as a recipient order, related to the initial order. The system assigns this order (and any subsequent recipient order) the same order number, but increments the shipping suffix by 1 for every additional recipient address on the order.

Adding a Sold-to Record

The system also assigns a sold to customer number to the person or company receiving each recipient order and creates a separate record for each recipient address in the Sold To

Customer table. The system updates the recipient customer record with an *R* in the Original mail type field to indicate that the customer was added to the Customer Sold To table as a recipient customer; see [Creating and Updating Sold-to Customers \(WCST\)](#). This code is used for historical purposes to trace how the customer was added to the system.

If the [Update Original Source Code for Recipient Customers \(F90\)](#) system control value is *selected*, the system writes the source code defined for the sold to customer to the Original source field for a recipient customer.

Linking Orders

The system links the Sold To customer's order and any recipient orders by the order number and payment information. You only need to enter payment information for one of the related orders, this information applies to all recipient orders and displays at the [Enter Payment Method Screen](#).

Select *Summary* to review the order totals across all recipients on the order. The Order Totals pop-up window summarizes the individual charges on each recipient order and displays balances for what the customer has purchased, paid and owes. See [Adding a Recipient Order in Order Entry](#).

The system does not capture sales history for any of the recipients.

About Gift Orders

Another type of recipient order is a gift order. You identify an order as a gift order by *selecting* the Gift field. You can then select *Sold To/Rcp.* and enter the address where the gift will be shipped. The gift recipient's address is entered on the same screen you use to enter the address for a recipient order.

As with recipient orders, the system adds a ship-to suffix to the order number to indicate an alternate address. Additionally, the system assigns a sold to customer number to the recipient of the gift order, creates a separate sold-to customer record under this number and updates the Original mail type field with an *R* (recipient) to track how the order was received on the system; see [Creating and Updating Sold-to Customers \(WCST\)](#). If the Update Original Source Code for Recipient Customers (F90) system control value is *selected*, the system writes the source code defined for the sold to customer to the Original source field for a recipient customer.

This makes the gift recipient eligible for future mailings because the customer is already familiar with your product.

A gift order differs from a recipient order because:

- pricing information may not print on the pick slip, depending on your pick slip printing program
- a gift acknowledgment card prints for the customer who placed the order (sold to customer) to confirm that the gift has been shipped

The system performs the same updates as with recipient orders. The system does not capture sales history for the gift recipient.

Alternating Display of Sold-to/Recipient Addresses

Select *Sold To/Rcp.* on the [Work with Order Screen in Order Maintenance](#) to review or enter the buyers (sold to) address or recipient's address. Notice that the addresses of

the customer who placed the order (sold to customer) and the customer who will receive the order alternate each time you select *Sold To/Rcp.*

Recipient entry methods: You can enter a recipient order in two ways:

- Select *Accept/Add Rcp.* on the [Work with Order Screen in Order Maintenance](#) or [Work with Order Lines Screen](#).
- Select *Sold To/Rcp.* on the [Work with Order Screen in Order Maintenance](#) if the recipient is a gift order.

Confirm Missing Recipient Window

This pop-up window displays if you select *Accept/Add Rcp.* or *Sold To/Rcp.* to add a recipient and then select *Accept/Add Rcp.* or *Sold To/Rcp.* again without entering a recipient address.

The system is looking for a recipient address. Select *OK* to override this message and use the sold to address or select *Order Ship To* to enter a recipient address.

When you select *Accept/Add Rcp.* or *Sold To/Rcp.* to add a recipient order, you advance to the [Work with Order Screen in Order Maintenance](#). On this screen, the customer address lines default blank. Here you can:

- Enter the recipient's address information. You advance to the Display Duplicate Sold To pop-up window if the system finds a match to the address you entered (see [Adding a Recipient Order in Order Entry](#)); otherwise, the system creates a new sold to customer record for the address.
- Select *Prompt* on the name or company name fields to advance to the [Entering a Customer Number](#), where you can scan for an existing customer.

Entering a Customer Number

At the [Entering a Customer Number](#), enter a customer number in the Customer field and select *OK* to select the recipient customer for the order. The address information for the customer defaults in the recipient address lines, but can be updated.

Scanning for a Customer Number

Enter information in any of the scan fields at the [Entering a Customer Number](#) to locate a customer for the recipient address if you do not know the customer number.

A message displays when you select an existing customer address to default into the recipient address fields on the [Work with Order Screen in Order Maintenance](#):

Customer (46) has been updated with changes!

This message indicates that the order has been updated with the recipient address.

Entering a Recipient Customer

Purpose: You can enter the recipient's address information in the address fields on the Work with Order screen for the recipient order.

How to display this screen: Select *Recipient.* at the [Work with Order Screen in Order Maintenance](#) to enter a gift recipient's address, or select *Add Recipient* to enter a recipient order shipping to a different address.

How to complete this screen: To complete the recipient address information, you can:

- Type the recipient's information in the address fields.

- If the recipient customer is an existing customer, you can *click* on the arrow in the recipient address fields to select the customer from one of the Select Customer Sold To scan screens. See [Select Customer Sold To Pop-up Window](#).

See [Work with Order Screen in Order Maintenance](#) for field descriptions and options.

The system verifies that the ship via (carrier) used on the previous order is still valid for the recipient address.

Entering changes for a recipient: You can change any order information for a recipient order. For example, you can select a different shipping service. Any other recipient orders are not updated.

For a multi-recipient order (entering an order for a customer and a friend), the updates you make affect only the current recipient order. Additionally, you update the recipient customer when you update any of the customer-specific fields on the recipient screen.

Shipping restrictions: If one or more items on the order is restricted from being shipped to the state or country of the ship to address you have selected, a message indicates:

One or more items on the order line are restricted to new Shipping country/state.

See [Entering Additional Item Information](#), for information on item/state restrictions.

Maintaining Quotes in Order Maintenance

Purpose: Quote Maintenance allows you to update an existing quote by:

- Changing customer, quote, item, or payment information
- Adding a payment type
- Adding an item
- Deleting an item
- Canceling a quote
- Holding or releasing a line
- Repricing items on the quote and applying discounts and promotions to a quote; see [Order Repricing, Premiums, Discounts, and Promotions](#) and [Changing Item Detail Line Information in Quote Maintenance](#)
- Recalculating the freight on the quote if the [Override Freight on Quote Conversion \(K76\)](#) system control value is *unselected*.
- Recalculating the order totals based on the changes you have made in quote maintenance

Additionally, you can select Quote Maintenance to review quote history.

In this topic:

- [How is Quote Maintenance Different from Order Maintenance?](#)
- [Selecting a Quote for Maintenance](#)
- [Work with Order Screen in Quote Maintenance](#)
- [Changing Item Detail Line Information in Quote Maintenance](#)
- [Enter Payment Methods Screen in Quote Maintenance](#)

- [Completing Quote Maintenance](#)
- [Cancelling a Quote through Order Maintenance](#)

For more information: See:

- [Entering Pre-Order Quotes](#) for an overview, the required setup, and how to create a quote.
- [Cancelling a Quote through Order Maintenance](#) for more information on how to cancel a quote.
- [Converting Quotes to Orders](#) for more information on the updates the system performs when you convert a quote to a regular order.

How is Quote Maintenance Different from Order Maintenance?

You use the same screens in quote maintenance as you do in order maintenance. However, the system displays the screens for a quote in Review mode. When you convert the quote to an order, the system displays the screens in maintenance mode.

Unlike standard orders:

- Because the system does not reserve items on quotes, adding an item to a quote does not guarantee that the item will be available when the customer is ready to order. When you convert a quote to an order, the system reserves inventory and displays the [Unavailable quoted order lines screen](#), listing the items on the quote that are not available because they are on backorder or are soldout.
- You can have only one ship to customer on a quote, and all of the items on a quote must ship to the same address.
- The price of each item on a quote is not guaranteed unless you enter a price override reason code in the [Price Override Reason for Quotes \(K75\)](#) system control value. The system assigns this price override reason code to each order line that does not already have a price override reason code defined when you accept the quote. **Note:** Before you convert a quote to an order, the system allows you to reprice and apply any discounts or promotions to the lines on a quote that do not have a price override reason defined; if the totals for a quote change during quote maintenance, you should resend a Quote Confirmation or Quote form to the customer to indicate the new estimated order totals.
- The freight charges on a quote are not guaranteed unless you select the [Override Freight on Quote Conversion \(K76\)](#) system control value.
- You cannot express bill any items on a quote.
- You cannot apply a pre-paid pay type to a quote.
- You cannot perform a return or exchange.
- You can perform end-of-order repricing, promotional pricing, and add free gifts; however, the updates apply only to lines that do not contain a price override reason code.
- The system does not reduce inventory or update demand until you convert a quote to an order.
- The system does not perform any credit or fraud checking until you convert a quote to an order.

See [Quote Restrictions](#) for additional functionality that is not available on a pre-order quote.

Similar to order maintenance, quote maintenance does not allow you to:

- Display Upsell Promotions pop-up windows.

- Let you change a payment method if it has been charged.
- Let you change the source code to a source code for a different offer.
- Let you change the customer sold to or ship to number.
- Let you advance to the Order Recap screen.

Order history message: When you maintain a quote, the system creates an order history message, indicating the date the quote was maintained, the new order total, and the user ID of the person that maintained the quote; for example: 10/29/09 MAINT Quote was maintained 277.95 KBROWN. See [Display Order History Screen](#).

Selecting a Quote for Maintenance

You can advance to quote maintenance as you would advance to maintenance for any standard order:

- Select *Maintain* from the standard Order Inquiry screens.
- Select *Order Maint* from the Order Entry Customer Selection screen.
- Select *Maintenance* from the Customer Selection CTI screen.

Use the [Order Maintenance Selection Screen](#) to find the quote you wish to maintain, using information you have about either the quote or the customer. Select *Quote* in the Order Status field to restrict your search criteria to quotes only. See [Selecting an Order for Maintenance](#) for more information on the fields on this screen.

Cannot Maintain Order window: The system advances you to the [Cannot Maintain Order Window](#) if you select to maintain a canceled quote. In this situation, the system does not allow you to enter quote maintenance to maintain the quote.

Work with Order Screen in Quote Maintenance

Use the [Work with Order Screen](#) to maintain customer and header information on the quote.

Printing order header messages on the Quote form: You can flag an order header message to print on the [Quote Form](#) by selecting *Quote* in the Print field for the message. The first four order header messages whose Print flag is set to *Quote* print on the form.

Recipient customers on quotes: You cannot add multiple ship to customers to a quote. If you select *Accept/Add Recip* for a quote, the system displays an error message: Add recipient not allowed with Quote.

Work with Order Ship to Properties screen: When you accept a quote:

- The system *selects* the Quote origin field on the [Work with Order Ship to Properties Screen](#) to indicate the order is a pre-order quote. You cannot change this field in quote maintenance.
- The system applies the freight and additional freight charges on the quote as a freight override if the *Override Freight on Quote Conversion (K76)* system control value is *selected*. You can review the freight and additional freight charges on the quote in the Freight override field on the [Work with Order Ship to Properties Screen](#). If you wish to recalculate the freight for the quote, you can remove the freight override amount; the system recalculates the freight when you accept the quote and applies the new freight charges as a freight override.

Field descriptions and screen options: See [Work with Order Screen](#) for a description of the fields and the options available on this screen.

The fields below describe information on the Work with Order screen that applies specifically to Quote maintenance. See [Work with Order Screen in Order Maintenance](#) for more information on the fields you can change that are not specific to Quote maintenance.

Field	Description
Ship via	You cannot enter an express bill ship via code on a quote. The shipper update on the quote header screen affects all items except those with a ship via override.
Salesrep	Any <i>Quote Form</i> or Quote Confirmation generated after you update this field includes the new salesman number.
Type Order type	If you change the order type to an order type whose Quote field is also <i>selected</i> , the system: <ul style="list-style-type: none">Recalculates the cancel date for the quote and each item on the quote, based on the number defined in the Expiration days field for the new order type. If an Expiration days has not been defined for the new order type, the system removes the cancellation date from the quote. See Cancelling a Quote through Order Maintenance.Requires a pay method for the quote, based on the setting of the Pay method required field for the new order type. If you change the order type to an order type whose Quote field is <i>unselected</i> , the system converts the quote to an order; see Converting Quotes to Orders .
Hold reason	If you enter a hold reason, the system places the entire quote on hold; however, the status of the Quote remains <i>Quote</i> . If you convert the quote to an order, the system retains the hold reason and updates the status of the order to <i>Held</i> .

 **Note:**

Held quotes are not included in the Release Held Orders (ERHO) menu option; you must use quote maintenance to remove the hold reason on the Work with Order screen from the quote.

Field	Description
Calc freight	The system suppresses all freight charges for new items (including freight and additional freight) when you deselect this field. If service charges by ship via would normally apply, the system suppresses these as well.

 **Note:**

The system does not calculate freight for new items you add to the quote when this field is *unselected*; the system charges the customer any freight previously calculated for existing order detail lines if using a line-level freight method.

The *Recalculate Freight Default (F62)* system control value controls the default setting of this field.

The setting of the *Override Freight on Quote Conversion (K76)* system control value controls whether the freight and additional freight charges on a pre-order quote are used as a freight override when the quote is converted to a regular order.

Arrival date

The system updates each item on the quote automatically with the new arrival date.

Regardless of the arrival date, the system does not reserve inventory on quotes. The system reserves inventory when the quote is converted to an order; see *Converting Quotes to Orders*.

If a number of days has been entered in the *Expiration days* field for the order type on the quote, the system assigns a cancel date to the quote and each line on the quote, indicating when the quote is no longer valid and should be cancelled.

The system uses the following calculation to assign a cancel date to a quote:

Quote arrival date + Order type Expiration dates
= Quote expiration date

The system stores the quote expiration date in the Cancel date field in the Order Header table and Order Detail table.

 **Note:**

The cancel date cannot be earlier than the arrival date: Cancel date cannot be earlier than arrival date.

Field	Description
Cancel date	<p>If a number of days has been entered in the Expiration days field for the order type on the quote, the system assigns a cancel date to the quote and each line on the quote when you accept the quote. The cancel date indicates when the quote is no longer valid; see Assigning an Expiration Date to a Quote.</p> <p>The system uses the following calculation to assign a cancel date to a quote:</p> $\text{Quote arrival date} + \text{Order type Expiration dates} = \text{Quote expiration date}$ <p>If you manually enter a date in the Cancel date field on the Work with Order screen, the system uses this date instead of the calculated quote expiration date.</p>

 **Note:**

The cancel date cannot be earlier than the arrival date: Cancel date cannot be earlier than arrival date.

Order Cancellation List

Once the cancel date has been reached the quote prints on the [Order Cancellation List](#). Customer Service uses this list to contact each customer to see if the deadline can be extended. If not, Customer Service must use Order Maintenance to cancel the quote. See [Cancelling a Quote through Order Maintenance](#).

Changing Item Detail Line Information in Quote Maintenance

Purpose: Use the Work with Order Lines screen to:

- review information about items on the quote
- make changes and additions
- delete a line
- review quote line history

The system does not reserve inventory for order lines on a quote. The system performs inventory reservation when the quote is converted to an order. See [Converting Quotes to Orders](#).

Changing a set component item: You cannot change, cancel, delete, or sell out a set component item if you do not have the required authority under the [Set Component Maintenance \(J01\)](#) secured feature. See that secured feature for more information.

Adding an item in quote maintenance: Use the [Work with Order Line Screen](#) to add another item to an existing quote and enter item-level overrides. You can also add an item by entering the information on the blank order line in the center of the [Work with Order Lines Screen](#). The system:

- Assigns the next available line number to the item you are adding to the quote.
- Assigns the cancel date on the quote header to the item.

- Performs the same item validations as in Quote Entry; see [Adding Items to a Quote](#).

Enter Add Reason window: Regardless of the setting of the [Require Reason for Lines Added in Order Maintenance \(D75\)](#) system control value and Require reason code field for an item offer or SKU offer, the system does not advance you to the [Enter Add Reason Window](#) when you add an item to a quote in Quote maintenance.

Deleting an item in quote maintenance: Select *Delete* for an order line to remove it from the quote. If you delete a membership item from a quote, the system also deletes the customer membership.

Repricing an existing line in quote maintenance: You can select *Reprice* during quote maintenance to reprice the quote and apply any qualifying discounts, premiums, and promotions to the quote; however, the system does not reprice any lines that contain a price override reason code. If you wish to reprice these lines, you must remove the price override reason code from the line. The system reprices lines that do not contain a price override reason code using regular pricing logic. **Note:** If you maintain a quote after printing the Quote form or generating the Quote Confirmation email, and the estimated order totals for the quote change as a result of your changes, you should use the [Print/Email Quote Window](#) to resend the Quote form or Quote Confirmation to the customer so that the customer has the most recent estimated totals for the quote.

Accompanying item: The system adds an accompanying item to the order if the selected item has been associated with one through the [Work with Accompanying Item Screen](#), and if the [Add Accompanying Items in Order Maintenance \(H28\)](#) system control value is *selected*. **Note:** If you update the originating item in quote maintenance, the system does not update the accompanying item. For example, if you sell out the originating item in quote maintenance, the system does not also sell out the accompanying item.

Returns: You cannot process returns or exchanges in quote maintenance.

Recipient customers on quotes: You cannot add multiple ship to customers to a quote. If you select *Accept/Add Recip* for a quote, the system displays an error message: Add recipient not allowed with Quote.

Customer profile: The system advances automatically to the [Work with Customer Profile Screen](#) if you need to obtain mandatory demographic information for a customer, if the [Prompt for Mandatory Demographics in Order Maintenance \(E60\)](#) system control value is *selected*.

Field descriptions and screen options: See [Working with Items on the Order](#) for a description of the fields and the options available on this screen.

The fields below describe information on the Work with Order Lines screen that applies specifically to Quote maintenance. See [Changing Item Detail Line Information in Order Maintenance](#) for more information on the fields you can change that are not specific to Quote maintenance.

Field	Description
Qty	You cannot enter an item for a negative quantity on a quote: Negative quantity not allowed on quote. When you change the quantity ordered of a main set item, the change is also reflected in its component items.

Field	Description
Price	<p>The system calculates the price of an item by taking into account any price breaks and source or order discounts, and uses the pricing routine (pricing hierarchy) in the Pricing Values (B31) system control value to determine the price of the item on the order line.</p> <p>If you override the price for an existing order line, you must enter a price override reason code in the Ovr field.</p> <p>The Price Overrides (A23) secured feature controls whether you can update the price defined for the order line; if you do not have authority to this secured feature, the Price field is display-only.</p> <p>User and user class security determine whether you can perform a price override. You can also define a maximum percentage operators can discount an item by entering a percentage in the Price Override Limit Percent (E55) system control value.</p> <p>You can select <i>Reprice</i> during quote maintenance to reprice the quote and apply any qualifying discounts, premiums, and promotions to the quote; however, the system does not reprice any lines that contain a price override reason code. If you wish to reprice these lines, you must remove the price override reason code from the line. The system reprices lines that do not contain a price override reason code using regular pricing logic.</p>

 **Note:**

If you maintain a quote after printing the Quote form or generating the Quote Confirmation email, and the estimated order totals for the quote change as a result of your updates, you should use the [Print/Email Quote Window](#) to resend the Quote form or Quote Confirmation to the customer so that the customer has the most recent estimated totals for the quote.

Field	Description
Ovr	<p>The price override reason code assigned to the order line. If you have the authority, you can override the price of an item and specify a price override reason code.</p> <p>When you accept a quote, the system assigns the price override reason code defined in the Price Override Reason for Quotes (K75) system control value to each detail line so that the quoted price for each item is retained. However, the system allows you to remove the price override reason and update the price of a line in quote maintenance.</p> <p>You can select <i>Reprice</i> during quote maintenance to reprice the quote and apply any qualifying discounts, premiums, and promotions to the quote; however, the system does not reprice any lines that contain a price override reason code. If you wish to reprice these lines, you must remove the price override reason code from the line. The system reprices lines that do not contain a price override reason code using regular pricing logic.</p>
Frt	<p>This field does not display in Quote Maintenance, regardless of the settings of the <i>Override Freight on Quote Conversion (K76)</i> and <i>Recalculate Freight Default (F62)</i> system control values.</p>
Ship via	<p>You cannot enter an express bill ship via code on a quote.</p>
Arr date	<p>Regardless of the arrival date, the system does not reserve inventory on quotes. The system reserves inventory when the quote is converted to an order; see Converting Quotes to Orders.</p>

 **Note:**

If you maintain a quote after printing the Quote form or generating the Quote Confirmation email, and the estimated order totals for the quote change as a result of your updates, you should use the [Print/Email Quote Window](#) to resend the Quote form or Quote Confirmation to the customer so that the customer has the most recent estimated totals for the quote.

 **Note:**

The cancel date for the quote cannot be earlier than the arrival date: Cancel date cannot be earlier than arrival date.

Field	Description
Cancel date	<p>If a number of days has been entered in the Expiration days field for the order type on the quote, the system assigns a cancel date to the quote and each line on the quote when you accept the quote. The cancel date indicates when the quote is no longer valid; see Assigning an Expiration Date to a Quote.</p> <p>If you manually enter a date in the Cancel date field on the Work with Order screen, the system overrides the date you entered with the calculated quote expiration date.</p> <p>The system recalculates the quote cancellation date when you accept the quote in Quote Maintenance only if you changed the order type on the quote to another order type whose Quote field is <i>selected</i> and whose Expiration days is different from the expiration days defined for the original order type on the quote.</p>

 **Note:**

The cancel date cannot be earlier than the arrival date: Cancel date cannot be earlier than arrival date.

Order Cancellation List

Once the cancel date has been reached the quote prints on the *Order Cancellation List*. Customer Service uses this list to contact each customer to see if the deadline can be extended. If not, Customer Service must use Order Maintenance to cancel the quote. See [Cancelling a Quote through Order Maintenance](#).

Enter Payment Methods Screen in Quote Maintenance

Purpose: Use the [Enter Payment Methods Screen](#) to apply a payment to the quote or to change existing payment information.

 **Note:**

The Enter Payment Methods screen is the only screen where you can enter payment information in Quote Maintenance.

Payment method required? The [Pay method required](#) field for the order type on the quote defines whether a pay type is required on a quote.

- If the Pay method required field is *selected*, the system requires you to enter a pay type on a quote before the quote can be accepted.
- If the Pay method required field is *unselected*, the system does not require a pay type on a quote. A pay type is not required until the quote is converted to an order.

The system performs the same pay type validation as in standard order entry; see [Pay Type Editing](#).

Cash/check pay type: You cannot enter a cash/check pay type on a quote. You can add a cash/check pay type when the quote is converted to a regular order.

Adding, changing, and deleting a payment plan to a quote: The system allows you to add, change, or delete a payment plan on a quote in quote maintenance.

- In order to add a payment plan to a quote, the system checks to make sure the payment plan is eligible; see [Adding a Deferred or Installment Payment Plan](#).
- You can change a payment plan by selecting *Change* for the credit card pay type for the quote and entering in a new payment plan code in the Pay plan field at the Enter Payment Methods screen.
- You can delete a payment plan from the quote by selecting *Change* for the credit card payment method and clearing the payment plan code in the Pay plan field at the Enter Payment Methods screen.

Performing online authorization during quote maintenance: You can send and receive electronically the information required to authorize a credit card during quote maintenance by selecting *Auth Online* for a credit card payment method that is eligible for online credit card authorization. You would use this option if you are setup to perform online authorization and:

- the credit card was not authorized during quote entry due to a communication failure.
- the credit card received a declined authorization during quote entry and you wish to resend the card for authorization.
- you added items to the quote in quote maintenance and wish to authorize the card for the added dollar amount.
- you added a credit card payment method to the quote in quote maintenance.

See [Performing Online Authorization during Order Maintenance](#) for more information.

Recipient customers on quotes: You cannot add multiple ship to customers to a quote. If you select *Accept/Add Recipient* for a quote, the system displays an error message: Add recipient not allowed with Quote.

Field descriptions: See [Enter Payment Methods Screen](#) for field descriptions and options available on this screen.

The fields below describe information on the Enter Payment Methods screen that applies specifically to Quote maintenance. See [Enter Payment Methods Screen in Order Maintenance](#) for more information on the fields you can change that are not specific to Quote maintenance.

Field	Description
Pay type	You cannot enter a cash/check pay type on a quote. You can add a cash/check pay type when the quote is converted to a regular order.

Field	Description
Plan (Deferred or installment payment plan code)	<p>Represents the deferred or installment payment plan assigned to the quote. When you convert the quote to an order, the system updates the deferred bill date or installment bill dates. A quote is eligible for a payment plan only if it uses a credit card whose Card type is Credit Card rather than, for example, a stored value card. See Types of Credit Cards for more information.</p> <p>This field displays only if the Deferred and Installment Billing (F51) system control value is <i>selected</i>.</p> <p>If you do not have authority to the Override Deferred and Installment Billing Options (A81) secured feature, this field is display-only.</p> <p>An error message indicates if you enter a payment plan code and the quote is not eligible.</p> <p>Payment Plans are defined in and validated against the Flexible Payment Option table. See Working with Flexible Payment Options (WFPO).</p>

Completing Quote Maintenance

Select *Accept Order* to accept your changes to the quote, or select *Reject Order* to exit the quote without saving your changes.

When you accept your changes to the quote, the system:

- If you changed the Arrival date and a number of days has been entered in the [Expiration days](#) field for the order type on the quote, recalculates the cancel date assigned to the quote header and each item on the quote; see [Assigning an Expiration Date to a Quote](#). In addition, assigns the expiration date to each new line added in quote maintenance.
- Assigns the price override reason defined in the [Price Override Reason for Quotes \(K75\)](#) system control value to each detail line that does not already have a price override reason defined.
- Applies the freight and additional freight charges to the Freight override field on the [Work with Order Ship to Properties Screen](#) if the [Override Freight on Quote Conversion \(K76\)](#) system control value is *selected* and you cleared the Freight override field during quote maintenance.
- If you changed the order type to an order type whose Quote field is also *selected*, the system:
 - Recalculates the cancel date for the quote and each item on the quote, based on the number defined in the Expiration days field for the new order type. If an Expiration days has not been defined for the new order type, the system removes the cancellation date from the quote. See [Cancelling a Quote through Order Maintenance](#)
 - Requires a pay method for the quote, based on the setting of the Pay method required field for the new order type.
- Creates an order history message, indicating the date the quote was maintained, the new order total, and the user ID of the person that maintained the quote; for example: 10/29/09 MAINT Quote was maintained 277.95 KBROWN. See [Display Order History Screen](#).

- Advances you to the [Print/Email Quote Window](#), where you can select to print the *Quote Form* or generate the Quote Confirmation email.

Resending the Quote form or Quote Confirmation: If you maintain a quote after printing the Quote form or generating the Quote Confirmation email, and the estimated order totals for the quote change as a result of your changes, you should use the [Print/Email Quote Window](#) to resend the Quote form or Quote Confirmation to the customer so that the customer has the most recent estimated totals for the quote.

Converting a quote to an order: If you change the order type to an order type whose Quote field is *unselected*, the system converts the quote to an order; see [Converting Quotes to Orders](#).

Canceling a Quote through Order Maintenance

You can use the *Order Cancellation List* to determine which quotes to cancel.

You can cancel the entire quote by selecting *Cancel Order* on the [Work with Order Screen in Order Maintenance](#) or the [Work with Order Lines Screen](#) in order maintenance.

Note:

You cannot cancel individual items on a quote. If you wish to cancel an item on the quote, select *Delete* for the item in order maintenance to remove the order line from the quote.

Enter Cancel Reason Window

To cancel: Select *Cancel Order* at the [Work with Order Screen in Order Maintenance](#) to display the Confirm Cancel window. If you select *OK* at this window, you advance to the Enter Cancel Reason window.

Field	Description
Order#	The number of the quote you wish to cancel. Numeric, 9 positions; display-only, assigned by the system.
Ship to number (unlabeled field to the right of the quote number)	The ship to number for the quote you wish to cancel. Because quotes can have only one ship to customer, this number is always 1. Numeric, 3 positions; display-only; assigned by the system.

Field	Description
Cancel reason	The reason for canceling the entire quote. Cancel reason codes are defined in and validated against the Cancel Reason table; see Establishing Cancel Reason Codes (WCNR) .

 **Note:**

The system does not reduce demand, regardless of the Reduce demand setting for the selected cancel reason code since the system does not include quotes in initial demand tracking.

Quote Updates for Cancellation

The system performs these updates when you cancel a quote.

Order Header: The system updates the status of the quote to *X Closed*.

Order Ship To: The system updates:

- The status of the ship to on the quote to *X Closed*.
- The Cancel date for the ship to on the quote to the date the quote was canceled.

Order Detail: The system updates:

- The status of each open order line on the quote to *X Closed*.
- The Cancel date for each order line on the quote to the date the quote was canceled.
- The Cancel reason for each order line on the quote to the cancel reason code entered on the Enter Cancel Reason window.
- Does not update the Quantity cancelled for the order lines on the quote in order to separate canceled quotes from canceled orders.

Order history: When you cancel a quote, the system creates an order history message, indicating the date the quote was canceled, the cancel reason code, and the user ID of the user that canceled the quote; for example: 11/04/09 CANCEL Quote was canceled. Reason code: 1 KBROWN

Order line history: The system creates an order line history transaction indicating the item on the quote was canceled.

Order maintenance: The quote remains on the system for inquiry purposes; once a quote has been canceled, you can no longer perform any maintenance activity against the quote. The Cannot Maintain Order window displays if you try to access order maintenance for the quote indicating the canceled quote cannot be maintained.

Customer membership: If you cancel a quote that is associated with a customer membership, the system also cancels the customer membership.

Demand: The system does not reduce demand, regardless of the Reduce demand setting for the selected cancel reason code since the system does not include quotes in initial demand tracking.

Converting Quotes to Orders

Purpose: Quote conversion allows you to convert a pre-order quote into a regular order.

To convert:

1. Advance to order maintenance for the quote you wish to convert.
2. Optionally, perform any updates to the quote, such as adding or removing a line and performing any pricing updates; see [Maintaining Quotes in Order Maintenance](#).
3. On the Order Header screen, change the Order type field for the quote to an order type whose Quote field is *unselected*.
4. Optionally, perform any updates to the order; see [Performing Order Maintenance](#).
5. Optionally, enter a payment method on the order. The order may not have a payment method if the Pay method required field for the order type on the converted quote is *unselected*. **Note:** When you convert a quote to an order, the system will perform online authorization for eligible payment methods only if the [Authorize Full Amount During Order Entry \(G99\)](#) system control value is selected. See [Performing Online Credit Card Authorizations](#).
6. *Accept* or *Reject* the converted order.
7. If you accept the converted order, the system displays the [Unavailable Quoted Order Lines Screen](#) if any of the items on the converted order are on backorder or soldout.

See [Quote Conversion Updates](#) for the updates the system performs when you convert a quote to an order.

Changing to a different quote order type: If you change the order type on a quote to another order type whose Quote field is *selected*, the system does not convert the quote to an order. The quote remains a quote. The system:

- Recalculates the cancel date for the quote, based on the number defined in the Expiration days field for the new order type. See [Cancelling a Quote through Order Maintenance](#).
- Requires a pay method for the quote, based on the setting of the Pay method required field for the new order type.

In this topic:

- [Unavailable Quoted Order Lines Screen](#)
- [Quote Conversion Updates](#)

For more information: See:

- [Entering Pre-Order Quotes](#) for an overview, the required setup, and how to create a quote.
- [Maintaining Quotes in Order Maintenance](#) for more information on the updates you can make to a quote before it is converted to an order.

- [Cancelling a Quote through Order Maintenance](#) for more information on how to cancel a quote.

Unavailable Quoted Order Lines Screen

Use this screen to review the items on a converted quote that are not available because they are on backorder or are soldout.

How to display this screen: In quote maintenance, change the Order type field for the quote to an order type whose Quote field is *unselected* and select *Accept*. This screen does not display if none of the items on the converted quote are on backorder or are soldout.

Field	Description
Order #	The order number for the converted quote that contains items that are on backorder or are soldout. Numeric, 9 positions; display-only.
Ship to # Unlabeled field next to Order # field	The ship to number for the converted quote that contains items that are on backorder or are soldout. Numeric, 3 positions; display-only.
Lin Order line number	The line on the converted quote that contains the item that is on backorder or is soldout. Numeric, 3 positions; display-only.
Item	A code for the item on the converted quote that is on backorder or soldout. Alphanumeric, 12 positions; display-only.
SKU	A code for the SKU of the item on the converted quote that is on backorder or soldout. Alphanumeric, three 4-position fields; display-only.
Description	A description of the item. Alphanumeric, 25 positions; display-only.
Ord Ordered quantity	The number of units of the item ordered on the order line. Numeric, 5 positions; required.
Rsv Reserved quantity	The number of units of the item reserved on the order line. See Influences on Reservation . Numeric, 5 positions; display-only.
B/O Backordered quantity	The number of units of the item on backorder on the order line. Numeric, 5 positions; display-only.
S/O Soldout quantity	The number of units of the item that are soldout on the order line. Numeric, 5 positions; display-only.

Quote Conversion Updates

- [Quote Conversion Immediate Updates](#)
- [Quote Conversion Updates During Background Processing](#)

Quote Conversion Immediate Updates

The system performs the following updates immediately when you convert a quote to an order.

Update	Made When?
Cancel date	The system removes the cancel date defined on the order header and for each order line.
Order date and arrival dates	The system updates the order date and arrival date on the order to the date the quote is converted to an order. The system does not update the entered date so that you can track the date when the quote was created.
Order type	The system updates the Order type field on the Work with Order screen for the converted order to display-only.
Inventory reservation	The system performs inventory reservation against all qualifying lines on the quote. Once the quote is converted to an order, you should manually review the lines on the order to determine if there are any items on backorder or that are soldout based on inventory availability at the time of quote conversion. Any items that are on backorder or are soldout display on the Unavailable Quoted Order Lines Screen .
Soldout items	When you convert a quote to an order that contains a soldout item, the item remains soldout; the system does not reevaluate soldout order lines based on current inventory status. In order to reevaluate soldout order lines during quote conversion, you will need to delete the existing soldout order line and add a new order line to the order for the item that is soldout.
Price override reason for quotes	The system uses regular pricing logic to reprice each line on the quote that does not have a price override reason defined.
Held quotes	If you convert a held quote to an order, the system retains the hold reason defined in the Hold reason field on the Work with Order Screen and updates the status of the order to <i>Held</i> .
Freight charges	<p>The system looks at the setting of the Override Freight on Quote Conversion (K76) system control value to determine whether the freight and additional freight charges on a pre-order quote are used as a freight override when the quote is converted to a regular order.</p> <ul style="list-style-type: none">• If this system control value is <i>selected</i>, the system carries over the freight and additional freight charges on the pre-order quote when the quote is converted to a regular order. You can review the freight and additional freight charges in the Freight override field on the Work with Order Ship to Properties Screen. Note: If a freight override amount exists, the system does not automatically recalculate freight. For example, if you cancel a line on the converted order, the system will not recalculate freight based on the changed order total. In order to recalculate freight for the converted order, you must remove the freight override amount and change an order line.• If this system control value is <i>unselected</i>, the system does not retain the freight and additional freight charges on a pre-order quote when the quote is converted to a regular order. The system re-calculates the freight and additional freight charges when the quote is converted to a regular order.

Update	Made When?
Membership items	If the converted quote contains a membership item, the system displays the Order Total Window (Reviewing the First Order Total) , where you can review the estimated dollar total of the first order you will generate for the membership, and updates the status of the customer membership to active.
Order Orchestration	When you convert a quote to an order, the system automatically sends eligible backordered lines to the Order Orchestration module in Order Orchestration for fulfillment. See Order Orchestration Integration .
Payment	The system validates that a payment method exists on the order. If a payment method does not exist, the system requires one.

 **Note:**

When you convert a quote to an order, the system will perform online authorization for eligible payment methods only if the [Authorize Full Amount During Order Entry \(G99\)](#) system control value is selected. See [Performing Online Credit Card Authorizations](#).

Order history	When you convert a quote to an order, the system creates an order history message, indicating the date the quote was converted, the order total of the quote at the time of conversion, and the user ID of the user that converted the quote to an order; for example: 11/04/09 CONVERT Quote was converted to an order 301.29 KBROWN
Pick Slip Preparation	When you convert a quote to an order, the system evaluates the order to determine if it qualifies for pick slip preparation. See Preparing Orders for Pick Slip Generation and Applying Pick Slip Preparation to an Order .
Order Async	The system sends the converted order to the order async for background updates.

Update	Made When?
Deferred or installment payment plan	<p>When you convert the quote to an order, the system updates the deferred bill date or installment bill dates.</p> <p><i>Deferred payment plan example:</i> On 11/10/09, you enter a quote and apply a deferred payment plan to the credit card pay type on the quote. When you accept the quote, the system assigns a deferred bill date of 12/20/09 to the quote (based on a 30 day deferral). On 11/12/09, you convert the quote to an order. When you accept the converted order, the system updates the deferred bill date to 12/22/09.</p> <p><i>Installment payment plan example:</i> On 11/10/09, you enter a quote and apply an installment payment plan to the credit card pay type on the quote. When you accept the quote, the system assigns the following installment bill dates to the quote: 11/10/09 and 12/10/09. On 11/12/09, you convert the quote to an order. When you accept the converted order, the system updates the installment bill dates to 11/12/09 and 12/12/09.</p>

Quote Conversion Updates During Background Processing

The system performs the balance of the field and table updates during a background processing job (Order ASYNC) that runs after you accept the converted quote. See [Updates During Background Processing](#) for a detailed listing.

See [Performing the Release](#) and [Introducing Order Hold Reason Codes](#) for more information about the credit check process that evaluates customers, orders, and payment types and performs record updates if any condition on the order fails a credit check.

Process	Table	Field
Update the Item/Warehouse for each item ordered	Item Warehouse	ITW B/O qty Reserve qty Special handling reserve quantity ITW On order qty
Update the SKU for each item ordered	SKU	Orders availability pick generation Open quantity On-hold quantity
Update the order detail data queue for each item ordered	Order Detail Data Queue	Qty ordered Qty soldout Original price Price Price override code
Update order line history	Order Line History	
Update order ship to data queue	Order Ship To Data Queue	The system creates the record using the order date (the date the quote was converted to an order), rather than the entry date (the date the quote was created).
Update order transaction history	Order Transaction History

Managing Declined Authorizations

In this part: This part presents the functions available to cancel orders that are declined by an authorization service, and includes the following topic:

- [Working with Credit Card Cancellations \(WCCC\)](#) shows you how to cancel orders flagged for cancellation due to credit card decline.

Releasing Held Orders

Topics in this part: The following sections describe how to review and release held orders:

- [Introducing Order Hold Reason Codes](#) describes system-assigned hold reason codes and their application to orders, and presents the screens you work with to create user-assignable hold reason codes.
- [Working with Customer Fraud Tables \(WCFD\)](#) discusses the process of creating, changing, and deleting fraudulent customers based on customer name and address.
- [Working with Miscellaneous Frauds \(WMFF\)](#) discusses the process of creating, changing, and deleting fraudulent customers based on postal or zip code, credit card, and check.
- [Selecting Held Orders \(ERHO\)](#) describes the screens that provide your initial point of access to held orders display and release tables.
- [Displaying Order Hold Information](#) presents the customer screens you can use to investigate customer detail on a held order, and the Order Inquiry function you can use to review order status.
- [Performing the Release](#) presents a pictorial map of screen relationships between the Release Held Order scan screen and the Release Recipients screens, and discusses release functions you use to release orders by recipient, payment method, and order number.

Introducing Order Hold Reason Codes

Purpose: The system places orders on hold for a variety of reasons, most having to do with the credit checking process. Hold reason codes are defined in the Order Hold Reason Code table. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

Overview: You must release all holds on an order before the order can continue to process through the system. For example, if a multiple pay type order that includes a credit card and a check is placed on hold for credit card and check fraud, you must correct both conditions to release the order.

It is important to understand the various hold conditions and system hold codes to evaluate and release held orders.

In this topic:

- [Understanding System-Assigned Order Hold Reason Codes](#)
 - [Header-Level \(System\) Holds](#)
 - [Ship-to Holds](#)

- [Pay Type Holds](#)
- [Summarizing System Hold Reason Codes](#)

! Important:

You need to verify that each of these system-assigned codes exist in the Order Hold Reason Code table. Although the system assigns these codes to orders it places on hold, you will not be able to release the orders if the system does not find the appropriate code defined in the Order Hold Reason Code table. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

For more information:

- Pay types: [Working with Pay Types \(WPAY\)](#)
- System control values: [Setting Up Order Entry Values](#)
- Customer tables: [Creating and Updating Customers](#)
- Authorization services: [Work with Authorization Services \(WASV\)](#)
- Miscellaneous frauds: [Working with Miscellaneous Frauds \(WMFF\)](#)

Understanding System-Assigned Order Hold Reason Codes

Purpose: The system assigns most order hold reason codes as part of its Credit Checking function. The credit checking program executes automatically whenever you accept a new order (by selecting *Accept* or *Accept/Add Rcpt*) during Order Entry, or when you accept changes to an existing order (by selecting *Accept* or *Accept/Add Rcpt*) during Order Maintenance.

Quotes: The system does not perform the credit check process until you convert a quote to an order; see [Entering Pre-Order Quotes](#) and [Converting Quotes to Orders](#).

Assigning an order hold reason to an order: The system assigns order hold reason codes based on conditions that exist at the order header level and with certain pay types. You must establish fraud and hold criteria in the System Control table, Customer and Miscellaneous Fraud tables, Customer tables, and the Pay Type table.

You cannot modify or delete hold reason codes that the system assigns, although you can prevent their use in some cases by *unselecting* the [Fraud Checking \(A68\)](#) system control value.

Each hold updates the order header table status to *H* (Hold). The system checks for hold conditions and assigns holds at three levels:

- Header (or system) level
- Ship To level
- Pay type level

An order can be on hold at all three levels at the same time, or just on header hold. There will always be a header hold when there is a Ship To hold or a Pay Type hold.

The system looks for, and assigns, hold codes in the following order:

- Sold To customer
- Bill To customer, when the system does not place an order on Sold To customer hold

- Ship To customer
- Dollar amount, when the system does not place an order on Sold To or Bill To customer hold
- Pay types, regardless of header and Ship To holds already placed on the order

E-commerce cancel requests: You can use the [Hold Reason for Failed E-Commerce Maintenance Transactions \(H11\)](#) to hold an order if the customer attempts to cancel an order from the web storefront, and the attempt fails. For example, the system does not permit cancellation of an order through the e-commerce interface if the order is in use, or if there are pick slips printed for any items on the order.

Header-Level (System) Holds

Orders go on header-level holds for reasons at the Sold To level, Bill To level, dollar level, or if there is only a Ship To or pay type hold. When any of the hold codes described below apply, the system updates the Order Header table with the system hold reason code.

Hold Code	Assigned When:
AR (Declined Credit Card Reauthorization)	Assigned when the REAUTH periodic function attempts to reauthorize an expired authorization, and the reauthorization is declined. See Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration for more information.

 **Note:**

This hold reason is created automatically through the 19.4 update. If the AR hold reason already existed, it is overwritten.

AT (Declined Credit Card Authorization)	The credit card the customer used for the order has been declined from authorization. The specific reason for the decline is identified by a code you define in the Authorization Service table.
--	--

Hold Code	Assigned When:
AU (Broker Order Under Review)	<p>Assigned when a status inquiry response message from Order Orchestration indicates that the Under Review flag is selected for the retail pickup or delivery order. These status inquiry requests are generated through pick slip generation and through the BROKER integration layer process. Also applied when the order is created through the fulfillments response message.</p> <p>See Order Orchestration Integration for background on how orders are flagged as Under Review. Also, see Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration for a discussion.</p>
	<div style="border: 1px solid #0070c0; padding: 10px; background-color: #e6f2ff;"> <p> Note:</p> <p>This hold reason is created automatically through the 19.4 update. If the AU hold reason already existed, it is overwritten.</p> </div>
AV (Address Verification)	<p>The authorization sends a code that has not been defined as a vendor response code through Defining Authorization Services (WASV).</p>
BD (Balance Due)	<p>The order is paid with a prepaid pay type (pay category Cash/Check) and the amount of the short payment is greater than the dollar amount or percentage specified in the Pay Type table. If both a dollar amount and a percentage are defined for the pay type, then the system checks the dollar limit first to determine whether to apply the hold reason.</p> <p>The system writes balance due amounts to the refund/credit subsystem for manual review and write-off.</p> <p>If you apply sufficient additional payment to the order, the system releases the order from a balance due hold automatically.</p>
BF (Bill To Fraud)	<ul style="list-style-type: none"> • you enter <i>Fraud</i> in the Hold/bypass/fraud field of the Bill To Customer table for the customer or • the system finds a match on the standard match code or one of three fraud match codes in the Customer Fraud table.
BU (Bill To Unconditional Hold)	<p>You enter <i>Hold</i> in the Hold/bypass/fraud field in the Bill To Customer table for the customer.</p>
CB (Customer Rejected Deposit/Credit Card)	<p>The system finds a match to the order's credit card on a rejected deposit associated with a deferred or installment payment plan.</p> <p>When an order is placed on <i>CB</i> hold, the system writes an order transaction history message indicating the order has been placed on hold.</p>
CI (Check Interface Hold)	<p>Not currently implemented.</p>

Hold Code	Assigned When:
DH (Dollar Hold)	<ul style="list-style-type: none"> you defined a maximum order total in the Maximum Order Amount (A92) system control value, and the order total exceeds this value, and the system detects no hold conditions at the Sold To, Bill To, or Ship To level the order is not an e-commerce order that exceeds the Maximum Order Amount for E-Commerce Orders (H54)
EH (E-Commerce Dollar Hold)	<ul style="list-style-type: none"> you defined a maximum order total in the Maximum Order Amount for E-Commerce Orders (H54) system control value, and you also defined a maximum order total in the Maximum Order Amount (A92) system control value, and the e-commerce (order API) order total exceeds the Maximum Order Amount for E-Commerce Orders (H54), and the system detects no hold conditions at the Sold To, Bill To, or Ship To level <p>Order Administration identifies an e-commerce order if the order type matches the E-Commerce Order Type (G42) system control value or if the Internet order flag in the Order Header table is set to <i>I</i>. The order API sets this flag to <i>I</i> when it creates an order.</p>
EO (Email Fraud Hold)	The bill-to customer or sold-to customer has an Email address that matches an email address in the Miscellaneous Fraud table, or the order-level email matches; see Working with Miscellaneous Frauds (WMFF) .
FC (Fraud Cancellation Hold)	<p>The CyberSource Decision Manager Update Process retrieved order information from Decision Manager for orders that were marked as review during the CyberSource Decision Manager Update Process and the new decision assigned to the order is REJECT, indicating a user in Decision Manager reviewed the order and rejected the order.</p> <p>In this situation, Order Administration places the order on <i>FC</i> Fraud Cancellation hold if the entire order cannot be canceled.</p>
FS (Fraud Scoring Hold)	The online authorization transaction sent to Cybersource for the credit card payment on the order was evaluated by CyberSource Decision Manager Fraud Scoring, and based on the order profile, requires review for possible fraud.
GC (Gift Card Hold)	The order contains a stored value card item and a stored value card payment method. The system evaluates this hold only if the Use Gift Card Fraud Checking (L72) system control value is selected.
IP	<p>The <code>ip_addr</code> in the <i>Inbound Order XML Message (CWORDERIN)</i> (when creating an order through the generic order API) matched an IP address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF).</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>

Hold Code	Assigned When:
PT (Pay Type)	The order is on pay type hold and no other hold exists. The system places the order pay type on hold, but displays <i>PT</i> at the header level to let you know that you need to investigate and release the pay type record.
RL (Oracle Retail Customer Engagement Communication Failure)	<p>During the order accept process, Order Administration could not connect with Oracle Retail Customer Engagement to redeem the award amount applied to an order.</p> <p>When an order is placed on <i>RL</i> hold, the system writes an order transaction history message indicating the award amount was not automatically redeemed so a user can log in to Oracle Retail Customer Engagement and manually redeem the award amount against the loyalty card: <code>SYSTEM UPDATE Loyalty Award Redemption Failed 99.99</code>, where <code>99.99</code> is the award amount applied to the order. See Applying and Redeeming Customer Engagement Awards during Order Processing for more information.</p>
SB (Customer Rejected Deposit/Customer Fraud)	<p>The system finds a match to the order's sold to customer on a rejected deposit associated with a deferred or installment payment plan.</p> <p>When an order is placed on <i>SB</i> hold, the system writes an order transaction history message indicating the order has been placed on hold.</p>
SF (Sold To Fraud)	<ol style="list-style-type: none"> 1. you enter <i>Fraud</i> in Hold/bypass/fraud field in the Sold To Customer table for the customer, or 2. the system finds a match on the standard match code or one of three fraud match codes in the Customer Fraud table; see Working with Customer Fraud Tables (WCFD). <p>The system also sets a ship-to hold of <i>HS</i>.</p>
SH (Ship To Hold)	The order is on Ship To hold only. The system places the Ship To record on hold, but displays <i>SH</i> at the header level to let you know that you need to investigate and release a Ship To record.
SM (Ship-to Mismatch)	<p>The system places an order on <i>SM</i> Ship To Mismatch hold if the following conditions are met:</p> <ul style="list-style-type: none"> • the order contains a <i>Credit Card</i> pay category payment method, and • the ship to address on the order is different from the sold to address, and • the order total is greater than the Maximum Order Amount for Fraud Checking (D24), and • the ship via priority for the ship via on the order header matches the Ship Via Priority for Ship To Mismatch (L71), and • the number of times shipped to the address is less than the # of Times Shipped to Same Address (D25) OR the number of days since the last shipment to the address is less than the # of Days Since Last Order (D26). <p>See the Maximum Order Amount for Fraud Checking (D24) for examples.</p>

Hold Code	Assigned When:
SU (Sold To Unconditional)	You enter <i>Hold</i> in the Hold/bypass/fraud in the Sold To Customer table for the customer.
UB (Unreferenced Bill To)	You create a new bill-to customer through Order Entry. The system assigns this hold reason only if the Allow Order for New Bill-to Without Order Hold (D84) system control value is <i>unselected</i> . Unlike the holds described below, this header level hold occurs prior to credit checking.
VD (Void Pick)	A pick slip for the order is voided through the Void/Reprint pick function by selecting <i>Void All/Hold Order</i> (see Void All Pick Slips and Hold Order in Reprinting and Voiding Pick Slips (WVRP or WSVP)). You must release the order through Selecting Held Orders (ERHO) , not through Order Maintenance. Although this type of hold is not applied during the credit checking process, it has been described here because it is a system-level hold.
WO (Warranty Order Hold)	The cost for all of the warranty items on an order exceeds the amount defined in the Maximum Warranty Order Amount (F97) system control value. Since warranty items are added to an order at no charge, the system uses the cost defined for the item to determine the dollar amount of a warranty item on an order. If the cost was overridden on the order detail line, the system uses the cost override.
WC (Warranty Customer Hold)	The Life to date warranty dollars field on the Work with Customer Warranty Information Screen for the sold to customer exceeds the amount defined in the Maximum LTD Warranty Amount for Customer (F98) system control value. The system uses this calculation to update the Life to date warranty dollars field: warranty shipped amount - warranty returned amount = life to date warranty dollars amount.
ZB (Bill To Zip Fraud)	The postal code on the Bill To address matches a postal code in the Miscellaneous Fraud table.
ZS (Sold To Zip Code Fraud):	The postal code on the Sold To address matches a postal code in the Miscellaneous Fraud table.

Ship-to Holds

The system continues searching for hold conditions at the Ship To level. When a hold occurs at the Ship To level, the system updates the Ship To order reason and status with one of the codes discussed below. The following code applies when there is only a Sold To customer on the order.

Hold code	Assigned When:
ES	The shipping address on the order has an email address that matches an email address in the Miscellaneous Fraud table; the match can be a recipient, a permanent ship-to or an order ship-to. (Note: The system puts the order on hold only if the customer's primary email address matches the email address in the Miscellaneous Fraud table.) See Working with Miscellaneous Frauds (WMFF) , Creating and Updating Ship-to Customers (WCST) , Adding a Recipient Order in Order Entry , and Assigning an Order Shipping Address .
HF (Ship To Fraud)	Applies to a permanent Ship To on an order when the system locates a match on the standard match code or on a fraud match code in the Fraud table; see Working with Customer Fraud Tables (WCFD) .
HS (Ship To/Sold To Fraud)	The ship-to address on the order matches an address in the Fraud table; see Working with Customer Fraud Tables (WCFD) . This is a secondary hold applied if a sold-to fraud (SF) occurs. Also, the system assigns this hold reason code if you have not set up all four of the match code types through Setting Up Match Codes (MMCH) .
ZH (Ship To Zip Fraud)	The postal code on the Ship To address matches a postal code in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF) .

**Note:**

The HF or ZH hold codes may apply when the Ship To and Sold To customers differ (that is, when the order includes a permanent or one-time shipping address).

Pay Type Holds

The system checks for pay type holds, regardless of any other order holds. The payment methods used on the order control how the system performs the credit check routines.

Prepaid orders:(Cash/Check) Prepaid orders are orders paid by cash, check or money order. The following holds may occur:

Hold code	Assigned When:
TM (Time hold)	You specify a time period in the Pay Type table. For example, you may decide to hold a customer's check for a specified number of days, so that you are sure that the check clears. The hold remains in effect until the time period elapses or until you release the order from hold manually through the Release Held Orders program; see Selecting Held Orders (ERHO) . The system places all recipient orders on time hold if the order uses multiple payment methods or has multiple recipients.
KF (Check fraud)	The system checks orders against the Miscellaneous Fraud table, and the micra number (routing number, located on the bottom of the check) is in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF) .

Credit card orders: The system checks orders paid by credit card for the following holds:

Hold code	Assigned When:
CF (Credit Card Fraud)	The system finds the credit card number in the Miscellaneous Fraud table; see <i>Working with Miscellaneous Frauds (WMFF)</i> .
CW (Waiting for Credit Card Authorization)	<p>Orders are waiting for authorization from a credit card service bureau.</p> <p>If the only hold on the order is CW, then the order does not actually go on hold. Instead, the order continues its normal routing process. The order displays CW as the pay type status in standard Order Inquiry, but the order is open. The system authorizes the amount to be shipped during Pick Slip Generation. If the service bureau declines the order at this point, then the order may go on hold, depending on the reason for the decline.</p> <p>When the service bureau declines the credit card charge, the system checks the Vendor Authorization table to determine if a hold code exists for the decline reason. If the Hold reason field in the Vendor Response record is blank, the system will not place the order on a declined authorization hold. Instead, it assigns <i>AV</i> as a hold reason at the header level of the order to remind you that the order is waiting to be resubmitted for authorization.</p> <p>If the Vendor Response record includes a hold reason code for the declined reason, then the system places the pay type on hold using the hold reason code in the Vendor Response record, and assigns a code of <i>AT</i> to the order header.</p> <p><i>Example:</i></p> <p>The service bureau gives you the following reasons for declining authorization:</p> <p>01 = Card stolen 02 = Unable to reach bank</p> <p>You create a record for each reason in the Vendor Authorization table, entering <i>XY</i> in the Hold reason field as a code for “card stolen,” and leaving the Hold reason field blank for “unable to reach bank.”</p> <p><i>Scenario 1:</i> The service bureau declines a credit card charge, returning 01 (card stolen) as the reason for the decline. The system:</p> <ol style="list-style-type: none"> 1. Checks the Vendor Response record for response code 01 and finds <i>XY</i> in the Hold reason field. 2. Places the order on hold, assigning <i>AT</i> (Authorization declined) to the order header. 3. Places the pay type on hold, assigning <i>XY</i> to the pay type. <p><i>Scenario 2:</i> The bank's phone line is busy when the service bureau tries to authorize the credit card charge. The service bureau returns code 02 (unable to reach bank) as the reason. The system:</p> <ol style="list-style-type: none"> 1. Checks the Vendor Authorization table for response reason code 02 and finds no code in the Hold reason field. 2. Leaves <i>CW</i> at the pay type level, indicating that the order will be automatically resubmitted for authorization.

Hold code	Assigned When:
PV (Pay Plan Velocity Hold)	<p data-bbox="638 268 1383 388">A credit card has been used too many times within a specified period for an order containing a deferred or installment payment plan. The system determines when to place an order on <i>PV</i> pay type hold based on the values defined in the:</p> <ul data-bbox="638 394 1383 535" style="list-style-type: none"><li data-bbox="638 394 1383 535">• <i>Number of Times Flexible Payment Option is Used (F52)</i> system control value. This system control value defines the number of times a credit card can be used before an order containing a deferred or installment payment plan is placed on <i>PV</i> hold. <p data-bbox="638 541 755 577">Example:</p> <p data-bbox="638 583 1383 703">If you enter 2 in the <i>Number of Times Flexible Payment Option is Used (F52)</i> system control value, the system will place an order on <i>PV</i> hold if the credit card has been used on more than 2 orders containing a deferred or installment payment plan.</p> <ul data-bbox="638 709 1383 976" style="list-style-type: none"><li data-bbox="638 709 1383 976">• <i>Number of Days Flexible Payment Option is Used (F53)</i> system control value. This system control value defines the number of days this credit card can be used before an order is placed on hold. The system only determines the number of days a credit card can be used before its next use on an order containing a deferred or installment payment plan if the credit card exceeded the number of days defined in the <i>Number of Times Flexible Payment Option is Used (F52)</i> system control value. <p data-bbox="638 982 755 1018">Example:</p> <p data-bbox="638 1024 1383 1312">If you entered 2 in the <i>Number of Times Flexible Payment Option is Used (F52)</i> system control value and the credit card was used on more than 2 orders containing a deferred or installment payment plan, the system would then determine the last time the credit card was used. If you entered 5 in the <i>Number of Days Flexible Payment Option is Used (F53)</i> system control value, the system would place the order on <i>PV</i> hold if the credit card was used on more than 2 orders containing a deferred or installment payment plan and the credit card was used less than 5 days ago.</p>

Hold code	Assigned When:
P\$ (Pay plan Dollar Threshold)	<p>The total dollar amount and invoice amount outstanding for a sold to customer on orders containing a deferred or installment payment plan exceeds the dollar amount defined in the Dollar Threshold for Sold To Customer Orders with Flexible Payments (F54) system control value.</p> <p>The system uses this calculation to determine the total dollar amount outstanding for a sold to customer on orders containing a deferred or installment payment plan:</p> $\text{balance open amount} + \text{open invoice amount} = \text{total outstanding dollar amount}$ <p><i>Example:</i></p> <p>Dollar threshold amount = 100.00 balance open amount = 75.00 open invoice amount = 50.00 75.00 + 50.00 = 125.00 (total outstanding dollar amount)</p> <p>Since the total outstanding dollar amount is greater than the dollar threshold amount defined in the Dollar Threshold for Sold To Customer Orders with Flexible Payments (F54) system control value, the system places the order on P\$ hold.</p>

User-defined holds: Most of the hold reason codes the system assigns revolve around issues of suspicious credit. However, you can also create your own hold reason codes for other business reasons, which are assigned as user holds. See [Establishing Order Hold Reason Codes \(WOHR\)](#). You would not normally assign system-defined holds manually to orders in order to prevent confusion.

Summarizing System Hold Reason Codes

Hold Code	Description	See	SCV(s)	Hold Level
AR	Declined Credit Card Reauthorization	Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration		Order Header
AT	Declined Credit Card			Order Header
AU	Broker Order Under Review	Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration		Order Header
BD	Balance Due Exceeds \$ Amount	Working with Pay Types (WPAY) .		Order Header

Hold Code	Description	See	SCV(s)	Hold Level
BF	Bill To Fraud	<i>Creating and Updating Bill-to Customers (WCBT)</i>	<i>Fraud Checking (A68)</i>	Order Header
BU	Bill To Unconditional	<i>Creating and Updating Bill-to Customers (WCBT)</i>		Order Header
CB	Customer Rejected Deposit/Credit Card			Pay Type
CF	Credit Card Fraud	<i>Working with Miscellaneous Frauds (WMFF)</i>		Pay Type
CI	Check Interface Hold		Not currently implemented.	Order Header

Hold Code	Description	See	SCV(s)	Hold Level
CW	Credit Authorization	 Note: CW does not stop the order from processing; hold as		Pay Type

Hold Code	Description	See	SCV(s)	Hold Level
		<p>S i g n e d d u r i n g P i c k S l i p G e n e r a t i o n</p>		
DH	Dollar Hold		<i>Maximum Order Amount (A92)</i>	Order Header
EB	Bill-to Email Addresses	<i>Working with Miscellaneous Frauds (WMFF) and Creating and Updating Bill-to Customers (WCBT)</i>	<i>Fraud Checking (A68)</i>	Order Header
EC	Sold-to Customer Email Addresses	<i>Working with Customer Email Addresses and Working with Miscellaneous Frauds (WMFF)</i>	<i>Fraud Checking (A68)</i>	Order Header
EH	E-Commerce Dollar Hold		<i>Maximum Order Amount for E-Commerce Orders (H54)</i>	Order Header

Hold Code	Description	See	SCV(s)	Hold Level
EO	Order Email Addresses	<i>Working with an Order-Level Email Address and Working with Miscellaneous Frauds (WMFF)</i>	Fraud Checking (A68)	Order Header
ES	Ship-to Email Addresses	<i>Creating and Updating Ship-to Customers (WCST), Assigning an Order Shipping Address and Working with Miscellaneous Frauds (WMFF)</i>	Fraud Checking (A68)	Order Ship To
FC	Fraud Cancellation Hold	CyberSource Decision Manager Review Process		Order Header
FS	Fraud Scoring Hold	CyberSource Decision Manager Review Process		Order Header
GC	Gift Card Hold		Use Gift Card Fraud Checking (L72)	Order Header
HF	Ship To Fraud	<i>Working with Customer Fraud Tables (WCFD)</i>	Fraud Checking (A68)	Order Ship To (permanent Ship To only)
HS	Sold To/Ship To Fraud	<i>Working with Customer Fraud Tables (WCFD) or Setting Up Match Codes (MMCH)</i>		Order Ship To
HS	Sold-to/Ship Fraud	<i>Working with Customer Fraud Tables (WCFD)</i>		Order Ship To
IP	IP Addresses	<i>Working with Customer Fraud Tables (WCFD)</i>		Order Header
KF	Check Fraud	<i>Working with Miscellaneous Frauds (WMFF)</i>		Pay Type
OB	Outstanding Balance Due	<i>Creating and Updating Bill-to Customers (WCBT)</i>		Pay Type
PT	Pay Type			Order Header

Hold Code	Description	See	SCV(s)	Hold Level
PV	Pay Plan Velocity Hold		<i>Number of Times Flexible Payment Option is Used (F52); Number of Days Flexible Payment Option is Used (F53)</i>	Pay Type

ZS	Sold To Zip Code Fraud	<i>Working with Miscellaneous Frauds (WMFF)</i>		Order Header

Displaying Order Hold Information

Purpose: You might want to display held order information at a summary or detail level when determining whether to release orders from hold. You can view order status and distinguish orders that are on hold versus orders that are closed, canceled, or in some other state. As

part of your prerelease management process, you can identify and evaluate specific system and user holds, as well as whether payment methods and ship-to records are on hold.

In this topic:

- [Held Order Reasons Pop-Up Window \(Displaying Hold Reason Codes\)](#)
- [First Display Customer Screen](#)
- [Second Display Customer Screen](#)
- [Using the Order Inquiry Header Screen to Review Held Orders](#)

For more information: See the [Work with Order Recipients Screen](#).

Held Order Reasons Pop-Up Window (Displaying Hold Reason Codes)

Purpose: You might find it useful to review the primary system hold and user hold codes assigned to an order before you release it, or to determine whether you need to take a closer look at the order.

How to display this window: Select *Hold reasons* for a held order at the [Release Held Orders Screen \(Working with Releases\)](#).

About this window: The information on this window includes:

- Order number
- Customer name
- System hold reason code and description, if applicable
- User hold reason code and description, if applicable
- Payments held condition and description
- Recipients held condition and description, if applicable

See [Release Held Order Scan Screen](#) and [Release Held Orders Screen \(Working with Releases\)](#) for field descriptions.

Hold hierarchy: The system hold reason code that appears on this screen is the reason code at the highest level. See [Understanding System-Assigned Order Hold Reason Codes](#) for a description of the sequence the system follows when assigning system holds. An order may contain additional holds that are not visible on this screen until you release the order from the displayed hold. You can, however, identify whether the order has a payment method or ship-to holds.

First Display Customer Screen

Purpose: Use the Display Customer screens to review customer information for held orders.

How to display this screen: At the [Release Held Orders Screen \(Working with Releases\)](#), select *Cust Info* for an order.

For more information: See [Creating and Updating Sold-to Customers \(WCST\)](#) for descriptions of the fields and options on this screen.

Second Display Customer Screen

Purpose: This screen displays additional information on the sold-to customer.

How to display this screen: Select *OK* at the [First Display Customer Screen](#).

For more information: See [Creating and Updating Sold-to Customers \(WCST\)](#) for descriptions of the fields and options on this screen.

Using the Order Inquiry Header Screen to Review Held Orders

Purpose: Use the [Order Inquiry Header Screen](#) when you want to see the order's summary information and the system header reason code, or ship-to reason code, affecting an order.

This screen displays the ship-to hold reason, when one exists, and displays the header hold reason when no ship-to hold exists. When you identify a ship-to hold reason, you then need to determine whether more than one ship-to address exists for the order. Check the Recip field to determine this information. If there is more than one ship-to, you can identify the held ship-to records by viewing the [Work with Order Recipients Screen](#).

Whenever a hold applies at either the header or ship-to level, the entire order is held as a result.

How to display this screen: At the [Release Held Orders Screen \(Working with Releases\)](#), select *Order Inquiry* for an order.

The [Order Inquiry Header Screen](#) displays information relating to both sold-to and ship-to customers. Fields on this screen reflect information created through Order Entry.

Performing the Release

Purpose: You can release all holds associated with the order, or release only pay type or ship-to holds. This topic presents the screens you work with to release:

- Ship-to holds
- Pay type holds
- System-level holds

Note:

Releasing a system level hold releases ship-to and pay type holds automatically.

Release authority: You can set authority to release held orders for users or user classes. Users can be restricted from releasing orders with particular order hold reasons, or all hold reason codes. This authority controls header-level hold reasons only; you cannot use it to control access to pay type or recipient hold release. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

Releasing through a web service request: You can use the *Order Maintenance API* to release a user hold.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

If the order has a system hold reason of AR or AU: See [Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration](#) for a discussion of how these orders can be released from hold.

In this topic:

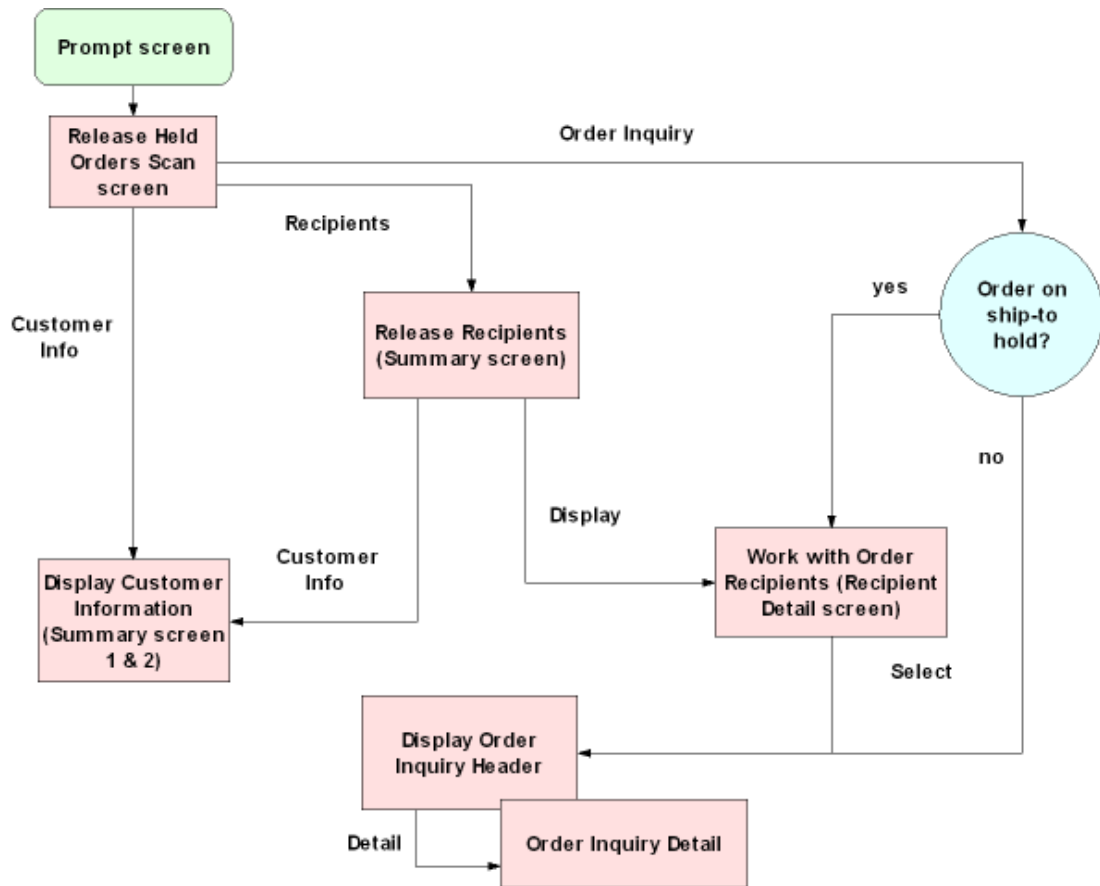

- [Recap of Screen Relationships](#)
- [Release Order Recipients Screen](#)
- [Work with Order Recipients Screen](#)
- [Releasing Recipient \(Ship-to\) Holds](#)
- [Release Recipient Hold Reason Pop-Up Window](#)
- [Release All Recipients Prompt Pop-Up Window](#)
- [Release Held Order Payment Methods Screen](#)
- [Releasing Order Payment Methods](#)
- [Release Order Payment Method Window](#)
- [Release All Payments Window](#)
- [Releasing Held Orders by Order Number](#)
- [Release Reason Prompt Pop-Up Window](#)

Order maintenance allows you to work with payment information or clear a header-level hold, using the [Enter Payment Methods Screen in Order Maintenance](#) or the [Work with Order Screen in Order Maintenance](#).

Recap of Screen Relationships

Purpose: From the [Release Held Orders Screen \(Working with Releases\)](#), you can advance to summary and detail screens that will enable you to review, evaluate, and release held orders.

Diagram: This diagram shows you the routes you take from one screen to another when you are working from the [Release Held Orders Screen \(Working with Releases\)](#).

Release Order Recipients Screen

Purpose: Use this screen to release holds for ship-to customers. From the [Release Held Orders Screen \(Working with Releases\)](#), you can review and release held recipients from ship-to hold. You can identify held recipient records by the Yes in the order's Rcp field on the Release Held Orders screen, or by viewing the [Held Order Reasons Pop-Up Window \(Displaying Hold Reason Codes\)](#). Releasing held recipients releases holds that apply to ship-to customers only. See [Performing the Release](#) and [Recap of Screen Relationships](#).

Note:

You cannot set release authority for recipient-level holds, only for order-level holds. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

How to display this screen: Select *Recipients* for an order at the [Release Held Orders Screen \(Working with Releases\)](#).

Field	Description
Ship via	The carrier selected for the order. Alphanumeric, 15 positions; display-only.

Field	Description
Recipient (Ship-to number)	The system assigns a ship-to number sequentially to each shipping address on an order. The ship-to number appears as a suffix to the order number. Numeric, 3 positions; display-only.
Recipient name (Unlabeled field to the right of the ship-to number)	The name of the recipient. Alphanumeric, 41 positions; display-only.
Hold	Represents the type of hold assigned to the ship-to record. Only system holds display on this screen. Alphanumeric, 2 positions; optional.

Screen Option	Procedure
Display order recipients	Select <i>Display</i> for a recipient to advance to the Work with Order Recipients Screen .
Release held order recipients	Select <i>Release</i> for a recipient to display a pop-up window providing the option to release the record. See Releasing Recipient (Ship-to) Holds .
Display customer information	Select <i>Cust Info</i> for a recipient to advance to the First Display Customer Screen .
Release all held order recipients	Select <i>Release All</i> to release all recipients from hold. See Releasing Recipient (Ship-to) Holds .

Work with Order Recipients Screen

Purpose: Use this screen to review the customer and order detail screens for the recipients on an order.

How to display this screen: At the [Release Order Recipients Screen](#), select *Display* for the recipient(s) you want. If there is more than one recipient to the order, you advance to the Work with Order Recipients screen. If there is only one recipient for the order on the screen, you advance directly to the [Order Inquiry Header Screen](#) or the [Order Inquiry Detail Screen](#), depending on the setting of the [Default Version for Order Inquiry \(C34\)](#) system control value.

Field	Description
Order #	The number the system assigned to the held order. Numeric, 8 positions; display-only.
Sold to	The customer number the system assigned to the customer who placed the order. Numeric, 9 positions; display-only.
Customer name (Unlabeled field to the right of the sold-to number)	The name of the customer who placed the order. Alphanumeric, 25 positions; display-only.
Rcp # (Recipient number)	The number the system assigns sequentially to each ship-to address on an order. Numeric, 3 positions; display-only

Field	Description
Customer#	The number the system assigned to the ship-to customer. Numeric, 9 positions; display-only.
Name	The customer's name and address. Alphanumeric, 3 lines; display-only.
Sts (Status)	The status of the order. This field is not implemented on this screen. Alphanumeric, 1 position.
Merch amt (Merchandise amount)	The dollar value of the merchandise for the recipient. Numeric, 20 positions with a 2-place decimal; display-only.

Screen Option	Procedure
Select a recipient record for review	Select a recipient to advance to Order Inquiry.
Display customer address and information	Select <i>Display</i> for a recipient to advance to the <i>First Display Customer Screen</i> .

Releasing Recipient (Ship-to) Holds

Purpose: From the initial [Release Order Recipients Screen](#) you can release holds associated with an specific recipient, or release all held recipients for the order.

Note:

You cannot set release authority for recipient-level holds, only for order-level holds. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

Pick slip preparation: When you release an order from hold, the system determines whether the order is eligible for pick slip preparation; see [Preparing Orders for Pick Slip Generation](#).

Release Recipient Hold Reason Pop-Up Window

At the [Release Order Recipients Screen](#), select *Release* for a ship-to recipient you want to release from all ship-to holds to display the Release Recipient Hold Reason pop-up window. You can use this window to change the release flag from *unselected* to *selected*.

Release All Recipients Prompt Pop-Up Window

At the [Release Order Recipients Screen](#), select *Release All* to release all held ship-tos for the order and display this window.

Release Held Order Payment Methods Screen

Purpose: Use this screen to display payment method (pay type) information and to release orders from payment method holds.

 **Note:**

You cannot set release authority for payment method holds, only for order-level holds. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

How to display this screen: At the [Release Held Orders Screen \(Working with Releases\)](#), select *Pay Methods* for an order.

Field	Description
Order	A unique number the system assigns to an order. Numeric, 8 positions; display-only.
Order date	Unlabeled field to the right of the order number. The date the order was created. Numeric, 6 positions (in user date format); display-only.
Pay type	A user-defined code that represents the pay type on the order. Pay type codes must represent the following: <ul style="list-style-type: none"> • Cash/check • Credit card Pay types are created in and validated against the Pay Type table. See Working with Pay Types (WPAY) . Numeric, 2 positions; optional.
Hold reason	The reason the user placed the record on hold. See Establishing Order Hold Reason Codes (WOHR) .
	Alphanumeric, 2 positions; optional.
Balance open	The unbilled portion of the order that must be changed to this payment method. Numeric, 20 positions with a 2-place decimal; optional.
Until date	The date when the order becomes eligible for release by the Release Orders on Time Hold Periodic Function. This date displays only for orders held because of a declined credit card authorization. The system calculates this date based on the number of days you specify for the vendor response code. See Defining Vendor Response Codes for more information on setting up authorization services. Numeric, 6 positions (in user date format); display-only, assigned by the system.

 **Note:**

You cannot release the Awaiting Credit Card Auth (CW) hold.

Screen Option	Procedure
Display a payment method record	Select <i>Display</i> for a payment method to advance to the Display Order Payment Methods Screen .
Release a specific payment hold	Select <i>Release</i> for a payment method to display a Release Order Payment Method Window .
Release all payment holds on the order	Select <i>Release All</i> to display the Release All Payments Window .

Releasing Order Payment Methods

Purpose: From the [Release Held Order Payment Methods Screen](#), you can release an individual payment method from hold, or release all payment methods on the order.

Pick slip preparation: When you release an order from hold, the system determines whether the order is eligible for pick slip preparation; see [Preparing Orders for Pick Slip Generation](#).

Credit card pay types requiring authorization: When you release a credit card pay type from hold, if the pay type has an authorization service code defined and the credit card requires authorization, the system places the credit card pay type on *CW Waiting for Credit Card Authorization* hold. If the only hold on the order is CW, the order does not actually go on hold. Instead, the order continues its normal routing process. The order displays CW as the pay type status in standard Order Inquiry, but the order is open. The system authorizes the shipment amount during Pick Slip Generation. If the service bureau declines the order at this point, then the order may go on hold, depending on the reason for the decline.

Release Order Payment Method Window

Use this pop-up window to release a payment method from hold. At the [Release Held Order Payment Methods Screen](#), select *Release* for a payment method to display this pop-up window.

Enter Y in the Release field to confirm the release, or enter N to retain hold status.

Release All Payments Window

Use this pop-up window to release all payment methods on an order from hold. Select *Release All* at the [Release Held Order Payment Methods Screen](#).

You can also release payment method (pay type) holds through order maintenance. You must use the [Enter Payment Methods Screen in Order Maintenance](#) in order maintenance to release pay type holds if you need to apply money or change the pay type information.

Note:

You cannot set release authority for payment method holds, only for order-level holds. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

Releasing Held Orders by Order Number

Purpose: From the [Release Held Orders Screen \(Working with Releases\)](#), you can perform a global or individual order release on any order listed.

Pick slip preparation: When you release an order from hold, the system determines whether the order is eligible for pick slip preparation; see [Preparing Orders for Pick Slip Generation](#).

If the order has a system hold reason of AR or AU: See [Reauthorization and Under Review Hold Scenarios for Orders Fulfilled through Order Orchestration](#) for a discussion of how these orders can be released from hold.

Release Reason Prompt Pop-Up Window

At the [Release Held Orders Screen \(Working with Releases\)](#), select *Release* for the order you want to release from hold. The Release field in this window defaults to *N* (do not release the order).

Select the Release field to confirm the release.

Release authority: If you do not have authority to release the order from hold, the screen displays an error message. See [Establishing Order Hold Reason Codes \(WOHR\)](#).

Note:

This action releases all holds for the order (payment and ship-to holds). You receive a warning message if you attempt to release an order that has payment or ship-to holds.

Managing Returns

In this part:

- [Introducing Return Authorizations \(WRTA\)](#) discusses the three stages of creating, receiving, and issuing credit for merchandise returns.
- [Selecting Orders for Return \(WRTA\)](#) shows you how to use the Select Order for Return Authorization screen to select an order for return authorization through the Work with Return Authorizations menu option.
- [Working with Return Authorizations: Standard Process](#) describes how to create or work with a return authorizations using the standard process, which involves creating, receiving, and crediting returns in separate steps.
- [Working with Return Authorizations: Streamlined Process](#) describes how to create or work with return authorizations using the streamlined process, which involves automatically processing the return authorization as far as your authority extends.
- [Receiving Returns \(WRAR\)](#) shows you how to receive returns into your warehouse using a separate menu option.
- [Crediting Returns \(WRAC\)](#) shows you how to credit returns using a separate menu option.
- [Processing Credits by Line of Business \(MCLB\)](#) describes how to process credits for a specific line of business and dollar amount.
- [Work with Return Interface Errors \(WRIE\)](#) describes the screens you use to review or delete return records which went into error status when received from an outside return system.

- *Inbound Return API* describes using the generic returns API (RETURNS_IN process) to create and process a return against an order detail line, based on XML messages from an external system.
For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Working with Return Authorizations: Standard Process

Purpose: Use the standard return authorizations process to create, receive, and credit return authorizations in separate steps. When you select an order for return authorization, you advance to the screens you use for the standard process if the [Use Streamlined Return Authorizations \(F44\)](#) system control value is *unselected*. In addition to using separate steps and screens to process the return, the standard process differs from the streamlined process in that:

- you must select each item on the order for return individually; there is no "select all"
- you cannot work with additional charges through this method
- you can change a return authorization without processing it further

When you use the standard process, the screen you first advance to after selecting an order varies, depending on whether you have already created a return authorization for the order.

Selecting an order: The process you use to select an order for return authorization processing is the same regardless of whether you use the standard or streamlined process. See [Selecting Orders for Return \(WRTA\)](#).

Return authorization download triggers: If the [Create Return Download Triggers \(K28\)](#) system control value is *selected*, the system creates a return authorization download (RAD) trigger when you create, change, or delete a return authorization line, based on the trigger rules defined for the Return Authorization Download (RETURN_OUT) integration layer job. The RETURN_OUT integration layer job monitors for return authorization download triggers and generates a *Return Authorization Outbound XML Message (CWReturnRAOut)* to send the return authorization information to a remote system.

Retail pickup or delivery orders: You can process a return against a retail pickup or delivery order; however, shipping the order deactivates the [Order Broker Payment Type \(K98\)](#) applied to these orders, so you would then need to enter a new payment method in order to process the related refund.

Note:

You cannot process an exchange against a retail pickup or delivery order.

The system does not send a status update to Order Orchestration when you process a return against a retail pickup or delivery order.

See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview.

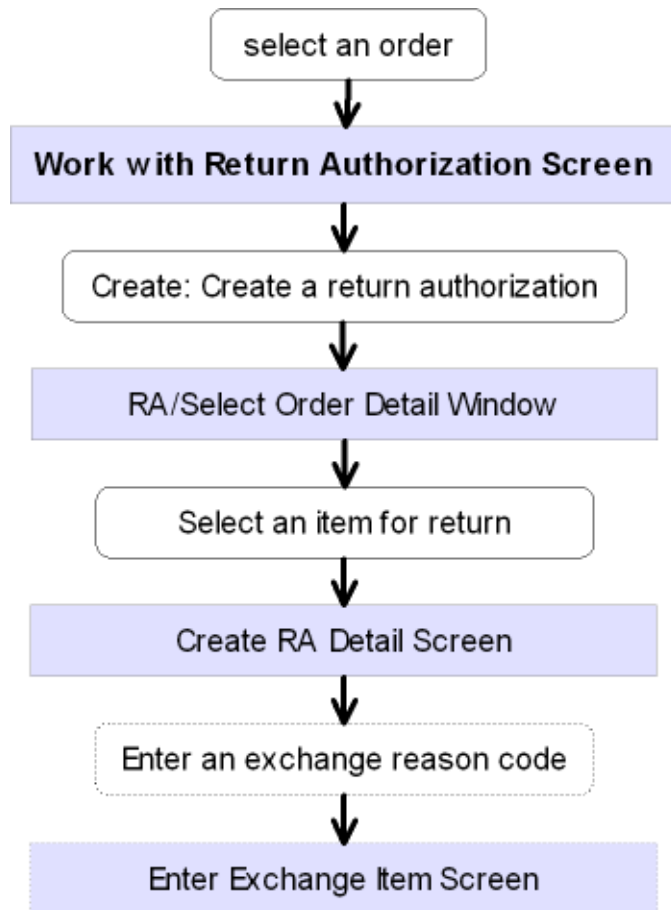

Pick slip preparation: When you select an order for return authorization, the system removes any pick slip preparation from the order. When you accept or reject the return authorization, the system determines if the order qualifies for pick slip preparation and reapplies it to the order. If you add an exchange item to the order, the system performs pick slip preparation for the exchange item when you receive the return authorization. See [Preparing Orders for Pick Slip Generation](#).

In this topic:

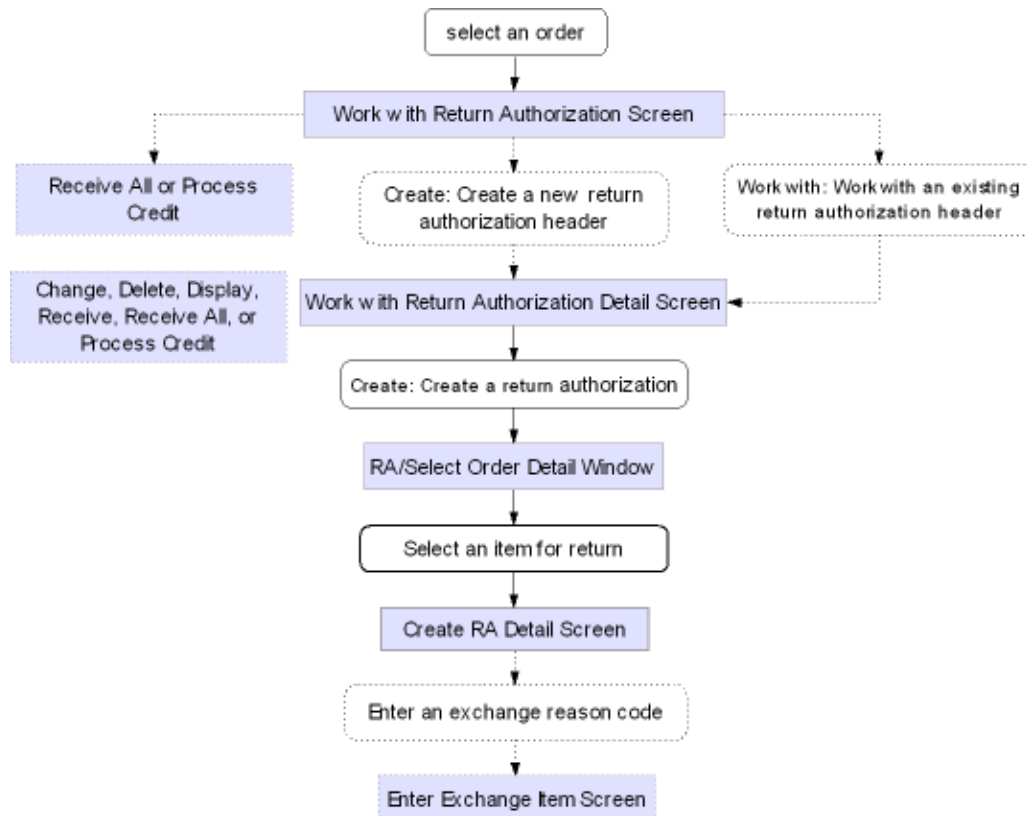

- *Screen Flow*
 - *Authority Level*
- *Work with Return Authorizations Screen*
- *Work with Return Authorization Detail Screen*
- *R/A Select Order Detail Pop-Up Window*
- *Create RA Detail Screen*
- *Enter Exchange Item Screen*
- *Create RA Detail Screen (Processing Misships)*
- *Receiving All Returns*
 - *Receive All/Header Screen*
 - *Receive All/Detail Screen*
- *Receive RA Items Screen (Receiving Detail)*
- *Change RA Detail Screen*
- *RA Exchange Item Window (Review Exchange)*
- *Process RA Credits Screen*
- *Accepting or Rejecting Your Entries*

Screen Flow

When you are creating the first return authorization for an order:

When there is already a return authorization for the order:

Authority Level

Your authority level is determined by the following secured features:

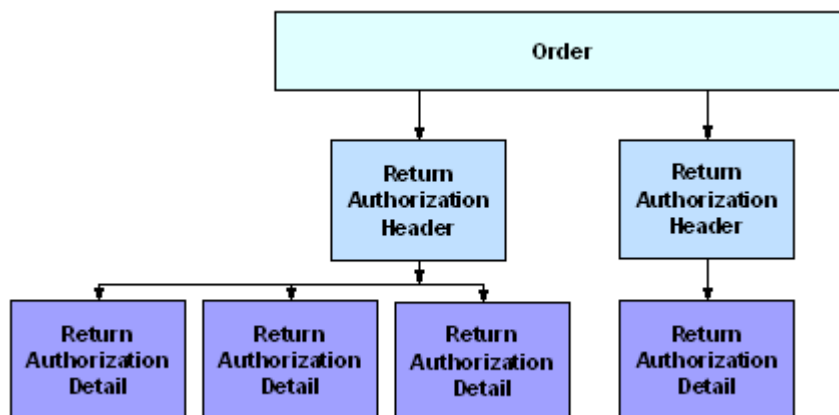

- [Enter Return Authorization \(A28\)](#): You must have enter authority for access to Work with Return Authorizations, or ability to create a return or exchange.
- [Receive Return Authorization \(A29\)](#): You must have *both* enter and receive authority to enter or receive a return authorization, or to create a misship return (because misships are created and received automatically).
- [Credit Return Authorization \(A34\)](#): You must have authority to *all* steps of return authorization (enter, receive, and credit) to process the credit.

Additionally, the [Delete Return Authorizations \(B03\)](#) secured feature controls the ability to delete a return authorization that has been created, but not yet received.

Work with Return Authorizations Screen

Purpose: Use this screen to select or review existing return authorizations for an order, or to advance to the screens you use to add a new return authorization for the order. This screen lists all return authorization headers, regardless of their processing stage, for the order and ship-to.

Order/header/detail structure: The relationship between the order and return authorization header and detail is illustrated in the chart below.

Each return or exchange of an item (detail record) must be associated with a header and an order. However, each order can have any number of return authorization headers, and each header can have any number of detail records.

How to display this screen: Select an order through the Work with Return Authorizations scan screens if there are already one or more return authorizations on the order; see [Selecting Orders for Return \(WRTA\)](#).

 **Note:**

The [Edit Customer Actions](#) pop-up window may appear before this screen.

See messages: The text *SEE MSGS* appears in the upper right corner of the screen if:

- the [Display Customer Action Notes/Messages in RA \(F64\)](#) system control value is selected, and,
- there are any order messages for the order you selected.

You can display the [Work with Order Messages Screen](#) by selecting *Messages* in standard order inquiry.

Field	Description
Order #	A unique number to identify an order. Numeric, 7 positions; display-only, assigned by the system.
Ship-to number (Unlabeled field to the right of the order number)	The number of the shipping address on the order. Numeric, 3 positions; display-only, assigned by the system.
Customer name	The name of the customer who placed the order. Alphanumeric, 41 positions; display-only.
RA# (Return authorization number)	The number of the return authorization for the order and ship-to customer. The return authorization number ordinarily appears as a suffix to the combined order and ship-to number. Numeric, 3 positions; display-only, assigned by the system.

Field	Description
Quantity	<p>A series of three fields to identify the quantity of the item the customer is returning, the quantity you have received, and the quantity credited, as follows:</p> <p>Entered The total quantity of all items that you have authorized the customer to return on this return authorization. Numeric, 5 positions; display-only.</p> <p>Received The total quantity of the returned items that you have received into your warehouse. Numeric, 5 positions; display-only.</p> <p>Credited The total quantity of the returned items for which you have issued credit. Numeric, 5 positions; display-only.</p>
Date	<p>Three fields indicating when the return was created, received, and credited.</p> <p>Entered The date you first created the return authorization. Numeric, 6 positions (in user date format); display-only.</p> <p>Received The date you received the customer's returned merchandise into your warehouse for the return authorization. If you received on multiple dates, the most recent date displays. Numeric, 6 positions (in user date format); display-only.</p> <p>Credited The date you issued a credit for the returned merchandise (for the quantity shown). Numeric, 6 positions (in user date format); display-only.</p>
User	<p>The system ID of the person who created the return authorization. Alphanumeric, 10 positions; display-only.</p>

Screen Option	Procedure
Create a return authorization	Select <i>Create</i> to advance to the Work with Return Authorization Detail Screen and create a new return authorization header and detail record.
Work with an existing return authorization	Select <i>Work with</i> for a return authorization to advance to the Work with Return Authorization Detail Screen and add another return or exchange to the return authorization header, or to work with and process a return or exchange already in process for the header.
Receive returns	Select <i>Receive all</i> for a return authorization to receive all unreceived merchandise on that return authorization header. See Receiving All Returns .
Credit the return	Select <i>Process Credit</i> for a return authorization to advance to the Process RA Credits Screen .

Screen Option	Procedure
Accept your entries	Select <i>Accept</i> . See Accepting or Rejecting Your Entries .
Reject your entries, or exit the screen if you have not made any changes	Select <i>Reject</i> . See Accepting or Rejecting Your Entries .

Work with Return Authorization Detail Screen

Purpose: Use this screen to create, change, delete, or display returns or exchanges for a return authorization header. You can also use this screen to receive or credit returns, or to advance to other screens you use for receiving and crediting.

Accepting updates at this screen: Accepting entries on the Work with Return Authorization Detail screen is a final accept; if you reject entries on the [Work with Return Authorizations Screen](#), the system will not reject the entries that you accepted on the Work with Return Authorization Detail screen. For example, if you receive an RA on the Work with Return Authorization Detail screen and then select *Reject* on the [Work with Return Authorizations Screen](#), the RA will remain in a received status.

How to display this screen:

- Select an order from the Work with Return Authorization scan screens if no return authorizations exist for the order; see [Selecting Orders for Return \(WRTA\)](#)
- Select *Work with* for an existing return authorization header at the [Work with Return Authorizations Screen](#), or
- Select *Create* at the [Work with Return Authorizations Screen](#) to create a new return authorization header and detail

You can also advance to this screen by selecting *Work with* for a return authorization header through the Work with Return Authorization Receiving menu option; see [Receiving Returns \(WRAR\)](#).

Note:

The [Edit Customer Actions](#) window may appear before this screen.

See messages: The text *SEE MSGS* appears in the upper right corner of the screen if:

- the [Display Customer Action Notes/Messages in RA \(F64\)](#) system control value is *selected*, and,
- there are any order messages for the order you selected.

You can display the [Work with Order Messages Screen](#) by selecting *Messages* in standard order inquiry

Field	Description
RA Number (Return authorization number)	A number representing the return authorization header. This number consists of: Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only. Return authorization number: numeric, 3 positions; display-only.
Customer #	This number identifies the customer who placed the order. Numeric, 9 positions; display-only; assigned by the system.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer. Alphanumeric, 41 positions; display-only.
Ln # (Line number)	The line number of the return. Numeric, 3 positions; optional.
Item	The unit of inventory to be returned. The actual item code, rather than the alias, always displays here. Alphanumeric, 12 positions; optional.
SKU (Stock keeping unit)	The item's unique characteristics, such as its size and color. Alphanumeric, three 4-position fields; optional.
Qty to return (Quantity to return)	The quantity of the item authorized for return. Numeric, 5 positions; optional.
Qty rtn'd (Quantity returned)	The total quantity of the item that the customer has returned to date against a line. Alphanumeric, 2 positions; optional.
Rtn rsn (Return reason)	The reason that the customer is returning the item or items. A return reason code indicates whether returned items are defective, and are used for reporting purposes. You must enter either a return reason code or an exchange reason code. Return reason codes are defined in and validated against the Return Reason table. See Establishing Return Reason Codes (WRTR) . Numeric, 3 positions; optional.
Xch rsn (Exchange reason)	The reason that the customer is exchanging the item. An exchange reason code indicates whether returned items are defective, and are used for reporting purposes. You must enter either a return reason code or an exchange reason code. Exchange reason codes are defined in and validated against the Exchange Reason table. See Establishing Exchange Reason Codes (WEXR) . Numeric, 3 positions; optional.
WH (Warehouse)	Represents the warehouse to receive the return. Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS) . Alphanumeric, 3 positions; optional.

Field	Description
Rtn dispn (Return disposition)	Controls how to handle the return (for example, whether to increase inventory). Return disposition codes are defined in and validated against the Return Disposition Values table. See Establishing Return Disposition Values (WRDV) . Alphanumeric, 2 positions; optional.
Location	A code that identifies the location in the warehouse to receive the return. Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC) . Alphanumeric, 7 positions; optional.
Description (Unlabeled field below the item code)	The description of the item and SKU, if any, separated by a space. Item description: 120 positions; display-only. SKU description: 20 positions; display-only.

Screen Option	Procedure
Change a return authorization	Select <i>Change</i> for an item to advance to the Change RA Detail Screen .
Delete a return authorization	Select <i>Delete</i> for a return authorization line to delete the line.

Note:

You can delete a return authorization record only if you have the proper authority, as controlled by the [Delete Return Authorizations \(B03\)](#) secured feature, and if the return has not yet been received. However, if you have received the return and not yet accepted your entries, you can reject the entries in the current session, then reselect the return authorization and delete the item.

Display a return authorization	Select <i>Display</i> for a return authorization line to advance to the Display RA Detail Screen .
Receive a returned line	Select <i>Receive line</i> for a return authorization line to advance to the Receive RA Items Screen (Receiving Detail) .
Create a return authorization	Select <i>Create</i> to display the R/A Select Order Detail Pop-Up Window .
Receive all lines	Select <i>Receive All</i> to receive all unreceived items on the return authorization. See Receiving All Returns .

Screen Option	Procedure
Accept your entries	Select <i>Accept</i> . See Accepting or Rejecting Your Entries .

 **Note:**

Accepting entries on the Work with Return Authorization Detail screen is a final accept; if you reject entries on the [Work with Return Authorizations Screen](#), the system will not reject the entries that you accepted on the Work with Return Authorization Detail screen. For example, if you receive an RA on the Work with Return Authorization Detail screen and then select *Reject* on the [Work with Return Authorizations Screen](#), the RA will remain in a received status.

Reject your entries	Select <i>Reject</i> . See Accepting or Rejecting Your Entries .
Process return authorization credit	Select <i>Process Credits</i> to advance to the Process RA Credits Screen .
Create a tickler for the order, sold to customer on the order, and/or bill to customer on the order	Select <i>Create tickler</i> to advance to the Create Tickler Screen .

 **Note:**

To create a *MN* tickler, you must have authority to the [Create Manual Tickler \(B13\)](#) secured feature.

R/A Select Order Detail Pop-Up Window

Purpose: This window lists all lines on the order that are eligible for return and do not currently have a return authorization in process. Use this window to select an order line for the return authorization.

How to display this window: Select *Create* at the [Work with Return Authorization Detail Screen](#).

 **Note:**

If the window does not display any eligible items, or if you do not select one of the items at the window, the system assumes you are creating a return authorization for a misshipment or over-shipment. Therefore, selecting *Exit* closes the window and advances you to the [Create RA Detail Screen \(Processing Misships\)](#).

Field	Description
Seq #	The order line number. Numeric, 3 positions; optional.
Quantity shipped	The number of units of the item you have shipped to the customer. Numeric, 5 positions; optional.
Quantity returned	The number of units on the order line that have been received back into your warehouse to date. Numeric, 5 positions; optional.

Select an item: You can select an item for return by *Selecting* it. You advance to the [Create RA Detail Screen](#), where you can enter a return authorization for the selected item.

If there are no items on the order eligible for return, select *Exit* to advance to the [Create RA Detail Screen \(Processing Misships\)](#).

Create RA Detail Screen

Purpose: Use this screen to enter the detail information you need to create a return authorization.

How to display this screen: Select an item at the [R/A Select Order Detail Pop-Up Window](#). See [Create RA Detail Screen \(Processing Misships\)](#) if you selected *Exit* at the RA/Select Order Detail pop-up window to create a misship return.

Field	Description
RA number (Return authorization number)	A number representing the return authorization header. This number consists of the order number, ship to number, and return authorization number. Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only. Return authorization number: numeric, 3 positions; display-only.
Line #	A number that identifies the line on the return authorization header. Numeric, 3 positions; display-only, assigned by the system.
Item	A code identifying the item being returned. <i>Misship:</i> The item field is required. Alphanumeric, 12 positions; display-only (or required for a misship return).
SKU (Stock keeping unit)	The item's unique characteristics, such as its color and size. <i>Misship:</i> The SKU is required for a SKU'ed item. Alphanumeric, three 4-position fields; display-only (or required for a misship return).

Field	Description
Order line#	<p>The line number on the original order containing the item you selected for return.</p> <p><i>Misship:</i> The order line number is zero.</p> <p>Numeric, 3 positions; display-only.</p>
Invoice #	<p>This field is made up of two segments, separated by a hyphen:</p> <p>Invoice number The number of the invoice on which you billed the item. Numeric, 7 positions; display-only.</p> <p>Line number (Unlabeled field to the right of the invoice number) The line number of the invoice on which the merchandise was billed. <i>Misship:</i> The invoice number and line number are 0 - 0. Numeric, 3 positions; display-only.</p>
Refund freight	<p>Indicates whether to refund freight to the customer when crediting the return. Valid values are:</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Refund freight. If a <i>Freight override</i> amount is defined for the order, the system advances you to the <i>Enter Freight Refund Window</i>. • <i>Unselected</i> (default) = Do not refund freight. <p><i>To change after entry:</i> Although the refunding does not take place until the time you credit the return, you will not have an opportunity to change the setting at that time or at any time after receiving the return. To change the setting of this field before processing the credit, you must select <i>Change</i> for the item at the <i>Work with Return Authorization Detail Screen</i> to advance to the <i>Change RA Detail Screen</i>. This field is enterable at the Change RA Detail screen only if you have full authority to create, receive, and credit return authorizations.</p>
Refund add'l chgs (Refund additional charges)	<p>Indicates whether to refund additional charges when crediting the return. If there were negative additional charges billed on the order, refunding them results in adding positive additional charges, or decreasing the net amount of any refund.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Refund additional charges. • <i>Unselected</i> (default) = Do not refund additional charges. <p><i>To change after entry:</i> Although the refunding does not take place until the time you credit the return, you will not have an opportunity to change the setting at that time or at any time after receiving the return. To change the setting of this field before processing the credit, you must select <i>Change</i> for the item at the <i>Work with Return Authorization Detail Screen</i> to advance to the <i>Change RA Detail Screen</i>. This field is enterable at the Change RA Detail screen only if you have full authority to create, receive, and credit return authorizations.</p>

Field	Description
Refund handling	<p>Indicates whether to refund handling charges when crediting the return.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = Refund handling. • <i>Unselected</i> (default) = Do not refund handling. <p><i>To change after entry:</i> Although the refunding does not take place until the time you credit the return, you will not have an opportunity to change the setting at that time or at any time after receiving the return. To change the setting of this field before processing the credit, you must select <i>Change</i> for the item at the Work with Return Authorization Detail Screen to advance to the Change RA Detail Screen. This field is enterable at the Change RA Detail screen only if you have full authority to create, receive, and credit return authorizations.</p>
Refund duty	<p>Indicates whether to refund duty charges when crediting the return.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> (default) = Refund duty. • <i>Unselected</i> = Do not refund duty. <p><i>To change after entry:</i> Although the refunding does not take place until the time you credit the return, you will not have an opportunity to change the setting at that time or at any time after receiving the return. To change the setting of this field before processing the credit, you must select <i>Change</i> for the item at the Work with Return Authorization Detail Screen to advance to the Change RA Detail Screen. This field is enterable at the Change RA Detail screen only if you have full authority to create, receive, and credit return authorizations.</p>
Qty to return (Quantity to return)	<p>The total number of units to return. Unless you are entering a misship, you cannot enter an amount greater than the unreturned quantity or the screen displays an error message; you must enter any additional quantity as a misship.</p> <p>Numeric, 5 positions; required.</p>
Unreturned quantity	<p>The quantity of the item that has been shipped and not yet returned.</p> <p><i>Misship:</i> The unreturned quantity is zero.</p> <p>Numeric, 5 positions; display-only.</p>
Qty returned (Quantity returned)	<p>The total quantity of the item that the customer has returned to date on this return authorization detail record.</p> <p>The system does not update this field until you process receipt of the returned item.</p> <p>Numeric, 5 positions; display-only.</p>
Qty credited (Quantity credited)	<p>The total quantity of the item for which a credit has been issued. The system does not update this field until you process the credit for a returned item.</p> <p>Numeric, 5 positions; display-only.</p>

Field	Description
Return reason	<p>The reason that the customer is returning the item or items. A return reason code indicates whether returned items are defective, and are used for reporting purposes. You must enter either a return reason code or an exchange reason code.</p> <p>You can use different return reason codes, or a mix of return reason codes and exchange reason codes, if you are processing returns against the same item but for different reasons. For example, if the customer is returning four units but one unit is damaged, you could process the return for that unit using a different return reason code. However, you cannot have more than one return in process for an item against the same location.</p> <p><i>Time of update:</i> The system does not post updates that include the return reason code until you receive the return.</p> <p>Return reason codes are defined in and validated against the Return Reason table. See Establishing Return Reason Codes (WRTR).</p> <p>Numeric, 3 positions; required if you do not enter an exchange reason code.</p>
Exchange reason code	<p>The reason that the customer is exchanging the item. An exchange reason code indicates whether returned items are defective, and are used for reporting purposes. You must enter either a return reason code or an exchange reason code.</p> <p>If you enter an exchange reason code, you advance automatically to the Enter Exchange Item Screen or window if the Require Exchange Item at Time of Receipt (F42) system control value is <i>unselected</i>; otherwise, you do not advance to this screen until the time you receive the return.</p> <p>You can use different exchange reason codes, or a mix of return reason codes and exchange reason codes, if you are processing exchanges against the same item but for different reasons. For example, if the customer is exchanging four units but one unit is damaged, you could process the exchange for that unit using a different exchange reason code. However, you cannot have more than one return or exchange in process for an item against the same location.</p> <p><i>Retail pickup or delivery orders:</i> This field is not available when you are working with a retail pickup or delivery order. See Maintaining Retail Pickup or Delivery Orders from Order Orchestration for a discussion.</p> <p><i>Time of update:</i> The system does not post updates that include the exchange reason code until you receive the return.</p> <p>Exchange reason codes are defined in and validated against the Exchange Reason table. See Establishing Exchange Reason Codes (WEXR).</p> <p>Numeric, 3 positions; required if you do not enter a return reason code.</p>

Field	Description
Disposition code	<p>A code that identifies how a returned item is handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the item is returned.</p> <p><i>Required for return:</i> You must enter a valid return disposition code when performing any type of return, such as a straight return, entering an exchange item, etc. The return disposition code defined in the Default Disposition Code (C18) system control value defaults, but you can override it.</p> <p>For returns initiated from an outside system such as a third-party warehouse management system, if there is no return authorization for the order, the system assigns the return disposition code defined in the Default Return Disposition Code for Inbound Returns (H65) system control value to the return.</p> <p><i>Affect inventory?</i> If the return disposition code affects inventory (meaning that the item is returned into active inventory and update the on-hand quantity in the specified location), the system requires the warehouse and location where the item is returned.</p> <p>If the disposition code is set up to affect inventory and return to the primary location, the system will check for a primary location in the Item record. If one is available, the system will return the item automatically to this warehouse location. If one is not available or if the disposition code is not set up to receive returns in the primary location, the system will receive the return in the warehouse and location defined in the Return Disposition record; however, you can override these values to return the item to an alternate location. If the item/location does not exist, the system will create a record in the Item/Location table automatically.</p> <p>Regardless of whether the return disposition code specifies returning to the primary location, if the system control value Display "No Primary Location" Message in Returns (G46) is selected, and an item does not have a primary location, a pop-up window will display when you select <i>OK</i> to validate your entries and then select <i>OK</i> again to update the record; the pop-up window warns you that a primary location for the item does not exist. Select <i>Cancel</i> to cancel the window and either change the return disposition code, or select <i>OK</i> again to retain the disposition code you have already entered.</p> <p><i>Time of update:</i> The system does not post updates that include the return disposition code until you receive the return.</p> <p><i>Authority:</i> You can set authority to process a return for a specific return disposition value at the user or user class level. This can be a blanket authority for all disposition values, or can be specific to individual codes. See Establishing Return Disposition Values (WRDV). An error message indicates if you do not have authority to the return disposition code specified:</p> <pre>User Does not have authority to return disposition code 4A.</pre> <p>Alphanumeric, 2 positions; required.</p>

Field	Description
Warehouse	<p>The code representing the warehouse where the item is or items are being returned. When you are returning a single item, if there is a default warehouse and primary location specified for the item or SKU, the warehouse defaults here, but you can override it.</p> <p><i>Time of update:</i> The system does not post updates that include the warehouse until you receive the return.</p> <p>Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; required if the return disposition value affects inventory.</p>
Location	<p>The code representing the location within the warehouse where the item is being returned. If there is a default warehouse and primary location specified for the item or SKU, the location defaults here, but you can override it.</p> <p><i>Time of update:</i> The system does not post updates that include the location until you receive the return.</p> <p>Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC).</p> <p>Alphanumeric, 7 positions; required if the return disposition value affects inventory.</p>

Drop ship orders from multiple vendors: Order Administration does not allow you to create returns for multiple drop ship vendors at the same time. If you complete this screen for a second drop ship vendor on a single return, the system displays the following error message when you select **OK**: Returns against multiple drop ship items/vendors not allowed at the same time.

You must complete your return for the first vendor and create another return for each subsequent vendor on the order.

Completing the Create RA Detail Screen

Enter Exchange Item screen: If you entered an exchange reason code and if the [Require Exchange Item at Time of Receipt \(F42\)](#) system control value is *unselected*, you advance to the [Enter Exchange Item Screen](#) or window. If you are not processing an exchange, you return to the [Work with Return Authorization Detail Screen](#).

No primary location warning: If the item does not have a primary location, the system displays an informational pop-up window when you select **OK** if the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value is *selected*.

Scan Return ID window: If the [Display Return ID Window \(L99\)](#) system control value is *selected*, the system advances you to the [Scan Return ID Window](#) after you complete the required information on this screen and select **OK**. This window allows you to assign a return ID to the RA detail line in order to identify the return in an external system.

Select *Exit* to exit the screen without creating the return authorization.

Enter Freight Refund Window

Use this window to enter the freight amount to refund.

How to display this screen: This window displays if you select the Refund freight field on the [Create RA Detail Screen](#), a [Freight override](#) amount is defined for the order, and the Calculate freight field for the order ship to is selected.

Field	Description
Current freight amount	The current freight amount for the order, based on the Freight override amount on the Display Order Properties Screen . Numeric, 20 positions with a 2-place decimal; display-only.
Freight refund	The amount of freight to refund. Freight tax override: If a Freight tax override is defined for the order, the system uses the Freight tax rate to calculate the amount of tax on freight to refund. Numeric, 20 positions with a 2-place decimal; required.

Instructions:

1. Enter the amount of freight to refund in the Freight refund field.
2. Select *OK*. The system subtracts the freight refund amount from the current freight amount and updates the [Freight override](#) amount on the [Display Order Properties Screen](#) with the new [Freight override](#) amount. If a [Freight tax override](#) is defined for the order, the system uses the [Freight tax rate](#) to determine the new freight tax amount.

Example: You return a line on an order whose freight override amount is \$10.00 and freight tax override amount is \$2.50. The freight tax rate is 25%. At the Enter Freight Refund window, you enter \$4.00 as the freight refund amount. Based on the freight refund amount, the system:

- Refunds \$4.00 freight and \$1.00 freight on tax.
- Updates the freight override amount to \$6.00.
- Updates the freight tax override amount to \$1.50.

Enter Exchange Item Screen

Purpose: Use this screen to enter an exchange item and quantity for the returning merchandise.

How to display this screen: You advance to this screen when you enter an exchange reason code on the [Create RA Detail Screen](#) if the *Require Exchange Item at Time of Receipt (F42)* system control value is *selected*; otherwise, you advance to this screen at the time you receive the return. You can also display this screen through the [Receiving Returns \(WRAR\)](#) menu option.

Retail pickup or delivery orders: This screen is not available when you are working with a retail pickup or delivery order. See [Maintaining Retail Pickup or Delivery Orders from Order Orchestration](#) for a discussion.

Pop-up or screen: Depending upon whether you are processing a misship, receiving individual items, or receiving all returns, a pop-up window may display instead of a screen; however, all fields are the same on both the screen and the window.

Field	Description
RA number	<p>A number representing the return authorization. You create a new return authorization header record each time you create a return authorization for an item. This number consists of the order number, ship to number, and return authorization number.</p> <p>Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only. Return authorization number: numeric, 3 positions; display-only.</p>
RA line #	<p>The return authorization line associated with the exchange.</p> <p>Numeric, 3 positions; display-only.</p>
Offer	<p>The offer to use for tracking demand for the exchange item. The offer originally used on the order defaults.</p> <p>Offers are defined in and validated against the Offer table. See Working with Offers (WOFR).</p> <p>Alphanumeric, 3 positions; required.</p>
Item	<p>A code that identifies the unit of merchandise the customer is requesting in exchange for the return.</p> <p>You can enter a cross reference code that represents another system's item and SKU code in this field. If you enter a cross reference code, the system searches the SKU Cross Reference table alphabetically for the first Order Administration item and SKU that is associated with this cross reference code. See Updating SKU Offer Prices (MUSK).</p> <p>Alphanumeric, 12 positions; required.</p>
SKU (Stock keeping unit)	<p>The item's unique characteristics, such as its size and color.</p> <p>Alphanumeric, three 4-position fields; required if the item has SKUs.</p>
Qty ordered (Quantity ordered)	<p>The total of the exchange item to ship to the customer.</p> <p>Numeric, 5 positions; required.</p>
No charge	<p>Indicates whether the exchange item should be given to the customer at no charge.</p> <p>Values are:</p> <ul style="list-style-type: none">• <i>No Charge</i> = This is a no charge item.• <i>Priced</i> = Charge the customer for this item.

Field	Description
Use existing price	<p>Controls whether the system will apply the unit price of the returned item for each unit you ship of the replacement item, resulting in no net increase or decrease in merchandise charge for the exchange. This might be useful if you sold the original item at a discount and want to replace the item without imposing the regular, non-discounted price. However, if you enter Y in this field, the system uses the original item price whether it was higher or lower than the returned item price.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Use the price of the original item for the replacement item. <i>Unselected</i> (default) = Use the regular price of the replacement item.
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The system requires that you have defined a default price override reason in the Price Override Reason for Same Price Exchanges (D92) system control value if you selected it. If no default has been defined, a message displays:</p> </div> <p>Price Override Reason Code not found (SCV=D92).</p>
Override price	<p>The price at which the item is added to the order. You cannot enter an override price if the Use existing price field is <i>selected</i>.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>To enter an override price, you must have authority to the secured feature Price Overrides (A23).</p> </div> <p>Even if you have authority to override prices, the percentage you can discount the existing price may be limited by system control value E55, Price Override Limit Percent, unless you have authority to secured feature Override Price Override Limit (A64), which allows you to override the limit percent defined in the system control table.</p> <p>Alphanumeric, 13 positions with a 2-place decimal; optional.</p>
Override reason	<p>The reason you enter an override price. Price override reasons are defined in and validated against the Price Override Reason table. See Establishing Price Override Reason Codes (WPOR).</p> <p>Alphanumeric, 1 position; required if you enter a price in the Override price field.</p>

Field	Description
Ship via	<p>The shipper to deliver the exchange item. The shipper who originally shipped the order is used if you do not enter a default.</p> <p>The system validates that the ship via code you enter is set up as an SCF/ship via combination; otherwise, the screen displays an error message.</p> <p>Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA).</p> <p>Numeric, 2 positions; optional.</p>
Warehouse	<p>The warehouse from which the exchange item should ship. Otherwise, the system uses the default specified for the item or SKU.</p> <p>The system validates that there is a record of the exchange item in the warehouse you enter; otherwise, the screen displays an error message.</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; optional.</p>

Completing this screen:

- If the original shipment was an express bill, the Enter Location pop-up window displays. See [Entering Orders](#) for more information on completing this window.
- If there are any item comments associated with the exchange item you entered, you advance to the [Work with Item/SKU Comments Window](#).

The table below indicates how the exchange item is priced, based on the setting of the No charge, Use existing price, Override price and Override reason fields.

No charge	Use existing price	Override price and reason	Results
Priced	blank	blank	Add the exchange item to the order using the regular price.
Priced	selected	blank	Add the exchanged item to the order using the existing price of the return item.
Priced	blank	10.00, P	Add the exchange item to the order using the override price of 10.00 and the price override reason P.
No Charge	blank or selected	blank	Add the exchange item to the order for 0.00 using the override reason defined in the Default Price Override Reason (B35) system control value.

Create RA Detail Screen (Processing Misships)

Purpose: Use this screen to process a misship return.

Misships are items that were inadvertently shipped to your customer. When you process a misship through return authorizations, you add a record of the item to the order and process other updates, such as receipt into inventory, as required. Misships differ from regular returns, in which you process a return against an item that was already on the order. Misship returns cannot be credited, since they were not billed. However, the system updates the Date credited field in the RA Header table to indicate a pending credit does not exist.

Required authority: When you enter a misship, the return authorization is created and received at once. For this reason, you must have authority to create and receive return authorizations to enter a misship.

How to display this screen: You can display this screen by selecting *Create* at the [Work with Return Authorization Detail Screen](#), and then selecting *Exit* at the [R/A Select Order Detail Pop-Up Window](#) without selecting an item for return. Select *Exit* if you do not wish to enter a misship item.

Receiving All Returns

Purpose: Through the Work with Return Authorizations menu option (standard process), you can receive a return by:

- *Receive all/header screen:* selecting *Receive line* for the return authorization header at the [Work with Return Authorizations Screen](#)
- *Receive detail:* selecting *Receive line* for the return authorization detail at the [Work with Return Authorization Detail Screen](#)
- *Receive all/detail screen:* selecting *Receive all* at the [Work with Return Authorization Detail Screen](#)

Each method of receiving returns is described below.

Note:

You can also receive returns through the [Receiving Returns \(WRAR\)](#) menu option.

Pick slip preparation: When you receive an item that has been exchanged, the system performs pick slip preparation for the exchange item; see [Preparing Orders for Pick Slip Generation](#).

Receive All/Header Screen

Use this option if you do not need to review the items on the return authorization before receiving.

Select *Receive line* for the return authorization header at the [Work with Return Authorizations Screen](#).

An error message indicates if there are no current return authorizations ready for receipt, or if you do not have authority to receive. Also, if you have not yet entered exchange item information for an exchange, you advance to the [Enter Exchange Item Screen](#).

After you select *OK* and complete any necessary exchange information, the *Received* date changes to the current date. You can then select *Reject* to reject your entries, select *Accept* to accept, or continue working on the Work with Return Authorizations screen.

You must accept or reject before leaving this screen. If you choose to create another return authorization header by selecting *Create* or work with a return authorization by selecting

Display for it, the Confirm Accept pop-up window displays; see [Accepting or Rejecting Your Entries](#).

Receive All/Detail Screen

Use this option if you want to review the individual items before receiving the entire return authorization. Select *Receive All* at the [Work with Return Authorization Detail Screen](#) to receive all items on return authorizations that have been created but not yet received.

An error message indicates if there are no items on the return authorization eligible for receipt, or if you do not have authority to receive.

You can then Select *Reject* to reject your entries, Select *Accept* to accept, or continue working on the Work with Return Authorization Detail screen. If you choose to process credits by selecting *Process Credits*, the Confirm Accept pop-up window displays; see [Accepting or Rejecting Your Entries](#).

Receive RA Items Screen (Receiving Detail)

Purpose: Use this option if you want to select individual items on the return authorization to receive.

How to display this screen:

- Select *Display* for a return authorization header at the [Work with Return Authorizations Screen](#).
- Select *Receive Line* for the item(s) you are receiving at the [Work with Return Authorization Detail Screen](#).

You can also display this screen by selecting *Receive line* for an item at the [Receive Returns Screen](#) through the [Receiving Returns \(WRAR\)](#) menu option.

An error message indicates if you select an item that has already been received, or if you do not have authority to receive. If there is an exchange reason code for the return and you need to complete the exchange information, you advance first to the [Enter Exchange Item Screen](#).

Complete the screen to process the receipt; otherwise, select *Exit* to cancel. The only enterable fields on this screen are the [Qty returned \(Quantity returned\)](#), [Warehouse](#), and [Location](#). Each field on this screen is described under [Create RA Detail Screen](#).

When you return to the Work with Return Authorization Detail screen, the [Qty rtn'd \(Quantity returned\)](#) field is updated.

You can then select *Reject* to reject your entries, select *Accept* to accept, or continue working on the Work with Return Authorization Detail screen. If you choose to process credits by selecting *Process Credits*, the Confirm Accept pop-up window displays; see [Accepting or Rejecting Your Entries](#).

Change RA Detail Screen

To change: Select *Change* for a return authorization at the [Work with Return Authorization Detail Screen](#) to advance to the Change RA Detail screen. See [Create RA Detail Screen](#) for field descriptions.

 **Note:**

The Refund freight, Refund additional charges, Refund handling and Refund duty fields are enterable at this screen only if you have full authority to create, receive, and credit a return authorization.

RA Exchange Item Window (Review Exchange)

Purpose: Use this window to review information on the item to ship in exchange for a returned item.

How to display this window: You can display this window by selecting *Review exchange* at the [RA Exchange Item Window \(Review Exchange\)](#). If there is not an exchange item to be shipped for the return, the screen displays an error message.

About this window: Each field on this window is described earlier in this topic in [Enter Exchange Item Screen](#).

Process RA Credits Screen

Purpose: Use this screen to credit return authorizations.

How to display this screen:

- Selecting *Process Credits* for the return authorization header at the [Work with Return Authorizations Screen](#)
- Selecting *Process Credits* at the [Work with Return Authorization Detail Screen](#)

You can also display this screen through the Work with Return Authorization Receiving and Work with Return Authorization Credits menu options, described in [Receiving Returns \(WRAR\)](#), and [Crediting Returns \(WRAC\)](#).

For more information: See [Crediting Returns \(WRAC\)](#) for information on processing credits.

Accepting or Rejecting Your Entries

- [Accepting Your Entries](#)
- [Rejecting Your Entries](#)

Pick slip preparation: When you accept or reject a return authorization, the system determines if the order qualifies for pick slip preparation and applies it to the order. If you add an exchange item to the order, the system performs pick slip preparation for the exchange item when you receive the return authorization. See [Preparing Orders for Pick Slip Generation](#).

Accepting Your Entries

Select *Accept* to accept all of your entries during the current session at each screen when *Working with Return Authorizations: Standard Process*. Depending on your entries, the updates made at this point are as follows:

- [Create Return Authorization](#)
- [Receive Return Authorization](#)
- [Credit Return Authorization](#)

Create Return Authorization

The return authorization record(s) is/are created, and a message is written to order history:

7/17/06 M Order was maintained through R/A. 26.25 EJOHNSON

Note that the dollar amount that displays with this message refers to the entire order total, not just the dollar value of any return.

If the return authorization was created through the e-commerce interface: You can enable your web customers to create return authorizations on the storefront. When a return authorization is created through this method, a message such as the following is written to order history:

7/14/06 N RA 5525-1-1 created from the web.

**Note:**

Note that this message does not include a dollar amount or user ID.

You can review these messages by selecting *Order History* in standard order inquiry to advance to the [Display Order History Screen](#). They are also available for review by selecting *History* in streamlined order inquiry.

Return authorization download triggers: If the [Create Return Download Triggers \(K28\)](#) system control value is *selected*, the system creates a return authorization download (RAD) trigger when you create, change, or delete a return authorization line, based on the trigger rules defined for the Return Authorization Download (RETURN_OUT) integration layer job. The RETURN_OUT integration layer job monitors for return authorization download triggers and generates a *Return Authorization Outbound XML Message (CWReturnRAOut)* to send the return authorization information to a remote system.

Receive Return Authorization

Receipts are processed through the ORDR_ASYNC job. Updates include:

- The inventory for the item, including increasing on-hand in the item location and item warehouse, and adding an inventory transaction history record
- the order, including the order detail and order line history
- for an exchange, adds the exchange item to the order
- the return authorization header and detail

Credit Return Authorization

Credits are processed through the ORDR_ASYNC and BILL_ASYNC jobs, which update:

- the order, including order history, and creating the credit invoice and refund, if appropriate. Any unbilled additional charges on the order bill at this time, as well
- the return reason or exchange reason history for the offer
- the return authorization header and detail record.

 **Note:**

Refunds can be either positive (you owe the customer money) or negative (the customer owes you money).

Select Active Pay Method screen: The system displays the Select Active Pay Method screen when you accept the return authorization if there is a deactivated payment method on the order. Use this screen to select the active payment method to receive the credit.

Rejecting Your Entries

Select *Reject* to reject all of your entries during the current session. Any updates to the return authorization tables is undone, and additional updates do not take place.

 **Note:**

Accepting entries on the [Work with Return Authorization Detail Screen](#) is a final accept; if you reject entries on the [Work with Return Authorizations Screen](#), the system will not reject the entries that you accepted on the [Work with Return Authorization Detail Screen](#). For example, if you receive an RA on the [Work with Return Authorization Detail Screen](#) and then select *Reject* on the [Work with Return Authorizations Screen](#), the RA will remain in a received status.

Working with Return Authorizations: Streamlined Process

Purpose: If the [Use Streamlined Return Authorizations \(F44\)](#) system control value is selected, when you process return authorizations:

- When you select an order for returns processing, the screen displays each item on that order that is available for returns processing. Items are available for return if they have been shipped and a return has not yet been completely processed.
- Depending on your authority to create, receive, and credit return authorizations, returns are processed automatically as far as your authority extends. For example, you cannot specify that you want to "create only" if you also have authority to receive, or to receive and credit.
- You can review order line history while processing returns.
- You can work with additional charge codes while processing returns.

See [Working with Return Authorizations: Standard Process](#) for more information on how standard processing works.

Selecting an order: The process you use to select an order for return authorization processing is the same regardless of whether you use the standard or streamlined process. See [Selecting Orders for Return \(WRTA\)](#).

Authority level: Your authority level is determined by the following secured features:

- [Enter Return Authorization \(A28\)](#)
- [Receive Return Authorization \(A29\)](#)
- [Credit Return Authorization \(A34\)](#)

Additionally, the [Delete Return Authorizations \(B03\)](#) secured feature controls the ability to delete a return authorization that has been created, but not yet received.

Return authorization download triggers: If the [Create Return Download Triggers \(K28\)](#) system control value is *selected*, the system creates a return authorization download (RAD) trigger when you create, change, or delete a return authorization line, based on the trigger rules defined for the Return Authorization Download (RETURN_OUT) integration layer job. The RETURN_OUT integration layer job monitors for return authorization download triggers and generates a Return Authorization Outbound XML Message (CWReturnRAOut) to send the return authorization information to a remote system.

Retail pickup or delivery orders: You can process a return against a retail pickup or delivery order; however, shipping the order deactivates the [Order Broker Payment Type \(K98\)](#) applied to these orders, so you would then need to enter a new payment method in order to process the related refund.

 **Note:**

You cannot process an exchange against a retail pickup or delivery order.

The system does not send a status update to Order Orchestration when you process a return against a retail pickup or delivery order.

See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview.

Pick slip preparation: When you select an order for return authorization, the system removes any pick slip preparation from the order. When you accept or reject the return authorization, the system determines if the order qualifies for pick slip preparation and reapplies it to the order. If you add an exchange item to the order, the system performs pick slip preparation for the exchange item when you receive the return authorization. See [Preparing Orders for Pick Slip Generation](#).

Work with Returns for Order Screen

Use this screen to create and process return authorizations as far as your authority extends. From this screen, you can also display a return authorization in process, review order line history, advance to standard order inquiry, or work with additional charges.

This screen displays each item on the order eligible for a return (that is, all shipped items that have not yet had returns fully processed).

Note:

The *Edit Customer Actions Window* may appear before this screen.

How to display this screen: Select an order through the Work with Return Authorizations scan screens; see *Selecting Orders for Return (WRTA)*.

See messages: The text *SEE MSGS* appears in the upper right corner of the screen if:

- the *Display Customer Action Notes/Messages in RA (F64)* system control value is *selected*, and,
- there are any order messages for the order you selected.

You can select *Order Inquiry* to advance to standard order inquiry and select *Messages* to display the *Work with Order Messages Screen*.

Field	Description
Order number	A number to identify an order. Numeric, 7 positions; display-only, assigned by the system.
Ship-to number (Unlabeled field to the right of the order number)	A number that identifies the shipping address on an order; separated from the order number by a hyphen. Numeric, 3 positions; display-only, assigned by the system.
Customer #	This number identifies the customer who placed the order. Numeric, 9 positions; display-only; assigned by the system.
Customer name (Unlabeled field to the right of the customer number)	The name of the customer. Alphanumeric, 41 positions; display-only.
Ln# (Line number)	The number of the order line containing the item eligible for return. Numeric, 3 positions; optional.
Item	The code representing the item eligible for return. If the <i>Display Item Alias (D56)</i> system control value is <i>selected</i> , and if the customer ordered this item using an alias, the alias displays. Alphanumeric, 12 positions; optional.
SKU	The item's unique characteristics, such as its color or size. Only items on the order that are eligible for return display on this screen. To be eligible for return, there must be at least one unit that has been shipped and not fully returned and credited. If the <i>Display SKU Description in place of SKU Element (F25)</i> system control value is <i>selected</i> , the first 14 positions of the description of the SKU displays instead. Scanning on this field is not currently implemented. Alphanumeric, three 4-position fields; optional.
Qty shipped	The total quantity of the item that has been shipped to the customer. Numeric, 5 positions; display-only.

Field	Description
Qty rtn'd (Quantity returned)	The total quantity of the item that has been received at your warehouse as a return, either in a previous or in the current session. Numeric, 5 positions; display-only.
Qty crtd (Quantity credited)	The total quantity of the item that has been fully returned and credited, either in a previous or in the current session. Numeric, 5 positions; display-only.
RA pend (Return authorization pending)	Indicates whether there is currently a return authorization in process for this item. Valid values are: <ul style="list-style-type: none"> <i>Selected</i> = There is currently a return authorization in process for this item. This flag displays if a return was partially processed during a previous session or the current session, or if you have selected to fully process the return in the current session, but have not yet selected <i>Accept</i> to process the updates. <i>Unselected</i> = There is not currently a return authorization in process for this item.

Screen Option	Procedure
Display a return authorization in process	Select <i>Display</i> for an item. <i>Single return authorization:</i> You advance to the Display RA Detail Screen if there is just one return authorization in process for the item. <i>Multiple return authorizations:</i> You advance to the Work with RA Detail for Item Screen .
Begin a new return authorization against an item	Select <i>Create/process return</i> for an item to advance to the Return/Exchange Item Screen (Creating a Return) .
Complete processing an existing return authorization against an item	Select <i>Complete/process return(s)</i> for the item. <i>Single return authorization:</i> You advance to the Change RA Detail Screen (Complete/Process a Return for an Item) if there is just one return authorization in process for the item. <i>Multiple return authorizations:</i> You advance to the Work with RA Detail for Item Screen .
Display order line history for an item	Select <i>Order line history</i> for an item to advance to the Display Order Line History Screen .
Create a misship return	Select <i>Create misship</i> . See Create RA Detail Screen (Processing Misships) .
Advance to standard order inquiry	Select <i>Order Inquiry</i> to advance to the Order Inquiry Header Screen or the Order Inquiry Detail Screen , depending on the setting of the Default Version for Order Inquiry (C34) system control value.
Begin return authorization for all displayed items	Select <i>Create/Return all</i> to advance to the Return/Exchange Item Screen (Creating a Return) .
Accept your entries	Select <i>Accept</i> . See Accepting or Rejecting .
Reject your entries	Select <i>Reject</i> See Accepting or Rejecting .

Screen Option	Procedure
Work with additional charges for the order	Select <i>Additional Charges</i> to display the Enter Additional Charges pop-up window. See Adding Miscellaneous Charges or Credits in Order Entry .

 **Note:**

Additional charges bill the next time a transaction on the order (such as crediting a return) goes through billing.

Create a tickler for the order, sold to customer on the order, and/or bill to customer on the order	Select <i>Create tickler</i> to advance to the Create Tickler Screen .
---	--

 **Note:**

To create a *MN* tickler, you must have authority to the [Create Manual Tickler \(B13\)](#) secured feature.

Return/Exchange Item Screen (Creating a Return)

Purpose: Use this screen to begin processing a return or exchange against an item. When you accept your entries against the order, the return authorization will be processed as far as your authority extends.

 **Note:**

You use the same screen when creating return authorizations for the entire order at once; however, its fields are different. See [Return/Exchange Item Screen \(Create/Return All\)](#).

How to display this screen: Select *Create/process return* for an item at the [Work with Returns for Order Screen](#). If the item is not available for a new return authorization because a return authorization has been entered for each shipped unit already, the screen displays an error message:

No returns left to create - function not processed.

Returning an item with no primary location: You may receive returns for items which have no primary location, such as items you have previously liquidated and sold through an outlet store, or drop ship items which are returned directly to your drop ship vendor. For these items, if you have selected the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value, the system displays a pop-up window indicating that a primary location for the item does not exist when you enter and validate an item as a return or a mis-ship.

This window is informational only. You can select *Cancel* to cancel the window, and then, if you wish, change the return disposition code before updating your entries and accepting/processing the return.

 **Note:**

This pop-up window displays only when you are posting a return for a single item; if you have advanced to the Return/Exchange Item screen selecting *Create/Return all*, the warning window does not appear, regardless of the setting in the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value, or of whether any item on the order has no defined primary location.

Field	Description
Item	<p>The code representing the item you selected at the Work with Returns for Order Screen for return or exchange.</p> <p>If the Display Item Alias (D56) system control value is selected, and the customer ordered by alias, then the alias displays.</p> <p>This field does not display when you select <i>Create/Return all</i> to create/return all.</p> <p>Alphanumeric, 12 positions; display-only.</p>
SKU (Stock keeping unit)	<p>The item's unique characteristics, such as its size and color.</p> <p>This field does not display when you select <i>Create/Return all</i> to create/return all.</p> <p>Alphanumeric, three 4-position fields; display-only.</p>
Description	<p>The description of the item.</p> <p>This field does not display when you select <i>Create/Return all</i> to create/return all.</p> <p>Alphanumeric, 120 positions; display-only.</p>
RA # (Return authorization number)	<p>A number representing the return authorization. If you have authority to create, but not receive or credit, return authorizations, you create a new return authorization header record each time you create a return authorization for an item. Regardless of your authority level, however, one or more items would have the same return authorization number if you selected <i>Create/Return all</i> to return them all at once. This number consists of the order number, ship to number and return authorization number.</p> <p>Order number: numeric, 8 positions; display-only.</p> <p>Ship-to number: numeric, 3 positions; display-only.</p> <p>Return authorization number: numeric, 3 positions; display-only.</p>

Field	Description
Qty to return	<p>Enter the quantity of the item you are returning or exchanging to the same location and with the same return or exchange reason code. You cannot enter a number greater than the unreturned quantity that displays to the right.</p> <p><i>Time of update:</i> The system does not post updates related to the quantity until you receive the return; so if you have create authority only, the operator who processes the receipt or receipt/credit can change the quantity.</p> <p>This field does not display when you select <i>Create/Return all</i> to create/return all.</p> <p>Numeric, 5 positions; required.</p>
Unreturned quantity	<p>The quantity of the item available to return. This is the quantity that is not included in another previous or current return.</p> <p>This field does not display when you select <i>Create/Return all</i> to create/return all.</p> <p>Numeric, 5 positions; display-only.</p>
Return reason	<p>The reason that the customer is returning the item or items. A return reason code indicates whether returned items are defective, and is used for reporting purposes. You must enter either a return reason code or an exchange reason code.</p> <p>You can use different return reason codes, or a mix of return reason codes and exchange reason codes, if you are processing returns against the same item but for different reasons. For example, if the customer is returning four units but one unit is damaged, you could process the return for that unit using a different return reason code. However, you cannot have more than one return in process for an item against the same location.</p> <p><i>Time of update:</i> The system does not post updates that include the return reason code until you receive the return; so if you have create authority only, the operator who performs the receipt or receipt/credit can change the return reason at that time, or change from a return reason to an exchange reason.</p> <p>Return reason codes are defined in and validated against the Return Reason table. See Establishing Return Reason Codes (WRTR).</p> <p>Numeric, 3 positions; required if you do not enter an exchange reason code or when you select <i>Create/Return all</i> to create/return all.</p>
Exchange reason code	<p>The reason that the customer is exchanging the item. An exchange reason code indicates whether returned items are defective, and are used for reporting purposes. You must enter either a return reason code or an exchange reason code.</p> <p>If you enter an exchange reason code, you advance automatically to the Enter Exchange Item Screen or window depending on your authority level and the setting of the Require Exchange Item at Time of Receipt (F42) system control value. For example, if you have authority only to create a return authorization, not to return or credit, and if this system control value is <i>selected</i>, you will not need to enter an exchange item at this time.</p>

Field	Description
Return disposition	<p>You can use different exchange reason codes, or a mix of return reason codes and exchange reason codes, if you are processing exchanges against the same item but for different reasons. For example, if the customer is exchanging four units but one unit is damaged, you could process the exchange for that unit using a different exchange reason code. However, you cannot have more than one return or exchange in process for an item against the same location.</p> <p><i>Retail pickup or delivery orders:</i> This field is not available when you are working with a retail pickup or delivery order. See Maintaining Retail Pickup or Delivery Orders from Order Orchestration for a discussion.</p> <p><i>Time of update:</i> The system does not post updates that include the exchange reason code until you receive the return; so if you have create authority only, the operator who performs the receipt or receipt/credit can change the exchange reason at that time, or change from an exchange reason to a return reason. If you change from an exchange reason to a return reason and had already specified an exchange item, the exchange item will not be added to the order.</p> <p>This field is not available when you select <i>Create/Return all</i> to create/return all.</p> <p>Exchange reason codes are defined in and validated against the Exchange Reason table. See Establishing Exchange Reason Codes (WEXR).</p> <p>Numeric, 3 positions; required if you do not enter a return reason code.</p> <p>A code that identifies how a returned item will be handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the item will be returned.</p> <p><i>Required for return:</i> You must enter a valid return disposition code when performing any type of return, such as a straight return, entering an exchange item, and so on. The return disposition code defined in the Default Disposition Code (C18) system control value defaults, but you can override it.</p> <p><i>Affect inventory?</i> If the return disposition code affects inventory (meaning that the item will be returned into active inventory and update the on-hand quantity in the specified location), the system requires the warehouse and location where the item will be returned.</p> <p>If the disposition code is set up to affect inventory and return to the primary location, the system will check for a primary location in the Item record. If one is available, the system will return the item automatically to this warehouse location. If one is not available or if the disposition code is not set up to receive returns in the primary location, the system will receive the return in the warehouse and location defined in the Return Disposition record; however, you can override these values to return the item to an alternate location. If the item/location does not exist, the system will create a record in the Item/Location table automatically.</p>

Field	Description
Warehouse	<p data-bbox="651 275 1377 562">Regardless of whether the return disposition code specifies returning to the primary location, if the system control value Display "No Primary Location" Message in Returns (G46) is <i>selected</i>, and an item does not have a primary location, a pop-up window will display when you select <i>OK</i> to validate your entries and then select <i>OK</i> again to update the record; the pop-up window warns you that a primary location for the item does not exist. Select <i>Cancel</i> to cancel the window and either change the return disposition code, or select <i>OK</i> again to retain the disposition code you have already entered.</p> <p data-bbox="651 575 1377 716"><i>Time of update:</i> The system does not post updates that include the return disposition code until you receive the return; so if you have create authority only, the operator who performs the receipt or receipt/credit can change the return disposition code at that time.</p> <p data-bbox="651 728 1377 898">Authority: You can set up authority to process a return for a specific return disposition value at the user or user class level. This can be a blanket authority for all disposition values, or can be specific to individual codes. An error message indicates if you do not have authority to the return disposition code specified:</p> <pre data-bbox="651 911 1260 968">User Does not have authority to return disposition code 4A.</pre> <p data-bbox="651 980 1352 1066">Return disposition codes are defined in and validated against the Return Disposition Values table. See Establishing Return Disposition Values (WRDV).</p> <p data-bbox="651 1079 1073 1106">Alphanumeric, 2 positions; required.</p> <p data-bbox="651 1119 1369 1260">The code representing the warehouse where the item is or items are being returned. When you are returning a single item, if there is a default warehouse and primary location specified for the item or SKU, the warehouse defaults here, but you can override it.</p> <p data-bbox="651 1272 1313 1329">If you are returning a single item, there must already be a record of the item in the warehouse you select.</p> <p data-bbox="651 1341 1377 1451"><i>Time of update:</i> The system does not post updates that include the warehouse until you receive the return; so if you have create authority only, the operator who performs the receipt or receipt/credit can change the warehouse at that time.</p> <p data-bbox="651 1463 1308 1549">Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS).</p> <p data-bbox="651 1562 1349 1619">Numeric, 3 positions; required if the return disposition value affects inventory.</p>

Field	Description
Location	<p>The code representing the location within the warehouse where the item is or items are being returned. If there is a default warehouse and primary location specified for the item or SKU, the location defaults here, but you can override it.</p> <p><i>Time of update:</i> The system does not post updates that include the location until you receive the return; so if you have create authority only, the operator who performs the receipt or receipt/credit can change the location at that time.</p> <p>Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC).</p> <p>Alphanumeric, 7 positions; required if the return disposition value affects inventory.</p>
Refund freight	<p>Indicates whether to refund freight to the customer when crediting the return.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Refund freight. If a Freight override amount is defined for the order and the Calculate freight field for the order ship to is selected, the system advances you to the Enter Freight Refund Window. <i>Unselected</i> (default) = Do not refund freight. <p>This field is enterable only if you have authority to the Receive Return Authorization (A29) secured feature.</p>
Refund add'l chgs (Refund additional charges)	<p>Indicates whether to refund any additional charges on the order to the customer when crediting the return. If there were negative additional charges billed on the order, refunding them results in adding positive addition charges, or decreasing the net amount of any refund.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Refund all additional charges on the order when crediting this return. <i>Unselected</i> (default) = Do not refund additional charges. <p>This field is enterable only if you have authority to receive return authorizations.</p>
Refund handling	<p>Indicates whether to refund handling charges to the customer when crediting the return. Only handling charges related to the item(s) or units of the item(s) being returned are refunded.</p> <p>If the Evaluate Special Handling Charges by Order Line (D67) system control value is <i>selected</i>, handling charges are refunded only if you process a return against all units of the item on the order line.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>Selected</i> = Refund handling charges. <i>Unselected</i> (default) = Do not refund handling charges. <p>This field is enterable only if you have authority to receive return authorizations.</p>

Field	Description
Refund duty charges	<p>Indicates whether to refund any duty charges for the returned item(s) or units to the customer when crediting the return.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> (default) = Refund duty charges. • <i>Unselected</i> = Do not refund duty charges. <p>This field is enterable only if you have authority to receive return authorizations.</p>

Drop ship orders from multiple vendors: Order Administration does not allow you to create returns for multiple drop ship vendors at the same time. If you complete this screen for a second drop ship vendor on a single return, the system displays the following error message when you select *OK*: Returns against multiple drop ship items/vendors not allowed at the same time.

You must complete your return for the first vendor and create another return for each subsequent vendor on the order.

Processing returns through the integration with Order Orchestration's Drop Ship Manager module is not currently implemented.

Completing the Return/Exchange Item Screen (Creating a Return)

Authority level: The system processes the updates as far as your authority extends. See [Accepting or Rejecting](#) for more information on the updates that take place when you select *Accept* based on your authority level.

No primary location warning: If the item does not have a primary location, the system displays an informational pop-up window when you select *OK* if the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value is *selected*.

Scan Return ID window: If the [Display Return ID Window \(L99\)](#) system control value is *selected*, the system advances you to the [Scan Return ID Window](#) after you complete the required information on this screen and select *OK*. This window allows you to assign a return ID to the RA detail line in order to identify the return in an external system.

If you are not processing an exchange at this time, you return to the [Work with Returns for Order Screen](#), where a message indicates how far the return was processed. Additionally, the Quantity shipped, quantity returned, quantity credited, and RA pending fields are updated appropriately.

If you make a mistake: If you have made a mistake on this screen and already selected *OK*, generally you cannot correct the return authorization in the current session. Instead, you must select *Reject* to reject your entries in the current session and reenter the return authorization for the item. See the description of the *Delete* option on the [Work with RA Detail for Item Screen](#) for the one exception.

Processing an exchange? Depending on your authority level and the setting of the [Require Exchange Item at Time of Receipt \(F42\)](#) system control value, you may need to enter an exchange item at this time if you entered an exchange reason code.

- If the [Require Exchange Item at Time of Receipt \(F42\)](#) system control value is *selected*, and if your authority extends at least to receiving a return authorization, you will need to enter an exchange item at this time.

- If the [Require Exchange Item at Time of Receipt \(F42\)](#) system control value is *unselected*, you will always need to enter an exchange item even if you have authority only to create a return authorization.

See [Enter Exchange Item Screen](#).

Screen Option	Procedure
Create a misship return	Select <i>Create misship return</i> . See Create RA Detail Screen (Processing Misships) .

Enter Freight Refund Window

Use this window to enter the freight amount to refund.

How to display this screen: This window displays if you select the Refund freight field on the [Return/Exchange Item Screen \(Creating a Return\)](#), a [Freight override](#) amount is defined for the order, and the Calculate freight field for the order ship to is selected.

Field	Description
Current freight amount	The current freight amount for the order, based on the Freight override amount on the Display Order Properties Screen . Numeric, 20 positions with a 2-place decimal; display-only.
Freight refund	The amount of freight to refund. Freight tax override: If a Freight tax override is defined for the order, the system uses the Freight tax rate to calculate the amount of tax on freight to refund. Numeric, 7 positions with a 2-place decimal; required.

Instructions:

1. Enter the amount of freight to refund in the Freight refund field.
2. Select *OK*. The system subtracts the freight refund amount from the current freight amount and updates the [Freight override](#) amount on the [Display Order Properties Screen](#) with the new [Freight override](#) amount. If a [Freight tax override](#) is defined for the order, the system uses the [Freight tax rate](#) to determine the new freight tax amount.

Example: You return a line on an order whose freight override amount is \$10.00 and freight tax override amount is \$2.50. The freight tax rate is 25%. At the Enter Freight Refund window, you enter \$4.00 as the freight refund amount. Based on the freight refund amount, the system:

- Refunds \$4.00 freight and \$1.00 freight on tax.
- Updates the freight override amount to \$6.00.
- Updates the freight tax override amount to \$1.50.

Enter Exchange Item Screen

Purpose: Use this screen to enter an exchange item and quantity to replace the returned item.

How to display this screen: This screen displays when you enter an exchange reason code at the [Return/Exchange Item Screen \(Creating a Return\)](#), depending on your level of authority and the setting of the [Require Exchange Item at Time of Receipt \(F42\)](#) system control value.

The Enter Exchange Item window may display instead, depending on whether you are processing a misship return, or the steps you use to create and process the return authorization. However, the window includes all the of same fields as the screen.

For more information: See [Enter Exchange Item Screen](#) in [Working with Return Authorizations: Standard Process](#), for field descriptions and instructions on completing this screen.

Retail pickup or delivery orders: This screen is not available when you are working with a retail pickup or delivery order. See [Maintaining Retail Pickup or Delivery Orders from Order Orchestration](#) for a discussion.

Return/Exchange Item Screen (Create/Return All)

Purpose: Select *Create/Return all* at the [Work with Returns for Order Screen](#) to return all eligible items on the order as far as your authority extends. To be eligible, the item must have been shipped and must not currently have a return authorization completed or in process.

Not all options available: Although you advance to the Return/Exchange Item screen, the same screen you use to create individual return authorizations, you do not have all of the same options when you select *Create/Return all* to return all. For example:

- You cannot enter an exchange reason.
- You cannot specify item quantities.
- The system does not display informational pop-up windows informing you that an item has no primary location or that its primary location is frozen.
- The system does not display the [Scan Return ID Window](#) where you can assign a return ID to each RA detail line.

See [Return/Exchange Item Screen \(Creating a Return\)](#).

Completing returns: There is no equivalent option to complete processing all items on the order. If you select *Create/Return all* to return all but your authority does not extend all the way through receiving and crediting, another operator with greater authority can complete processing the returns by:

- selecting [Complete/process return\(s\)](#) for each individual item to complete processing; it is possible to change settings at this time if updates have not already taken place
- using [Receiving Returns \(WRAR\)](#) or [Crediting Returns \(WRAC\)](#) to complete processing.

Retail pickup or delivery orders: This screen is not available when you are working with a retail pickup or delivery order. See [Maintaining Retail Pickup or Delivery Orders from Order Orchestration](#) for a discussion.

How to display this screen: Select *Create/Return all* at the [Work with Returns for Order Screen](#). If there are currently no items that have been shipped but have not yet had return authorizations created, the screen displays an error message.

Field descriptions: See [Return/Exchange Item Screen \(Creating a Return\)](#).

Completing this screen: The system processes the updates as far as your authority extends. See [Accepting or Rejecting](#) for more information on the updates that take place when you select *Accept* based on your authority level.

You return to the [Work with Returns for Order Screen](#), where a message indicates how far the return was processed. Additionally, the Quantity shipped, quantity returned, quantity credited, and RA pending fields are updated appropriately for each item.

If you make a mistake: If you have made a mistake on this screen and already selected *OK*, you generally cannot correct the return authorization in the current session. Instead, you must select *Reject* to reject your entries in the current session and reenter the return authorization for the order. See the description of the *Delete* option on the [Work with RA Detail for Item Screen](#) for the one exception.

Change RA Detail Screen (Complete/Process a Return for an Item)

Purpose: Use this screen to complete or continue processing a return authorization that an operator without full authority created in an earlier session if your authority extends further. For example:

- the return authorization was created, and you have authority to create and receive, or create, receive and credit
- the return authorization was created and received, and you have authority to create, receive and credit

You can also use the [Receiving Returns \(WRAR\)](#) or [Crediting Returns \(WRAC\)](#) menu options to complete processing.

How to display this screen: You can display this screen by selecting *Complete/process return(s)* for a return authorization that is pending but not yet complete at the [Work with Returns for Order Screen](#) or the [Work with RA Detail for Item Screen](#). You can also display this screen by selecting *Accept* at the [Display RA Detail Screen](#).

If multiple returns: If there is more than one return authorization in process for the item you select, you advance to the [Work with RA Detail for Item Screen](#) when you select *Complete/process return(s)* for an item at the [Work with Returns for Order Screen](#).

An error message indicates if there are no returns pending for the item, or if you do not have the authority to continue processing the return.

Field	Description
RA number	<p>A number representing the return authorization. You create a new return authorization header record each time you create a return authorization for an item. One or more items would have the same return authorization number if you selected <i>Create/Return all</i> to return them all at once. This number consists of the order number, ship to number and return authorization number.</p> <p>Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only. Return authorization number: numeric, 3 positions; display-only.</p>
Line#	<p>The return authorization line associated with the return. The line number may be greater than 1 if you created the return authorization for all unreturned items on the order by selecting <i>Create/Return all</i>.</p> <p>Numeric, 3 positions; display-only.</p>

Field	Description
Item	A code that identifies the unit of merchandise the customer is returning. Alphanumeric, 12 positions; display-only.
SKU (Stock keeping unit)	The item's unique characteristics, such as its size and color. Alphanumeric, three 4-position fields; display-only.
Order line#	The number of the order line on which the item was ordered. Numeric, 3 positions; display-only.
Invoice#	A unique number to identify the invoice and the line number of the invoice on which the item was shipped and billed. Invoice number: numeric, 7 positions; display-only. Invoice line number: numeric, 3 positions; display-only.
Refund freight	Indicates whether to refund freight to the customer when crediting the return. Valid values are: <ul style="list-style-type: none"> <i>Selected</i> = Refund freight. If a <i>Freight override</i> amount is defined for the order, the system advances you to the Enter Freight Refund Window. <i>Unselected</i> (default) = Do not refund freight. This field is enterable only if you have authority to credit return authorizations.
Refund add'l chgs (Refund additional charges)	Indicates whether to refund any additional charges on the order to the customer when crediting the return. If there were negative additional charges billed on the order, refunding them results in adding positive addition charges, or decreasing the net amount of any refund. Valid values are: <ul style="list-style-type: none"> <i>Selected</i> = Refund all additional charges on the order when crediting this return. <i>Unselected</i> (default) = Do not refund additional charges. This field is enterable only if you have authority to credit return authorizations.
Refund handling	Indicates whether to refund handling charges to the customer when crediting the return. Only handling charges related to the item or units of the item being returned are refunded. If the Evaluate Special Handling Charges by Order Line (D67) system control value is <i>selected</i> , handling charges are refunded only if you process a return against all units of the item on the order line. Valid values are: <ul style="list-style-type: none"> <i>Selected</i> = Refund handling charges. <i>Unselected</i> (default) = Do not refund handling charges. This field is enterable only if you have authority to credit return authorizations.

Field	Description
Refund duty charges	<p>Indicates whether to refund any duty charges for the returned item or units to the customer when crediting the return.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• <i>Selected</i> (default) = Refund duty charges.• <i>Unselected</i> = Do not refund duty charges. <p>This field is enterable only if you have authority to credit return authorizations.</p>
Qty to return (Quantity to return)	<p>Enter the quantity of the item you are returning or exchanging to the same location and with the same return or exchange reason code.</p> <p>This field is:</p> <ul style="list-style-type: none">• required if the return authorization has been created only and you are receiving, or receiving and crediting, at this time, as this information is required to process updates.• display-only if the return authorization has been created and received, and you are crediting at this time, as the related updates have already been processed. <p>Numeric, 5 positions; required or display-only.</p>
Qty returned (Quantity returned)	<p>The quantity of the item that has been received into the warehouse on this return authorization only.</p> <p>Numeric, 3 positions; display-only.</p>
Qty credited (Quantity credited)	<p>The quantity of the item that has been credited on this return authorization only. This number should always be zero.</p> <p>Numeric, 3 positions; display-only.</p>
Return reason	<p>The reason that the customer is returning the item. A return reason code indicates whether returned items are defective, and are used for reporting purposes. You must enter either a return reason code or an exchange reason code to process a return authorization. You cannot have more than one return in process for an item against the same location.</p> <p>This field is:</p> <ul style="list-style-type: none">• required if you do not enter an exchange reason code, the return authorization has been created only, and you are receiving, or receiving and crediting, at this time, as this information is required to process updates.• display-only if the return authorization has been created and received, and you are crediting at this time, as the related updates have already been processed. <p>Return reason codes are defined in and validated against the Return Reason table. See Establishing Return Reason Codes (WRTR).</p> <p>Numeric, 3 positions; required or display-only.</p>

Field	Description
Exchange reason code	<p>The reason that the customer is exchanging the item. An exchange reason code indicates whether returned items are defective, and are used for reporting purposes. You must enter either a return reason code or an exchange reason code to process a return authorization.</p> <p>If you enter an exchange reason code, you advance automatically to the Enter Exchange Item Screen if this information was not already completed in an earlier session. You cannot have more than one return or exchange in process for an item against the same location.</p> <p>This field is:</p> <ul style="list-style-type: none"> required if you do not enter a return reason code, the return authorization has been created only, and you are receiving, or receiving and crediting, at this time, as this information is required to process updates. display-only if the return authorization has been created and received, and you are crediting at this time, as the related updates have already been processed. <p><i>Retail pickup or delivery orders:</i> This field is not available when you are working with a retail pickup or delivery order. See Maintaining Retail Pickup or Delivery Orders from Order Orchestration for a discussion.</p> <p>Exchange reason codes are defined in and validated against the Exchange Reason table. See Establishing Exchange Reason Codes (WEXR).</p> <p>Numeric, 3 positions; required or display-only.</p>
Return disposition	<p>A code that identifies how a returned item will be handled by the system, in terms of whether the return updates inventory and the warehouse and location to which the item will be returned.</p> <p>This field is:</p> <ul style="list-style-type: none"> required if the return authorization has been created only, and you are receiving, or receiving and crediting, at this time, as this information is required to process updates. display-only if the return authorization has been created and received, and you are crediting at this time, as the related updates have already been processed <p>Regardless of whether the return disposition code specifies returning to the primary location, if the system control value Display "No Primary Location" Message in Returns (G46) is selected, and an item does not have a primary location, a pop-up window will display when you select <i>OK</i> to update the record; the pop-up window warns you that a primary location for the item does not exist. Select <i>Cancel</i> to cancel the window. If you are receiving the item, or receiving and crediting, you can change the return disposition code if you wish. Otherwise, select <i>OK</i> again to retain the code already entered.</p> <p>See Return/Exchange Item Screen (Creating a Return).</p> <p>Return disposition codes are defined in and validated against the Return Disposition Values table. See Establishing Return Disposition Values (WRDV).</p> <p>Alphanumeric, 2 positions; required or display-only.</p>

Field	Description
Warehouse	<p>The code representing the warehouse where the item is being returned. If there is a default warehouse and primary location specified for the item or SKU, the warehouse defaults here, but you can override it.</p> <p>There must already be a record of the item in the warehouse you select.</p> <p>This field is:</p> <ul style="list-style-type: none"> required if the return disposition value affects inventory, if the return authorization has been created only, and you are receiving, or receiving and crediting, at this time, as this information is required to process updates. display-only if the return authorization has been created and received, and you are crediting at this time, as the related updates have already been processed. <p>Warehouse codes are defined in and validated against the Warehouse table; see Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; required or display-only.</p>
Location	<p>The code representing the location within the warehouse where the item is being returned. If there is a default warehouse and primary location specified for the item or SKU, the location defaults here, but you can override it.</p> <p>This field is:</p> <ul style="list-style-type: none"> required if the return disposition value affects inventory, if the return authorization has been created only, and you are receiving, or receiving and crediting, at this time, as this information is required to process updates. display-only if the return authorization has been created and received, and you are crediting at this time, as the related updates have already been processed. <p>Location codes are defined in and validated against the Location table; see Creating and Maintaining Locations (WLOC).</p> <p>Alphanumeric, 7 positions; required or display-only.</p>

Completing this screen:

- If the item does not have a primary location, the system displays an informational pop-up window when you select *OK* if the [Display "No Primary Location" Message in Returns \(G46\)](#) system control value is selected.
- The system processes the updates as far as your authority extends. See [Accepting or Rejecting](#) for more information on the updates that take place when you select *Accept* based on your authority level.
- If you are not processing an exchange at this time, you return to the [Work with Returns for Order Screen](#), where a message indicates how far the return was processed. Additionally, the Quantity shipped, quantity returned, quantity credited, and RA pending fields are updated appropriately.

If you make a mistake: If you have made a mistake on this screen and already selected *OK*, you cannot correct the return authorization in the current session. Instead, you must select *Reject* to reject your entries in the current session and reenter the return authorization for the item.

Display RA Detail Screen

Purpose: Use this screen to review a return authorization that is in process for an item. From this screen, you can also:

- Display the [RA Exchange Item Window](#), which includes information on the exchange item for the return, if any.
- Advance to the [Change RA Detail Screen \(Complete/Process a Return for an Item\)](#), where you can continue processing the return authorization.

How to display this screen:

- Select *Display* for an item at the [Work with Returns for Order Screen](#) (streamlined process)
- Select *Display* for a return authorization at the [Work with Return Authorization Detail Screen](#) (standard process)
- Select *Display* for an item at the [Second Process RA Credits Screen](#) (Crediting Returns (WRAC))

If multiple returns: If there is more than one return authorization in process for the item you select, you advance to the [Work with RA Detail for Item Screen](#) instead.

Field descriptions: See [Return/Exchange Item Screen \(Creating a Return\)](#).

RA Exchange Item Window

Purpose: Use this window to review information on the item to ship in exchange for a returned item.

How to display this window: Select *Exchange Info* at the [Display RA Detail Screen](#). If there is not an exchange item to be shipped for the return, the screen displays an error message.

Field descriptions: See [Enter Exchange Item Screen](#).

Work with RA Detail for Item Screen

Purpose: Use this screen to review return authorizations for an item if there is more than one authorization in process, or to delete a return authorization which has not yet been received and credited.

How to display this screen: Select *Display* or *Complete/process return(s)* for an item at the [Work with Returns for Order Screen](#) if there is more than one authorization in process.

Field	Description
Date created	The date the return authorization was created. Numeric, 6 positions (in user date format); display-only.

Screen Option	Procedure
Delete a return authorization	Select <i>Delete</i> for a return authorization to delete it.
Review a return authorization in process for the item	Select <i>Display</i> for a return authorization to advance to the <i>Display RA Detail Screen</i> .
Continue processing a return authorization for the item	Select <i>Complete/process return</i> for a return authorization to advance to the <i>Change RA Detail Screen (Complete/Process a Return for an Item)</i> .

 **Note:**

You can delete a return authorization record only you have the proper authority, as controlled by the *Delete Return Authorizations (B03)* secured feature, and if the return has not yet been received. However, if you have received the return and not yet accepted your entries, you can reject the entries in the current session, then reselect the return authorization and delete the item.

Accepting or Rejecting

- [Accepting Your Entries](#)
- [Rejecting Your Entries](#)

Pick slip preparation: When you accept or reject a return authorization, the system determines if the order qualifies for pick slip preparation and applies it to the order. If you add an exchange item to the order, the system performs pick slip preparation for the exchange item when you receive the return authorization. See [Preparing Orders for Pick Slip Generation](#).

Accepting Your Entries

Select *Accept* to accept all of your entries during the current session while *Working with Return Authorizations: Streamlined Process*. Depending on your authority, the updates made at this point are as follows:

- [Create a Return Authorization](#)
- [Receive a Return Authorization](#)
- [Credit a Return Authorization](#)

Create a Return Authorization

A message is written to order history:

Order was maintained through R/A.

Note that the dollar amount that displays with this message refers to the entire order total, not just the dollar value of any return.

If the return authorization was created through the e-commerce interface: You can enable your web customers to create return authorizations on the storefront. When a return authorization is created through this method, a message such as the following is written to order history:

```
7/14/06 N RA 5525-1-1 created from the web.
```

Note that this message does not include a dollar amount or user ID.

You can review these messages by selecting *Messages* in standard order inquiry to advance to the [Display Order History Screen](#). These messages are also available by selecting *Messages* in streamlined order inquiry.

Return authorization download triggers: If the [Create Return Download Triggers \(K28\)](#) system control value is *selected*, the system creates a return authorization download (RAD) trigger when you create, change, or delete a return authorization line, based on the trigger rules defined for the Return Authorization Download (RETURN_OUT) integration layer job. The RETURN_OUT integration layer job monitors for return authorization download triggers and generates a Return Authorization Outbound XML Message (CWReturnRAOut) to send the return authorization information to a remote system.

Receive a Return Authorization

Receipts are processed through the ORDR_ASYNC job. Updates include:

- The inventory for the item, including increasing on-hand in the item location and item warehouse, and adding an inventory transaction history record
- the order, including the order detail and order line history
- for an exchange, adds the exchange item to the order
- the return authorization header and detail

Credit a Return Authorization

Credits are processed through the ORDR_ASYNC and BILL_ASYNC jobs, which update:

- the order, including order history, and creating the credit invoice and refund, if appropriate
- the return reason or exchange reason history for the offer
- the return authorization header, deleting the detail record.

Note:

Refunds can be either positive (you owe the customer money) or negative (the customer owes you money).

Select Active Pay Method screen: The system displays the Select Active Pay Method screen when you accept the return authorization if a deactivated payment method exists on the order. Use this screen to select which active payment method will receive the credit.

Rejecting Your Entries

Select *Reject* to reject all of your entries during the current session. Any updates to the return authorization tables will be undone, and additional updates will not take place.

To undo an error you made while processing a return authorization against any of items during the current session, you must reject all entries. You cannot undo an individual return authorization.

Issuing Refunds

Topics in this part:

- [Introducing the Refund Process](#) presents an overview of the refund process, including a discussion of situations that can cause a refund, refund types and reason codes.
- [Printing and Interpreting Refund Due Lists \(MRDU\)](#) explains how to print the Refund Due List and use this report to verify and document the changes you make to refunds prior to processing.
- [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#) shows you how to research refunds, change a refund's type, place a refund on hold indefinitely or until a specific date, release a refund from hold, or change the refund's status so it will be canceled or written off when you next process refunds.
- [Processing Refunds \(MREF\)](#) shows you how to print and reprint refund checks and process credits and write-offs.
- [Printing the Processed Refund Register \(PPRR\)](#) explains how to generate the Processed Refund Register.
- [Processing Refunds by Order Number \(MRFO\)](#) explains how to generate refunds for selected orders only.

Introducing the Refund Process

Purpose: You can use the system's refund functions to review and manage:

- refunds you owe your customers
- balances your customers owe you.

With this option, you can issue refund checks and credits or write refunds off. You can also void and reconcile refund checks, review refund check detail, and purge refund check records.

Working with the Refund Process

The system creates a refund any time there is a difference between the order total and the payment.

Refunds occur when:

- The customer returns an item.
- You cancel all or part of a prepaid order at the customer's request.
- You cancel all or part of a prepaid order because the merchandise is soldout.
- The system cancels all or part of a prepaid order through the Automatic Backorder Cancellation program.
- You cancel part of an order when the customer has already paid the entire freight amount.
- The customer's initial payment exceeds the total cost of the order (overpayment).

- The customer pays less than the order total (underpayment).

! Important:

The system will never generate a refund for an order if you cancel an item on the order with a cancel reason whose *Generate refund?* field is set to 3 (do not generate a refund).

Refund types: There are several types of refunds:

- *Checks* = A refund check can be cut for the exact amount of the refund.
- *Credit card credits* = In addition to crediting the customer's credit card account, you can issue a credit card credit acknowledgment. See [Processing Refunds \(MREF\)](#).
- *Stored value card credits* = The system generates a new stored value card for the refund amount; the customer can use this stored value card credit towards a new order; see [Generating Stored Value Card Refunds](#) for more information on when the system creates a stored value card credit.

The system generates a refund type that corresponds to the way the customer paid for the merchandise. For example, if the customer paid using a Visa card, the system generates a credit card credit. However, you can control how the money is refunded by defining an alternative refund type in the Pay Type table. You can also change the refund type by defining an alternate refund category. See [How Pay Type Determines Refund Type](#).

Functions that produce refunds: Refunds are created from:

- Order Entry (or Order Async): overpayment due to a soldout item or an initial amount more than what is owed (overpayment) or less than what is owed (underpayment)
- Order Maintenance (Returns or Billing cancellations)
- Return Authorization Process (Credit returns)
- Billing (Automatic Backorder Cancellation)
- Auto Soldouts (Auto Soldouts program)

! Important:

The system will never generate a refund for an order if you cancel an item on the order with a cancel reason whose *Generate refund?* field is set to 3.

Refund reason codes: The system assigns each refund a reason code. These codes are:

Code	Description
A	<i>Auto cancel backorders</i> This reason applies when a backorder item exists on an order and you process automatic backorder cancellations.
B	<i>Balance due</i> This reason applies when an order has an unpaid balance.

Code	Description
O	<i>Overpayment</i> This reason applies when a customer pays more than the order total, when the customer cancels a prepaid item or order, or when an item on a prepaid order is sold out.
R	<i>Return</i> This reason applies when a customer returns one or more items using a return authorization.
S	<i>Soldout</i> This reason applies when a soldout item exists on an order and you process automatic soldout cancellations.

Why do refunds go on hold? The system can hold a refund automatically or you can place them on hold.

Automatic holds occur when:

- the refund check amount is less than the minimum or more than the maximum amount specified in the Pay Type table; see [Working with Pay Types \(WPAY\)](#).
- the refund release days have not elapsed (this is used to hold refunds for an order paid by check until the check has cleared)
- the order that includes the refund is on hold
- the cancel reason you used to cancel any item on the order had the [Generate refund?](#) field set to 2
- the refund is associated with [Credit Card Net Exchange Billing](#)

You can also place a refund on hold manually through [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#) (for example, if you suspect a fraudulent customer).

Can I release held refunds? You can release refunds that are on hold. Releasing refunds from hold, however, does not mean that they will be processed if the order is on hold.

The system releases the refund automatically when the order hold is released or the refund release days pass. However, if the refund is on hold because it is more than the maximum for the pay type or because you put it on hold manually, you must release it through [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#).

Writeoffs: When the amount of a refund is less than the minimum defined for the pay type, the system marks the refund to be written off. The refund will be written off the next time you process refunds unless you change the status (for example, to generate a refund check because the customer requests it).

You can also change the status of a refund to “writeoff pending” through [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#) regardless of the refund amount (for example, if you have tried and failed to collect a balance due).

What happens to writeoff amounts? When you write off a refund amount the system updates the customer record with the writeoff amount. The writeoff balance accumulates for the customer. You can apply the balance to a new order as a payment if it is a positive amount or as an additional charge if it is a negative amount.

Can I cancel a refund? You can cancel a refund through [Working with Refunds, Writeoffs and Balances Due \(WREF\)](#) if the refund was created by mistake or the customer is a fraud.

Guidelines for issuing refunds: Follow the guidelines below when you are working with Refunds.

1. Print the [Refund Due List](#)
2. Review the refunds that are ready for processing.
3. Check the order status and determine which held orders you want to release.
4. Determine which refunds you want to release from hold.
5. Use the [Work with Refunds Screen](#) to research refunds, to release, hold, cancel or writeoff a refund, or to change the type of refund to issue.
6. Reprint the [Refund Due List](#) so that you have a record of the changes you make to the refunds and to verify that you changed the refunds correctly.
7. Process refunds and writeoffs. See [Processing Refunds \(MREF\)](#).

What if I have a printing problem? If you have a problem printing the refund checks, you can reprint them with the [Reprint Refunds Screen \(MREP\)](#).

Why is each refund associated with a bank? Whenever the system creates a refund record, it associates the refund with a bank code. The system determines the bank code as follows:

- When you created the source code used on the order header, you specified a division.
- When you created the division associated with the source code, you specified a bank. The system uses this bank code.

The system uses the bank code in one or more ways, depending on whether you process orders in multiple currencies (determined by the [Multi Currency by Offer \(E03\)](#) system control value).

For all orders: Even if you process orders in only one currency, you might use more than one bank for deposits and refunds. When you process refund checks, the system determines the next sequential check number to use by checking the Bank table.

For orders in foreign currency: If you process an order in a foreign currency, you generate the refund in this currency as well. The system requires additional setup and validation when the [Multi Currency by Offer \(E03\)](#) system control value is *selected*; among other things, each currency is associated in Order Administration with a unique bank. The bank code that appears on the [Work with Refunds Screen](#) indicates the currency that the customer used to pay for the order. Because the system requires a bank code when you process refunds, you can generate refunds in only one currency at a time. If you specify a dollar limit to generate for one of your refund types, the system interprets this limit in your local currency, but generates the refund in the customer's currency.

Suppressing refunds: You can suppress refund processing:

- For orders you receive through the [Generic Order Interface \(Order API\)](#). See [Suppressing Deposits and Refunds](#) for an overview.
- For returns you receive through the [Inbound Return API](#). See [Suppressing Refunds](#) for an overview.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

In this situation, the refund is generated in a cancel pending status.

Working with Catalog Requests

In this part:

- [Entering Catalog Requests \(WCAT\)](#) shows you how to use the Catalog Request screens to create catalog requests for new and existing customers, and to change, delete, or display catalog request records.
- [Processing Catalog Requests \(PCAT\)](#) shows you how to use the Process Catalog Requests screen, discusses printing options, and shows you how to reset printed requests so that you can reprint labels, if needed.
- [Deleting All Printed Catalog Requests \(DCAT\)](#) discusses the screen you use to delete all printed catalog requests at one time.
- [Working with the Catalog Request Interface \(WCRU\)](#) discusses processing catalog requests you receive through an interface with Order Administration.
- [Catalog Request History Options](#) describes [Purge Catalog Request History \(PCRH\)](#).

Catalog Request History Options

Purpose: There are two menu options related to the Catalog Request History table. This table provides an historical record of catalog requests within your company, even after you have purged outdated catalog requests. You can include this information in reports, such as the Campaign Performance Report; see [Print Campaign Performance Reports \(PCPR\)](#) for more information.

In this topic:

- [Purge Catalog Request History \(PCRH\)](#)

Managing Soldouts and Backorders

In this part:

- [Working with Soldout Controls \(WSLD\)](#) shows you how to create, change, delete, and display soldout controls in the Soldout Control table.
- [Processing Auto Soldout Cancellations \(MASO\)](#) presents the screen you use to cancel soldout items from those orders that contain them.
- [Generating Soldout Notifications \(MSON\)](#) shows you how to use the Print Soldout Notifications screen to produce soldout notifications that you send to your customers.
- [Purchase Order Layering and Backorder Notifications](#) shows you how to use the Generate Backorder Cards function to print backorder notification cards and the Backorder Cancellation Register.
- [Working with Held Detail Lines \(WOHD\)](#) shows you how to use the Work with Order Hold Detail screen. You use this screen to work with items that were held because they were coordinate grouped with items canceled through Process Auto Soldouts.
- [Working with Backorders Pending Cancellation \(WBPC\)](#) shows you how to use this menu option to continue to work with backorders once you have generated a

second notice if the *FTC--second notice output system control value* is set to *FILE* or *FILE/PRINT*.

- [Processing Item Substitutions \(PSUB\)](#) shows you how to cancel all open, unreserved order lines for a particular item and add a substitute item to each order.

Purchase Order Layering and Backorder Notifications

Purpose: Use the Generate Backorder Notifications function to generate notices informing customers when backordered items are expected to ship. You must work within the guidelines of the Federal Trade Commission (FTC) on backorder notifications; for this reason, backorder cards are also called “FTC cards.”

This function also produces the [Backorder Cancellation Register](#), which lists orders containing backordered items that are due for cancellation. You have the option of canceling the items through order maintenance or contacting the customers to suggest alternate items.

If the *FTC--Second Notice Output (E68)* system control value is set to *FILE* or *FILE/PRINT*, and the *FTC -- Action after Second Notification (C70)* system control value is set to *CANCEL*, you can use [Working with Backorders Pending Cancellation \(WBPC\)](#) to continue to work with orders once you have generated second notices.

Future orders: Future orders are not included in backorder processing until their arrival date is within the [Reservation Lead Days \(B27\)](#) system control value.

Quotes: Quotes are not included in backorder processing until they are converted to orders; see [Entering Pre-Order Quotes](#) for an overview.

Email notifications: The system sends an email notice or the *Outbound Email XML Message (CWEmailOut)* rather than generating a document for printing in certain situations. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1). Also see [When Does the System Generate an Email Notification?](#)

Email template: You can use the [Working with Entities \(WENT\)](#) menu option to create an entity-level email template, and the [Working with E-Mail Notification Templates \(WEMT\)](#) menu option to create a default company-level backorder notification template. The template specifies the text to print above and below the standard backorder information. The template also controls whether to generate an actual email or the *Outbound Email XML Message (CWEmailOut)*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Generate notice if purchase order changes? The *FTC - Suppress Backorder Notice for Due Date Changes (L65)* system control value controls whether to generate a backorder notice if you change the due date for the next expected purchase order to a later date, or cancel the purchase order.

Sample backorder email notification: See [Backorder Notification Email Sample and Contents](#).

! Important:

The outbound XML version for the EMAIL_OUT process in [Working with Integration Layer Processes \(IJCT\)](#) must be set to 2.0 in order to generate backorder notices in email or [Outbound Email XML Message \(CWEmailOut\)](#) format.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Save in email repository? The [Write Outbound Email to Email Repository \(H99\)](#) system control value controls whether email notifications are stored in correspondence history. See this system control value for more information on identifying and reviewing outbound emails for a customer.

Note:

You should run [Purchase Order Layering](#) before generating backorder notices to update the expected delivery dates of backordered items.

Drop ship items, including brokered items: The [Assign Drop Ship Expected Ship Date \(I59\)](#) system control value controls whether the expected ship date is displayed or printed for drop ship items. See that system control value for more information.

Order Orchestration: If an order line is assigned to Order Orchestration for fulfillment, the [Generate Backorder Notices \(GBOC\)](#) option does not generate backorder notices for the order line while the Order Orchestration request is in process; however, if Order Orchestration cannot fulfill the order or if you cancel the Order Orchestration request, the order line returns to standard backorder processing and is eligible for backorder notice generation. See the [Order Orchestration Integration](#) for background.

See:

- [Generate Backorder Notices \(GBOC\)](#)
- [Backorder Card](#)
- [Backorder Cancellation Register](#)
- [Purchase Order Layering](#)

System Control Values Related to Backorder Notices and Purchase Order Layering

Purpose: The following values control [Generate Backorder Notices \(GBOC\)](#) and [Purchase Order Layering](#). See [Purchase Order Layering and Backorder Notifications](#).

Description	Valid Values	Summary
Backorder Card Print Program (D04)	program name (the standard program is <i>BOCARDS</i>)	The print program that the system uses to generate backorder cards.

Description	Valid Values	Summary
<i>Days after 2nd Backorder Notification to Cancel Order (D07)</i>	numeric value	Number of days to allow before including the item on the Backorder Cancellation Register. The system uses this value only if you entered <i>Cancel</i> in the <i>FTC -- Action after Second Notification (C70)</i> system control value.
<i>FTC -- # of Days to Add for Special Handling (C67)</i>	numeric value	Number of days to add to the expected receipt date to perform special handling before shipping a backordered item.
<i>FTC -- # of Days to Add for Drop Ships (C68)</i>	numeric value	<p>Number of days to add to the expected receipt date for shipping backordered drop ship items, including brokered items.</p> <p>A drop ship item is an item that your vendor ships for you, rather than shipping it from your own warehouse. The calculation is for the expected ship date = the current date + <i>FTC -- # of Days to Add for Drop Ships (C68)</i> + the <i>Lead days</i> for the vendor item.</p> <p>The <i>Assign Drop Ship Expected Ship Date (I59)</i> system control value controls whether the expected ship date is displayed for drop ship items. See that system control value for more information.</p>
<i>FTC -- Action after Second Notification (C70)</i>	CANCEL, CONTINUE, STOP	The action for the system to take the next time you generate backorder notices after you have sent the second notification to a customer.
<i>FTC -- # of Days for Items without Expected Ship Date (C71)</i>	numeric value	The number of days for the system to add to the expected arrival date for items with no open purchase orders.
<i>Number of Days to Delay Initial Backorder Notice (D89)</i>	numeric value	The number of days to delay sending a backorder notice for order types that receive immediate backorder notices (defined in the Order Type table; see <i>Establishing Order Types (WOTY)</i>). If an item is backordered, but you will be able to ship it before this number of days passes, the system does not generate a backorder notice.

Description	Valid Values	Summary
FTC--Number of Days Prior to Next Backorder Date to Generate Second Notice (E67)	numeric value	The number of days before the second backorder notice is due to generate the notice, or include the order in a report listing orders flagged for cancellation. The system uses this value if the action after second notification is CANCEL. You can use this system control value either to generate backorder notices in advance, or take corrective action to avoid cancelling backordered items.
FTC--Second Notice Output (E68)	FILE, PRINT, FILE/ PRINT	The destination for second notices: written to the Backorder Pending Cancellation table only, generated and not written to the file, or generated and written to the file. If you set this field to FILE or FILE/PRINT, you can use Working with Backorders Pending Cancellation (WBPC) to continue to work with the orders.
Number of Days to Add for Accepted Delays (E69)	numeric value	The number of days to add to the backorder date when a customer accepts the delay following the second notice. This option is available through Working with Backorders Pending Cancellation (WBPC) .
Unconditional Suppression of Backorder Card (F19)	Selected or Unselected	Indicates whether items or SKUs whose Suppress backorder card field is selected will appear on first backorder notices, or never appear. Items/SKUs set to suppress never trigger a backorder notice on their own, and are included on a first backorder notice only if an unsuppressed item is backordered. You would typically choose to suppress promotional items, free gifts, catalogs, etc. from backorder notification. Such items are never eligible to be canceled through Working with Backorders Pending Cancellation (WBPC) .

Description	Valid Values	Summary
Backorder Notification E-Mail Program (G95)	program name (the standard program is <i>BONOTF</i>)	Indicates the program to use when sending an email backorder notification to a customer. See When Does the System Generate an Email Notification? for an overview of how the system determines whether to send an email notification or to generate a document for printing, and for information on entering the text to appear in the email.
Assign Drop Ship Expected Ship Date (I59)	Selected or Unselected	Indicates whether to calculate and display (or print) the expected ship dates for drop ship items, including brokered items. The expected ship dates for drop ship items are calculated as follows: the expected ship date = the current date + <i>FTC -- # of Days to Add for Drop Ships (C68)</i> + the <i>Lead days</i> for the vendor item
FTC - Suppress Backorder Notice for Due Date Changes (L65)	Selected or Unselected	Indicates whether to generate a backorder notice for an order line if the due date for the next expected purchase order changes to a later date, or if the purchase order is canceled.

Processing and Purging Subscriptions

In this part:

- [Generating the Subscription Extract Table \(WGSE\)](#) describes the process of identifying the issue number of the subscriptions you want to send and creating a file of customers who should receive this issue.
- [Purging Subscriptions \(MPCS\)](#) describes how to purge closed (expired) or canceled subscriptions from the Customer Subscription table.

Memberships

In this part:

- [Membership Overview](#) provides a high-level overview of creating membership programs, assigning them to customers, and generating membership orders.
- [Working with Membership Types \(WWMT\)](#) describes the menu option you use to set up membership types for tracking, sorting, and revision control.
- [Working with Membership Programs \(WWMP\)](#) describes the menu option you use to set up membership programs in which you can enroll customers.

- [Working with Customer Memberships \(WWCM\)](#) describes the menu option you use to work with customer memberships, including creating, changing, working with included items, and changing status.
- [Generating Membership Orders \(EGMO\)](#) describes the menu options you use to create orders for customer memberships.
- [Printing the Expected Membership Orders Report \(PEMO\)](#) describes the menu option you use to generate this report and provides a sample.
- [Update Customer Memberships \(MMCM\)](#) describes how to update the source code and replace an item on existing customer memberships and, optionally, membership programs.

Membership Overview

Overview: There are two types of memberships:

1. **Standard memberships:** Programs you can use to generate regular periodic orders for a customer. For example, you might set up a membership program to create an order for a food or beverage item each month. Once you generate an order through a membership, you can ship and bill it like any other order.
2. **Loyalty memberships:** Programs that provide a discount and/or other rewards to customers based on their order history. The background jobs automatically create or deactivate loyalty memberships for customers based on order activity. For example, you could offer customers a 5% discount and free shipping once their total merchandise dollars to date exceeds \$500.

Creating standard memberships: You can create standard memberships for customers in order entry, on the web storefront, or through a separate menu option.

Standard memberships can be open-ended or can have a specified number of shipments. They can include the same items each time you generate an order or you can rotate the items. Standard memberships can also include a discount percentage that applies to any order the customer places; or you can also create discount-only standard memberships that do not generate orders.

E-commerce interface (order API): You can sell standard memberships on orders for web customers if your web storefront supports it. When a customer orders a membership item on the web storefront, Order Administration passes a status message to the storefront indicating that the item represents a membership, rather than a regular inventoried item with a reservation or backorder status.

Note:

- If you sell a membership item on the web storefront, it must have the same name as the membership program itself. See [Setup for Standard Membership Programs](#).
- If the order detail line creating the membership is in error status, the system still creates the customer membership provided there is sufficient data available to create it; however, if you later delete the order detail line or reject the order or order batch, the system deletes the customer membership.
- When a customer purchases a membership item and the payment information is passed separately, the system does not create the customer membership or apply any membership discount until receiving the payment message. In this situation, the system initially applies an error to the order: `Missing Membership`.

Loyalty memberships: You cannot sell or manually create loyalty memberships; loyalty membership activation occurs only when the ORDR_ASYNC or job updates the customer's total merchandise sales or order dollars, and determines that the customer now qualifies for a new loyalty membership program based on customer class or sales, order, or external sales dollars.

When you set up loyalty membership programs, you specify whether to base eligibility on sales or order dollars and whether to subtract activity such as cancellations, soldouts, and returns from the total dollar value required to qualify. You can set up a series of graduated loyalty programs with increasing discounts and rewards. For example, you could have BRONZE, SILVER, AND GOLD loyalty programs, with the system automatically promoting customers from one program to the next as their order history qualifies them.

In this topic:

- [Examples of Standard Membership Programs](#)
- [Setup for Standard Membership Programs](#)
- [Order Entry](#)
- [Work with Customer Memberships](#)
- [Generating Orders](#)
- [Expected Membership Orders Report](#)
- [About Discount Memberships](#)
- [Loyalty Memberships](#)
- [Updating Memberships](#)

Examples of Standard Membership Programs

Purpose: Some sample standard membership programs are described below.

Example 1: A year of shipments. In this example, the membership includes a different order each month for a year, such as “fruit of the month” or “coffee of the month.” The items included in each order, the sequence in which they are shipped, and the pricing are all fixed at the start of the membership, and the customer does not have the option to change or add items. When the predefined number of orders has been generated, the membership closes automatically.

Example 2: Open-ended. The customer chooses the item or items, such as coffee, food items, or other consumables, to receive. Additionally, the customer specifies how frequently the orders should be generated; some prefer monthly shipments, while others receive shipments every two or three weeks. You might include an initial free gift with the first order. Also, the customer can request an additional item to be included in selected rotations, such as every other shipment. The customer pays the current offer price for included items. You leave this type of membership open, and continue generating new orders, until the customer advises you to close the membership.

Example 3: Discount membership. The customer purchases a discount “card” which is good for one year. Any time the customer places an order, this discount applies to the merchandise total.

Setup for Standard Membership Programs

Purpose: The setup required for standard memberships consists of:

Membership type: Before you set up a membership program, you must first set up one or more membership types. Membership types are codes that you use to group membership programs. Also, the membership type controls whether you can change any of the settings that default from the membership program, such as the items included in shipments or the intervals at which you generate orders, when you create a membership for a customer.

Additionally, at the time you generate membership orders, you can select specific membership types. For example, if you have just received a shipment of an item you include in a certain type of membership, you can choose to generate that type of membership order only.

For more information: See [Working with Membership Types \(WWMT\)](#).

Membership program: You set up membership programs to identify the settings that default when you create individual customer memberships. These settings include:

- The interval at which you generate orders. You can choose a specific day of the month, or a number of days between orders. If you specify the number of days between orders, you can also indicate whether to delay the initial shipment, or whether the membership should be eligible for order generation immediately.
- First and last dates when you can create new customer memberships.
- Discount percentage, if any, and the number of months that the discount will be effective.
- Source code, ship via, and order type to default to generated membership orders.
- Items to include on generated membership orders, including:
 - the quantity to include on each generated order
 - the rotation in which to include the item, if you use varying rotations
 - the total number of times to include the item on generated orders
 - price override, if any

You can override the settings from the membership program for an individual customer membership if the membership type allows it.

For more information: See [Working with Membership Programs \(WWMP\)](#).

Membership Item: In order to create new customer memberships in order entry, you need to set up one or more membership items. When you enter a membership item in order entry, the system displays a pop-up window for you to specify the membership program in which the customer wants to enroll.

- *Identify a membership item:* You identify an item as a membership item by selecting the [Membership](#) field. You should also *select* the Non-inventory field.
- *Simplify order entry:* You can use the same code to identify both the membership item and the membership program. For example, you could create both with a code of *MEMB01*. When you enter the membership item *MEMB01* in order entry, the *MEMB01* membership program ID defaults. **Note:** If you process orders through the web storefront, the membership item and program ID *must* be the same.
- *Price of a membership item:* If you plan to charge for creating the membership program in order entry, you need to set up an item/offer for a membership item. If you do not plan to charge for the customer membership itself, the order entry

operator will need authority to override the price and add the membership item at no charge.

- *Membership item price and discount:* If you charge for the customer membership, and if the membership includes a discount, you must set the membership item to be non-discountable (*select* to the Discountable field). Otherwise, the price of the membership itself will be discounted. For example, you offer a membership that carries a 10% discount on all orders for one year. The price of the membership is \$10.00. You must *select* the Discountable field, or the price of the membership itself will be discounted to \$9.00.
- *Initial shipment:* In order to generate an initial shipment to the customer at the start of a discount-only membership, you should set up the item(s) using the Accompanying Item option at the [Work with Item Offers Screen](#). If you attempt to generate the initial shipment through standard membership order generation, the membership's status will change to *Complete* after you generate the order, and the discount will no longer apply.
- *Soldout flag:* If you define a soldout control code for the membership item, the system will not generate a customer membership once the membership item is soldout. See [Soldout Calculation](#) for more information on when the system determines to sell out an item.

System control values:

- *Display First Membership Order Total (G14):* If this system control value is *selected*, the system displays a window providing the estimated dollar total for the first membership order when you accept an order creating a membership.
- *Write Order Messages for Membership Rotation (K04):* If this system control value is *selected*, the system writes an order message on the order that originates the customer membership, and on generated orders. The message indicates the name of the membership program and the Next release date, and is flagged to print on the pick slip.

Order Entry

Purpose: An overview of creating standard customer memberships in order entry is provided below.

Quotes: You can also create a standard customer membership in quote entry. The system performs the same updates as it would when you create a customer membership in order entry; however, the system creates the customer membership in an inactive status and does not update the status to active until you convert the quote to an order. See [Entering Customer Memberships in Quote Entry](#) for more information.

Entering a membership item: You can sell a standard membership through any order. The membership does not need to be the only item on the order, although it can be.

When you enter the membership item, a pop-up window opens. From this window, you can specify the membership program for the customer or confirm the program that defaulted based on the membership item you entered. You can advance to subsequent screens where you can override information that defaults from the current order, such as payment method. You can also override information that defaults from the membership program if the membership type allows it.

Once you have entered the membership, you can still make changes to the membership, or cancel it, by selecting Customer Memberships at the [Display More Options Screen](#) (available by selecting *Options*). You can also cancel a membership in order maintenance by canceling the membership item; see [Canceling a Membership Item](#) for more information.

 **Note:**

You cannot create a membership in Contact Center Order Entry.

Soldout membership: If the membership item is soldout, the system updates the status of the order line to S (Soldout) and does not display the Membership window. If the membership item is sold out, the system does not generate a customer membership.

See [Entering Customer Memberships in Order Entry](#).

Defaults and overrides: The customer, payment information, and original source code default from the order to the customer membership; however, you can override the pay type or recipient customer for the membership, or enter an alternate shipping address.

Default from membership program: The source code and order type default from the membership program to the customer membership, in addition to the items, shipment interval, and discount, if any. The ship via also defaults from the membership program if it is specified there; otherwise, it defaults from the current ship via on the order header. You can also override these defaults in the membership type allows it.

Updating the membership after entry: Aside from [Canceling a Membership Item](#), changes you make to the order in order maintenance do not update the customer membership. You must use [Working with Customer Memberships \(WWCM\)](#) to maintain a membership once you have created it; or, you can work with customer memberships by selecting Customer Memberships at the [Display More Options Screen](#) in order entry or order maintenance (available by selecting *Options*).

Order message: The system writes an order message indicating the name of the membership program and the Next release date if the [Write Order Messages for Membership Rotation \(K04\)](#) system control value is selected. This order message is flagged to print on the pick slip. See the system control value for more information.

Cash amount: If you create a customer membership while entering a prepaid order, the system displays a pop-up window in which you can specify the amount of the prepayment to apply to the membership.

For example, the customer sends a check for \$100.00, and the current order total is \$20.00. At the pop-up window, you would apply \$80.00 toward the customer membership.

As you generate orders for the customer membership, the system applies cash from the membership prepayment amount of \$80.00 until this amount is exhausted. Afterward, any orders you generate for the membership will go on hold until you apply sufficient payment. However, if there is a cash amount remaining after you generate the last order for the membership (that is, any items have been included on orders the specified number of times), the system creates a refund.

When you review the originating order in standard or streamlined order inquiry, the payment amount for the order appears as \$20.00, not \$100.00. However, an order history message will indicate that you have applied a prepayment to a customer membership and note the amount.

For more information: See [About Entering Cash Amounts for a Customer Membership](#) for more information on entering cash for a membership.

Other payment methods: You can also use a credit card payment method for a membership. The payment method from the order defaults, but you can override this default for the membership.

The system goes through the same credit checking when you generate an order for a membership as for any other order, based on the payment method.

Order total pop-up: If the [Display First Membership Order Total \(G14\)](#) system control value is *selected*, the system displays a pop-up window providing the estimated dollar total for the first membership order when you accept an order creating a membership.

Closing the order: If the membership item is the only item on the order, the order remains open until you generate pick slips, provided the entire order is eligible based on the pick slip generation criteria. At that point, the order then closes automatically (assuming it does not fail authorization if it is paid by credit card).

**Note:**

You cannot create a loyalty membership through order entry as described above. See [Loyalty Memberships](#) for an overview.

Work with Customer Memberships

Purpose: In addition to creating a standard customer membership in order entry, you can use the [Working with Customer Memberships \(WWCM\)](#) menu option. You can also use this menu option to review or work with existing customer memberships. Additional options at this menu option include:

- Changing a membership's status (deactivating, reactivating, or canceling)
- Changing the release date or the next rotation
- Deleting a membership if you have not yet generated any orders for it
- Changing information, such as shipment intervals, recipient or alternate address, items, pay type, or discount

Required information: When you create a membership through the Work with Customer Memberships menu option, you must include any required information, such as pay type, customer, and recipient, that would default from the order if you create a membership in order entry.

You cannot charge a customer for the membership itself if you create it through this menu option.

**Note:**

You cannot create a loyalty membership through this menu option. See [Loyalty Memberships](#) for an overview.

Generating Orders

Purpose: Use the [Generating Membership Orders \(EGMO\)](#) menu option to create new orders for standard customer memberships. This menu option selects active memberships based on release date. You can also restrict the selection based on membership type.

Memberships in error: The system does not attempt to create an order and prints the membership on an error report, in the following scenarios:

- There are no items specified for the membership.
- The payment information is not complete.

Other types of errors do not prevent the system from generating the order; however, the order is in suspended status and is listed on the [Print Remote Order Errors Report](#). For example, an order fails the edit if it includes an item that does not have a price, or has an invalid SCF/ship via combination. You can use batch order entry, described in [Accepting or Rejecting the Order Batch](#), to correct such orders and resubmit them to the phone edit process. When the membership order is accepted, the system clears the batch number from the order header.

Expected Membership Orders Report

Purpose: Use the [Expected Membership Orders Report](#) to review the total number of standard memberships that are eligible to generate orders based on the next release date. This report provides totals for each release date, and does not contain any detailed information.

For more information: See [Printing the Expected Membership Orders Report \(PEMO\)](#).

About Discount Memberships

Purpose: If you set up a standard membership program for discounting purposes only (that is, you will not be generating orders), you should be aware of the following:

- *Flagged as errors at order generation:* Discount-only memberships will appear on the Memberships in Error report when you generate membership orders unless you select only membership types that produce orders.
- *Must have eligible status for discount:* The discount applies only if the customer membership is in an active, in process or error status; otherwise, no discount will apply.
- *Discounting price of membership item:* Any discount will apply to the price of the membership item itself in order entry, unless you *select* the Discountable field for the membership item.
- *Membership remains open:* A discount-only customer membership will never close automatically. Even after the discount end date passes, the membership will remain active, although the discount will no longer apply to new orders.
- *Initial shipment:* In order to include one order shipment to the customer to initiate a discount-only membership, you should set up the item(s) using the Accompanying Item option at the [Work with Item Offers Screen](#). If you attempt to generate the initial shipment through standard membership order generation, the membership's status will change to Complete after you generate the order, and the discount will no longer apply.

 **Note:**

The above refers to standard discount memberships, that is, memberships that you sell or create. See [Loyalty Memberships](#) for information on memberships that the background jobs assign to customers based on order history.

Loyalty Memberships

Overview: You can have the system create customer loyalty memberships automatically when a customer reaches a required merchandise sales, order, or external sales dollar total value, or when a customer has a specified customer class. These loyalty membership programs can provide various benefits to the customer, such as:

- a percentage discount to default in order entry
- free freight
- higher backorder priority
- special customer class

You can set up a single loyalty program or graduated loyalty programs. For example, you can offer a discount of 5% when a customer reaches \$1000 in total orders, a discount of 10% when a customer reaches \$1500, and so on.

 **Note:**

The total dollars used to evaluate a customer for loyalty membership are based on merchandise only, and do not include charges such as tax, freight, or handling. The merchandise total is based on the actual selling price of items on orders.

System control value: The [Use Loyalty Membership Program \(I81\)](#) system control value controls whether the system evaluates customers for loyalty program membership.

When does evaluation take place? The system evaluates customers for loyalty membership during the order and billing background jobs, as described in the following table.

Program Type	Membership created if:	Evaluated When?
order (O)	<ol style="list-style-type: none">1. the LTD dollars required for the program is less than the \$ order total for all entries in the Order Billing History table since the Effective start date specified for the loyalty program. If there is no Effective start date specified for the program, the customer's entire order history is compared with the LTD dollars requirement. If there is an External sales amount specified in the Customer Order History table, this amount is added to the order dollar total; or,2. the customer is assigned to the Customer class requirement for the program.	ORDR_ASYNC

 **Note:**

If the program specifies both a LTD dollars and a Customer class requirement, the customer must meet both requirements to earn the membership.

sales (S)	<ul style="list-style-type: none">• the LTD dollars required for the program is less than the \$ sold total for all entries in the Order Billing History table since the Effective start date specified for the loyalty program. If there is no Effective start date specified for the program, the customer's entire sales history is compared with the LTD dollars requirement. If there is an External sales amount specified in the Customer Order History table, this amount is added to the order dollar total; or,• the customer is assigned to the Customer class requirement for the program.	BILL_ASYNC
-----------	---	------------

 **Note:**

If the program specifies both a LTD dollars and a Customer class requirement, the customer must meet both requirements to earn the membership.

Program Type	Membership created if:	Evaluated When?
external (E)	<ul style="list-style-type: none"> the LTD dollars required for the program is less than the External sales amount specified in the Customer Order History table plus the \$ order total for all entries in the Order Billing History table since: <ul style="list-style-type: none"> the External sales date specified in the Customer Order History table; if any; otherwise, the Effective start date specified for the loyalty program, if any; otherwise, If there is no Effective start date specified for the program, the customer's entire order history is compared with the LTD dollars requirement; or, the customer is assigned to the Customer class requirement for the program. 	ORDR_ASYNC BILL_ASYNC

 **Note:**

If the program specifies both a LTD dollars and a Customer class requirement, the customer must meet both requirements to earn the membership.

Example:

You set up an order dollars-based loyalty program with a LTD dollars requirement of \$500 and an Effective start date of 01/01/06 so that you can provide customers who have placed \$500 in orders in the current year with a 10% discount.

A customer has the following order activity in the Order Billing History table:

12/01/05: \$200.00

01/31/06: \$200.00

02/06/06: \$100.00

The customer places an order with a merchandise total of \$250.00.

Result: When the current order is processed by the ORDR_ASYNC job, the customer is assigned to the loyalty program based on a total dollar value of \$550.00 as follows:

- the \$200.00 from 01/31/06
- the \$100.00 from 02/06/06
- the \$250.00 from today's order

The \$200.00 from the 12/01/05 order is not included in the total, because it was placed before the Effective start date.

 **Note:**

The External sales and External sales date fields are not populated by any Order Administration process.

Graduated loyalty programs: You can set up multiple loyalty programs so that customers can be “promoted” from one to the next as their sales or order totals increase. The background jobs use the Priority assigned to each loyalty program to determine the order in which they should evaluate whether a customer qualifies for each loyalty program. A higher-priority loyalty program should be assigned a lower Priority number so that the background jobs evaluate the customer against this program first.

Example: You have three current sales-based loyalty programs with the same Effective start date:

- **GOLD:** 10% discount plus free freight. Requires \$1500 in sales, and has a priority of 1.
- **SILVER:** 10 discount. Requires \$1000 in sales, and has a priority of 2.
- **BRONZE:** 5% discount. Requires \$500 in sales, and has a priority of 3.

You ship an order to a customer for a total of \$1000 in merchandise. The customer's previous total sales \$ in the Order Billing History table since the Effective start date was \$100, raising the new total to \$1100.

Result:

1. The BILL_ASYNC job checks the GOLD program first because its priority is 1. The customer does not qualify.
2. The BILL_ASYNC job next checks the SILVER program, because it has the next priority level. The customer qualifies for this loyalty program. The BILL_ASYNC job assigns the customer to the SILVER loyalty program and stops checking other loyalty programs.

 **Note:**

Typically, you would set up graduated loyalty programs using a lower priority number (higher priority) for higher-level programs, as in the example above; however, if there is more than one current loyalty program with the same Priority, the background job evaluates these programs in alphanumeric order.

Only one active loyalty membership at a time: The background jobs evaluates the customer against the current loyalty programs each time there is order activity, such as entering, maintaining, or billing an order. If the customer qualifies for a higher-level loyalty program as a result of order activity, the job deactivates the customer's current loyalty membership and activates a new one. Similarly, if the customer no longer qualifies for a higher-level loyalty program due to order activity that reduces the qualifying total, such as a cancellation, the job deactivates the current loyalty membership and activates the appropriate lower-level one. A customer cannot have more than one active loyalty membership.

Notifying the customer: The system generates a notification email to the customer each time a loyalty membership is activated or deactivated through the background jobs. You can set up individual activation and deactivation templates at both the company level and the entity level. See the [Loyalty Setup](#) described below for more information.

When does the customer receive the discount? If the customer qualifies as a result of order activity, the background jobs perform loyalty program assignments after you complete entering, updating, or billing an order. As a result, the loyalty discount never applies on the order which qualifies the customer for the loyalty membership. However, the next time the customer places an order, the discount and other benefits of the loyalty program default to the order.

Loyalty discounts and other benefits do not default in order maintenance, only on new orders.

How long does a customer loyalty membership last? A loyalty membership can be deactivated in the following ways:

- You can deactivate or cancel a customer's loyalty membership through the [Working with Customer Memberships \(WWCM\)](#) menu option.
- If you specify a number of months as the Discount duration for a loyalty program, the system creates customer loyalty memberships with a Discount end date based on this duration. For example, if you set the Discount duration to 12, and a customer qualifies for the loyalty program on 10/18/06, the system sets the Discount end date to 10/18/07 (12 months later). No discounts or other benefits apply in order entry once the Discount end date is reached. However, if you do not specify a Discount duration for a loyalty program, the system does not set a Discount end date for the customer's loyalty membership.
- Each time the background jobs process orders for a customer, they evaluate the customer's current loyalty membership assignment. If the customer is currently assigned to a loyalty membership but should now be assigned to a different program, the background job deactivates the customer's current membership and creates the new membership. Similarly, if the customer no longer qualifies for the current loyalty membership and does not now qualify for any other existing loyalty program, the background job simply deactivates the current loyalty membership.

What information is stored with the customer loyalty membership? When the background jobs create a loyalty membership for a customer, the information that defaults from the loyalty program settings includes:

- Discount end date
- Discount %
- Priority B/O, if any
- Free freight, if any

 **Note:**

If the customer is eligible for free freight through a loyalty program, you cannot apply a promotion that includes free freight. See [Working with Promotions \(WPRO\)](#) for background.

Netting returns, cancels, and soldouts: When you set up loyalty programs, you have the option of netting (or subtracting) the merchandise value of returns, exchanges, cancellations, and soldouts from the total dollar value of sales or orders used to determine whether a customer qualifies for a loyalty program.

Example: A customer is currently assigned to an order-based loyalty program with a LTD dollars requirement of \$500 and an Effective start date of 01/01/06. The customer has the following order activity in the Order Billing History table since the Effective start date:

02/06/06: \$100.00

09/12/06: \$200.00

The customer's External sales field is currently set to \$250.00.

The customer cancels \$100.00 of the merchandise on the 9/12 order.

Result: When the current order is processed by the ORDR_ASYNC job, the customer's total order dollars of \$550.00, and the total canceled dollars is \$100.00. The loyalty program's Net cancels flag is *selected*. When the system subtracts the \$100.00 cancellation from the \$550.00 orders total, the remaining \$450.00 is not enough to qualify for the loyalty program. The customer's membership in the loyalty program is deactivated.

Troubleshooting loyalty programs that net returns, cancels, and soldouts:

- *Activity against orders before the Effective start date:* Returns, exchanges, cancellations, or soldout activity is evaluated based on the date of the activity itself, rather than the date of the original order. For example, you process a return of \$50 in merchandise on January 31 against an order that was entered on December 30. The system is evaluating the customer for a loyalty program with an effective start date of January 1. The value of the \$50 return is subtracted from the total dollar value since January 1, even though the order was originally entered before that date.
- *Exchange activity:* If the Net returns/exchanges flag is *unselected* and you process an exchange, the dollar value of the exchange, or replacement, item is included in the calculation of loyalty eligibility. For example, if the customer exchanges an item with a selling price of \$50 for an item with the same selling price, this activity effectively increases the customer's total merchandise value to date by \$50 if you do not net returns and exchanges.
- *Update demand flag:* A cancellation always reduces the total merchandise order amount if you use a cancel reason code whose Update demand? flag is *selected*. The result of this type of cancellation might be to make a customer ineligible for a particular loyalty program if it is based on the order total.
- *Update demand for order maintenance transactions?* If the [Update Demand for Order Maintenance Transactions \(C72\)](#) system control value is *unselected*, it is possible to understate the customer's total merchandise order dollars. Because the order dollar total in this situation does not increase if, for example, you add an item in order maintenance, processing a cancellation (or return, exchange, or soldout) can have the effect of "double dipping" when the system subtracts the cancellation dollars from the order total. For example, a customer's total dollars ordered is \$500.00. You add a \$100.00 item in order maintenance, and then cancel it. Because the total dollars ordered was never increased by the \$100.00 in order maintenance, the cancellation effectively reduces the customer's total dollars ordered to \$400.00. For this reason, you might want to leave the netting flags for a loyalty program *unselected* if the [Update Demand for Order Maintenance Transactions \(C72\)](#) system control value is *unselected*.

Reviewing order and sales totals: Use the following screens to review the customer's order and sales activity:

- [Display Customer Order History Screen](#): Displays totals for the customer life-to-date (that is, not restricted based on a range of activity dates). This information is stored in the Customer Sold To Order History table.
- [Customer Sold To Order History Screen \(Reviewing Detail\)](#): A listing of each activity that updated the total orders, sales, returns, exchanges, cancellations, exchanges, or soldouts in the Order Billing History table. You can also generate the Customer Sold To Order History Detail report by selecting *Print List* at this screen.
- [Order Billing History Detail Screen](#): Displays detail on a single Order Billing History Detail record. The system creates a separate record for each order activity.

Consolidating Order Billing History: If you use the [Consolidating Order Billing History \(MOBH\)](#) menu option, you need to have Consolidate by Customer *selected* in order to include activity in the consolidated date range to evaluate customers for loyalty memberships. If you have Consolidate by Customer *unselected*, the system consolidates records using a customer number of zero, so the order activity for the consolidated date range cannot be used for loyalty evaluation purposes.

Turning loyalty evaluation on or off: The [Use Loyalty Membership Program \(I81\)](#) system control value controls whether the background jobs evaluate customers for loyalty eligibility; however, it does not prevent the discount percentage for an existing loyalty membership from applying when the customer places an order. In order to prevent the discount from applying, you would need to use [Working with Customer Memberships \(WWCM\)](#) to deactivate the loyalty membership, or wait until the Discount end date for the loyalty membership is reached.

Loyalty Setup

The required and recommended setup for using loyalty memberships is described below.

System control values:

- [Use Loyalty Membership Program \(I81\)](#): Controls whether the background jobs evaluate customers for loyalty membership based on order activity.
- [Loyalty Membership Activation Notification Email Program \(I82\)](#): Specifies the program to generate the loyalty membership activation email.
- [Loyalty Membership Deactivation Notification Program \(I83\)](#): Specifies the program to generate the loyalty membership deactivation email.
- [Alternate Customer Number Label Description \(H95\)](#): Specifies the text to include in the Subject line for loyalty membership notification emails as well as on certain screens. For example, if this system control value is set to *Reward #*, the subject lines are `Reward # Activation` or `Reward # Deactivation`. If this system control value is unselected, the Subject line uses `Loyalty Activation` or `Loyalty Deactivation`.
- [Update Demand for Order Maintenance Transactions \(C72\)](#): See the troubleshooting information above for considerations related to the setting of this system control value.

Membership types: Use the [Working with Membership Types \(WWMT\)](#) menu option to create one or more membership types with the Loyalty flag *selected*. The membership type also specifies whether you can change existing customer loyalty memberships.

Membership programs: Use the [Working with Membership Programs \(WWMP\)](#) menu option to create one or more loyalty membership programs, specifying a membership type that has the Loyalty flag *selected*.

 **Note:**

Do not mix active orders-based, sales-based, or external dollars-based loyalty programs in a single company; it is best to have a single method for evaluating customers for loyalty memberships.

Email templates: Use the [Working with E-Mail Notification Templates \(WEMT\)](#) menu option to specify the text to include in the activation and deactivation emails. You can also set up an email template at the entity level as an override; see [Email Setup within Order Administration](#) and [Working with E-Mail Notification Templates \(WEMT\)](#).

You can also use the [Work with Entity Email Overrides Screen](#) to specify the “from” email address to use on these notification emails. However, using a different “from” email address based on entity for various notifications, such as the loyalty membership activation or deactivation notice, might be confusing to your customers if the same customers commonly place orders in multiple entities within your company. In this situation, the “from” email address on a deactivation email might not match the entity where the customer places the majority of his or her orders.

For example, a customer might qualify for a loyalty membership based on orders placed in entity 1, and receive a loyalty activation notice using the “from” email address for this entity. Then the customer places an order in entity 2 that makes him eligible for a higher loyalty program. In this situation, it is possible for him to receive a deactivation notice for the first loyalty membership using the “from” email address from entity 1, and an activation notice for the second loyalty membership using the “from” email address from entity 2.

 **Note:**

The background jobs generate email notifications for a customer only if the order type has the Email notification flag *selected* and the customer’s Opt-in/out setting (see [Determining the Opt-in/out Setting](#)) is O1 or O2.

For more information: See:

- [Working with Membership Types \(WWMT\)](#)
- [Working with Membership Programs \(WWMP\)](#)
- [Working with Customer Memberships \(WWCM\)](#)
- [Working with E-Mail Notification Templates \(WEMT\)](#)
- [Use Loyalty Membership Program \(I81\)](#)
- [Loyalty Membership Activation Notification Email Program \(I82\)](#)
- [Loyalty Membership Deactivation Notification Program \(I83\)](#)
- [Operating the Background Jobs](#)

Updating Memberships

Purpose: You can use the [Update Customer Memberships \(MMCM\)](#) to update the source codes and/or replace an item on customer memberships for one or more membership programs. This function also provides the option to update the

membership program(s) as well. See [Update Customer Memberships \(MMCM\)](#) for more information.

Email Repository

In this part:

- [Working with Email Category \(WEMC\)](#) provides information on setting up categories for tracking and grouping emails.
- [Working with Email \(WEML\)](#) provides information on reviewing unrouted emails and assigning them to customers and orders.
- [Purging Email History \(MPCH\)](#) provides information on purging emails earlier than a given date.
- [Updating Email Domains \(MUÉE\)](#) provides information on making universal updates to the domain name for all matching email addresses in your company.
- [Printing the Email Error Report \(PEME\)](#) provides information on printing a report listing all email addresses in your company that do not conform to formatting requirements.

Customer Service Appendices

Purpose: These topics provide reference information for use throughout the system.

- [Displaying More Options in OIOM](#) describes several options related to Order Inquiry, Order Maintenance and Order Entry that are not available on the regular screens.
- [Loading Address Updates](#) describes how to load and process a table containing Sold To Customer address updates, and how to review changed and unchanged customer information.

Displaying More Options in OIOM

Purpose: Select *Options* or *More Options* when you are [Entering Orders](#), using standard [Order Inquiry](#), or using order maintenance, to display a screen that provides additional related options that are unavailable on the regular screens.

In this topic:

- [Display More Options Screen](#)
- [Work with Ticklers Screen \(order view\)](#)
- [About Customer Action Notes](#)
 - [Edit Customer Actions Window](#)
- [Work with Email by Order Number Screen](#)
- [Work with Customer Profile Screen](#)
- [Work with Email by Customer Sold To Number Screen](#)
- [Edit Customer Notes Screen](#)
- [Work with Email by Customer Ship To Number Screen](#)
- [Work with Email by Customer Bill To Number Screen](#)
- [Display Pick Tickets for Order Screen](#)

- [Display Order Totals Window](#)
- [Work with Subscriptions Screen](#)
- [Customer Order Item History Screen](#)
- [Brokered Backorder Summary Screen](#)

Display More Options Screen

 **Note:**

The Void/Reprint Picks option is not available in standard order inquiry and the Subscriptions option is not available in order entry/maintenance; however, these options are consolidated on one screen for documentation purposes.

Field	Description
Order #	The number of the order and the order ship-to (shipping address) you are currently working with. Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only.
Sold to	A unique number to identify the customer who placed the order, and the customer's name or company name. Customer number: numeric, 9 positions; display-only. Name: alphanumeric, 41 positions; display-only.
Bill to	The bill-to customer associated with the customer who placed the order. Numeric, 7 positions; display-only.

Available options:

- *Customer action notes*: select this option to enter, update, delete or resolve an action issue for a customer. A pop-up action window opens each time you select the customer until the issue is resolved. See [About Customer Action Notes](#).
- *Customer notes*: select this option to record or view information about the current customer. See [Edit Customer Notes Screen](#).
- *Customer ownership*: select this option to work with products a customer owns. If customer ownership records have been defined for the customer, you advance to the [Work with Customer Ownership Screen](#); otherwise, you advance to the [Create Customer Ownership Screen](#).
- *Customer profile*: select this option to create a demographic profile for the current customer, which may describe the customer's gender, age, income, geographic location, or other types of demographic data. See the [Work with Customer Profile Screen](#).
- *Customer email addresses*: select this option to advance to the [Work with Customer Email Address Screen](#), where you can review and work with email addresses for a sold-to customer.
- *Customer memberships*: select this option to review or work with membership programs you use to generate periodic orders for the customer. This screen opens

each customer membership for the sold-to customer on the current order. This information appears only for the customer who purchased the membership, not the recipient (if any). If the membership was created through order entry rather than the Work with Customer Membership menu option, the order number appears on this screen. You cannot create a customer membership through this screen. See [Working with Customer Memberships \(WWCM\)](#).

- *Customer warranty information:* select this option to review, create, change, and delete customer warranty information for a product on the order. See the [Work with Customer Warranty Information Screen](#).
- *Customer order item history:* select this option to advance to the [Customer Order Item History Screen](#) to display items that the customer has ordered on previous orders.
- *Display invoices:* select this option to advance to the [Display Invoices Screen](#) where you can review invoices associated with the order.
- *Display picks:* select this option to find out the status of picks generated for an order, such as when they were prepared, printed and confirmed. See the [Display Pick Tickets for Order Screen](#).
- *Email for customer bill to:* select this option to advance to the [Work with Email by Customer Bill To Number Screen](#), where you can review or work with emails sent to or received from the sold-to or bill-to customer on the order.
- *Email for customer ship to:* select this option to advance to the [Work with Email by Customer Ship To Number Screen](#), where you can review or work with emails sent to or received from the sold-to customer on the order.
- *Email for customer sold to:* select this option to advance to the [Work with Email by Customer Sold To Number Screen](#), where you can review or work with emails sent to or received from the sold-to, ship-to, or bill-to customer on the order.
- *Email for order:* select this option to advance to the [Work with Email by Order Number Screen](#), where you can review or work with emails sent to or received from the customer related to the current order.
- *Loyalty Account:* Select this option to review loyalty account information from Oracle Retail Customer Engagement for a customer. When you select this option, the system retrieves the customer's information from Oracle Retail Customer Engagement.
 - If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the [Display Loyalty Account Screen](#). If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer.
 - If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the [Customer Loyalty Registration Window](#), where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program.
 - If a Relate ID is not defined for the customer in the Customer Sold To table, the system displays an error message similar to the following: `This customer does not have a Relate ID.`
 - If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: `Unable to connect to ORCE.`

 **Note:**

This option is available only if the *Use ORCE Loyalty (M06)* system control value is *selected*. See *Customer Engagement Loyalty Integration* for an overview.

- *Order totals*: select this option to view accumulated totals across all shipping addresses (recipients) on an order. See *Display Order Totals Window*.
- *Print/Email Quotes*: Select this option to advance to the *Print/Email Quote Window*, where you can select to print the Quote form or generate the Quote Confirmation email. See *Entering Pre-Order Quotes*. **Note:** This option is available only for orders whose order type has the Quote option *selected*. In addition, this option does not display if the *Quote Printing Program (K73)* and *Quote Confirmation Email Program (K74)* system control values do not contain a value or if all of the items on the quote are soldout and the Exclude S/O on order confirmation field for the order type on the quote is *selected*.
- *Purchase History*: Select this option to review completed sales and return transactions from Oracle Retail Customer Engagement for a customer. When you select this option, the system retrieves the customer's information from Oracle Retail Customer Engagement and advances you to the *Display Purchase History Screen*. If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE. **Note:** This option is available only if the *ORCE Customer Integration (L37)* system control value is set to *INTERACT*. See *Customer Engagement Purchase History Integration*.
- *Rewards Points*: Not implemented.
- *Send contact us email*: Select this option to generate an email requesting that the customer contact you about the order. See the *Summary of Customer Correspondence* for more information on when this option is available, and see the *"Contact Us" Notification Sample and Contents* for more information on the generated email.
- *Subscriptions (standard order inquiry only)*: select this option to review, fulfill, or modify the subscription ordered by the customer. See the *Work with Subscriptions Screen*.
- *Ticklers*: select this option to work with ticklers associated with the order. See *Work with Ticklers Screen*. This option is available only if the *Use Workflow Management (H96)* system control value is *selected*.
- *Void/reprint picks (order entry/maintenance only)*: select this option to void or reprint a pick slip for a previous order for the customer, if, for example, the customer wants to use a different shipping service. See the *Reprint/Void Pick Slips by Order Screen* in *Reprinting and Voiding Pick Slips (WVRP or WSVP)*.

Work with Ticklers Screen (order view)

Purpose: Use this screen to review, work with, and resolve ticklers associated with the order, sold to customer on the order, and bill to customer on the order.

Secured feature: If you do not have authority to the *Update All Ticklers (B09)* secured feature, you cannot update a tickler that is not assigned to you or your tickler groups or an error message indicates: Not authorized to change.

This secured feature controls updating a tickler by:

- selecting *Change* for a tickler to change it.
- selecting *Delete* for a tickler to delete it.
- selecting *In process* for a tickler to assign the tickler to yourself.
- selecting *Resolve* for a tickler to resolve it.

If you do not have access to this feature, you can update only ticklers assigned to you or your tickler groups. However, you can still release an order associated with the tickler from hold.

See [Workflow Management Overview and Setup](#) for an overview and required setup for workflow management processing.

How to display this screen: At the [Display More Options Screen](#), select Ticklers.

Field	Description
Order #	The order associated with the ticklers on the screen. Numeric, 9 positions; display-only.
Status	The status of the order. Valid values: <ul style="list-style-type: none"> • Open • Archived (This option is not currently implemented) • Cancelled • Held • Purged • Quote • Suspended • Closed Alphanumeric, display-only.
Sold to	The number and description of the sold to customer associated with the ticklers on the screen. Sold to number: Numeric, 9 positions; display-only. Sold to description: Alphanumeric, 40 positions; display-only.
Bill to	The number and description of the bill to customer associated with the ticklers on the screen. Bill to number: Numeric, 9 positions; display-only. Bill to description: Alphanumeric, 40 positions; display-only.
Status	The status of the tickler. Valid values: <ul style="list-style-type: none"> • <i>Open</i> = the tickler is open and is available to work on in the assigned tickler work queue. • <i>Inprocess</i> = the tickler is currently being worked on by the assigned user. • <i>Resolved</i> = the tickler has been resolved. Optional.
P (tickler priority)	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is the lowest priority and 9 is the highest priority). Numeric, 1 position; optional.
Assigned (assign date)	The date the tickler was assigned to the user or tickler user group. Numeric, 7 positions (in user date format); optional.

Field	Description
Ev (tickler event code)	<p>The code for the tickler event that created the tickler.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>BO</i> = Backorders • <i>CO</i> = Cancelled orders • <i>HO</i> = Held orders • <i>MN</i> = Manually created • <i>NO</i> = New orders • <i>OO</i> = Aged open orders • <i>SO</i> = Sold out orders • <i>UP</i> = Unconfirmed pick tickets • <i>VP</i> = Voided pick tickets • <i>WF</i> = Remote workflow <p>See System Delivered Tickler Events.</p> <p>Alphanumeric, 2 positions; optional.</p>
Cat (tickler category)	<p>The tickler category assigned to the tickler.</p> <p>Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT).</p> <p>Alphanumeric, 3 positions; optional.</p>
Tickler#	<p>The tickler number assigned to the tickler, from the Tickler Number number assignment record.</p> <p>Numeric, 9 positions; optional.</p>
User group	<p>The group ID of the tickler user group assigned to the tickler.</p> <p>Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG).</p> <p>Tickler group ID: Alphanumeric, 10 positions; display-only.</p>
User	<p>The user ID of the user assigned to the tickler.</p> <p>Users are defined in and validated against the User table; see Working with User Records (WUSR).</p> <p>User ID: Alphanumeric, 10 positions; display-only.</p>
Item	<p>The item associated with the tickler.</p> <p>Alphanumeric, 12 positions; optional.</p>
OST# (order ship to number)	<p>The order ship to associated with the tickler.</p> <p>Numeric, 3 positions; optional.</p>

Screen Option	Procedure
Change a tickler	Select <i>Change</i> for a tickler to advance to the Change Tickler Screen .
Delete a tickler	Select <i>Delete</i> for a tickler to delete it. You can only delete <i>MN</i> (manually created) ticklers.
Display a tickler	Select <i>Display</i> for a tickler to advance to the Display Tickler Screen. See the Change Tickler Screen for field descriptions.

Screen Option	Procedure
Release the order associated with the tickler from hold	<p>Select <i>Release</i> for a tickler to advance to the Release Reason Prompt Pop-Up Window (order header hold), Release Recipient Hold Reason Pop-Up Window (recipient hold), and/or Release Order Payment Method Window (pay type hold).</p> <p>If you release an order from hold for an <i>HO</i> (held order) tickler, the system automatically resolves the tickler. Also, the system evaluates any other ticklers associated with the order to determine if they can be resolved.</p> <p>If you select <i>Release</i> for a tickler not associated with a held order, an error message indicates: Order not on hold.</p> <p>If you select <i>Release</i> for a tickler not associated with an order, an error message indicates: Tickler not eligible for this option.</p>
Select a tickler to work on	<p>Select <i>In Process</i> for a tickler to change the status of the tickler from open to in process.</p> <p>You can only select to work with a tickler that is in an open status; if you select <i>In process</i> for a tickler that is in an in process or resolved status, an error message indicates: Tickler status cannot be changed - resolved or already in process.</p> <p>Selecting this option automatically assigns the tickler to the user and creates a tickler history record.</p>
Enter or review tickler work notes	<p>Select <i>Notes</i> for a tickler to advance to the work notes screen, based on the note type defined for the tickler.</p> <p>Note type <i>A</i> advances you to the Edit Customer Actions Window.</p> <p>Note type <i>B</i> advances you to the Work with Bill To Notes Screen.</p> <p>Note type <i>O</i> advances you to the Work with Order Messages Screen.</p> <p>Note type <i>S</i> advances you to the Edit Customer Notes Screen.</p> <p>Note type <i>T</i> advances you to the Work with Tickler Notes Screen.</p>

 **Note:**

You must have authority to the Release Held Orders (ERHO) menu option to release the order from hold.

Screen Option	Procedure
Review the tickler source	Select <i>Detail</i> for a tickler to advance to the source screen, based on the tickler event associated with the tickler. <i>BO, CO, HO, NO, OO, SO, UP, VP, and WF</i> ticklers advance you to the Order Inquiry Header Screen . You cannot view the source for <i>MN</i> ticklers: Requested tickler has no source reference.
Review tickler history	Select <i>History</i> for a tickler to advance to the Work with Tickler History Screen .
Resolve a tickler	Select <i>Resolve</i> for a tickler to advance to the Resolve Tickler Window .
Review procedures for a tickler	Select <i>Procedure</i> for a tickler to advance to the Work with Tickler Event Rule Procedure Screen . You cannot add or change tickler procedures when you advance from the Work with Tickler screen. You cannot review procedures for <i>MN</i> ticklers.
Create a tickler for the <i>MN</i> (manually created) tickler event	Select <i>Create</i> to advance to the Create Tickler Screen .
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note: To create a <i>MN</i> tickler, you must have authority to the Create Manual Tickler (B13) secured feature.</p> </div>
Review the number of ticklers in the work queue, based on the selection criteria you have defined	Select <i>Count</i> to advance to the Current Tickler Count Window window.
Toggle between displaying open and in use ticklers or resolved ticklers	Select <i>Open/Resolved</i> . The system toggles between displaying: <ul style="list-style-type: none"> • ticklers in an open or in process status. • tickler in a resolved status.
Review ticklers associated with the sold to customer on the order	Select <i>Cust sold to</i> to advance to the Work with Ticklers Screen (sold to customer view) .

About Customer Action Notes

Purpose: Use Customer Action Notes to identify and address critical customer issues that need action. The two options you can use to enter, delete, display, resolve, update the status, or attach detailed notes about a customer issue are:

- [Edit Customer Actions Window](#)
- [Work with Email by Order Number Screen](#)

You can use the Customer Actions function to enter and track customer issues regarding an order (or anything else). In a customer action note you can:

1. Enter a brief statement about a customer issue or problem.

2. Enter a reason code to identify the issue or problem for further grouping and reports.
3. Assign the issue to a specific user for follow up or resolution.
4. Add detailed information describing the customer issue.
5. Update the status of the action from *O* (open) to *W* (work in process), and, optionally, override the assigned user.
6. Identify the issue as *R* (resolved) when it meets the customer's satisfaction.

Dealing with customer action issues: To resolve an unresolved action issue you should:

1. Review the action description, which is a brief description of the problem.
2. Respond to the issue by:
 - Selecting *Delete* to delete the issue immediately.
 - Selecting *Display* to review time and date statistics associated with the customer action.
 - Selecting *Detail Notes* to view or enter detailed information about the action issue.
 - Selecting *Work in Process* to view or enter detailed information about the action issue. This option also automatically updates the status from *O* (open) to *W* (work in process), and automatically updates the most recent user.
 - Selecting *Resolve* to resolve the issue and change the status from *O* (open) or *W* (work in process) to *R* (resolved).

Secured features: The following secured features define whether you have authority to add, delete, update, or resolve customer action issues:

- [Change Customer Action Notes Description \(A93\)](#)
- [Add Customer Action Detail Notes \(A94\)](#)
- [Change Customer Action Detail Notes \(A95\)](#)
- [Delete Customer Action Notes \(A96\)](#)
- [Change Customer Action Notes Status/Work in Process \(A97\)](#)
- [Change Customer Action Notes Status/Resolve \(A98\)](#)

Edit Customer Actions Window

Purpose: A pop-up window opens during order entry or when you work with Customer Memberships when you select a customer with an unresolved action issue. This window opens when you select *OK* at the order header screen and the system validates your entries. The system assigns a status of *O* (open) to all new customer action issues. The status can be updated to *W* (work in process) if the issue has been investigated but not yet resolved. The customer actions pop-up window opens each time you select this customer (through order entry, standard order inquiry, order maintenance, customer maintenance, customer memberships, or catalog requests) until you mark the action issue as *R* (resolved).

[Printing the Customer Exposure Report \(PCER\)](#)

Note:

- This window opens automatically only once per order.
- This window displays the customer action issues entered for a single customer. To review all action issues in your company, use the [Work with Email by Order Number Screen](#) menu option.

- You can print a report listing customer action notes by date or by the person who entered them. See and [Printing the Customer Detail Exposure Report \(PCAR\)](#).
- This window does not open in streamlined order inquiry.

How to display this window:

- at the [Display More Options Screen](#), *Select* for Customer Action Notes.
- select *Actions* for a customer at a Work with Customer screen (see [Selecting Customers](#))
- select *Customer Actions* at the Create or Change Customer Sold To screen (see [Creating and Updating Sold-to Customers \(WCST\)](#)).

If you [Use Workflow Management \(H96\)](#):

- select *Notes* for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#) (tickler supervisor).
- select *OK* at the [Create Tickler Screen](#).
- select *Notes* at the [Change Tickler Screen](#) or Display Tickler Screen.

Field	Description
Customer (Sold-to customer number)	A number assigned by the system to identify the customer. Numeric, 9 positions; display-only, assigned by the system.
Customer name (unlabeled field to the right of the Customer field)	The customer's last name, first name and middle initial. Last name: alphanumeric, 25 positions; display-only. First name: alphanumeric, 15 positions; display-only. Initial: alphanumeric, 1 position; display-only.
Action description	The issue that needs to be investigated and resolved for the customer. Enter only 1 issue per line. If necessary, enter more information about the issue by selecting <i>Detail notes</i> for the issue.
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If there are multiple action notes for a customer, the Customer Detail Exposure Report by Reason Code lists just the first note.</p> </div>
Reason (Customer action reason code)	Alphanumeric, 40 positions; required. Identifies the reason behind the customer action note. Reason codes are defined in and validated against the Customer Action Reason Codes table; see Working with Customer Action Reason Codes (WCAR) .
User	Alphanumeric, 2 positions; optional. The user ID of the person who should follow up on or resolve the action issue. Alphanumeric, 10 positions, optional.

Field	Description
Status)	The current status of the issue. Valid status codes are: <ul style="list-style-type: none"> • <i>O</i> = Open; initial status of all action issues • <i>W</i> = Work in Process; issue investigated but not yet resolved. Select <i>Work in process</i> for the issue to view the details of the issue, update the user ID, and update the status to <i>W</i> (work in Process). • <i>R</i> = Resolved; issue resolved and closed Select <i>Resolve</i> for the issue to update the status to <i>R</i> (resolved). Alphanumeric, 1 position; display-only, updated by the system.
Resolved (Date resolved)	The date when the customer action issue was resolved. The current date defaults when you select <i>Resolve</i> for an issue to close it. Numeric, 6 positions (in user date format); display-only, updated by the system.
D (Details; unlabeled field to the right of the Resolved field)	Identifies whether the customer action note provides a further description. Select <i>Detail notes</i> for an issue to view the details. Alphanumeric, 1 position; display-only.

Screen Option	Procedure
Create a note for an action issue	Enter a brief description of an issue on one of the lines available. Optionally, you can enter a reason code and the ID of the user assigned to follow up on the issue.
Delete an action issue	Select <i>Delete</i> for an issue to delete it. See Resolving or Deleting an Action Issue .
Display statistics for an action issue	Select <i>Display</i> for an issue to advance to the Display Customer Action screen. Each field on this screen is described under Edit Customer Actions Window and Work with Customer Action Notes Screen .
Update the status of an action issue to “work in process”	Select <i>Work in process</i> for an issue to set its status to <i>W</i> and advance to the Customer Action Note Details Screen .
Identify an issue as “resolved”	Select <i>Resolve</i> for an issue to “resolve” it. See Resolving or Deleting an Action Issue .
Enter detailed notes for an issue	Select <i>Detail notes</i> for an issue to advance to the Customer Action Note Details Screen .

Work with Email by Order Number Screen

Purpose: Use this screen to review emails associated with an order.

About emails: The Correspondence History table stores outbound and inbound emails related to an order, customer (including sold-to, ship-to, and bill-to customers), vendor or purchase order. You can associate an email with an order by indicating the order number when you forward the email into the system, or by specifying the order number at the [Change Email Screen](#). See [Email Repository Overview](#) for more information.

Outbound emails: The [Write Outbound Email to Email Repository \(H99\)](#) system control value controls whether to store header information for outbound email notifications, or for the [Outbound Email XML Message \(CWEmailOut\)](#) if specified for the notification type.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Note:

Shipment-related emails generated through the [Narvar Integration](#) are not displayed.

How to display this screen: [Select Email for Order at the Display More Options Screen.](#)

Field	Description
Order #	A number identifying the order that you are currently reviewing or working with. The order ship-to number is separated by the order number with a semicolon (-). Order number: numeric, 8 positions; display-only. Order ship-to number: numeric, 3 positions; display-only.
Status	The status of the order. Possible statuses are: <ul style="list-style-type: none"> • Canceled • Held • Suspended • Closed • Open • Quote Alphanumeric, 10 positions; display-only.
Customer #	A number to identify the customer who placed the order, the customer's name, and the company name, if any. Customer number: numeric, 9 positions; display-only. Customer company and name: alphanumeric, 41 positions; display-only.
Create date	The date when the email was forwarded into the system, and the Correspondence History record was created. Numeric, 6 positions (in user date format); optional.
Email date	The date when the email was originally sent. Numeric, 6 positions (in user date format); optional.
Category	A category that you use to group email correspondence between you and your customers. A category of <i>NTF</i> indicates that the email was a notification generated by the system and sent to the customer. Alphanumeric, 3 positions; optional.

Field	Description
Source	<p>Indicates whether the email was inbound or outbound.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• <i>EXT</i> = the email was forwarded into Order Administration• <i>INT</i> = the email originated in Order Administration and was sent to a customer. <p>A user-supplied code indicating the email's source is not currently implemented.</p> <p>Alphanumeric, 3 positions; optional.</p>
Subject	<p>The subject line of the email.</p> <ul style="list-style-type: none">• <i>Inbound emails:</i> Things to note:• When you forward an email into Order Administration, the system deletes <i>FW:</i> from the beginning of the subject line; however, if the email has been forwarded multiple times, only the first occurrence will be deleted.• The system renders the text of the subject line in all capital letters.• The subject line is truncated if it exceeds the maximum length of this field.• The system converts certain special characters. See Symbol and Special Character Conversion in Emails. <p>The system deletes the email identifiers from the subject line if translation is successful. For example, a subject line reading <code>FW: COMPANY=27;CUSTOMER=613;ATTACHMENT=N; Where is my order?</code> would be translated to <code>WHERE IS MY ORDER?</code> Even if translation is successful, however, it does not necessarily mean that the email is assigned to a customer; it is possible for the email identifiers to be formatted correctly, but for the values specified to be incorrect or inconsistent.</p>

Field	Description
	<ul style="list-style-type: none"> • <i>Outbound emails</i>: Possible subject lines for outbound email notifications include: • BACKORDER NOTIFICATION • CONTACT US NOTIFICATION • CREDIT CARD CREDIT ACKNOWLEDGEMENT • CREDIT CARD DECLINE NOTIFICATION • LOYALTY MEMBERSHIP-D • LOYALTY MEMBERSHIP-A • ORDER CONFIRMATION • ORDER UPDATE CONFIRMATION • Return Conf. - Order #99999999 • Ship Conf. - Order #99999999 • SOLDOUT CONFIRMATION • STORED VALUE CARD NOTIFICATION • QUOTE CONFIRMATION <p>Summary information for an outbound email or <i>Outbound Email XML Message (CWEmailOut)</i> is stored only if the Write Outbound Email to Email Repository (H99) system control value is selected.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>See When Does the System Generate an Email Notification? for information on system-generated emails.</p> <p>To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i>.</p> <p>Alphanumeric, 78 positions; display-only.</p>
Email address	<p>The email address of the person who originated the email.</p> <p>To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i>.</p> <p>Alphanumeric, 50 positions; display-only.</p>

Option	Procedure
Change the assignment of an email	Select <i>Change</i> for an email to advance to the Change Email Screen . The system confirms that your entries at this screen are consistent; see Identifying an Unrouted Email for more information.
<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px;"> <p> Note:</p> <p>The Changed Routed Email (B08) secured feature controls the ability to change an email assigned to an order number or customer. If you do not have authority to change a routed (assigned) email, you can select <i>Display</i> for an email to advance to the Display Email Screen, where you can review all of the same information.</p> </div>	
Delete an email	Select <i>Delete</i> for an email to delete it.
Display information about an email	Select <i>Display</i> for an email to advance to the Display Email Screen .
Create a tickler for the <i>MN</i> (manually created) tickler event	Select <i>Create Tickler</i> for an email to advance to the Create Tickler Screen .
<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px;"> <p> Note:</p> <p>To create a <i>MN</i> tickler, you must have authority to the Create Manual Tickler (B13) secured feature.</p> </div>	
Display email subject and text	Select <i>Display Detail</i> for an email to advance to the Display Email Screen .
Review all emails assigned to the sold-to customer	Select <i>W/W Email by Customer#</i> to advance to the Work with Email by Customer Sold To Number Screen .
Switch between displaying the subject line and the originating email address for the email	Select <i>Subject/Email Address</i> .

Work with Customer Profile Screen

Purpose: Use this screen to create or view the customer's demographic profile. This helps you gather as much information as possible about the customer, categorize the customer, target the customer for specific promotions or catalog mailings, and include the customer's name in customer lists you sell to other companies.

You define customer profile categories, such as age, income, or gender, and the valid values for each category through the Work with Profile Categories function. See [Setting Up Customer Profiles \(WPFL\)](#).

When you first advance to this screen for a customer: When you first advance to this screen for a customer for which you have not yet defined demographic data:

- If a default response has been defined for a profile category, the system defaults the response to the Data field.
- If a default response has not been defined for a profile category, the system leaves the Data field blank until you enter data for the field.

Order API: You can define demographic data for a customer on an order received through the *Generic Order Interface (Order API)*; see the *Profile* element in the *Inbound Order XML Message (CWORDERIN)*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Inbound customer: You can define demographic data for a customer through the *Generic Customer API*; see the *CustProfile* element in the *Inbound Customer Message (CWCustomerIn)*.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

How to display this screen:

- select a Customer Profile at the [Display More Options Screen](#);
- select *Profile* for a customer at a Work with Customer screen (see [Selecting Customers](#));
- select *Customer Profile* at the Create or Change Cust Sold To screen (see [Creating and Updating Sold-to Customers \(WCST\)](#)).

To auto-display this screen in order entry: The Work with Customer Profile screen opens automatically in order entry if you need to collect information in a demographic profile category flagged as mandatory for the sold to customer on the order. **Note:** If the [Alternate ID Required for Displaying Customer Profile \(K87\)](#) system control value is *selected*, the Work with Customer Profile screen opens automatically only if an alternate customer number is defined for the sold to customer on the order.

To auto-display this screen in order maintenance: The Work with Customer Profile screen opens automatically in order maintenance if the [Prompt for Mandatory Demographics in Order Maintenance \(E60\)](#) system control value is *selected*. **Note:** If the [Alternate ID Required for Displaying Customer Profile \(K87\)](#) system control value is *selected*, the Work with Customer Profile screen opens automatically only if an alternate customer number is defined for the sold to customer on the order.

Field	Description
Customer #	A number assigned by the system to identify the customer. Numeric, 9 positions; display-only, assigned by the system.
Customer name (unlabeled field to the right of Customer #)	The customer's last name, first name and middle initial. Last name: Alphanumeric, 25 positions; display-only. First name: Alphanumeric, 15 positions; display-only. Initial: Alphanumeric, 1 position; display-only.

Field	Description
Profile	<p>A number used to identify a demographics category, such as gender, income, or geographic area.</p> <p>Demographic categories are defined through the Work with Profile Categories option; see dSetting Up Customer Profiles (WPFL).</p> <p>Numeric, 3 positions; display-only.</p>
Description	<p>Text associated with the demographics category, such as <i>Gender, Income, or Geographic Location</i>, etc.</p> <p>Alphanumeric, 20 positions; display-only.</p>
Data	<p>A valid response code for the demographics category. The current demographic data, if any, appears in the Data field; if you have not yet gathered the data from the customer, but you have assigned a default response for the category, then this value appears here.</p> <p>For example, if the category (in the Profile field) is <i>Gender</i>, you can enter or select the appropriate value for this customer, such as <i>Female, Male, or Unknown</i>.</p> <p>If you assign a default response for a profile category, then you will not be able to leave this category blank; the system will default the response back into the field when you select <i>OK</i>.</p> <p>Alphanumeric, 1 position.</p>
Description	<p>The description associated with the demographic data, such as <i>Male, Female, or Unknown</i>.</p> <p>Alphanumeric, 30 positions; display-only.</p>
Mandatory	<p>Indicates whether the profile category is mandatory. The system prompts you to collect a response for any category flagged as mandatory by advancing to this screen automatically when you select <i>Accept</i> or <i>Accept/Add Rcp.</i> to accept an order in order entry. You also advance to the screen automatically in order maintenance if the Prompt for Mandatory Demographics in Order Maintenance (E60) system control value is <i>selected</i>.</p> <p>If you have assigned a default response to a mandatory profile category, the Work with Customer Profile Screen does not display automatically; instead, the system assigns the default response to the customer in order entry or order maintenance if you have not already collected the data from the customer.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Yes</i> = This is a mandatory profile category. • <i>No</i> = This is not a mandatory profile category.

Work with Email by Customer Sold To Number Screen

Purpose: Use this screen to review emails associated with a customer.

About emails: The Correspondence History table stores outbound and inbound emails related to an order, customer (including sold-to, ship-to, and bill-to customers), vendor or purchase order. You can associate an email with a customer by indicating the customer number when you forward the email into the system, or by specifying the customer number at the [Change Email Screen](#); also, the system can assign the email based on a matching email address. See [Email Repository Overview](#) for more information.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Outbound emails: The *Write Outbound Email to Email Repository (H99)* system control value controls whether to store header information for outbound email notifications, or for the *Outbound Email XML Message (CWEmailOut)* if specified for the notification type.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Note:

Shipment-related emails generated through the *Narvar Integration* are not displayed.

How to display this screen:

- Select *Email for Customer Sold To* at the [Display More Options Screen](#), or *Customer Email Correspondence* at the [More Customer Sold To Options Screen](#)
- Select *W/W Email by Customer#* at the [Work with Email by Order Number Screen](#)

Field	Description
Customer #	A number to identify the customer, the customer's name, and the company name, if any. Customer number: numeric, 9 positions; display-only. Customer company and name: alphanumeric, 41 positions; display-only.
Create date	The date when the email was forwarded into the system, and the Correspondence History record was created. Numeric, 6 positions (in user date format); optional.
Email date	The date when the email was originally sent. Numeric, 6 positions (in user date format); optional.
Category	A category that you use to group email correspondence between you and your customers. A category of <i>NTF</i> indicates that the email was a notification generated by the system and sent to the customer. Alphanumeric, 3 positions; optional.
Source	Indicates whether the email was inbound or outbound. Valid values are: <ul style="list-style-type: none"> • <i>EXT</i> = the email was forwarded into Order Administration • <i>INT</i> = the email originated in Order Administration and was sent to a customer. A user-supplied code indicating the email's source is not currently implemented. Alphanumeric, 3 positions; optional.

Field	Description
Subject	<p>The subject line of the email.</p> <ul style="list-style-type: none"> • <i>Inbound emails:</i> Things to note: • When you forward an email into Order Administration, the system deletes FW: from the beginning of the subject line; however, if the email has been forwarded multiple times, only the first occurrence will be deleted. • The system renders the text of the subject line in all capital letters. • The subject line is truncated if it exceeds the maximum length of this field. • The system converts certain special characters. See <i>Symbol and Special Character Conversion in Emails</i>. <p>The system deletes the email identifiers from the subject line if translation is successful. For example, a subject line reading FW: COMPANY=27;CUSTOMER=613;ATTACHMENT=N; Where is my order? would be translated to WHERE IS MY ORDER? Even if translation is successful, however, it does not necessarily mean that the email is assigned to a customer; it is possible for the email identifiers to be formatted correctly, but for the values specified to be incorrect or inconsistent.</p> <ul style="list-style-type: none"> • <i>Outbound emails:</i> Possible subject lines for outbound email notifications are: • BACKORDER NOTIFICATION • CONTACT US NOTIFICATION • CREDIT CARD CREDIT ACKNOWLEDGEMENT • CREDIT CARD DECLINE NOTIFICATION • LOYALTY MEMBERSHIP-D • LOYALTY MEMBERSHIP-A • ORDER CONFIRMATION • ORDER UPDATE CONFIRMATION • Return Conf. - Order #99999999 • Ship Conf. - Order #99999999 • SOLDOUT CONFIRMATION • STORED VALUE CARD NOTIFICATION • QUOTE CONFIRMATION <p>Summary information for an outbound email or <i>Outbound Email XML Message (CWEmailOut)</i> is stored only if the <i>Write Outbound Email to Email Repository (H99)</i> system control value is selected.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>See When Does the System Generate an Email Notification? for information on system-generated emails.</p> <p>To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i>.</p> <p>Alphanumeric, 78 positions; display-only.</p>

Field	Description
Email address	The email address of the person who originated the email. To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i> . Alphanumeric, 50 positions; display-only.

Option	Procedure
Change the assignment of an email	Select <i>Change</i> for an email to advance to the <i>Change Email Screen</i> . The system confirms that your entries at this screen are consistent; see <i>Identifying an Unrouted Email</i> for more information.

 **Note:**

The *Changed Routed Email (B08)* secured feature controls the ability to change an email assigned to a customer. If you do not have authority to change a routed (assigned) email, you can select *Display* for an email to advance to the *Display Email Screen*, where you can review all of the same information.

Delete an email	Select <i>Delete</i> for an email to delete it.
Display information about an email	Select <i>Display</i> for an email to advance to the .
Create a tickler for the <i>MN</i> (manually created) tickler event	Select <i>Create Tickler</i> for an email to advance to the <i>Create Tickler Screen</i> .

 **Note:**

To create a *MN* tickler, you must have authority to the *Create Manual Tickler (B13)* secured feature.

Display email subject and text	Select <i>Display Detail</i> for an email to advance to the <i>Display Email Detail Screen</i>
--------------------------------	--

Option	Procedure
Switch between displaying the subject line and the originating email address for the email	Select <i>Subject/Email Address</i> .
Advance to standard order inquiry	Select <i>Order Inquiry</i> for an email. If the email is associated with an order number, you advance to the Order Inquiry Header Screen or the Order Inquiry Detail Screen , depending on the setting of the <i>Default Version for Order Inquiry (C34)</i> system control value. If the email is not associated with an order number, you advance to the Order Inquiry Scan Screen .

 **Note:**

This option is not available if you advanced to this screen through standard order inquiry.

Edit Customer Notes Screen

Purpose: Use this screen to enter, view, or delete informational messages about sold-to customers. You can view this information through several key areas in the system, such as order entry or Customer Maintenance.

You can create customer note types to display the note automatically in a pop-up window when you select this customer in order entry. You can also define text that defaults into the Note field when you select the note type. See [Working with Customer Note Types \(WNTY\)](#).

 **Note:**

There is also a screen available to work with bill-to customer notes; see [Work with Bill To Notes Screen](#).

How to display this screen:

- Select *Customer Notes* at the [Display More Options Screen](#).
- select *Notes* for a customer on a Work with Customer screen (see [Selecting Customers](#)).
- select *Notes* at the first or second Create or Change Cust Sold To screen (see [Creating and Updating Sold-to Customers \(WCST\)](#)).
- select *Customer Notes* at the [Customer Selection Screen](#)

If you [Use Workflow Management \(H96\)](#):

- select *Notes* for a tickler at the [Work with Tickler Screen \(user/group view\)](#) or [Workflow Management Screen](#) (tickler supervisor).
- select *OK* at the [Create Tickler Screen](#).

- select *Notes* at the [Change Tickler Screen](#) or Display Tickler Screen

Entering/editing notes: When you advance to this screen, the cursor is positioned at the first blank entry field. If the first screen is already filled with previously entered notes, press *Page Down* or select *Next* to advance to the first blank entry field. You can enter your new note.

To edit existing notes which are display-only, select *Add/Change Note* to switch the fields from display-only to editable fields.

Note sequence: The [Display Customer Notes in LIFO Sequence \(D55\)](#) system control value controls how customer notes are listed on the screen. If you select this value, the notes display in reverse chronological order (most recent first). If you deselect this value, the notes display in chronological order.

Address changes: The system writes a message to the Customer Note table each time you enter a change to a sold-to or permanent ship-to customer's name, address or phone number. The messages for a ship-to customer change are stored with the sold-to customer messages. See [Reviewing Customer Address Changes](#).

Membership cancellations: The system writes a message, such as `Memship Cancel Conf to ejohnson@example.com.` to the Customer Note table when you cancel a customer membership and generate the membership cancellation notification email. The note is written even if the system generates the *Outbound Email XML Message (CWEmailOut)* rather than an actual message, or if the email cannot be relayed if, for example, there is a problem with the destination email address. For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1). See the [Membership Cancellation Email Program \(K77\)](#) for an overview on membership cancellation emails

Field	Description
Customer (Sold-to customer number)	A number assigned by the system to identify the customer. Numeric, 9 positions; display-only, assigned by the system.
Customer name (unlabeled field to the right of Customer #)	The customer's company, and/or last name, first name and middle initial. Company: alphanumeric, 30 positions; display-only. Last name: alphanumeric, 25 positions; display-only. First name: alphanumeric, 15 positions; display-only. Initial: Alphanumeric, 1 position; display-only.
Notes	Fields where you can view, enter, or delete customer notes. The existing notes fields are display-only when you advance to the screen. The cursor is positioned at the first blank entry field. If the first screen is already filled with previously entered notes, select <i>Next</i> or press <i>Page Down</i> until you reach the first enterable field. If you need extra space, use <i>Scroll</i> or <i>Page Down</i> to display additional entry fields. To edit existing notes, select <i>Add/Change Note</i> to switch the display-only fields to editable fields. Alphanumeric, 60 positions per line.

Field	Description
Type	<p>The type of customer note. You can use the Work with Customer Note Type menu option to define note types, and set up note types to display automatically in a pop-up window in order entry or order maintenance. You can also define text that will default into the Notes field. This text will default only if you have not already made an entry in that note line, and you can override any default. See Working with Customer Note Types (WNTY).</p> <p>This field is display-only when you first advance to the screen. Select <i>Cust. Note Type</i> to make it enterable.</p> <p>Alphanumeric, 1 position; optional or display-only.</p>
User (User Id)	<p>A code that identifies the person who entered the customer notes or who performed the activity (such as changing an address or cancelling a customer membership) that produced the note. If there is more than one note by the same user on the same date, the user ID and date are displayed just once.</p> <p>Alphanumeric, 10 positions; display-only.</p>
Date	<p>The date when the customer notes were entered. If there is more than one note by the same user on the same date, the user ID and date are displayed just once.</p> <p>Numeric, 6 positions (in user date format); display-only, updated by the system.</p>

Screen Option	Procedure
Enter a new customer note	Begin typing at the first available Note field. You may need to press <i>Page Down</i> until you reach the first enterable field. Press <i>Tab</i> to advance from line to line, and select <i>OK</i> when you are done.
Add or change an existing note	Press <i>F7</i> to toggle <i>Add/Change Note</i> to edit an existing note. Press <i>Tab</i> to advance from line to line, and select <i>OK</i> when you are done.
Make the Type field enterable or switch it back to display-only	Select <i>Cust. Note Type</i> .

Work with Email by Customer Ship To Number Screen

Purpose: Use this screen to review emails associated with a ship-to customer.

About emails: The Correspondence History table stores outbound and inbound emails related to an order, customer (including sold-to, ship-to, and bill-to customers), vendor or purchase order. You can associate an email with a ship-to customer by indicating the sold-to and ship-to customer numbers when you forward the email into the system, or by specifying these numbers at the *Change Email Screen*; also, the system can assign the email based on a matching email address. See [Email Repository Overview](#) for more information.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Outbound emails: The *Write Outbound Email to Email Repository (H99)* system control value controls whether to store header information for outbound email notifications, or for the *Outbound Email XML Message (CWEmailOut)* if specified for the notification type.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Note:

Shipment-related emails generated through the [Narvar Integration](#) are not displayed.

How to display this screen: Select Email for Customer Ship To at the [Display More Options Screen](#). You can also display this screen by selecting *Email history* for a ship-to customer at the [Work with Customer Ship Tos Screen](#).

Field	Description
Customer #	A number to identify the customer, the customer's name, and the company name, if any. Customer number: numeric, 9 positions; display-only. Customer company and name: alphanumeric, 41 positions; display-only.
Ship to #	A number to identify a permanent shipping address associated with a sold-to customer. The ship-to customer name is to the right. Numeric, 3 positions; optional.
Create date	The date when the email was forwarded into the system, and the Correspondence History record was created. Numeric, 6 positions (in user date format); optional.
Email date	The date when the email was originally sent. Numeric, 6 positions (in user date format); optional.
Category	A category that you use to group email correspondence between you and your customers. A category of <i>NTF</i> indicates that the email was a notification generated by the system and sent to the customer. Alphanumeric, 3 positions; optional.
Source	Indicates whether the email was inbound or outbound. Valid values are: <ul style="list-style-type: none"> <i>EXT</i> = the email was forwarded into Order Administration <i>INT</i> = the email originated in Order Administration and was sent to a customer. A user-supplied code indicating the email's source is not currently implemented. Alphanumeric, 3 positions; optional.

Field	Description
Subject	<p>The subject line of the email.</p> <ul style="list-style-type: none"> • <i>Inbound emails:</i> Things to note: • When you forward an email into Order Administration, the system deletes FW: from the beginning of the subject line; however, if the email has been forwarded multiple times, only the first occurrence will be deleted. • The system renders the text of the subject line in all capital letters. • The subject line is truncated if it exceeds the maximum length of this field. • The system converts certain special characters. See <i>Symbol and Special Character Conversion in Emails</i>. <p>The system deletes the email identifiers from the subject line if translation is successful. For example, a subject line reading FW: COMPANY=27;CUSTOMER=613;ATTACHMENT=N; <i>Where is my order?</i> would be translated to WHERE IS MY ORDER? Even if translation is successful, however, it does not necessarily mean that the email is assigned to a customer; it is possible for the email identifiers to be formatted correctly, but for the values specified to be incorrect or inconsistent.</p> <ul style="list-style-type: none"> • <i>Outbound emails:</i> Possible subject lines for outbound email notifications are: • BACKORDER NOTIFICATION • CONTACT US NOTIFICATION • CREDIT CARD CREDIT ACKNOWLEDGEMENT • CREDIT CARD DECLINE NOTIFICATION • LOYALTY MEMBERSHIP-D • LOYALTY MEMBERSHIP-A • ORDER CONFIRMATION • ORDER UPDATE CONFIRMATION • Return Conf. - Order #99999999 • Ship Conf. - Order #99999999 • SOLDOUT CONFIRMATION • STORED VALUE CARD NOTIFICATION <p>Summary information for an outbound email or <i>Outbound Email XML Message (CWEmailOut)</i> is stored only if the <i>Write Outbound Email to Email Repository (H99)</i> system control value is selected.</p> <p>See <i>When Does the System Generate an Email Notification?</i> for information on system-generated emails.</p> <p>To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i>.</p> <p>Alphanumeric, 78 positions; display-only.</p>
Email address	<p>The email address of the person who originated the email.</p> <p>To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i>.</p> <p>Alphanumeric, 50 positions; display-only.</p>

Option	Procedure
Change the assignment of an email	Select <i>Change</i> for an email to advance to the <i>Change Email Screen</i> . The system confirms that your entries at this screen are consistent; see <i>Identifying an Unrouted Email</i> for more information.

 **Note:**

The *Changed Routed Email (B08)* secured feature controls the ability to change an email assigned to a customer. If you do not have authority to change a routed (assigned) email, you can select *Display* for an email to advance to the *Display Email Screen*, where you can review all of the same information.

Delete an email	Select <i>Delete</i> for an email to delete it.
Display information about an email	Select <i>Display</i> for an email to advance to the <i>Display Email Screen</i> .
Create a tickler for the <i>MN</i> (manually created) tickler event	Select <i>Create tickler</i> for an email to advance to the <i>Create Tickler Screen</i> .

 **Note:**

To create a *MN* tickler, you must have authority to the *Create Manual Tickler (B13)* secured feature.

Display email subject and text	Select <i>Display detail</i> for an email to advance to the <i>Display Email Detail Screen</i> .
Switch between displaying the subject line and the originating email address for the email	Select <i>Subject/email address</i> .

Option	Procedure
Advance to order inquiry	Select <i>Order inquiry</i> for an email. If the email is associated with an order number, you advance to the Order Inquiry Header Screen or the Order Inquiry Detail Screen , depending on the setting of the <i>Default Version for Order Inquiry (C34)</i> system control value. If the email is not associated with an order number, you advance to the Order Inquiry Scan Screen .

 **Note:**

This option is not available if you advanced to this screen through order inquiry.

Work with Email by Customer Bill To Number Screen

Purpose: Use this screen to review emails associated with a bill-to customer.

About emails: The Correspondence History table stores outbound and inbound emails related to an order, customer (including sold-to, ship-to, and bill-to customers), vendor or purchase order. You can associate an email with a bill-to customer by indicating the bill-to customer number when you forward the email into the system, or by specifying the bill-to customer at the *Change Email Screen*; also, the system can assign the email based on a matching email address. See *Email Repository Overview* for more information.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Outbound emails: The *Write Outbound Email to Email Repository (H99)* system control value controls whether to store header information for outbound email notifications, or for the *Outbound Email XML Message (CWEmailOut)* if specified for the notification type.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

 **Note:**

Shipment-related emails generated through the [Narvar Integration](#) are not displayed.

How to display this screen: Select *Email for Customer Bill To* at the [Display More Options Screen](#). You can also display this screen by selecting *Email history* for a bill-to customer at the *Work with Bill To Customers Screen*.

Field	Description
Customer bill to #	<p>A number identifying a customer responsible for payment on an order. Validated against the Customer Bill To table. The bill-to customer's name appears to the right.</p> <p>Bill-to number: numeric, 7 positions; display-only. Bill-to name: alphanumeric, 41 positions; display-only.</p>
Create date	<p>The date when the email was forwarded into the system, and the Correspondence History record was created.</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Email date	<p>The date when the email was originally sent.</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Category	<p>A category that you use to group email correspondence between you and your customers. A category of <i>NTF</i> indicates that the email was a notification generated by the system and sent to the customer.</p> <p>Alphanumeric, 3 positions; optional.</p>
Source	<p>Indicates whether the email was inbound or outbound.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>EXT</i> = the email was forwarded into Order Administration • <i>INT</i> = the email originated in Order Administration and was sent to a customer. <p>A user-supplied code indicating the email's source is not currently implemented.</p> <p>Alphanumeric, 3 positions; optional.</p>
Subject	<p>The subject line of the email.</p> <ul style="list-style-type: none"> • <i>Inbound emails</i>: Things to note: • When you forward an email into Order Administration, the system deletes <i>FW</i>: from the beginning of the subject line; however, if the email has been forwarded multiple times, only the first occurrence will be deleted. • The system renders the text of the subject line in all capital letters. • The subject line is truncated if it exceeds the maximum length of this field. • The system converts certain special characters. See <i>Symbol and Special Character Conversion in Emails</i>. <p>The system deletes the email identifiers from the subject line if translation is successful. For example, a subject line reading <code>FW: COMPANY=27;CUSTOMER=613;ATTACHMENT=N; Where is my order?</code> would be translated to <code>WHERE IS MY ORDER?</code> Even if translation is successful, however, it does not necessarily mean that the email is assigned to a customer; it is possible for the email identifiers to be formatted correctly, but for the values specified to be incorrect or inconsistent.</p>

Field	Description
	<ul style="list-style-type: none"> • <i>Outbound emails</i>: Possible subject lines for outbound email notifications are: • BACKORDER NOTIFICATION • CONTACT US NOTIFICATION • CREDIT CARD CREDIT ACKNOWLEDGEMENT • CREDIT CARD DECLINE NOTIFICATION • LOYALTY MEMBERSHIP-D • LOYALTY MEMBERSHIP-A • ORDER CONFIRMATION • ORDER UPDATE CONFIRMATION • Return Conf. - Order #99999999 • Ship Conf. - Order #99999999 • SOLDOUT CONFIRMATION • STORED VALUE CARD NOTIFICATION • QUOTE CONFIRMATION <p>Summary information for an outbound email or <i>Outbound Email XML Message (CWEmailOut)</i> is stored only if the <i>Write Outbound Email to Email Repository (H99)</i> system control value is <i>selected</i>.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>See <i>When Does the System Generate an Email Notification?</i> for information on system-generated emails.</p> <p>To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i>.</p> <p>Alphanumeric, 78 positions; display-only.</p>
Email address	<p>The email address of the person who originated the email.</p> <p>To switch between displaying the subject line and the originating email address for the email, select <i>Subject/email address</i>.</p> <p>Alphanumeric, 50 positions; display-only.</p>

Option	Procedure
Change the assignment of an email	Select <i>Change</i> for an email to advance to the <i>Change Email Screen</i> . The system confirms that your entries at this screen are consistent; see <i>Identifying an Unrouted Email</i> for more information.
	<div data-bbox="1031 451 1383 1024" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The <i>Changed Routed Email (B08)</i> secured feature controls the ability to change an email assigned to a customer. If you do not have authority to change a routed (assigned) email, you can select <i>Display</i> for an email to advance to the <i>Display Email Screen</i>, where you can review all of the same information.</p> </div>
Delete an email	Select <i>Delete</i> for an email to delete it.
Display information about an email	Select <i>Display</i> for an email to advance to the <i>Display Email Screen</i>
Create a tickler for the <i>MN</i> (manually created) tickler event	Select <i>Create tickler</i> for an email to advance to the <i>Create Tickler Screen</i> .
	<div data-bbox="1031 1270 1383 1564" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>To create a <i>MN</i> tickler, you must have authority to the <i>Create Manual Tickler (B13)</i> secured feature.</p> </div>
Display email subject and text	Select <i>Display detail</i> for an email to advance to the <i>Display Email Detail Screen</i> .
Switch between displaying the subject line and the originating email address for the email	Select <i>Subject/email address</i> .

Option	Procedure
Advance to order inquiry	Select <i>Order inquiry</i> for an email. If the email is associated with an order number, you advance to the Order Inquiry Header Screen or the Order Inquiry Detail Screen , depending on the setting of the <i>Default Version for Order Inquiry (C34)</i> system control value. If the email is not associated with an order number, you advance to the Order Inquiry Scan Screen .

 **Note:**

This option is not available if you advanced to this screen through order inquiry.

Display Pick Tickets for Order Screen

Purpose: Through standard order inquiry or order entry/maintenance, you can display the Pick Slip Generation Inquiry screens. Use these screens to review picks for the order you are working with.

How to display this screen: Select the Display Picks option at the [Display More Options Screen](#).

Field	Description
Ship to #	A number to identify the shipping address on the order. Numeric, 3 positions; optional.
Pick # (Pick control number)	The control number for this pick. Numeric, 7 positions; optional, assigned by the system.
Printed	The date the pick slip was printed. Numeric, 6 positions (in user date format); display-only.
Confirmed	The date the items on the pick slip were shipped and billed. Numeric, 6 positions (in user date format); display-only.

Field	Description
Status	<p>The status of the pick slip. Valid statuses are:</p> <ul style="list-style-type: none"> • Open • Generated No Authorization • Generated Has Authorization • Submitted to Async • Billing Pending • Confirmed • Declined Authorization • Async Processing Error • Manifest Submission • Packed • Reprinted • Suspended • Voided • Waiting for Authorization • Authorized <p>Display-only; updated by system.</p>
Reprint	<p>The pick control number that has been reprinted. Numeric, 7 positions; display-only.</p>

Screen Option	Procedure
Display pick control header information	Select <i>Display</i> for a pick slip to advance to the Display Pick Control Header (1 of 2) Screen .
Display pick details	Select <i>Details</i> for a pick slip to advance to the Work with Pick Details Screen .

Display Order Totals Window

Purpose: Use this window to review the total charges across all shipping addresses on an order, which is the initial order plus any recipient orders.

A recipient order is an order that is placed by and paid by a customer, but will ship to another address.

This window provides some basic order information (order number, number of recipients, prepaid amount, and current order balance), and breaks out the order charges by individual charge, namely:

- Merchandise
- Freight
- Additional freight
- Tax
- Handling
- Additional charges

The individual order charges for each recipient order “roll up” to this screen and are summarized in the Total bucket. This allows you to determine the total amount the customer will be charged.

The system updates this window as the customer places additional recipient orders. The system updates the Order Totals fields as you change any single order by adding or deleting items on an order or as you add additional recipient orders. Initially, the fields on the Order Totals pop-up window are blank, but are updated automatically as you enter the order.

How to display this screen: Select for Ord Totals (All Recips) at the [Display More Options Screen](#).

This window differs from the running order totals on the order entry screens because it represents the accumulated totals for all shipping addresses on the order. The totals on the individual orders, however, represent the totals for the current order only.

About recipient orders: The Order Totals window accumulates the totals for the original order and any additional orders with different shipping addresses entered using *Accept/Add Rcp*.

Recipient orders use the same order number; however, the suffix attached to the Order# field indicates an alternate shipping address -- signifying a recipient order. For example, the original order is order# 1255 - 1. The system adds “- 1” to the order number to indicate the number of shipping addresses. The shipping number increases by 1 with each additional order you place.

Still using the example above, the system assigns order# 1255 - 2 to the order with a different shipping address. As a result, the system groups all related orders under the same order number, but creates separate order records for historical and order management purposes.

Field	Description
Order#	A unique number assigned by the system to identify an order. Numeric, 8 positions; display-only, assigned by the system.
# of recipients	The number of shipping addresses on the current order. Each shipping address represents a recipient, which is the person or company for whom an order is placed. For example, when a customer places an order for herself only, there is one shipping address on the order and only one recipient. However, if the customer places an order for herself and for another person there are 2 recipients on this order -- the initial order plus a “related” orders. The initial order always is recipient number 1. You may add up to 999 recipients to an order.

 **Note:**

The ship-to suffix (in an unlabeled field to the right of the Order# field) is initially set to 1 to indicate the first recipient order; the system increments this field by a 1 for each additional recipient order entered using *Accept/Add Rcp*.

Numeric, 3 positions; display-only, updated by the system.

Field	Description
Merchandise	<p>The total value of merchandise across all recipient orders, which is the item price multiplied by the quantity ordered. This total does not include freight, additional charges (such as gift wrap or special handling), tax, or handling.</p> <p>The system updates this field as items are added to or canceled from each order.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Freight	<p>The total charge for shipping all orders. The system performs this calculation based on the freight method defined for the source code on the each order. This total may depend on the quantity or weight of items ordered or on the order as a whole.</p> <p>The system updates this field as items are added to or canceled from each order.</p> <p>This field does not include any additional charges associated with shipping this item (see the Additional Freight field for these totals). Shipping charges will not be included in the order totals (and the Freight field will be blank) if the Calc freight field on all recipient orders is <i>unselected</i> to indicate that freight will not be calculated for these orders.</p> <p>Working with Offers (WOFR) discusses each freight method and freight calculation.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Additional freight	<p>The total dollar amount for additional freight charges on all orders, above and beyond the regular shipping charges.</p> <p><i>Additional freight charges for shipper</i></p> <p>Additional freight charges for a shipper are defined in the ship via record. For example, additional shipping charges may be added to an order being delivered by an overnight shipper.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Tax	<p>The total sales tax on all recipient orders.</p> <p>The value in the Tax field is based on the value of the merchandise on the order, and may also include tax on freight and handling. Tax is not accumulated in the Tax field on orders subject to VAT; instead, a hidden tax is included in the order detail line. See the description of the Tax Included in Price (E70) system control value.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>

Field	Description
Handling	<p>The total charge for gift wrapping or special handling. <i>What is special handling?</i></p> <p>Special handling is any type of item personalization, such as monogramming, alterations, engraving, etc.</p> <p>The SKU/Offer record controls whether the item may be personalized and defines the special handling charge if special handling is allowed. <i>Can any item be gift wrapped?</i></p> <p>The SKU/Offer record controls whether an item may be gift wrapped and defines the gift wrapping charge if gift wrapping is allowed.</p> <p>This field will be blank if none of the items on the order will be gift wrapped or personalized.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Additional charges	The total extra charges added to each recipient order.

 **Note:**

Another type of additional charge is a credit that may be added to the order during order maintenance.

Additional charges may be added to the order in a variety of ways, for a variety of reasons, including:

1. An additional service charge defined for the source code, based on the dollar value of merchandise on the order.
2. An additional shipping charge defined for the item in the Shipper/Item record.
3. An additional charge entered manually through *Charges*.

Each type of additional charge is described briefly below.

Source code additional charges

An additional charge may be added to an order, depending on whether service charges have been defined for the source code. In this case, a record exists in the service charges table for the source code. The system will add an additional charge to the order based on the total dollar value of merchandise.

Shipper/item additional charges

An additional charge may be defined for an item, depending on the shipper you select to deliver the item.

For example, a special shipper/item record may exist for a desk when it will be delivered by Sample Shippers. Usually, Sample Shippers charges \$8.50 to deliver most items, but, because the desk is oversized and heavy, the customer will be charged \$25.00 for delivery.

A record exists on the system in the Shipper/Item table that specifies this information. The \$25.00 additional shipping charge will be added to the order automatically in the Additional charges field when the customer orders the desk and requests delivery through Sample Shippers.

Field	Description
Total	<p><i>Manually entered additional charges</i></p> <p>You may add any type of additional charge to an order by selecting <i>Charges</i>. A pop-up window appears for you to select an additional charge code and specify the additional charge. This allows you to add additional charges to an order at any time.</p> <p>Additional charges are defined in and validated against the Additional Charges table; see Establishing Additional Charge Codes (WADC). You may define additional charge codes for any reason, such as a store-restocking fee, duty fee, long- distance telephone charges, etc.</p> <p>This field will be blank if no additional charges exist on any order.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Prepaid amount	<p>The sum of all charges for all recipient orders, including: merchandise, freight, additional freight, tax, handling, and additional charges.</p> <p>This is the amount that the customer owes for the entire order. The order total will be adjusted by the system if the order or customer is eligible for any discounts.</p> <p>The system increases or decreases the order totals as orders are added or changed.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p> <p>The total dollar amount prepaid on the order by the customer on check. This field is blank if no prepayment was received or if the customer will pay by credit card.</p> <p>This is the grand total of all prepayments for each recipient order, because you must define a method of payment for each order placed.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>
Balance	<p>The balance due for all recipient orders, calculated by subtracting the value in the Prepaid amount field from the value in the Total field.</p> <p><i>A zero balance?</i> If the balance is zero:</p> <ul style="list-style-type: none"> • the customer has prepaid for all recipient orders and there is no balance due from the customer, OR • the order represents a pre-order quote and not a regular order; see Entering Pre-Order Quotes. <p><i>A negative balance?</i> If the balance is negative (such as 54.99-), there is a balance due on the order that will be charged to the customer's credit card.</p> <p><i>A positive balance?</i> If the balance is positive, the customer has overpaid on the prepayment amount with a check.</p> <p>Numeric, 20 positions with a 2-place decimal; display-only, updated by the system.</p>

The status of the order in relation to the balance is:

Balance	Why?	The next step is...
Zero	<ul style="list-style-type: none"> The customer has prepaid for all recipient orders with a check, OR The order represents a pre-order quote and not a regular order; see Entering Pre-Order Quotes 	<ul style="list-style-type: none"> The customer has paid what was owed. No further activity required, OR At the customer's request, convert the quote to a regular order; see Converting Quotes to Orders.
Negative	The customer has not prepaid all or part of the order. The customer owes you money (balance due).	Charge the customer's credit card.
Positive	The customer has overpaid for all recipient orders. You owe the customer some type of credit.	Credit the customer's account the overpayment amount. The type of credit issued is determined by the payment type used on the order or the value in the Alt refund type field in the Pay Type table if you cannot credit the original pay type. Ultimately, the system determines how you will credit the customer for the overpayment.

Work with Subscriptions Screen

Purpose: Use this screen to view the subscription items ordered by a customer. The system adds a record to this table automatically when you generate a pick slip for a subscription item. This table provides the required information to fulfill or modify the customer's subscription.

This option is not available in order entry or maintenance, only standard order inquiry.

Definition: A subscription item is:

- identified by a *selected* Subscription field in the Item record
- defined as a non-inventory item in the Item record (*selected* Non-inv field)
- defined further in the Item Subscription table in terms of the current issue, frequency of issues, etc.
- express billed (the entire amount) and closed immediately by the system when you generate a pick slip for the order

For more information: For more information on generating an extract file of customers to receive subscriptions, or on purging this file, see [Processing and Purging Subscriptions](#).

How to display this screen: At the [Display More Options Screen](#), Select for the Subscriptions option. You can also display this screen by selecting *Subscriptions* for a customer on any Work with Customers screen (see [Selecting Customers](#)), or selecting *Subscriptions* at the Change Customer or Create Customer screen (see [Creating and Updating Sold-to Customers \(WCST\)](#)).

Field	Description
Customer #	A number to identify the customer receiving the subscription. Numeric, 9 positions; display-only, assigned by the system.

Field	Description
Customer name (Unlabeled field to the right of the customer number)	The name of the customer receiving the subscription. Alphanumeric, 41 positions; display-only.
S (Status)	<p>The status of the subscription.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • <i>Cancelled</i> = changed to this status when the operator cancels the subscription using option 4 on the Work with Subscriptions screen. <div data-bbox="873 590 1458 961" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Canceling the order detail line containing the subscription item does not update the status of the subscription item to <i>Cancelled</i>; you must manually update the status by using option #4 to cancel. Additionally, if you use an outside service to fulfill your subscriptions, you must notify them of any cancellations to active subscriptions.</p> </div> <ul style="list-style-type: none"> • <i>Closed</i> = Expired; automatically updated to this status when expiring issue = last issue sent. If this subscription was included in a subscription extract file you generated using Select All Open Subscriptions, the status of the subscription will be <i>Closed</i>. See Generating the Subscription Extract Table (WGSE). • <i>Open</i> • <i>Purged</i> <p>Updated by the system.</p>

Customer Order Item History Screen

Purpose: Use this screen to review items that a customer has previously ordered.

How to display this screen: Select *Customer Order Item History* at the [Display More Options Screen](#), or select *Cust Item History* at the [Customer Selection Screen](#).

Initial display: The Customer Order Item History screen displays items ordered by the customer in reverse chronological order based on entered date.

Field	Description
Sold To	<p>The number that identifies the customer who placed the order, and the customer's first name, last name, and middle initial. If the customer does not have a last name, then the company name is displayed. This is the sold-to customer on the current order, if you advanced to this screen from standard order inquiry; otherwise, it is the customer you are currently reviewing at the Customer Selection Screen.</p> <p>Sold to number: Numeric, 9 positions; display-only. Sold to name: Alphanumeric, 41 positions (last name, first name middle initial format); display-only. Sold to company: Alphanumeric, 30 positions; display-only.</p>
Date	<p>The date when the item was added to the order, if the item was added after initial order entry, such as through an exchange; otherwise, this is the same as the entered date for the order.</p> <p>Enter a valid date and select <i>OK</i> to review items ordered on that date.</p> <p>Numeric, 6 positions (in user date format); optional.</p>
Item	<p>The code identifying the item ordered.</p> <div data-bbox="873 894 1458 1066" style="border: 1px solid #0070c0; background-color: #e1eef6; padding: 10px; margin-top: 10px;"> <p> Note: Place your cursor over the Item code to display the item description.</p> </div> <p>Enter a full or partial item code and select <i>OK</i> to review items whose item code begins with your entry. Alphanumeric, 12 positions; optional.</p>
Colr Size Othr	<p>The SKU elements that further identify an item, such as its color or size.</p> <p>Enter a full or partial SKU and select <i>OK</i> to review items whose SKU code contains your entry. Alphanumeric, three 4-position fields; optional.</p>
Order #	<p>A unique number assigned by the system to identify the order. Numeric, 8 positions; display-only.</p>
Ship To #	<p>The number identifying the shipping address for the order. A number greater than one indicates that the order has multiple shipping addresses. Numeric, 3 positions; display-only.</p>

Field	Description
Sts	<p>The status of the line on the order. Possible statuses are:</p> <ul style="list-style-type: none"> • <i>X</i> = Closed. The item was shipped, or cancelled with a cancel reason code flagged to reduce demand. This status can also indicate a return that was created by entering a negative quantity, rather than by processing a return against a shipped order line. • <i>B</i> = Billing or Express Bill. An express-bill order has been submitted to the billing async job, which has not yet processed the record. • <i>C</i> = Canceled. The item was canceled using a cancel reason that was not flagged to reduce demand. • <i>H</i> = Held. The item (but not necessarily the order) was put on hold to prevent printing it on a pick slip. • <i>S</i> = Sold Out. The line item was sold out, either by an operator or automatically by the system. • <i>E</i> = Error. You received the order through the order API, and there are one or more errors related to the item. In this case, the order is suspended until you fix the error(s). • Blank = the line is open. An open line might be partially or fully backordered, or have had a partial shipment or cancellation take place. <p>Alphanumeric, 1 position; display-only.</p>
Price	<p>The single-unit price of the item, after applying all discounts and repricing. The item price does not include other charges on the order such as freight, tax, handling, or additional charges.</p> <div data-bbox="873 1073 1458 1272" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>If the item was added at no charge, such as a free gift or a component of a set, the Price field is blank.</p> </div>
Qty Ordered	<p>Numeric, 13 positions with a 2-place decimal; display-only.</p> <p>The total number of units of the item ordered. A minus sign indicates a return created by entering a negative quantity in order entry. This field is blank when you cancel a line using a cancel reason flagged to reduce demand.</p> <p>Numeric, 5 positions; display-only.</p>
Qty Shipped	<p>The total number of units of the item that have been shipped. A minus sign indicates a return created by entering a negative quantity in order entry.</p> <p>Numeric, 5 positions; display-only.</p>
Qty Returned	<p>The total number of units of the item returned or exchanged. This field is blank for a return created by entering a negative quantity in order entry. This field is updated when the return is received.</p> <p>Numeric, 5 positions; display-only.</p>

Field	Description
Ship Date	The most recent ship date for the item. If the line has more than one shipment date because of multiple shipments, the most recent shipment date is displayed. This situation might occur if there was a backordered quantity which you were later able to ship, or because the order line was for more than one unit but the item is flagged as “ship alone” (indicating that each unit must ship separately). Numeric, 7 positions; display-only.

Brokered Backorder Summary Screen

Purpose: Use this screen to review the status of all brokered backordered lines on the order.

How to display this screen: Select *Brokered Backorder Summary* at the [Display More Options Screen](#). This option is available only if the order includes any brokered backordered lines.

For more information: See [Brokered Backorders](#) for more information on brokered backorders.

Field	Description
Order #	The order number and ship-to number that you are currently reviewing. Order number: numeric, 8 positions; display-only. Ship-to number: numeric, 3 positions; display-only.
Status	The current status of the Order Orchestration request. The description is to the right, separated by a hyphen (-). See the Fulfillment Process: After Order Creation and Status Updates for a discussion of possible statuses. Status code: alphanumeric, 1 position; display-only. Status description: alphanumeric; display-only.
Line #	The sequence number in the Order Detail table that identifies the order line to be fulfilled through the Order Orchestration integration. The sequence number might differ from the order line number displayed in order maintenance or order inquiry if, for example, you deleted or canceled one of the previous lines on the order. Numeric, 5 positions; display-only.
Item/SKU	The item and SKU fulfilled through the Order Orchestration integration. Item: alphanumeric, 12 positions; display-only. SKU: alphanumeric, three 4-position fields; display-only.
Qty	The quantity of a brokered backorder line that is currently assigned to Order Orchestration for fulfillment, or that has been fulfilled or canceled. Numeric, 5 positions; display-only.
Fulfilling Location	The location selected by Order Orchestration to fulfill the brokered backorder. See the Order Orchestration Originating Location, Fulfilling Location, and Pickup Location for a discussion, including information on when the location might be blank. Alphanumeric, 50 positions; display-only.

Field	Description
Request ID	<p>A unique ID number assigned by Order Orchestration to identify the order. If the <i>Use Split Order (L56)</i> system control value is:</p> <ul style="list-style-type: none"> <i>unselected</i>: each individual brokered backorder item submitted to Order Orchestration receives a unique request ID, and Order Orchestration treats it as a separate order. <i>selected</i>: Order Administration sends a single submit order request for all backordered lines that are eligible for brokering. <p>The request ID is blank for requests whose status is:</p> <ul style="list-style-type: none"> <i>Z: Canceled</i> <i>C: Closed</i> <i>J: Rejected</i> <i>R: Ready</i> <i>W: Waiting</i> <p>The field might also be blank for requests in <i>E: Error</i> status, depending on the nature of the error. For example, requests that Order Orchestration did not receive and create successfully are not assigned request ID's.</p> <p>Numeric, 30 positions; display-only.</p>

Option	Procedure
Review details about an Order Orchestration request	Select <i>Display</i> for a record to advance to the <i>Display Order Broker Screen</i> .
Review history for an Order Orchestration request	Select <i>History</i> for a record to advance to the <i>Display Order Broker History Screen</i> .

Purchase Order Layering

Purchase order layering updates the expected delivery dates for items on backorder, based on records in the PO Layering table. The oldest orders on the system receive stock before new orders.

When to run purchase order layering: It is important to run this function before you generate backorder notices or run any other function that relies on accurate purchase order date and quantity information. You can run Purchase Order Layering on demand at any time.

Note:

When you run purchase order layering, the system clears the PO Layering table and rebuilds it based on the purchase order records that are uploaded to the table. In order to ensure accurate updates, you must upload the PO Layering table with ALL open purchase orders every time you perform an upload.

Instructions: Follow these steps to update purchase order layering.

Step

- 1 Upload the most recent purchase order information to the PO Layering table:
- Use the [File Storage API](#) to upload a POLAYR text file to the FILE_STORAGE table, and then run the UPPOLAY Upload PO Layering File (Program name PFR0134, Parameter POLAYR) periodic function to update the PO Layering table, or

Use the [Work with File Uploads \(WUPL\)](#) menu option to upload the text file and update the PO Layering table.

PO Layering Table (POLAYR)

The PO Layering table contains the following fields:

- Company (numeric, 3 positions)
- Item number (alphanumeric, 12 positions)
- SKU code (alphanumeric, 14 positions)
- Warehouse (numeric, 3 positions)
- PO number (numeric, 7 positions)
- Sequence number (numeric, 5 positions)
- Due date (numeric, 7 positions)
- Open quantity (numeric, 7 positions)
- Status (alphanumeric, 16 positions)
- Reference number (alphanumeric, 15 positions)

You can use the following sample data to create a PO Layering upload file:

```
7|RF123SKU4567|ROSE XXML WMNS|4|53|1|1080915|20| |Ref#
```

 **Note:**

- To leave any field in the upload file blank, pass a space in an alphanumeric field and a 0 in a numeric field so that the file can be processed without errors. Leaving a field with no space or 0 is interpreted as null in the database and causes errors.
- If you run the UPPOLAY periodic function and a POLAYR file is not in the folder defined in the CWDIRECTCP_UPLOAD_DIRECTORY property, the system writes an error that you can review in Work with File Uploads (WUPL). The error indicates that the process could not complete because the POLAYR file was not found in the upload folder.

- 2 Once the records are uploaded to the PO Layering table, the process uses the newly uploaded records to update the due date and backorder quantity for order lines on backorder. This update occurs for all companies and all warehouses for which there is an entry in the PO Layering table.

Errors: If an error occurs during the upload, the system clears the file and does not update the due date and backorder quantity for order lines on backorder.

 **Note:**

The system does not update records in the PO layering table when you change an item on backorder (such as deleting, rejecting, or canceling an order line on backorder). In this situation, you must perform a PO Layering Upload again to make sure the information in the PO Layering table is correct.

The following records are in the PO Layering table for item ABC:

Update PO Layering Example

PO#	Due Date	Open Qty
100	January 1	2
115	February 1	50

You place the following orders for item ABC:

Order#	Order Qty	Results
1010	1	The system: <ul style="list-style-type: none"> decreases the Open Qty for PO# 100 in the PO Layering table to 1. assigns an expected date of January 1 to the order line.
1012	2	The system: <ul style="list-style-type: none"> decreases the Open Qty for PO# 100 in the PO Layering table to 0 and updates its status to C (Closed). decreases the Open Qty for PO# 115 in the PO Layering table to 49. assigns an expected date of February 1 to the order line.
1015	1	The system: <ul style="list-style-type: none"> decreases the Open Qty for PO# 115 in the PO Layering table to 48. assigns an expected date of February 1 to the order line.

You cancel order 1010, freeing up 1 unit of item ABC on purchase order 100. However, the system does not reevaluate the expected date assigned to the open orders for item ABC until you upload the PO Layering table with the most recent purchase order information in your external system.

You upload the most recent purchase order information in your external system to the PO Layering table. The following records are now in the PO Layering table for item ABC:

PO#	Due Date	Open Qty
100	January 1	2
115	February 1	50

PO#	Due Date	Open Qty
129	February 15	50

The system updates the expected date for the open orders that contain item ABC based on the records in the PO Layering table:

Order#	Order Qty	Updates
1010	N/A - line canceled	The system does not update the order since it has been canceled.
1012	2	The system: <ul style="list-style-type: none"> decreases the Open Qty for PO# 100 in the PO Layering table to 0 and updates its status to C (Closed). assigns an expected date of January 1 to the order line.
1015	1	The system: <ul style="list-style-type: none"> decreases the Open Qty for PO# 115 in the PO Layering table to 49. assigns an expected date of February 1 to the order line.

Update on-order quantity? The [UPDATE_ON_ORDER_FROM_PO_LAYERING](#) property controls whether the PO layering process updates the on-order quantity for the warehouse:

- You should set this property to TRUE if you upgrade to 19.0 or higher from a release prior to 18.0, in order to have PO layering update the on-order quantity consistently with prior functionality.
- You should leave this property set to FALSE if you use the [Enterprise Order Integration \(Future Receipts and Active PO/Pre-Order Processing\)](#), since the OCDSFA periodic function also updates the warehouse on-order quantity.

If this property is set to TRUE and you run the OCDSFA periodic function as well as the PO layering process, whichever process ran most recently updates the on-order quantity for the warehouse.

Creating and Updating Ship-to Customers (WCST)

Purpose: Ship to customers can be stored in the system as temporary or permanent records.

You can create a temporary ship to record through Order Entry when you select *Order Ship To*. You might create a temporary ship to record for a gift order. The system stores the temporary ship to record in the Order Ship To table.

The system stores permanent ship to records in the Customer table. Permanent ship to customers are those to whom a sold to customer regularly directs merchandise. You can create permanent ship to customers directly through Customer Maintenance. You can also create permanent ship to records through Order Entry by selecting *Ship To's*.

The system retains mail, item, and order history for permanent ship to customers, and captures information on address changes.

In this topic:

- [Work with Customer Ship Tos Screen](#)
- [Create Ship-to Customer Screen](#)

- [Work with Ship To Phone Numbers Screen](#)
- [Create Ship To Phone Number Screen](#)
- [Work with Ticklers Screen \(ship-to customer view\)](#)

Work with Customer Ship Tos Screen

Purpose: Use this screen to create a permanent ship-to customer, or to change, delete, or display customer ship-to information.

How to display this screen:

- select *Ship To's* for a customer at a Work with Customer scan screen (see [Selecting Customers](#))
- select *Ship To's* at a Create, Change, or Display Customer screen in Work with Customers (see [Creating and Updating Sold-to Customers \(WCST\)](#)) or standard Order Inquiry (see [Using the Order Inquiry Scan Screens \(OIOM\)](#))

Field	Description
Last name	The customer's last name. Enter a full or partial last name to list customers who match your entry alphanumerically. Alphanumeric, 25 positions; optional.
First name	The customer's first name. Enter a full or partial last name to list customers whose names follow your entry alphanumerically. Enter a full or partial last name and first name to list customers with last names and first names that follow your entry alphanumerically. Alphanumeric, 15 positions; optional.
St (State)	The state or province where the customer lives, or receives mail or shipments. See Setting Up the Country Table (WCTY) for more information on state codes. Alphanumeric, 2 positions; optional.
Zip	The postal or zip code for this customer. Alphanumeric, 10 positions; optional.
Ship To #	A unique number assigned to the customer for identification purposes. Numeric, 9 digits; display-only.
Company	The name of the company placing the order. Alphanumeric, 30 positions; optional.

Screen Option	Procedure
Create a permanent ship-to customer	Select <i>Create</i> to advance to the Create Ship-to Customer Screen .

Screen Option	Procedure
Change ship-to customer information	<p>Select <i>Change</i> for a customer to advance to the Change Ship To Customer screen. You can change any information on this screen except the:</p> <ul style="list-style-type: none"> • Sold-to customer number and name • Ship-to record number • Match code <p><i>Customer Workflow Management window:</i> You automatically advance to the Customer Workflow Management Window when you select <i>Change</i> for a ship-to customer if open or in use ticklers exist for the ship-to customer. Select <i>Ticklers</i> at this window to advance to the Work with Ticklers Screen (ship-to customer view) where you can review and work with ticklers associated with the sold to customer and the specific ship to customer.</p>
Delete a permanent ship-to customer	<p>Select <i>Delete</i> for the customer to delete it.</p> <p>If there is an unpurged order on the system for this ship-to customer, the system does not allow you to delete the record. Instead, a message displays: Record not deleted. Ship To 438-1 used on Order # 2664-1.</p>
Display a ship-to customer	<p>Select <i>Display</i> for a customer to advance to the Display Ship To screen. See Create Ship-to Customer Screen for field descriptions. You cannot change any information on this screen.</p>
Work with ship-to phone numbers	<p>Select <i>Phone numbers</i> for a customer to advance to the Work with Ship To Phone Numbers Screen.</p>
Review ship-to customer mail history	<p>Select <i>Mail History</i> for a customer to advance to the Display Ship To Mail History screen. See Display Customer Mail History Screen for field descriptions.</p>
Review ship-to customer item history	<p>Select <i>Item History</i> for a customer to advance to the Display Ship To Item History Screen. (Note: You can review ship-to item history only if the field for the sold-to customer is set to 3.</p>
Review ship-to order history	<p>Select <i>Order History</i> for a customer to advance to the Display Ship To Order History Screen.</p>
Review address changes	<p>Select <i>Previous Addr</i> for a customer to advance to the Display Address Changes Screen.</p>
Work with ticklers associated with the ship-to customer	<p>Select <i>Ticklers</i> for a customer to advance to the Work with Ticklers Screen (ship-to customer view).</p>
Review email correspondence history	<p>Select <i>Email history</i> for a customer to advance to the Work with Email by Customer Ship To Number Screen.</p>
Send customer letters	<p>This option is not currently supported.</p>

Create Ship-to Customer Screen

Create a ship-to customer: At the [Work with Customer Ship Tos Screen](#), select *Create* to add a permanent ship-to customer.

Field	Description
Customer	A number to identify the sold-to customer. Numeric, 9 positions; display-only, assigned by the system.
Name	<p>The following 5 fields are available for you to enter the customer's full name:</p> <p>Prefix A title that belongs before the customer's name (such as "Mrs." or "Dr."). The prefix value will print on labels, reports, etc. Alphanumeric, 3 positions; optional.</p> <p>First Name The customer's first name. Alphanumeric, 15 positions; optional.</p> <p>Initial The customer's middle initial. Alphanumeric, 1 position; optional.</p> <p>Last Name The customer's last name. Alphanumeric, 25 positions; required if Company name is blank.</p> <p>Suffix An addition to the customer's full name, such as ("M.D.", "Fr.", or "III"). Alphanumeric, 3 positions, optional.</p>
Company	<p>The name of the company placing the order. Alphanumeric, 30 positions; required if you do not enter a last name.</p>

Field	Description
<p>Street</p>	<p>The customer's street address. This is the primary delivery address. The United States Postal Service requires a street address for delivery.</p> <p>Shipping to a Post Office Box To ship to a Post Office Box, enter <code>POST OFFICE BOX</code>, <code>POST BOX</code>, or any variation of <code>PO BOX</code> (with or without spaces or non-alphabet characters, such as <code>P.O. BOX</code>), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table).</p> <p><i>Example:</i> Enter <code>P.O. BOX 9999</code> in the Street field to indicate delivery to a post office box instead of a home or company address.</p> <div data-bbox="857 716 1383 1161" style="border-left: 2px solid #0070C0; padding-left: 10px; margin-top: 10px;"> <p> Note:</p> <p>If you type <code>POST OFFICE BOX</code>, <code>POST BOX</code>, or any variation of <code>PO BOX</code> in the customer's street address during order entry or through the Order API, the system automatically selects the PO box field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the PO box flag.</p> </div> <div data-bbox="857 1199 1383 1486" style="border-left: 2px solid #0070C0; padding-left: 10px; margin-top: 10px;"> <p> Note:</p> <p>When you create a customer outside of order processing, you need to select the PO box field manually. Selecting the PO box field manually only applies in Work with Customers (WCST).</p> </div>
<p>Apt./suite</p>	<p>Alphanumeric, 32 positions; required.</p> <p>The apartment number or suite number of the delivery address. To enter an apartment or suite address: Enter <i>APT</i> to indicate an apartment or <i>STE</i> to indicate a suite. Insert a space and type the number of the apartment or suite, for example: <i>APT 4</i> or <i>STE 116</i>.</p> <p>Field contents must conform to United States Parcel Service (USPS) address formatting standards. Always precede the apartment or suite number with the applicable abbreviation (e.g., <i>APT</i> or <i>STE</i>), to meet USPS regulations and correctly identify this information on labels or reports.</p> <p>Alphanumeric, 10 positions; optional.</p>

Field	Description
Address	<p>Three additional lines for the customer's delivery address. Field contents must conform to United States Postal Service (USPS) formatting standards. If the address represents a post office box, you must type <i>P.O. Box</i> on this line to meet USPS regulations and correctly identify this information on labels or reports.</p> <p>Alphanumeric, three 32-position fields; optional.</p>
Postal code	<p>The postal or zip code for this customer. This code represents a delivery area. Required only if the Require postal code? flag is selected for the country; see Setting Up the Country Table (WCTY).</p> <p>If a postal code is required, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The system fills in the City and State fields appropriately if you set up the Postal Code/City/State table and you enter a valid postal code.</p> </div>
	<p>Alphanumeric, 10 positions; required or optional based on country.</p>
City	<p>The city where the customer lives, or receives mail or shipments. The system completes this field for you when you enter a valid zip code.</p> <p>Alphanumeric, 25 positions; required.</p>
St (State)	<p>The state or province where the customer lives or receives mail or shipments. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Required only if the Require state? flag is selected for the country.</p> <p>The system validates that the state you enter is assigned to the SCF for the postal code.</p> <p>Alphanumeric, 2 positions; required or optional based on country.</p>
Country	<p>The code for the customer's country. The system defines and validates this code against the Country table. Defaults from the Default Country for Customer Address (B17) system control value.</p> <p>Alphanumeric, 3 positions; required.</p>

Field	Description
Delivery code	<p data-bbox="649 262 1385 451">Identifies a business (commercial) or residential address. The value is a shipping rate indicator that applies when you ship an order by a carrier that uses or consumer rate tables (such as United Parcel Service). This code defaults from the Default Delivery Code for New Order Entry Customers (D13) system control value, but you can override it.</p> <p data-bbox="649 451 1385 483">Valid values:</p> <ul data-bbox="649 483 1385 735" style="list-style-type: none"><li data-bbox="649 483 1385 556">• <i>Business</i> = Business rate table determines shipping charges.<li data-bbox="649 556 1385 619">• <i>Residential</i> = Residential rate table determines shipping charges.<li data-bbox="649 619 1385 735">• <i>No Distinction</i> = No distinction between residential and business address. (This is not a valid delivery code for a U.P.S. shipper, as defined in the Ship Via table. See Working with SCF/Ship Via Values (WSHV).) <p data-bbox="649 735 1385 770">Required.</p>

Field	Description
PO box	<p>A flag that identifies the customer's address as a post office box. Whenever an address represents a post office box, orders must ship by Parcel Post. Commercial carriers cannot deliver to Post Office boxes.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Selected</i> = The address is a post office box. • <i>Unselected</i> = The address is not a post office box. <p>Shipping to a Post Office Box To ship to a Post Office Box, enter <code>POST OFFICE BOX</code>, <code>POST BOX</code>, or any variation of <code>PO BOX</code> (with or without spaces or non-alphabet characters, such as <code>P.O. BOX</code>), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table).</p> <p><i>Example:</i> Enter <code>P.O. Box 9999</code> in the Street field to indicate delivery to a post office box instead of a home or company address.</p>

 **Note:**

If you type `POST OFFICE BOX`, `POST BOX`, or any variation of `PO BOX` in the customer's street address during order entry or through the Order API, the system automatically selects the PO box field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the PO box flag.

 **Note:**

When you create a customer outside of order processing, you need to select the PO box field manually. Selecting the PO box field manually only applies in Work with Customers (WCST).

Rent	<p>This flag identifies whether to include the customer's name on a mailing list that you rent.</p> <p>Valid values are:</p> <ol style="list-style-type: none"> 1. <i>Selected</i> = Rent the customer's name. 2. <i>Unselected</i> = Do not rent the customer's name. <p>Defaults from the Default Rent Name (D11) system control value.</p>
-------------	---

Field	Description
Mail code	<p>Defines when, and under what circumstances, you will send mail to the customer. Mail codes are defined in and validated against the Mail/Call Code table; see Working with Mail/Call Codes (WMCC). Not to be confused with the Mail flag.</p> <p>Defaults from the Mail code specified for the sold-to customer. If mail flag of customer is Y, then mail code default is Y. If mail flag of customer is N, then mail code is N.</p> <p>Alphanumeric, 3 positions; optional.</p>
Call code	<p>Defines when, and under what circumstances, you will call the customer. Call codes are defined in and validated against the Mail/Call Code table; see Working with Mail/Call Codes (WMCC).</p> <p>Alphanumeric, 3 positions; optional.</p>
Language code	<p>This field is not currently implemented.</p> <p>Alphanumeric, 3 positions; optional.</p>
Email address	<p>The customer's email address. See Email Address Validation for information on how the system verifies that your entry is formatted correctly.</p> <p>Fraud checking: An order goes on <i>ES</i> hold if this email address matches an email address in the Miscellaneous Fraud table; see Working with Miscellaneous Frauds (WMFF).</p> <p>Alphanumeric, 50 positions; optional.</p>
Reserve Warehouse	<p>The warehouse code to default to the Order Header for new orders created for this customer. In this situation, the system reserves inventory for the order from this warehouse only.</p> <p>The warehouse you specify must be an allocatable warehouse (the Allocatable flag for the warehouse is <i>selected</i>).</p> <p>Warehouse codes are defined in and validated against the Warehouse table. See Creating and Maintaining Warehouses (WWHS).</p> <p>Numeric, 3 positions; optional.</p>

Field	Description
Phone numbers	The customer's day, evening and third (fax or mobile) phone numbers.

 **Note:**

The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number.

You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and displays as it was entered by the operator.

Telephone Number Format Examples

An operator enters a phone number containing 10 numbers:
5085550100

The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100

When an operator enters a phone number containing 10 numbers (as in the example), the phone number displays so that the first 3 positions are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100, and no format exists for 6 numbers, the phone number would display as it was entered (5550100). See [Work with Telephone Number Format Screen](#) form more information.

Alphanumeric, 14 positions (phone number) and 4 positions (phone extension); optional.

Work with Ship To Phone Numbers Screen

Purpose: Use this screen to add, change, delete, or display ship-to customer phone numbers quickly. You can also work with phone numbers through the [Create Ship-to Customer Screen](#) and the Change Ship To Customer screen.

How to display this screen: Select *Phone numbers* for a customer at the [Work with Customer Ship Tos Screen](#).

Field	Description
Type	<p>The type of phone number. You can define only one number of each type.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Day</i> = Day/business • <i>Evening</i> = Evening/home • <i>Fax/Mobile</i> = The ship-to customer's third phone number

 **Note:**

The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mobile number on screens and reports.

Optional.

See [Create Ship-to Customer Screen](#) for descriptions of the remaining fields.

Screen Option	Procedure
Create a new phone number	Select <i>Create</i> to advance to the Create Ship To Phone Number Screen .
Change a phone number	Select <i>Change</i> for a phone number to change it. You can change the area code, number, and extension. See Create Ship To Phone Number Screen for field descriptions.
Delete a phone number	Select <i>Delete</i> for a phone number to delete it.

Create Ship To Phone Number Screen

Purpose: Use this screen to create a new day, evening, or fax phone number for a ship-to customer.

See [Create Ship-to Customer Screen](#) for more information on phone number formats and validation.

How to display this screen: Select *Create* at the [Work with Ship To Phone Numbers Screen](#).

About this screen: See [Create Ship-to Customer Screen](#) and [Work with Ship To Phone Numbers Screen](#) for field descriptions.

Work with Ticklers Screen (ship-to customer view)

Purpose: Use this screen to review, work with, and resolve ticklers associated with a ship-to customer.

Secured feature: If you do not have authority to the [Update All Ticklers \(B09\)](#) secured feature, you cannot update a tickler that is not assigned to you or your tickler groups or an error message indicates: Not authorized to change.

This secured feature controls updating a tickler by:

- selecting *Change* for a tickler to change it.
- selecting *Delete* for a tickler to delete it.
- selecting *In process* for a tickler to assign the tickler to yourself.
- selecting *Resolve* for a tickler to resolve it.

If you do not have access to this feature, you can update only ticklers assigned to you or your tickler groups. However, you can still release an order associated with the tickler from hold.

See [Workflow Management Overview and Setup](#) for an overview and required setup for workflow management processing.

How to display this screen:

- select *Ticklers* for a ship-to customer at the [Work with Customer Ship Tos Screen](#).
- select *Ticklers* at the [Customer Workflow Management Window](#) (which displays when you advance to the Change Ship To Customer screen.).

Field	Description
Sold to	The number and description of the sold to customer associated with the ship to customer. Sold to number: Numeric, 9 positions; display-only. Sold to description: Alphanumeric, 40 positions; display-only.
Ship to	The number and description of the ship to customer associated with the ticklers on this screen. Ship to number: Numeric, 9 positions; display-only. Ship to description: Alphanumeric, 40 positions; display-only.
S (tickler status)	The status of the tickler. Valid values: <ul style="list-style-type: none"> • <i>Open</i> = Open; the tickler is open and is available to work on in the assigned tickler work queue. • <i>In Process</i> = In process; the tickler is currently being worked on by the assigned user. • <i>Resolved</i> = Resolved; the tickler has been resolved. Optional.
P (tickler priority)	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is the lowest priority and 9 is the highest priority). Numeric, 1 position; optional.
Assigned (assign date)	The date the tickler was assigned to the user or tickler user group. Numeric, 7 positions (in user date format); optional.

Field	Description
Ev (tickler event code)	<p>The code for the tickler event that created the tickler.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>BO</i> = Backorders • <i>CO</i> = Cancelled orders • <i>HO</i> = Held orders • <i>MN</i> = Manually created • <i>NO</i> = New orders • <i>OO</i> = Aged open orders • <i>SO</i> = Sold out orders • <i>UP</i> = Unconfirmed pick tickets • <i>VP</i> = Voided pick tickets • <i>WF</i> = Remote workflow <p>See System Delivered Tickler Events.</p> <p>Alphanumeric, 2 positions; optional.</p>
Cat (tickler category)	<p>The tickler category assigned to the tickler.</p> <p>Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT).</p> <p>Alphanumeric, 3 positions; optional.</p>
Tickler#	<p>The tickler number assigned to the tickler, from the Tickler Number number assignment record.</p> <p>Numeric, 9 positions; optional.</p>
User group	<p>The group ID code for the tickler user group assigned to the tickler.</p> <p>Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG).</p> <p>Tickler group ID: Alphanumeric, 10 positions; display-only.</p>
User	<p>The user ID of the user assigned to the tickler.</p> <p>Users are defined in and validated against the User table; see Working with User Records (WUSR).</p> <p>User ID: Alphanumeric, 10 positions; display-only.</p>
Sts (order status)	<p>The status of the order associated with the tickler.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>blank</i> = Open. • <i>A</i> = Archived to optical disk. This option is not currently implemented. • <i>C</i> = Cancelled. • <i>H</i> = Held. Note: The system highlights the held status in a different color (for example fuchsia) if the sold to customer is a new customer, based on purchase history. A new customer has placed an order, but no orders have shipped (# orders LTD is equal to or greater than 1 and # sales LTD is equal to 0 in the Customer Sold To Order History table). • <i>P</i> = Purged. • <i>S</i> = Suspended. • <i>X</i> = Closed. <p>Alphanumeric, 1 position; display-only.</p>

Field	Description
Order #	The order associated with the tickler. Numeric, 9 positions; display-only.
Bill to	The bill to customer associated with the tickler. Numeric, 9 positions; display-only.

Screen Option	Procedure
Change a tickler	Select <i>Change</i> for a tickler to advance to the Change Tickler Screen .
Delete a tickler	Select <i>Delete</i> for a tickler to delete it. You can only delete <i>MN</i> (manually created) ticklers.
Display a tickler	Select <i>Display</i> for a tickler to advance to the Display Tickler Screen. See the Change Tickler Screen for field descriptions.
Release the order associated with the tickler from hold	Select <i>Release</i> for a tickler to advance to the Release Reason Prompt Pop-Up Window (order header hold), Release Recipient Hold Reason Pop-Up Window (recipient hold), and/or Release Order Payment Method Window (paytype hold). If you release an order from hold for an <i>HO</i> (held order) tickler, the system automatically resolves the tickler. Also, the system evaluates any other ticklers associated with the order to determine if they can be resolved. If you select <i>Release</i> for a tickler not associated with a held order, an error message indicates: Order not on hold. If you select <i>Release</i> for a tickler not associated with an order, an error message indicates: Tickler not eligible for this option.

 **Note:**

You must have authority to the Release Held Orders (ERHO) menu option to release the order from hold.

Select a tickler to work on	Select <i>In process</i> for a tickler to change the status of the tickler from open to in process. You can only select to work with a tickler that is in an open status; if you select <i>In process</i> for a tickler that is in an in process or resolved status, an error message indicates: Tickler status cannot be changed - resolved or already in process. Selecting this option automatically assigns the tickler to the user and creates a tickler history record.
-----------------------------	---

Screen Option	Procedure
Enter or review tickler work notes	<p>Select <i>Notes</i> for a tickler to advance to the work notes screen, based on the note type defined for the tickler.</p> <p>Note type <i>A</i> advances you to the Edit Customer Actions Window.</p> <p>Note type <i>B</i> advances you to the Work with Bill To Notes Screen.</p> <p>Note type <i>O</i> advances you to the Work with Order Messages Screen.</p> <p>Note type <i>S</i> advances you to the Edit Customer Notes Screen.</p> <p>Note type <i>T</i> advances you to the Work with Tickler Notes Screen.</p>
Review the tickler source	<p>Select <i>Detail</i> for a tickler to advance to the source screen, based on the tickler event associated with the tickler.</p> <p><i>BO, CO, HO, NO, OO, SO, UP, VP, and WF</i> ticklers advance you to the Order Inquiry Header Screen.</p> <p>You cannot view the source for <i>MN</i> ticklers: Requested tickler has no source reference.</p>
Review tickler history	<p>Select <i>History</i> for a tickler to advance to the Work with Tickler History Screen.</p>
Resolve a tickler	<p>Select <i>Resolve</i> for a tickler to advance to the Resolve Tickler Window.</p>
Review procedures for a tickler	<p>Select <i>Procedure</i> for a tickler to advance to the Work with Tickler Event Rule Procedure Screen.</p> <p>You cannot add or change tickler procedures when you advance from the Work with Ticklers screen.</p> <p>You cannot review procedures for <i>MN</i> ticklers.</p>
Create a tickler for the <i>MN</i> (manually created) tickler event	<p>Select <i>Create</i> to advance to the Create Tickler Screen.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>To create a <i>MN</i> tickler, you must have authority to the Create Manual Tickler (B13) secured feature.</p> </div>
Review the number of ticklers in the work queue, based on the selection criteria you have defined	<p>Select <i>Count</i> to advance to the Current Tickler Count Window.</p>
Toggle between displaying open and in use ticklers or resolved ticklers	<p>Select <i>Open/Resolved</i>. The system toggles between displaying:</p> <ul style="list-style-type: none"> • ticklers in an open or in process status. • tickler in a resolved status.

Creating and Updating Sold-to Customers (WCST)

Purpose: The system creates a sold to customer record automatically when you:

- enter an order for a new customer through order entry, or the *Generic Order Interface (Order API)*, or
- enter a quote for a new customer through quote entry, or the order API; see [Entering Pre-Order Quotes](#).
- enter a catalog request for a new customer, or
- process an Add request through the *Generic Customer API*.
For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1)

Although most customers are added to the system by the means listed above, you can also add new customers to the system through Work with Customers, described here.

Outbound customer API: You can generate a customer download XML message when you create, change, or delete a customer. See the *Generic Customer Download API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for more information.

Communication with Oracle Retail Customer Engagement: If you use the Oracle Retail Customer Engagement customer integration, Oracle Retail Customer Engagement is the system of record for customer information, and Order Administration synchronizes customer information between the two systems. When you search for a customer in Order Administration, the Oracle Retail Customer Engagement database is searched first; and when you create or update a customer through customer maintenance, Order Administration sends the new or updated name, address, email, and phone number information to Oracle Retail Customer Engagement. See the [Customer Engagement Customer Integration](#) for more information.

First Create Sold To Customer Screen

Purpose: You use two Create Customer Sold-to screens to create new customers.

How to display this screen: Select *Create* at the [Select Customer Sold To Screen](#).

Field	Description
Customer (Customer number)	<p>A unique number to identify a customer. The system assigns a customer number automatically when you create a new Sold To Customer record.</p> <p>The system assigns the customer number whether or not you complete the customer record.</p> <p>Numeric, 9 positions; display-only, assigned by the system.</p>
Match code	<p>A code assigned by the system to identify duplicate customers and detect fraudulent addresses.</p> <p>When you create a new customer, the system creates the standard match code automatically, based on selected elements of the customer's name and address. The match code is compared against match codes in the Fraud tables; if there is a match, the order is placed on hold. Also, the system updates the match code automatically when you change any of the related elements.</p> <p>The system uses the match code when determining whether to use an existing customer or create a new customer on orders you receive through the order API; see Remote Order Values (F70).</p> <p>Alphanumeric, 15 positions; display-only.</p>
Entered	<p>The date you create the customer record. The system uses the job date for this value, and assigns this date as soon as you select <i>Create</i>.</p> <p>Numeric, 6 positions (in user date format), display-only, assigned by the system.</p>
Name	<p>The following 5 fields are available for you to enter the customer's full name:</p> <p>Prefix A title (such as "Mrs." or "Dr.") that precedes the customer's name. The prefix prints on labels and forms. Alphanumeric, 3 positions; optional.</p> <p>First Name The Sold-to customer's first name. Alphanumeric, 15 positions; optional.</p> <p>Initial The initial of the customer's middle name. Alphanumeric, 1 position; optional.</p> <p>Last Name The customer's last name. Alphanumeric, 25 positions; required if company name is not present.</p> <p>Suffix An addition to the customer's full name (such as "M.D.," "Fr.," or "III"). The suffix prints on labels and forms, but is not accessible to scans. Alphanumeric, 3 positions, optional.</p>
Company	<p>The name of the company associated with the customer placing the order.</p> <p>Alphanumeric, 30 positions; required if last name is not present.</p>

Field	Description
Street	<p>The customer's street address. This is the primary delivery address.</p> <p>Shipping to a Post Office Box To ship to a Post Office Box, enter <code>POST OFFICE BOX</code>, <code>POST BOX</code>, or any variation of <code>PO BOX</code> (with or without spaces or non-alphabet characters, such as <code>P.O. BOX</code>), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table).</p> <p><i>Example:</i> Enter <code>P.O. Box 9999</code> in the Street field to indicate delivery to a post office box instead of a home or company address.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If you type <code>POST OFFICE BOX</code>, <code>POST BOX</code>, or any variation of <code>PO BOX</code> in the customer's street address during order entry or through the Order API, the system automatically selects the PO box field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the PO box flag.</p> </div>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>When you create a customer outside of order processing, you need to select the PO box field manually. Selecting the PO box field manually only applies in Work with Customers (WCST).</p> </div>
Apt/suite (Apartment/suite)	<p>Alphanumeric, 32 positions; required.</p> <p>The apartment number or suite number associated with the customer's delivery address.</p> <p>Follow these steps to enter an apartment or suite address:</p> <ul style="list-style-type: none"> • Type <code>APT</code> to indicate an apartment or <code>STE</code> to indicate a suite. • Insert a space and type the number of the apartment or suite, for example: <code>APT 4</code> or <code>STE 116</code>. <p>Addresses must conform to United States Parcel Service (USPS) address formatting field description standards. For example, always precede the apartment or suite number with the appropriate abbreviation (for example, <code>APT</code> or <code>STE</code>).</p> <p>Alphanumeric, 10 positions; optional.</p>
Address	<p>Three additional lines of the customer's delivery address. If the address represents a post office box, you must type <code>P.O. Box</code> on the first line to meet USPS delivery regulations.</p> <p>Alphanumeric, three 32-position lines; optional.</p>

Field	Description
Postal code	<p>The postal or zip code for this customer. This code represents a delivery area.</p> <p>If a postal code is required for the country, it is validated against the Zip/City/State (Postal Code) table; see Setting Up the Zip/City/State (Postal Code) Table (WZIP).</p> <div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>The system fills in the City and State fields appropriately if you set up the Postal Code/City/State table and you enter a valid postal code.</p> </div>
City	<p>Alphanumeric, 10 positions; required or optional based on country.</p> <p>The city where the customer lives or receives mail or shipments.</p> <p>Alphanumeric, 25 positions; required.</p>
St (State)	<p>The state or province where the customer lives or receives mail or shipments. State codes are defined in and validated against the State table, accessible through the Work with Countries menu option; see Setting Up the Country Table (WCTY). Required only if the Require state? flag is selected for the country.</p> <p>The system validates that the state you enter is assigned to the SCF for the postal code.</p> <p>Alphanumeric, 2 positions; required or optional based on country.</p>
Country	<p>The code for the customer's country. Country codes are defined in and validated against the Country table.</p> <p>The Default Country for Customer Address (B17), if any, from the System Control table defaults here when you create a new customer; however, you can override the default.</p> <p>Alphanumeric, 3 positions; required.</p>

Field	Description
Delivery code	<p>Identifies a business (commercial) or residential address. Used to calculate shipping charges for shippers that use rate tables (such as U.P.S.).</p> <p>The Default Delivery Code for New Order Entry Customers (D13) system control value defaults here; however, you can override this default. If this system control value is blank, a setting of Business defaults.</p> <p>Valid values:</p> <ul style="list-style-type: none">• <i>Business</i> = Business rate table determines shipping charges.• <i>Residential</i> = Residential rate table determines shipping charges.• <i>No distinction</i> = No distinction between business and residence.

 **Note:**

Only *Business* and *Residential* are valid values for U.P.S. The system defines the shipper on an order as U.P.S. if the Type field in the Ship Via table = *U*; see [Working with Ship Via Codes \(WVIA\)](#).

Required.

Field	Description
PO box	<p>A flag that identifies the customer's delivery address as a Post Office box. Whenever you identify an address as a PO box, orders must ship by Parcel Post.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = The address is a Post Office box. <i>unselected</i> (default) = The address is not a Post Office box. <p>Shipping to a Post Office Box</p> <p>To ship to a Post Office Box, enter <code>POST OFFICE BOX</code>, <code>POST BOX</code>, or any variation of <code>PO BOX</code> (with or without spaces or non-alphabet characters, such as <code>P.O. BOX</code>), and the box number in the customer's street address. During order processing, the system validates that the carrier can ship to a post office box (as defined in the Ship Via table).</p> <p><i>Example:</i> Enter <code>P.O. Box 9999</code> in the Street field to indicate delivery to a post office box instead of a home or company address.</p>

 **Note:**

If you type `POST OFFICE BOX`, `POST BOX`, or any variation of `PO BOX` in the customer's street address during order entry or through the Order API, the system automatically selects the PO box field for the customer. However, if you remove this text from the customer's street address, the system does not automatically deselect the PO box flag.

 **Note:**

When you create a customer outside of order processing, you need to select the PO box field manually. Selecting the PO box field manually only applies in Work with Customers (WCST).

Class	<p>A code that categorizes customers at a high level for reporting purposes. You can use customer class codes to:</p> <ul style="list-style-type: none"> send offers to a limited group of customers restrict item sales to a group of customers bypass normal item reservation (If the customer is assigned to a class flagged to bypass reservation, then the bypass setting applies even if the <i>Bypass res (Bypass reservation)</i> setting for the customer is <i>unselected</i>) determine whether to prompt for user-defined fields in order entry <p>You can define a <i>Default Customer Class in Order Entry (D63)</i> to assign to all customers you create through order entry.</p>
--------------	---

Field	Description
	<p><i>Required?</i> The Require Customer Class in OE, WCAT, and WCST (H85) system control value defines whether this field is required.</p> <p><i>Secured?</i> The Maintenance of Customer Class Field (B07) secured feature defines whether you can enter or maintain the customer class field at this screen.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If the Require Customer Class in OE, WCAT, and WCST (H85) is selected and the customer does not have a customer class code assigned, a user who does not have authority based on the Maintenance of Customer Class Field (B07) secured feature cannot update a customer.</p> </div>
Type	<p>See Setting Up the Customer Class Table (WCCL) on working with customer classes.</p> <p>Alphanumeric, 2 positions; optional.</p> <p>A user-defined code to identify a group of customers further for reporting purposes.</p> <p>Alphanumeric, 3 positions; optional.</p>
Salesrep # (Sales representative number)	<p>A number that identifies a sales representative who takes an order. You can use Salesrep information for tracking and reporting sales activity and commissions.</p> <p>This number appears during order entry when you enter a new order for this customer.</p> <p>Salesrep numbers are defined in and validated against the Salesrep table. See Working with Sales Representatives (WLSLS).</p> <p>If you prompt on this field, the system displays the Select Salesrep window where you can review and select a valid salesrep. The window indicates whether the salesrep is active and if a home store has been assigned to the salesrep.</p> <p>Numeric, 7 positions; optional.</p>

Field	Description
Suppress Sales Rep Email	<p>Defines whether the <i>Outbound Email XML Message (CWEmailOut)</i> sent to this sold to customer is also sent to the email address of the salesrep assigned to the customer.</p> <ul style="list-style-type: none"> <i>Selected</i> = Do not send Outbound Email (CWEmailOut) messages sent to the sold to customer to the email address of the salesrep assigned to the customer. The system sets the <i>sold_to_suppress_sales_rep_email</i> attribute in the CWEmailOut message to <i>Y</i>, indicating a copy of the message was not sent to the salesrep. <i>Unselected</i> = Send Outbound Email (CWEmailOut) messages sent to the sold to customer to the email address of the salesrep assigned to the customer. The system sets the <i>sold_to_suppress_sales_rep_email</i> attribute in the CWEmailOut message to <i>N</i>, indicating a copy of the message was sent to the salesrep. The system sends a CWEmailOut message to the email address of the salesrep assigned to the customer for the following <i>notification_types</i>: <ul style="list-style-type: none"> <i>order confirmations</i> (notification_type <i>OC</i>). <i>shipment and return confirmations</i> (notification_type <i>SC</i> and <i>RC</i>). <i>backorder notices</i> (notification_type <i>B1</i>, <i>B2</i>, <i>B3</i>). <i>soldout notifications</i> (notification_type <i>S1</i>). <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)</p> <p>This setting does not apply to emails generated through the Narvar Integration.</p>
Changed	<p>The date of the most recent update to the customer's record. The system uses the starting date of the ORDR_ASYNC job that was running at the time of the update.</p>

Note:

This field is on the Change and Display screens only.

Numeric, 6 positions (in user date format); display-only.

Field	Description
Opt in/Opt out	<p>Indicates the preferred method of correspondence for the primary email address.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>O1</i> (Email) = Email is the preferred method of correspondence. • <i>O2</i> (Order-only email) = Use email for order-related correspondence only; generate a document for other correspondence. • <i>O3</i> (No email) = Do not use email for any correspondence; generate a document instead. • <i>O4</i> (Do not ask the customer) = Do not ask the customer for his/her email address; the customer has already been asked and has declined to provide it. The system does not generate any email correspondence to the customer, even if an email address is specified. <p>For a new customer, this value defaults from the Default Opt In/Opt Out Flag (G97) system control value, but you can override the default.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>The above values use the letter O, not the number 0 (zero).</p> </div>
	<p>Email notifications: See When Does the System Generate an Email Notification? for an overview.</p> <p>Outbound email API: The opt in/opt out settings controls the generation of the <i>Outbound Email XML Message (CWEmailOut)</i> using the same logic as the generation of outbound emails. See Outbound Email API for an overview.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)</p> <p>Updating from an external system: See Receiving Customer Email Status Updates From an External System for an overview and the required setup.</p>
Language	<p>Alphanumeric, 2 positions; required.</p> <p>Informational. Language codes are defined in and validated against the Language table; see Working with Language Codes (WLAN) for more information.</p>
Mail code	<p>Alphanumeric, 3 positions; optional.</p> <p>This code specifies how often, and under what conditions, you send mail to the customer. You can use this code to indicate the customer's mail preferences with more precision than the Mail flag, discussed below, permits.</p> <p>Mail codes are defined in and validated against the Mail/Call Code table. See Working with Mail/Call Codes (WMCC).</p> <p>After you create a sold-to customer at this screen, the value in the Mail flag defaults into the mail code field if you have not entered a mail code. You must define this value (either Y or N) in the Mail/Call Code table or the screen displays an error message.</p> <p>Alphanumeric, 3 positions; optional.</p>

Field	Description
Call code	<p>This code specifies how often, and under what conditions, you call the customer.</p> <p>Call codes are defined in and validated against the Mail/Call Code table. See Working with Mail/Call Codes (WMCC).</p> <p>Alphanumeric, 3 positions; optional.</p>
Currency	<p>This field is not currently implemented.</p> <p>Alphanumeric, 3 positions; optional.</p>
Mail	<p>Controls whether the customer receives future catalogs. Not to be confused with the three-position, alphanumeric Mail code field described above. This field is <i>selected</i> or <i>N</i> for new customers (added through order entry or a catalog request), depending on the value in the Default Mail Name (D10) system control value. Also defaults into the mail code on the first Create Customer Sold To screen, although you can override it.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = Mail catalogs to the customer • <i>unselected</i> = Do not mail catalogs to the customer
Rent	<p>Controls whether to include the customer's name in lists you sell to other companies for their own catalog mailings.</p> <p>This field is <i>selected</i> or <i>N</i> for new customers (added through order entry or a catalog request), depending on the value in the Default Rent Name (D11) system control value.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = You can sell the customer's name to another company • <i>unselected</i> = Do not sell the customer's name to another company
Do not fax	<p>Informational only. This field displays only if the Third Phone Number Type (L53) system control value is set to <i>FAX</i>.</p> <ul style="list-style-type: none"> • <i>selected</i> = Do not fax the customer. • <i>unselected</i> = Authorized to fax the customer.
Inactive	<p>Identifies the customer's status. You can still place orders for inactive customers. This information is useful for exception reporting you might conduct on your house list.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = Customer is inactive. • <i>unselected</i> (default) = Customer is active.
Commercial	<p>Identifies whether the customer is commercial for reporting purposes.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>selected</i> = This is a commercial customer. • <i>unselected</i> (default) = This is a non-commercial customer.

Field	Description
Hold/bypass/fraud	<p>Controls how credit checking is performed for the customer during order entry.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Hold</i> = The system places the customer's orders on hold automatically so you can review, then manually release each order. • <i>Bypass</i> = Orders for the customer are not included in the credit check function in order entry; however, the customer is still subject to other fraud-checking, as described in for the Fraud Checking (A68) system control value. • <i>Fraud</i> = The system places the customer's orders on "fraud" hold automatically so you can review each order and release it as needed. <p>Entering the customer's name in the Fraud table does not by itself set this field to <i>Fraud</i>, although the system still holds all of the customer's orders for fraud.</p> <p>The system generates a report that identifies all held orders and their reason codes. You can review this information through Order Inquiry. See Releasing Held Orders for more information about held orders and reason codes.</p> <p>The Maintenance of Hold/Fraud/Bypass Flag (A57) secured feature controls access to this field. If you attempt to change this field and you do not have proper authority, an error message indicates: Not authorized to maintain.</p> <p>Alphanumeric, 1 position; optional.</p>

Field	Description
Bypass res (Bypass reservation)	<p>Controls when to reserve items for the customer. This feature lets you reserve inventory selectively for direct and wholesale customers and manage distribution of large quantities of merchandise. It is useful to assign a consistent customer class to customers flagged to bypass reservation, so that you can easily scan for these customers in Working with Interactive Reservation (MIRV).</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = The customer bypasses reservation; you need to use Working with Interactive Reservation (MIRV) to reserve items for the customer. <i>Important:</i> Use this flag only if the Use OROB for Fulfillment Assignment (M31) system control value is unselected; if this system control value is selected, the system uses the Bypass reservation flag to send items to Order Orchestration for fulfillment assignment; see Brokered Backorders. <i>unselected</i> (default) = The system reserves inventory in the normal way for all orders for this customer (either through regular order entry or batch reservation, depending on the setting of the Immediate Reservation (A64) system control value) unless the customer is assigned to a customer class flagged to bypass reservation. <p>Determining whether to bypass reservation based on customer-level setting or customer class setting:</p> <ul style="list-style-type: none"> If the Bypass res flag for the customer is <i>selected</i>, the customer always bypasses reservation regardless of whether there is a Class specified for the customer, or the class's Bypass reservation setting If the Bypass res flag for the customer is <i>unselected</i>, the customer still bypasses reservation if there is a Class specified for the customer and the class is flagged to Bypass reservation. <p>See Setting Up the Customer Class Table (WCCL) for more information on customer class.</p>
Auto cancel B/O (Automatic cancel backorder)	<p>Controls whether the system cancels items that are not in stock (backordered items) automatically with the first shipment on the order.</p> <p>Select this field for customers who want only one shipment on an order. The setting appears in the Auto can B/O field during order entry.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = Cancel backordered items automatically with the first shipment on the order. <i>unselected</i> (default) = Do not cancel backordered items.

Field	Description
Track item history	<p>Controls the level of sales history to capture for each customer. Valid values are:</p> <ul style="list-style-type: none"> • <i>No Item Tracking</i> = Do not track the sale of items for the customer. • <i>Sold To Tracking Only</i> = Track item history for the customer placing the order (Sold To customer) only. • <i>Sold To + Ship To Tracking</i> = Track item history for the customer placing the order (Sold To customer) and the customer receiving the order (Ship To customer). <p>The Default Item History Tracking (B18) system control value controls how this field defaults when you create a new customer. You can change this value at any time through Work with Customers, even after entering orders, to gain visibility to the ship-to customers' item history.</p> <p>Optional.</p>

Duplicate customer: A pop-up window appears if the system identifies the new customer as a “duplicate.” Here, you can select an existing customer record or select *Accept* to create a new customer record from the name and address information you entered.

Second screen: Select *OK* to advance to the [Second Create Customer Sold To Screen](#).

Second Create Customer Sold To Screen

How to display this screen: Select *OK* at the [First Create Sold To Customer Screen](#).

Continue entering information on this screen to complete creation of a new customer.

Field	Description
Customer	<p>A unique number to identify the customer. Numeric, 9 positions; display-only.</p>
Bill to	<p>The bill-to account assigned this customer. You can assign only one bill-to record to a sold-to customer; however, multiple sold-to customer records can use the same bill-to customer record. See Creating and Updating Bill-to Customers (WCBT). If a sold-to customer is assigned a bill-to customer in this field, that bill-to customer is added to each new order for the customer. Numeric, 7 positions; optional.</p>

Field	Description
Alternate customer number	<p>An additional way to identify a customer, such as a customer or membership number in another system.</p> <p>Alternate Customer Number Label Description The field label on this screen is based on the name you enter in the Alternate Customer Number Label Description (H95) system control value; if you do not enter a name in this system control value, the field label is Alt cust.</p> <p><i>Example:</i> If you enter the field label name <i>MEMBER#</i> in the system control value, the field label on this screen is MEMBER#.</p> <p>Secured Feature The Change Alternate Customer Number (B11) secured feature controls whether you can change this entry; if you prohibit access to this feature, the system displays an error message if you try to change the value: Not authorized to add/change Alt Customer #.</p> <p>Alternate Customer Number Cross Reference The alternate customer number at this screen is normally duplicated in the Alternate Customer # Cross Reference table. The system uses this table as a means to track each alternate customer number that has ever been assigned to the customer. Whenever you enter a value in the Alt cust field, the system creates a matching record in the Alternate Customer # Cross Reference table.</p> <p>See Working with Alternate Customer Number Cross-References for more information.</p> <p>Automatic Alternate Customer Number Assignment The Assign Alternate Customer # (188) system control value controls whether the system automatically assigns an alternate customer number each time a customer is created by any means. See that system control value for more information.</p> <ul style="list-style-type: none">• If the Display Alternate Customer Cross Reference Window (184) system control value is <i>selected</i>, you cannot delete an existing alternate customer number; however, you can replace the alternate customer number. You can also delete alternate customer number cross-references through the Working with Alternate Customer Number Cross-References option.• If the Display Alternate Customer Cross Reference Window (184) system control value is <i>unselected</i>, you can delete an existing alternate customer number only if there are no additional cross references stored in the Alternate Customer # Cross Reference table besides the one that matches the Alt cust itself. In this situation, when you delete the Alt cust, the system also deletes the matching Alternate Customer # Cross Reference record. <p>Numeric, 7 positions; optional or display-only, as described above.</p>

Field	Description
Phone # (Day, Eve, Fax or Mbl)	The customer's day, evening and third (fax or mobile) phone numbers.

 **Note:**

The *Third Phone Number Type (L53)* system control value determines whether the third phone number is labeled the Fax or Mbl (mobile) number.

You can define a telephone number format to map to the phone numbers operators enter into the system. Telephone number formats are defined by arranging numbers and special characters such as hyphens and parenthesis in the same order and position as the numbers in a phone number would display. When an operator enters a phone number, the system compares the number of numeric characters in the phone number with the telephone number formats you have defined. In order to match a format, the phone number must have the same number of numeric positions as a telephone number format. If the system cannot find a match, the phone number does not map to a telephone number format and is displayed as it was entered by the operator.

Telephone Number Format Example

An operator enters a phone number containing 10 numbers:
 5085550100

The telephone number format used in the United States to represent an area code, local exchange and local phone number is: (508) 555-0100

When an operator enters a phone number containing 10 numbers (as in the example), the phone number displays so that the first 3 numbers are in parenthesis and a hyphen is between the sixth and seventh numbers, regardless of how the operator entered it into the system. If an operator enters a phone number containing 6 numbers, for example 5550100 and no format exists for 6 numbers, the phone number would display as it was entered (5550100). See [Work with Telephone Number Format Screen](#).

Alphanumeric, 14 positions; optional.

Ext (Extension) The extension of the customer's phone or fax number.
 Numeric, 4 positions; optional.

Reserve Warehouse The warehouse code to default to the Order Header for new orders created for this sold-to customer. In this situation, the system reserves inventory for the order from this warehouse only.
 The warehouse must be an allocatable warehouse (the Allocatable flag for the warehouse is *selected*).
 Warehouse codes are defined in and validated against the Warehouse table. See [Creating and Maintaining Warehouses \(WWHS\)](#).
 Numeric, 3 positions; optional.

Field	Description
Source (Current, Original)	<p>A unique code to identify a segment of your customer base (list of customers) targeted for an offer (catalog, newspaper or television advertisement). Source codes can be used to analyze sales and determine the effectiveness of advertising or catalog offerings.</p> <p>You may set up special prices or discounts for a source code. See Working with Source Codes (WSRC).</p> <p>The following two fields are available for source codes:</p> <p>Current source code The source code used by the customer on the most recent order. You can change this value. Alphanumeric, 9 positions; optional.</p> <p>Original source code A code that identifies how you first acquired the customer. The system retains the source code used on a new customer's first order or catalog request, depending on how you first acquired the customer.</p> <p>If the Update Original Source Code for Recipient Customers (F90) system control value is <i>selected</i> and the Original source code field for the customer is blank, the system updates the Original source code field for a recipient customer with the source code defined on the order header for the customer sold to. Alphanumeric, 9 positions; display-only.</p>
Mail type (Current, Original)	<p>This code identifies the source of the customer based on how you and the customer first established contact (Original mail type) and whether the customer then purchased merchandise from you (Current mail type).</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Buyer</i> = a customer who places an order (the “sold-to” customer). A customer is coded as a buyer when this customer places an order, if the order is accepted. Note: <ul style="list-style-type: none"> • The system does not update a customer’s mail type to <i>Buyer</i> when you accept a quote for the customer; see Entering Pre-Order Quotes. • The mail type is not set to Buyer until the order async processing takes place; until that time, the mail type is <i>Suspect</i>. • <i>Catalog request</i> = a person who requested a catalog. The system assigns this mail type to customers that you add through: <ul style="list-style-type: none"> • Work with Customers; or • a catalog request order type, if the order is accepted. The system compares the order type with the Order Type to Process as Catalog Request/Item Samples (E08) system control value to determine if an order is a catalog request. • Work with Catalog Requests (see Entering Catalog Requests (WCAT))

Field	Description
	<ul style="list-style-type: none"><li data-bbox="568 262 1383 472">• <i>Recipient</i> = the customer who receives the order (also known as the Ship To customer). The system tracks the mail type only for ship to customers that you add to an order by selecting <i>Accept/Add Recip</i> or <i>Sold To/Recip</i>. Note: The system does not update a customer's mail type to <i>Recipient</i> when you accept a quote that contains the customer as a ship to customer; see Entering Pre-Order Quotes.<li data-bbox="568 472 1383 682">• <i>Suspect</i> = a customer whose name you acquired through a telemarketing effort or a public or industry listing, or a customer who places an order that is then rejected. Also, when you create a new customer through order entry or the order API, the customer's mail type is initially set to <i>Suspect</i> until the order async process completes its updates; at that time, the mail type is set to <i>Buyer</i>. <p data-bbox="568 682 1383 886">Entity: If the Track Customer History at Entity Level (F89) system control value is <i>selected</i>, the system also tracks the mail type separately for each entity based on the first activity for the customer within the entity. For example, if the first activity for a customer within entity 100 is to place and accept an order, the mail types for this customer/entity are set to <i>Buyer</i>, even though the customer-level current and original may be set differently.</p>

Field	Description
	<p>There are two categories of mail type, as follows:</p> <p>Current mail type The customer's current status.</p>
	<p> Note:</p> <p>The only time that the system updates the current mail type at either the customer or entity level is to change the code to a <i>Buyer</i> if an existing customer places and accepts an order.</p>
	<p>Alphanumeric, 1 position; display-only, updated by the system.</p> <p>Original mail type The original status of the customer.</p>
	<p> Note:</p> <p>You cannot change the original mail type, and the system never updates it automatically after initial creation and any related async processing (that is, to change the mail type from <i>Suspect</i> to <i>Buyer</i> for a new customer created through order entry or the order API).</p>
	<p>The only exception to the above rule is if you happen to enter an order for a customer and reject it (producing an original mail type of <i>Suspect</i>), and then enter an order and accept it <i>on the same day</i>; in this case only, the original mail type changes to <i>Buyer</i>.</p> <p>Display-only, updated by the system.</p>
Seed	<p>Identifies a customer name that you “plant” in a list to ensure that the company buying the list pays you for each use.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = This customer is a seed. <i>unselected</i> = This customer is not a seed.
	<p> Note:</p> <p>Flagging a customer as a seed on your house rental list does not prevent you from placing orders for the customer.</p>

Field	Description
Ghost	<p>A customer number that remains in the system after you merge duplicate customer records. Duplicate match codes can result when two customers have similar demographic information. For example, Gerald Smith and Geraldine Smith live at the same address. Duplicates may also occur during order entry when customers use variations of their first names on different orders. For example, John Jones places orders on two occasions, and gives John as his first name on one order, Jack as his first name on another order.</p> <p>When duplicate customers exist in the database, you can run a merge program that combines the duplicate customer information into a single (target) customer record. You can, optionally, retain the source customer as a ghost customer. See Working with Merge/Purge Sold-to Names (MMCS) for more information on the merge/purge function.</p> <p>If you enter a ghost customer number in order entry, a pop-up window warns you that the customer you entered is a ghost customer. If you press <i>Enter</i> to advance to the order header screen, the target customer defaults on the order. For example, if you enter 202, a ghost customer, the Ghost Customer Number Warning Window opens, informing you that customer 202 has been merged into customer 137. When you continue with the order process, customer 137 defaults on the Work with Order screen.</p> <p>Ghost customers do not display on any scan screens in order entry, order maintenance, order inquiry, catalog requests, customer maintenance, working with return authorizations, or working with customer memberships. If you enter a ghost customer number in any maintenance function, the system does not display any history, such as orders or catalog requests, because all history has been merged to the target customer.</p> <p>Valid values are:</p> <ul style="list-style-type: none">• <i>selected</i> = This is a ghost record.• <i>unselected</i> = This is not a ghost record.

 **Note:**

If this field is *selected*, you can change it; if you deselect, the system no longer considers the customer a ghost, and no pop-up window opens in order entry when you enter the customer's number.

If this field is *unselected*, you cannot change it; ghost customers can be created only when performing a merge/purge.

Field	Description
Associate	<p>Identifies whether the customer as an associate or member who is eligible to receive special pricing on merchandise. The Default Associate Code (D09) system control value determines the default value of field for new customers.</p> <p>Valid values are:</p> <ol style="list-style-type: none"> 1. <i>selected</i> = The customer is an associate customer. 2. <i>unselected</i> = The customer is not an associate customer. <p>Secured Feature The Change Associate Customer Flag (B10) secured feature controls whether you can change this entry; if you prohibit access to this feature, an error message indicates if you try to change the value: Not authorized to change Associate Customer.</p>
Birth Month/Day	<p>The sold to customer's birth month and birth day.</p> <p>Valid birth months are: Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec.</p> <p>Valid birth days are 1-31. The system validates the birth day against the selected birth month.</p> <p>The system stores the birth month and day in the Customer Sold To table. The birth year does not display on the screen; however, it defaults to 1900 in the Customer Sold To table unless it has been updated through the Customer Engagement Customer Integration.</p> <p>Birth Month: Numeric, 2 positions (01-12 in table); required if you define a birth day.</p> <p>Birth Day: Numeric, 2 positions; required if you define a birth month.</p> <p>Birth Year (in table only): Numeric, 4 positions; optional.</p>
Price discount %	<p>The discount applied automatically to the regular offer price for items on each order the customer places.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>If the customer has a Price discount % and is also flagged as an Associate (see above), then the system applies the Price discount % to the regular offer price, not to the associate price.</p> </div>
Price column	<p><i>Example:</i> Customer is flagged as an associate and also has a Price discount % of 10%. The regular offer price of an item is \$100.00, and the associate price is \$95.00. The system applies the 10% discount to the regular offer price of \$100.00, resulting in a price to the customer of \$90.00.</p> <p>Numeric, 5 positions with 2 place decimal; optional.</p> <p>The customer's pricing column.</p> <p>Items may be set up on the system with special (discounted) prices for different price columns. When the customer orders this item, the customer pays the discounted price automatically if the customer's pricing column and the item's pricing column are the same.</p> <p>Numeric, 2 positions; optional.</p>

Field	Description
Price group	<p>The customer price group to use for quantity price matrix pricing, customer price group pricing, or as a qualifier for a promotion. You can assign the price group through customer maintenance, or by passing the code through the order API or customer API.</p> <p>Customer price groups are defined in and validated against the Customer Price Group table.</p> <p>If you do not assign a customer price group to a customer, the system assigns the customer price group defined in the Customer Price Group Code for CPG Pricing Only (L58) system control value to the customer.</p> <p>For more information: See:</p> <ul style="list-style-type: none"> • Working with Customer Price Groups (WCPG) • Working with Quantity Price Matrix (WQPM) • Customer Price Group Pricing • Working with Promotions (WPRO) • Generic Order Interface (Order API) in the Order Administration Web Services Guide • Generic Customer API in the Order Administration Web Services Guide <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1)</p> <p>Alphanumeric, 4 positions; optional.</p>
Tax code	<p>The tax status of this customer. Valid values are:</p> <ul style="list-style-type: none"> • <i>Exempt</i> = The customer is not required to pay tax on purchases. If the order is shipping to a Canadian address, it is exempt from both GST and PST. • <i>GST Only</i> = The customer is a Canadian customer and subject to the Goods and Services Tax on purchases only, not PST. See Working with GST Tax Exemption Status (MGTX) for information on how tax is calculated in this case. • <i>Non Taxable</i> = The system determines the customer's tax status in order entry based on whether you enter a Resale/Exempt # and on the shipping address. • <i>PST Only</i> = The customer is a Canadian customer and subject to the Provincial Services Tax only, not GST. See Working with GST Tax Exemption Status (MGTX) for information on how tax is calculated in this case.

Field	Description
	<ul style="list-style-type: none"> • <i>Resale</i> = The customer is a reseller and not subject to tax. If the order is shipping to a Canadian address, it is exempt from both GST and PST. • <i>Standard Tax</i> = The customer is subject to all taxes. Canadian customers are subject to both GST and PST tax. <p>If you select a tax code of <i>Exempt</i> or <i>Resale</i>, an Tax identification is also required. The customer's tax code and tax identification number defaults in order entry. At that time the system validates that the customer's Expiration date (Tax identification expiration date), if one has been entered, has not passed; if so, an error message indicates that you need to change the customer's tax information before proceeding with the order.</p> <p>The tax-related fields on this screen override any information you enter for specific states or provinces. You should enter <i>either</i> customer-level tax information or state/province-level tax information. See Working with Customer Tax Status for a complete description of how customer tax information defaults in order entry. Required if a Tax identification code is entered.</p>
VAT number	<p>The customer's VAT exemption number. The system checks this field only if the Tax Included in Price (E70) system control value is <i>selected</i>; if so, and if the order would normally be subject to VAT, this number provides a VAT exemption for the customer. The VAT number is not subject to the Expiration date and cannot be overridden in order entry.</p> <p>See Working with Customer Tax Status for a complete description of how customer tax information defaults in order entry.</p> <p>Alphanumeric, 20 positions; optional.</p>
Tax identification	<p>The customer's tax identification number, typically the resale or exempt certificate number assigned to a customer who is identified as tax exempt (<i>E</i>) or as a reseller (<i>R</i>); otherwise, the tax identification number does not control taxability. Any combination of letters, numbers, or special characters is accepted.</p> <p>If you enter a tax identification number, the expiration date is also required.</p> <p>Alphanumeric, 30 positions; required if customer is defined as tax exempt or as a reseller.</p>
Expiration date (Tax identification expiration date)	<p>The date the customer's exempt or reseller tax identification expires. In evaluating the customer's tax status, either at the customer level or for a specific state, the system validates that any date entered in this field has not passed, or that this date is blank. See Working with Customer Tax Status for a complete description of how customer tax information defaults in order entry.</p> <p>Numeric, 6 positions (in user date format); required if a Tax identification code is entered.</p>

Field	Description
Pop up window messages 1-4	<p>Four optional message lines.</p> <p>Where do these messages display? These messages display on the:</p> <ul style="list-style-type: none"> • Customer Selection Screen as one 80-position field. Note: The system does not add or remove any spaces when displaying these messages as one 80-position field; enter the text as you wish it to display. For example: If a word ends at the end of a message, put a space at the beginning of the next message so that the next word is separated from the previous word. If a word splits between the end of one message and the beginning of the next message, do not add a space at the end of the first message or the beginning of the next message. • Display Pop Up Msgs For Window in order entry for this customer unless the customer advanced to the order from the Customer Selection Screen. <p>Secured feature: The Access to Customer Pop-up Messages (A79) secured feature controls whether you can create or change a customer message. If this secured feature is set to <i>*ALLOW</i>, you can create or change a customer message. If this secured feature is set to <i>*EXCLUDE</i>, the message fields are display-only.</p> <p>Alphanumeric, 20 positions each field; optional.</p>
Email address	<p>The customer's primary email address. This address, along with any other email addresses for the customer, is stored in the Customer Sold To Email table. A plus sign (+) indicates that there are additional email addresses on record for the customer. See Email Address Validation for information on how the system verifies that your entry is formatted correctly.</p> <p>Entering a new email address: If you overwrite the existing email address in this field, the system flags your entry as the primary email address for the customer, but retains the previous email address in the Customer Sold To Email table. In order to delete the previous email address from this table, you need to prompt in order to display the Select Customer Email Address Screen and delete the previous email address there. See Working with Customer Email Addresses for an overview.</p> <p>Deleting the email address: Similar to entering a new email address, if you delete the email address at this screen, the system removes the primary email flag for the address but retains the address in the Customer Sold To Email table. Follow the steps described above to delete the email address from this table.</p> <p>Defaulting in order entry: The customer's primary email address defaults in order entry. See Working with an Order-Level Email Address for an overview.</p> <p>Email notifications: See When Does the System Generate an Email Notification? for an overview of how the system determines when to generate an email notification to the customer, and which email address to use.</p> <p>Email format: See Email Address Validation for information on how the system verifies that your entry is formatted correctly.</p> <p>Alphanumeric, 50 positions; optional.</p>
Job title	<p>The customer's job title. This field is not currently implemented.</p> <p>Alphanumeric, 26 positions; optional.</p>

Field	Description
User fields (1-4)	Four additional fields you can use to enter any type of information about the customer. Alphanumeric, 10 positions per field; optional.

Screen Option	Procedure
Work with customer address information	Press <i>Page Up</i> to advance to the First Create Sold To Customer Screen , Change Customer Sold To screen (1 of 2), or the Display Customer Sold To screen (1 of 2), depending on whether you are creating, changing, or displaying a customer.
Work with ship-to customers	Select <i>Ship To's</i> to advance to the Work with Customer Ship Tos Screen .
Work with bill-to customers	Select <i>Bill To</i> . If the customer already has a bill-to customer, you advance to the Work with Bill To Customers Screen . If the customer does not already have a bill-to customer, you advance to the Create Bill-to Customer Screen .
Work with customer subscriptions	Select <i>Subscriptions</i> to advance to the Work with Subscriptions Screen .
Work with more customer sold to options	Select <i>More options</i> to advance to the More Customer Sold To Options Screen .
Work with contract pricing	Select <i>Contract Pricing</i> to advance to the Work with Contract Price Screen .
Work with customer tax status in specific states or provinces	Select <i>Customer Tax</i> to advance to the Working with Customer Tax Status . See Working with Customer Tax Status for an overview.
Review mail history	Select <i>Mail History</i> to advance to the Display Customer Mail History Screen . See Reviewing Customer History for an overview of customer history.
Enter and resolve customer actions	Select <i>Customer Actions</i> to advance to the Edit Customer Actions Window .
Work with customer profile	Select <i>Customer Profile</i> to advance to the Work with Customer Profile Screen .
Review item history	Select <i>Item History</i> to advance to the Customer Sold To Item History Screen . See Reviewing Customer History for an overview of customer history.
Review order history	Select <i>Order History</i> to advance to the Display Customer Order History Screen . See Reviewing Customer History for an overview of customer history.
Exclude customers from using certain payment methods	Select <i>Pay Type Excl.</i> to advance to the Exclude Pay Types By Customer Screen .
Work with customer notes	Select <i>Notes</i> to advance to the Edit Customer Notes Screen .

Changing Sold To Customers

To change: Select *Change* for a customer at a scan screen or enter a customer number at the [Select Customer Sold To Screen](#) to change it. You advance to the first Change Customer screen. Select *OK* at the first Change Customer screen to advance to the second Change Customer screen.

See [Selecting Customers](#) for more information.

Customer Workflow Management window: The [Customer Workflow Management Window](#) automatically opens when you select *Change* for a customer if open or in use ticklers exist for the sold to customer. Select *Ticklers* at this window to advance to the [Work with Ticklers Screen \(sold to customer view\)](#) where you can review and work with ticklers associated with the sold to customer.

Field descriptions: See [First Create Sold To Customer Screen](#) and [Second Create Customer Sold To Screen](#) for field descriptions.

Match code update: You can change customer information on either Change Customer screen. If you change any of the information that the system extracts for the match code, the match code is updated also.

Affected functions: Several functions are affected when you change sold to information:

- The system records the change in the Customer Address Change table. You can review address changes in this table by selecting *Previous Address* at a work with customer sold-to scan screen; see [Reviewing Customer Address Changes](#). The system also writes a line in the Customer Notes table about the nature of the change and the date.
- A pop-up window opens if the Sold-to customer is linked to a permanent Bill-to account and the Update Bill-to Address with Sold-to Address Changes system control value is *selected*. The pop-up window allows you to apply the Sold-to address changes to the Bill-to address. See [Display/Update Bill to Screen](#).

On the first Change Customer Sold To screen, you can change all the fields except the customer number, match code, or entered date.

On the second Change Customer Sold To screen, you can change all the fields except the customer number, customer name, original source code, or original mail type.

Display/Update Bill to Screen

Purpose: Use this screen to update a Bill-to address when you make changes to its linked Sold-to address.

You can also update bill-to address changes with sold-to address changes in the MBS Work table if the old address of the sold-to customer is an exact match of the old address of the bill-to customer. The MBS Work table includes address information from the National Change of Address (NCOA) Service. See [Loading Address Updates](#).

The system creates a permanent Bill-to record for a Sold-to customer when the person being billed for the order is different from the customer who placed the order.

See [Creating and Updating Bill-to Customers \(WCBT\)](#).

How to display this screen: You advance to this screen whenever you make a change to a customer linked to a bill-to account in customer maintenance or order

entry if the [Update Bill-to Address with Sold-to Address Changes \(E13\)](#) system control value is selected. See [First Create Sold To Customer Screen](#) for field descriptions.

Completing this screen: This screen displays the name and address of the Sold-to customer with its changes in the upper half of the window, and its linked Bill-to record without the changes in the bottom half of the window.

Select *Accept* to update the Bill-to address with the changes made to the Sold-to address; otherwise, select *Reject*.

The following Bill-to fields update when you change their linked Sold-to customer fields:

- prefix
- first name
- middle initial
- last name
- suffix
- company
- street
- apt/suite
- address line 2
- address line 3
- address line 4
- postal code
- city
- state
- country
- delivery code
- PO box
- day phone number/extension
- eve phone number/extension
- mobile or fax phone number/extension

More Customer Sold To Options Screen

Purpose: Use this screen to advance to additional options available when working with a sold to customer.

How to display this screen: Select *More options* at the [First Create Sold To Customer Screen](#), the [Second Create Customer Sold To Screen](#), or the related change or display customer maintenance screens.

Option	Procedure
Work with customer email addresses	Select <i>Customer Email Addresses</i> to advance to the Work with Customer Email Address Screen .

Option	Procedure
Work with customer email correspondence	Select <i>Customer Email Correspondence</i> to advance to the Work with Email by Customer Sold To Number Screen .
Work with customer address change history	Select <i>Customer Address Change History</i> to advance to the Display Address Changes Screen .
Work with customer user-defined fields	Select <i>Customer User Defined Fields</i> to advance to the Work with User Fields Screen .
Work with ticklers associated with the sold to customer	Select <i>Work with Ticklers</i> to advance to the Work with Ticklers Screen (sold to customer view) .
Work with customer ownership	Select <i>Customer Ownership</i> . <ul style="list-style-type: none"> • If the customer is currently associated with customer ownership records, you advance to the Work with Customer Ownership Screen. • If the customer is currently not associated with customer ownership records, you advance to the Create Customer Ownership Screen.
Work with alternate customer number cross references	Select <i>Work with Alternate Customer Cross Reference</i> to advance to the Work with Alternate Customer # Screen . See Working with Alternate Customer Number Cross-References for an overview.
Review promotions for which the customer is eligible	Select <i>Customer Promotions</i> to advance to the Display Customer Promotions Screen , where you can review promotions for which the customer is eligible through direct customer assignment and advance to subsequent screens providing information on promotions.
Review one-time use promotions applied to the customer's orders	Select <i>One Time Use Promotions</i> to advance to the Display One Time Use Promotions Screen .

Option	Procedure
Review the customer's loyalty account information	<p>Select <i>Loyalty Account</i>. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement.</p> <ul style="list-style-type: none"> • If Oracle Retail Customer Engagement finds a loyalty card assigned to the customer, the system advances you to the <i>Display Loyalty Account Screen</i>. If more than one loyalty card is assigned to the customer in Oracle Retail Customer Engagement, the system displays loyalty account information for the first card assigned to the customer. • If Oracle Retail Customer Engagement does not find a loyalty card for the customer, the system advances you to the <i>Customer Loyalty Registration Window</i>, where you can select to enroll the customer in the Oracle Retail Customer Engagement Loyalty program. • If a Relate ID is not defined for the customer in the Customer Sold To table, the system displays an error message similar to the following: This customer does not have a Loyalty card. • If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.

 **Note:**

This option displays only if the *Use ORCE Loyalty (M06)* system control value is selected; see *Customer Engagement Loyalty Integration*.

Option	Procedure
Review the customer's purchase history from Oracle Retail Customer Engagement	<p>Select <i>Purchase History</i>. When you select this option, the system retrieves the sold to customer's information from Oracle Retail Customer Engagement and advances you to the <i>Display Purchase History Screen</i> where you can review the completed sales and returns transactions from Oracle Retail Customer Engagement.</p> <p>If a connection could not be made to Oracle Retail Customer Engagement, the system displays an error message similar to the following: Unable to connect to ORCE.</p>

 **Note:**

This option displays only if the *ORCE Customer Integration (L37)* system control value is set to *INTERACT*; see *Customer Engagement Purchase History Integration*.

Work with Ticklers Screen (sold to customer view)

Purpose: Use this screen to review, work with, and resolve ticklers associated with a sold to customer.

Secured feature: If you do not have authority to the *Update All Ticklers (B09)* secured feature, you cannot update a tickler that is not assigned to you or your tickler groups or an error message indicates: `Not authorized to change.`

This secured feature controls updating a tickler by:

- selecting *Change* for a tickler to change it.
- selecting *Delete* for a tickler to delete it.
- selecting *In process* for a tickler to assign the tickler to yourself.
- selecting *Resolve* for a tickler to resolve it.

If you do not have access to this feature, you can update only ticklers assigned to you or your tickler groups. However, you can still release an order associated with the tickler from hold.

See *Workflow Management Overview and Setup* for an overview and required setup for workflow management processing.

How to display this screen:

- select *Cust sold to* at the *Work with Ticklers Screen (order view)*.
- select *Ticklers* at the *Customer Workflow Management Window* (which opens when you advance to the *Changing Sold To Customers* screen or *Select Orders For Return Authorization Screen*).
- select the *Work with Ticklers* option from the *More Customer Sold To Options Screen*.

Field	Description
Sold to	The number and description of the sold to customer associated with the ticklers on this screen. Sold to number: Numeric, 9 positions; display-only. Sold to description: Alphanumeric, 40 positions; display-only.
S (tickler status)	The status of the tickler. Valid values: <ul style="list-style-type: none"> • <i>Open</i> = Open; the tickler is open and is available to work on in the assigned tickler work queue. • <i>In Process</i> = In process; the tickler is currently being worked on by the assigned user. • <i>Resolved</i> = Resolved; the tickler has been resolved. Optional.
P (tickler priority)	The priority of the tickler, indicating how important the issue associated with the tickler is to resolve (1 is the lowest priority and 9 is the highest priority). Numeric, 1 position; optional.
Assigned (assign date)	The date the tickler was assigned to the user or tickler user group. Numeric, 7 positions (in user date format); optional.
Ev (tickler event code)	The code for the tickler event that created the tickler. Valid values: <ul style="list-style-type: none"> • <i>BO</i> = Backorders • <i>CO</i> = Cancelled orders • <i>HO</i> = Held orders • <i>MN</i> = Manually created • <i>NO</i> = New orders • <i>OO</i> = Aged open orders • <i>SO</i> = Sold out orders • <i>UP</i> = Unconfirmed pick tickets • <i>VP</i> = Voided pick tickets • <i>WF</i> = Remote workflow See System Delivered Tickler Events . Alphanumeric, 2 positions; optional.
Cat (tickler category)	The tickler category assigned to the tickler. Tickler categories are defined in and validated against the Tickler Category table; see Working with Tickler Category (WTCT) . Alphanumeric, 3 positions; optional.
Tickler#	The tickler number assigned to the tickler, from the Tickler Number number assignment record. Numeric, 9 positions; optional.
User group	The group ID of the tickler user group assigned to the tickler. Tickler user groups are defined in and validated against the Tickler User Group table; see Working with Tickler User Groups (WTUG) . Tickler group ID: Alphanumeric, 10 positions; display-only.
User	The user ID of the user assigned to the tickler. Users are defined in and validated against the User table; see Working with User Records (WUSR) . User ID: Alphanumeric, 10 positions; display-only.

Field	Description
Sts (order status)	<p>The status of the order.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <i>blank</i> = open • <i>A</i> = archived to optical disk. This option is not currently implemented. • <i>C</i> = cancelled • <i>H</i> = held Note: The system highlights the held status in a different color (for example fuchsia) if the sold to customer is a new customer, based on purchase history. A new customer has placed an order, but no orders have shipped (# orders LTD is equal to or greater than 1 and # sales LTD is equal to 0 in the Customer Sold To Order History table). • <i>P</i> = purged • <i>S</i> = suspended • <i>X</i> = closed <p>Alphanumeric, 1 position; display-only.</p>
Order #	<p>The order associated with the tickler.</p> <p>Numeric, 9 positions; display-only.</p>
Bill to	<p>The bill to customer associated with the tickler.</p> <p>Numeric, 9 positions; display-only.</p>

Screen Option	Procedure
Change a tickler	Select <i>Change</i> for a tickler to advance to the Change Tickler Screen .
Delete a tickler	<p>Select <i>Delete</i> for a tickler to delete it.</p> <p>You can only delete <i>MN</i> (manually created) ticklers.</p>
Display a tickler	Select <i>Display</i> for a tickler to advance to the Display Tickler Screen. See the Change Tickler Screen for field descriptions.
Release the order associated with the tickler from hold	<p>Select <i>Release</i> for a tickler to advance to the Release Reason Prompt Pop-Up Window (order header hold), Release Recipient Hold Reason Pop-Up Window (recipient hold), and/or Release Order Payment Method Window (pay type hold).</p> <p>If you release an order from hold for an <i>HO</i> (held order) tickler, the system automatically resolves the tickler. Also, the system evaluates any other ticklers associated with the order to determine if they can be resolved.</p>

Screen Option	Procedure
	<p>If you select <i>Release</i> for a tickler not associated with a held order, an error message indicates: Order not on hold.</p> <p>If you select <i>Release</i> for a tickler not associated with an order, an error message indicates: Tickler not eligible for this option.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>You must have authority to the Release Held Orders (ERHO) menu option to release the order from hold.</p> </div>
Select a tickler to work on	<p>Select <i>In process</i> for a tickler to change the status of the tickler from open (<i>O</i>) to in use (<i>I</i>).</p> <p>You can only select to work with a tickler that is in an open status; if you select <i>In process</i> for a tickler that is in an in use (<i>I</i>) or resolved (<i>R</i>) status, an error message indicates: Tickler status cannot be changed - resolved or already in process.</p> <p>Selecting this option automatically assigns the tickler to the user and creates a tickler history record.</p>
Enter or review tickler work notes	<p>Select <i>Notes</i> for a tickler to advance to the work notes screen, based on the note type defined for the tickler.</p> <p>Note type <i>A</i> advances you to the Edit Customer Actions Window.</p> <p>Note type <i>B</i> advances you to the Work with Bill To Notes Screen.</p> <p>Note type <i>O</i> advances you to the Work with Order Messages Screen.</p> <p>Note type <i>S</i> advances you to the Edit Customer Notes Screen.</p> <p>Note type <i>T</i> advances you to the Work with Tickler Notes Screen.</p>
Review the tickler source	<p>Select <i>Detail</i> for a tickler to advance to the source screen, based on the tickler event associated with the tickler.</p> <p><i>BO, CO, HO, NO, OO, SO, UP, VP, and WF</i> ticklers advance you to the Order Inquiry Header Screen.</p> <p>You cannot view the source for <i>MN</i> ticklers: Requested tickler has no source reference.</p>
Review tickler history	<p>Select <i>History</i> for a tickler to advance to the Work with Tickler History Screen.</p>
Resolve a tickler	<p>Select <i>Resolve</i> for a tickler to advance to the Resolve Tickler Window.</p>

Screen Option	Procedure
Review procedures for a tickler	Select <i>Procedure</i> for a tickler to advance to the Work with Tickler Event Rule Procedure Screen . You cannot add or change tickler procedures when you advance from the Work with Tickler screen. You cannot review procedures for <i>MN</i> ticklers.
Create a tickler for the <i>MN</i> (manually created) tickler event	Select <i>Create</i> to advance to the Create Tickler Screen .
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>To create a <i>MN</i> tickler, you must have authority to the Create Manual Tickler (B13) secured feature.</p> </div>
Review the number of ticklers in the work queue, based on the selection criteria you have defined	Select <i>Count</i> to advance to the Current Tickler Count Window .
Toggle between displaying open and in use ticklers or resolved ticklers	Select <i>Open/Resolved</i> . The system toggles between displaying: <ul style="list-style-type: none"> • ticklers in an open or in process status. • tickler in a resolved status.

Display Customer Promotions Screen

Purpose: Use this screen to review promotions for which the customer is eligible through direct customer number assignment, or advance to subsequent screens providing more information on promotions for which the customer is eligible.

 **Note:**

This screen does not display all promotions for which the customer might be eligible through source code, offer, order total, or other criteria; it lists promotions only if the customer is assigned directly by customer number.

For more information: See [Working with Promotions \(WPRO\)](#).

How to display this screen: Select *Customer Promotions* at the [More Customer Sold To Options Screen](#).

Field	Description
Promotion	A code to identify a promotion for which the customer is eligible through direct customer number assignment. Alphanumeric, 7 positions; optional.
Description	The description of the promotion. Alphanumeric, 30 positions; display-only.

Field	Description
Start date	The date when the promotion first becomes effective. Numeric, 6 positions (in user date format); display-only.
End date	The last date when the promotion is effective. Numeric, 6 positions (in user date format); display-only.
Type	The type of promotion. Valid values are: <ul style="list-style-type: none"> • <i>Additional freight</i> • <i>BOGO</i> • <i>Freight</i> • <i>Item Category</i> • <i>Order</i> • <i>Tiered discount</i> • '' = messaging or reporting promotion Display-only.

Option	Procedure
Display promotions for which the customer is eligible through a customer price group	Select <i>Promotions by Price Group</i> to advance to the Display Customer Price Group Promotions Screen .
Display or work with all promotions	Select <i>Promotions</i> to advance to the Work with Promotions Screen .

 **Note:**

This option is available only if the customer is assigned to a customer price group that is assigned to a promotion.

Display Customer Price Group Promotions Screen

Purpose: Use this screen to review promotions for a customer price group. When you display this screen through:

- **Work with Customers:** This screen is available only if the customer is eligible for one or more promotions through customer price group assignment.

 **Note:**

This screen does not display promotions for which the customer is eligible through other criteria besides customer price group. Promotions for which the customer is eligible through direct customer number assignment are listed at the [Display Customer Promotions Screen](#). Other promotions for which the customer might be eligible through other criteria, such as source code, offer, or total order value, are not listed at either of these screens.

- **Work with Customer Price Group:** This screen displays promotions to which the customer price group is assigned.

For more information: See [Working with Promotions \(WPRO\)](#).

How to display this screen:

- Select *Promotions by Price Group* at the [Display Customer Promotions Screen](#).
- Select *Promotions* for a customer price group at the [Work with Customer Price Groups Screen](#).

Field	Description
Promotion	A code to identify a promotion for which the customer you are reviewing is eligible through customer price group assignment, or to which the customer price group you are reviewing is assigned. Alphanumeric, 7 positions; optional.
Description	The description of the promotion. Alphanumeric, 30 positions; display-only.
Start date	The date when the promotion first becomes effective. Numeric, 6 positions (in user date format); display-only.
End date	The last date when the promotion is effective. Numeric, 6 positions (in user date format); display-only.
Type	The type of promotion. Valid values are: <ul style="list-style-type: none"> • <i>Additional freight</i> • <i>BOGO</i> • <i>Freight</i> • <i>Item Category</i> • <i>Order</i> • <i>Tiered discount</i> • '' = messaging or reporting promotion Display-only.

Option	Procedure
Display or work with all promotions	Select <i>Promotions</i> to advance to the Work with Promotions Screen .

Display One Time Use Promotions Screen

Purpose: Use this screen to review the one-time-use promotions used by the customer.

About one-time-use promotions: You can use the [Use once](#) field to flag a promotion for one-time use, indicating that a customer cannot use the same promotion to discount more than one order. You can also override the one-time-use restriction in order entry if you have the required authority under the [Override One Time Use Promotion \(J08\)](#) secured feature. See [Working with Promotions \(WPRO\)](#) for more general information on promotions, and see [Cautions for One-Time-Use Promotions](#) for additional notes.

How to display this screen: Select the *One Time Use Promotions* option at the [More Customer Sold To Options Screen](#).

Field	Description
Customer	A number to identify the customer, the customer's name, and the company name, if any. Customer number: numeric, 9 positions; display-only. Customer company and name: alphanumeric, 41 positions; display-only.
Date	The order date, which might differ from the entered date. Numeric, 6 positions (in user date format); display-only.
Order #	A unique number assigned by the system to identify the order and ship-to. Order number: numeric, 8 positions; display-only. Ship-to: numeric, 3 positions; display-only.
Promotion	The code identifying the promotion. A promotion is listed on this screen for each order on which it was applied. Promotion codes are defined in and validated against the Promotion table; see Working with Promotions (WPRO) for more information. Alphanumeric, 7 positions; display-only.
Description	The description of the promotion, as set up through Working with Promotions (WPRO) . Alphanumeric, 30 positions; display-only.
Type	The type of promotion. Possible types are: <ul style="list-style-type: none"> • Additional freight • BOGO • Freight • Item Category • Order • Tiered discount See Working with Promotions (WPRO) for a discussion of each type.

Introducing Return Authorizations (WRTA)

Purpose: The Work with Return Authorizations (WRTA) menu option processes returns in three stages:

- Creating the return authorization record
- Receiving the returned merchandise
- Crediting the return

The stages in the return authorization process are explicit; in this way, the return authorization menu option provides you with greater efficiency and control.

You might prefer to use the Work with Return Authorization menu option to process returns if you need different staff members in different locations to perform updates separately, or to enable staff to process returns without giving them authority to the additional functionality in order maintenance.

Secured features: A separate secured feature controls the ability to perform each step of the return process. For example, an operator might have authority to create and receive a return, but not to perform the credit.

- [Enter Return Authorization \(A28\)](#)
- [Receive Return Authorization \(A29\)](#)
- [Credit Return Authorization \(A34\)](#)

Standard or streamlined return processing: The [Use Streamlined Return Authorizations \(F44\)](#) system control value controls whether you must perform the create, receipt, and credit as separate steps, or whether the return is automatically processed as far as your authority extends.

Return authorization download triggers: If the [Create Return Download Triggers \(K28\)](#) system control value is *selected*, the system creates a return authorization download (RAD) trigger when you create, change, or delete a return authorization line in the Work with Return Authorizations (WRTA) menu option, based on the trigger rules defined for the Return Authorization Download (RETURN_OUT) integration layer job. The RETURN_OUT integration layer job monitors for return authorization download triggers and generates a Return Authorization Outbound XML Message (CWReturnRAOut) to send the return authorization information to a remote system.

Retail pickup or delivery orders: You can process a return against a retail pickup or delivery order; however, shipping the order deactivates the [Order Broker Payment Type \(K98\)](#) applied to these orders, so you would then need to enter a new payment method in order to process the related refund.

**Note:**

You cannot process an exchange against a retail pickup or delivery order.

The system does not send a status update to Order Orchestration when you process a return against a retail pickup or delivery order.

See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview.

Store pickup orders: You cannot process a return against a store pickup order. See [Store Pickup Orders](#) for an overview.

Pick slip preparation: When you select an order for return authorization, the system removes any pick slip preparation from the order. When you accept or reject the return authorization, the system determines if the order qualifies for pick slip preparation and reapplies it to the order. If you add an exchange item to the order, the system performs pick slip preparation for the exchange item when you receive the return authorization. See [Preparing Orders for Pick Slip Generation](#).

Credit card net exchange billing: If the [Use CC Net Exchange Billing \(M23\)](#) system control value is selected and the order contains a credit card pay type, the system may hold the credit invoice for the return to net it against the debit invoice for the associated exchange in order to reduce the number of transactions that occur for an exchange; see [Credit Card Net Exchange Billing](#).

In this topic: This topic presents a conceptual overview of the return authorization process, briefly discussing each stage and its effect on system tables:

- [Understanding the Return Authorization Process](#)
- [Standard Return Authorization Process](#)
- [Streamlined Return Authorization Process](#)

- [Posting Returns Outside of Work with Return Authorizations](#)

Understanding the Return Authorization Process

Three stages: Before reviewing your different options in processing returns through the return authorization options, it is important to understand the three stages of a return. These three stages occur "behind the scenes" when you process a return through order maintenance; however, the return authorization options allow you to separate and control them.

Stage 1: Creating the return: The first step in processing a return is to create the return authorization record. This occurs whenever you process a return through either Work with Return Authorizations or order maintenance; however, in order maintenance, it occurs automatically "behind the scenes." At this point, the system also writes a message to order history.

- *Return or exchange:* The return authorization can be either a straight return (specify a return reason code), or an exchange (specify an exchange reason code).
- *Exchange item information:* When you process an exchange you need to supply information about the exchange item. The [Require Exchange Item at Time of Receipt \(F42\)](#) system control value controls the point when you must supply this information (that is, at the time of creating or receiving the return).
- *Multiple returns against an order line:* You can process multiple returns or exchanges against the same order line. For example, if a customer returns one unit because it is defective and wishes to exchange another unit for a different color, you can create two separate return authorizations for the item using a return reason code and an exchange reason code. Similarly, if the customer is returning two units for two different reasons, you can create two separate return authorizations for the item using the different return reason codes.
- *Returning the entire order:* You can also create a return authorization against all shipped, unreturned items on the order at once.

Stage 2: Receiving returned merchandise: The second step in processing the return is to receive the returned item into your warehouse. At this point, the receipt is processed through the ORDR_ASYNC job, which updates:

- inventory for the item, including increasing on-hand in the item location and item warehouse, and adding an inventory transaction history record
- the order, including the order detail and order line history
- in the case of an exchange, adds the exchange item to the order
- in the case of a misshipped item, adds the returned item to the order
- the return authorization header and detail

Adding an exchange item to the order: When you process an exchange, adding the exchange item reopens the order if it was closed. Adding a new line causes the order to move through the normal processing routines, which may cause the order to go on hold if, for example, the exchange item has a higher price and the customer paid by check. See [Releasing Held Orders](#).

Stage 3: Processing the credit: The third and final step in processing the return is to credit the customer for the return. At this point, the credit is processed through the ORDR_ASYNC and BILL_ASYNC jobs, which update:

- the order, including order history, and creating the credit invoice and refund, if appropriate

- the return reason or exchange reason history for the offer
- the return authorization header and detail record.

Note:

Refunds can be either positive (you owe the customer money) or negative (the customer owes you money).

Standard Return Authorization Process

Summary: If the [Use Streamlined Return Authorizations \(F44\)](#) system control value is *unselected*, the return authorization process after you select an order consists of:

1. creating one or more return authorizations
2. receiving the return(s) as a separate step
3. crediting the return(s) as a separate step

You can perform all three steps through the Work with Return Authorization menu option. You can also perform the receipt and credit separately, using the [Receiving Returns \(WRAR\)](#) and [Crediting Returns \(WRAC\)](#) menu options respectively.

For more information:

- [Selecting Orders for Return \(WRTA\)](#)
- [Working with Return Authorizations: Standard Process](#)

Streamlined Return Authorization Process

Summary: If the [Use Streamlined Return Authorizations \(F44\)](#) system control value is *selected*, the return authorization process after you select an order consists of selecting one or more items to return or exchange. At this time, the return is processed as far as your authority extends. For example, if you have create and receive but not credit authority, the return is automatically created and received at this time.

Once a return authorization has been created, or created and received, by one operator, another operator with greater authority must complete the return authorization processing.

For more information:

- [Selecting Orders for Return \(WRTA\)](#)
- [Working with Return Authorizations: Standard Process](#)
- [Working with Return Authorizations: Streamlined Process](#)
- [Receiving Returns \(WRAR\)](#)
- [Crediting Returns \(WRAC\)](#)

Posting Returns Outside of Work with Return Authorizations

You can post returns outside of the Work with Return Authorizations (WRTA) menu option using the following methods.

- [Posting Returns in Order Entry](#)

- [Posting Returns using the Order API](#)
- [Posting Returns in Order Maintenance](#)
- [Posting Returns using the Inbound Return API](#)

Posting Returns in Order Entry

You can post a return in order entry by entering an order line with a negative quantity for the number of units of the item being returned.

When you post a return in order entry, the system performs the following updates:

Table	Description
RA Header table	Creates a record in the RA Header table unless the Use Streamlined Return Authorizations (F44) system control value is <i>selected</i> and the Create Return Download Triggers (K28) system control value is <i>unselected</i> .
RA Detail table	Creates a record for each negative order line on the order in the RA Detail table if the Create Return Download Triggers (K28) system control value is <i>selected</i> .
WRTA	Displays the posted return in the Work with Return Authorizations (WRTA) menu option only if the Use Streamlined Return Authorizations (F44) system control value is <i>unselected</i> and the Create Return Download Triggers (K28) system control value is <i>selected</i> . The return is entered, received, and credited.
RAD Trigger	Creates a return authorization download (RAD) trigger for each order line returned if the Create Return Download Triggers (K28) system control value is <i>selected</i> .

For more information: See [Posting a Return or Exchange Through Order Entry](#) for an overview and instructions.

Posting Returns using the Order API

You can post a return through the Order API by entering an order line with a negative quantity for the number of units of the item being returned.

When you post a return through the Order API, the system performs the following updates:

Table	Description
RA Header table	Creates a record in the RA Header table unless the Use Streamlined Return Authorizations (F44) system control value is <i>selected</i> and the Create Return Download Triggers (K28) system control value is <i>unselected</i> .
RA Detail table	Creates a record for each negative order line on the order in the RA Detail table if the Create Return Download Triggers (K28) system control value is <i>selected</i> .
WRTA	Displays the posted return in the Work with Return Authorizations (WRTA) menu option only if the Use Streamlined Return Authorizations (F44) system control value is <i>unselected</i> and the Create Return Download Triggers (K28) system control value is <i>selected</i> . The return is entered, received, and credited.

Table	Description
RAD Trigger	Creates a return authorization download (RAD) trigger for each order line returned if the Create Return Download Triggers (K28) system control value is <i>selected</i> .

For more information: See *Processing a Return* in the *Generic Order Interface (Order API)* for an overview and instructions.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Posting Returns in Order Maintenance

You can post a return in order maintenance by selecting *Return* for an order line (to return an individual item) or by selecting *Return Order* for the order (to return the entire order).

When you post a return in order maintenance, the system performs the following updates:

Table	Description
RA Header table	Creates a record in the RA Header table for the posted return. The RA is entered, received, and credited.
RA Detail table	Creates a record for each order line returned in the RA Detail table. The RA detail is returned and credited.
WRTA	Displays the RA and RA lines in the Work with Return Authorizations (WRTA) menu option. The RA is entered, received, and credited. If the Use Streamlined Return Authorizations (F44) system control value is <i>selected</i> , the RA displays only if there are remaining lines on the order that are eligible for return. In addition, you cannot view the RA lines.
RAD Trigger	Creates a return authorization download (RAD) trigger for each order line returned if the Create Return Download Triggers (K28) system control value is <i>selected</i> .

In addition, you can also post a return in order maintenance by entering an order line for a negative quantity for the number of units being returned; see [Posting Returns in Order Entry](#) for more information on the updates that occur for a negative order line.

For more information: See [Returning and Exchanging Items in Order Maintenance](#) for an overview and instructions.

Posting Returns using the Inbound Return API

You can use the *Inbound Return API* to create and process a return against an order detail line, based on a *Return Request Message (CWReturnIn)* received from an external system.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

When you post a return through the inbound Return API, the system performs the following updates:

Table	Description
RA Header table	Creates a record in the RA Header table for the posted return.
RA Detail table	Creates a record for each order line returned in the RA Detail table.
WRTA	Displays the posted return in the Work with Return Authorizations (WRTA) menu option. The return is entered, received, and credited.
RAD Trigger	Does not create a return authorization download (RAD) trigger, regardless of the setting of the Create Return Download Triggers (K28) system control value.

For more information: See *Inbound Return API* in the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for an overview and instructions.

Using the Order Inquiry Scan Screens (OIOM)

Purpose: You use Order Inquiry primarily when you want to answer questions about an order, such as:

- What is the status of the order?
- What is the status of an item on the order? Has the item shipped?
- Why is the order on hold?
- What was the reason for an exchange?
- What form of payment was used for an order?
- When is a backordered item expected to be available to ship?

Quotes: You can also use Order Inquiry to review quotes; see [Entering Pre-Order Quotes](#) for an overview and required setup.

All Order Inquiry screens use display mode, which means that you cannot change the information you see on these screens. However, if you have the appropriate authority, you can switch to Order Maintenance to update an order.

Streamlined order inquiry: As an alternative to standard order inquiry, the [Streamlined Order Inquiry \(DORI\)](#) option provides fewer search criteria and a consolidated, one-page view of the order.

In this topic:

- [Order Inquiry Scan Screen](#)
 - [Cross-Company Scanning](#)
- [Advancing from the Initial Order Inquiry Scan Screen](#)
 - [Scan Screens by Customer](#)
 - [Scan Screens by Order](#)
- [Scanning Paths by Field](#)
- [Customer Sold To Scan Screens](#)
- [Order Scan Screens](#)
- [Display Customer Sold To Screen \(Reviewing Summary Information\)](#)

Order Inquiry Scan Screen

Use this screen to find a quote or order using whatever information you have. This screen is your principle point of access to the Order Inquiry function.

How to display this screen: Enter *OIOM* in the Fast path field on any menu or select Order Inquiry/Order Maintenance from a menu.

How to scan: You can use any field on the Order Inquiry scan screen to help you find the quote or order you want. For example, if you enter an order status of *Closed*, you advance to a screen that lists all closed orders. If you enter a customer's last name, a screen displays that lists customers alphabetically starting with the name you entered.

Each of the fields available for scanning at the [Order Inquiry Scan Screen](#) is unique, but the scanning process falls into one of three main groups:

1. initially scanning based on what you know about the customer, then selecting one of that customer's quotes or orders. See [Scan Screens by Customer](#).
2. scanning based on what you know about the quote or order itself. See [Scan Screens by Order](#).
3. entering exact information about a quote or order, such as the quote or order number, invoice number, or exact tracking number, which brings you directly to the [Order Inquiry Header Screen](#).

Retaining scan entries: If you enter a quote or order number in the Order # field, you advance directly to the quote or order; when you return to the Order Inquiry Scan screen the quote or order number you entered and the customer sold to number associated with the quote or order displays on the screen, allowing you to scan for other quotes or orders associated with the customer.

Example: If you enter order number 5600 in the Order number field, the system advances you to the Order Inquiry Header screen where you can review the sold to customer on the order (in this example, sold to customer 6 is associated with the order). If you return to the Order Inquiry Scan screen, order number 5600 displays in the Order # field and customer sold to number 6 displays in the Sold to customer field.

Note:

The system does not retrieve the sold to customer number for any other scan fields on the Order Inquiry Scan screen; for example if you scan for a quote or order by order status, the system does not display the sold to customer number when you return to the Order Inquiry Scan screen. Additionally, the system retrieves the quote or order number and sold to customer number only if you select *Cancel* to return to the Order Inquiry Scan screen; if you select *Exit*, the system does not display the quote or order number and sold to customer number on the Order Inquiry Scan screen.

Cross-Company Scanning

If you are working within a company set up for cross-company scanning, you can scan for customers in any other company that has a similar setup in the Company table. (See [Working with Companies \(WCMP\)](#) for more information on working with companies.)

You can scan for customers across companies with these fields:

- Postal code
- Match code
- Postal code, restricted by Company name
- Postal code, restricted by Customer name

When you scan on any of these fields, you advance to a subsequent customer scan screen displaying information, including the company code, of customers that match your entry. You cannot scan by Company name or Customer name alone; however, you can restrict your scan on Postal code by your entry in either field.

If you advance to Order Inquiry for a customer from a different company, all of the system control values from the new company will be in effect. You can review the order or perform Order Maintenance. When you exit the order, you will return to your default company.

Field	Description
Order #	<p>A combination of quote or order number and ship to record number. The system assigns a unique number to every quote and order created through Order Entry.</p> <p>To scan on this field, enter a valid quote or order number and, optionally, a ship to number. You advance directly to the Order Inquiry Header Screen for this quote or order.</p> <p>If you return to the Order Inquiry Scan screen after reviewing the quote or order, the quote or order number you entered and the customer sold to number associated with the quote or order displays on the screen.</p> <p><i>Example:</i> If you enter order number 5600 in the Order number field, the system advances you to the Order Inquiry Header screen where you can review the sold to customer on the order (in this example, sold to customer 6 is associated with the order). If you return to the Order Inquiry Scan screen, order number 5600 displays in the Order # field and customer sold to number 6 displays in the Sold to customer field.</p>

 **Note:**

The system does not retrieve the sold to customer number for any other scan fields on this screen; for example if you scan for an order by order status, the system does not display the sold to customer number when you return to the Order Inquiry Scan screen. Additionally, the system retrieves the quote or order number and sold to customer number only if you select *Cancel* to return to the Order Inquiry Scan screen; if you select *Exit*, the system does not display the quote or order number and sold to customer number on the Order Inquiry Scan screen.

Order number: numeric, 8 positions; optional.

Ship-to number: numeric, 3 positions; optional.

It is common to use the Postal code, Last name, First name, and Company name fields together when searching for a quote or order. For example, you may want a listing of orders for a specific postal code and last name.

Field	Description
Postal code	<p>The customer's postal or zip code.</p> <ul style="list-style-type: none"> Enter a full or partial postal code or postal code and company name to advance to the Scan Sold To by Postal Code/Company screen. This screen lists all customers by postal code in ascending (lowest to highest) numeric sequence, beginning with the code you entered. Enter a full or partial postal code and last name or postal code, last name, and company name to advance to the Scan Cust Sold To by Postal Code screen. This screen lists all customers alphabetically beginning with the postal code you entered. <p>See Customer Sold To Scan Screens.</p> <p><i>Scan length:</i> The Postal Code Scan Length (F61) system control value controls how many characters of the postal code to use when searching for a customer. See that system control value for a discussion.</p> <p>You can scan for customers across companies with the postal code field if cross-company scanning is set up. See Cross-Company Scanning.</p> <p>Alphanumeric, 10 positions; optional.</p>
Last name	<p>The name of the customer who placed the quote or order.</p> <ul style="list-style-type: none"> Enter a full or partial last name or last name and first name to advance to a Scan Cust Sold To By Last Name screen. This screen lists all customers alphabetically beginning with the name you entered. Enter a full or partial last name and postal code to advance to the Scan Cust Sold To by Postal Code screen. This screen lists all customers alphabetically beginning with the postal code you entered. <p>See Customer Sold To Scan Screens.</p> <p>Alphanumeric, 25 positions; optional.</p>
First name	<p>The first name of the customer who placed the quote or order.</p> <ul style="list-style-type: none"> Enter the last name, first name, and postal code to advance to the Scan Customer Sold To by Postal Code screen. This screen lists all customers alphabetically beginning with the postal code you entered. Enter a full last name and full or partial first name to advance to the Scan Cust Sold To By Last Name screen. This screen lists all customers alphabetically beginning with the name you entered.

 **Note:**

First name must be used in conjunction with Postal code, Last name or with just Last name for scanning. You cannot scan on first name alone.

See [Customer Sold To Scan Screens](#).

Alphanumeric, 15 positions; optional.

Field	Description
Company name	<p>The name of the company associated with the quote or order.</p> <ul style="list-style-type: none"> • Enter a full or partial company name to advance to the Scan Cust Sold To By Company Name screen. This screen lists all customers alphabetically by company name, beginning with the name you entered. • Enter a postal code and company name to advance to the Scan Sold To by Postal Code/Company screen. This screen lists all customers by postal code in ascending (lowest to highest) numeric sequence, beginning with the code you entered. • Enter a postal code, last name, and company name to advance to the Scan Cust Sold To by Postal Code screen. This screen lists all customers alphabetically beginning with the postal code you entered. <p>See Customer Sold To Scan Screens.</p> <p>Alphanumeric, 30 positions; optional.</p>
Phone number	<p>The customer's daytime, evening, or third (fax or mobile) telephone number.</p> <p>Enter information in one or more of the phone number fields to advance to the Scan Cust Sold To by Phone # screen. This screen lists customers in ascending order by phone number, beginning with the phone number you entered. See Customer Sold To Scan Screens.</p> <p>You can define a telephone number format for each country to map to the phone numbers operators enter into the system. See Setting Up the Country Table (WCTY).</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Your entry should include any formatting specified by the telephone number format for the country; for example, if the telephone number format for the United States is (111) 111-111, your entry should include the parentheses and hyphen.</p> </div>
Pick control #	<p>Alphanumeric, 14 positions; optional.</p> <p>A code the system assigns to each batch of pick slips.</p> <p>Enter a pick control number that has been billed to advance to the Scan Orders By Pick Control # screen. From this screen you can also use options to display the Invoice Detail and Invoice Detail Pay Methods screens. See Reviewing Financial Information on an Order.</p>
Card number	<p>Numeric, 7 positions; optional.</p> <p>The card number the customer used on the quote or order. Information will be provided by Oracle at a later date.</p> <p>Alphanumeric, 20 positions; optional.</p>

Field	Description
User	<p>The user ID of the person or process that created the quote or order. This is the Entered by field at the Order Inquiry Scan Screen.</p> <p>Enter a valid user ID or prompt to advance to the Scan by User screen. See Order Scan Screens.</p> <p>Entering a partial user ID is not supported.</p> <p>User ID's are defined in and validated against the User table. See Working with User Records (WUSR) for more information.</p> <p>Alphanumeric, 10 positions; optional.</p>
Sold to customer	<p>A unique number that identifies the customer who placed the quote or order.</p> <p>Enter a valid customer number to advance to the Scan Orders by Customer screen. If there is only one quote or order for this customer, you advance directly to Order Inquiry for the quote or order. See Order Scan Screens.</p> <p>If you scan for a quote or order by entering its number in the Order # field and then return to the Order Inquiry Scan screen after reviewing the quote or order, the number you entered and the customer sold to number associated with the quote or order displays on the screen.</p> <p><i>Example:</i> If you enter order number 5600 in the Order number field, you advance to the Order Inquiry Header screen where you can review the sold to customer on the order (in this example, sold to customer 6 is associated with the order). If you return to the Order Inquiry Scan screen, order number 5600 displays in the Order # field and customer sold to number 6 displays in the Sold to customer field.</p>

 **Note:**

The system does not retrieve the sold to customer number for any other scan fields on this screen; for example if you scan for an order by order status, the system does not display the sold to customer number when you return to the Order Inquiry Scan screen.

Ghost customers: If you enter the customer number of a ghost customer, the scan screen does not display any quotes or orders; this is because a merge/purge has assigned any quotes or orders using that customer number to the “target” customer. You can identify a ghost customer by the setting of the [Ghost](#) flag.

Numeric, 9 positions, assigned by the system; optional.

Field	Description
Sales rep # (Sales representative number)	<p>A code that identifies your company's sales representative credited for the quote or order.</p> <p>Enter a valid sales representative number to advance to the Scan Orders by Sales Rep screen. This screen lists quotes and orders in ascending (lowest to highest) sequence by sales rep number, then by quote or order number and date, beginning with the number you entered. See Order Scan Screens.</p> <p>Numeric, 7 positions; optional.</p>
Alternate customer number	<p>The alternate customer number defined for the customer who placed the quote or order. Alternate customer number is an additional number to identify the customer on the system, such as a customer number carried over from a system conversion.</p> <p>Enter an alternate customer number to advance to the Scan Customer by Alternate Cust # screen. This screen lists customers by alternate customer number. See Display Alternate Customer Cross Reference Window (184) for more information.</p> <p><i>Alternate Customer Number Label Description:</i> The field label on this screen is based on the name you enter in the Alternate Customer Number Label Description (H95) system control value; if you do not enter a name in this system control value, the field label is Alt cust.</p> <p><i>Example:</i> If you enter the field label name <i>PC MEMBER#</i> in the system control value, the field label on this screen is PC MEMBER#.</p>
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Scanning by the alternate customer number of a ghost customer is not currently implemented if the Display Alternate Customer Cross Reference Window (184) system control value is <i>selected</i>.</p> </div>
Recipient	<p>Alphanumeric, 15 positions; optional.</p> <p>The last name of the customer who receives a gift order. This scan includes customers you add to an order using <i>Sold To/ Recip</i>, not shipping addresses that you add to an order using <i>Ship To</i> or <i>Order Ship To</i>.</p> <p>Enter a full or partial name to advance to the Scan Orders For Recipients screen. This screen lists all customers in the Customer table, beginning with the name you have entered. Enter <i>1</i> next to a customer to find orders for which this customer was a recipient. See Customer Sold To Scan Screens.</p> <p>Alphanumeric, 25 positions; optional.</p>

Field	Description
Batch #	<p>A number that identifies a group of mail orders.</p> <p>Enter a batch number to advance to a Scan Orders by Batch # screen. This screen lists orders in ascending (lowest to highest) sequence by batch number, beginning with the number you entered. See Order Scan Screens.</p> <p>Numeric, 5 positions; optional.</p>
Purchase order #	<p>The purchase order number associated with the customer's quote or order.</p> <p>Enter a full or partial purchase order number to advance to a Scan Orders by Purchase Order Number screen. This screen lists purchase quotes and orders in ascending (lowest to highest) numeric sequence by order number. See Order Scan Screens.</p> <p>Alphanumeric, 15 positions; optional.</p>
Invoice #	<p>A number assigned to each shipment on an order.</p> <p>Enter an invoice number to advance to Order Inquiry for the order.</p> <p>Numeric, 7 positions; optional.</p> <p>It is common to use the Item, Order status, and Order date fields together when searching for a quote or order. For example, you may want a listing of open orders entered prior to a specific date that contain a specific item.</p>
Order status	<p>A code that describes the state of an order.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • Cancelled • Error • Held • Open • Purged • Quote • Suspended • Closed <p>Scan options:</p> <ul style="list-style-type: none"> • Enter a valid order status code to advance to the Scan Orders by Order Status screen. This screen displays orders of the selected status in ascending (lowest to highest) order number sequence. • Enter a valid order status code and order date to advance to the Scan By Order Date screen. This screen lists quotes and orders in descending sequence (newest to oldest orders), beginning with the date you entered. • Enter a valid order status code and item/SKU to advance to the Scan By Order Items screen. This screen lists all quotes and orders that contain the item and SKU you entered. • Enter a valid order status code, item/SKU, and order date to advance to the Scan By Order Items and Date screen. This screen lists all quotes and orders that contain the item and SKU you entered in descending sequence (newest to oldest orders), beginning with the date you entered. <p>See Order Scan Screens.</p> <p>Display-only.</p>

Field	Description
Order date	<p>The date the quote or order was entered.</p> <ul style="list-style-type: none"> • Enter an order date or order date and order status to advance to the Scan Orders by Date screen. This screen lists quotes and orders in descending sequence (newest to oldest orders), beginning with the date you entered. • Enter an order date and item/SKU to advance to the Scan By Order Items and Date screen. This screen lists all quotes and orders that contain the item and SKU you entered in descending sequence (newest to oldest orders), beginning with the date you entered. <p>See Order Scan Screens.</p>
Item/SKU	<p>Numeric, 6 positions (in user date format); optional.</p> <p>The code for the item and style of the item.</p> <ul style="list-style-type: none"> • Enter a valid item code or item code and SKU code to advance to the Scan Orders by Item screen, which lists all quotes and orders that contain the item and SKU you entered. • Enter a valid SKU to advance to the Scan Orders by Item screen, which lists all quotes and orders that contain the item and SKU you entered. • Enter a valid item/SKU and order date, or item/SKU, order date, and order status, to advance to the Scan By Order Items and Date screen. This screen lists all quotes and orders that contain the item and SKU you entered in descending sequence (newest to oldest orders), beginning with the date you entered. <p>See Order Scan Screens.</p> <p>Item: Alphanumeric, 12 positions; optional (required if scanning on SKU information).</p> <p>SKU: Alphanumeric, three 4-position fields; optional.</p>
Order type	<p>A code that identifies how an order was received, such as by telephone, mail, fax, or other methods.</p> <p>Enter a valid order type to advance to the Orders by Order Type screen. See Order Scan Screens.</p> <p>Alphanumeric, 1 position; optional.</p>

Field	Description
Order cross ref #	<p>The quote or order number, if any, that was passed through the <i>Generic Order Interface (Order API)</i> and used to identify the quote or order in an external system.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>In the case of a retail pickup or delivery order assigned through the Order Orchestration Integration, this is the order number in the system originating the order. If the originating system is Order Administration, the system prefaces the originating order number with the text ORIG#: . For example: ORIG#: 9999-001, where ORIG#: indicates the order originated in Order Administration, 9999 is the original order number in Order Administration, and 001 is the ship to number.</p> <p>This is the Alt ord displayed at the Display Order Properties Screen.</p> <p>Enter a full or partial order cross reference number to advance to the Scan by Order Cross Reference # screen.</p> <p>If you wish to review all retail pickup and delivery orders whose originating system is Order Administration, enter ORIG#: in the Order cross ref # field and select <i>OK</i> to advance to the Scan by Order Cross Reference # screen where all orders whose E-Commerce order number in the Order Header Extended table begin with ORIG#: display.</p> <p>See Order Scan Screens.</p> <p>Alphanumeric, 35 positions; optional.</p>
Match code	<p>A code comprised of elements of the customer's name and address, which is used to detect duplicate and fraud customers.</p> <p>Enter a full or partial match code to advance to the Scan Sold To Customer by Match Code screen. This screen lists customers alphabetically by match code, beginning with the code you entered. See Customer Sold To Scan Screens.</p> <p>You can scan for customers across companies with the match code field if cross-company scanning is set up. See Cross-Company Scanning.</p> <p>Alphanumeric, 15 positions; optional.</p>
Country	<p>The code for the customer's country. Country codes are defined in and validated against the Country table.</p> <p>Enter a full or partial country code to advance to the Scan Customer Sold To by Country screen. This screen lists all customers associated with the country code you entered. See Customer Sold To Scan Screens.</p> <p>Alphanumeric, 3 positions; optional.</p>

Field	Description
E-mail address	<p>An email address for the customer.</p> <p>When you enter a full or partial email address, you advance to the Scan Customer by E-mail Address screen, where you can scan by any email address on file for a sold to customer. This field is not case sensitive; an email address of <i>abc@example.com</i> matches an entry of <i>ABC@EXAMPLE.COM</i>, and vice versa. See Customer Sold To Scan Screens.</p> <p>Alphanumeric, 50 positions; optional.</p>
Membership ID	<p>A code identifying a membership program you use to generate periodic orders to a customer.</p> <p>Enter a full or partial membership ID to advance to the Orders by Membership ID screen, which lists orders that were generated through membership programs. See Order Scan Screens and Membership Overview.</p> <p>Alphanumeric, 12 positions; optional.</p>
Tracking#	<p>The number assigned by the shipper to track the shipment. This number is stored in the Manifest Upload Audit table.</p> <p>Enter a full or partial tracking number to advance to the Scan by Tracking # screen. If your entry is an exact match to a tracking number for an order, you advance directly to the order. See Order Scan Screens.</p> <p>Alphanumeric, 30 positions; optional.</p>

Advancing from the Initial Order Inquiry Scan Screen

Process: Each of the fields available for scanning at the [Order Inquiry Scan Screen](#) is unique, but the scanning process falls into one of three main groups:

- initially scanning based on what you know about the customer, then selecting one of that customer's quotes or orders;
- scanning based on what you know about the quote or order itself;
- entering exact information about a quote or order, such as the quote or order number, invoice number, or exact tracking number, which brings you directly into Order Inquiry.

The processes for the first two types of scans are described below. See [Reviewing the Order Inquiry Header Screen](#) for more information on the Order Inquiry Header screen.

Scan Screens by Customer

You advance to a Customer Sold To scan screen if you enter full or partial information in one or more of the following fields at the initial Order Inquiry scan screen.

If you enter...	you advance to...
Postal code	Scan Sold To by Postal Code/Company screen
or	
Postal code and Company name	

If you enter...	you advance to...
<i>Postal code</i> and <i>Last name</i> or <i>Postal code</i> , <i>Last name</i> and <i>Company name</i>	Scan Cust Sold To by Postal Code screen
<i>Last name</i> or <i>Last name</i> and <i>First name</i>	Scan Cust Sold To By Last Name screen
<i>Company name</i>	Scan Cust Sold To by Company Name screen
<i>Phone number</i>	Scan Cust Sold To by Phone # screen
<i>Recipient</i>	Scan Orders for Recipients screen
<i>Alternate customer number</i>	Scan Customer by Alternate Cust # screen
<i>Match code</i>	Scan Customer Sold To by Match Code screen
<i>Country</i>	Scan Customer Sold To by Country screen
<i>E-mail address</i>	Scan Customer By Email Address screen

Note:

Customer scan screens do not display ghost customers, identified by the setting of the *Ghost* flag. These are customers who were merged during a merge/purge process.

From the customer scan screens, you can advance to the:

- *Customer Sold To Scan Screens:*
- Scan Orders by Customer screen when you select *Select* for a customer (or go directly to Order Inquiry if the customer has only one quote or order)
- Ship To Customer Scan screen by selecting *Ship To's* (at a sold to or bill to customer scan screen)
- Bill To Customer Scan screen by selecting *Bill To* (at a sold to or ship to customer scan screen)
- Order Ship To Customer Scan screen by selecting *Scan Ord Ship To* (at a sold to, bill to, or ship to customer scan screen)
- *Display Customer Sold To Screen (Reviewing Summary Information)* when you select *Display* for a customer (at a customer sold to, ship to, or bill to scan screen)

Scan Screens by Order

You advance to a Scan Orders by screen when you scan on one or more of these fields on the initial Order Inquiry scan screen.

If you enter...	you advance to...
<i>Pick control #</i>	Scan Orders by Pick Control # screen
<i>User</i>	Scan By User screen

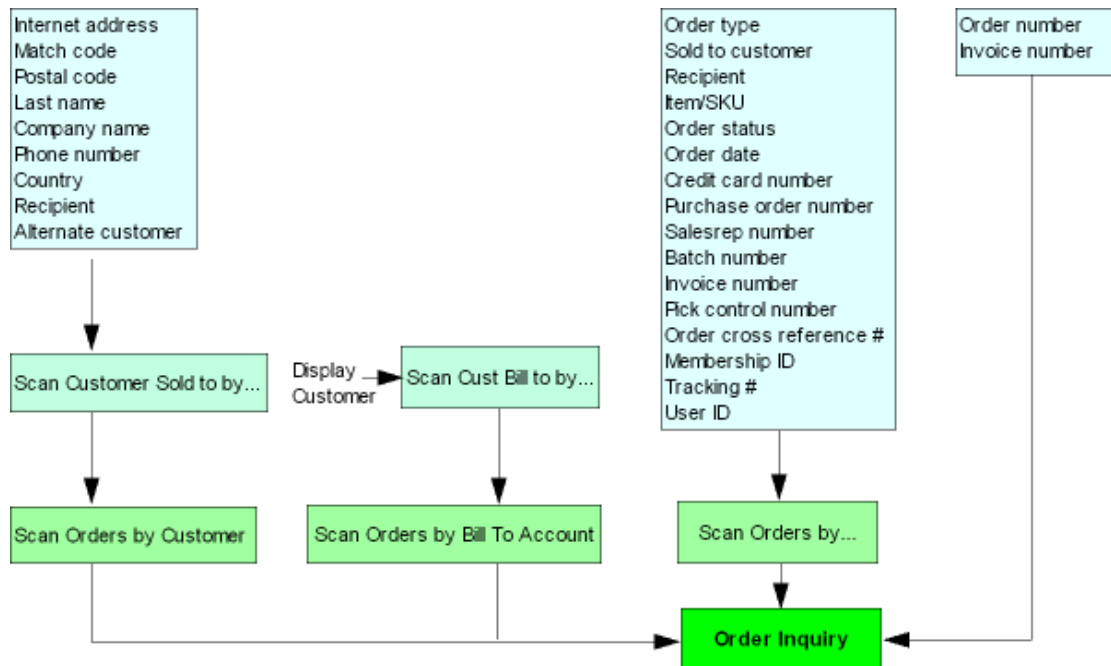

If you enter...	you advance to...
<i>Sold to customer</i>	Scan Orders By Customer screen
<i>Sales rep # (Sales representative number)</i>	Scan By Salesrep screen
<i>Batch #</i>	Scan By Batch # screen
<i>Purchase order #</i>	Scan By Purchase Orders screen
<i>Order status</i>	Orders By Order Status screen
<i>Order date</i>	Scan By Order Date screen
or	
<i>Order date and Order status</i>	
<i>Item/SKU</i>	Scan By Order Items screen
or	
<i>Item/SKU and Order status</i>	
<i>Item/SKU and Order date</i>	Scan By Order Items and Date screen
or	
<i>Item/SKU, Order date and Order status</i>	
<i>Order cross ref #</i>	Scan By Order Cross Reference # screen
<i>Membership ID</i>	Orders By Membership ID screen
<i>Tracking#</i>	Scan By Tracking # screen

See [Order Scan Screens](#). From an order scan screen you can advance to Order Inquiry by selecting *Select* for a quote or order. If the order you select has more than one shipping address, however, you may need to select a recipient order first.

Ghost customers: If you enter the customer number of a ghost customer, the scan screen does not display any quotes or orders; this is because a merge/purge has assigned any quotes or orders using that customer number to the “target” customer. You can identify a ghost customer by the setting of the [Ghost](#) flag.

Scanning Paths by Field

Flowchart: This chart illustrates the paths you can take from the [Order Inquiry Scan Screen](#).

Customer Sold To Scan Screens

Purpose: Customer Sold To scan screens list records in sequential numeric or alphabetical sequence based on your selection at the initial Order Inquiry scan screen. Use the Customer Sold to scan screens to select a particular customer for order inquiry. From this screen you can also perform customer ship to, customer bill to, and customer order ship to scans.

You can scan further on the Customer Sold To Scan screens by entering full or partial information in the open fields at the top of the screen.

- *Scan Sold To by Postal Code/Company screen:* When you first advance to the screen, the system defaults the values you entered in the *Postal code* and *Company name* fields on the *Order Inquiry Scan Screen* to the Postal Code and Company Name/Address fields. You can scan by postal code and company name/address.
- *Scan Cust Sold To by Postal Code screen:* When you first advance to the screen, the system defaults the values you entered in the *Postal code*, *Last name* and *First name* fields on the *Order Inquiry Scan Screen* to the Postal Code, Last Name and First Name fields. You can scan by postal code, last name, and first name.
- *Scan Cust Sold To By Last Name screen:* When you first advance to the screen, the system defaults the values you entered in the *Last name* and *First name* fields on the *Order Inquiry Scan Screen* to the Customer Name/Address and First Name fields. You can scan by customer name/address and first name.
- *Scan Cust Sold To by Company Name screen:* When you first advance to the screen, the system defaults the value you entered in the *Company name* field on the *Order Inquiry Scan Screen* to the Company Name/Address field. You can scan by company name/address and customer number.
- *Scan Cust Sold To by Phone # screen:* When you first advance to the screen, the system defaults the value you entered in the *Phone number* field on the *Order Inquiry Scan Screen* to the Telephone # field. You can scan by phone type (day, eve, fax/mobile) and telephone number.
- *Scan Orders for Recipients screen:* When you first advance to the screen, the system defaults the value you entered in the *Recipient* field on the *Order Inquiry Scan Screen* to

the Customer Name/Address field. You can scan by customer name/address and first name.

- *Scan Customer by Alternate Cust # screen:* When you first advance to the screen, the system defaults the value you entered in the *Alternate customer number* field on the *Order Inquiry Scan Screen* to the Alt cust # field. You can scan by alternate customer number and company name.
- *Scan Customer Sold To Match Code screen:* When you first advance to the screen, the system defaults the value you entered in the *Match code* field on the *Order Inquiry Scan Screen* to the Match Code field. You can scan by match code.
- *Scan Customer Sold To by Country screen:* When you first advance to the screen, the system defaults the value you entered in the *Country* field on the *Order Inquiry Scan Screen* to the Cty field. You can scan by country code and name/address.
- *Scan Customer By Email Address screen:* When you first advance to the screen, the system defaults the value you entered in the *E-mail address* field on the *Order Inquiry Scan Screen* to the Email Address field. You can scan by email address.

How to display this screen: At the *Order Inquiry Scan Screen*, enter available information about a customer in the appropriate scan field; see *Scan Screens by Customer* for a list of fields that advance you to a Customer Sold To Scan screen.

Screen Option	Procedure
Select a specific customer	Select a customer to advance to the Scan Orders by Customer screen. (If there is only one quote or order for the customer, you advance directly to Order Inquiry.) See <i>Order Scan Screens</i> .
Display sold to customer summary information	Select <i>Display</i> for a customer to advance to the <i>Display Customer Sold To Screen (Reviewing Summary Information)</i> .
Advance to the Scan Customer Ship To screen	Select <i>Scan by Ship To</i> to advance to the Scan Customer Ship To By... screen.

Note:

This option is not available on the following customer scan screens:

- Scan Orders for Recipient screen
- Scan Customer by Alternate Cust # screen

Screen Option	Procedure
Advance to the Scan Customer Bill To screen	<p>Select <i>Scan by Bill To</i> to advance to the Scan Customer Bill To By... screen.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>This option is not available on the following customer scan screens:</p> <ul style="list-style-type: none"> • Scan Orders for Recipient screen • Scan Customer by Alternate Cust # screen • Scan Cust Sold To by Country screen • Scan Customer By Email Address screen </div>
Advance to the Scan Customer Order Ship To screen	<p>Select <i>Scan by Order Ship To</i> to advance to the Scan Customer Bill To By... screen.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>This option is not available on the following customer scan screens:</p> <ul style="list-style-type: none"> • Scan Cust Sold To Phone # screen • Scan Orders for Recipient screen • Scan Customer by Alternate Cust # screen • Scan Customer Sold To by Match Code screen • Scan Cust Sold To by Country screen • Scan Customer By Email Address screen </div>

Order Scan Screens

Purpose: Use the order scan screens to obtain a list of quotes and orders and gain access to Order Inquiry for any quote or order listed. Order scan screens list records in numeric or alphabetical sequence based on the field you selected for scanning.

You can scan further on the Order Scan screens by entering full or partial information in the open fields at the top of the screen.

- *Scan Orders by Pick Control # screen:* When you first advance to the screen, the system defaults the value you entered in the *Pick control #* field on the *Order Inquiry Scan Screen* to the *Control #* field. You can scan by pick control number, order number, ship to number, and invoice number.
- *Scan By CC Last 4 screen:* When you first advance to the screen, the system defaults the value you entered in the *Card number* field on the *Order Inquiry Scan Screen* to the *CC Last 4* field. You can scan by order number, order status, charge amount, and expiration date.

- *Scan Orders By Credit Card screen:* When you first advance to the screen, the system defaults the value you entered in the *Card number* field on the *Order Inquiry Scan Screen* to the Card Number field. You can scan by card number last 4, order number, order status, charge amount, and expiration date.
- *Scan By User screen:* When you first advance to the screen, the system defaults the value you entered in the *User* field on the *Order Inquiry Scan Screen* to the User field. No additional scans are available on this screen.
- *Scan Orders By Customer screen:* When you first advance to the screen, the system defaults the value you entered in the *Sold to customer* field on the *Order Inquiry Scan Screen* to the Sold To field. You can scan by order date, order number, order status, and order type.
- *Scan By Salesrep screen:* When you first advance to the screen, the system defaults the value you entered in the *Sales rep # (Sales representative number)* field on the *Order Inquiry Scan Screen* to the Salesrep field. You can scan by salesrep, customer number and order number.
- *Scan By Batch # screen:* When you first advance to the screen, the system defaults the value you entered in the *Batch #* field on the *Order Inquiry Scan Screen* to the Batch# field. You can scan by order batch number, order number, and order status.
- *Scan By Purchase Orders screen:* When you first advance to the screen, the system defaults the value you entered in the *Purchase order #* field on the *Order Inquiry Scan Screen* to the Purchase Order # field. You can scan by purchase order number, order number and order ship to number, customer number, order status, and order date.
- *Orders By Order Status screen:* When you first advance to the screen, the system defaults the value you entered in the *Order status* field on the *Order Inquiry Scan Screen* to the Order Status field. You can scan by order number, order date, and customer number.
- *Scan By Order Date screen:* When you first advance to the screen, the system defaults the values you entered in the *Order date* and *Order status* fields on the *Order Inquiry Scan Screen* to the Order Date and Order Status fields. You can scan by order date, order number, and order status.
- *Scan By Order Items screen:* When you first advance to the screen, the system defaults the value you entered in the *Item/SKU* field on the *Order Inquiry Scan Screen* to the Item field. You can scan by SKU code, order number and ship to number, customer number, order status, price, quantity ordered, quantity shipped, and warehouse.
- *Scan By Order Items and Date screen:* When you first advance to the screen, the system defaults the values you entered in the *Order date*, *Order status* and *Item/SKU* fields on the *Order Inquiry Scan Screen* to the Item, Date and Order Status fields. You can scan by order date, SKU code, order number and ship to number, customer number, order status, price, quantity ordered, quantity shipped, and warehouse.
- *Scan By Order Cross Reference # screen:* When you first advance to the screen, the system defaults the value you entered in the *Order cross ref #* field on the *Order Inquiry Scan Screen* to the Order Cross Ref # field. You can scan by order cross reference number.
- *Orders By Membership ID screen:* When you first advance to the screen, the system defaults the value you entered in the *Membership ID* field on the *Order*

Inquiry Scan Screen to the Membership ID field. You can scan by order date, order number, order status, and customer number.

- *Scan By Tracking # screen:* When you first advance to the screen, the system defaults the value you entered in the *Tracking#* field on the *Order Inquiry Scan Screen* to the Tracking # field. You can scan by tracking number.

About activity indicators: The Activity fields on some order scan screens indicate whether any item on the order has been returned or exchanged, and whether the order includes any backordered items. The return indicator (*RT*) is in column 1, the exchange indicator (*EX*) is in column 2, and the backorder indicator (*BO*) is in column 3. The date of the most recent return or exchange is in the R/E Date (Return/exchange date) field.

If an order has both a return and an exchange, the return date is indicated.

How to display this screen: At the *Order Inquiry Scan Screen*, enter available information about a quote or order in the appropriate field; see *Scan Screens by Order* for a list of fields that advance you to an Order Scan screen. You can also reach this screen by *selecting* a customer on a customer scan screen.

Screen Option	Procedure
Select an order	Select any record to advance to Order Inquiry for the quote or order you selected.

 **Note:**

If the order you select has additional recipient orders, you may need to select one of the shipping addresses before advancing to Order Inquiry.

Screen Option	Procedure
Toggle between FIFO and LIFO view	<p>Select <i>View by FIFO</i> to change the sequence of records to oldest to newest (FIFO).</p> <p>Select <i>View by LIFO</i> to change the sequence of records to newest to oldest (LIFO).</p>

 **Note:**
 This option is not available on the following order scan screens:

- Scan Orders By Pick Control # screen
- Scan By CC Last 4 screen
- Scan By Card screen
- Scan by User screen
- Scan By Salesrep screen
- Scan By Batch # screen
- Scan By Purchase Orders screen
- Orders By Order Status screen
- Scan By Order Date screen
- Scan By Order Cross Reference # screen
- Orders By Membership ID screen
- Scan By Tracking # screen

Display Customer Sold To Screen (Reviewing Summary Information)

Purpose: Customer summary screens display address information for the customer who placed the quote or order (Sold To) who received the quote or order (Ship To) or who is billed for the quote or order (Bill To). You may want to review this address prior to advancing to Order Inquiry to be sure this is the correct customer.

How to display this screen: Select *Display* for a customer on a customer scan screen. See [Customer Sold To Scan Screens](#).

Selecting Orders for Return (WRTA)

Purpose: You can select orders through the Return Authorization scan screen to create return authorizations, receive returns, or process credits.

The selection process works the same way regardless of whether you use the standard or streamlined process for return authorizations.

Retail pickup or delivery orders: Unless the [Suppress Returns for Retail Pickup/Delivery \(L88\)](#) system control value is selected, you can process a return against a retail pickup or delivery order; however, shipping the order deactivates the [Order Broker Payment Type \(K98\)](#) applied to these orders, so you would first need to enter a new payment method in order to process the related refund.

**Note:**

You cannot process an exchange against a retail pickup or delivery order.

The system does not send a status update to Order Orchestration when you process a return against a retail pickup or delivery order.

See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview.

Ship-for-pickup orders: You can process a return for a ship-for-pickup order as long as the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value is not selected. See [Ship-for-Pickup Orders](#) for an overview.

Store pickup orders: You cannot process a return against a store pickup order. See [Store Pickup Orders](#) for an overview.

Pick slip preparation: When you select an order for return authorization, the system removes any pick slip preparation from the order. When you accept or reject the return authorization, the system determines if the order qualifies for pick slip preparation and reapplies it to the order. If you add an exchange item to the order, the system performs pick slip preparation for the exchange item when you receive the return authorization. See [Preparing Orders for Pick Slip Generation](#).

In this topic:

- [Select Orders For Return Authorization Screen](#)
- [Scanning Process](#)
- [Edit Customer Actions](#)

Select Orders For Return Authorization Screen

Purpose: Use this screen to advance to subsequent return authorization screens.

Customer Workflow Management window: The [Customer Workflow Management Window](#) automatically displays when you select an order for return if open or in use ticklers exist for the customer. Select [Ticklers](#) at this window to advance to the [Work with Ticklers Screen \(sold to customer view\)](#) where you can review and work with ticklers associated with the sold to customer.

How to display this screen: Enter *WRTA* in the Fast Path field on any menu screen or select [Work with Return Authorizations](#) from a menu.

Field	Description
Order #	<p>A unique number to identify an order and the shipping address.</p> <p>Enter the order number to advance to a screen where you can work with return authorizations for the order. (If the order has more than one shipping address, you advance first to the Work with Order Recipients Screen to select a recipient.)</p> <p>Order number Numeric, 8 positions; optional.</p> <p>Ship-to number Numeric, 3 positions; optional.</p>

Field	Description
Sold-to customer	<p>A unique number to identify the customer who places an order. Enter a customer number to advance to the Scan Orders by Customer Screen.</p> <p>Ghost customers: If you enter the customer number of a ghost customer, the scan screen does not display any orders; this is because a merge/purge has assigned any orders using that customer number to the “target” customer. You can identify a ghost customer by the setting of the <i>Ghost</i> flag. Numeric, 9 positions; optional.</p>
Recipient customer	<p>A unique number to identify the customer who receives the order (sold-to customer) and the permanent shipping address for the customer (ship-to customer).</p> <p>Enter a sold-to customer number and a ship-to number for this customer to advance to the Scan Orders by Customer Ship To screen, which lists orders for each sold-to/ship-to combination. Sold-to number: numeric, 9 positions; optional. Ship-to number: numeric, 3 positions; optional.</p>
Item	<p>A code identifying a unit of inventory. Enter a full or partial item code and SKU, if any, to advance to the Scan Orders by Item screen. Alphanumeric, 12 positions; optional.</p>
SKU (Stock keeping unit)	<p>The unique characteristics of an item, such as its color and size. Alphanumeric, three 4-position fields; optional.</p>
Order status	<p>Indicates the state of an order. Valid values are:</p> <ul style="list-style-type: none"> • blank = Open • <i>Cancelled</i> • <i>Error</i> • <i>Held</i> • <i>Purged</i> • <i>Quote</i> • <i>Suspended</i> • <i>Closed</i> <p>Select an order status to advance to the Orders by Order Status scan screen. Optional.</p>
Order date	<p>The date that you took the order. Enter a date to advance to the Scan Orders by Date screen. Numeric, 6 positions (in user date format); optional.</p>
Purchase order #	<p>The customer's internal purchase order number. Enter a full or partial purchase order number to advance to the Scan Orders by Purchase Order Number screen. Alphanumeric, 15 positions; optional.</p>

Field	Description
Tracking #	<p>The number assigned by the shipper to track the shipment. This number is stored in the Manifest Upload Audit table if you use PC manifesting, <i>Generic Pick In API (Shipments, Voids, and Backorders)</i>, or <i>Manually Confirming Shipments (MCON)</i> to ship an order.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>Enter a full or partial tracking number to advance to the Scan by Tracking # screen. If your entry is an exact match to a tracking number for an order, you advance directly to the order.</p> <p>Alphanumeric, 30 positions; optional.</p>
Order cross ref #	<p>The order number, if any, that was passed through the <i>Generic Order Interface (Order API)</i> and used to identify the order in an external system.</p> <p>In the case of a retail pickup or delivery order assigned through the Order Orchestration Integration, this is the order number in the system originating the order. If the originating system is Order Administration, the system prefaces the originating order number with the text <code>ORIG# :</code>. For example: <code>ORIG# : 9999-001</code>, where <code>ORIG# :</code> indicates the order originated in Order Administration, <code>9999</code> is the original order number in Order Administration, and <code>001</code> is the ship to number.</p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p> <p>This is the Alt ord displayed at the Display Order Properties Screen.</p> <p>Enter a full or partial order cross reference number to advance to the Scan by Order Cross Reference # screen.</p> <p>If you wish to review all retail pickup and delivery orders whose originating system is Order Administration, enter <code>ORIG# :</code> in the Order cross ref # field and select <i>OK</i> to advance to the Scan by Order Cross Reference # screen where all orders whose E-Commerce order number in the Order Header Extended table begin with <code>ORIG# :</code> display.</p> <p>Alphanumeric, 35 positions; optional.</p>
Customer scan options	
Match code	<p>A code the system assigns to each customer to provide a unique standard or fraud identifier.</p> <p>Enter a full or partial match code to advance to the Scan Sold To Customer by Match Code screen.</p> <p>Alphanumeric, 15 positions; optional.</p>
Postal code	<p>The customer's postal or zip code.</p> <p>Enter a full or partial code to advance to the Scan Sold To by Postal Code/ Company screen. This screen lists all customers by postal code in ascending (lowest to highest) numeric sequence, beginning with the code you entered.</p> <p><i>Scan length:</i> The Postal Code Scan Length (F61) system control value controls how many characters of the postal code to use when searching for a customer. See that system control value for a discussion.</p> <p>If you enter a postal code, last name, and first name, you advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered.</p> <p>Alphanumeric, 10 positions; optional.</p>

Field	Description
Last name	<p>The customer's last name.</p> <p>Enter a full or partial name to advance to a Scan Cust Sold To By Last Name screen, which lists all customers alphabetically beginning with the name you entered. You can also include a full or partial first name along with a full (not partial) last name to restrict the scan further. Alphanumeric, 25 positions; optional.</p>
First name	<p>The first name of the customer who placed the order.</p> <p>Enter the last name, first name, and postal code to advance to the Scan Customer Sold To by Postal Code screen, which lists all customers alphabetically beginning with the postal code you entered. You can also enter just the full (not partial) last name and full or partial first name to advance to the Scan Cust Sold To By Last Name screen.</p>
<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>First name must be used in conjunction with Postal code, Last name or with just Last name for scanning. You cannot scan on first name alone.</p> </div>	
Company name	<p>Alphanumeric, 15 positions; optional.</p> <p>The name of the company placing the order.</p> <p>Enter a full or partial company name to advance to the Scan Cust Sold To By Company Name screen.</p> <p>Alphanumeric, 30 positions; optional.</p>
Phone number	<p>The customer's daytime, evening, or third (fax or mobile) telephone number.</p> <p>Alphanumeric, 14 positions; optional.</p>
E-mail address	<p>An email address for the customer.</p> <p>When you enter a full or partial email address, you advance to the Scan Customer by E-mail Address screen, where you can scan by any email address on table for a sold-to customer. This field is not case sensitive; an email address of <i>abc@example.com</i> matches an entry of <i>ABC@EXAMPLE.COM</i>, and vice versa.</p> <p>Alphanumeric, 30 positions; optional.</p>
Other scan options	
Sales rep # (Sales representative number)	<p>A code that identifies a sales representative from your company.</p> <p>Enter a sales representative number to advance to the Scan Orders by Salesrep screen.</p> <p>Numeric, 7 positions; optional.</p>
Batch #	<p>A number that identifies a group of orders entered as a batch.</p> <p>Enter a valid batch number to advance to the Scan Orders by Batch # screen.</p> <p>Numeric, 5 positions; optional.</p>

Field	Description
Invoice #	<p>A unique number the system assigns to an invoice for each shipment on an order.</p> <p>Enter an invoice number to advance to the a return authorization screen. See Working with Return Authorizations: Standard Process or Working with Return Authorizations: Streamlined Process.</p> <p>Numeric, 7 positions; optional.</p>
Country	<p>The code representing the customer's country. Country codes are defined in and validated against the Country table. See Setting Up the Country Table (WCTY).</p> <p>Enter a full or partial country code to advance to the Scan Customer Sold To By Country screen.</p> <p>Alphanumeric, 3 positions; optional.</p>

Scanning Process

Type of Scan	Fields	Result
unique information on the order	<p>order number</p> <p>invoice number</p> <p>tracking number (if exact match)</p>	<p>Advance directly to a screen where you can create return authorizations or work with existing return authorizations for the order. See Working with Return Authorizations: Standard Process or Working with Return Authorizations: Streamlined Process.</p>
general information on the order	<p>item/SKU</p> <p>order status</p> <p>order date</p> <p>credit card #</p> <p>PO #</p> <p>salesrep #</p> <p>batch #</p> <p>country</p> <p>tracking number (if not an exact match)</p> <p>order cross reference number</p>	<p>Advance to an order scan screen (select an order to advance to one of the return authorization screens).</p>
information on the customer	<p>sold to customer match code</p> <p>postal code</p> <p>last name</p> <p>first name</p> <p>company name</p> <p>phone number</p> <p>email address</p>	<p>Advance to a customer scan screen (select a customer to advance to an order scan screen).</p>

How to Advance from a Customer Scan Screen

Select the customer. Selecting a customer record from this screen (or from any sold-to customer scan screen when you are using the Return Authorization function) advances you to an order scan screen, where you can select an order for return authorization.

Ghost customers: If you enter the customer number of a ghost customer, the scan screen does not display any orders; this is because a merge/purge has assigned any orders using that customer number to the “target” customer. You can identify a ghost customer by the setting of the *Ghost* flag.

How to Advance from an Order Scan Screen

How to advance from an order scan screen: From an order scan screen, select the order you want to work with.

Standard process:

If a return authorization already exists for the order you select, you advance to the [Work with Return Authorizations Screen](#). From this screen, you can create a new return authorization, or you can work with an existing authorization, adding new items or receiving and/or crediting the items already selected.

If no return authorization exists for the order you select, you advance to the [Work with Return Authorization Detail Screen](#). From this screen, you can create a new return authorization and process it as far as necessary.

Streamlined process:

You advance directly to the [Work with Returns for Order Screen](#), where any items available for returns processing display. To be available for returns processing, the item must be either shipped and unreturned, or have one or more return authorization currently in process.

Edit Customer Actions

The [Edit Customer Actions Window](#) opens when:

- the [Display Customer Action Notes/Messages in RA \(F64\)](#) system control value is selected, and,
- you select an order for return authorization and there are open action notes for the sold to customer.

The window opens in both standard and streamlined return authorizations.

Working with Customer Warranty Information (WCST)

Warranty items are items you can add to an order at no charge. For example, if a customer previously ordered a grill that came with a 2-year warranty and the burner on the grill was defective, you could add the replacement burner to the customer’s order free of charge.

Customer warranty information is a way to track which unit of a product the customer has purchased and the date the purchase took place. You can define warranty information, such as model number, serial number, and the date of purchase, for the

products that a customer has purchased at no charge. This is helpful to track specific units of a product in case of a recall.

Where can I view customer warranty information? You can create or work with customer warranty information in order entry, maintenance, inquiry, quote entry, maintenance, inquiry and customer maintenance. The system automatically displays the [Work with Customer Warranty Information Screen](#) in order entry and maintenance and quote entry and maintenance if an operator enters a source code on the order header whose Warranty required field is *selected*.

How can I set up a warranty item? You can define an item or SKU as a warranty item by *selecting* the Warranty field on the item offer or SKU offer. When the item or SKU for the offer defined on an order detail line is set up as a warranty item, the system adds the item to the order at no charge.

Adding a warranty item to an order: When an operator adds a warranty item to an order in order entry or order maintenance:

- the system updates the Warranty field on the order detail line to *selected*.
- the system updates the No charge field on the order detail line to *selected*.
- if a [Default Price Override Reason for Warranty Items \(G01\)](#) is specified, the system defaults the price override reason code to the Price override code field on the order detail line. If this system control value is unselected, the operator must manually enter a price override code. If a price override code already exists for the order detail line, the system uses this reason.
- if you want to track the reason why the warranty item was added to the order, you can require the operator to enter an add reason code for the item, by *selecting* the Require reason field on the item offer or SKU offer. When this field is *selected*, the system displays the Enter Add Reason pop-up window where the operator is required to enter the reason why the item was added to the order. See [Entering Orders](#).
- if an operator enters a price for the warranty item, the system displays an error message similar to the following: Warranty item - price not allowed.

 **Note:**

Because a quote may not be converted to a standard order, it is not recommended that you add a warranty item to a quote.

Warranty holds: The system tracks the amount of warranty items a customer is ordering and automatically places orders on hold if the warranty dollar amount exceeds one or two thresholds. You can define a maximum warranty order amount or a maximum life to date warranty amount for a customer using the following system control values.

System Control Value	Description
<i>Maximum Warranty Order Amount (F97)</i>	<p>Defines the maximum dollar amount allowed for warranty items on an order in order entry and order maintenance before the order is placed on warranty order hold (WO).</p> <p><i>Example:</i></p> <p>Maximum warranty order amount = 30.00 Warranty item 1 = 20.00 Warranty item 2 = 15.00</p> <p>If an operator entered warranty item 1 and warranty item 2 to an order, the total cost for the warranty items would equal 35.00 (20.00 + 15.00 = 35.00). Since 35.00 dollars exceeds the maximum warranty order amount, the system would place this order on warranty order hold.</p>
<i>Maximum LTD Warranty Amount for Customer (F98)</i>	<p>Defines the maximum life to date warranty dollar amount allowed for a customer before orders for this customer containing warranty items are placed on warranty customer hold (WC).</p> <p><i>Example:</i></p> <p>Maximum life to date warranty for a customer = 100.00 Current life to date warranty dollar amount = 60.00 Dollar amount for warranty items on the order = 50.00</p> <p>If the current life to date warranty amount for this customer is 60.00 and an operator entered an order for this customer that contained warranty items whose dollar amount equaled 50.00, the system would place the order on warranty customer hold since the life to date warranty amount now equaled 110.00 (60.00 + 50.00 = 110.00).</p>

Costing: Since warranty items are added to an order at no charge, the system uses the cost defined for the item to determine the dollar amount of a warranty item on an order. If the cost was overridden on the order detail line, the system uses the cost override.

Credit checking: The system places an order on hold during the credit checking process. You can bypass warranty credit checking by *selecting* the Bypass credit check field in the Source Code table. When this field is *selected*, the system does not perform credit checking or warranty checking against any orders entered with this source code defined on the order header. The system writes a message similar to the following to Order Transaction History: CREDIT CHECKING WAS BYPASSED.

Billing updates: When a warranty item is shipped or returned, the system updates:

- the Warranty dollars shipped field in the Customer Sold To Order History table with the dollar amount of the warranty items on the order. The system uses the cost defined for the item to determine the dollar amount of a warranty item on an order since a warranty item is added to an order at no charge. If the cost was overridden on the order detail line, the system uses the cost override.

- the Warranty dollars returned field in the Customer Sold To Order History table with the dollar amount of the warranty items that have been returned or exchanged on an order. The system uses the cost defined for the item to determine the dollar amount of a warranty item since a warranty item is added to an order at no charge.
- the Life to date warranty dollars amount field using the following calculation: warranty dollars shipped - warranty dollars returned = life to date warranty dollars amount. The life to date warranty dollars amount field is calculated by the system when an order is processed through the Billing Async and is used to determine if an order is put on warranty customer hold. This field displays on the [Work with Customer Warranty Information Screen](#).

For more information:

- reviewing customer sold to order history: [Display Customer Order History Screen](#)
- warranty holds the system can place on an order: [Introducing Order Hold Reason Codes](#)

In this topic:

- [Work with Customer Warranty Information Screen](#)
- [Create Customer Warranty Information Screen](#)

Work with Customer Warranty Information Screen

How to display this screen: Select *Customer Warranty Info* for a customer at a scan screen in customer maintenance. See [Selecting Customers](#).

You advance automatically to this screen in order entry or order maintenance if you enter a source code on the order header that is set up to require warranty information (the Warranty required field for the source code is *selected*) and there is already warranty information for this customer.

You can also advance to this screen in order entry, order maintenance, and standard order inquiry from the [Display More Options Screen](#).

Field	Description
LTD warranty \$ (Life to date warranty dollar amount)	<p>A system calculated field that is updated when an order is processed through the Billing Async that indicates the life to date warranty dollar amount for this sold to customer. The system uses the life to date warranty dollar amount to determine if an order should be put on warranty customer hold.</p> <p>The system uses the following calculation to determine the life to date warranty dollar amount: warranty dollars shipped - warranty dollars returned = life to date warranty dollar amount</p> <p>Numeric, 13 positions with a 4-place decimal; display-only.</p>
Customer	<p>The number and last name, first name, and middle initial of the sold to customer for whom you are creating customer warranty information.</p> <p>Customer number: Numeric, 9 positions; display-only.</p> <p>Customer sold to name: Alphanumeric, 41 positions; display-only.</p>
Model #	<p>A number used to represent a product. The model number is informational only.</p> <p>Alphanumeric, 20 positions; optional.</p>

Field	Description
Type	A code used to define the type of product. The product type is informational only. Alphanumeric, 3 positions; optional.
Serial number	A number used to define a specific unit of your product. The serial number is informational only. Numeric, 15 positions; optional.
Date of purchase	The date the product was purchased. Numeric, 6 positions (in user date format); display-only.

Screen Option	Procedure
Change a customer warranty	Select <i>Change</i> for a customer warranty to advance to the Change Customer Warranty Information Screen. You can change anything on this screen except the Customer number, Customer name and the Life to date warranty dollars fields. See Create Customer Warranty Information Screen for field descriptions.
Delete a customer warranty	Select <i>Delete</i> for a customer warranty to delete it.
Display a customer warranty	Select <i>Display</i> for a customer warranty to advance to the Display Customer Warranty Information Screen. You cannot change any information on this screen. See Create Customer Warranty Information Screen for field descriptions.
Create a customer warranty	Select <i>Create</i> to advance to the Create Customer Warranty Information Screen .

Create Customer Warranty Information Screen

Purpose: Use this screen to create a customer warranty.

How to display this screen: Select *Create* at the [Work with Customer Warranty Information Screen](#). You also advance to this screen in order entry and order maintenance if you enter a source code whose Warranty required field is *selected* and warranty information does not exist for the sold to customer.

Field	Description
Customer	The number and sold to last name, first name, and middle initial of the customer for whom you are creating warranty information. Customer number: Numeric, 9 positions; display-only. Customer sold to name: Alphanumeric, 41 positions; display-only.
Model #	A number used to represent a product. The model number is informational only. Alphanumeric, 20 positions; required.

Field	Description
LTD warranty \$ (Life to date warranty dollar amount)	<p>A system calculated field that is updated when an order is processed through the Billing Async that indicates the life to date warranty dollar amount for this sold to customer. The system uses the life to date warranty dollar amount to determine if an order should be put on warranty customer hold.</p> <p>The system uses the following calculation to determine the life to date warranty dollar amount: warranty dollars shipped - warranty dollars returned = life to date warranty dollar amount</p> <p>Numeric, 13 positions with a 4-place decimal; display-only.</p>
Type	<p>A code used to define the type of product. The type code is informational only.</p> <p>Alphanumeric, 3 positions; optional.</p>
Serial number	<p>A number used to define a specific unit of your product. The serial number is informational only.</p> <p>Numeric, 15 positions; optional.</p>
Date of purchase	<p>the date the product was purchased.</p> <p>An error message indicates if you enter a date that is later than today's date: Date entered must not be greater than today's date.</p> <p>Numeric, 6 positions (in user date format); optional.</p>

Supplier Direct Fulfillment Processing

Purpose: Order Orchestration's Supplier Direct Fulfillment module is an Oracle application that provides a collaborative, browser-based environment for retailers and vendors to share order, customer, and shipping information related to [Drop Ship Processing](#), and to automatically process drop ship orders.

Order Orchestration and its Supplier Direct Fulfillment module are sold as separate products. For more information about purchasing Order Orchestration's Supplier Direct Fulfillment, contact your Oracle representative.

What Does Order Administration send to Order Orchestration's Supplier Direct Fulfillment Module?

Order Administration sends the following information to Order Orchestration for Supplier Direct Fulfillment:

- Vendor: current name and address
- New purchase orders
- Purchase order address changes
- Purchase order cost changes
- Purchase order cancel requests

What Does Order Orchestration's Supplier Direct Fulfillment Module send to Order Administration?

Order Orchestration's Supplier Direct Fulfillment module sends the following information to Order Administration:

- Purchase order acknowledgements
- Purchase order updates, including address change and cancellation acceptances or rejections, status changes, and changes to accepted ship dates
- Purchase order shipment confirmations

Creating or Updating Vendors in Order Orchestration

Order Administration sends the CreateDSVendor message for each vendor whose *Drop ship output* field on the [Second Create Vendor Screen](#) to OROB drop shipping when you use the [Downloading Drop Ship Vendors \(ECSV\)](#) option. If the vendor already exists in Order Orchestration, the existing information is overwritten. See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for the vendor information that Order Administration sends to Order Orchestration.

You can also use the Order Orchestration screens to create or update a vendor, and need to use these screens to specify additional vendor configuration options, such as assignment of carriers (ship vias), pack slip output, and the creation of vendor user IDs who can log into the Vendor Portal.

 **Note:**

You can also create a vendor through the CreateDSOrder message sent through [Selecting Vendors for Drop Ship Processing \(MDSP\)](#) if the vendor does not already exist in Order Orchestration; however, this creates the vendor with minimal information, and you will need to complete vendor setup, typically through the Order Orchestration screens.

Creating Drop Ship Orders for Order Orchestration's Supplier Direct Fulfillment Module

You must identify the vendor for each item flagged for drop ship, and typically use the vendor item record to specify additional information about the item to include on the purchase order. You flag a drop ship vendor to use Order Orchestration's Supplier Direct Fulfillment module by setting the vendor's [Drop ship output](#) field to OROB drop shipping. The [Selecting Vendors for Drop Ship Processing \(MDSP\)](#) option determines whether to send purchase orders to Order Orchestration based on this setting.

You can view all unprocessed drop ship orders, regardless of whether the vendor is flagged for Order Orchestration drop shipping or any other setting, using the [Displaying Unprocessed Drop Ship Items \(DUDS\)](#) menu option.

D/S PO history: When you create the purchase order through [Selecting Vendors for Drop Ship Processing \(MDSP\)](#), the [Display P/O Drop Ship Screen](#) displays the message: Drop Ship PO Created.

Sending Drop Ship Purchase Order Information to the Supplier Direct Fulfillment Module

You create and send drop ship purchase orders through the [Selecting Vendors for Drop Ship Processing \(MDSP\)](#) menu option. For drop ship purchase orders whose vendors are flagged for OROB drop shipping, the system:

- Creates drop ship purchase order records.
- Sends the CreateDSOrder message to Order Orchestration to create the purchase order for any drop ship items on the order for each vendor. Multiple items are included on the same purchase for a vendor, regardless of whether the items are flagged to ship alone. See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for details on the information included in the message.

When Order Orchestration receives a purchase order, it sends an email notification to the vendor indicating that there are drop ship purchase orders to be fulfilled.

The vendor can access the purchase order information in the Order Orchestration Vendor Portal. At this point, the drop ship purchase order has been created and sent, but not yet selected by the vendor for fulfillment.

 **Note:**

You can also print or reprint a drop ship purchase order using the [Printing Purchase Orders \(MPRP\)](#) menu option. Printing or reprinting a drop ship purchase order does not resend the purchase order to Order Orchestration.

D/S PO history: When Order Administration sends the purchase order to Order Orchestration, the [Display P/O Drop Ship Screen](#) displays the message: PO available to vendor.

Required Information in Order Orchestration

When you use [Selecting Vendors for Drop Ship Processing \(MDSP\)](#) to send a new drop ship purchase order to Order Orchestration through the CreateDSOrder message, the information in the message includes:

- vendor: If the vendor does not already exist in Order Orchestration, Order Orchestration creates the record using the vendor code, name, and email address specified; however, this is the only vendor information included in the CreateDSOrder message, and you will need to complete vendor configuration in Order Orchestration. See [Creating or Updating Vendors in Order Orchestration](#) for information on sending current vendor name and address information to Order Orchestration.

Order Orchestration does not update an existing vendor based on the code, name, or email address passed in the CreateDSOrder message.

- carrier: If the ship via does not already exist in Order Orchestration as a valid carrier, Order Orchestration creates a new carrier based on the ship via code; however, this is the only carrier information included in the CreateDSOrder message, and you will need to complete carrier configuration in Order Orchestration. If the ship via code is a single position, it is passed with a padding zero; for example, a code of 7 is passed as 07.
- item: If the item does not already exist in Order Orchestration as a valid item, and Order Administration is the system of record in your Order Orchestration organization, Order Orchestration creates the item and vendor item, using the information passed in the CreateDSOrder message.

The drop ship item and vendor item in Order Orchestration do not need to match an existing product imported into Order Orchestration as part of Order Orchestration processing, and the item does not need to be flagged as *OROB eligible* in Order Administration.

- brand: The brand you set up through [Working with Retail Brands \(WRBD\)](#) must match a brand you have created in Order Orchestration.

For more information: See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for details on the data passed to Order Orchestration from Order Administration.

Special Handling on Orders Sent to the Supplier Direct Fulfillment Module

The Supplier Direct Fulfillment interface supports only custom special handling for drop ship items. See the [Work with Special Handling Screen](#) for information on entering custom special handling instructions.

To set up custom special handling for a drop ship item, see [Establishing Custom Special Handling Formats \(WSHF\)](#).

Order and Gift Messages

The Supplier Direct Fulfillment interface sends the following messages for a drop ship purchase order:

- Order messages or gift messages: Up to 8 total order header (sales order) messages with a *Print* flag setting of Picks, Both, or Gift msg can print below the ship-to address at the top of the pack slip.
- Order line messages: You can send up to 99 order line messages for a drop ship order line. Order line messages identified in Order Administration with a *Print* flag setting of Picks or Both print below the order line on the pack slip.

See [Adding Order Messages](#).

Viewing Errors and Re-entering Orders in Error

You can use the [Working with Drop Ship Errors \(WDSE\)](#) menu option to review different types of drop ship errors, including errors related to sending a purchase order to Order Orchestration.

You cannot resend a drop ship purchase order if Order Orchestration does not receive it; instead, you can recreate the order as a new order to process it, or retrieve the CreateDSOrder message from Order Orchestration's `xml_ds.log` and resend it to Order Orchestration if the message was logged.

Requesting Updates from Order Orchestration

To obtain updates on vendor activity related to drop ship purchase orders, the CDC async job periodically sends the GetDSChanges request message to Order Orchestration for each company whose [Use OROB Drop Shipping \(H13\)](#) system control value is selected. Possible activities include:

- generating the pack slip
- acknowledgement of the purchase order from an integrated vendor
- shipment: see [Shipping Orders through the Supplier Direct Fulfillment Module](#)
- acceptances or rejections of cancel requests: see [Cancelling Order Orchestration Drop Ship Order Lines](#)
- vendor changes to due dates or a purchase order line's hold status: see the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1).

Examples: See the [Display P/O Drop Ship Screen](#) for examples of related history messages.

How many changes sent? The `OROB_PURCHASING_SERVICES_MAX_UPDATES` in [Working with Customer Properties \(PROP\)](#) determines the maximum number of changes to request for each company at a time. If the number of changes since the last request exceeds this maximum, Order Orchestration sends any additional changes in response to the next GetDSChanges request.

Shipping Orders through the Supplier Direct Fulfillment Module

When your vendor completes shipment of a drop ship purchase order line, the Order Administration purchase order line is closed, and the corresponding Order Administration order line is also closed. Order Administration automatically performs shipment confirmation updates for the order and the purchase order.

Depending on the carrier settings you have specified in Order Orchestration, vendors may be required to enter or upload shipping-related information (including carrier (ship via), tracking number, rate, weight, and ship date) for shipments. This shipment information is transmitted to Order Administration and can be available to the customer through, for example, the shipment confirmation email.

If the carrier does not match a valid ship via: If the carrier passed for a shipment in the GetDSChanges response message does not match a valid ship via, Order Administration uses the existing ship via on the order. In this case, the tracking number link in the shipment confirmation email might not be a valid link for the ship via indicated.

Order Administration does not require that there be a valid SCF/ship via record for the carrier passed for the shipment and the shipping address on the order.

Order Orchestration sends shipment information to Order Administration in the GetDSChanges response message. See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for more information.

D/S PO history: When Order Administration receives a shipment confirmation update from Order Orchestration, the [Display P/O Drop Ship Screen](#) displays a message such as: Item Shipped 11/02/13.

Updates to Order Orchestration Drop Ship Purchase Orders

Overview: The changes that you can apply to purchase orders once they are sent to Order Orchestration are described below.

Note:

Changes can be applied to purchase orders only if the vendor uses the Vendor Portal screens. If the vendor uses the vendor integration rather than Vendor Portal screens to work with purchase orders, the changes are not sent to the integrated vendor's system.

- [Cancelling Order Orchestration Drop Ship Order Lines](#)
- [Changing Address and Cost Information](#)

Cancelling Order Orchestration Drop Ship Order Lines

You can request to cancel a Order Orchestration drop ship order line at the [Display P/O Drop Ship Screen](#), available through standard Order Inquiry or Purchase Order Inquiry. Order Administration sends the SetDSCancel message to Order Orchestration. It is not possible to cancel a partial quantity. If the vendor has:

- not yet generated a pack slip for the purchase order line, Order Orchestration cancels the line automatically. The cancellation is noted in the next GetDSChanges response message from Order Orchestration, and Order Administration cancels the line.
- already generated a pack slip for the purchase order line or put the line on hold, Order Orchestration notifies the vendor that there is a cancellation request pending and displays related messages on various screens in the Vendor Portal. If the vendor:
 - accepts the cancel request, Order Orchestration cancels the line automatically. The cancellation is noted in the next GetDSChanges response message from Order Orchestration, and Order Administration cancels the line. Similarly, if the line goes back to New Order status in Order Orchestration if the vendor voids the pack slip, Order Orchestration cancels the line automatically.
 - declines the cancel request Order Orchestration does not cancel the line. Order Orchestration sends an email notification to your *PO Status Notification*

email address specified through its **Drop Ship Preferences** screen. The rejection is noted in the next GetDSChanges response message from Order Orchestration, and Order Administration does not cancel the line.

- confirms shipment without responding to a cancel request, Order Orchestration closes the purchase order line. The shipment is noted in the next GetDSChanges response message from Order Orchestration, and Order Administration bills the line.

If line is already shipped? If the cancel request arrives in Order Administration after the vendor has confirmed shipment of the line, Order Orchestration automatically rejects the cancel request and does not perform any additional updates, but does send an email notification to your *PO Status Notification* email address specified through its **Drop Ship Preferences** screen.

You can generate a report of pending cancellation requests using the [Printing Drop Ship Reports \(PDSR\)](#) menu option. See [Drop Ship Reports](#).

D/S PO history: When you send a cancellation request to Order Orchestration, the [Display P/O Drop Ship Screen](#) displays the message: Cancel Request Sent. If:

- the vendor declines the cancel request, the message is Cancel Request Rejected.
- the vendor accepts the cancel request, or the cancellation applies automatically because the vendor has not yet begun processing the purchase order, the message is Cancel Request Confirmed
- the cancellation is rejected automatically because the vendor has shipped the line, there is no message noting the automatic rejection.

Secured feature: If you have authority to the [Cancel OROB Drop Ship PO \(J04\)](#) secured feature, you can cancel a Order Orchestration drop ship purchase order line using the Cancel option on the [PO Maintenance - Maintain Detail Screen](#). In this situation, the system does not send a cancel request to Order Orchestration and instead immediately performs a full cancellation, cancelling the purchase order line and order line, removing the printed quantity on the order line, writing an order transaction history message: DS PO line canceled, and updating the drop ship status of the line to cancelled.

 **Note:**

- The only situation in which you should use the Cancel option on the [PO Maintenance - Maintain Detail Screen](#) to cancel a Order Orchestration drop ship purchase order line is if you have previously sent a cancel request to Order Orchestration and did not receive a response indicating whether the vendor confirmed or rejected the cancellation.
- Because the cancellation updates the drop ship status of the line to cancelled, you cannot use the cancel request option on the [Display P/O Drop Ship Screen](#) to send a cancellation request to Order Orchestration. However, if Order Orchestration returns an update in the GetDSChanges response message for the order line that updates its status to an open status, such as Held, after the cancellation has been performed, you can use the cancel request option to send a cancellation request to Order Orchestration.
- If the GetDSChanges response message includes a shipment confirmation from Order Orchestration after the line has been cancelled, Order Administration does not update the line as shipped, but does update order transaction history with the shipment confirmation.

For more information: See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for details on the information sent to Order Orchestration for a cancellation request.

Changing Address and Cost Information

- [Changing Address Information](#)
- [Changing Cost Information](#)

Changing Address Information

When you maintain an order that includes at least one Order Orchestration drop ship PO line item which has been sent to Order Orchestration and has not yet been shipped, and the changes to the order include an update to the ship-to address, Order Administration sends the updated address information to Order Orchestration in the SetDSAddressChange message.

Sold-to same as ship-to? If the sold-to and the ship-to address are the same, then the SetDSAddressChange message includes a flag indicating to apply the same update to both.

Updates in Order Orchestration: Order Orchestration creates a record of the original and changed ship-to address and:

- If all lines on the PO are in a new (not in process) status, automatically updates the address information and does not generate an email to the vendor.
- If any line on the PO is already in process, generates an email notification to the vendor about the requested address change; also, various screens in the Vendor Portal display a warning message about the requested change. If the vendor:
 - declines the address change, Order Orchestration sends an email notification of the rejection to your *PO Status Notification* email address specified through its **Drop Ship Preferences** screen.
 - accepts the address change, Order Orchestration updates the address for all open (unshipped, uncanceled) lines. The vendor then needs to void and reprint the pack slip in order to generate a pack slip with the correct address.
- If all lines on the PO are in shipped or cancelled status, Order Orchestration automatically rejects the address change and sends an email notification of the rejection to your *PO Status Notification* email address specified through its **Drop Ship Preferences** screen.

Conditions:

- If you update a customer's address in any way besides using order maintenance to maintain the order that includes the drop ship purchase order, the address change is not sent to Order Orchestration.
- If there are additional open purchase orders for the same customer being fulfilled through the Supplier Direct Fulfillment module, Order Administration does not send address updates to Order Orchestration for these purchase orders.
- If you change the sold-to customer's address but the order is shipping to a different address, Order Administration does not send an address update to Order Orchestration.
- If you change information that is not part of the shipping address, Order Administration does not send an address update to Order Orchestration.

D/S PO history: When you send an address change request to Order Orchestration, the [Display P/O Drop Ship Screen](#) displays the message: Address change sent to vendor. No additional drop ship purchase order history is written for address changes, regardless of vendor action or automatic acceptance or rejection.

For more information: See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for details on the information sent to Order Orchestration for an address change request.

Changing Cost Information

When you update the *Cost* field on the [PO Maintenance - Change PO Detail Screen](#), Order Administration sends the SetDSCostChange message to Order Orchestration. Order Orchestration creates a record of the original and updated PO cost, and updates the PO with the new cost. No action by the vendor is required.

D/S PO history: When you change the cost of a purchase order line, the [Display P/O Drop Ship Screen](#) displays the message Cost change sent to vendor if you advance to the screen through Purchase Order Maintenance (MPOI). This message is not displayed in order inquiry.

For more information: See the Order Administration Web Services Guide on <https://support.oracle.com> (ID 2953017.1) for details on the information sent to Order Orchestration for a cost change request.

Drop Ship Reports

You can use the [Printing Drop Ship Reports \(PDSR\)](#) menu option to generate reports for drop ship purchase orders fulfilled through the Supplier Direct Fulfillment module:

- [Drop Ship Integration Items on Hold from Vendor Report](#)
- [Drop Ship Integration Items with Revised Due Date Report](#)
- [Drop Ship Integration Items Pending Cancellation Report](#)
- [Drop Ship Integration Items Confirmed Cancellation Report](#)
- [Drop Ship Integration Items Sent to Integrated System Report](#)
- [Drop Ship Integration Items Pending Shipment Report](#)
- [Drop Ship Integration Items Shipped Report](#)

Supplier Direct Fulfillment Backorder Notice Processing

Backorder notices for drop ship items fulfilled through the Supplier Direct Fulfillment module are based on accurate expected ship date information that your vendors communicate to Order Administration. Because expected shipment information is readily available for these drop ship items, the interface evaluates drop ship items for backorder notices in a manner similar to the way it evaluates non-drop-ship backordered items. The integration offers the following advantages over regular drop ship processing:

- When you enter an order for a drop ship item fulfilled through the Supplier Direct Fulfillment module, the system calculates an expected ship date based on vendor item [Lead days](#) plus the [Drop Ship Lead Days \(H36\)](#).
- When your vendor revises the expected ship date for a drop ship order line, the expected ship date is updated on the Order Administration order. This updated expected ship date is included on the backorder notice to the customer.
- Drop ship items fulfilled through the Supplier Direct Fulfillment module are eligible for immediate backorder card notices, if immediate notices are selected for the order type.

Setup for backorder notifications: If you want to generate backorder notices for an item fulfilled through the Supplier Direct Fulfillment module:

- leave the [Suppress backorder card](#) field in the SKU table unselected.
- make sure the [Unconditional Suppression of Backorder Card \(F19\)](#) system control value is unselected.
- set accurate [Lead days](#) for the vendor item, using the [Working with Vendor Items \(WVNI\)](#) menu option.
- set the [Drop Ship Lead Days \(H36\)](#) system control value to the number of days you want to add to the date passed to Order Orchestration to calculate the *Expected ship date* in Order Administration.

Due date calculation: For a purchase order line fulfilled through the Supplier Direct Fulfillment interface, the due date sent to the vendor and the *Expected ship date* to present to the customer are calculated as: `Current date + Vendor item Lead days + Drop Ship Lead Days \(H36\)`.

Future arrival date? An order line with a future *Arrival date* will not be eligible for processing through [Selecting Vendors for Drop Ship Processing \(MDSP\)](#) until the line's *Arrival date* is within the vendor item lead days for the item plus the [Drop Ship Lead Days \(H36\)](#).

When the expected ship date passes with no shipment: If the *Expected ship date* passes, the *Next BO card date* has been reached, and the item has not been shipped, the backorder notification program generates a notification to the customer. In this case, the new *Expected ship date* reported to the customer is calculated by adding the [FTC -- # of Days for Items without Expected Ship Date \(C71\)](#) to the date you generate the backorder notices.

Example: When the expected ship date passes but the order has not shipped:

- Order date: 9/10
- Arrival date: 9/10
- Vendor item lead days: 14
- Drop ship lead days (H36): 3
- Expected delivery date [`Current date + Vendor item lead days + Drop ship lead days`]: 9/27
- [FTC -- # of Days for Items without Expected Ship Date \(C71\)](#): 30

Date	Action	Backorder Notice Result (GBOC)
9/10	You enter the order.	No notice is produced (<i>Immediate Backorder Notification</i> is set to N). Expected ship date on the order is 9/27.
9/27	Expected ship date expires but the order has not shipped.	Backorder notice is generated with new expected ship date: 10/25. (<code>9/27 + FTC -- # of Days for Items without Expected Ship Date (C71)</code>).

When the vendor revises the expected ship date: When the vendor revises an expected ship date, the system updates the *Expected ship date* to reflect your vendor's entry. If the *Expected ship date* is later than the date calculated when you entered the order, and the *Next BO card date* for the line has been reached, the

backorder notification program generates a notification with the revised date the next time you generate notifications.

See [System Control Values Related to Order Orchestration's Supplier Direct Fulfillment Module](#) for information on system control value settings.

Example:

- Order date: 9/10
- Arrival date: 9/10
- Vendor item lead days: 14
- Drop ship lead days (H36): 3
- Expected delivery date [Current date + Vendor item lead days + Drop ship lead days]: 9/27

Date	Action	Backorder Notice Result (GBOC)
9/10	You enter the order.	No notice is produced (<i>Immediate Backorder Notification</i> for the order type is unselected). <i>Expected ship date</i> on the line is 9/27.
9/20	Your vendor revises the expected ship date to 10/14.	If the <i>Next BO card date</i> has been reached, a backorder notice is generated with the new expected ship date of 10/14.
10/14	Expected ship date expires but the order has not shipped.	If the <i>Next BO card date</i> has been reached, a backorder notice is generated with the new expected ship date of 11/13 (10/14 + FTC -- # of Days for Items without Expected Ship Date (C71)).

Immediate backorder notice? For drop ship items processed through the Supplier Direct Fulfillment interface, you have the option to generate immediate backorder notifications to inform your customers of an accurate expected delivery date. Immediate backorder notifications are controlled by [Immediate B/O notice](#) setting for the order type, set up in the [Establishing Order Types \(WOTY\)](#) menu option.

Note:

The [Number of Days to Delay Initial Backorder Notice \(D89\)](#) system control value does not apply to items fulfilled through the Supplier Direct Fulfillment module.

Shipping Zone Reservation Overview

Purpose: The Shipping Zone Reservation process insures that weather-sensitive inventory, such as plant stock, will ship to different regions of the country within time windows suitable to the regions, or *geographic zones*, of the country. Frost-sensitive seedlings, for example, must be shipped after the last frost date, but early enough in the season for optimal growth. This date window varies for different geographic zones.

The zone reservation process identifies weather-sensitive items as they are ordered. These items are not reserved during order entry; instead, they are assigned a backorder status of Z (Zone reservation), and are reserved during pick slip generation.

The zone reservation process:

- evaluates the shipping address for the order to determine which geographic zone the order will ship to
- determines the season for which an item is being ordered
- determines whether the item is zone reservation-coded, and, if it is:
 - evaluates the applicable zone reservation date window for the item in this geographic zone and this season
 - applies zone reservation rules to the order line in order entry and maintenance

In this topic:

- [About Geographic Zones](#)
 - [Zone Reservation Seasons](#)

- [Zone Reservation Rules Summary](#)
- [Zone Reservation Setup](#)
 - [Other Optional Table Values](#)
 - [Reserving Items/Generating Pick Slips](#)
 - [Zone Reservation/Long SKU Class](#)
- [Other Information to Note](#)

About Geographic Zones

The country is divided into geographic zones based on relative weather conditions. The shipping zone reservation process uses geographic zones to restrict shipping of weather-sensitive inventory such as plant stock. Each particular kind of plant stock will have a shipping date window corresponding to each zone of the country.

Example: You might ship asparagus roots to Florida (Zone 9) in February, to Rhode Island (Zone 6) in April, and to Maine (Zone 3) in May.

Geographic zones are linked to zip codes or to SCF codes. The system first looks at the zip code of the shipping address to determine if the Zip/City/State table specifies a geographic zone. If it does not, the system looks at the SCF table to determine the geographic zone. The geographic zone of the zip code overrides the geographic zone of the SCF. If you have not assigned a geographic zone to either the zip code or the SCF code for an order's shipping address, zone reservation rules do not apply to your order.

Zone reservation codes: Items such as bulbs, bare root plants, or potted plants can be assigned zone reservation codes that group them for the purpose of restricting shipping dates. Each zone reservation code has a different set of restrictions.

Example: Bulbs may have earlier shipping windows than bare root plants. Tulip bulbs, Crocus bulbs and Daffodil bulbs might be assigned to a zone reservation code with an early spring shipping window for each zone of the country. (Early spring in Florida may be February; early spring in Maine may be April.) Asparagus roots may be assigned to a zone reservation code with a mid-spring shipping window to each zone of the country. (Mid-spring in Florida may be March; mid-spring in Maine may be May.)

Zone reservation codes are assigned at the SKU level.

The following types of items are not eligible for zone reservation codes:

- [Drop ship](#) items
- [Non/inv \(Non inventory\)](#) items
- [Kit type](#) items of type:
 - S = Set
 - V = Variable set

Zone reservation date windows: Zone reservation date windows specify the best time for shipping zone reservation-coded items to different geographic zones in the country. For each zone reservation code, you can define a set of zone reservation date windows, one window for each geographic zone.

A zone reservation date window consists of the following dates:

- Start date: the date you start shipping an item with this code.
- Deferred cutoff date: the backorder cutoff date. On or after this date you will not take orders for this item if the item is not available in your warehouse.

 **Note:**

The Deferred cutoff date is not considered if you use alternate zone reservation rules, as controlled by the [Use Alternate Zone Reservation Logic \(I52\)](#) system control value. See [Alternate Zone Reservation Rules](#) for a discussion.

- Cutoff date: the cutoff date for taking orders, whether or not stock is available in your warehouse.
- End date: the last date for shipping the item.
- Next season open date: the start date of the next season for items with this code.

Example: If you have set up a zone reservation code which includes asparagus roots, and you have divided the country into 6 geographic zones, (Zone 1 through Zone 6), then for each zone you can define a zone reservation date window for shipping asparagus roots.

Zone Reservation Code: AR (Roots):		Spring shipping dates			
Zone	Dates	Deferred cutoff date	Cutoff date	End date	Next open date
	Start date				
Zone 1 (Deep South)	2/1/06	3/1/06	3/15/06	4/1/06	2/1/06

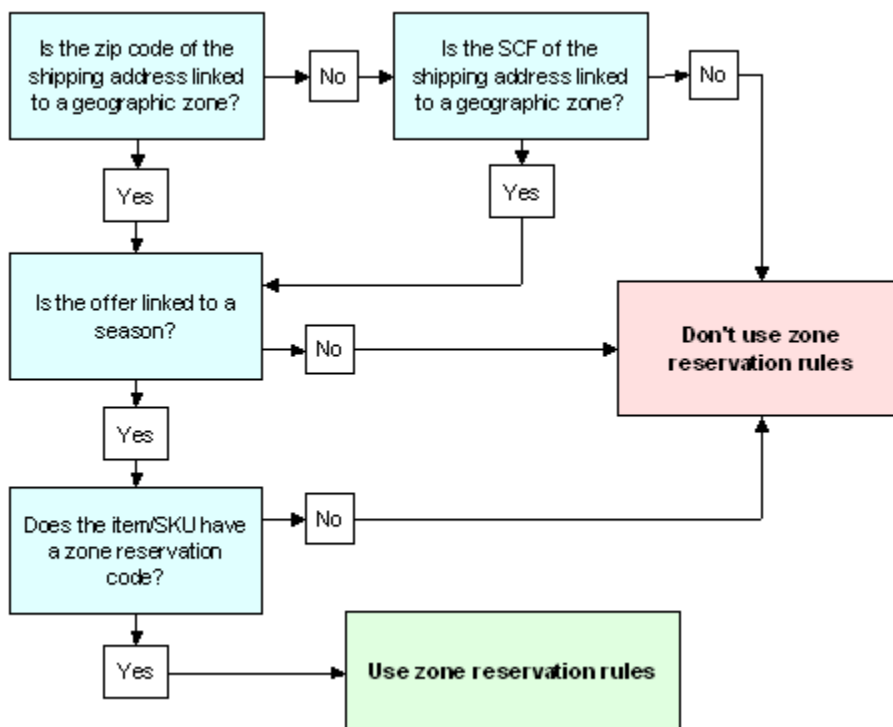

Zone Reservation Code: AR (Roots):	Spring shipping dates				
Zone 2 (Mid South)	2/10/06	3/10/06	3/25/06	4/11/06	2/10/06
Zone 3 (South Atlantic)	2/20/06	3/20/06	4/5/06	4/20/06	2/20/06
Zone 4 (Mid-Atlantic)	3/1/06	4/1/06	4/15/06	5/1/06	3/1/06
Zone 5 (New England/Central)	3/15/06	4/15/06	4/30/06	5/5/06	3/15/06
Zone 6 (North)	4/1/06	4/20/06	5/5/06	5/10/06	4/1/06

Zone Reservation Seasons

A zone reservation-coded item may be shipped in more than one season. For example, you might offer potted perennials in spring and in fall. You would specify two sets of zone date windows: one set for spring, and one for fall.

The zone reservation season is specified on the offer associated with the source code on the order header.

When Do Zone Reservation Rules Apply?

For an order line to be eligible for zone reservation processing:

- The item/SKU must be assigned a zone reservation code in the item table to identify it as a zone reservation item.

- The offer associated with the order must be linked to a season in the offer table
- The shipping address must be assigned to a geographic zone. The system uses ZIP codes or SCF codes to identify geographic zones.
- For each zone reservation code, you must define zone date windows for all geographic zones in the country.

 **Note:**

In order for the system to search for a zone in order entry or maintenance, the [Bypass Geographic Zone Searching in Order Entry/Order Maintenance \(H55\)](#) system control value must be unselected.

Zone Reservation Rules

How does the system use zone reservation dates? Zone reservation date windows are used in order entry or maintenance as the basis for zone reservation rules, which control the arrival date for the order line, the display of pop-up windows, and the ability to backorder zone reservation-coded items. Order lines which fall under zone reservation rules are not reserved during order entry; they are reserved during pick slip generation.

Standard Zone Reservation Rules

If the [Use Alternate Zone Reservation Logic \(I52\)](#) system control value is unselected, items which are eligible for zone reservation processing in order entry follow these rules based on the current date:

Prior to the season start date:

- The order line is taken as an open order, but is not reserved.
- The backorder status = F (Future order).
- The arrival date of the order = the zone start date.
- The system presents the [Display Zone Reservation Dates Window](#) if you have flagged the order type to display zone date windows.

After the season start date but prior to the zone start date:

- The order line is taken as an open order, but is not reserved.
- The backorder status = Z (Zone reservation).
- The arrival date of the order line = the current date.
- The system presents the [Display Zone Reservation Dates Window](#) if you have flagged the order type to display zone date windows.

After the zone start date but prior to the deferred cutoff date:

- The order line is taken as an open order, but is not reserved.
- The backorder status = Z (Zone reservation).
- The arrival date of the order line = the current date.

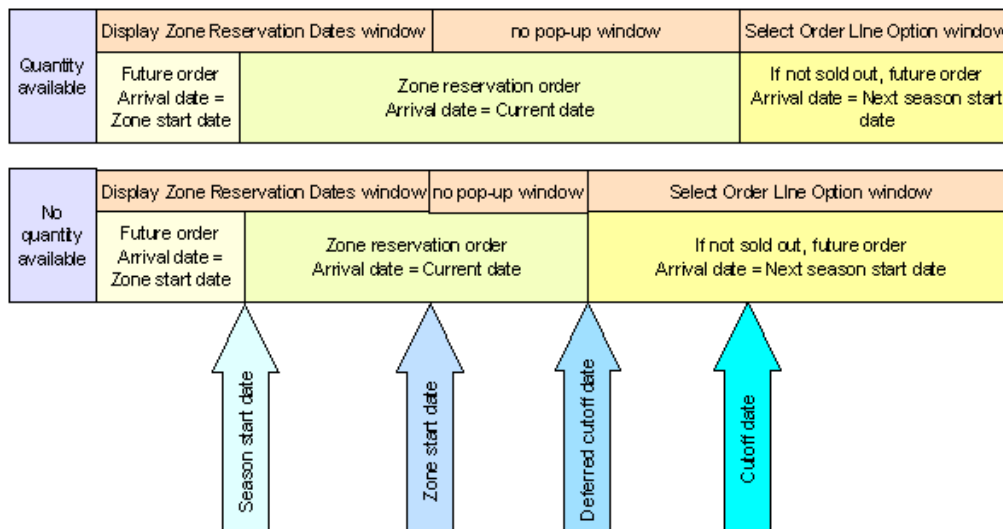

After the deferred cutoff date (backorder cutoff date) but prior to the cutoff date:

- If stock is available, the order follows the rule listed above.
- If stock is not available, the order line follows the rule below.

After the cutoff date, the [Select Order Line Option Window](#) presents two options:

1. Sell out the order line
2. Take the order line as a future order (backorder status = F) with an arrival date = the next season's start date

Future orders: An order line taken outside the season as a future order will have a future *Arrival date* and a backorder status of F (Future order). [Future order](#) lines are reserved or backordered during the Evaluate Future Orders periodic process. The order is then selected for pick slip generation when the zone opens, since this date is the arrival date for the order line.

Alternate Zone Reservation Rules

Use Alternate Zone Reservation Logic (I52)

Prior to the season start date:

- The order line is taken as an open order, but is not reserved.
- The backorder status = F (Future order).
- The arrival date of the order = the zone start date.
- The system presents the [Display Zone Reservation Dates Window](#) if you have flagged the order type to display zone date windows.

After the season start date but prior to the zone start date:

- If the item has an available quantity or any open purchase orders:
 - The order line is taken as an open order, but is not reserved.
 - The backorder status = Z (Zone reservation).
 - The arrival date of the order line = the current date.
 - The system presents the [Display Zone Reservation Dates Window](#) if you have flagged the order type to display zone date windows.
- If the item has no available quantity or open purchase orders, the [Select Order Line Option Window](#) presents two options:

- Sell out the order line
- Take the order line as a future order (backorder status = F) with an arrival date = the next season's start date

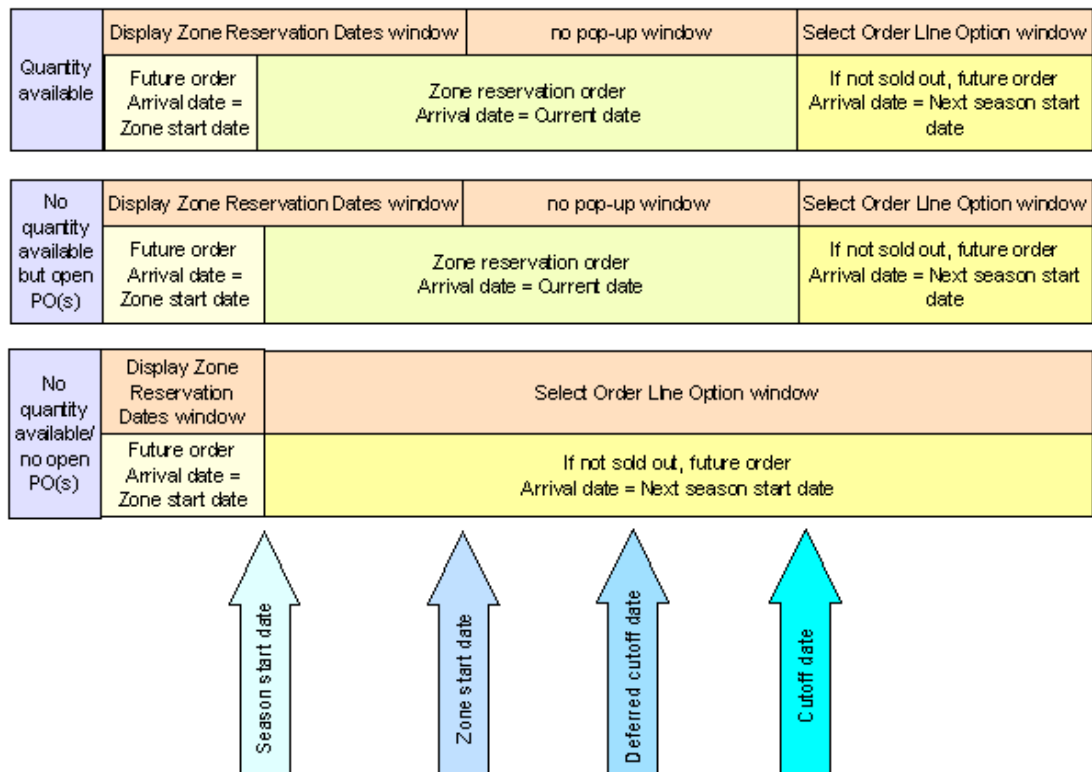

After the zone start date but prior to the cutoff date:

- If the item has an available quantity or any open purchase orders:
 - The order line is taken as an open order, but is not reserved.
 - The backorder status = Z (Zone reservation).
 - The arrival date of the order line = the current date.
- If the item has no available quantity or open purchase orders, the [Select Order Line Option Window](#) presents two options:
 - Sell out the order line
 - Take the order line as a future order (backorder status = F) with an arrival date = the next season's start date

After the cutoff date, the [Select Order Line Option Window](#) presents two options:

1. Sell out the order line
2. Take the order line as a future order (backorder status = F) with an arrival date = the next season's start date

Future orders: An order line taken outside the season as a future order will have a future *Arrival date* and a backorder status of F (Future order). [Future order](#) lines are reserved or backordered during the Evaluate Future Orders periodic process. The order is then selected for pick slip generation when the zone opens, since this date is the arrival date for the order line.

Pop-up Windows

Display Zone Reservation Dates Window

If you take an order before the start date: For zone reservation orders taken before the start date, the system displays zone reservation date information in an informational pop-up window.

Controlling the display of this window: This window displays automatically if the *Zone date windows* field for the order type is selected. For example, you might want to display this informational window for phone orders, but not for mail orders. See [Establishing Order Types \(WOTY\)](#).

 **Note:**

This window displays only once during order entry if multiple items on the order have the same zone start date.

Select Order Line Option Window

If cutoff date has passed: The system displays this window if the item is eligible for zone reservation, but not available for shipment within the zone reservation dates based on the rules used in your company. See [Standard Zone Reservation Rules](#) and [Alternate Zone Reservation Rules](#) for a discussion of each.

Choosing an option: From this window, you can:

1. Enter 1 to sell out the order line, and close it immediately.
2. Enter 2 to add the item as a future order. The arrival date is the *Start* date of the next season's zone date window for this item in this zone, as specified through [Creating and Maintaining Zone Reservation Dates \(WZRD\)](#). Future orders do not fall under zone reservation rules. The order is reserved through the Evaluate Future Orders periodic function.

 **Note:**

Depending on whether you use [Standard Zone Reservation Rules](#) or [Alternate Zone Reservation Rules](#) and the current date relative to the zone reservation dates, this window might display a slightly different message. For example, if you are using [Alternate Zone Reservation Rules](#), it is after the season start date, and there is no available or open PO quantity for the item, the window displays the message `Item is not currently available, select one of the following options`. However, the options are always the same, regardless of the situation which triggered the display of the window.

Overriding Zone Reservation Rules by Arrival Date

You can override zone reservation rules by overriding the order line's arrival date with a different date. Overriding the arrival date automatically updates the order priority to 9 (highest priority) if the [Auto Update Order Priority \(G45\)](#) field in the System Control table is selected. In addition, the override date works in the following ways:

- **Orders taken before the start of the season:** Zone reservation-coded items ordered before the Season start date, regardless of zone, are taken as future orders; the arrival date = the Start date of the zone date window. You can reserve, generate a pick slip for, and ship the item sooner than this date by overriding the arrival date for the order line. If you enter a date that is within the [Reservation Lead Days \(B27\)](#) specified for your company, the item ceases to be a future order, and is reserved immediately if available.
- **Orders taken on or after the cutoff date:** Items ordered after the cutoff date are not taken for the current season, but you can choose to accept the order as a future order with an arrival date = the start date of the next season in which you sell the item. If there is stock available, you can reserve, generate a pick slip for, and ship the item sooner than this by overriding the arrival date for the order line. If you enter a date that is within the [Reservation Lead Days \(B27\)](#) specified for your company, the item ceases to be a future order, and is reserved immediately. When you generate pick slips for current orders this item may be included.
- **Otherwise, if stock is available:** Overriding the arrival date of a zone reservation-coded item (one added with a backorder status of Z (zoned reservation) and the order date as the arrival date) does not change the backorder status of the line; however, you can select this arrival date as a criterion for pick slip generation.

Zone Reservation Rules Summary

Additional Condition?	Zone Reservation Rule	Overriding Zone Reservation
Prior to season start date		
None	Zone reservation order line taken as future order Arrival date = zone start date Display Zone Reservation Dates Window if order type specifies	Override the <i>Arrival date</i> on the order line; if you enter a date that is within the Reservation Lead Days (B27) , the item ceases to be a future order, and is reserved immediately; otherwise, generate pick slip by <i>Priority</i> (if you have entered a date other than the current date) or <i>Arrival date</i> .
After season start date but prior to zone start date		
<ul style="list-style-type: none"> • the Use Alternate Zone Reservation Logic (I52) system control value is selected and there is an available or open PO quantity, or • the Use Alternate Zone Reservation Logic (I52) system control value is unselected 	Zone reservation order line taken as open order Backorder status = Z Arrival date = current date Display Zone Reservation Dates Window if order type specifies	Override the <i>Arrival date</i> on the order line. Generate pick slip by <i>Priority</i> or <i>Arrival date</i> .
the Use Alternate Zone Reservation Logic (I52) system control value is selected and there is no available or open PO quantity	Select Order Line Option Window provides two options: <ol style="list-style-type: none"> 1. Sell out order line 2. Take the order as future order with arrival date = zone start date for the next season 	Take order as future order.

Additional Condition?	Zone Reservation Rule	Overriding Zone Reservation
After zone start date		
<ul style="list-style-type: none"> the Use Alternate Zone Reservation Logic (I52) system control value is selected and there is an available or open PO quantity, or the Use Alternate Zone Reservation Logic (I52) system control value is unselected 	Zone reservation order line taken as open order Backorder status = Z Arrival date = current date No pop-up window	Override <i>Arrival date</i> . Override <i>Arrival date</i> on order line; if new arrival date is within Reservation Lead Days (B27) and item is available, it is reserved; otherwise, generate pick slip by <i>Priority</i> (if you have entered a date other than the current date) or <i>Arrival date</i> .

Zone Reservation Setup

Overview: All of the values specified below must be set in order for zone reservation rules to apply to an item in order entry.

SKU table: The [Zone reservation code](#) field in the SKU table indicates whether or not an order line is processed under zone reservation rules.

Offer table: The *Season* field in the Offer table identifies the season linked to the offer. A zoned reservation item offered in more than one season (spring and fall, for example) has more than one set of date windows (spring date windows and fall date windows). The zone reservation program uses this information to identify which season's date windows to use. Only order lines whose offers are linked to a season are eligible for zone reservation rules. See [Working with Offers \(WOFR\)](#).

ZIP/City/State table or SCF table: The *Geographic zone* field in the ZIP/City/State table, or alternatively the *Geographic zone* field in the SCF table identifies the geographic zone of the ship-to address. You must specify a geographic zone for each ZIP code, or alternatively for each SCF code, to which you ship zone reservation items. You can specify a geographic zone for a range of ZIP codes on the [Update Postal Codes by Range Screen](#).

The *Geographic zone* in the ZIP/City/State table overrides the *Geographic zone* in the SCF table for zone reservation processing. The ZIP/City/State table is not company specific; zones assigned at the ZIP/City/State table applies to all companies in your system. You can define different geographic zones for different companies by leaving the *Geographic zone* field blank in the ZIP/City/State table and instead entering values in the *Geographic zone* field of the SCF table, which is specific to each company. See [Working with SCF Codes \(WSCF\)](#).

Either of these tables can supply the third required value for an order line to be eligible for processing under zone reservation rules.

System control values:

- [Bypass Geographic Zone Searching in Order Entry/Order Maintenance \(H55\)](#): must be unselected.
- Use Alternate Zone Reservation Logic (I52): controls whether the system uses [Standard Zone Reservation Rules](#) or [Alternate Zone Reservation Rules](#)
- [Auto Update Order Priority \(G45\)](#): updates to 9 the priority of any order on which the arrival date has been overwritten with a date other than the current date. This includes all zone reservation orders for which you have overridden the zone reservation arrival date. Orders with a priority of 9 takes precedence in pick slip generation if you specify *Priority* as a criterion.

Note:

You can update the priority of an order by changing the arrival date for the order, for the order ship to, or for the order detail. If you also want to change the shipping date for a zoned reservation item, you must change the arrival date on the [Work with Order Line Screen \(Changing/Adding an Item\)](#).

Other Optional Table Values

Order Type table: The *Zone date windows* flag in the Order Type table controls whether to display the [Display Zone Reservation Dates Window](#) in order entry when a zoned reservation item is ordered prior to the start date for the order's shipping zone. You might want to display

this window for phone orders, for example, but not for mail orders. See [Establishing Order Types \(WOTY\)](#) for more information.

Season table: The *Start date* field in the Season table determines when a zoned reservation item ordered before its *Zone Start date* is flagged as a future order. The *Season Start date* must be earlier than the start date for any zone date windows. Zoned reservation items ordered before this earlier *Season Start date*, are processed as future orders with an arrival date = the zone window start date; they do not fall under zone reservation rules. If the season *Start date* is left blank, all orders taken before the zone reservation *Start date* fall under zone reservation rules.

The *End date* field in the season table is informational only. See [Working with Season Codes \(WSEA\)](#) for more information.

Order Ship-To table: The *Geographic zone* field in the order ship-to table is automatically populated during order entry for zoned reservation items, and can be used during pick slip generation as a selection criterion.

Reserving Items/Generating Pick Slips

Order lines which fall under zone reservation rules are not reserved or back ordered when the order is taken; they are reserved or back ordered when you generate pick slips, using option 10 (batch reservation). You can generate pick slips for zone reservation-coded items by selecting criteria such as geographic zones, SCF code range, arrival date range.

Zone Reservation/Long SKU Class

Zone reservation codes cannot be used as a selection option for pick slip generation; however, you can generate pick slips for specific long SKU classes. If you designate long SKU classes to parallel zone reservation codes, you can use this selection option to generate pick slips for items with a specific zone reservation code. See [Working with Long SKU Classes \(WLSC\)](#).

Other Information to Note

Backorder reservation: An item/SKU which has been assigned a zone reservation code is processed under zone reservation rules only if the additional requirements for the zone reservation program are in place; otherwise, a zone reservation-coded item follows the standard order entry process. However, a zone reservation-coded item which is backordered under standard order entry procedure is not reserved during backorder reservation (EBO ASYNC) or the Reserve Backorders periodic process even if stock is available. You can reserve backordered stock for these items through [Working with Interactive Reservation \(MIRV\)](#).

Generic order interface: If an item is subject to zone reservation, the system applies the [Standard Zone Reservation Rules](#) or [Alternate Zone Reservation Rules](#) based on your setup. However, if the zone reservation rules that apply to the item would normally display the [Select Order Line Option Window](#) in order entry, the system always adds the item as a future order.

If you are using the [Alternate Zone Reservation Rules](#) and you attempt to maintain or review a suspended order that does not yet have payment information, the order does not reflect the zone reservation rules. The zone reservation rules do not apply until the order goes through the editing process.

Reserving Inventory and Generating Pick Slips

Topics in this part:

- [Reviewing Reservation Types](#) describes the three types of reservations: Immediate, Batch, and Interactive.
- [Reviewing Other Reservation Conditions](#) discusses other reservation conditions, such as: Coordinate grouping, drop ship reservations, special handling reservations, and reserving inventory for sets and variable sets.
- [Working with Interactive Reservation \(MIRV\)](#) discusses creating, changing, deleting, and displaying order information using this reservation type.
- [Preparing Orders for Pick Slip Generation](#) provides an overview on preparing an order for pick slip generation.
- [Performing Pick Slip Generation](#) includes locating the pick slip generation function, printing pick slips, performing cubing, selecting pick locations, replenishing stock, and using cart/bin picking.
- [Selecting Vendors for Drop Ship Processing \(MDSP\)](#) includes creating, changing, deleting, and displaying vendors for drop ship processing.
- [Displaying Pick Slip Generation Inquiry \(DPSI\)](#) describes this management tool.
- [Working with Pick Slip Messages \(WPSM\)](#) describes creating, changing, deleting, and displaying pick slip messages.
- [Processing Drop Ship Orders by Batch \(MDSB\)](#) describes how to generate drop ship picks by batch for selected vendors.
- [Printing the Carryover Report \(PCOR\)](#) describes how to generate the Carryover reports.
- [Generic Pick Out API](#) describes how to generate the outbound pick slip message for integration with another system.
For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).
- [Streamlined Pick Slip Generation \(WSPS\)](#) describes a streamlined version of the pick slip generation option.
- [Pick Print Eligibility \(WPPE\)](#) determines whether the system will include picks for a specified order in the next pick slip generation run for the selected pick slip generation template.
- [Unlock Pick Slip \(MUPI\)](#) allows you to unlock a pick slip.

Reviewing Reservation Types

Purpose: The Reservation module reserves inventory from a specific warehouse or multiple warehouses for customer orders as they are entered and accepted through Order Entry.

The system continually evaluates new orders and backorders to ensure that stock is being reserved appropriately for all orders. There are two reservation types:

- Immediate = The system reserves stock when an order is placed, providing stock is available. In an immediate or real-time environment, the system reserves inventory on a first-come, first-served basis (FIFO) in the specified warehouse as each item is added to an order.

- **Interactive** = The system reserves stock through an interactive entry program. When using the Interactive Reservation function, no inventory is reserved until you use [Working with Interactive Reservation \(MIRV\)](#). This program allows you to disburse inventory manually to preferred customers or to customers who order in large wholesale volume.

Note:

In order for the system to reserve inventory for a particular item in a warehouse, the [Reservation freeze](#) field for that item warehouse must be unselected.

In this topic:

- [Reserve Warehouse Hierarchy](#)
- [Reviewing Immediate Reservation](#)
 - [Reserving Backorders](#)
- [Reserving Stock with Immediate Reservation](#)
- [Reviewing Interactive Reservation](#)
- [Reserving Stock with Interactive Reservation](#)

Reserve Warehouse Hierarchy

The system assigns a warehouse to an order or order line using the following hierarchy:

- **A warehouse code for an individual order line:** If you enter a warehouse code for an individual order line using the Add Line option, the system will use this warehouse to reserve the order line. This warehouse assignment will override all other reserve warehouse logic.
- **A warehouse code entered on the order header:** If you enter a warehouse code in the *Warehouse* field on the Work with Order screen, the system will use this warehouse to reserve all lines on the order. This warehouse assignment will override all other warehouse assignments except a warehouse code entered for an individual order line.
- **Warehouse list:** If you have not entered a warehouse code for an individual order line, or a warehouse code on the order header, the system will look for a warehouse list for the SCF of the order ship to address, if system control value [Ship Complete from 1 Warehouse \(B16\)](#) selected.
- **The item's primary warehouse:** If no reserve warehouse can be assigned based on individual order lines, a warehouse code entered on the order header, or a warehouse list, the system will reserve the item in the warehouse defined for the item in the Item table. See [Warehouse Lists and Single Order Lines](#).

Reviewing Immediate Reservation

Overview: In the Immediate Reservation environment, the system reserves inventory for an item when the order is placed. In addition, stock is reserved for eligible backorders as new merchandise is received into active inventory in the warehouse. This ensures that eligible backorders receive stock prior to new orders. Backorders are

reviewed on a continual basis to ensure that eligible backorders receive stock prior to new orders and that orders are ready for printing as soon as possible.

The system prepares an order for pick slip generation when an order is created or changed; see [Preparing Orders for Pick Slip Generation](#).

You must run [Streamlined Pick Slip Generation \(WSPS\)](#) to generate and print pick slips. See [Performing Pick Slip Generation](#).

System control values which control Immediate Reservation:

System Control Value	Results
Immediate Reservation (A64) Selected/Unselected	<ul style="list-style-type: none"> Selected = Inventory is reserved for open orders as each line is entered in Order Entry. Unselected = Inventory is reserved for orders through Working with Interactive Reservation (MIRV).
FIFO Flag (A03) Selected/Unselected	<ul style="list-style-type: none"> Selected = Inventory will be held for orders on a first-in/first-out basis, regardless of whether the order is eligible for fulfillment. Must be selected if Immediate Reservation (A64) is selected. Unselected = Inventory will not be held for orders that are not eligible for fulfillment. <p>NOTE: If this field is unselected, the system subtracts the SKU open quantity from the On hand quantity for each warehouse in calculating the Available quantity. For example, if you have 10 units of an item on-hand in warehouse 1 and warehouse 2, and you enter an order for a quantity of 2, the system displays an available quantity of 8 in both warehouse 1 and warehouse 2.</p>
Default Warehouse (A04)	<p>Enter a valid Warehouse code that represents the primary shipping warehouse. This code will display on many screens throughout the system.</p> <p>NOTE If you are in a multiple warehouse environment, you may want to leave this field blank.</p>
Ship Complete from 1 Warehouse (B16) Selected/Unselected	<ul style="list-style-type: none"> Selected = The system will attempt to consolidate reserve warehouses for the order, using warehouse list logic. Unselected = The system will attempt to reserve inventory from the item's primary warehouse as defined in the item table. <p>See Working with Warehouse Lists (WWHL) for an explanation of the system's reserve warehouse logic.</p>
Split Line Over Multi Whse (B19) Selected/Unselected	<ul style="list-style-type: none"> Selected = A line on an order can be fulfilled by inventory from more than one warehouse. Unselected = An order line must be fulfilled by inventory from only one warehouse. <p>NOTE: When This system control value is not currently implemented.</p>
Reservation Lead Days (B27)	<p>Enter the number of days after which an order (or order line) should be considered a future order and will not be reserved.</p>

Reserving Stock with Immediate Reservation

Determining stock availability: In the Immediate Reservation environment, the system reserves inventory on a first-come, first-served (FIFO) basis in the specified warehouse, as you add an item to an order.

The system is always attempting to reserve stock, based on your System Control table values and by using the Quantity Available calculation to determine if there is sufficient stock for new orders.

Quantity Available Calculation

On hand - Protected - Reserved - Reserve transfer - Backordered = Quantity Available

Definitions:

On hand: the quantity of the item currently in the warehouse

Protected: the quantity of the item that can be reserved only through Interactive Reservation.

Reserved: the quantity of the item that is already set aside for other orders.

Reserve transfer: the quantity of the item set to be transferred to another warehouse

Backorder: the quantity of the item unavailable for existing orders that must be fulfilled through PO Receipts

Note:

Each time an item is reserved, the system reduces the *Quantity available* and updates the *Quantity open* by the *Quantity ordered* fields in the Item/Warehouse table. Availability is reduced, regardless of the reservation type.

Reserving stock: In the Immediate Reservation environment, the system reserves stock, as follows:

- If the total order is available: The system increments the order detail line with the quantity reserved to fulfill the order. The program increments the *Quantity open* and *Quantity reserved* fields in the Item/Warehouse table.
- If a partial order is available: The system reserves what it can and backorders the rest. See [Reserving Backorders](#).
- If no part of the order is available: See [Reserving Backorders](#).

Note:

In a FIFO environment, an eligible order is any order taken for an item, open or held. In a Non-FIFO environment, only open orders are considered eligible for reservation.

Reserving Backorders

Orders for which stock is unavailable at the time of order entry will not be eligible for immediate reservation. These orders will have stock reserved using the Evaluate

Backorders Program. This is a batch program that can be initiated automatically by PO Receiving or Inventory Transactions. The system processes backorders as follows:

- When no part of the order is available: The system does not reserve the item in any warehouse and increments the *Quantity backordered* field in the Item/Warehouse table.
- When a partial order is available: The system reserves what it can and backorders the rest, and increments the *Quantity reserved* and the *Quantity backordered* fields in the Item/Warehouse table.

 **Note:**

Any item/SKU which has been assigned a zone reservation code will be excluded from backorder reservation in the Evaluate Backorders Program. These items are normally reserved and shipped through the zone reservation process; however, zone reservation coded items which have been backordered through the standard order entry process can be reserved in Work with Interactive Reservation. See [Shipping Zone Reservation Overview](#), for information on zone reservation. See [Working with Interactive Reservation \(MIRV\)](#), for more information on reserving interactively.

Evaluating future orders: The arrival date is the date on which the customer wants to receive the order; this date controls whether the system reserves inventory immediately and whether to create pre-generated picks. The system uses the following calculation to determine future orders.

Future Orders Calculation:

If Arrival date - Reservation lead days is equal to or greater than today's date, the order is a Future order.

The Evaluate Future Orders program runs each evening to evaluate all order detail lines marked as "future order." The system re-runs the arrival date calculation and reserves the required inventory based on the order date, if the system-calculated date is less than or equal to today's date.

When the system determines that an order is a future order:

- Inventory is not reserved.
- Each detail line is marked as a future order.

Reviewing Interactive Reservation

Overview: This feature allows you to reserve stock for specific customers or orders via [Working with Interactive Reservation \(MIRV\)](#). No inventory is reserved until you run the Interactive Reservation Program to manually disperse inventory to preferred customers, or to customers who purchase large volumes of inventory.

You can designate specific customers for interactive reservation using a Customer Class code in which the [Bypass reservation](#) field is flagged, or by selecting the flag for individual customers; for these customers, orders is not reserved in order entry. You can designate specific items to bypass reservation in order entry by using a quantity limit in the Item/SKU table (i.e., items for which there is limited stock).

Note:

Use the *Bypass reservation* flag only if the [Use OROB for Fulfillment Assignment \(M31\)](#) system control value is unselected. This system control value uses the *Bypass reservation* flag to send orders to Order Orchestration for fulfillment assignment.

System control values that control Interactive Reservations:

System Control Value	Results
Immediate Reservation (A64) Selected/Unselected	<ul style="list-style-type: none"> Selected = Inventory is reserved for open orders as each line is entered in Order Entry. Unselected = Inventory is reserved for orders through Interactive Reservation. <p>NOTE: A Bypass reservation flag in the Customer table indicates that you do not want to reserve stock for that customer via Immediate Reservation.</p>
FIFO Flag (A03) Selected/Unselected	<ul style="list-style-type: none"> Selected = Inventory will be held for orders on a first-in/first-out basis, regardless of whether the order is eligible for fulfillment. Must be selected if Immediate Reservation (A64) is selected. Unselected = Inventory will not be held for orders that are not eligible for fulfillment.
Default Warehouse (A04)	<p>Enter a valid Warehouse code that represents the default warehouse. This code will display on many screens throughout the system.</p> <p>NOTE: If you have multiple warehouses, you may want to leave this field blank.</p>
Ship Complete from 1 Warehouse (B16) Selected/Unselected	<ul style="list-style-type: none"> Selected = The system will attempt to consolidate reserve warehouses for the order, using warehouse list logic. Unselected = The system will attempt to reserve inventory from the item's primary warehouse as defined in the item table. <p>See Working with Warehouse Lists (WWHL) for an explanation of the system's reserve warehouse logic.</p>
Split Line Over Multi Whse (B19) Selected/Unselected	<ul style="list-style-type: none"> Selected = A line on an order can be fulfilled by inventory from more than one warehouse. Unselected = An order line must be fulfilled by inventory from only one warehouse. <p>NOTE: This system control value is not currently implemented.</p>
Reservation Lead Days (B27)	<p>Enter the number of days after which an order (or order line) should be considered a future order and will not be reserved.</p>

Reserving Stock with Interactive Reservation

Reservation conditions: In [Working with Interactive Reservation \(MIRV\)](#), the system reserves stock only if:

- The order is not a future order; the system-calculated date is less than or equal to today's date.
- The [Reservation freeze](#) field in the item/SKU warehouse record is not selected.

- Reservations can be performed against the warehouse in the Item/Warehouse record.

**Note:**

Each time an item is reserved, the system reduces the *Quantity available* and updates the *Quantity reserved*. Availability is reduced, regardless of the reservation type.

Reserving stock: In the Immediate Reservation environment, the system reserves stock based on the values defined in the *Quantity reserve limit* field in the Item table. This quantity represents the maximum quantity that can be reserved for any one order through Immediate Reservation in order entry. If the quantity ordered by a customer exceeds this quantity, the system will not reserve any inventory for that order detail line. This order detail line must be flagged for reservation by the Interactive Reservation Program.

Displaying held orders: In Interactive Reservation, you can display held orders that have inventory reserved for them.

The list of held orders is displayed by hold code (e.g., all fraud orders are displayed first) and within hold code by date. You can release the inventory reservation on these orders; however, to cancel the order or take any other action, you must use the Order Maintenance function.

Reviewing Other Reservation Conditions

Purpose: The Reservation function reserves stock for customer orders; however, some orders may include items that require special handling, drop ships, or coordinate groups. Additionally, some orders have items that belong to sets or variable sets. These special conditions may cause the system to process reservations and generate picks differently than it would for regular items.

In this topic:

- [Reserving Coordinate Group Items](#)
- [Reserving Drop Ship Items](#)
- [Reserving Special Handling Items](#)
- [Reserving Inventory for Finished Good Orders](#)
- [Reserving Inventory for Set Orders](#)
- [Reserving Inventory for Variable Set Orders](#)

Reserving Coordinate Group Items

Overview: Coordinate grouping ensures that items on an order ship together. Items with the same coordinate group number will not allocate unless inventory is available for all of the items. Items are coordinate grouped in Order Entry and Order Maintenance.

If the Reservation program cannot reserve stock for all items linked by a common coordinate group, it will reserve stock for the available items and leave the other items on backorder. The remaining items will be reserved in the same manner as all other backorders.

Creating pre-generated picks: The system creates a pre-generated pick only if all lines that are coordinate grouped are eligible for pick slip preparation. The system may split the lines

that are coordinate grouped across multiple picks. See [Preparing Orders for Pick Slip Generation](#) and [Splitting an Order Across Multiple Picks](#).

Printing pick slips: No special information pertaining to coordinate grouping appears on the pick slip. See [Performing Pick Slip Generation](#).

! Important:

The same ship via must be assigned to items that belong to the same coordinate group.

Reserving Drop Ship Items

Overview: A drop ship item is an item that you do not stock in inventory. When a customer places an order for a drop ship item, you order the item from your supplier (vendor). The vendor ships the item directly to your customer.

Reserving stock: To use the Drop Ship Reservation feature, you must indicate in the Vendor table whether you want to send drop ship picks, POs, and/or EDI transmissions, or process drop ship orders for this vendor using the [Order Orchestration Drop Ship Integration](#). You can also ship items that are typically drop ship items from your own warehouse. For example, you may have returns that can be used to fulfill new orders; these items could be shipped from your warehouse rather than the vendor's warehouse.

When you take an order for a drop ship item, the system attempts to reserve stock from your warehouse, rather than from the vendor, as follows:

- If the entire quantity is available in the warehouse, it is reserved.
- If the entire quantity is not available in the warehouse, the system requires the order be sent from the vendor.

Printing drop ship pick slips: Drop ship items produce drop ship pick slips or drop ship purchase orders. If a drop ship item cannot be allocated from inventory, which is usually the case, the system produces a drop ship pick slip or purchase order.

The system performs the following procedures during drop ship processing:

1. An item is flagged as “Drop Ship” in the Item table.
2. When you add the item to an order, it displays on neither reserved nor backordered. The “Drop Ship” flag appears on the order line detail.
3. When you generate pick slips or purchase orders, the system checks the Item/SKU table to determine the primary vendor assigned to the item/SKU ordered.
4. The system then checks the Vendor table to determine whether this vendor takes drop ship purchase orders, drop ship pick slips, or processes drop ship orders using the interface with Order Orchestration's Drop Ship Manager. If the vendor takes drop ship pick slips, the system prints a separate pick slip.

Reserving Special Handling Items

Overview: Items that can be personalized or finished are considered special handling (S/H) items. Personalization might include monogramming, engraving, hemming, etc.

Reserving S/H items: The system reserves inventory for these items in the same way as for any other item. A separate processing step is not required to reserve stock for these orders. Stock is reserved immediately or by the Evaluate All Backorders Program. See [Reviewing Reservation Types](#).

As inventory is reserved for these orders, the reservation program increments the *S/H Reserve* field in the Item/Warehouse table.

Pick slip preparation: The [Split Special Handling Picks \(L44\)](#) controls whether the system creates a separate pre-generated pick for the order lines on an order that contain a special handling code. This system control value also controls whether the system creates a separate pick slip PDF document for picks that contain items that require special handling.

Printing pick slips: The [Special Handling](#) field on the [Streamlined Pick Slip Generation Screen](#) allows you to select pre-generated picks for pick slip generation based on the presence of a special handling code for an item. Special handling instructions entered during Order Entry will print on the pick slip if the pick slip printing program you are using permits it. This is true whether the line prints on an individual pick slip or is on a pick slip with other items.

Reserving Inventory for Finished Good Orders

Overview: Finished good orders are orders that require assembly prior to picking and packing. A finished good, defined as Finished Good in the [Kit type](#) field in the Item table, is comprised of one or more component items that you may also sell individually.

Reserving stock: Finished goods are reserved at the finished good level, not at the component level.

Orders where the inventory is not reserved immediately will have stock reserved using the Evaluate All Backorders Program. See [Reviewing Reservation Types](#).

Creating pre-generated picks: Typically, the system looks at the lead days for the shipper and your internal lead time to determine when to create a pre-generated pick.

Printing pick slips: The pick slip lists only the finished good; component information does not appear.

See [Entering Finished Goods Information \(WFGD\)](#) for more information on working with finished goods.

Reserving Inventory for Set Orders

Overview: A set item, identified by a Set in the [Kit type](#) field in the Item table, is composed of two or more items that you sell together as a unit. The items that make up a set are often referred to as components. You can also sell these components individually.

Reserving stock: Sets are reserved at the component level only. Orders where the inventory is not reserved immediately will have stock reserved using the Evaluate All Backorders Program. See [Reviewing Reservation Types](#).

Soldouts:

- **Component item(s):** If any of the component items on a set are sold out based on the assigned soldout control code and the current inventory situation, the main set item and each of the component items are added to the order in a soldout status (S). For example, if the set includes five items, and one of the items is assigned a soldout control code indicating to sell the item out immediately, the main set item and all of the component items will be added to the order in a soldout status.

- Main set item: Similarly, if the main set item itself is assigned *any* soldout control code, the main set item and each of the component items are added to the order in a soldout status (S).

See [Working with Soldout Controls \(WSLD\)](#) for a discussion on how soldout controls indicate when an item is sold out.

Pick slip preparation: To create a pre-generated pick for a set:

- If the set and component items are coordinate grouped, all of the component items must be reserved and in an open status.
- If the set and component items are not coordinate grouped, at least one of the component items must be reserved and in an open status.

See [Selecting Order Lines for Pick Slip Preparation](#).

Printing pick slips: The pick slip shows the components of the set, but not the price of each component. The price of the set displays on the pick slip next to the set item only.

For more information: See [Entering Set Information \(WSET\)](#) for more information on working with sets.

Reserving Inventory for Variable Set Orders

Overview: Variable sets, defined as Variable Set in the [Kit type](#) field in the Item table, are items that allow customers to choose from a list of component items to make up the set they want to purchase.

Reserving stock: Variable sets are reserved at the component level. Orders where inventory is not reserved immediately will have stock reserved using the Evaluate All Backorders Program. See [Reviewing Reservation Types](#).

Printing pick slips: The pick slip lists an order detail line for each component item and does not refer to the variable set at all. Prices are shown for each component.

See [Entering Variable Set Information \(WVST\)](#) for more information on working with variable sets.

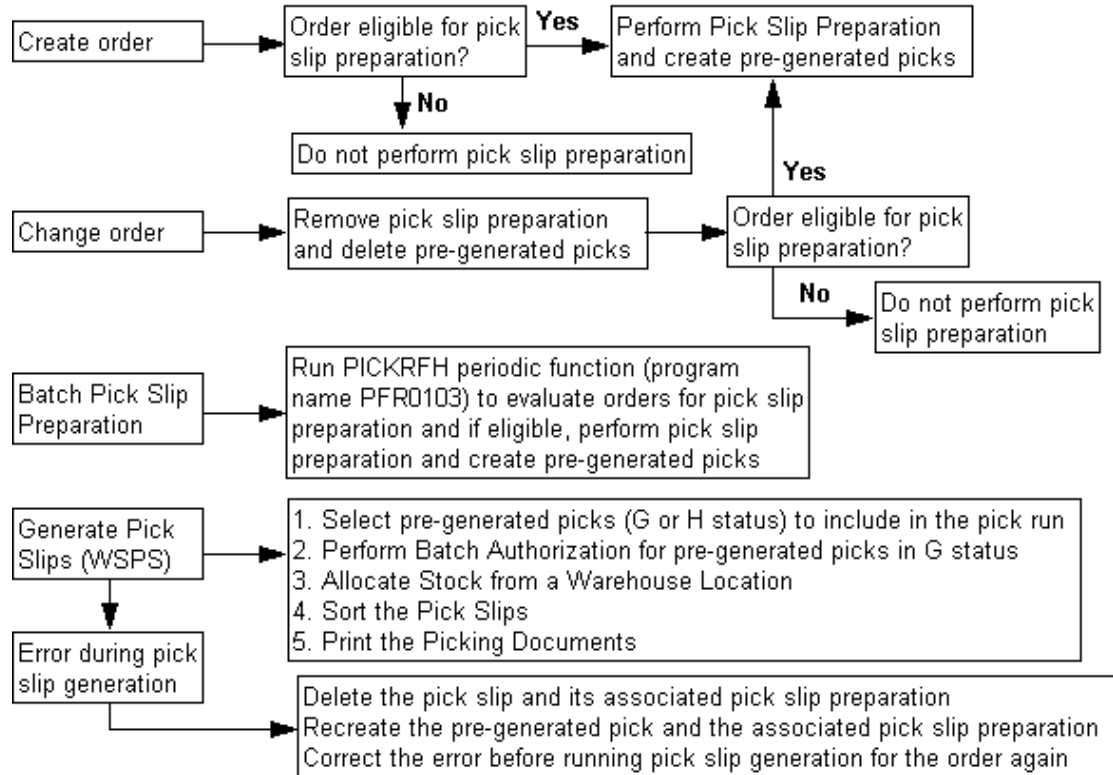

Preparing Orders for Pick Slip Generation

Pick slip preparation prepares an order for fulfillment when you create or change an order, such as creating pre-generated picks in the Pick Control Header and Pick Control Detail tables and defining whether the pre-generated picks require authorization. Preparing the order for pick slip generation in advance reduces the time it takes to run Streamlined Pick Slip Generation (WSPS) to fulfill and print the picking documents.

Pre-generated picks are picks created prior to running pick slip generation for an order. The status of a pre-generated pick is either G Generated No Authorization, indicating the pick requires authorization during pick slip generation, or H Generated Has Authorization, indicating the pick can bypass authorization during pick slip generation. Pick slip generation selects pre-generated picks to fulfill and print based on the pick slip selection criteria specified.

Pick slip preparation process:

Preparing Orders for Pick Slip Generation

Standard pick slip generation: You cannot use standard pick slip generation (WPSG) for orders that are eligible for pick slip preparation; you must use Streamlined Pick Slip Generation (WSPS) to complete the pick slip generation process.

In this topic:

- [Pick Slip Preparation Setup Requirements](#)
- [Selecting Order Lines for Pick Slip Preparation](#)
- [When is Pick Slip Preparation Performed?](#)
- [Batch Pick Slip Preparation](#)
- [Applying Pick Slip Preparation to an Order](#)
- [Splitting an Order Across Multiple Picks](#)
- [Creating Pre-Generated Picks](#)
- [Removing Pick Slip Preparation from an Order](#)

For more information: See:

- [Performing Pick Slip Generation](#) for an overview and processing details.
- [Streamlined Pick Slip Generation \(WSPS\)](#) to review the options you can use to select picks for pick slip generation.

Pick Slip Preparation Setup Requirements

- [Pick Slip Generation Templates](#)
- [System Control Values](#)

For more information: See [Pick Slip Generation Setup Requirements](#) for more information on the setup required to run pick slip generation.

Pick Slip Generation Templates

Use the [Streamlined Pick Slip Generation Screen](#) to create pick slip generation templates to define the selection criteria the system uses to select pre-generated picks for fulfillment. Review the pick slip generation templates that you may have used in Standard Pick Slip Generation (WPSG) to determine the pick slip generation templates to create in Streamlined Pick Slip Generation.

System Control Values

System Control Value	Description
Reservation Lead Days (B27)	Enter the number of days after which an order (or order line) should be considered a future order and should not be reserved. The FUTURE periodic function (FLR0246) uses this number of days to determine when an order line's arrival date makes it eligible to reserve as a future order.
Pick Processing Days (B37)	Enter the number of days it takes your company, on average, to pick, pack, and ship an order. This is your internal lead time. This number determines when to create a pre-generated pick; see Selecting Order Lines for Pick Slip Preparation .
Split Special Handling Picks (L44)	Select this field to have pick slip preparation create a separate pre-generated pick for all items on an order that contain a special handling code. When you generate pick slips for the order, the system creates a separate PDF document for picks that contain items with special handling. Deselect this field to have pick slip preparation include items on the order that contain a special handling code on the same pre-generated pick as the other shippable items on the order (assuming another reason does not cause the system to split the order across multiple picks; see Splitting an Order Across Multiple Picks). When you generate pick slips for the order, the system does not create a separate PDF document for special handling items. See this system control value for examples.
Create Separate Picks for Ship for Pickup Orders (L89)	Select this field to have pick slip preparation create a separate pre-generated pick for each item on a ship-for-pickup order. When you generate pick slips for the order, the system submits each order line to Order Orchestration as a separate order. Deselect this field to have pick slip preparation include all reserved items within the warehouse on the same pre-generated pick. When you generate pick slips for the order, the system submits all items on the pick slip together, even if it creates a multi-line order. See Ship-for-Pickup Orders for background.

Selecting Order Lines for Pick Slip Preparation

In order for the system to perform pick slip preparation and create pre-generated picks, an order must meet the following requirements.

- The Order Header must be in an open status and not locked by a user.
- A line on the order must be reserved and in an open status.
- For each reserved, open order line:
 - The *Arrival date* cannot be a future arrival date. The system uses the arrival date defined for the order line or the order ship to if not defined at the line level; see [Arrival Date Calculation](#).
 - The *Cancel date* cannot fall within the time it takes to process and fulfill the pick slip. The system uses the cancel date defined for the order line or the order ship to if not defined at the line level; see [Cancel Date Calculation](#).
 - The *Quantity remaining* must be less than or equal to the *Quantity reserved* in the Reserved Order Line table.
 - The *Quantity remaining* in the Reserved Order Line table must be less than or equal to the *Quantity reserved - Quantity Printed* in the Order Detail table.
 - The *Quantity printed* in the Reserved Order Line table must be less than or equal to the *Quantity reserved* in the Order Detail table.

Also:

Ship complete orders: If the order is flagged as ship complete, all of the lines on the order must be reserved and in an open status.

Sets: If the order contains a set and the set and component items are coordinate grouped, all of the component items must be reserved and in an open status. If the set and component items are not coordinate grouped, at least one of the component items must be reserved and in an open status.

Coordinate-grouped items: Pick slip preparation is not applied to order lines that are assigned the same coordinate group number until all of the coordinate grouped lines are eligible for pick slip preparation.

Non-inventory items: If the only items on the order are non-inventory, the items do not need to be reserved, but must be in an open status in order to be eligible for pick slip preparation. The system creates a pre-generated pick for the non-inventory item, even if all other items on the order are not eligible for pick slip preparation; however, the system will not create a pre-generated pick for a non-inventory item if all other items on the order are backordered; when one or more backordered items are available, the system creates a pre-generated pick for the non-inventory item as well as for the available item(s).

Drop ship items: The system does not include drop ship items on a pre-generated pick.

Multiple recipients: If the order contains multiple recipients, the system evaluates each order ship to individually to determine if it qualifies for pick slip preparation.

Ship-for-pickup orders: If the [Create Separate Picks for Ship for Pickup Orders \(L89\)](#) system control value is selected, the system prepares a separate pick for each reserved order line.

Arrival Date Calculation

The system checks the arrival date for each line on an order to determine when to create a pre-generated pick.

Arrival Date from Order Line (or Order Ship To) - (Pick Processing Days (B37) + Ship Via Lead Days in WSHV) < or = Today's Date

The system creates a pre-generated pick for the order line if this system-calculated date is less than or equal to today's date; otherwise, the system does not create a pre-generated pick for the order line until the date is within the allotted time frame.

 **Note:**

To retrieve the correct ship via lead days in [Working with SCF/Ship Via Values \(WSHV\)](#), the system uses the ship via on the order line (or order ship it not defined at the line level) and the SCF (first 3 digits of the postal code) and country code defined for the order ship to delivery address.

Cancel Date Calculation

The system checks the cancel date for each line on the order to determine whether to create a pre-generated pick.

Cancel Date > Today's Date + Pick Processing Days (B37) + Ship Via Lead Days in WSHV

The system creates a pre-generated pick for the order line if the cancel date is greater than this system-calculated date; otherwise, the system does not create a pre-generated pick for the order line.

Fields used in the arrival date and cancel date calculations:

Arrival date is the date when the customer wants to receive the order. This date controls whether the system reserves inventory and prints pre-generated picks immediately.

You can define the arrival date for an order line on the [Work with Order Line Screen \(Changing/Adding an Item\)](#) and you can define an arrival date for an order ship to on the [Work with Order Screen](#). See [Reviewing Reservation Types](#).

Cancel date is the date when the customer wants to cancel an order if it has not been shipped.

You can define a cancel date for an order line on the [Work with Order Line Screen \(Changing/Adding an Item\)](#) and you can define a cancel date for an order ship to on the [Work with Order Screen](#).

Pick processing days are the number of days it takes your company, on average, to pick, pack, and ship an order. This is your internal lead time. The system uses this number to determine when to generate a pick slip.

You use the [Pick Processing Days \(B37\)](#) system control value to define your pick processing days.

Ship via lead days, as defined in the [Working with SCF/Ship Via Values \(WSHV\)](#) menu option, represents the number of days it takes a shipper to deliver the order to its destination. The SCF represents the first 3 positions of the destination postal code. To retrieve the correct ship via lead days, the system uses the ship via on the order line (or order ship it not defined at the line level) and the SCF (first 3 digits of the postal code) and country code defined for the order ship to delivery address.

When is Pick Slip Preparation Performed?

The system performs pick slip preparation when:

- An order is created; see [Pick Slip Preparation when an Order is Created](#).
- A user or the system updates an order; see [Pick Slip Preparation when an Order is Maintained](#).
- Pick slip generation (WSPS) cannot generate a pick slip; see [Pick Slip Preparation when Pick Slips are not Generated \(WSPS\)](#).

Pick Slip Preparation when an Order is Created

The system performs pick slip preparation when an order is created; see [Applying Pick Slip Preparation to an Order](#) for the updates that are performed.

Pick Slip Preparation...	applied to an order when:
Entering Orders	The system performs the final order accept. If the order contains multiple recipients, the system does not perform pick slip preparation until you accept the last order ship to on the order.
<i>Generic Order Interface (Order API)</i> For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	Order Administration receives the order through the Generic Order Interface (Order API) and it is not placed in an error status. Pick slip preparation occurs after the system generates the Order Response.
Working with Error Order Batches	You select to Edit/Accept the order batch. The system performs pick slip preparation only for orders that are accepted in the order batch.
dGenerating Membership Orders (EGMO)	Order Administration generates a membership order.

Pick Slip Preparation when an Order is Maintained

The system performs pick slip preparation when a user or the system updates an order. In this situation, the system performs the following updates.

1. The system REMOVES any pick slip preparation from the order; see [Removing Pick Slip Preparation from an Order](#) for the updates that are performed.
2. Once the changes to the order have been made, the system EVALUATES the order to determine if it is eligible for pick slip preparation.
3. If the order is eligible for pick slip preparation after the changes to the order have been made, the system RE-APPLIES pick slip preparation to the order; see [Applying Pick Slip Preparation to an Order](#) for the updates that are performed.

Pick Slip Preparation...	removed and reapplied to an order when:
Performing Order Maintenance	Removed when you select the order for maintenance, across all order ship tos. Reapplied when you accept or reject the order maintenance changes, across all order ship tos.
Releasing Held Orders (ERHO)	You release an order from hold and its status changes to Open.

Pick Slip Preparation...	removed and reapplied to an order when:
Working with Tickler Users/User Groups (WTIC)	You release an order from hold and its status changes to Open.
Working with Held Detail Lines (WOHD)	You select Release to release an order line from hold or select Batch Release to release multiple order lines from hold.
Evaluate Future Orders periodic function (program name FLR0246)	An order is reserved and updated to an open status.
Working with the EBO_ASYNC Job (MBJC)	Stock is reserved against an order.
Evaluate Backorder Reasons without Backorder Warehouse periodic function (program name PFR0024)	An item on backorder is reserved.
Reserve Backorders periodic function (program name FLR0804)	An item on backorder is reserved.
Processing Auto Soldout Cancellations (MASO)	<ul style="list-style-type: none"> • An order is flagged as ship complete and the item that was preventing a pre-generated pick from being created for the order is soldout, or • Items on the order are assigned to the same coordinate group and the item in the group that was preventing a pre-generated pick from being created for the order is soldout.
Working with Return Authorizations (WRTA) and Receiving Returns (WRAR)	<p>Removed when you select an order for return authorization.</p> <p>Reapplied when you accept or reject the return authorization.</p> <p>If you add an exchange item, the system performs pick slip preparation for the exchange item when you receive the return authorization.</p>
Working with Interactive Reservation (MIRV)	<p>Removed when you:</p> <ul style="list-style-type: none"> • scan by order number. • scan by customer class and select an order. • scan by item/SKU and perform an action against an item on the order. <p>Reapplied when you exit the screen.</p>
Processing Item Substitutions (PSUB)	You substitute an item that is on backorder with an item that is in stock.
<p><i>Inventory Transaction Upload XML Message (inCreateInvXaction)</i></p> <p>For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).</p>	The system unreserves an order to perform a negative adjustment.
Release Order on Time Hold periodic function (program name CSR0557)	An order is released from hold.
Working with Backorders Pending Cancellation (WBPC)	You cancel an item that is on backorder and the order is flagged as ship complete or the item being cancelled is the item that prevented a pre-generated pick from being created for the order.

Pick Slip Preparation...	removed and reapplied to an order when:
Working with Credit Card Cancellations (WCCC)	You cancel orders whose credit cards have been declined by the authorization service. NOTE: Because the order is cancelled, the system removes pick slip preparation from the order and does not reapply it.
Working with Inventory Transaction Errors (WITE)	An order is unreserved.
Processing Refunds (MREF)	You refund a stored value card item, causing the system to add a new stored value card item to the order and create a pre-generated pick for the new card.
Reset Allocation Quantities (MRPC)	You perform the reset. NOTE: To reduce the amount of time it takes to run this process, you should use Streamlined Pick Slip Generation (WSPS) to generate pick slips for as many orders as possible.
Unlocking a Stranded Order or Batch (MULO)	You unlock an order.
Reprinting and Voiding Pick Slips (WVRP or WSVP)	You void a pick slip. NOTE: <ul style="list-style-type: none"> If the pick slip is voided and unreserved, the system removes pick slip preparation and does not reapply it to the order. If the pick slip is reprinted, the system does not perform pick slip preparation.
Generic Pick In API (Shipments, Voids, and Backorders)	The <i>transaction_type</i> for a <i>CWPickIn XML Message</i> is B (full or partial backorder) or V (void).
For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1).	For more information see the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1). NOTE: The Generic Pick In API is available only for pick slips that have been fulfilled and printed through Streamlined Pick Slip Generation (WSPS) ; you cannot use the Generic Pick In API for pre-generated picks (picks in a G Generated No Authorization or H Generated Has Authorization status).
NO (New Orders) Event Processing	A NO New Order tickler is created. NOTE: If the order is placed on hold, the system does not reapply pick slip preparation to the order.
VP (Voided Pick Tickets) Event Processing	A VP Voided Pick Tickets tickler is created. NOTE: If the order is placed on hold, the system does not reapply pick slip preparation to the order.

Pick Slip Preparation when Pick Slips are not Generated (WSPS)

If the system cannot generate a pick slip during pick slip generation, the system determines the updates that need to be performed for pick slip preparation.

Pick Slip Not Generated Because:	Pick Slip Preparation Updates:
Declined Authorizations During Pick Slip Generation	<p>The system:</p> <ul style="list-style-type: none"> Deletes the pick slip. Prints the order on the declined Credit Card Authorization Listing. If the order is not placed on hold, creates a pre-generated pick in a G Generated No Authorization status. <p>NOTE: If the authorization remains in an S Sent status, the system updates the status of the pick to W Waiting for Authorization and does not delete it.</p>
Allocating Stock Error	<p>If a stock allocation error occurs and the Withhold Picks due to Item Allocation Error (F04) system control value is selected, the system:</p> <ul style="list-style-type: none"> Deletes all pre-generated picks for the order. Does not print a pick slip for the item which created an allocation error, or for any item that is on the same ORDER as the item that has the item stock allocation error, regardless if the other items on the order were created on a separate pre-generated pick. Prints the item with the stock allocation error on the Item Stock Allocation Error Report. Creates new pre-generated picks for the order. <p>If a stock allocation error occurs and the Withhold Picks due to Item Allocation Error (F04) system control value is unselected, the system:</p> <ul style="list-style-type: none"> Prints a pick slip for the items not in error, with the item associated with the stock allocation error in a backorder status. Deletes the pre-generated pick for the item with the stock allocation error. Prints the item with the stock allocation error on the Item Stock Allocation Error Report. Creates a new pre-generated pick for the item with the stock allocation error. <p>NOTE: If the item that has the item stock allocation error is part of a set or is part of a coordinate group, the system holds the other items that are part of the set or coordinate group.</p> <p>See the Withhold Picks due to Item Allocation Error (F04) system control value for examples.</p>
Stored value card number not assigned during pick slip generation	<p>If the system cannot assign a card number to a virtual stored value card or a card using the Oracle Retail Customer Engagement Stored Value Card integration, the system:</p> <ul style="list-style-type: none"> Deletes the pick slip. Prints the stored value card item on the Stored Value Card Assignment Errors Report. Recreates the pre-generated pick, removing the <i>Billing batch number</i> and <i>Date and Time printed</i> that was assigned during pick slip generation. <p>See Assigning a Stored Value Card Number.</p>

Pick Slip Not Generated Because:	Pick Slip Preparation Updates:
Order Orchestration indicates the retail pickup or delivery order has been canceled	<p>If Order Administration sends pick slip information to Order Orchestration and Order Orchestration indicates the order or line has been canceled, the system:</p> <ul style="list-style-type: none"> • Deletes the pick slip. • Puts the order on hold using the Order Broker Hold Reason (Cancel) (L02). • Does not recreate the pre-generated pick since the order is on hold. <p>See Retail Pickup (including Ship-for-Pickup) or Delivery Orders and the Use OROB Status Inquiry List Web Service (M05) system control value.</p>
Order Orchestration indicates the retail pickup or delivery order is under review	<p>If Order Administration sends pick slip information to Order Orchestration and Order Orchestration indicates the order is under review, the system:</p> <ul style="list-style-type: none"> • Deletes the pick slip. • Puts the order on hold using the AU hold reason (BROKER ORDER UNDER REVIEW). • Does not recreate the pre-generated pick since the order is on hold. <p>See Retail Pickup (including Ship-for-Pickup) or Delivery Orders and the Use OROB Status Inquiry List Web Service (M05) system control value.</p>
Error During Ship-for-pickup Order Processing	<p>If Order Administration sends pick slip information to Order Orchestration and Order Orchestration returns an error, the system:</p> <ul style="list-style-type: none"> • Does not print a pick slip. • Writes an order transaction history message: Submit Order Failed - OROB Unavailable. • Puts the order on hold using the Hold Reason for Errored Ship for Pickup Orders (L10). • Does not recreate the pre-generated pick since the order is on hold. <p>See Ship-for-Pickup Orders.</p>

Batch Pick Slip Preparation

The PICKRFH Pick Gen Refresh periodic function (program name PFR0103) allows you to submit a process that evaluates orders for pick slip preparation, and if eligible:

1. Removes any pick slip preparation that may have already occurred for the order; see [Removing Pick Slip Preparation from an Order](#) for the updates that are performed.
2. Applies pick slip preparation to the order; see [Applying Pick Slip Preparation to an Order](#) for the updates that are performed.

Use this periodic function to:

- Initially prepare existing orders for pick slip generation; see [Converting Orders to Pick Slip Preparation](#).
- Perform pick slip preparation for orders that initially were not eligible for pick slip preparation (for example, the order had a future arrival date).

See [How to Schedule a Job](#) for instructions on assigning this periodic function to a periodic process and to schedule when the process runs.

**Note:**

Oracle recommends you run this periodic function on a daily basis.

Logging: For each eligible order, the system writes a message to the [Trace Log](#) if its [Logging Level](#) is set to ERROR or higher.

Converting Orders to Pick Slip Preparation

Use the following steps to apply pick slip preparation to existing open and reserved orders.

Before running the PICKRFH Pick Gen Refresh periodic function and to minimize the amount of time it takes to convert orders to pick slip preparation, you should:

- Make sure you have a current backup of the Order Administration database.
- Use [Streamlined Pick Slip Generation \(WSPS\)](#) to generate pick slips for as many orders as possible to reduce the number of orders that require pick slip preparation.

To estimate the time it will take you to run the conversion process, to perform pick slip preparation for 11,000 orders takes roughly 68 minutes; however, based on your system, your time may vary.

To run the conversion process:

1. Log all users off Order Administration and stop any batch jobs, such as Background Asyncs (MBCJ) and any Integration Layer Jobs (IJCT). This ensures there are no locks on the Order and Pick tables, no new orders are created during the conversion process, and reduces the conversion time.
2. Log in to Order Administration and verify you are in the company you wish to convert.
3. In [Executing Periodic Processes \(EPRO\)](#), select the CVTIAPICK periodic process and select OK.
4. At the [First Execute Periodic Process Screen \(Setting Parameters\)](#), enter the company you wish to convert and select OK.
5. On the [Second Execute Periodic Process Screen \(Selecting Functions\)](#), select Execute. The system submits the CVTIAPICK job.
6. Once the CVTIAPICK job completes, open the Trace Log and verify the system wrote a message indicating the conversion completed. The message should be similar to the following: PickGen Refresh completed. It generated picks for approximately 9999 orders.

Once the conversion process completes, you can allow users back in the system.

Applying Pick Slip Preparation to an Order

For orders that qualify for pick slip preparation, the system performs the following updates.

- [Creates Pre-Generated Picks](#)

- [Updates Reserved Order Lines for the Order](#)
- [Updates Authorizations for the Order](#)

For more information: See [Selecting Order Lines for Pick Slip Preparation](#) and [When is Pick Slip Preparation Performed?](#) for more information on determining when an order line is eligible for pick slip preparation, and when the system performs pick slip preparation.

Creates Pre-Generated Picks

When creating pre-generated picks for an order, the system performs the following updates.

Splits an order across multiple picks: The system may split an order into multiple pre-generated picks for several reasons; see [Splitting an Order Across Multiple Picks](#).

Flags a pick as the first pick: If a pick doesn't already exist for the order that is flagged as the first pick, the system flags the pre-generated pick as the first pick. If multiple pre-generated picks are created for the order, the system flags one of the picks as the first pick. If a pick contains only bill immediately items (such as virtual stored value card items, membership items, and subscription items), the system flags this pick as the first pick.

- If the *Prorate Freight Charges (D39)* system control value is unselected, the system charges all freight charges on an order with the first shipment; in this situation, all freight charges are added to the pick the system flags as the first pick.
- If the *Prorate Freight Charges (D39)* system control value is selected, the system charges a proportional amount of freight for partial shipments on an order. However, if the *Prorate Freight Charges (D39)* system control value is selected and all of the items on the order are exempt from freight, the system applies any item and weight charges defined for the ship via to the pick the system flags as the first pick.

Note:

If the pick flagged as the first pick is NOT selected for the first pick slip generation run for the order, the system:

- Updates the *First pick* field in the Pick Control Header table for the pick that is included in the pick slip generation run to Y and looks at the setting of the *Prorate Freight Charges (D39)* system control value to determine how to apply freight charges.
- Updates the *First pick* field in the Pick Control Header table for the pick that was originally flagged as the first pick to N.

Recalculates tax: The system recalculates the tax for each pick created.

Creates a record in the Pick Control Header table: The system creates a record in the Pick Control Header table for each pick created for the order; see [Creating Pre-Generated Picks](#) for information on the fields that are updated. If the [Split Special Handling Picks \(L44\)](#) system control value is selected, the system creates a separate Pick Control Header record for all items on the order that contain a special handling code.

Creates a record in the Pick Control Detail table: The system creates a record in the Pick Control Detail table for each item on the order that qualifies for pick slip preparation; see [Creating Pre-Generated Picks](#) for information on the fields that are updated.

Creates a record in the Pick Stored Value Card table: The system creates a record in the Pick Store Value Card table for each physical stored value card item included on the pre-generated pick.

Viewing pre-generated picks: You can review pre-generated picks on the [Display Pick Tickets for Order Screen](#) in Order Inquiry. The status of the pick will be either G Generated No Authorization or H Generated Has Authorization; see [Pick status](#) for more information on how the system determines the status of the pre-generated pick.

 **Note:**

Picks in a G or H status will not display on the [Display Pick Tickets for Order Screen](#) in Order Maintenance because the system removes these picks when you advance to Order Maintenance and does not recreate them until you accept or reject out of Order Maintenance.

Updates Reserved Order Lines for the Order

The system updates the Reserved Order Line table for the order:

- Increments the *Qty printed* by the quantity on the Pick Control Detail.
- Decrements the *Qty remaining* by the quantity on the Pick Control Detail.

You can review the reserved order lines on an order on the [Display Reserved Order Lines Screen](#) in Order Inquiry.

 **Note:**

The system does not update the *Qty printed* in the Order Detail table during pick slip preparation; this update occurs during pick slip generation. You can review the quantity printed for an order detail line on the [Order Inquiry Detail Screen](#).

Updates Authorizations for the Order

If the credit card payment on the order has been authorized, the system performs the following updates.

Determines if the authorization has expired: If the authorization for the credit card payment has expired, the system:

- Updates the *Status* of the Authorization History record to E Expired.
- Reduces the *Amount authorized* on the Order Payment Method by the expired authorization amount.
- Reduces the Void Auths record by the expired authorization amount.

You can review authorizations in an E Expired status on the [Display Authorization History Screen](#) in Order Inquiry and in [Streamlined Order Inquiry \(DORI\)](#).

If the authorization for the credit card payment has NOT expired, the system performs the updates below.

Creates an Authorization History record if it does not yet exist: The record contains:

- A *Status* of A Authorized if the credit card was authorized using online authorization, or G Generated if the credit card contains a manual authorization.

Once a pick associated with a manual authorization is printed, the system updates the status to A Authorized.

- The authorization date defined for the payment (or the current date if an authorization date was not defined).
- The authorization number defined for the payment.
- The authorization amount defined for the payment (or the *Total Order Amount* for the Pick Control Header if an authorization amount was not defined).

You can review authorizations in an A Authorized and G Generated status on the [Display Authorization History Screen](#) in Order Inquiry and in [Streamlined Order Inquiry \(DORI\)](#).

Creates an Authorization History Pick record: The system creates an Auth History Pick record for each pre-generated pick created for the order.

Creates an Order Transaction History record: A message similar to the following is created if a manual authorization exists on the order, where TST3442 is the authorization number, 99.99 is the authorization amount, and OEPICKAUTH is the user:

```
AUTH MANUAL AUTH# DETECTED - TST3442 99.99 OEPICKAUTH
```

You can review order history on the [Display Order History Screen](#).

Updates authorizations for the Order Payment Method:

If the [Pick status](#) for the Pick Control Header record is H Generated Has Authorization, the system:

- Removes the *Authorization date*, *Authorization number*, and *Manual authorization amount* from the Order Payment Method.
- Updates the *Amount authorized* with the authorization amount.

If the [Pick status](#) for the Pick Control Header record is G Generated No Authorization, the system:

- Retains the *Authorization date*, *Authorization number*, and *Manual authorization amount* for the Order Payment Method.
- Does not update the *Amount authorized*.
- Creates a record in the Void Auths table for the amount authorized.

You can review this information on the [Display Order Pay Type Screen \(1 of 2\)](#).

Creates a record in the Void Auths table: The system creates a record in the Void Auths table when:

- The credit card payment on the order has been authorized, but the [Pick status](#) for the Pick Control Header record is G Generated No Authorization.
- The *Manual authorization amount* for the Order Payment Method is greater than the *Total Order Amount* for the Pick Control Header; in this situation, the system takes the difference and creates a Void Auths record for the amount. Example: If the *Manual authorization amount* is 50.00 and the *Total Order Amount* is 30.00, the system creates a Void Auths record for 20.00.
- The credit card payment on the order has been authorized, but the order is not eligible for pick slip preparation (for example, the order is placed on hold).

Splitting an Order Across Multiple Picks

The system splits an order into several pre-generated picks for any of the following reasons.

! Important:

If you change an item in [Work with Item/SKUs \(MITM\)](#) or change a ship via in [Working with Ship Via Codes \(WVIA\)](#) after a pre-generated pick has been created, the system does not recreate the picks based on the updated information. You must change the order to trigger the system to remove and reapply pick slip preparation to the order.

Reason to Split an Order	Description
Different warehouse for item	<p>An order line on the order is in a different warehouse than other order lines on the order, or a single order line on the order is reserved from multiple warehouses.</p> <p>Example: If item A123 is reserved in warehouse 1 and items B123 and C123 are reserved in warehouse 2, the system creates a Pick Control record for item A123 and a separate Pick Control record for items B123 and C123.</p> <p>NOTE: The system also creates a separate pick slip PDF document for picks based on warehouse; see Sorting Pick Slips into Separate PDF Documents.</p>
Different ship via for item	<p>An order line on the order is assigned to a different ship via than other order lines on the order.</p> <p>Example: If item A123 is assigned ship via 1 and items B123 and C123 are assigned ship via 2, the system creates a Pick Control record for item A123 and a separate Pick Control record for items B123 and C123.</p> <p>NOTE: The system also creates a separate pick slip PDF document for picks based on warehouse; see Sorting Pick Slips into Separate PDF Documents.</p>
Special handling for item	<p>An item on the order requires special handling or personalization. The system splits an order by special handling only if the Split Special Handling Picks (L44) system control value is selected. This system control value also works in conjunction with the setting of the <i>Special Handling</i> field on the Streamlined Pick Slip Generation Screen.</p> <p>Example: See the Split Special Handling Picks (L44) system control value for examples.</p> <p>NOTE: If the Split Special Handling Picks (L44) system control value is selected, the system also creates a separate pick slip PDF document for picks based on special handling; see Sorting Pick Slips into Separate PDF Documents.</p>

Reason to Split an Order	Description
Physical stored value card	<p>An item on the order is flagged as a physical stored value card. The system creates a separate Pick Control record for each order line that has a physical stored value card.</p> <p>Also, if the physical stored value card item is set up as a ship alone item, the system creates a separate Pick Control record for each unit of a stored value card item on an order line.</p> <p>You can flag an item as a physical stored value card at the Create Item Screen or Change Item screen.</p> <p>Example: An order has the following order lines. The stored value cards are NOT flagged to ship alone.</p> <ul style="list-style-type: none"> • Order line 1: a physical stored value card for a quantity of 1. • Order line 2: a physical stored value card for a quantity of 2. • Order line 3: a regular item for a quantity of 1. <p>Results: The system creates the following pre-generated picks:</p> <ul style="list-style-type: none"> • A separate pre-generated pick for the regular item. • A separate pre-generated pick for the stored value card item for a quantity of 1. • A separate pre-generated pick for the stored value card item for a quantity of 2. <p>See Stored Value Card Purchase and Activation for more information on generating pick slips for stored value card items.</p>
Ship alone item	<p>An item on the order is flagged to ship alone.</p> <p>Example: An order has the following order lines:</p> <ul style="list-style-type: none"> • Order line 1: ship alone item for a quantity of 1. • Order line 2: ship alone item for a quantity of 2. • Order line 3: regular item for a quantity of 1. <p>Results: The system creates the following pre-generated picks:</p> <ul style="list-style-type: none"> • A separate pre-generated pick for the regular item. • A separate pre-generated pick for 1 unit of the ship alone item. • A separate pre-generated pick for 1 unit of the ship alone item. • A separate pre-generated pick for 1 unit of the ship alone item.
Hazardous item	<p>An item on the order is flagged as hazardous.</p> <p>Example: An order has the following order lines:</p> <ul style="list-style-type: none"> • Order line 1: a hazardous item for a quantity of 1. • Order line 2: a hazardous item for a quantity of 2. • Order line 3: a regular item for a quantity of 1. <p>Results: The system creates the following pre-generated picks:</p> <ul style="list-style-type: none"> • A separate pre-generated pick for the regular item. • A separate pre-generated pick for all of the hazardous items.

Reason to Split an Order	Description
Different location class for item	<p>An item on the order has a different location class than other items on the order.</p> <p>NOTE: The system uses the location class defined at the item level.</p> <p>Example: An order has the following order lines:</p> <ul style="list-style-type: none"> Order line 1: item A123 assigned location class AA. Order line 2: item B123 assigned location class BB. Order line 3: item C123 assigned location class AA. <p>Results: The system creates the following pre-generated picks:</p> <ul style="list-style-type: none"> A pre-generated pick for items A123 and C123 (location class AA). A separate pre-generated pick for item B123 (location class BB).
Ship-for-pickup order	<p>The order is a ship-for-pickup order and the Create Separate Picks for Ship for Pickup Orders (L89) system control value is selected.</p> <p>Example: An order has the following order lines:</p> <ul style="list-style-type: none"> Order line 1: item A123. Order line 2: item B123. <p>Results: The system creates the following pre-generated picks:</p> <ul style="list-style-type: none"> A pre-generated pick for item A123. A separate pre-generated pick for item B123. When you generate pick slips, the system submits each order line to Order Orchestration as a separate ship-for-pickup order. If the Create Separate Picks for Ship for Pickup Orders (L89) system control value is unselected and there is no other reason to split the pick slip, such as a ship-alone item, the system pre-generates a single pick and submits both order lines to Order Orchestration as a single order.

Creating Pre-Generated Picks

Pick Slip Preparation creates pre-generated picks in the Pick Control Header and Pick Control Detail tables when an order is created or changed. You can review pre-generated picks on the [Display Pick Tickets for Order Screen](#).

- [Pick Control Header Updates for Pre-Generated Picks](#)
- [Pick Control Detail Updates for Pre-Generated Picks](#)

Restrictions: The following options are not available until after you use [Streamlined Pick Slip Generation \(WSPS\)](#) to fulfill and print a pick slip:

- You cannot confirm and bill shipments for a pre-generated pick using the [Manually Confirming Shipments \(MCON\)](#) menu option.
- You cannot assign a number to a physical stored value card using the [Working with Physical Stored Value Card Assignment \(WPSA\)](#) menu option.
- You cannot use the *Generic Pick In API (Shipments, Voids, and Backorders)* for a pre-generated pick.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

- Pre-generated picks do not display in the [Displaying Pick Slip Generation Inquiry \(DPSI\)](#) menu option.
- The *Printed* field in the [Reviewing Pending Orders \(DOSS\)](#) menu option does not include pre-generated picks.
- Pre-generated picks are not included in the [Reviewing Operations Control Summary \(FLSH\)](#) menu option.
- Pre-generated picks are not included in the [Ship Via/Item Inquiry \(SVII\)](#) menu option.
- Pre-generated picks are not included on the [Operations Control Report \(POCT\)](#).
- Pre-generated picks are not included on the [Carryover Report \(PCOR\)](#).

Pick Control Header Updates for Pre-Generated Picks

Pick Slip Preparation updates the following fields in the Pick Control Header table for pre-generated picks. The remaining fields are not updated until you run pick slip generation for the order.

Subscription items: The system creates a separate pre-generated pick for a subscription item (the *Subscription* and *Non-inventory* fields for the item are selected). When you generate pick slips for the order, the system bills the subscription item immediately and indicates on the pick slip that the subscription is shipping separately. See [Working with Item Subscriptions \(WISB\)](#).

Membership items: The system creates a separate pre-generated pick for a membership item (the *Membership* field for the item is selected). When you generate pick slips for the order, the system bills the membership item immediately and indicates on the pick slip that the membership is shipping separately.

Field	Pick Slip Preparation Update
Pick control #	<p>The system assigns the next available number from the PCH Control # number assignment wheel.</p> <p>NOTE: The system assigns a new pick control number when a pre-generated pick is created, including when a pre-generated pick is deleted and then recreated because the order was updated by a user or the system.</p>

Field	Pick Slip Preparation Update
Pick status	<p>Defines whether the pre-generated pick requires authorization during pick slip generation.</p> <p>G Generated No Authorization = The pick requires authorization during pick slip generation.</p> <p>The system updates the pick status to G if:</p> <ul style="list-style-type: none"> • A credit card payment method with another payment method exists on the order. • Multiple recipients exist on the order. • The Use Auto Authorization Interface (C14) system control value is selected and the order has a single credit card payment that: <ul style="list-style-type: none"> – does not have a valid authorization. – has an online or manual authorization that has expired. – has an online or manual authorization that does not cover the amount on the pre-generated pick. – is associated with a credit card authorization reversal. – has an online authorization whose status is not A Authorized. <p>H Generated Has Authorization = The pick can bypass authorization processing during pick slip generation.</p> <p>The system updates the pick status to H if:</p> <ul style="list-style-type: none"> • The Use Auto Authorization Interface (C14) system control value is unselected. • A pay category 2 Credit Card payment does not exist on the order. • The order total (merchandise amount + freight + tax + handling + additional charges + additional freight) for the order ship to is zero. • The Use Auto Authorization Interface (C14) system control value is selected and the order has a single recipient and credit card payment with a valid online or manual authorization (authorization status = A) that covers the amount on the pre-generated pick. <p>NOTE: If an authorization amount is not defined for the manual authorization, the system uses the order total as the authorization amount.</p> • The Use Auto Authorization Interface (C14) system control value is selected and the order has a single credit card payment whose pay type does not have an authorization service defined. • The order is a ship for pickup order (the <i>OST OBR delivery type</i> field in the Order Ship To table is set to S), the Payment at POS for Ship for Pickup Orders (L60) system control value is selected, and the order type does not match the order type defined in the Order Type for Special Orders (L15) system control value. <p>NOTE: When Selecting Pre-Generated Picks for Pick Slip Generation, the system looks at Authorization History to determine if any picks in an H Generated Has Authorization status are associated with an expired authorization, and if so, the system changes the status of the pick to G Generated No Authorization.</p>

Field	Pick Slip Preparation Update
Billing batch #	The system does not assign a billing batch number to a pre-generated pick; the system assigns a billing batch number to the pick during pick slip generation; see Selecting Pre-Generated Picks for Pick Slip Generation .
Date and Time of last update	The date and time when the system created the pre-generated pick. The system updates this field when a pre-generated pick is created, including when a pre-generated pick is deleted and then recreated because the order was updated by a user or the system.
Generation type	Defines whether the pick contains an item that requires special handling or whether the pick is billed immediately after pick slip generation. R Regular = The pick does not contain an item that requires special handling and is billed after the shipment is confirmed. S Special Handling = The pick contains an item that requires special handling and is billed after the shipment is confirmed. I Bill Immediately = The pick is confirmed and billed immediately after pick slip generation.
PO #	The purchase order number assigned to the order.
Merch	The merchandise amount on the pre-generated pick.
Freight	The freight amount on the pre-generated pick.
Add'l freight	The additional freight amount on the pre-generated pick.
Add'l charges	The additional charge amount on the pre-generated pick.
Handling	The handling amount on the pre-generated pick.
Tax	The tax amount on the pre-generated pick.
GST	The GST tax amount on the pre-generated pick.
PST	The PST tax amount on the pre-generated pick.
Total Order Amount	The total amount on the pre-generated pick.
First pick	Indicates whether this is the first pick for the order. Y = This is the first pick for the order. N = This is not the first pick for the order.
Order #	The order number associated with the pre-generated pick.
Ship to #	The order ship to associated with the pre-generated pick.
Ship via code	The shipper assigned to the pre-generated pick.
Last update by user	The process that created the Pick Control Header record.
Customer #	The sold to customer number on the order.
Warehouse	The warehouse assigned to the pre-generated pick. The system uses this warehouse during Pick Slip Allocation Processing .
Drop point	The drop point specified for the warehouse or for the warehouse/ship via/SCF combination if you are using zone skipping. See the Work with Ship Via Indicia Screen for an overview.
Country	The country code for the shipping address on the pick.
State	The state code for the shipping address on the pick.

Field	Pick Slip Preparation Update
Prefix	The prefix, first name, middle initial, last name and suffix of the ship to customer on the pick.
First Name	
Initial	
Last Name	
Suffix	
Apartment	The apartment for the shipping address on the pick.
Address line 2	The second address line for the shipping address on the pick.
City	The city for the shipping address on the pick.
Zip	The postal code for the shipping address on the pick.
Delivery code	Defines whether the shipping address is a residential or business address. B = Business address. R = Residential address. N = No distinction.
PO Box?	Defines whether the shipping address is a post office box. Y = The address is a post office box. N = The address is not a post office box.

Pick Control Detail Updates for Pre-Generated Picks

Pick Slip Preparation updates the following fields in the Pick Control Detail table for pre-generated picks. The remaining fields are not updated until you run pick slip generation for the order. The system creates a record in the Pick Control Detail table for each shippable line on the order that qualifies for pick slip preparation.

Backordered and drop ship items: The system does not create a Pick Control Detail record for any items on backorder or that are flagged as drop ship until you run pick slip generation for the order.

Non-inventory items: The system:

- Does not create a pre-generated pick for a non-inventory item if all other items on the order are backordered; when one or more backordered items are available, the system creates a pre-generated pick for the non-inventory item as well as for the available item(s).
- Creates a pre-generated pick for a non-inventory item if all other items on the order are not selected for pick slip preparation; see [Selecting Order Lines for Pick Slip Preparation](#).

Coordinate-grouped items: The system does not create a pre-generated pick for order lines that are assigned the same coordinate group number until all of the coordinate grouped lines are eligible for pick slip preparation.

Field	Pick Slip Preparation Update
Line #	The pick line number assigned to a shippable order line on the order.
Original qty printed	The quantity available to ship on the pick.
Qty printed	The same as the original quantity printed.

Field	Pick Slip Preparation Update
Affect inventory	Defines whether shipping the item affects the inventory count. Y = Affect inventory. N = Do not affect inventory.
Price	The single-unit selling price of the item after applying any repricing or discounts.
PCD Extension	The selling price times the printed quantity.
Freight charge	The freight charge for the item on the pick. Included only if there is a printed quantity and the source code uses an item-level freight method.
Spec Handling \$	The total special handling charges for the item.
Gift Charge	The total giftwrap charge.
Qty Ordered	The original quantity ordered for the order detail line.
Tax	The total tax amount for the item on the pick.
GST	The total GST tax amount for the item on the pick.
PST	The total PST tax amount for the item on the pick.
Order #	The order number associated with the pick.
Ship to #	The order ship to associated with the pick.
Seq #	The order line sequence number.
ITM Number	A code for the item on the pick.
SKU Code	A code for the item's unique characteristics, such as color and size, on the pick.
Add'l chg code	The additional charge code related to special handling for the item on the pick.

Removing Pick Slip Preparation from an Order

The system REMOVES any pick slip preparation that may have already occurred when you or the system changes an order; see [When is Pick Slip Preparation Performed?](#) to review when the system removes pick slip preparation from an order.

The system:

- Deletes the pre-generated picks for the order in the Pick Control Header, Pick Control Detail, Pick Control Label, and Pick Stored Value Card tables that are in a G Generated No Authorization or H Generated Has Authorization status, across all order ship tos.
- Resets the *Qty printed* and *Qty remaining* fields for the order in the Reserved Order Lines table.
- If pick slips have not been generated for the order and the order contains an online authorization:
 - Retains records for the order in the Authorization History table that are in a status other than G Generated.
 - Updates the *Amount authorized* in the Order Payment Method table to 0.00.
 - Creates a record in the Void Auths table for the amount authorized in the Authorization History table.

- If pick slips have not been generated for the order and the order contains a manual authorization:
 - Deletes records for the order in the Authorization History table that are in a Generated status (the system retains records in any other status).
 - Removes any message for the order in the Order Transaction History table regarding a manual auth detected.
 - Restores any manual authorization information for the order in the Order Payment Method table.
 - Deletes any records for the order payment in the Void Auths table.

Note:

After removing pick slip preparation from an order and updating the order with any changes, the system evaluates the order to determine if it is eligible for pick slip preparation, and if it is, the system RE-APPLIES pick slip preparation to the order; see [Pick Slip Preparation when an Order is Maintained](#).

Pick Slip Preparation Examples

Examples of how the system performs pick slip preparation when an order is created or updated are described below.

- [Example 1: Pick Slip Preparation when Order is Created with no Authorization](#)
- [Example 2: Pick Slip Preparation when Order is Created with Online Authorization](#)
- [Example 3: Pick Slip Preparation when Order is Created with Manual Authorization](#)
- [Example 4: Pick Slip Preparation when an Order is Maintained](#)

Example 1: Pick Slip Preparation when Order is Created with no Authorization

You create an order that contains the following information:

Order Header:

- Arrival date = today's date
- Ship via = 1

Order Detail:

Line#	Item	Status	Arrival Date	Reserve Qty	Ship Via	Whs
1	A1	Open	today's date	1	1	1
2	B1	Open	today's date	2	1	1
3	C1	Backorder	today's date	0	1	1

Order Payment:

Pay category	Authorization Date	Authorization Amount
2 Credit Card	blank	blank

Pick slip preparation: When you accept the order, the order does not go on hold. The system:

Creates one pre-generated pick for the order in a G Generated No Authorization status:

Pick Control#	Status	Last Update	Gen Type	First Pick	Whs	Ship Via
5051	G	Current date	R Regular	Y	1	1

Creates two pick control details for the pre-generated pick:

Pick Control#	Item	Qty Printed
5051	A1	1
5051	B1	2

Updates the *Qty printed* and *Qty Remaining* for the reserved order lines on the order:

Line#	Whs	Reserved	Printed	Remaining	Reservation Date
1	1	1	1	0	today's date
2	1	2	2	0	today's date

Pick slip generation: When you process pick slip generation for the order, the system:

- Assigns a billing batch number to the pick.
- Updates the *Date last update* to the date when pick slip generation is run.
- Updates the *Date printed* to the date when pick slip generation is run.
- Updates the *Status* of the pick from G Generated No Authorization to 1 Waiting for Authorization.
- Performs batch authorization for the pick; see [Authorizations During Pick Slip Generation](#).
- Determines which item/locations to reserve stock from in order to fulfill the quantity required for the pick; see [Allocating Stock](#).
- Sorts the picks so that they generate and print in the correct order. The sort also determines when the system creates a new pick slip PDF document for the picks in the pick slip generation run. See [Sorting Pick Slips into Separate PDF Documents](#) and [Pick Slip Sort within a Pick Slip PDF Document](#).
- Groups the picks into documents for printing; see [Generating and Printing Pick Slips](#).

Example 2: Pick Slip Preparation when Order is Created with Online Authorization

You create an order that contains the following information:

Order Header:

- Arrival date = today's date

- Ship via = 1
- Order total = 100.00

Order Detail:

Line#	Item	Status	Arrival Date	Reserve Qty	Ship Via	Whs
1	A1	Open	today's date	1	1	1
2	B1	Open	today's date	2	1	1
3	C1	Backorder	today's date	0	1	1

Order Payment:

Pay category	Authorization Date	Authorization Amount
2 Credit Card	today's date	110.00 (10.00 greater than order amount)

Pick slip preparation: When you accept the order, the order does not go on hold. The system:

Creates one pre-generated pick for the order in an H Generated Has Authorization status:

Pick Control#	Status	Last Update	Gen Type	First Pick	Whs	Ship Via
5052	H	Current date	R Regular	Y	1	1

Creates two pick control details for the pre-generated pick:

Pick Control#	Line#	Qty Printed	Item
5052	1	1	A1
5052	2	2	B1

Updates the *Qty printed* and *Qty Remaining* for the reserved order lines on the order:

Line#	Whs	Reserved	Printed	Remaining	Reservation Date
1	1	1	1	0	today's date
2	1	2	2	0	today's date

Updates authorizations history for the order:

Status	Auth Amt	Auth#	Auth Date
A Authorized	110.00	TST1	today's date

Updates the Order Payment Method:

- Removes the *Authorization date*, *Authorization number*, and *Manual authorization amount*.
- Updates the *Amount authorized* with the authorization amount.

Creates a Void Auths record for 10.00 since the authorization amount (110.00) is greater than the order total (100.00).

Pick slip generation: When you process pick slip generation for the order, the system:

- Assigns a billing batch number to the pick.
- Updates the *Date updated* to the date when pick slip generation is run.
- Updates the *Date printed* to the date when pick slip generation is run.
- Updates the *Status* of the pick from H Generated Has Authorization to 2 Authorized.
- Skips batch authorization for the pick.
- Determines which item/locations to reserve stock from in order to fulfill the quantity required for the pick; see [Allocating Stock](#).
- Sorts the picks so that they generate and print in the correct order. The sort also determines when the system creates a new pick slip PDF document for the picks in the pick slip generation run. See [Sorting Pick Slips into Separate PDF Documents](#) and [Pick Slip Sort within a Pick Slip PDF Document](#).
- Groups the picks into documents for printing; see [Generating and Printing Pick Slips](#).

Example 3: Pick Slip Preparation when Order is Created with Manual Authorization

You create an order that contains the following information:

Order Header:

- Arrival date = today's date
- Ship via = 1
- Order total = 100.00

Order Detail:

Line#	Item	Status	Arrival Date	Reserve Qty	Ship Via	Whs
1	A1	Open	today's date	1	1	1
2	B1	Open	today's date	2	1	1
3	C1	Backorder	today's date	0	1	1

Order Payment:

Pay category	Authorization Date	Authorization Amount
2 Credit Card	today's date	110.00 (10.00 greater than order amount)

Pick slip preparation: When you accept the order, the order does not go on hold. The system:

Creates one pre-generated pick for the order in an H Generated Has Authorization status:

Pick Control#	Status	Last Update	Gen Type	First Pick	Whs	Ship Via
5053	H	Current date	R Regular	Y	1	1

Creates two pick control details for the pre-generated pick:

Pick Control#	Line#	Qty Printed	Item
5053	1	1	A1
5053	2	2	B1

Updates the *Qty printed* and *Qty Remaining* for the reserved order lines on the order:

Line#	Whs	Reserved	Printed	Remaining	Reservation Date
1	1	1	1	0	today's date
2	1	2	2	0	today's date

Updates authorizations history for the order:

Status	Auth Amt	Auth#	Auth Date
G Generated	110.00	TST1	today's date

Creates an order transaction history message for the manual authorization:

Type	Transaction Note	Amount	User
AUTH	MANUAL AUTH# DETECTED - TST1	110.00	OEPICKAUTH

Updates the Order Payment Method:

- Removes the *Authorization date*, *Authorization number*, and *Manual authorization amount*.
- Updates the *Amount authorized* with the authorization amount.

Creates a Void Auths record for 10.00 since the authorization amount (110.00) is greater than the order total (100.00).

Pick slip generation: When you process pick slip generation for the order, the system:

- Assigns a billing batch number to the pick.
- Updates the *Date updated* to the date when pick slip generation is run.
- Updates the *Date printed* to the date when pick slip generation is run.
- Updates the *Status* of the pick from H Generated Has Authorization to 2 Authorized.
- Skips batch authorization for the pick.

- Determines which item/locations to reserve stock from in order to fulfill the quantity required for the pick; see [Allocating Stock](#).
- Sorts the picks so that they generate and print in the correct order. The sort also determines when the system creates a new pick slip PDF document for the picks in the pick slip generation run. See [Sorting Pick Slips into Separate PDF Documents](#) and [Pick Slip Sort within a Pick Slip PDF Document](#).
- Groups the picks into documents for printing; see [Generating and Printing Pick Slips](#).

Example 4: Pick Slip Preparation when an Order is Maintained

You create an order that contains the following information:

Order Header:

- Arrival date = today's date
- Ship via = 1
- Order total = 100.00

Order Detail:

Line#	Item	Status	Arrival Date	Reserve Qty	Ship Via	Whs
1	A1	Open	today's date	1	1	1
2	B1	Open	today's date	2	1	1
3	C1	Backorder	today's date	0	1	1

Order Payment:

Pay category	Authorization Date	Authorization Amount
2 Credit Card	today's date	110.00 (10.00 greater than order amount)

Pick slip preparation: When you accept the order, the order does not go on hold. The system:

Creates one pre-generated pick for the order in an H Generated Has Authorization status:

Pick Control#	Status	Last Update	Gen Type	First Pick	Whs	Ship Via
5054	H	Current date	R Regular	Y	1	1

Creates two pick control details for the pre-generated pick:

Pick Control#	Line#	Qty Printed	Item
5054	1	1	A1
5054	2	2	B1

Updates the *Qty printed* and *Qty Remaining* for the reserved order lines on the order:

Line#	Whs	Reserved	Printed	Remaining	Reservation Date
1	1	1	1	0	today's date
2	1	2	2	0	today's date

Updates authorizations history for the order:

Status	Auth Amt	Auth#	Auth Date
G Generated	110.00	TST1	today's date

Creates an order transaction history message for the manual authorization:

Type	Transaction Note	Amount	User
AUTH	MANUAL AUTH# DETECTED - TST1	110.00	OEPICKAUTH

Updates the Order Payment Method:

- Removes the *Authorization date*, *Authorization number*, and *Manual authorization amount*.
- Updates the *Amount authorized* with the authorization amount.

Creates a Void Auths record for 10.00 since the authorization amount (110.00) is greater than the order total (100.00).

Maintain order: You advance to Order Maintenance for the order. As soon as you advance to Order Maintenance for the order, the system removes all pick slip preparation from the order.

You add an item to the order.

Order Detail:

Line#	Item	Status	Arrival Date	Reserve Qty	Ship Via	Whs
1	A1	Open	today's date	1	1	1
2	B1	Open	today's date	2	1	1
3	C1	Backorder	today's date	0	1	1
4	D1	Open	today's date	1	1	2

Pick slip preparation: When you accept the order, the order does not go on hold. The system:

Because the new item added to the order has a different warehouse, the system creates two pre-generated picks for the order in a G Generated No Authorization status (since the authorization amount no longer covers the shippable amount on the order):

Pick Control#	Status	Last Update	Gen Type	First Pick	Whs	Ship Via
5055	G	Current date	R Regular	Y	1	1
5056	G	Current date	R Regular	N	2	1

Creates two pick control details for the first pre-generated pick and 1 pick control detail for the second pre-generated pick:

Pick Control#	Line#	Qty Printed	Item
5055	1	1	A1
5055	2	2	B1
5056	4	1	D1

Updates the *Qty printed* and *Qty Remaining* for the reserved order lines on the order:

Line#	Whs	Reserved	Printed	Remaining	Reservation Date
1	1	1	1	0	today's date
2	1	2	2	0	today's date
4	1	1	1	0	today's date

Updates authorizations history for the order:

Status	Auth Amt	Auth#	Auth Date
G Generated	110.00	TST1	today's date

Creates an order transaction history message for the manual authorization:

Type	Transaction Note	Amount	User
AUTH	MANUAL AUTH# DETECTED - TST1	110.00	OEPICKAUTH

Updates the Order Payment Method:

- Removes the *Authorization date*, *Authorization number*, and *Manual authorization amount*.
- Updates the *Amount authorized* with the authorization amount.

Creates a Void Auths record for 10.00 since the authorization amount (110.00) is greater than the order total (100.00).

Pick slip generation: When you process pick slip generation for the order, the system:

- Assigns a billing batch number to each pick.
- Updates the *Date updated* to the date when pick slip generation is run.
- Updates the *Date printed* to the date when pick slip generation is run.

- Updates the *Status* of the pick from G Generated No Authorization to 1 Waiting for Authorization.
- Performs batch authorization for each pick.
- Determines which item/locations to reserve stock from in order to fulfill the quantity required for the pick; see [Allocating Stock](#).
- Sorts the picks so that they generate and print in the correct order. The sort also determines when the system creates a new pick slip PDF document for the picks in the pick slip generation run. Because a different warehouse is defined for each pick, the system sorts the picks into separate pick slip PDF documents. See [Sorting Pick Slips into Separate PDF Documents](#) and [Pick Slip Sort within a Pick Slip PDF Document](#).
- Groups the picks into documents for printing; see [Generating and Printing Pick Slips](#).

Performing Pick Slip Generation

Purpose: Pick slip generation controls the warehouse workload by determining the volume and type of orders to print. Use this program to print pick slips as needed.

Pick Slip Generation Overview

To perform pick slip generation, select Gen Picks for a pick slip generation template on the [Work with Streamlined Pick Slip Generation Screen](#). The system submits the PICK_GEN job. By default, this job is submitted to the PICKGEN job queue at the [Job Management Screen](#) rather than the QBATCH job queue.

PICKGEN job queue: In order to avoid errors during pick slip generation, DO NOT route the PICK_GEN job from the PICKGEN job queue. The PICKGEN job queue processes one job at a time. If a PICKGEN job is running and another job is submitted, the job remains in a RDY status until the PICKGEN job queue is available to process it.

Preparing an order for pick slip generation: The system prepares an order for fulfillment when you create or change an order by creating records in the Pick Control Header and Pick Control Detail tables and defining whether the records require authorization. Preparing the order for pick slip generation in advance reduces the time it takes to run [Streamlined Pick Slip Generation \(WSPS\)](#) to fulfill and print the picking documents. See [Preparing Orders for Pick Slip Generation](#) for an overview and processing details.

Pick slip generation performs the following steps.

#	Step
1.	<p>Select Pre-Generated Picks for Pick Slip Generation</p> <p>The system determines which pre-generated picks to include in the pick slip generation run, based on the pick slip selection criteria specified on the Streamlined Pick Slip Generation Screen. To be eligible for pick slip generation, an order cannot be locked by some other process, such as order maintenance.</p> <p>Pre-generated picks are picks created during pick slip preparation prior to running pick slip generation for an order. The status of a pre-generated pick is either G Generated No Authorization, indicating the pick requires authorization during pick slip generation, or H Generated Has Authorization, indicating the pick can bypass authorization during pick slip generation. See Creating Pre-Generated Picks.</p> <p>When the system selects a pre-generated pick to include in the pick slip generation run, the system changes the <i>Pick status</i> from G Generated No Authorization to 1 Waiting for Authorization or H Generated Has Authorization to 2 Authorized. See Selecting Pre-Generated Picks for Pick Slip Generation.</p>
2.	<p>Perform Card Authorizations</p> <p>The system performs batch authorization processing for picks in the Pick Control Header table that are in a 1 Waiting for Authorization status. The system sends the authorization request for the shippable amount on the pick.</p> <p>If a credit card or stored value card type payment method that requires authorization does not receive an approved authorization, the system does not generate the pick slip. See Authorizations During Pick Slip Generation.</p>

#	Step
3.	<p>Allocate Stock from a Warehouse Location</p> <p>The system determines which item/locations to reserve stock from in order to fulfill the quantity required for the pick. See Allocating Stock.</p> <p>If the Let Down Replenishment (C36) system control value is set to REPORT or RPT/EXEC, the system determines if a primary location needs to be replenished. See Let Down Replenishment.</p> <p>If an item cannot be picked due to allocation errors, the system prints the item on the Item Stock Allocation Error Report. The Withhold Picks due to Item Allocation Error (F04) system control value defines whether the system prints a pick slip for an order when an item on the order creates a stock allocation error.</p> <p>Once the system determines the location(s) from where to allocate stock for pick slip generation, the system creates the associated records in the Pick Location table.</p>
4.	<p>Sort the Pick Slips</p> <p>The system uses the Pick Sort GH table to sort the pick slips so that they generate and print in the correct order. The sort also determines when the system creates a new pick slip PDF document for the pick slips in the pick slip generation run. See Sorting Pick Slips into Separate PDF Documents and Pick Slip Sort within a Pick Slip PDF Document.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>Streamlined pick slip generation does not sort pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p> </div> <p>If the Use Cart/Bin Picking? (B38) system control value is selected, the system:</p> <ul style="list-style-type: none"> • Groups items together for picking by determining the total number of items that can fit on a single picking cart. • Generates a Cart/Bin Batch Picking Pullsheet for each cart, and a Cart Batch Recap for the pick slip run. • Sorts and groups orders by batch number. <p>See Using Cart/Bin Picking, Sorting Pick Slips into Separate Cart Batches, and Pick Slip Sort Within a Cart Batch.</p>
5.	<p>Print the Picking Documents</p> <p>The system groups the pick slips into documents for printing.</p> <ul style="list-style-type: none"> • You can review the Pick Slip on the Forms Management Screen. • You can review pick slip reports for the pick slip generation run on the Document Management Screen. <p>Bypass printable picks: Streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p> <p>See Generating and Printing Pick Slips and Available Pick Slip Generation Documents.</p>

Picks not included? If you run pick slip generation and the system does not include the picks you were expecting, you can use [Pick Print Eligibility \(WPPE\)](#) to determine the reason why the picks for an order were not included.

Pick Slip Generation Setup Requirements

- [Pick Slip Selection Criteria](#)
- [Scheduling Pick Slip Generation](#)
- [Freeze Evaluation in Pick Slip Generation](#)
- [Pick Slip Form Setup Requirements](#)
- [Images on Pick Slips](#)
- [Number Assignment Values](#)
- [Warehouse Management Settings for Pick Slip Generation](#)
- [System Control Values That Apply to Pick Slip Generation](#)
- [Property Related to Pick Slip Generation](#)

Pick Slip Selection Criteria

Select the [Streamlined Pick Slip Generation \(WSPS\)](#) menu option to define the pick slip selection criteria that the system uses to generate pick slips. Once you create a pick slip generation template, you can use it to define your criteria, submit the pick slip generation process, and print the pick slip documents.

Scheduling Pick Slip Generation

You can schedule when pick slip generation runs for a particular pick slip generation template using a periodic function whose *Program name* is PFR0107 and whose *Parameter* matches the pick slip generation template's *Description*.

To set up:

#	Step
1.	<p>Use Streamlined Pick Slip Generation (WSPS) to create a pick slip generation template.</p> <p>The system automatically creates a periodic function for the pick slip generation template if you select the <i>Create Periodic Function</i> flag and the template's <i>Description</i> is 7 characters or less. NOTE: The <i>Description</i> must be 7 characters or less because the maximum length for the periodic function name is 7 positions. Also, in order to create a periodic function for the template, the description cannot contain a single quote (').</p> <p>Example: To run pick slip generation by selected order number, create a pick slip generation template with a description of ORDER # and select the <i>Create Periodic Function</i> flag.</p> <p>The system creates the periodic function with the following settings:</p> <ul style="list-style-type: none"> • Function = the text you entered in the <i>Description</i> field for the pick slip generation template. • Description = the text you entered in the <i>Description</i> field for the pick slip generation template; however, you can change it. • Company parameter = selected • Appl area (Application area code) = FUL Fulfillment • Program name = PFR0107 • Parameter = the text you entered in the <i>Description</i> field for the pick slip generation template. The parameter must match the <i>Description</i> defined for the pick slip generation template. For example, if the description of the pick slip generation template is ORDER #, the parameter must also be ORDER # and not ORDER#. <p>NOTE: You can also use Working with Periodic Functions (WPER) to manually create the periodic function. In this situation, the program name must be PFR0107 and the <i>Parameter</i> must match the <i>Description</i> of the pick slip generation template.</p>
2.	<p>Use Working with Periodic Processes (WPPR) to assign the periodic function to a periodic process.</p> <ul style="list-style-type: none"> • To run a separate schedule for each pick slip generation template, create a separate periodic process for each periodic function that represents a pick slip generation template. • If you plan to run your pick slip generation templates on the same schedule, you can create one periodic process for all periodic functions that represent a pick slip generation template. When the periodic process is executed, the system processes the periodic functions in assigned sequence order.
3.	<p>Once you have created the periodic process, you can use the Execute Periodic Process screen (located in the Working with Periodic Processes (WPPR) or Executing Periodic Processes (EPRO) menu option) to define a schedule for the job. See How to Schedule a Job for instructions.</p>

Freeze Evaluation in Pick Slip Generation

Pick slip generation evaluates the status of the [Reservation freeze](#) field for an item warehouse, the [Reservation freeze](#) flag for an item location, and the [Frz \(Freeze\)](#) field for a warehouse location. If there is a freeze at any level, pick slips do not print. Instead, the system prints the [Item Stock Allocation Error Report](#) listing the items that were ordered but not picked and the reason why the inventory was not picked.

Pick Slip Form Setup Requirements

See [Forms Setup](#) for more information on the setup required for the pick slip form. This setup includes:

- [Specify the Maximum Number of Pick Slips Per Spool File](#)
- [Set up Related System Control Values](#)
- [Create Image Files for Company or Entity Logos \(Graphical Forms\)](#)
- [Forms Properties](#)

Images on Pick Slips

You can include a company or entity logo on the printed pick slip. See [Setting Up Company Logos for Forms](#) for more information.

Important:

Company and entity logos on forms is not currently implemented.

Number Assignment Values

Use the [Setting Up the Number Assignment Table \(WNUM\)](#) menu option to set up the following number assignment values.

Number Assignment	Description	End #
PCH Billing Batch # (A13)	Assigns the next number to a batch of pick slips so that you may bill all pick slips in the batch in a single step.	7 positions
PCH Control # (A15)	Assigns the next number to uniquely identify each pick.	7 positions
Cart Batch # (A26)	Assigns the next number to a cart to be used for cart/bin picking.	3 positions

Warehouse Management Settings for Pick Slip Generation

If you are using a warehouse management system and do not need to generate pick slip documents, use streamlined pick slip generation and select the *Bypass Creation of Pick Forms during WSPS Pick Generation (K55)* to improve pick slip performance.

System Control Values That Apply to Pick Slip Generation

- [System Control Values Related to Drop Ship Pick Slips](#)
- [System Control Values Related to Pick Slip Allocation](#)
- [System Control Values Related to Let Down Replenishment](#)
- [System Control Values Related to Pick Slip Sort](#)
- [System Control Values Related to Cart/Bin Picking](#)
- [System Control Values Related to Printing Pick Slips](#)

System Control Values Related to Drop Ship Pick Slips

See [Drop Ship Pick Slips](#) for more information about each system control value.

System Control Value	Description
Print Amounts on Drop Ship Picks (C81)	Defines whether to print prices on drop ship pick slips.
Allow Only Single Line on Drop Ship Pick (C82)	Defines whether a single item or multiple items print on a drop ship pick slip.
Authorize Only Merchandise for Drop Ship (C92)	Defines how to authorize charges for drop ship picks.
Print One Drop Ship Invoice per Ship Alone Item (E38)	Defines whether the system prints a separate drop ship invoice for each ship alone item on an order.
Drop Ship Pick Print Program (E92)	Defines the program that prints drop ship pick slips.
Add Printed Drop Ship Lines as Backordered on Pick (E93)	Defines whether the system displays drop ship items as backordered on the regular pick slip even after a drop ship pick slip or purchase order has been generated for the drop ship item.

System Control Values Related to Pick Slip Allocation

See [Allocating Stock](#) for more information about each system control value.

System Control Value	Description
Inventory Sharing (A69)	Defines whether a company will fulfill orders from another company's inventory.
Check Location Quantities During Pick Generation (C54)	Indicates whether pick slip generation allocates inventory from specific pickable locations in the warehouse.
Include Bulk Locations in Primary Primary Availability (F87)	Defines whether the system includes the quantity in bulk locations in the available pick quantity for the primary primary location.
Include Secondary Locations in Primary Primary Availability (F88)	Defines whether the system includes the quantity in secondary locations in the available pick quantity for the primary primary location.
Withhold Picks due to Item Allocation Error (F04)	Defines whether the system prints a pick slip for an order when an item on the order creates a stock allocation error.

System Control Values Related to Let Down Replenishment

See [Let Down Replenishment](#) for more information about each system control value.

System Control Value	Description
Let Down Replenishment (C36)	Determines whether to use let down replenishment during pick slip generation.
Replenish from Location Type (A66)	Defines the types of locations from which you want to replenish stock when performing primary location replenishment.
Include Print Quantity in Available Calculations (A65)	Defines whether you want to include the print quantity in primary replenishment calculations.

System Control Value	Description
Check Location Quantities During Pick Generation (C54)	Indicates whether pick slip generation allocates inventory from specific pickable locations in the warehouse.
Consolidated Replenishment Report Program Name (G49)	Determines whether you can print the consolidated replenishment detail reports for replenishment control requests created by multiple pick slip generations in a single day.

System Control Values Related to Pick Slip Sort

See [Sorting Pick Slips into Separate PDF Documents](#) for more information about each system control value.

System Control Value	Description
Pick Sort Program Name (C65)	Identifies the program that sorts data for pick slips in pick slip generation.
Sort Pick Slips by Gift Flag (D53)	Defines whether the system separates gift orders from non-gift orders when sorting pick slips.
Sort Picks by Foreign/Domestic Flag (D54)	Defines whether the system separates foreign from domestic addresses when sorting pick slips.
Sort Picks by Pick Sequence (E89)	Defines whether the system considers the pick sequence number defined in DCreating and Maintaining Locations (WLOC) when sorting pick slips in a batch.
Load Location into Pick Sequence (G34)	Indicates whether to load the location code(s) for each pick slip into the <i>Picking sequence array</i> field of the Pick Control Header Extended and Pick Sort GH tables when you generate pick slips, so that you can use this information for your pick sort program.

System Control Values Related to Cart/Bin Picking

See [Using Cart/Bin Picking](#) for more information about each system control value.

System Control Value	Description
Use Cart/Bin Picking? (B38)	Defines whether to use the cart/bin picking feature to sort pick slips.
Maximum Number of Single Line Picks (B39)	Defines the maximum number of single line pick slips to include in a single batch.
Maximum Number of Multi Line Picks (B40)	Defines the maximum number of multi-line pick slips to include in each batch.
Maximum Number of Zones (B41)	Defines the maximum number of zones (up to six) allowed on a multi-line pick slip before generating another batch.
Cube of Cart (B42)	Defines the total cubic volume of the cart.
Cube of Bin (B44)	Defines the cubic volume of the smallest bin within a cart.
Minimum Number of Picks in a Cart (B47)	Defines the minimum number of picks that can fit in a cart.

System Control Value	Description
Break Single Line Picks by Zone (E33)	Defines whether to break single line pick slips into separate cart/bin batches based on the warehouse zone.
Sort Picks by Pick Sequence (E89)	Defines whether the system considers the pick sequence number defined in Creating and Maintaining Locations (WLOC) when sorting pick slips in a batch.

System Control Values Related to Printing Pick Slips

See [Generating and Printing Pick Slips](#) for more information about each system control value.

System Control Value	Description
Generate Invoice Number at Pick Gen (H80) and Generate Invoice # at Pick Gen without Address Match (K81)	Define whether to assign pending invoice numbers to qualifying orders at pick slip generation.
Pick Printing Program (C37)	Defines the name of the program that prints pick slips.
Batch Pull Sheet Printing Program (C38)	Defines the name of the program that prints batch pull sheets.
Cart/Bin Batch Pull Sheet Printing Program (C39)	Defines the name of the program to print batch pull sheets for cart/bin picking.
Print Batch Pull Sheet Item Summary (C59)	Defines whether to print the Batch Pull Sheet Item Summary report when printing pick slips.
Automatic Generation of Gift Acknowledgement (B92)	Defines whether the system will print gift acknowledgements for Gift orders (The <i>Gift</i> field on the order header is selected) when you generate pick slips, when you bill the orders, or not at all.
Batch Item Pull Label Printing Program (F63)	Defines the program name to print batch item pull labels.
Bypass Creation of Pick Forms during WSPS Pick Generation (K55)	Indicates whether to bypass generation of printable pick slip and other documents in order to accelerate streamlined pick slip generation.

Property Related to Pick Slip Generation

Checking for authorizations: The [CHECK_AUTHS_IN_PICKS](#) property controls whether you can generate pick slips if generate pick slips when records exist for your company in the CC Authorization Transaction table. See this property for more information.

Drop Ship Pick Slips

Drop ship items are items that are not stocked in inventory. When a customer buys a drop ship item, you order the item from your supplier (vendor). The vendor ships the item directly to the customer.

System control values related to drop ship pick slips:

System Control Value	Description
Print Amounts on Drop Ship Picks (C81)	Defines whether to print prices on drop ship pick slips.
Allow Only Single Line on Drop Ship Pick (C82)	Defines whether a single item or multiple items print on a drop ship pick slip.
Authorize Only Merchandise for Drop Ship (C92)	Determines the amount to authorize for drop ship purchase order and drop ship pick slips.
Print One Drop Ship Invoice per Ship Alone Item (E38)	Defines whether the system prints a separate drop ship invoice for each ship alone item on an order.
Drop Ship Pick Print Program (E92)	Defines the program that prints drop ship pick slips.
Add Printed Drop Ship Lines as Backordered on Pick (E93)	Defines whether the system displays drop ship items as backordered on the regular pick slip even after a drop ship pick slip or purchase order was generated for the drop ship item.

Order Orchestration Drop Ship system control values: See [Drop Ship Integration Values \(H20\)](#) for a list of the system control values related to the [Order Orchestration Drop Ship Integration](#).

DROPSHIP Authorization Records in W Status

The system creates a record in the Drop Ship Work table when you process drop ship orders. The record remains in the Drop Ship Work table until the corresponding authorization transaction in the CC Authorization Transaction table receives an approved authorization. The drop ship output (pick slip or purchase order) is not produced until the credit card on the order receives an approved authorization.

When you select to generate pick slips, if a drop ship work record exists for a drop ship order paid with a credit card and the credit card did not receive an approved authorization during drop ship processing due to transmission failure, a pop-up window opens.

When you see this pop-up window during pick slip generation, you can either:

- select Accept to generate pick slips without first re-sending the drop ship order for authorization.

When you generate pick slips, the system sends all authorization records in the CC Authorization Transaction table to the authorization service, including the authorization transaction associated with the drop ship order. If you do this, a record remains in the Drop Ship Work table for the drop ship order, but the corresponding authorization record no longer exists in the CC Authorization Transaction table.

To generate drop ship output for the drop ship order, you need to delete the record from the Drop Ship Work table and process drop ship orders again.

Note:

When you process drop ship orders again, the system sends an authorization transaction to the authorization service for the drop ship order that was stranded in the Drop Ship Work table. You need to make sure that you do not receive a double authorization for the drop ship order since the authorization transaction associated with the drop ship order was sent to the authorization service when you ran pick slip generation.

 **Note:**

You continue to receive this pop-up window when you generate pick slips until you delete the record in the Drop Ship Work table.

- select Reject to return to the *Work with Streamlined Pick Slip Generation Screen* without generating pick slips. You can verify with the authorization service whether the drop ship authorization was received.
 - If the authorization was received by the authorization service, use the [Reprocess Drop Ship Authorizations Screen \(RPDS\)](#) to receive the authorization. If the drop ship order receives an approved authorization, the system generates the drop ship output (pick slip or purchase order) and deletes the record from the Drop Ship Work table.
 - If the authorization was not received by the authorization service, check the CC Authorization Transaction table to verify that only the authorization transaction for the drop ship order exists. Then, use the [Reprocess Drop Ship Authorizations Screen \(RPDS\)](#) to resend the drop ship authorization transaction. If the drop ship order receives an approved authorization, the system generates the drop ship output (pick slip or purchase order) and deletes the record from the Drop Ship Work table and CC Authorization Transaction table.

 **Note:**

If authorization transactions exist in the CC Authorization Transaction table for non-drop ship orders, the system sends the authorization transactions to the authorization service when you reprocess drop ship authorizations.

Screen Option	Procedure
Continue to generate pick slips without correcting the drop ship error	Select Accept. The system sends all records in the CC Authorization Transaction table to the Authorization Service, including the authorization associated with the drop ship order.
Return to Work with Pick Slip Generation without generating pick slips	Select Reject. The system returns you to the <i>Work with Streamlined Pick Slip Generation Screen</i> allowing you to correct the drop ship error before generating pick slips.

For more information: See [Selecting Vendors for Drop Ship Processing \(MDSF\)](#) for more information on processing drop ship orders.

Selecting Pre-Generated Picks for Pick Slip Generation

The system determines which pre-generated picks (picks in the Pick Control Header table whose status is either G Generated No Authorization or H Generated Has Authorization) to include in the pick slip generation run, based on the pick slip selection criteria specified on the *Streamlined Pick Slip Generation Screen*. To be eligible for pick slip generation, an order cannot be locked by some other process, such as order maintenance.

During pick selection, the system also:

- Assigns a billing batch number to the pick.
- Updates the *Date* and *Time Updated* in the Pick Control Header table to the current date and time.
- Updates the *Date* and *Time Printed* in the Pick Control Header table to the current date and time.
- Looks at Authorization History to determine if any picks in an H Generated Has Authorization status are associated with an expired authorization or credit card authorization reversal. If so, the system updates the status of the Authorization History record to E Expired and changes the status of the pick to G Generated No Authorization.
- Looks at Authorization History to determine if any picks in an H Generated Has Authorization status are associated with a stored value card payment and the [Perform Balance Inquiry during Batch Authorizations \(J19\)](#) system control value is selected. If so, the system changes the status of the pick to G Generated No Authorization.
- Looks at the Online Authorization table to determine if any picks are associated with an online authorization in an S Sent status for a deactivated pay type. In this situation, the system ignores the online authorization, and if another credit card type payment method is on the order, the pick goes out for authorization for the new payment method.
- Changes the *Pick status* from G Generated No Authorization to 1 Waiting for Authorization or H Generated Has Authorization to 2 Authorized. The system performs authorization during pick slip generation for picks that are in a 1 Waiting for Authorization status; see [Authorizations During Pick Slip Generation](#).

Submitting ship-for-pickup orders to Order Orchestration: If an order selected for pick slip generation is flagged to ship to a store location for customer pickup, the process sends a Submit Order request to Order Orchestration. See [Ship-for-Pickup Orders](#) for an overview.

Checking status for retail pickup or delivery orders: If a retail pickup or delivery order from Order Orchestration is selected for pick slip generation, the process sends a status inquiry or status list request to Order Orchestration to confirm that the order has not been canceled since the last update on its status was received, or that it is not currently under review. See [Retail Pickup \(including Ship-for-Pickup\) or Delivery Orders](#) for an overview, and see [Use OROB Status Inquiry List Web Service \(M05\)](#) for details.

Authorizations During Pick Slip Generation

Purpose: The system performs batch authorization processing during pick slip generation for picks that are in a 1 Waiting for Authorization status in the Pick Control Header table.

Includes drop ship or brokered items? If the order includes a drop ship or brokered order line as well as a backordered line, as well as any pickable lines:

- If none of the lines have been authorized, the system obtains an authorization for all order lines.
- If the drop ship or brokered lines have been authorized, the system obtains an authorization only for the backordered or pickable lines.

Picks that skip the authorization process: The system skips the authorization process for picks in the Pick Control Header table that are in a 2 Post-Authorization status. For these picks, the system continues with regular pick slip generation; see [Allocating Stock](#).

Also, the system does not authorize pick slips for ship-for-pickup orders if the [Payment at POS for Ship for Pickup Orders \(L60\)](#) system control value is selected. See that system control value for background.

Automatic authorization: You can approve all authorizations for a service bureau automatically if you want to avoid waiting for the response.

This option is available if all of the following are true:

- The [Default Vendor Response for Automatic Authorizations \(G10\)](#) system control value provides a valid response code for the service bureau,
- The [Immediate response](#) field for the service bureau is unselected, and
- The user has the required authority, as controlled by the [Continue Authorization without Receipt \(A90\)](#) secured feature.

You might choose automatic authorization if you expect a substantial delay before you receive the response from the service bureau, you want to approve and print pick slips quickly, and the possibility of the orders failing authorization is slight.

Determining the Amount to Authorize

The system sends the dollar amount associated with what is shippable on the order that has not yet received an authorization, across all ship to customers, for authorization.

- If the card is the only payment method, the shippable dollar amount includes:
 - shippable merchandise amount, excluding drop ship items.
 - tax associated with the shippable merchandise amount.
 - total freight
 - total additional freight
 - total order level additional charges

Note:

The system sends the total freight and total additional freight for authorization, regardless of whether you are prorating freight charges (the [Prorate Freight Charges \(D39\)](#) system control value is selected).

- If the card is the catch-all payment method, the amount to authorize is the remaining shippable dollar amount not associated with another payment method on the order. The system subtracts the amount applied to any other payment methods from the shippable dollar amount.

shippable dollar amount - dollar amount associated with other payment methods = amount to authorize for this card

If more than one card is sent for authorization: The system sends for authorization the card defined with a dollar amount, and then sends the catch-all card for authorization.

Example: If you specify that \$50.00 is to be charged to Visa and the remainder of the order is to be charged to Mastercard, the first \$50.00 will be applied to Visa. The system authorizes only the amount that can be shipped. If only \$40.00 is being shipped, an authorization request for \$40.00 will be sent for the Visa card. If an additional \$40.00 is shipped the following week, two authorizations will be requested: the remaining \$10.00 for Visa and \$30.00 for Mastercard. If the Visa card is approved and the Mastercard is declined, the second shipment will not occur. The full shipment

amount must be approved for the shipment to occur. The system will keep the authorization code, date and amount for the Visa card. The authorization will be good for the number of days you specify in the *Reauthorization days* field in the Payment Type table.

Deferred and installment pay plans: If the [Auth full amount \(Authorize full amount\)](#) field for the Flexible Payment Option is selected, the full pickable amount is sent for authorization. If this field is unselected, and:

- The order includes an installment payment plan, the first installment amount for the pickable merchandise is sent for authorization.
- The order includes a deferred payment plan, \$1.00 is sent for authorization.

 **Note:**

If the *Authorize full pickable amount* field is selected, the system submits the full amount of the pick slip for authorization, even though this amount is not deposited immediately.

Credit cards requiring authorizations less than \$1.00: If the credit card amount to authorize is less than \$1.00 and you have defined an authorization number in the [Authorization Number for Authorizations Under \\$1.00 \(I08\)](#) system control value, the system does not send the credit card to the service bureau for authorization and instead assigns the authorization number defined in the system control value to the credit card. If an authorization number is not defined in this system control value, the system sends the credit card to the service bureau for authorization, regardless of the amount that requires authorization.

If the order includes drop ship items: The system does not include any drop ship items in the amount requiring authorization for pick slip generation. However, when you use [Selecting Vendors for Drop Ship Processing \(MDSP\)](#), the system includes all items when determining the amount for the authorization request.

If a new authorization is required and an authorization for a previous shipment has expired: If there is an expired authorization for a previously generated pick slip, and a new authorization is required for the pick slip that is now being generated, the system authorizes the amount for the new pick slip, excluding the amount for previously generated pick slip. In this case, the amount of the expired authorization is authorized while the full amount is deposited through [Processing Auto Deposits \(SDEP\)](#).

Example: Item 1 on an order was authorized for 10.00 and the pick slip generated, but the authorization has since expired. A pick slip is now generated for item 2 for 15.00, and the amount authorized at this time is 15.00. During deposit processing, the 10.00 is authorized, and 25.00 is deposited.

Sending Authorization Requests to the Authorization Service

When you send a batch authorization request to the authorization service, the system:

- Creates a record in the CC Authorization Transaction table.
- Places the pick slip in a pending status.
- Sends the authorization request to the service bureau and waits for a response. If an authorization response is not received, the system continues with pick slip generation processing and does not generate a pick slip for the order that did not receive an authorization. The Pick Control Header and Pick Control Detail records for the pick slip requiring authorization will remain in a pending status.

Authorizations When Consolidating Invoices

The [Consolidated Invoice \(B49\)](#) system control value indicates whether to consolidate invoices for shipments on the same order on the same date. The setting of this system control value also determines whether the system sends a separate authorization request for each pick slip generated for an order.

If the *Consolidated Invoice* system control value is selected, the system consolidates order shipments that occur on the same date into a single invoice. The setting of the [Invoice Consolidation Method \(E29\)](#) system control value determines whether the system consolidates all order shipments (across ship tos) that occur on the same date into a single invoice, or whether the system consolidates all order ship to shipments (single ship to) that occur on the same date into a single invoice.

In this situation, the system will obtain one authorization (for all order shipments or for each order ship to shipment) and will create one deposit record for the total amount being shipped, regardless of the number of pick slips that are generated for the order. The full amount of the shipment must be authorized when this method is used. If the authorization is declined, the system does not generate any pick slips for the order.

Consolidating invoices allows you to limit the number of authorization and deposit transactions required for the order, and reduces your transaction fees to the service bureau.

- If all pick slips for the order are billed on the same day, the authorization amount will match the deposit amount and no more authorizations will be required for settlement.
- If all pick slips for the order are not billed on the same day, the authorization amount will not match the deposit amount and the order will be re-authorized at settlement with each deposit.

Example: Order # 745 has a shipment amount of \$100.00. The system generates 3 pick slips for the order, each with an authorization amount of \$100.00.

Pick Slip	Shipment Amount
1	\$25.00
2	\$40.00
3	\$35.00

One authorization will be obtained for the entire order. If the customer has an available balance of only \$30.00, nothing will be shipped. All 3 pick slips associated with the order will be deleted from the Pick Control tables.

! Important:

In Order Management System 21.0 or higher, or Order Administration, you cannot select the Consolidated Invoice system control value if it is not already selected. If the system control value is currently selected (set to Y) and you deselect it (change it to N or blank), you cannot then change it back to selected. The option to consolidate invoices will be removed at a later date.

If the *Consolidated Invoice* system control value is unselected, the system produces a separate invoice for each pick slip generated, regardless of when they ship (bill). In this situation, the system sends a separate authorization for each pick slip associated with the order.

Example: Order # 746 has a shipment amount of \$100.00. The system generates 3 pick slips for the order.

Pick Slip	Shipment Amount	Authorization Amount
1	\$25.00	\$25.00
2	\$40.00	\$40.00
3	\$35.00	\$35.00

A separate authorization will be obtained for each pick slip associated with the order. If the customer has an available balance of only \$30.00, pick slip 1 will ship, but pick slips 2 and 3 will not ship.

See [Consolidated Invoice \(B49\)](#) and [Invoice Consolidation Method \(E29\)](#) for more information.

Receiving a Response from the Authorization Service

When an authorization response is received, the system:

- Updates the Credit Card Authorization Transaction table with the values in the authorization response message.
- Updates the Authorization History table.
- Continues with pick slip generation.

If the authorization is declined: The system:

- Does not generate a pick slip for the order.
- Deletes the Pick Control Header and Pick Control Detail records since the items cannot ship.
- Prints the order on the [Credit Card Authorization Listing](#) for authorizations that have been declined.
- Updates the record in the Authorization History table indicating the card was declined. You can review the declined authorization on the [Display Authorization History Screen](#) and [Authorization History Details Window](#) in standard Order Inquiry.
- If the [Credit Card Decline Email Program \(K53\)](#) system control value specifies a valid email program, the pick slip generation program generates an email to customers whose orders are placed on hold due to credit card decline. See that system control value for more information.

If the authorization is approved: The system:

- Generates a pick slip for the order.
- Prints the order on the [Credit Card Authorization Listing](#) for authorizations that have been approved.
- Updates the status of the record in the Authorization table to *RCVD.
- Updates the record in the Authorization History table indicating the card has been approved, the authorization number, the date the card was authorized, and the dollar

amount authorized. You can review the approved authorization on the [Display Authorization History Screen](#) and [Authorization History Details Window](#) in standard Order Inquiry.

AVS response: If the credit card charge is approved (authorized) but the credit card fails the address verification check, the authorization may be placed on hold (based on the value in the *Hold reason* field in the Vendor Response table). The order header is also placed on AT (declined credit card) hold. You must contact the customer and obtain correct address information, then take the order header and credit card pay type off of hold through the [Selecting Held Orders \(ERHO\)](#) menu option and resend for authorization or cancel the order. A pick slip is not generated until the credit card receives an approved authorization and passes AVS verification. .

Voiding pick slips: If you void a pick slip, the credit card is still authorized. The authorization does not expire until the number of days you specify in the *Reauthorization days* field in the Payment Type table have elapsed. If the authorization is valid when the order is re-submitted for pick slip generation, the system will use the existing authorization. The authorization amount may not match the shipment amount when the deposit request is processed. If this occurs, the service bureau may reauthorize the order for the correct amount prior to accepting the deposit.

Deposits: Authorization numbers and authorization amounts should match the deposits. The system pulls the authorization numbers from the authorization history records for the order/payment method to try to match the authorizations and deposits. See [Processing Auto Deposits \(SDEP\)](#).

Stored Value Card Balance Inquiry: If the [Perform Balance Inquiry during Batch Authorizations \(J19\)](#) system control value is selected, the system sends a stored value card balance inquiry request to the service bureau before performing batch authorization against the stored value card.

- If the remaining balance on the stored value card is equal to or greater than the amount to authorize, the system performs batch authorization against the stored value card.
- If the remaining balance on the stored value card is less than the amount to authorize, and:
 - The stored value card is the catch-all pay type on the order, the system does not perform batch authorization for the order and does not generate a pick slip for the order. Also, if a [Hold Reason for Stored Value Cards with Insufficient Funds \(J18\)](#) is defined, the system places the order on hold.
 - The stored value card is not the catch-all pay type on the order, the system performs batch authorization for the order to authorize the stored value card pay type for the remaining balance and the catch-all pay type for the remaining authorization amount.

See [Batch Authorization Balance Inquiry](#) for more information.

Allocating Stock

Pick Slip Allocation determines the locations where the system pulls stock in order to fulfill the pick slips in the pick slip generation run.

The system calls pick slip allocation after authorization processing. The system deletes any pick slips that failed authorization before performing pick slip allocation.

Pick Location Types

As the system searches for locations in pick slip generation, it tries to allocate only from locations defined as pickable. The following warehouse location types exist.

Location Type	Description
Primary	<p>Primary locations are the main picking locations, although a primary location may be defined as pickable or non-pickable. These locations may contain more than one item/SKU.</p> <p>Pickable primary locations are filled during replenishment from other locations, based on the setting of the Replenish from Location Type (A66) system control value. Item/location records have min/max values used in the replenishment. Non-reservable primary locations are excluded from the replenishment system. Item/location records in a primary location are never deleted by the system.</p>
Secondary	<p>Secondary locations may be pickable or non-pickable, and they can contain more than one item/SKU.</p> <p>Pickable secondary locations can be replenished from other locations, based on the setting of the Replenish from Location Type (A66) system control value. Item/location records associated with these locations are never deleted by the system. Pickable and non-pickable secondary locations are used to replenish primary locations. Non-reservable locations are excluded from the replenishment system.</p>
Bulk	<p>Bulk locations are used to store overstock quantities. They usually contain case or carton quantities, can be defined as pickable or non-pickable, and can contain more than one item/SKU.</p> <p>Quantities stored in bulk locations are used to replenish primary or secondary locations. Item/location records associated with bulk locations are deleted by the system when the on-hand in that location reaches zero. Non-reservable locations are excluded from the replenishment system.</p>
Temporary	<p>Temporary locations are assigned by the system or an operator to temporarily store inventory until it can be put away or picked. A temporary location cannot exist without at least one item/location record associated with it. When stock is moved into a temporary location, the system creates an item/location record. When the on-hand in the item/location reaches zero, the system deletes the location and the item/location records. Order Administration does not allocate merchandise from a temporary location even if the location is defined as pickable. In order to allocate stock, you must move the merchandise to a non-temporary, pickable location.</p>

Pick Slip Allocation Processing

The system performs the following steps during pick slip allocation.

- [Determining the Type of Pick Slip Generated](#)
- [Determining the Inventory Sharing Setting](#)
- [Populating the Picking Sequence Array Field in the Pick Sort GH table](#)
- [Determining the Pick Detail Quantity](#)
- [Determining the Weight and Cube of the Pick Slip](#)
- [Determining Whether to Check Location Quantities during Allocation](#)
 - [Allocation Processing Against Multiple Locations](#)

- [Allocation Processing Against Primary Primary Location](#)
- [Determining the Shipper for the Pick Slip](#)
- [Determining Whether to Hold Pick Slips Due to Allocation Errors](#)
- [Performing Updates After Successful Allocation](#)

Inventory transactions: In order to allocate stock without errors, you should not process inventory transactions while running pick slip generation.

Inventoried item? The system performs allocation processing for inventoried items only (the *Non-inventory* field for the item is unselected and the *Affect inventory* field for the Pick Control Detail record is set to Y).

Streamlined allocation? If the [Use Streamlined Allocation \(L63\)](#) system control value is selected, the system allocates the entire quantity printed (and reserved) on the pick slips from the item's primary primary location in the warehouse on the Pick Control Header and bypasses certain allocation processing to accelerate pick slip generation. You might use streamlined allocation if you integrate with a warehouse management system. See [Streamlined Allocation](#) for processing details.

Determining the Type of Pick Slip Generated

The system looks at the records in the Pick Control Header table to determine if the *Generation type* is R (Regular), S (Special Handling), or I (Bill Immediately).

- If the *Generation type* for the record in the Pick Control Header table is R (Regular) or S (Special Handling), the system continues with allocation processing.
- If the *Generation type* for the record in the Pick Control Header table is I (Bill Immediately), the system confirms and immediately bills the pick slip. See [Confirming and Billing the Pick Slip Immediately](#).

Determining the Inventory Sharing Setting

The system looks at the setting of the Inventory Sharing (A69) system control value. This system control value defines whether a company will fulfill orders from another company's inventory.

Note:

The system does not perform this step if you [Use Streamlined Allocation \(L63\)](#).

- If selected, the company where you ran pick slip generation fulfills orders from another company's inventory. The *Shared company/warehouse* in the [Creating and Maintaining Warehouses \(WWHS\)](#) menu option indicates the company and warehouse that provides the inventory to fulfill orders against the company where you ran pick slip generation.
- If unselected, the company where you ran pick slip generation fulfills orders from its on-hand inventory.

See [Inventory Sharing \(A69\)](#) for more information about this system control value.

Populating the Picking Sequence Array Field in the Pick Sort GH table

The system looks at the following system control values to determine whether the system loads the location code or location picking sequence number into the *Picking sequence array* field in the Pick Control Header Extended table and Pick Sort GH table when you generate pick slips.

Note:

The system does not perform this step if you [Use Streamlined Allocation \(L63\)](#).

The system uses the *Picking sequence array* field to sort pick slips into separate PDF documents and during cart/bin picking. See [Sorting Pick Slips into Separate PDF Documents](#) and [Sorting Pick Slips into Separate Cart Batches](#).

Sort Picks by Pick Sequence (E89)	Load Location into Pick Sequence (G34)	Results:
unselected	unselected or selected	The system leaves the <i>Picking sequence array</i> field in the Pick Control Header Extended and Pick Sort GH tables blank.
selected	selected	The system loads the <i>Picking sequence array</i> field in the Pick Control Header Extended and Pick Sort GH tables with the location code.
selected	unselected	The system loads the <i>Picking sequence array</i> field in the Pick Control Header Extended and Pick Sort GH tables with the location picking sequence number.

See [Sort Picks by Pick Sequence \(E89\)](#) and [Load Location into Pick Sequence \(G34\)](#) for more information about each system control value.

Determining the Pick Detail Quantity

The system uses the following calculation to determine the quantity required to fulfill a pick slip detail record.

Qty Ordered in Pick Control Detail - Qty Backordered in Pick Control Detail = Quantity required for pick slip detail

Determining the Weight and Cube of the Pick Slip

The system determines the weight and cube of the pick slip.

Note:

The system does not perform this step if you [Use Streamlined Allocation \(L63\)](#).

Weight of pick calculation: If a *Ship weight* is defined for the SKU, the system uses the SKU *Ship weight*; otherwise, the system uses the item *Ship weight*:

SKU or Item Ship Weight * Quantity Printed on Pick Control Detail = Weight of pick in Pick Control Header Extended

The system rounds the weight of the pick slip to 3 decimal places, for example 9.999.

Example: The system generates a pick slip for the following items.

Item	Item Ship Weight	SKU Ship Weight	Pick Qty	Weight of Pick
ABC	1.234	3.111	2	2.468 + 3.111 +
BCD	3.111	4.25	1	4.25 = 9.829
CDE	4.0		1	

Cube of pick calculation: If a *Cube factor* is defined for the SKU, the system uses the SKU cube factor; otherwise, the system uses the item cube factor:

SKU or Item Cube factor * Quantity Printed on Pick Control Detail = Cube size of pick in Pick Control Header Extended

The system rounds the cube of the pick slip to the nearest integer.

Example: The system generates a pick slip for the following items.

Item	Item Cube Factor	SKU Cube Factor	Pick Qty	Cube Size of Pick
ABC	2.1	5.4	2	4.2 + 5.4 + 11.6 =
BCD	5.4	11.6	1	21 (rounded from 21.2)
CDE	11.0		1	

The system uses the cube size of pick value during cart/bin picking; see [Using Cart/Bin Picking](#).

Determining Whether to Check Location Quantities during Allocation

The system looks at the setting of the [Check Location Quantities During Pick Generation \(C54\)](#) system control value to determine whether to allocate inventory from specific pickable locations in the warehouse.

 **Note:**

The system ignores the setting of the *Check Location Quantities During Pick Generation (C54)* system control value if you *Use Streamlined Allocation (L63)*.

- If selected, the system allocates inventory from the first pickable location with enough stock to satisfy the quantity printed on the pick slip. If there is not enough stock, the system allocates inventory across multiple pickable locations, beginning with primary, secondary, then bulk locations. See [Allocation Processing Against Multiple Locations](#) for more processing information.

- If unselected, the system allocates the entire quantity printed on the pick slips from the item's primary primary location. If the primary primary location does not contain this quantity, you must perform replenishment immediately after running pick slip generation in order to replenish stock from bulk and secondary locations to the primary primary location. See [Allocation Processing Against Primary Primary Location](#).

 **Note:**

If you are using [Let Down Replenishment](#) to generate and process replenishments during pick slip generation, you must select the [Check Location Quantities During Pick Generation \(C54\)](#) system control value.

Determining the Shipper for the Pick Slip

The system uses the following hierarchy to determine the ship via code to default to the [Pick Control Header Table](#). The system uses the ship via code in the Pick Control Header table as the shipper for the pick slip.

1. Use the ship via override defined for the pick slip generation template.
2. Use an alternate ship via defined for the ship via on the Order Header.
3. For single line pick slips, use the ship via defined on the Order Detail.
4. For multi line pick slips, use the ship via defined on the Order Header.

Streamlined allocation: If you *Use Streamlined Allocation (L63)*, the system overrides the ship via that defaults to the [Pick Control Header Table](#) only if a ship via override is defined for the pick slip generation template; the system does not override the ship via to the alternate ship via defined for the ship via on the order header.

Freight exempt items at the ship via level: When the system applies a ship via override to the pick slip, the system does not look at the Freight Exempt Item Ship Via table to determine if one or more of the items on the pick slip is excluded from freight for the ship via override. The system keeps the freight that was applied to the order during order entry and prints this freight amount on the pick slip. See [Working with Freight Exempt Items \(WFEI\)](#) for more information about freight exempt items.

Order history message: If the system applies a ship via override to the pick slip, the system writes an order history message indicating the new ship via code that was applied to the pick slip. For example: *PICK GEN SHIPPER CHANGED TO 03*.

 **Note:**

The system does not write an order history message if you *Use Streamlined Allocation (L63)*.

1. Use the ship via override defined for the pick slip generation template.

If a ship via is defined in the *Override all orders to via* field for the pick slip generation template, and this ship via passes [Ship Via Override Validation during Pick Slip Generation](#), the system updates the *Ship via* field in the Pick Control Header record to the override ship via code.

Examples: The following ship via overrides exist in the Item Ship Via Override table for item ABC and ship via codes 1 and 2.

Example 1: You place an order for item ABC. The ship via code defined on the Order Header is ship via 1.

Ship via code 2 is defined as the *Override all orders to via* field for the pick slip generation template.

When you generate a pick slip for the order, the system updates the *Ship via* field in the Pick Control Header record to ship via code 2.

Example 2: You place an order for item ABC. The ship via code defined on the Order Header is ship via 1.

Ship via code 3 is defined as the *Override all orders to via* field for the pick slip generation template.

When you generate a pick slip for the order, the system updates the *Ship via* field in the Pick Control Header record to ship via code 1. The system does not apply the ship via defined in the *Override all orders to via* field for the pick slip generation template because that ship via is not a valid shipper for the item.

Example 3: You place an order for item ABC. The ship via code defined on the Order Header is ship via 1. The ship via code defined on the Order Detail is ship via 2.

Ship via code 3 is defined as the *Override all orders to via* field for the pick slip generation template.

When you generate a pick slip for the order, the system updates the *Ship via* field in the Pick Control Header record to ship via code 3. The system applies the ship via defined in the *Override all orders to via* field for the pick slip generation template because the system does not validate that the ship via is a valid shipper for the item when the ship via on the Order Detail does not match the ship via on the Order Header.

2. Use an alternate ship via defined for the ship via on the Order Header.

If the pick slip qualifies for an alternate ship via defined for the ship via on the order header, and this ship via code passes [Ship Via Override Validation during Pick Slip Generation](#), the system updates the *Ship via* field in the Pick Control Header record to the alternate ship via code.

You can define an alternate ship via code for a ship via on the [Create Ship Via \(2 of 2\) Screen](#). See this screen for more information on defining alternate shippers for a ship via code.

Note:

If the alternate ship via chosen for the order does not pass [Ship Via Override Validation during Pick Slip Generation](#), the system does not use this alternate ship via code for the Pick Control Header and does not reevaluate the other alternate ship vias defined for the ship via on the Order Header.

Alternate ship via hierarchy: The system uses the following hierarchy to determine which alternate ship via to use. Once the pick slip qualifies for one of the alternate ship

vias, the system does not continue to determine if the pick slip qualifies for any of the other alternate ship vias.

- Use the first alternate ship via defined for the ship via on the Order Header.
The pick slip qualifies for the first alternate ship via if:
 - The current date - the *Date shipped* defined in the Invoice Detail table for the first invoice for the order ship to is greater than the number defined in the *# of days since 1st shipment* field for the alternate ship via, *Or*
 - The *# of shipments* defined in the Order Ship To table is greater than the number defined in the *# of shipments* field for the alternate ship via.
- Use the second alternate ship via defined for the ship via on the Order Header.
The pick slip qualifies for the second alternate ship via if:
 - The total *Ship wgt. (Shipping weight)* for the items on the pick slip is less than the *Minimum weight* field for the alternate ship via, *Or*
 - The *Total order amount* for the pick slip in the Pick Control Header table is less than the *Minimum value* field for the alternate ship via.
- Use the third alternate ship via defined for the ship via on the Order Header.
The pick slip qualifies for the third alternate ship via if:
 - The total *Ship wgt. (Shipping weight)* for the items on the pick slip is greater than the *Maximum weight* field for the alternate ship via, *Or*
 - The *Total order amount* for the pick slip in the Pick Control Header table is greater than the *Maximum value* field for the alternate ship via.

First alternate ship via examples: The first alternate ship via is defined for ship via 1:

Setting	Example
Alternate ship via 1	11
# of days since 1st shipment	7
# of shipments	2

Example # of days since 1st shipment: On 8/18, you generate a pick slip for the first shipment on the order. The system creates an invoice and updates the *Date shipped* field for the Invoice Detail record to 8/18. Since this is the first shipment for the order, the system does not use alternate ship via code 11 on the pick slip and instead uses the ship via code on the Order Header (ship via code 1).

On 8/26, you generate a pick slip for the second shipment on the order. The system uses the following calculation to determine the number of days since the first shipment: *current date - earliest date shipped = number of days since the first shipment*. In this example, the calculation is: 8/26 - 8/18 = 8 days. The number of days since the first shipment is greater than the number defined for the *# of days since 1st shipment* field for alternate ship via 1. The system updates the *Ship via* field in the Pick Control Header record to alternate ship via code 11.

Example # of shipments: On 8/23, you generate a pick slip for the first shipment on the order.

On 8/24, you generate a pick slip for the second shipment on the order. Since the number of shipments (2) is equal to the *# of shipments* field for alternate ship via 1, the system does not

use alternate ship via code 11 on the pick slip and instead uses the ship via code on the Order Header (ship via code 1).

On 8/25, you generate a pick slip for the third shipment on the order. Since the number of shipments (3) is greater than the # of shipments field for alternate ship via 1, the system updates the *Ship via* field in the Pick Control Header record to alternate ship via code 11.

Second alternate ship via examples: The second alternate ship via is defined for ship via 1:

Setting	Example
Alternate ship via 2	12
Minimum weight	5
Minimum value	25.00

Example minimum weight: You place an order for item ABC for a quantity of 1 and item BCD for a quantity of 2. The ship via code on the Order Header is 1.

The *Shipping weight* defined for item ABC is 1.5. The *Shipping weight* for item BCD is .5. The total shipping weight for the order is 2.5 (1.5 + .5 + .5 = 2.5).

When you generate a pick slip for the order, because the total shipping weight for the items on the pick slip is less than the *Minimum weight* defined for alternate ship via 2, the system updates the *Ship via* field in the Pick Control Header record to alternate ship via code 12.

Example minimum value: You place an order for item ABC for a quantity of 5. The ship via code on the Order Header is 1.

The total order amount for the pick slip is \$18.30.

When you generate a pick slip for the order, because the pick slip total for the order is less than the *Minimum value* defined for alternate ship via 2, the system updates the *Ship via* field in the Pick Control Header record to alternate ship via code 12.

Third alternate ship via examples: The third alternate ship via is defined for ship via 1:

Setting	Example
Alternate ship via 3	13
Maximum weight	25
Maximum value	250.00

Example maximum weight: You place an order for item ABC for a quantity of 1 and item BCD for a quantity of 2. The ship via code on the Order Header is 1.

The *Shipping weight* defined for item ABC is 14.0. The *Shipping weight* for item BCD is 6.5. The total shipping weight for the order is 27.0 (14.0 + 6.5 + 6.5 = 27.0).

When you generate a pick slip for the order, because the total shipping weight for the items on the pick slip is greater than the *Maximum weight* defined for alternate ship via 3, the system updates the *Ship via* field in the Pick Control Header record to alternate ship via code 13.

Example maximum value: You place an order for item ABC. The ship via code on the Order Header is 1.

The total order amount for the pick slip is \$251.30.

When you generate a pick slip for the order, because the pick slip total for the order is greater than the *Maximum value* defined for alternate ship via 3, the system updates the *Ship via* field in the Pick Control Header record to alternate ship via code 13.

3. For single line pick slips, use the ship via defined on the Order Detail.

If the pick slip is for a single pick detail, the system updates the *Ship via* field in the Pick Control Header record to the ship via code defined on the Order Detail record.

If the ship via code on the Order Detail record is blank, the system uses the ship via on the Order Header.

Example: The following ship via overrides exist in the Item Ship Via Override table.

Item	Eligible Ship Via Override Codes for Item
ABC	1
	2
BCD	1
	2
	3

You place an order for items ABC and BCD.

- The ship via on the order header is ship via code 1.
- The ship via code on the order detail for item ABC is ship via code 2.
- The ship via code on the order detail for item BCD is ship via code 3.

During pick slip generation, the system creates a separate pick slip for item ABC and BCD.

- The system updates the *Ship via* field in the Pick Control Header record for the pick slip for item ABC to ship via code 2.
- The system updates the *Ship via* field in the Pick Control Header record for the pick slip for item BCD to ship via code 3.

4. For multi line pick slips, use the ship via defined on the Order Header.

If the pick slip does not qualify for a ship via override, or the ship via override does not pass [Ship Via Override Validation during Pick Slip Generation](#), the system updates the *Ship via* field in the Pick Control Header record to the ship via code defined on the Order Header record.

Ship Via Override Validation during Pick Slip Generation

Before the system applies a ship via override to the Pick Control Header record, the system validates that the ship via code is a valid shipper for each item on the associated Pick Control Detail records.

The system looks at the Item Ship Via Override table for each item on the Pick Control Detail records.

- If a ship via override exists in the Item Ship Via Override table for the item, the system validates that the ship via override for the Pick Control Header record exists as a valid ship via override for the item.
 - If the ship via override for the Pick Control Header record exists as a valid ship via override for the item, the system allows the ship via override to the Pick Control Header record.
 - If the ship via override for the Pick Control Header record does not exist as a valid ship via override for the item, the system does not allow the ship via override to the Pick Control Header record.
- If a ship via override does not exist in the Item Ship Via Override table for any of the items on the Pick Control Detail records, the system allows the ship via override to the Pick Control Header record.

 **Note:**

The system performs this validation only if the ship via code defined on the Order Detail record is blank or matches the ship via code on the Order Header.

For more information: See [Working with Item Ship Via Overrides](#) for more information on defining item ship via overrides.

Determining Whether to Hold Pick Slips Due to Allocation Errors

The setting of the [Withhold Picks due to Item Allocation Error \(F04\)](#) system control value defines whether the system prints a pick slip for an order when an item on the order creates a stock allocation error.

- If selected, the system does not print a pick slip for any item that is on the same order as the item that has the item stock allocation error, even if the item will print on a separate pick slip.
- If unselected, the system prints a pick slip for items on the order that did not create item stock allocation errors. If the item that has the item stock allocation error is part of a set or is part of a coordinate group, the system holds the other items that are part of the set or coordinate group.

Order history: The system creates an order transaction history message for the item that has the item stock allocation error: *PICK GEN Item Allocation error - Order line 1.*

Pick slip totals: The system recalculates the pick slip totals so that amounts related to items with an allocation error are not included on the pick slip.

Example 1: An example of how the system generates a pick slip when the *Withhold Picks Due to Item Allocation Error* system control value is selected.

Streamlined Pick Generation: Withhold Picks Due to Allocation Error Selected

Order Line	Item Type	Status	Coordinate Group #
1	regular item resulting in allocation error	in-stock	1
2	ship alone item	in-stock	

Order Line	Item Type	Status	Coordinate Group #
3	coordinate group item	in-stock	1
4	coordinate group item	in-stock	1
5.	regular item	in-stock	1

Result for all:

The system does not print a pick slip for the item which created an allocation error. The item is listed on the Item Stock Allocation Error report.

Also, the system does not print a pick slip for any item that is on the same order as the item that has the item stock allocation error.

Example 2: An example of how the system generates a pick slip when the *Withhold Picks Due to Item Allocation Errors* system control value is unselected.

Withhold Picks Due to Item Allocation Error = Unselected

Order Line	Item Type	Status	Coordinate Group Number	Result
1	regular item resulting in allocation error	in-stock	1	The system does not print a pick slip for the item which created an allocation error. The item is listed on the Item Stock Allocation Error report.
2	ship alone item	in-stock		The system prints a separate pick slip for the ship alone item.
3	coordinate group item	in-stock	1	The system does not print a pick slip for the 2 items that are coordinate grouped with the item that has the item stock allocation error.
4	coordinate group item	in-stock	1	
5	regular item	in-stock		The system prints a pick slip for the regular item.

Performing Updates After Successful Allocation

The system performs the following updates after the quantity required for the pick slip is successfully allocated.

Item Location Table

The system updates each record in the Item Location table whose stock was used during allocation processing.

Field	Description
Printed Qty	The system increases the printed quantity by the <i>Qty printed</i> from the Pick Control Detail record. For example, if the existing printed quantity for the Item Location record is 1 and you print a pick slip for a quantity of 2, the system updates the <i>Printed qty</i> to 3.

Order Ship To Table

Field	Description
# Picks outstanding	The system increases this field by the number of pick slips generated for the order ship to in the pick slip generation run.
Last pick print date	The system updates this field with the date of the pick slip generation run.

Order Detail Table

For each record in the Pick Control Detail table that was allocated successfully, the system updates the associated record in the Order Detail table.

Field	Description
Qty printed	The system increases the printed quantity by the <i>Qty printed</i> from the Pick Control Detail record. For example, if the existing printed quantity for the Order Detail record is 1 and you print a pick slip for a quantity of 2, the system updates the <i>Qty printed</i> to 3.
Date printed	The date pick slip generation was run.

Pick Control Detail Table

Field	Description
Qty printed	The system updates this field to the allocated quantity for the pick control line.

Pick Control Header Table

Field	Description
Date printed	The date pick slip generation was run.
Time printed	The time pick slip generation was run. NOTE: The system does not populate the <i>Pick zone 1 - 6</i> fields if you Use Streamlined Allocation (L63) .
Pick zone 1	The first zone to pick from in alphabetical sequence. An asterisk (*) displays if: <ul style="list-style-type: none"> the number of zones to pick from is greater than 6, or the number of zones to pick from is greater than the number defined in the Maximum Number of Zones (B41) system control value.

Field	Description
Pick zone 2	The second zone to pick from in alphabetical sequence. An asterisk (*) displays if: <ul style="list-style-type: none"> the number of zones to pick from is greater than 6, or the number of zones to pick from is greater than the number defined in the Maximum Number of Zones (B41) system control value.
Pick zone 3	The third zone to pick from in alphabetical sequence. An asterisk (*) displays if: <ul style="list-style-type: none"> the number of zones to pick from is greater than 6, or the number of zones to pick from is greater than the number defined in the Maximum Number of Zones (B41) system control value.
Pick zone 4	The fourth zone to pick from in alphabetical sequence. An asterisk (*) displays if: <ul style="list-style-type: none"> the number of zones to pick from is greater than 6, or the number of zones to pick from is greater than the number defined in the Maximum Number of Zones (B41) system control value.
Pick zone 5	The fifth zone to pick from in alphabetical sequence. An asterisk (*) displays if: <ul style="list-style-type: none"> the number of zones to pick from is greater than 6, or the number of zones to pick from is greater than the number defined in the Maximum Number of Zones (B41) system control value.
Pick zone 6	The sixth zone to pick from in alphabetical sequence. An asterisk (*) displays if: <ul style="list-style-type: none"> the number of zones to pick from is greater than 6, or the number of zones to pick from is greater than the number defined in the Maximum Number of Zones (B41) system control value.
# of lines	The number of associated records in the Pick Control Detail table.
Ship via code	The ship via code assigned to the pick control header. See Determining the Shipper for the Pick Slip for more information on how the system determines the ship via code to default to the Pick Control Header record and pick slip.

Pick Control Header Extended Table

Note:

The system does not populate the *Cube size of pick*, *Weight of pick*, or *Picking seq* fields if you *Use Streamlined Allocation (L63)*.

Field	Description
Cube size of pick	The system updates the cube size of the pick slip based on the cube of pick calculation. See Determining the Weight and Cube of the Pick Slip .
Weight of pick	The system updates the weight of the pick slip based on the weight of pick calculation. See Determining the Weight and Cube of the Pick Slip .
Picking seq array	<ul style="list-style-type: none"> If the Sort Picks by Pick Sequence (E89) and Load Location into Pick Sequence (G34) system control values are selected, the system updates this field with the location codes in alphanumeric order where the items on the pick slip were allocated from. For example, if the items were allocated from locations PRIMARY and A01, the system displays <i>A01 PRIMARY</i> in this field. If the Sort Picks by Pick Sequence (E89) system control value is selected and the Load Location into Pick Sequence (G34) system control value is unselected, the system updates this field with the location picking sequence numbers in numeric order where the items on the pick slip were allocated from. For example, if the items were allocated from locations PRIMARY (picking sequence # 3) and A01 (picking sequence # 1), the system displays <i>00000010000003</i> in this field. <p>NOTE: The system can display up to 25 locations or location picking sequence numbers in this field. If more than one pick slip detail record used the same item location to allocate from, the system displays the location or location picking sequence number in the picking sequence array once.</p>

Pick Location Table

The system creates a record in the Pick Location table for each location whose stock was used during allocation processing.

Field	Description
Company	The <i>Company</i> from the Pick Control Detail record.
PCH control #	The <i>PCH Control #</i> from the Pick Control Detail record.
PCD Line #	The <i>PCD Line #</i> from the Pick Control Detail record.
PDL CMP company	The <i>ROL CMP Company</i> from the Reserved Order Line record.
Warehouse	The <i>ROL WHS Warehouse</i> from the Reserved Order Line record.
Location	<ul style="list-style-type: none"> If performing Allocation Processing Against Multiple Locations, this is the item location where the pick slip quantity was allocated from. If the system allocates the pick slip quantity from more than one item location, the system creates multiple records in the Pick Location table. If performing Allocation Processing Against Primary Primary Location, this is the <i>Location</i> from the SKU record. This is the item's primary primary location.
PDL Qty allocated	The <i>PCD Qty printed</i> from the Pick Control Detail record.

Field	Description
PDL Zone	The <i>Location zone</i> from the Location record.
PDL Picking Sequence	The <i>Picking sequence</i> from the Location record.
PDL Billing Batch #	The <i>PCH Billing batch #</i> from the Pick Control Header record.
PDL Cart Batch #	The <i>PCH Cart batch #</i> from the Pick Control Header record. NOTE: The system does not populate this field if you <i>Use Streamlined Allocation (L63)</i> .
PDL Cart Bin #	The <i>PCD Cart bin #</i> from the Pick Control Detail record. NOTE: The system does not populate this field if you <i>Use Streamlined Allocation (L63)</i> .
Order #	The <i>Order #</i> from the Pick Control Detail record.
Ship to #	The <i>Ship to #</i> from the Pick Control Detail record.
PDL ITM Number	The <i>ITM Number</i> from the Pick Control Detail record.
PDL SKU Code	The <i>SKU Code</i> from the Pick Control Detail record.

Streamlined Allocation

If the *Use Streamlined Allocation (L63)* system control value is selected, the system performs streamlined allocation during pick slip generation.

When would you perform streamlined allocation? If you integrate with a warehouse management system, you might use the *Generic Pick Out API* to communicate pick slip information to the external system. In this case, you can accelerate pick slip processing by performing streamlined allocation.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Note:

The system performs Streamlined Allocation only if the [Bypass Creation of Pick Forms during WSPS Pick Generation \(K55\)](#) system control value is selected.

When the *Use Streamlined Allocation (L63)* system control value is selected, the system allocates the entire quantity printed (and reserved) on the pick slips from the item's primary primary location in the warehouse on the Pick Control Header.

Retail pickup or delivery orders? If there are any retail pickup or delivery orders eligible for pick slip generation, the system uses streamlined allocation only if:

- the [Use OROB Status Inquiry List Web Service \(M05\)](#) system control value is set to CANCELED or ALL, and
- the [Message Version Number](#) property is higher than 4.0

See the [Use OROB Status Inquiry List Web Service \(M05\)](#) system control value for a discussion.

During streamlined allocation, the system:

#	Step
1.	<p>Verifies that a primary primary location is defined for the item.</p> <p>If a primary primary location is not defined for the item, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: No prime loc.</p>
2.	<p>Determines if the item's primary primary location is in the warehouse defined on the Pick Control Header record.</p> <ul style="list-style-type: none"> • If the item's primary primary location is not in the warehouse defined on the Pick Control Header record, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: No prime loc. • If the item's primary primary location is in the warehouse defined on the Pick Control Header record, the system continues with allocation processing.
3.	<p>The system verifies that the item's primary primary location is eligible for allocation.</p> <p>The item's primary primary location is not eligible for allocation if:</p> <ul style="list-style-type: none"> • The <i>Allocation freeze</i> field for the Item Warehouse record is Y. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Itm Whs Rsv Frz. • The <i>Freeze</i> field for the Location record is Y. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Loc frozen. • The <i>Pickable location</i> field for the Location record is N or blank. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Loc unpickable. • The <i>Freeze flag</i> field for the Item Location record is Y. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Itm Loc Rsv Frz. • The <i>Pending transaction quantity</i> field for the Item Location record is less than 0. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Neg Pend Qty.
4.	<p>If no item stock allocation errors exist, the system allocates the quantity required for the pick slip from the item's primary primary location.</p>

 **Note:**

The system will not generate a stock allocation error if there is not enough stock in the item's primary primary location.

5. The system does several updates after allocation; see [Performing Updates After Successful Allocation.](#)

Bypassed allocation processing: Streamlined allocation bypasses the following:

- Ignores the setting and does not perform any functionality related to the following system control values:
 - [Inventory Sharing \(A69\)](#)

- [Sort Picks by Pick Sequence \(E89\)](#)
- [Load Location into Pick Sequence \(G34\)](#)
- [Check Location Quantities During Pick Generation \(C54\)](#)
- [Include Bulk Locations in Primary Primary Availability \(F87\)](#)
- [Include Secondary Locations in Primary Primary Availability \(F88\)](#)
- [Let Down Replenishment \(C36\)](#)
- Does not perform any calculations to determine the weight and cube of the pick slip.
- Only overrides the ship via that defaults to the [Pick Control Header Table](#) if a ship via override is defined for the pick slip generation template; the system does not override the ship via to the alternate ship via defined for the ship via on the order header.
- Does not populate the *Pick zone 1 - 6* fields in the Pick Control Header table.
- Does not populate the *Picking sequence array* field in the Pick Control Header Extended and Pick Sort GH tables.
- Does not populate the *Cube size of pick* and *Weight of pick* fields in the Pick Control Header Extended table.
- Does not populate the *PDL Zone*, *PDL Picking Sequence*, *PDL Cart Batch #*, or *PDL Cart Bin #* fields in the Pick Location table.

Allocation Processing Against Multiple Locations

When the [Check Location Quantities During Pick Generation \(C54\)](#) system control value is selected, the system allocates inventory from the first pickable location with enough stock to satisfy the quantity printed on the pick slip. If there is not enough stock, the system allocates inventory across multiple pickable locations, beginning with primary, secondary, then bulk locations.

The system performs the following steps for each pick control detail record in the pick slip generation run when the [Check Location Quantities During Pick Generation \(C54\)](#) system control value is selected.

#	Step
1.	<p>The system verifies that the Item warehouse record associated with the warehouse on the Reserved Order Line is not frozen.</p> <ul style="list-style-type: none"> • If the <i>Allocation freeze</i> field for the Item Warehouse record is Y, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Itm Whs Rsv Frz. • If the <i>Allocation freeze</i> field for the Item Warehouse record is N or blank, the system continues with allocation processing.
2.	<p>The system determines which item locations are eligible for allocation.</p> <p>Item locations excluded from allocation: The system excludes an item location from the list of locations available to allocate from if:</p> <ul style="list-style-type: none"> • The <i>Freeze</i> field for the Location record is Y. • The <i>Pickable location</i> field for the Location record is N or blank. • The <i>Freeze flag</i> field for the Item Location record is Y.

#	Step
3.	<p>The system uses the following calculation to determine the quantity available in each eligible item location.</p> <p>Item location available quantity calculation:</p> <p>On hand qty in Item Location - negative Pending transaction qty in Item Location - Printed qty in Item Location = Available quantity in Item Location</p> <p>NOTE: If the pending transaction quantity for the item location is a positive quantity, the system does not include it in the calculation.</p>
4.	<p>The system tries to allocate the pick slip detail quantity against one item location, comparing the quantity required for the Pick Control Detail record to the calculated available quantity in the item location.</p> <p>The system uses the following hierarchy when searching for an item location that can fulfill the entire pick slip detail quantity.</p> <ol style="list-style-type: none"> 1. Allocate the entire pick slip detail quantity from one primary pickable location, searching primary locations in alphabetical sequence. NOTE: The system does not consider the item's primary primary location first. <ul style="list-style-type: none"> • If the Include Bulk Locations in Primary Primary Availability (F87) system control value is selected, the system includes the quantity in non-pickable bulk locations in the available pick quantity for the primary primary location. See Example: Include Non-Pickable Bulk Locations in Primary Primary Availability for an example. • If the Include Secondary Locations in Primary Primary Availability (F88) system control value is selected, the system includes the quantity in non-pickable secondary locations in the available pick quantity for the primary primary location. See Example: Include Non-Pickable Secondary Locations in Primary Primary Availability for an example. • If both the Include Bulk Locations in Primary Primary Availability (F87) and Include Secondary Locations in Primary Primary Availability (F88) system control values are selected, the system includes stock from non-pickable bulk locations in the primary primary location's availability before including stock from non-pickable secondary locations in the primary primary location's availability. See Example: Include Non-Pickable Bulk and Secondary Locations in Primary Primary Availability for an example. 2. If the entire pick slip detail quantity cannot be allocated from one primary pickable location, allocate the entire quantity from one secondary pickable location, searching secondary locations in alphabetical sequence. 3. If the entire pick slip detail quantity cannot be allocated from one secondary pickable location, allocate the entire quantity from one bulk pickable location, searching bulk locations in alphabetical sequence.

#	Step
5.	<p>If the system cannot allocate the entire pick slip detail quantity against one item location, the system tries to allocate the pick slip detail quantity across item locations until the <i>Quantity ordered</i> for the Pick Control Detail record has been reached.</p> <p>The system uses the following hierarchy when searching across item locations to fulfill the pick slip detail quantity.</p> <ol style="list-style-type: none"> 1. Allocate the pick slip detail quantity from primary pickable locations, allocating from primary locations in alphabetical sequence. <ul style="list-style-type: none"> • If the <i>Include Bulk Locations in Primary Primary Availability (F87)</i> system control value is selected, the system includes the quantity in non-pickable bulk locations in the available pick quantity for the primary primary location. See Example: Include Non-Pickable Bulk Locations in Primary Primary Availability for an example. • If the <i>Include Secondary Locations in Primary Primary Availability (F88)</i> system control value is selected, the system includes the quantity in non-pickable secondary locations in the available pick quantity for the primary primary location. See Example: Include Non-Pickable Secondary Locations in Primary Primary Availability for an example. • If both the <i>Include Bulk Locations in Primary Primary Availability (F87)</i> and <i>Secondary Locations in Primary Primary Availability (F88)</i> system control values are selected, the system includes stock from non-pickable bulk locations in the primary primary location's availability before including stock from non-pickable secondary locations in the primary primary location's availability. See Example: Include Non-Pickable Bulk and Secondary Locations in Primary Primary Availability for an example. 2. If the entire pick slip detail quantity cannot be allocated from primary pickable locations only, continue allocating the pick slip detail quantity from secondary pickable locations, allocating from secondary locations in alphabetical sequence. 3. If the entire pick slip detail quantity cannot be allocated from primary and secondary pickable locations, continue allocating the pick slip detail quantity from bulk pickable locations, allocating from bulk locations in alphabetical sequence.
6.	<p>If the system cannot allocate the entire pick slip detail quantity across item locations, the system determines the setting of the Let Down Replenishment (C36) system control value.</p> <ul style="list-style-type: none"> • If the Let Down Replenishment (C36) system control value is set to REPORT or RPT/EXEC, the system performs let down replenishment to restock the item locations in order to complete allocation processing. See Let Down Replenishment for processing information. • If the Let Down Replenishment (C36) system control value is set to *NONE, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: No stock in Pck.
7.	<p>If the system is able to allocate the pick slip quantity in the Item Warehouse, the system allocates the stock and continues with pick slip generation processing; see Performing Updates After Successful Allocation.</p>

Examples: Allocation Against Multiple Locations

- [Example: Allocate Against One Item Location](#)
- [Example: Allocate Against Multiple Item Locations](#)
- [Example: Include Non-Pickable Secondary Locations in Primary Primary Availability](#)
- [Example: Include Non-Pickable Bulk Locations in Primary Primary Availability](#)
- [Example: Include Non-Pickable Bulk and Secondary Locations in Primary Primary Availability](#)

Example: Allocate Against One Item Location

In this example:

- The *Check Location Quantities During Pick Generation (C54)* system control value is selected.
- The *Include Secondary Locations in Primary Primary Availability (F88)* system control value is unselected.
- The *Include Bulk Locations in Primary Primary Availability (F87)* system control value is unselected.

You generate a pick slip for item ABC for a quantity of 25.

Item ABC exists in the following item locations that are eligible for allocation.

Location	Location Type	On Hand Qty	Pending Transaction Qty	Printed Qty
A1	P (primary)	10	-2	0
A2	P (primary)	10	0	8
PRIMARY	P (primary)	25	0	20
B1	S (secondary)	10	0	0
B2	S (secondary)	25	50	0

The system calculates the available quantity for each item location.

- location A1 = 8 (10 on hand - 2 negative pending transaction = 8 available)
- location A2 = 2 (10 on hand - 8 printed = 2 available)
- location PRIMARY = 5 (25 on hand - 20 printed = 5 available)
- location B1 = 10
- location B2 = 25

Because item location B2 has enough available stock to fulfill the entire pick slip quantity of 25, the system allocates the entire pick slip quantity from location B2.

Example: Allocate Against Multiple Item Locations

In this example:

- The *Check Location Quantities During Pick Generation (C54)* system control value is selected.
- The *Include Secondary Locations in Primary Primary Availability (F88)* system control value is unselected.
- The *Include Bulk Locations in Primary Primary Availability (F87)* system control value is unselected.

You generate a pick slip for item ABC for a quantity of 50.

Item ABC exists in the following item locations that are eligible for allocation.

Location	Location Type	On Hand Qty	Pending Transaction Qty	Printed Qty
A1	P (primary)	10	-2	0

Location	Location Type	On Hand Qty	Pending Transaction Qty	Printed Qty
A2	P (primary)	10	0	8
PRIMARY	P (primary)	25	0	20
B1	S (secondary)	10	0	0
B2	S (secondary)	25	50	0

The system calculates the available quantity for each item location.

- location A1 = 8 (10 on hand - 2 negative pending transaction = 8 available)
- location A2 = 2 (10 on hand - 8 printed = 2 available)
- location PRIMARY = 5 (25 on hand - 20 printed = 5 available)
- location B1 = 10
- location B2 = 25

Because an item location does not exist that can fulfill the entire pick slip quantity of 50, the system allocates the pick slip quantity across pickable locations, starting with primary locations in alphanumeric order and then secondary locations in alphanumeric order. The system allocates stock in the following order:

- 8 units from location A1.
- 2 units from location A2.
- 5 units from location PRIMARY.
- 10 units from location B1.
- 25 units from location B2.

Example: Include Non-Pickable Secondary Locations in Primary Primary Availability

In this example:

- The Check Location Quantities During Pick Generation (C54) system control value is selected.
- The Include Secondary Locations in Primary Primary Availability (F88) system control value is selected.
- The Include Bulk Locations in Primary Primary Availability (F87) system control value is unselected.

You generate a pick slip for item ABC for a quantity of 50.

Item ABC exists in the following item locations that are eligible for allocation. Location PRIMARY is the item's primary primary location.

Location	Location Type	Pickable?	On Hand Qty	Pending Transaction Qty	Printed Qty
A1	P (primary)	Y	10	-2	
A2	P (primary)	Y	10	0	8
PRIMARY	P (primary)	Y	25	0	20

Location	Location Type	Pickable?	On Hand Qty	Pending Transaction Qty	Printed Qty
B1	S (secondary)	Y	10	0	0
B2	S (secondary)	Y	25	50	0
B3	S (secondary)	N	25	0	0

The system calculates the available quantity for each item location.

- location A1 = 8 (10 on hand - 2 negative pending transaction = 8 available)
- location A2 = 2 (10 on hand - 8 printed = 2 available)
- location PRIMARY = 5 (25 on hand - 20 printed = 5 available)
- location B1 = 10
- location B2 = 25
- location B3 = 25 (included in the available pick quantity for location PRIMARY)

Because an item location does not exist that can fulfill the entire pick slip quantity of 50, the system allocates the pick slip quantity across pickable locations, starting with primary locations in alphanumeric order and then secondary locations in alphanumeric order. The system allocates stock in the following order:

- 8 units from location A1.
- 2 units from location A2.
- 30 units from location PRIMARY (5 available + 25 from B3 = 30)
- 10 units from location B1

Note:

In order for the system to pick 30 units from location PRIMARY, you must transfer the 25 units in location B3 to location PRIMARY.

Example: Include Non-Pickable Bulk Locations in Primary Primary Availability

In this example:

- The Check Location Quantities During Pick Generation (C54) system control value is selected.
- The Include Secondary Locations in Primary Primary Availability (F88) system control value is unselected.
- The Include Bulk Locations in Primary Primary Availability (F87) system control value is selected.

You generate a pick slip for item ABC for a quantity of 50.

Item ABC exists in the following item locations that are eligible for allocation. Location PRIMARY is the item's primary primary location.

Location	Location Type	Pickable	On Hand Qty	Pending Transaction Qty	Printed Qty
A1	P (primary)	Y	10	-2	
A2	P (primary)	Y	10	0	8
PRIMARY	P (primary)	Y	25	0	20
B1	S (secondary)	Y	10	0	0
B2	S (secondary)	Y	25	50	0
C1	B (bulk)	N	100	0	0

The system calculates the available quantity for each item location.

- location A1 = 8 (10 on hand - 2 negative pending transaction = 8 available)
- location A2 = 2 (10 on hand - 8 printed = 2 available)
- location PRIMARY = 5 (25 on hand - 20 printed = 5 available)
- location B1 = 10
- location B2 = 25
- location C1 = 100 (included in the available pick quantity for location PRIMARY)

Because item location PRIMARY has enough available stock to fulfill the entire pick slip quantity of 50 (once 45 units are added to the PRIMARY location's availability), the system allocates the entire pick slip quantity from location PRIMARY.

Note:

In order for the system to pick 50 units from location PRIMARY, you must transfer the 45 units in location C1 to location PRIMARY.

Example: Include Non-Pickable Bulk and Secondary Locations in Primary Primary Availability

In this example:

- The Check Location Quantities During Pick Generation (C54) system control value is selected.
- The Include Secondary Locations in Primary Primary Availability (F88) system control value is selected.
- The Include Bulk Locations in Primary Primary Availability (F87) system control value is unselected.

You generate a pick slip for item ABC for a quantity of 75.

Item ABC exists in the following item locations that are eligible for allocation. Location PRIMARY is the item's primary primary location.

Location	Location Type	Pickable	On Hand Qty	Pending Transaction Qty	Printed Qty
A1	P (primary)	Y	10	-2	
A2	P (primary)	Y	10	0	8
PRIMARY	P (primary)	Y	25	0	20
B1	S (secondary)	Y	50	0	0
B2	S (secondary)	Y	50	50	0
B3	S (secondary)	N	25	0	0
C1	B (bulk)	N	25	0	0

The system calculates the available quantity for each item location.

- location A1 = 8 (10 on hand - 2 negative pending transaction = 8 available)
- location A2 = 2 (10 on hand - 8 printed = 2 available)
- location PRIMARY = 5 (25 on hand - 20 printed = 5 available)
- location B1 = 10
- location B2 = 25
- location C1 = 50 (included in the available pick quantity for location PRIMARY)
- location B3 = 25 (included in the available pick quantity for location PRIMARY)

Because an item location does not exist that can fulfill the entire pick slip quantity of 75, the system allocates the pick slip quantity across pickable locations, starting with primary locations in alphanumeric order and then secondary locations in alphanumeric order. The system allocates stock in the following order:

- 8 units from location A1.
- 2 units from location A2.
- 55 units from location PRIMARY (5 available + 25 from C1 + 25 from B3 = 55)
- 10 units from location B1.

 **Note:**

In order for the system to pick 65 units from location PRIMARY, you must transfer the 25 units from location C1 and the 25 units from location B3 to location PRIMARY.

Allocation Processing Against Primary Primary Location

When the Check Location Quantities During Pick Generation (C54) system control value is unselected, the system allocates the entire quantity printed (and reserved) on the pick slips from the item's primary primary location. Even if the primary primary location does not contain this quantity, the system determined that this quantity is available in the warehouse. You must perform replenishment immediately after running

pick slip generation to transfer stock from secondary and bulk locations to the primary primary location to satisfy the quantities printed on the pick slips.

The system does the following steps when the Check Location Quantities During Pick Generation (C54) system control value is unselected.

#	Step
1.	<p>The system verifies that a primary primary location is defined for the item.</p> <p>If a primary primary location is not defined for the item, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: No prime loc.</p>
2.	<p>The system determines if the item's primary primary location is in the warehouse defined on the Pick Control Header record.</p> <ul style="list-style-type: none"> If the item's primary primary location is not in the warehouse defined on the Pick Control Header record, the system does not print the item on the pick slip. NOTE: The system does not include this error on the Item Stock Allocation Error Report because the item is placed in a backorder status on the order. If the item's primary primary location is in the warehouse defined on the Pick Control Header record, the system continues with allocation processing.
3.	<p>The system verifies that the item's primary primary location is eligible for allocation. The item's primary primary location is not eligible for allocation if:</p> <ul style="list-style-type: none"> The <i>Allocation freeze</i> field for the Item Warehouse record is Y. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Itm Whs Rsv Frz. The <i>Freeze</i> field for the Location record is Y. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Loc frozen. The <i>Pickable location</i> field for the Location record is N or blank. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Loc unpickable. The <i>Freeze flag</i> field for the Item Location record is Y. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Itm Loc Rsv Frz. The <i>Pending transaction quantity</i> field for the Item Location record is less than 0. In this situation, the system does not print the item on the pick slip and instead includes the item on the Item Stock Allocation Error Report: Neg Pend Qty. <p>Verification for secondary and bulk locations: If the system needs to pull inventory from a non-pickable secondary or bulk location in order to replenish the primary primary location, the system:</p> <ul style="list-style-type: none"> Does not verify that the <i>Freeze flag</i> for the location is N or blank. Does not verify that the <i>Freeze flag</i> for the item location is N or blank. Does not verify that the <i>Pending transaction quantity</i> for the item location is equal or greater than 0.
4.	<p>If no item stock allocation errors exist, the system allocates the quantity required for the pick slip from the item's primary primary location.</p> <p>NOTE: If the system used inventory from a non-pickable secondary or bulk location in order to fulfill the pick slip, you must perform replenishment immediately after running pick slip generation to transfer stock from secondary and bulk locations to the primary location to satisfy the quantity printed on the pick slip.</p>
5.	<p>The system does several updates after allocation; see Performing Updates After Successful Allocation.</p>

Examples: Allocation Against Primary Primary Location

- [Example: Primary Primary Item Location with Enough Inventory](#)
- [Example: Item Warehouse with Enough Inventory](#)

Example: Primary Primary Item Location with Enough Inventory

In this example, the primary primary location has enough on hand inventory to fulfill the pick slip.

Item ABC has the following locations in warehouse 2.

Location	On Hand	Pending
A1 (pickable primary primary location)	10	0
C1 (non-pickable bulk location)	10	0

You place an order for item ABC for a quantity of 8.

When you run pick slip generation, the system generates a pick slip for item ABC, pulling the 8 units needed for the pick slip from warehouse 2, location A1.

The system decreases the on hand quantity for the item locations by the quantity used by the pick slip.

Location	On Hand	Pending
A1 (pickable primary primary location)	2	0
C1 (non-pickable bulk location)	10	0

Example: Item Warehouse with Enough Inventory

In this example, the primary primary location does not have enough on hand quantity to fulfill the pick slip, but the item warehouse does have enough on hand inventory.

Item ABC has the following locations in warehouse 2.

Location	On Hand	Pending
A1 (pickable primary primary location)	2	0
C1 (non-pickable bulk location)	10	0

You place an order for item ABC for a quantity of 8.

When you run pick slip generation, the system generates a pick slip for item ABC, pulling the 8 units needed for the pick slip from warehouse 2, location A1. You will need to perform replenishment immediately after running pick slip generation to transfer stock from bulk locations to the primary locations to satisfy the quantities printed on the pick slips.

The system decreases the on hand quantity for the item locations by the quantity used by the pick slip.

Location	On Hand	Pending
A1 (pickable primary primary location)	4 (assuming the 10 units in bulk were moved to primary primary during replenishment processing)	0
C1 (non-pickable bulk location)	0	0

Confirming and Billing the Pick Slip Immediately

During allocation processing, if the *Generation type* for the Pick Control Header record is I (Bill Immediately), the system confirms and bills the pick slip immediately.

Which items are billed immediately? The system confirms and bills a pick slip immediately for the following types of items:

- virtual stored value card item; see [Stored Value Card Purchase and Activation](#).
- membership item; see [Membership Overview](#).
- subscription item; see [Working with Item Subscriptions \(WISB\)](#).

The system does the following steps during immediate billing.

#	Step
1.	The system updates the record in the Pick Control Header table. <ul style="list-style-type: none"> • Pick status = C (confirmed) • Date confirmed = The date the record was created. • Time confirmed = The time the record was created. • Include on S/J (sales journal) = Y
2.	The system creates a record in the Billing Header Data Queue table.
3.	The system creates a record in the Billing Detail Data Queue table for each record in the Pick Control Detail table that needs to bill immediately.
4.	The system creates a record in the Billing Loc Data Queue table for each record in the Pick Location table that needs to bill immediately.
5.	If the item on the pick slip is a virtual stored value card item, the system creates a record in the Billing SVC Data Queue table.
6.	Once the pick slip has been processed by billing, the system updates the <i>Pick status</i> field for the record in the Pick Control Header table to A (Submitted to Async).

Let Down Replenishment

Overview: Let down replenishment is the automatic restocking of primary locations initiated by the system when you generate pick slips. The system can recommend, or recommend and immediately process, a replenishment transfer, to insure that inventory quantities in primary locations will be adequate for the pick slips you have generated. The Let Down Replenishment (C36) system control value determines whether the system initiates replenishment when you generate pick slips, and whether the system completes the replenishment transfer, or recommends but does not complete the transfer. See [Let Down Replenishment Processing](#).

Note:

Let-down replenishment does not occur through streamlined pick slip generation if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Let Down Replenishment Setup

Before you can process a Let Down Replenishment, you need to complete the necessary setup. Setup includes:

- [System Control Values Related to Let Down Replenishment](#)
- [Location Table](#)
- [Item Location Table](#)
- [Item Warehouse Table](#)

System Control Values Related to Let Down Replenishment

The following system control values relate to Let Down Replenishment.

System Control Value	Description
Let Down Replenishment (C36)	<p>Defines whether the system performs Let Down Replenishment when you generate pick slips, and whether the replenishments will be immediately processed based on the system-recommended inventory transfers, or will be recommended but not processed.</p> <ul style="list-style-type: none"> • NONE (or blank) = The system does not perform Let Down Replenishment. • REPORT = The system creates the Replenish Control record and its details and generates the Replenishment Detail by From Location report; but, item transfers are not processed immediately. • RPT/EXEC = The system creates the Replenish Control record and its details and generates the Replenishment Detail Report by Item; also, the RPLN_UPD job processes the item transfers automatically.
Check Location Quantities During Pick Generation (C54)	<p>This field must be selected in order to use Let Down Replenishment (C36). See Allocation Processing Against Multiple Locations.</p>
Replenish from Location Type (A66)	<p>Determines the location types from which inventory will be pulled during Let Down Replenishment.</p> <ul style="list-style-type: none"> • Sec/Bulk = the system replenishes from both secondary and bulk locations. When both location types are used, the system will replenish from bulk locations first in earliest placement date/item location creation sequence, then from secondary locations in earliest placement date/item location creation sequence. • Bulk = the system replenishes from bulk locations only. <i>This option is not implemented.</i> • Secondary = the system replenishes from secondary locations only. <i>This option is not implemented.</i>

System Control Value	Description
Include Print Quantity in Available Calculations (A65)	<p>This field must be selected in order to use Let Down Replenishment (C36).</p> <p>When selected the system includes the number of units needed to fulfill printed pick tickets in the replenishment calculation. By using this option, the system reduces the on-hand quantity in the primary location by the number of units that are to be picked before determining the quantity to replenish. The system also reduces the quantity on-hand in the location that will be used to replenish the primary location by this amount, before determining the quantity available to move.</p>
Consolidated Replenishment Report Program Name (G49)	<p>Defines the print program used to print consolidated replenishment reports.</p> <p>You can use these reports to consolidate replenishment information from multiple let down replenishment transactions processed on the same day.</p> <p>To print consolidated replenishment reports, the following system control values must be set to these values:</p> <ul style="list-style-type: none"> • Replenish from Location Type (A66) = SEC/BULK, BULK, or SECONDARY. • Check Location Quantities During Pick Generation (C54) = Selected • Let Down Replenishment (C36) = REPORT <p>Leave this field blank if you do not want to print consolidated reports.</p>

Location Table

Type: Identifies which locations can be replenished, and which locations to use to replenish. Valid location types are primary, secondary, bulk, and temporary.

- Primary locations are the only locations that will be replenished.
- Non-pickable secondary and bulk locations are the only location types that can be used to replenish the primary location.

Freeze: The freeze status of the location indicates whether the location is on hold. If the primary location is frozen, it cannot be replenished. If the secondary or bulk location is frozen, inventory in the location cannot be used to replenish a primary location.

Item Location Table

The following fields must be completed for the replenishment calculation to be performed.

Min qty: The minimum number of units of the item/SKU that should be kept in the item location.

Max qty: the maximum number of units of the item/SKU that should be kept in the item location.

Reservation freeze: Indicates whether the item location is frozen. If the item in the primary location is frozen, it cannot be replenished. If the item in the secondary or bulk location is frozen, inventory in the location cannot be used to replenish a primary location. Also, Pick Slip Generation does not print pick slips for an item/location that is frozen.

Placement date: The system uses the placement date to determine the order in which bulk and secondary locations are used to stock the primary locations. The system replenishes from bulk locations first in earliest placement date/item location creation sequence, then from secondary locations in earliest placement date/item location creation sequence.

Item Warehouse Table

Reservation freeze: Indicates whether the item warehouse is frozen. If the item is frozen at the warehouse level, it is not evaluated for replenishment or pick slip allocation at any location.

Let Down Replenishment Processing

The system uses the following steps during Let Down Replenishment.

1. Determines if a pickable location for the item on the order has enough inventory to fill the pick slip.

- If a pickable location for the item on the order has enough inventory to fill the pick slip, the system does not call Let Down Replenishment, and instead, allocates stock from the pickable location and generates a pick slip for the order. See [Pick Slip Allocation Processing](#).
- If a pickable location for the item on the order does not have enough inventory to fill the pick slip, and [Let Down Replenishment Setup](#) has been completed, the system calls Let Down Replenishment.

2. Calculates the replenishment quantity.

The system moves enough stock to the pickable primary location to cover the open pick slips.

Which location to replenish? If a primary primary location is defined for the item, the system replenishes this location; otherwise, the system replenishes the first primary location defined for the item in alphabetical sequence.

The system uses the following calculations to determine the replenishment quantity required for Let Down Replenishment:

Adjusted on hand quantity in primary location calculation:

On-hand quantity in primary location + Positive pending transfer quantity in primary location - Negative pending transfer quantity in primary location - Printed quantity in primary location (if included) = Adjusted on-hand quantity in primary location

- The amount of any pending transfers to the location (a positive pending transfer quantity) is added to the on-hand quantity so that the location is not over-replenished.
- The amount of any pending transfers from the location (a negative pending transfer quantity) is subtracted from the on-hand quantity so the location is not under-replenished.
- The Include Print Quantity in Available Calculations (A65) system control value determines whether the quantity on printed pick slips is included in the calculation so that the location will also be replenished for the items being shipped. This system control value should be selected when using Let Down Replenishment (C36).

Replenishment quantity calculation:

Maximum quantity in primary location - Adjusted on-hand quantity in primary location + Pick slip quantity = Replenishment quantity.

3. Determines where to get the inventory.

If the Replenish from Location Type (A66) system control value is set to SEC/BULK, the system gets inventory first from eligible bulk locations in earliest placement date/ascending item location sequence. If the bulk locations cannot fulfill the entire quantity needed for replenishment, the system then gets inventory from secondary locations in earliest placement date/ascending item location sequence.

The freeze status of the location is also evaluated. If the *Reservation freeze* flag in the Item Location table is selected, the location will not be used to replenish the primary location.

4. Calculates the quantity to move from each bulk and/or secondary location.

If the location is eligible to be used to replenish the pickable primary location, the following calculation is done to determine the available quantity to move from the secondary or bulk location:

Quantity to move from secondary or bulk location calculation:

On hand quantity in secondary or bulk location - Printed quantity in secondary or bulk location (if included) - Negative pending transfer quantity in secondary or bulk location = Quantity to Move from secondary or bulk location

- Negative pending transfer quantities indicate that inventory in the location is in the process of being transferred from the location, but the transfer is not yet reflected in the on-hand quantity. Because this inventory has already been marked for transfer, it is subtracted from the on-hand quantity so that it will not be included in multiple transfers.
- Positive pending transfer quantities indicate that inventory is in the process of being transferred to the location, but the transfer is not yet reflected in the on-hand quantity. Because the inventory may or may not be in the location, it is not included in the on-hand quantity.
- The Include Print Quantity in Available Calculations (A65) system control value determines whether the quantity on printed pick slips is included in the calculation so that the location will also be replenished for the items being shipped. This system control value should be selected to use Let Down Replenishment (C36).

All eligible locations are evaluated in earliest placement date/item location creation sequence until the required quantity to replenish is reached, or until all locations have been evaluated.

What if the quantity available to move does not cover the pick slip quantity? If the quantity that is available to move to the primary location does not cover the pick slip quantity, the system will not perform Let Down Replenishment and instead, print the item on the [Item Stock Allocation Error Report](#).

5. Creates and confirms the Replenishment Control request.

As the system evaluates the primary locations to replenish and the quantities that will be moved from the bulk and/or secondary locations to replenish them, a record for each pending transfer transaction is added to the Replenishment Control request. When the request is generated:

- The *Pending* field in the Item Location table for the primary location is *increased* by the total quantity to transfer.

- The *Pending* field in the Item Location table for each bulk and secondary location that will be used to replenish the location is *decreased* by the quantity to transfer from that location.

6. Looks at the Let Down Replenishment (C36) system control value to determine how to proceed.

- If the Let Down Replenishment (C36) system control value is set to REPORT, the system generates the pick slips and the Replenishment Detail by From Location Report but does not process the replenishment.
- If the Let Down Replenishment (C36) system control value is set to RPT/EXEC, the system continues to the next step.

7. Submits the RPLN_UPD job.

The RPLN_UPD job:

- Increases the on-hand quantity in the primary location by the transaction amount.
- Decreases the pending transfer quantity in the primary location by the transaction amount.
- Decreases the on-hand quantity in the location from which the inventory was transferred by the transaction amount.
- Decreases the pending transfer quantity in the location from which the inventory was transferred by the transfer amount.
- Updates the Inventory Transaction History table with the transaction activity.
- Deletes the processed replenishment control request from the system.

8. Generates the pick slips.

The system also generates the Replenishment Detail Report by Item. You can use this report as a worksheet to move the recommended replenishment quantity to the primary location before you confirm the pick slip.

Let Down Replenishment Example

In this example:

- The Let Down Replenishment (C36) system control value is set to RPT/EXEC or REPORT.
- The Replenish from Location Type (A66) system control value is set to SEC/BULK.
- The Include Print Quantity in Available Calculations (A65) system control value is selected.

The following item locations exist for item A123 in warehouse 5.

Location	Type	Max	Min	On Hand	Printed	Pending	Date
B1	Bulk	120	12	120	0	-108	4/06
B2	Bulk	120	12	24	0	0	4/05
S1	Secondary	60	12	60	0	0	4/04
S2	Secondary	60	12	60	0	0	4/03
M1	Primary	60	12	6	2	2	4/02

A customer places an order for item A123 for a quantity of 50.

When you generate a pick slip for the order, the system allocates the quantity of 50 against location M1 (the item's primary location) and does the following steps:

1. Calculates the *Adjusted on hand quantity* for the primary item location:

On hand quantity + Positive pending quantity - Negative pending quantity - Printed quantity = Adjusted on hand quantity

Location	On Hand Qty	Pending Qty	Printed Qty	Adjusted On Hand Qty
M1	6	2	2	6

2. Calculates the *Replenishment quantity* for the primary item location:

Pick slip quantity - Adjusted on hand quantity = Replenishment quantity

Location	Pick Slip Qty	Adjusted On Hand Qty	Replenishment Qty
M1	50	6	44

3. Calculates the available quantity to move from bulk and secondary locations:

On hand quantity - Printed quantity - Negative pending transfer quantity = Quantity available to move

Location	On Hand Qty	Printed Qty	Pending Qty	Qty Available to Move
B1	120	0	-108	12
B2	24	0	0	24
S1	60	0	0	60
S2	60	0	0	60
Total quantity eligible to replenish primary locations:				156

4. Decides the sequence in which to take stock from the eligible locations. The system first looks at bulk locations in *Earliest placement date/Item location creation* sequence. If the bulk locations cannot fulfill the replenishment quantity, the system then looks at secondary locations in *Earliest placement date/Item location creation* sequence. In this example, the sequence is:

- B2: Bulk location, Placement date 4/05
- B1: Bulk location, Placement date 4/06
- S2: Secondary location, Placement date 4/03
- S1: Secondary location, Placement date 4/04

5. Creates the Replenish Control record, indicating the recommended replenishment quantity to move from bulk and secondary locations to the primary location.

From Location	To Location	Qty to Move
B1	M1	12
B2	M1	24
S2	M1	8

6. Updates the *Pending quantity* for the item locations, based on the recommended replenishment quantities. Also updates the *Printed quantity* for the primary location:

Location	Type	Max	Min	On Hand	Printed	Pending
B1	Bulk	120	12	120	0	-120
B2	Bulk	120	12	24	0	-24
S1	Secondary	60	12	60	0	0
S2	Secondary	60	12	60	0	-8
M1	Primary	60	12	6	52	46

7. If the Let Down Replenishment (C36) system control value is set to RPT/EXEC, the system processes the Let Down Replenishment and updates the *On hand quantity* and *Pending quantity* for the item locations:

Location	Type	Max	Min	On Hand	Printed	Pending
B1	Bulk	120	12	108	0	-108
S1	Secondary	60	12	60	0	0
S2	Secondary	60	12	52	0	0
M1	Primary	60	12	50	52	2

Note:

If the Let Down Replenishment (C36) system control value is set to REPORT, the system generates the pick slips and the Replenishment Detail by From Location Report but does not process the replenishment.

8. When you confirm the pick slip, the system updates the *On hand quantity* and *Printed quantity* for the primary location:

Location	Type	Max	Min	On Hand	Printed	Pending
B1	Bulk	120	12	108	0	-108
S1	Secondary	60	12	60	0	0
S2	Secondary	60	12	52	0	0
M1	Primary	60	12	0	2	2

Sorted Pick Sort GH Table

After [Pick Slip Allocation Processing](#) and [Let Down Replenishment](#), the system sorts records in the Pick Sort GH table in the following order in order to:

- Sort pick slips into separate PDF documents correctly. See [Sorting Pick Slips into Separate PDF Documents](#) and [Pick Slip Sort within a Pick Slip PDF Document](#).
- Sort pick slips into cart batches correctly and assign a cart bin number to each pick slip in the cart batch correctly. See [Sorting Pick Slips into Separate Cart Batches](#) and [Pick Slip Sort Within a Cart Batch](#).

Note:

Streamlined pick slip generation does not use the Pick Sort GH table if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Sorted Pick Sort GH table:

1. Company
2. Printed
3. Warehouse
4. Billing Batch #
5. Ship Via Priority in descending order
6. Special handling status in descending order
7. Gift Pick in descending order
8. Foreign Country in descending order
9. Single Line in descending order
10. Zone 1
11. Zone 2
12. Zone 3
13. Zone 4
14. Zone 5
15. Zone 6
16. Picking Sequence Array
17. Location
18. Item
19. SKU

Note:

The system sorts records in the Pick Sort GH table in this order regardless of the setting of the [Use Cart/Bin Picking? \(B38\)](#) system control value.

Sorting Pick Slips into Separate PDF Documents

The system generates each pick slip form as a PDF (portable document format) file, typically opened through the Adobe Reader or within a separate browser window. Each PDF file has one or more individual pick slip forms, based on the [Reasons to Sort Pick Slips into Separate PDF Documents](#).

Working with the pick slip form: Once the system finishes processing one pick slip PDF document, you can open and print the pick slips in the document using the [Forms](#)

[Management \(My Forms\)](#); you do not have to wait until all of the PDF documents for the pick slip generation run have generated.

Pick slip form naming convention: The system uses the print program, the user ID of the person who generated pick slips, the job date and time stamp, and the document sort number as the name of the pick slip PDF document. For example, a file named `PICKG.KBROWN.20090804.103001456_002.PDF` indicates this is a pick slip PDF document generated by user KBROWN on August 4, 2009 and the document is the second document for a specific pick sort, such as pick slips for warehouse 1 and ship via priority 5. See [Form Naming Conventions](#) for more information.

Pick sort program name: The setting of the Pick Sort Program Name (C65) system control value defines how the system sorts pick slips into separate PDF documents. The base pick sort program FLR2017 is described under [Reasons to Sort Pick Slips into Separate PDF Documents](#). The sorting order of your pick slips may vary depending on the pick sort program name you define in this system control value.

Note:

Streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Reasons to Sort Pick Slips into Separate PDF Documents

The system creates a new pick slip PDF document for the following reasons. The system uses the [Sorted Pick Sort GH Table](#) to decide how to sort the pick slips into separate pick slip PDF documents.

Once the system decides how many pick slip PDF documents to generate, the system decides how to sort the pick slips within the PDF document; see [Pick Slip Sort within a Pick Slip PDF Document](#).

Reason to Sort a Pick Slip into a Separate PDF Document	Description
Warehouse	The system creates a separate pick slip PDF document for each warehouse. Example: The system creates a separate pick slip for: <ul style="list-style-type: none"> • pick slips for warehouse 1. • pick slips for warehouse 2.

Reason to Sort a Pick Slip into a Separate PDF Document	Description
Special handling pick slip	<p>If the Split Special Handling Picks (L44) system control value is selected, the system creates a separate pick slip PDF document for special handling items. Also, when pre-generated picks are created, the system creates a separate pre-generated pick for the items on the order that contain a special handling code to further ensure that items that require special handling are not included on the same pick slip as items that do not require special handling.</p> <p>Example: The system creates a separate pick slip for:</p> <ul style="list-style-type: none"> • picks that contain items that require special handling. • picks that do not contain any items that require special handling. <p>NOTE: The <i>Special Handling</i> field on the Streamlined Pick Slip Generation Screen defines whether pick slip generation generates picks for items that require special handling:</p> <ul style="list-style-type: none"> • Include = Generate pick slips, regardless of the special handling flag for an item. • Only = Perform pick slip generation only for picks that contain an item that requires special handling. • Exclude = Perform pick slip generation only for picks that do not contain an item that requires special handling.
Ship via priority	<p>Within each warehouse, the system creates a separate pick slip PDF document for each ship via priority, in descending order.</p> <p>Example: The system creates a separate pick slip PDF document for:</p> <ul style="list-style-type: none"> • warehouse 1, ship via priority 2 • warehouse 1, ship via priority 1 • warehouse 2, ship via priority 5 <p>NOTE: If the system creates a separate pick slip PDF document for special handling items, the system does not create a separate pick slip PDF document based on ship via priority.</p> <p>Example: The system creates a separate pick slip PDF document for:</p> <ul style="list-style-type: none"> • pick slips that contain special handling items, any ship via priority. • pick slips that do not contain special handling items, warehouse 1, ship via priority 2. • pick slips that do not contain special handling items, warehouse 1, ship via priority 1. • pick slips that do not contain special handling items, warehouse 2, ship via priority 5.

Reason to Sort a Pick Slip into a Separate PDF Document	Description
Maximum Number of Pick Slips Per Spool File Setting	The PICKS_IN_SPOOL_FILE setting in Working with Admin Properties (CPRP) indicates the maximum number of pick slips in a single PDF document. If the number of pick slips in a PDF document reaches the number defined in the PICKS_IN_SPOOL_FILE setting, the system creates a new PDF document. See Specify the Maximum Number of Pick Slips Per Spool File for more information.

Example: Sorting Pick Slips into Separate Pick Slip PDF Documents

The system generates the following pick slips. In this example:

- The Split Special Handling Picks (L44) system control value is unselected.
- The PICKS_IN_SPOOL_FILE setting in [Working with Customer Properties \(PROP\)](#) is set to 250.

Pick Slip Count	Warehouse	Ship Via Priority
50	1	1
75	2	1
300	1	5
225	2	5
25	2	9
510	1	9

Based on the [Reasons to Sort Pick Slips into Separate PDF Documents](#), the system sorts the pick slips into 9 separate pick slip PDF documents:

- 50 pick slips for warehouse 1, ship via priority 1
- 250 pick slips for warehouse 1, ship via priority 5
- 50 pick slips for warehouse 1, ship via priority 5
- 250 pick slips for warehouse 1, ship via priority 9
- 250 pick slips for warehouse 1, ship via priority 9
- 10 pick slips for warehouse 1, ship via priority 9
- 75 pick slips for warehouse 2, ship via priority 1
- 225 pick slips for warehouse 2, ship via priority 5
- 25 pick slips for warehouse 2, ship via priority 9

Notice that the system creates multiple PDF documents for pick slips in warehouse 1, ship via priority 5 and for pick slips in warehouse 1, ship via priority 9, based on 250 in the PICKS_IN_SPOOL_FILE setting.

Voiding and reprinting pick slips:

- If you select the Reprint option for a pick slip, the system creates a separate pick slip PDF document based on warehouse, ship via priority, the Split Special Handling Picks (L44) system control value, and the PICKS_IN_SPOOL_FILE setting in [Working with Customer Properties \(PROP\)](#).
- If you select the Reprint All option, the system does not create a separate pick slip PDF document based on warehouse, ship via priority, or the Split Special Handling Picks (L44) system control value. The system will create a separate pick slip PDF document based only on the PICKS_IN_SPOOL_FILE setting in [Working with Customer Properties \(PROP\)](#).

See [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#) for more information on voiding and reprinting pick slips.

Pick Slip Sort within a Pick Slip PDF Document

The system uses the [Sorted Pick Sort GH Table](#) to decide how to sort the pick slips within a pick slip PDF document.

The system prints pick slips that contain one pick detail line before printing pick slips that contain multiple detail lines. Also, the following system control values determine whether the system sorts gift orders and foreign orders before non-gift orders and domestic orders.

Sort picks by gift flag?

- If the [Sort Pick Slips by Gift Flag \(D53\)](#) system control value is selected, the system prints pick slips for gift orders before pick slips for non-gift orders. The system considers the order a gift order if the *Gift* flag on the Order Ship To record is Y.
- If the [Sort Pick Slips by Gift Flag \(D53\)](#) system control value is unselected, the system does not include the gift order setting in the pick slip sort.

Sort picks by shipping destination?

- If the [Sort Picks by Foreign/Domestic Flag \(D54\)](#) system control value is selected, the system prints pick slips for foreign shipping addresses before pick slips for domestic shipping addresses. The system considers the address a foreign address if the country on the shipping address does not match the [Default Country for Customer Address \(B17\)](#).
- If the [Sort Picks by Foreign/Domestic Flag \(D54\)](#) system control value is unselected, the system does not consider the shipping destination in the pick slip sort.

Note:

Streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Non-inventory items: The system prints a non-inventory item ((the *Non-inventory* field for the item is selected and the *Affect inventory* field for the Pick Control Detail record is set to N) that is NOT identified as a virtual stored value card or membership item on a pick slip when it is eligible based on the pick slip generation criteria in any of the following situations:

- It is the only item on the order.
- The order includes inventory items that are printing on the same pick slip.
- The order includes inventory items that are printing on another pick slip in the same pick slip generation run.

- the order includes only other non-inventory items (no inventory items), but at least one of these items is a virtual stored value card or membership item.
- The order includes inventory items, but they have already been picked, cancelled, or closed in some other way.

If you specify a location for a non-inventory item, this location prints on the pick slip; but, the system does not include this location in the warehouse zones or picking sequence array used for the pick slip sort within a pick slip PDF document.

For more information: See:

- [Simplified Pick Slip Sort](#) to review how the system sorts pick slips within a pick document when the [Sort Pick Slips by Gift Flag \(D53\)](#) and [Sort Picks by Foreign/Domestic Flag \(D54\)](#) system control values are unselected.
- [Gift Flag Pick Slip Sort](#) to review how the system sorts pick slips within a pick document when the [Sort Pick Slips by Gift Flag \(D53\)](#) system control value is selected and the [Sort Picks by Foreign/Domestic Flag \(D54\)](#) system control value is unselected.
- [Shipping Destination Pick Slip Sort](#) to review how the system sorts pick slips within a pick document when the [Sort Pick Slips by Gift Flag \(D53\)](#) system control value is unselected and the [Sort Picks by Foreign/Domestic Flag \(D54\)](#) system control value is selected.
- [Gift Flag and Shipping Destination Pick Slip Sort](#) to review how the system sorts pick slips within a pick document when the [Sort Pick Slips by Gift Flag \(D53\)](#) and [Sort Picks by Foreign/Domestic Flag \(D54\)](#) system control values are selected.

Simplified Pick Slip Sort

If the [Sort Pick Slips by Gift Flag \(D53\)](#) and [Sort Picks by Foreign/Domestic Flag \(D54\)](#) system control values are unselected, the system sorts the pick slips within a pick document in the following order.

1. Single line pick slips.
2. Multi line pick slips.

If more than one pick slip meets a sort level, the system sorts the pick slips:

1. Alphabetically by the warehouse zones defined in the *Zone 1*, *Zone 2*, *Zone 3*, *Zone 4*, *Zone 5* and *Zone 6* fields in the Pick Sort GH table.
2. Alphabetically by picking sequence array. See [Populating the Picking Sequence Array Field in the Pick Sort GH table](#) for more information on how the system updates the *Picking sequence array* field in the Pick Control Header Extended table and Pick Sort GH table during pick slip allocation.

Single line only pick slip example: The system generates the following pick slips.

Pick Slip	Pick Line	Warehouse Zone	Picking Sequence Array
1	1	P	000007
2	1	M	000010
3	1	A	000012
4	1	P	000008
5	1	M	000009

Pick Slip	Pick Line	Warehouse Zone	Picking Sequence Array
6	1	A	0000011

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Warehouse Zone	Picking Sequence Array
6	A	0000011
3	A	0000012
5	M	0000009
2	M	0000010
1	P	0000007
4	P	0000008

Multi line only pick slip example: The system generates the following pick slips.

Pick Slip	Pick Line	Warehouse Zones	Picking Sequence Array
1	1	A	00000110000012
	2		
2	1	A	00000100000012
	2	M	
3	1	A	00000090000012
	2	M	
4	1	A	00000100000011
	2	M	
5	1	M	00000090000011
	2	A	
6	1	M	00000090000010
	2		

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Warehouse Zones Alphabetically	Picking Sequence Array
1	A	00000110000012
5	AM	00000090000011
3	AM	00000090000012
4	AM	00000100000011
2	AM	00000100000012
6	M	00000090000010

Single and multi line pick slip example: The system generates the following pick slips.

Pick Slip	Pick Line	Warehouse Zones	Picking Sequence Array
1	1	A	00000110000012
	2		
2	1	A	00000100000012
	2	M	
3	1	A	0000012
4	1	A	00000100000011
	2	M	
5	1	M	0000009
6	1	M	00000090000010
	2	M	

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Single Line?	Warehouse Zones Alphabetically	Picking Sequence Array
3	Y	A	0000012
5	Y	M	0000009
1	N	A	00000110000012
4	N	AM	00000100000011
2	N	AM	00000100000012
6	N	M	00000090000010

 **Note:**

Streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Gift Flag Pick Slip Sort

If the Sort Pick Slips by Gift Flag (D53) system control value is selected and the Sort Picks by Foreign/Domestic Flag (D54) system control value is unselected, the system sorts the pick slips within a pick document in the following order.

1. Single line pick slips for gift orders.
2. Multi line pick slips for gift orders.
3. Single line pick slips for non-gift orders.
4. Multi line pick slips for non-gift orders.

If more than one pick slip meets a sort level, the system sorts the pick slips:

1. Alphabetically by the warehouse zones defined in the *Zone 1*, *Zone 2*, *Zone 3*, *Zone 4*, *Zone 5* and *Zone 6* fields in the Pick Sort GH table.

- Alphabetically by picking sequence array. See [Populating the Picking Sequence Array Field in the Pick Sort GH table](#) for more information on how the system updates the *Picking sequence array* field in the Pick Control Header Extended table and Pick Sort GH table during pick slip allocation.

Single line gift flag example: The system generates the following pick slips.

Pick Slip	Gift?	Pick Line	Warehouse Zone	Picking Sequence Array
1	Y	1	P	0000007
2	N	1	M	0000010
3	Y	1	A	0000012
4	Y	1	P	0000008
5	N	1	M	0000009
6	N	1	A	0000011

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Gift?	Warehouse Zone	Picking Sequence Array
3	Y	A	0000012
1	Y	P	0000007
4	Y	P	0000008
6	N	A	0000011
5	N	M	0000009
2	N	M	0000010

Multi line gift flag example: The system generates the following pick slips.

Pick Slip	Gift?	Pick Line	Warehouse Zones	Picking Sequence Array
1	N	1	A	00000110000012
		2		
2	N	1	A	00000100000012
		2	M	
3	N	1	A	00000090000012
		2	M	
4	Y	1	A	00000100000011
		2	M	
5	N	1	M	00000090000011
		2	A	
6	Y	1	M	00000090000010
		2		

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Gift?	Warehouse Zones Alphabetically	Picking Sequence Array
4	Y	AM	00000100000011
6	Y	M	00000090000010
1	N	A	00000110000012
5	N	AM	00000090000011
3	N	AM	00000090000012
2	N	AM	00000100000012

Single and multi line gift flag example: The system generates the following pick slips.

Pick Slip	Gift?	Pick Line	Warehouse Zones	Picking Sequence Array
1	N	1	A	00000110000012
		2		
2	N	1	A	00000100000012
		2	M	
3	N	1	A	0000012
4	N	1	A	00000100000011
		2	M	
5	Y	1	M	0000009
6	Y	1	M	00000090000010
		2	M	

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Gift?	Single Line?	Warehouse Zones Alphabetically	Picking Sequence Array
5	Y	Y	M	0000009
6	Y	N	M	00000090000010
3	N	Y	A	0000012
1	N	N	A	00000110000012
4	N	N	AM	00000100000011
2	N	N	AM	00000100000012

 **Note:**

Streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Shipping Destination Pick Slip Sort

If the Sort Pick Slips by Gift Flag (D53) system control value is unselected and the Sort Picks by Foreign/Domestic Flag (D54) system control value is selected, the system sorts the pick slips within a pick document in the following order.

1. Single line pick slips with a foreign shipping address.
2. Multi line pick slips with a foreign shipping address.
3. Single line pick slips with a domestic shipping address.
4. Multi line pick slips with a domestic shipping address.

If more than one pick slip meets a sort level, the system sorts the pick slips:

1. Alphabetically by the warehouse zones defined in the *Zone 1, Zone 2, Zone 3, Zone 4, Zone 5* and *Zone 6* fields in the Pick Sort GH table.
2. Alphabetically by picking sequence array. See [Populating the Picking Sequence Array Field in the Pick Sort GH table](#) for more information on how the system updates the *Picking sequence array* field in the Pick Control Header Extended table and Pick Sort GH table during pick slip allocation.

Single line foreign ship example: The system generates the following pick slips.

Pick Slip	Foreign?	Pick Line	Warehouse Zone	Picking Sequence Array
1	Y	1	P	0000007
2	N	1	M	0000010
3	Y	1	A	0000012
4	Y	1	P	0000008
5	N	1	M	0000009
6	N	1	A	0000011

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Foreign?	Warehouse Zone	Picking Sequence Array
3	Y	A	0000012
1	Y	P	0000007
4	Y	P	0000008
6	N	A	0000011
5	N	M	0000009
2	N	M	0000010

Multi line foreign ship example: The system generates the following pick slips.

Pick Slip	Foreign?	Pick Line	Warehouse Zones	Picking Sequence Array
1	N	1 2	A	00000110000012

Pick Slip	Foreign?	Pick Line	Warehouse Zones	Picking Sequence Array
2	N	1	A	00000100000012
		2	M	
3	N	1	A	00000090000012
		2	M	
4	Y	1	A	00000100000011
		2	M	
5	N	1	M	00000090000011
		2	A	
6	Y	1	M	00000090000010
		2		

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Foreign?	Warehouse Zones Alphabetically	Picking Sequence Array
4	Y	AM	00000100000011
6	Y	M	00000090000010
1	N	A	00000110000012
5	N	AM	00000090000011
3	N	AM	00000090000012
2	N	AM	00000100000012

Single and multi line foreign ship example: The system generates the following pick slips.

Pick Slip	Foreign?	Pick Line	Warehouse Zones	Picking Sequence Array
1	N	1	A	00000110000012
		2		
2	N	1	A	00000100000012
		2	M	
3	N	1	A	0000012
4	N	1	A	00000100000011
		2	M	
5	Y	1	M	0000009
6	Y	1	M	00000090000010
		2	M	

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Single Line?	Foreign?	Warehouse Zones Alphabetically	Picking Sequence Array
5	Y	Y	M	0000009
6	N	Y	M	00000090000010
3	Y	N	A	0000012
1	N	N	A	00000110000012
4	N	N	AM	00000100000011
2	N	N	AM	00000100000012

Note:

Streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Gift Flag and Shipping Destination Pick Slip Sort

If the Sort Pick Slips by Gift Flag (D53) and Sort Picks by Foreign/Domestic Flag (D54) system control values are selected, the system sorts the pick slips within a pick document in the following order.

1. Single line pick slips for gift orders with a foreign shipping address.
2. Multi line pick slips for gift orders with a foreign shipping address.
3. Single line pick slips for gift orders with a domestic shipping address.
4. Multi line pick slips for gift orders with a domestic shipping address.
5. Single line pick slips for non-gift orders with a foreign shipping address.
6. Multi line pick slips for non-gift orders with a foreign shipping address.
7. Single line pick slips for non-gift orders with a domestic shipping address.
8. Multi line pick slips for non-gift orders with a domestic shipping address.

If more than one pick slip meets a sort level, the system sorts the pick slips:

1. Alphabetically by the warehouse zones defined in the *Zone 1*, *Zone 2*, *Zone 3*, *Zone 4*, *Zone 5* and *Zone 6* fields in the Pick Sort GH table.
2. Alphabetically by picking sequence array. See [Populating the Picking Sequence Array Field in the Pick Sort GH table](#) for more information on how the system updates the *Picking sequence array* field in the Pick Control Header Extended table and Pick Sort GH table during pick slip allocation.

Single line gift flag and foreign ship example: The system generates the following pick slips.

Pick Slip	Gift?	Foreign?	Pick Line	Warehouse Zone	Picking Sequence Array
1	Y	N	1	P	0000007

Pick Slip	Gift?	Foreign?	Pick Line	Warehouse Zone	Picking Sequence Array
2	N	Y	1	M	0000010
3	Y	N	1	A	0000012
4	Y	N	1	P	0000008
5	N	N	1	M	0000009
6	N	N	1	A	0000011
7	N	Y	1	P	0000008
8	Y	Y	1	P	0000008

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Gift?	Foreign?	Warehouse Zone	Picking Sequence Array
8	Y	Y	P	0000008
3	Y	N	A	0000012
1	Y	N	P	0000007
4	Y	N	P	0000008
2	N	Y	M	0000010
7	N	Y	P	0000008
6	N	N	A	0000011
5	N	N	M	0000009

Multi line gift flag and foreign ship example: The system generates the following pick slips.

Pick Slip	Gift?	Foreign?	Pick Line	Warehouse Zones	Picking Sequence Array
1	N	N	1	A	00000110000
			2		012
2	N	Y	1	A	00000100000
			2	M	012
3	N	N	1	A	00000090000
			2	M	012
4	Y	N	1	A	00000100000
			2	M	011
5	N	N	1	M	00000090000
			2	A	011
6	Y	N	1	M	00000090000
			2		010

Pick Slip	Gift?	Foreign?	Pick Line	Warehouse Zones	Picking Sequence Array
7	N	Y	1	A	0000090000 012
			2	M	
8	Y	Y	1	A	0000100000 012
			2	M	

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Gift?	Foreign?	Warehouse Zones Alphabetically	Picking Sequence Array
8	Y	Y	AM	0000100000012
4	Y	N	AM	0000100000011
6	Y	N	M	0000090000010
7	N	Y	AM	0000090000012
2	N	Y	AM	0000100000012
1	N	N	A	0000110000012
5	N	N	AM	0000090000011
3	N	N	AM	0000090000012

Single and multi line gift flag and foreign ship example: The system generates the following pick slips.

Pick Slip	Gift?	Foreign?	Pick Line	Warehouse Zones	Picking Sequence Array
1	N	N	1	A	00001100000 12
			2		
2	N	Y	1	A	00001000000 12
			2	M	
3	N	N	1	A	0000012
4	N	N	1	A	00001000000 11
			2	M	
5	Y	N	1	M	0000009
6	Y	Y	1	M	00000900000 10
			2	M	

In this example, the system sorts the pick slips in the pick document in the following order:

Pick Slip	Single?	Gift?	Foreign?	Warehouse Zones Alphabetically	Picking Sequence Array
6	N	Y	Y	M	00000900000 10

Pick Slip	Single?	Gift?	Foreign?	Warehouse Zones Alphabetically	Picking Sequence Array
5	Y	Y	N	M	0000009
2	N	N	Y	AM	000001000000 12
3	Y	N	N	A	0000012
1	N	N	N	A	000001100000 12
4	N	N	N	AM	000001000000 11

 **Note:**

Streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Using Cart/Bin Picking

Overview: Cart/bin picking generates a batch pick slip list for one picker to handle in a single pick slip run.

Cart/bin picking:

- Groups items together for picking by determining the total number of items that can fit on a single picking cart.
- Generates a [Cart/Bin Batch Picking Pullsheet](#) for each cart, and a [Cart Batch Recap](#) for the pick slip run.
- Sorts and groups pick slips by cart batch number. See [Sorting Pick Slips into Separate Cart Batches](#).

 **Note:**

Streamlined pick slip generation does not generate cart/bin batches if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Cart/Bin Picking Setup

In order to use cart/bin picking, you must complete the following information.

Cube factor of item: Enter a *Cube factor* for the item on the [Create Item Screen](#). You can also enter a *Cube factor* for the SKU on the [Create SKU 2 of 2 \(With Overrides\) Screen](#). The cube factor for the SKU overrides the cube factor for the item. The system uses this value to determine the cube size of the pick slip. See [Determining the Weight and Cube of the Pick Slip](#).

System control values: Complete the system control values that display on the [Edit Cart/Bin Values Screen \(B38\)](#).

System Control Value	Description
Use Cart/Bin Picking? (B38)	Must be selected in order to use cart/bin picking.
Sort Picks by Pick Sequence (E89)	If selected, the system includes the <i>Picking sequence array</i> field in the Pick Sort GH table when sorting pick slips in a batch. See Pick Slip Sort Within a Cart Batch .
Cube of Bin (B44)	Enter the cubic volume of the smallest bin within a cart.
Cube of Cart (B42)	Enter the total cubic volume of the cart. The system adds pick slips to a cart batch until adding another pick slip will cause the cube total for the cart batch to go over the Cube of Cart (B42) .
Minimum Number of Picks in a Cart (B47)	Enter the minimum number of picks that can fit in a cart. Example: <ul style="list-style-type: none"> • If you define the minimum number of picks as 20, each batch must contain at least 20 pick slips. • If the next batch to be created has only 15 picks, the 15 pick slips are added to the batch, rather than creating a new batch of 15 pick slips, because it is less than the required minimum of 20. • If the number of picks to be batched is less than the quantity you entered, the picks are added to the current batch instead of creating a new batch that would be less than the minimum size.
Maximum Number of Single Line Picks (B39)	Enter the maximum number of single line pick slips to include in a single batch. Example: If you enter 12, and the number of single line pick slips generated in a pick run is 15, the system creates 2 cart batches. The first cart batch has 12 single line pick slips and the second cart batch has the remaining 3 single line pick slips.
Maximum Number of Multi Line Picks (B40)	Enter the maximum number of multi-line pick slips to include in each batch. Example: If you enter 12, and the number of multi line pick slips generated in a pick run is 15, the system creates 2 cart batches. The first cart batch has 12 multi line pick slips and the second cart batch has the remaining 3 multi line pick slips.
Maximum Number of Zones (B41)	Enter the maximum number of zones (up to six) allowed on a multi-line pick slip before generating another batch.

 **Note:**

All cubing dimensions for evaluating cubic value of items, carts, and batches should be rendered in the same unit of measure throughout the system, whether you use inches, feet, or a point rating.

Examples of Cart/Bin Picking with Cubing and without Cubing

Example 1: Cart bin picking with cubing

Criteria:

- Total cube for batch = 31,000
- Total number of orders in batch = 10
- Minimum bin size = 3,000
- Total number of multi-line picks = 5
- Break single line picks by zone = Selected

Explanation:

Using the criteria, the system performs cubing and separates the single line picks from the multi-line picks. Within this grouping, the picks are further grouped by zone or by pick sequence number depending on the value entered in the [Sort Picks by Pick Sequence \(E89\)](#) system control value. In compiling each batch, the program accumulates the total cubic measurement for each line. When it has reached a total cube of 31,000 or ten single line picks, it creates a batch. The program continues to do this until all single line picks are written to the Pick Slip Print table. The program then does the same with the multi-line picks (using 5 picks or 31,000 cube for total batch limits) until all picks are exhausted.

Example 2: Cart bin picking without cubing

Criteria:

- Total cube for batch = 30,000
- Total number of orders in batch = 10
- Minimum, bin size = 3,000

Explanation:

Using the criteria, the system sorts the orders by warehouse zone or by pick sequence number depending on the value entered in the [Sort Picks by Pick Sequence \(E89\)](#) system control value. In compiling the orders for a single batch, the system accumulates the total cube for the orders. The accumulated cube and the number of orders is evaluated against the system control values. Once the program reaches either an accumulated cube of 30,000 or ten orders, it creates a batch. The number of bins to be used on the cart would be determined by dividing the minimum bin size of 3,000 into the total cube for the order. The system may only assign five orders to a batch based on the cube; only 5 bins would be needed.

Sorting Pick Slips into Separate Cart Batches

The system uses the [Sorted Pick Sort GH Table](#) to determine how to sort the pick slips into separate cart batches. The system creates a new cart batch for the following reasons.

#	Step
1.	The <i>Warehouse</i> in the Pick Sort GH table changes.
2.	Within warehouse, the <i>Ship Via Priority</i> in the Pick Sort GH table changes. The system sorts the pick slips in descending ship via priority order. For example, the system creates a cart batch for ship via priority 5 before creating a cart batch for ship via priority 1.
3.	The <i>Generation type</i> in the Pick Control Header table changes.
4.	The <i>Gift Pick</i> in the Pick Sort GH table changes from Y to N or blank. Y displays in this field if the <i>Gift</i> flag on the Order Ship To record is Y.

#	Step
5.	The <i>Foreign Country</i> in the Pick Sort GH table changes from Y to N or blank. Y displays in this field if the country on the shipping address does not match the Default Country for Customer Address (B17) .
6.	The <i>Single Line</i> in the Pick Sort GH table changes from Y to N or blank. Y displays in this field if the pick slip has 1 pick slip line.
7.	<p>The total cubic volume of the cart (defined in the Cube of Cart (B42) system control value) is reached.</p> <p>The system uses the following calculations to determine the total cubic volume of a cart.</p> <p># of bins used calculation: The system calculates the number of bins used for a pick slip as follows:</p> $(\text{Cube of pick slip from Pick Sort GH table} / \text{Cube of Bin (B44) value}) + .99 = \text{Number of Bins Used}$ <p>NOTE: If the # of bins used calculation results in a value that is less than or equal to 0, the system updates the # of bins used for a pick slip to 1.</p> <p>Cube total for pick slip calculation: The system calculates the cube total for a pick slip as follows:</p> $\text{Summation of (Number of Bins Used * Cube of Bin (B44)) value} = \text{Cube Total for Pick Slip}$ <p>The system adds pick slips to a cart batch until adding another pick slip will cause the cube total for the cart batch to go over the Cube of Cart (B42) value. At that point, the system creates a new cart batch.</p> <p>See Cart Batch Example: Total Cubic Volume of Cart Reached for an example.</p>
8.	The number of single line pick slips reaches the Maximum Number of Single Line Picks (B39) allowed. See Cart Batch Example: Maximum Pick Slips in a Batch Reached for an example.
9.	The number of multi line pick slips reaches the Maximum Number of Multi Line Picks (B40) allowed. See Cart Batch Example: Maximum Pick Slips in a Batch Reached for an example.
10.	The <i>Special handling sts</i> in the Pick Sort GH table changes from Y to N or blank. Y displays in this field if the pick slip has a line that requires special handling.
11.	<p>For multi line pick slips, the zone combination defined in the <i>Zone 1, Zone 2, Zone 3, Zone 4, Zone 5</i> and <i>Zone 6</i> fields in the Pick Sort GH table changes.</p> <p>Maximum number of zones for multi line pick slips: If the number of zones defined for a pick slip is greater than the Maximum Number of Zones (B41), the system updates the <i>Zone</i> fields in the Pick Sort GH table with asterisks (*) instead of the zone code. In this situation, the system sorts these pick slips to the top of the list and places these pick slips in the same cart batch.</p> <p>See Cart Batch Example: Maximum Number of Zones Reached for an example.</p>
12.	For single line pick slips, if the Break Single Line Picks by Zone (E33) system control value is selected, the zone defined in the <i>Zone 1</i> field in the Pick Sort GH table changes. For example, the system sorts pick slips for zone A into one cart batch and sorts pick slips for zone B into a separate cart batch.

When the system creates a new cart batch, the system:

- Uses the [Cart Batch #](#) number assignment wheel to assign the next cart batch number.

 **Note:**

The *End #* for this number assignment wheel should be 3 so that the system restarts the cart batch # at 1 once a cart batch # of 999 has been reached.

- Restarts the bin # at 1. You can have up to 999 bins in a cart batch.

Once the system determines how many cart batches to generate, the system determines how to sort the pick slips within the cart batch; see [Pick Slip Sort Within a Cart Batch](#).

Sorting Pick Slips into Cart Batches When Not Using Cart/Bin Picking

If the [Use Cart/Bin Picking? \(B38\)](#) system control value is unselected, the system:

1. Creates a cart batch # of 1.
2. Assigns a bin # of 1 to the first pick slip in the [Sorted Pick Sort GH Table](#).
3. Continues adding pick slips to cart batch # 1 until the bin # reaches 999.
4. Once the bin # reaches 999, the system creates cart batch # 2 and repeats steps 2 and 3 until all of the pick slips in the pick generation run have been assigned a cart batch # and bin #.

 **Note:**

Streamlined pick slip generation does not generate cart/bin batches if the [Bypass Creation of Pick Forms during WSPS Pick Generation \(K55\)](#) system control value is selected.

Cart Batch Example: Sorting Pick Slips into Separate Batches

You generate the following pick slips for a pick generation run. In this example, each pick slip in the run has the same warehouse, generation type, and special handling status. Also:

- The total cubic volume for a cart (defined in the [Cube of Cart \(B42\)](#) system control value) has not been reached. See [Cart Batch Example: Total Cubic Volume of Cart Reached](#) for an example.
- The item(s) for each pick slip is located in zone A. See [Cart Batch Example: Maximum Number of Zones Reached](#) for an example.
- The [Maximum Number of Single Line Picks \(B39\)](#) and [Maximum Number of Multi Line Picks \(B40\)](#) has not been reached. See [Cart Batch Example: Maximum Pick Slips in a Batch Reached](#) for an example.

Pick Slip	Whs	Ship Via Priority	Gift Pick	Foreign Country	Single Line?
1	1	5	N	N	N
2	1	1	Y	Y	Y
3	1	5	N	N	Y
4	1	5	N	Y	Y

Pick Slip	Whs	Ship Via Priority	Gift Pick	Foreign Country	Single Line?
5	1	1	N	N	N
6	1	1	Y	Y	Y
7	1	5	N	Y	Y
8	1	5	Y	Y	Y

In this example, the system sorts the pick slips into the following cart batches:

Cart Batch	Pick Slip	Whs	Ship Via Priority	Gift Pick	Foreign Country	Single Line?
1	8	1	5	Y	Y	Y
2	4 7	1	5	N	Y	Y
3	3	1	5	N	N	Y
4	1	1	5	N	N	N
5	2 6	1	1	Y	Y	Y
6	5	1	1	N	N	N

Note:

Streamlined pick slip generation does not generate cart/bin batches if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Cart Batch Example: Total Cubic Volume of Cart Reached

You generate the following pick slips for a pick generation run. In this example, each pick slip in the run has the same warehouse, ship via priority, generation type, gift pick setting, foreign setting, and special handling status. Also:

- The items for each pick slip are located in zone A. See [Cart Batch Example: Maximum Number of Zones Reached](#) for an example.
- Each pick slip has multiple lines and the Maximum Number of Multi Line Picks (B40) has not been reached. See [Cart Batch Example: Maximum Pick Slips in a Batch Reached](#) for an example.
- The Cube of Bin (B44) is 2.
- The Cube of Cart (B42) is 16

The [Sorted Pick Sort GH Table](#) sorts the pick slips into the following order:

Pick Slip	Cube of Pick Slip
1481	9
1483	5

Pick Slip	Cube of Pick Slip
1476	4
1478	7
1479	6
1482	11
1480	16

The system calculates the number of bins used for each pick slip.

(Cube of pick slip from Pick Sort GH table / Cube of Bin (B44) value) + .99 = Number of Bins Used

Pick Slip	Calculation	# of Bins Used
1481	$(9 / 2) + .99 = 5.49$	5
1483	$(5 / 2) + .99 = 3.49$	3
1476	$(4 / 2) + .99 = 2.99$	2
1478	$(7 / 2) + .99 = 4.49$	4
1479	$(6 / 2) + .99 = 3.99$	3
1482	$(11 / 2) + .99 = 6.49$	6
1480	$(16 / 2) + .99 = 8.99$	8

The system calculates the cube total for each pick slip.

Summation of (Number of Bins Used * Cube of Bin (B44) value) = Cube Total for a Cart Batch

Pick Slip	# of Bins Used	Calculation	Cube Total for Pick Slip
1481	5	$5 \times 2 = 10$	10
1483	3	$3 \times 2 = 6$	6
1476	2	$2 \times 2 = 4$	4
1478	4	$4 \times 2 = 8$	8
1479	3	$3 \times 2 = 6$	6
1482	6	$6 \times 6 = 12$	12
1480	8	$8 \times 8 = 16$	16

The system adds pick slips to a cart batch until adding another pick slip will cause the cube total for the cart batch to go over the value in the Cube of Cart (B42) system control value. In this example, because the Cube of Cart (B42) is 16, the system sorts the pick slips into the following cart batches:

Cart Batch	Pick Slips	Batch Cube Total	Cube Total for Cart Batch
1	1481 1483	10 6	16

Cart Batch	Pick Slips	Batch Cube Total	Cube Total for Cart Batch
2	1476	4	12
	1478	8	
3	1479	6	6
4	1482	12	12
5	1480	16	16

Note:

Streamlined pick slip generation does not generate cart/bin batches if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Cart Batch Example: Maximum Pick Slips in a Batch Reached

You generate the following pick slips for a pick generation run. In this example, each pick slip in the run has the same warehouse, ship via priority, generation type, gift pick setting, foreign setting, and special handling status. Also:

- The total cubic volume for a cart (defined in the Cube of Cart (B42) system control value) has not been reached. See [Cart Batch Example: Total Cubic Volume of Cart Reached](#) for an example.
- The item(s) for each pick slip is located in zone A. See [Cart Batch Example: Maximum Number of Zones Reached](#) for an example.
- The Maximum Number of Single Line Picks (B39) is 4.
- The Maximum Number of Multi Line Picks (B40) is 2.

Pick Slip	Single Line?
1	Y
2	Y
3	N
4	Y
5	N
6	Y
7	Y
8	N

In this example, the system sorts the pick slips into the following cart batches:

Cart Batch	Pick Slip	Single Line?
1	1	Y
	2	
	4	
	6	
2	7	Y
3	3	N
	5	
4	8	N

Note:

Streamlined pick slip generation does not generate cart/bin batches if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Cart Batch Example: Maximum Number of Zones Reached

You generate the following pick slips for a pick generation run. In this example, each pick slip in the run has multiple lines, the same warehouse, ship via priority, generation type, gift pick setting, foreign setting, and special handling status. Also:

- The total cubic volume for a cart (defined in the Cube of Cart (B42) system control value) has not been reached. See [Cart Batch Example: Total Cubic Volume of Cart Reached](#) for an example.
- Each pick slip has multiple lines and the Maximum Number of Multi Line Picks (B40) has not been reached. See [Cart Batch Example: Maximum Number of Zones Reached](#) for an example.
- The Maximum Number of Zones (B41) system control value is 3.

Pick Slip	Zone 1	Zone 2	Zone 3	Zone 4	Zone 5	Zone 6
1	A	M				
2	A	C	M			
3	A	C	D	M	S	
4	A	M				
5	C	D	M			
6	A	M				
7	C	M				
8	C	D	M			
9	C	D	M	S		
10	A	C	M	S		

In this example, the system sorts pick slips into the following cart batches:

Cart Batch	Pick Slip	Zone 1	Zone 2	Zone 3	Zone 4	Zone 5	Zone 6
1	3 9 10 Note: Because pick slips 3, 9 and 10 contain more zones than the <i>Maximum Number of Zones (B41)</i> allowed, the system updates the <i>Zone</i> fields in the Pick Sort GH table with asterisks (*). The system sorts pick slips with asterisks in the <i>Zone</i> fields to the top of the list and places them in the same cart batch number.	*	*	*	*	*	*
2	2	A	C	M			
3	1 4 6	A	M				
4	5 8	C	D	M			
6	7	C	M				

Note:

Streamlined pick slip generation does not generate cart/bin batches if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Pick Slip Sort Within a Cart Batch

The system sorts the pick slips within a cart batch in the following order.

1. Alphabetically by the warehouse zones defined in the *Zone 1*, *Zone 2*, *Zone 3*, *Zone 4*, *Zone 5* and *Zone 6* fields in the Pick Sort GH table.
2. Alphabetically by picking sequence array. See [Populating the Picking Sequence Array Field in the Pick Sort GH table](#) for more information on how the system updates the *Picking sequence array* field in the Pick Control Header Extended table and Pick Sort GH table during pick slip allocation.

Single line only cart batch example: The system sorts the following pick slips into a single cart batch.

Pick Slip	Pick Line	Warehouse Zone	Picking Sequence Array
1	1	P	0000007
2	1	M	0000010
3	1	A	0000012
4	1	P	0000008
5	1	M	0000009
6	1	A	0000011

In this example, the system sorts the pick slips in the cart batch in the following order:

Pick Slip	Warehouse Zone	Picking Sequence Array
6	A	0000011
3	A	0000012
5	M	0000009
2	M	0000010
1	P	0000007
4	P	0000008

Multi line only cart batch example: The system sorts the following pick slips into a single cart batch.

Pick Slip	Pick Line	Warehouse Zones	Picking Sequence Array
1	1	A	00000110000012
	2		
2	1	A	00000100000012
	2	M	
3	1	A	00000090000012
	2	M	
4	1	A	00000100000011
	2	M	
5	1	M	00000090000011
	2	A	
6	1	M	00000090000010
	2		

In this example, the system sorts the pick slips in the cart batch in the following order:

Pick Slip	Warehouse Zones	Picking Sequence Array
1	A	00000110000012
5	AM	00000090000011
3	AM	00000090000012

Pick Slip	Warehouse Zones	Picking Sequence Array
4	AM	00000100000011
2	AM	00000100000012
6	M	00000090000010

 **Note:**

Streamlined pick slip generation does not generate cart/bin batches if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Generating and Printing Pick Slips

How to generate pick slips: You can accept the criteria that were entered by selecting Generate Picks for a pick slip generation template and selecting OK at the Work with Streamlined Pick Slip Generation Screen. The system submits a batch job (PICK_GEN) to generate the pick slips. By default, this job is submitted to the PICKGEN job queue at the [Job Management Screen](#) rather than the QBATCH job queue.

Updates: Once the pick slips have generated, the system:

- Updates the *Printed* field in the Pick Sort GH table to Y.
- Updates the *Pick status* field in the Pick Control Header table to M (Manifesting).
- Unlocks the order by clearing the *User* field in the Order Header table.

Pick slip form: The system generates each pick slip form as a PDF (portable document format) file, typically opened through the Adobe Reader or within a separate browser window. Each PDF file has one or more individual pick slip forms, based on the [Reasons to Sort Pick Slips into Separate PDF Documents](#).

Once the system finishes processing one pick slip PDF document, you can open and print the pick slips in the document using the [Forms Management \(My Forms\)](#); you do not have to wait until all of the PDF documents for the pick slip generation run have generated.

 **Note:**

Streamlined pick slip generation does not generate cart/bin batches or printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.

Order Transaction History message: When it generates a pick slip, the system writes an Order Transaction History message:

- If the Use Cart/Bin Picking? (B38) system control value is selected and you are not using streamlined pick slip generation with the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value selected, the message includes the pick control number, warehouse number, cart batch number, billing batch number, and bin number, for example: Pk 1236612 Whs 1 Ct/Bn 1234734/411/1 where 1236612 is the

pick slip number, 1 is the warehouse number, 1234734 is the billing batch number, 411 is the cart batch number and 1 is the cart bin number.

- Otherwise, the message includes the pick control number, warehouse number, and billing batch number, for example: `Pk 1236609 Whs 1 Batch # 1234731` where 1236609 is the pick slip number, 1 is the warehouse number, and 1234731 is the billing batch number.

You can review these messages at the [Display Order History Screen](#).

Picks not included? If you run pick slip generation and the system does not include the picks you were expecting, you can use [Pick Print Eligibility \(WPPE\)](#) to determine the reason why the picks were not included.

Generate invoice number during pick slip generation? If the Generate Invoice Number at Pick Gen (H80) or Generate Invoice # at Pick Gen without Address Match (K81) system control value is selected, the system might assign a pending invoice number during pick slip generation and writes this number to the Pick Control Header table.

Include printed drop ship items as backordered on pick slip? The system prints drop ship items as backordered on the pick slip if a drop ship pick slip or purchase order has not yet been generated for the drop ship item.

Also, if the [Add Printed Drop Ship Lines as Backordered on Pick \(E93\)](#) system control value is selected, the system prints drop ship items as backordered on the pick slip after a drop ship pick slip or purchase order has been generated for the drop ship item.

Include soldout lines on pick slip? The system prints soldout order lines on the first pick slip generated for an order if the *Soldout notifications* field for the order type on the order is selected.

Set items on picking documents: When printing pick slip documents for set items:

- **Pick Slip:** The system prints the main set item and set component items on the pick slip. If the component items are flagged as ship alone items, a separate pick slip prints for each item included in the set with the message ***Other Items Shipped Separately***. However, the system will include the main set item with one of the component items in order to avoid printing the main set item on its own pick slip. The total for the set prints on one pick slip.
- **Cart/Bin Batch Picking Pullsheet:** The system prints the main set item and set components on this report. The system includes the quantity of the main set item and the quantity of each component item in the *Total Units* field. For example, if the set item consists of 1 unit of component 1 and 2 units of component 2 and you order 2 sets, the system displays 8 in the *Total Units* field (2 main set items + 2 component 1 items + 4 component 2 items).
- **Batch Item Pull Label:** The system prints a batch item pull label for the main set item and set component items.
- **Batch Pull Sheet Item Summary Report:** The system prints the main set item and set component on this report. A location displays for the set component items, but not the main set item.
- **Pick Unit Report:** The system includes the quantity of each component item in the *Units/All Picks* and *Units/Multi Line Picks* fields on this report.
- **Cart Batch Recap:** The system includes the quantity of the main set item and the quantity of each component item in the *Qty* and *Items* fields on this report.

Prorate freight charges? If the [Prorate Freight Charges \(D39\)](#) system control value is unselected, the system charges all freight charges on an order with the first shipment; in this situation, all freight charges are added to the first pick slip generated for the order. If the [Prorate Freight Charges \(D39\)](#) system control value is selected, the system charges a proportional amount of freight for partial shipments on an order.

Available Pick Slip Generation Documents

Invalid data during pick slip generation: If an order in the pick slip generation run contains invalid data, such as an invalid source code, customer, or ship via code, the system does not generate a pick slip for the order. However, depending on the type of information that is invalid, the system may include the order on the following reports:

- [Batch Pull Sheet Item Summary Report](#)
- [Cart Batch Recap](#)
- [Pick Unit Report](#)

Pick Slip Generation Document	When It Prints
Pick Slip	<p>If a print program is defined in the Pick Printing Program (C37) system control value, the system generates pick slips; however, streamlined pick slip generation does not generate printable pick slips if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p> <p>See Generating and Printing Pick Slips for more information on how the system determines which pick slips to generate.</p>
Picking Pullsheet	<p>The system generates the Cart/Bin Batch Picking Pullsheet when you generate pick slips if you are Using Cart/Bin Picking (the Use Cart/Bin Picking? (B38) system control value is selected) and a print program has been defined in the Cart/Bin Batch Pull Sheet Printing Program (C39) system control value.</p> <p>The system generates the Picking Pullsheet when you generate pick slips if you are NOT Using Cart/Bin Picking (the Use Cart/Bin Picking? (B38) system control value is unselected) and a print program has been defined in the Use Cart/Bin Picking? (B38) system control value.</p> <p>NOTE: Streamlined pick slip generation does not generate this report if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p>
Item Stock Allocation Error Report	<p>The system generates this report when you generate pick slips if you have items on the orders which cannot be picked.</p>
Batch Item Pull Label	<p>The system prints a batch item pull label when you are Generating and Printing Pick Slips if a print program name has been defined in the Batch Item Pull Label Printing Program (F63) system control value.</p> <p>NOTE: Streamlined pick slip generation does not generate this report if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p>
Batch Pull Sheet Item Summary Report	<p>The system generates this report when you generate pick slips if system control value Print Batch Pull Sheet Item Summary (C59) is selected.</p> <p>NOTE: Streamlined pick slip generation does not generate this report if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p>

Pick Slip Generation Document	When It Prints
Pick Unit Report	<p>The system generates this report automatically when you generate pick slips. This report indicates the pick slip generation template used to generate the pick slips.</p> <p>NOTE: Streamlined pick slip generation does not generate this report if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p>
Gift Acknowledgement	<p>The system generates gift acknowledgments during pick slip generation if the Automatic Generation of Gift Acknowledgement (B92) system control value is set to P.</p> <p>NOTE: Streamlined pick slip generation does not generate this report if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p>
Cart Batch Recap	<p>The system produces this recap listing when you generate pick slips if you are Using Cart/Bin Picking.</p> <p>NOTE: Streamlined pick slip generation does not generate this report if the Bypass Creation of Pick Forms during WSPS Pick Generation (K55) system control value is selected.</p>
Credit Card Authorization Listing	<p>The system generates this report if you perform authorization during pick slip generation. The system produces two versions of the report: one includes declines, and one includes authorized pick slips; see Authorizations During Pick Slip Generation for an overview.</p>
Address Verification Response List	<p>The system generates this report if you perform authorization during pick slip generation.</p>
Pick/Authorization Listing	<p>The system generates this report if you perform authorization during pick slip generation.</p>
Unmatched Reserved/ Remaining Qty Report	<p>The system generates this report during Streamlined Pick Slip Generation (WSPS) if:</p> <ul style="list-style-type: none"> The <i>Qty remaining</i> in the Reserved Order Line table is greater than the <i>Qty reserved</i> in the Order Detail table - the <i>Qty printed</i> in the Order Detail table, and The <i>Qty printed</i> in the Reserved Order Line table is greater than the <i>Qty printed</i> in the Order Detail table.

Confirming and Billing Shipments

Topics in this part:

- [Manually Confirming Shipments \(MCON\)](#) describes how to confirm shipments manually, or interactively, using the pick control number, billing batch number (without exceptions), and billing batch number (with exceptions).
- [Reprinting and Voiding Pick Slips \(WVRP or WSVP\)](#) explains how to reprint and void a single pick slip or a range of pick slips.
- [Void Pick Batch \(WSVP\)](#)
- [Printing the Fill Rate Reports \(PFRR\)](#) provides report samples and descriptions of the Fill Rate, Shipment Summary, and Backorder Summary reports.

Drop Ship Pick Slip/Invoice

Purpose: The drop ship pick slip/invoice lists item and retail price information for a drop ship order.

How to print: The system generates the drop ship pick slip/invoice when you process drop ship pick slips or drop ship purchase orders at the Select Vendors for Drop Ship Screen. Purchase order receiving also generates a drop ship pick slip/invoice if the Print Drop Ship Invoice at time of Purchase Order Receiving (F10) system control value is selected.

Working with forms: See Forms Management (My Forms) for information on displaying or printing drop ship pick slips and other forms.

Note:

The information presented here is included on your drop ship pick slip/invoice only if your print program supports it. The Drop Ship Pick Print Program (E92) system control value identifies the pick slip printing program to use for drop ship orders. The standard program for drop ship pick slips is the same as the standard program for regular pick slips (*PICKG* for the graphical pick slip). For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Sample pick slip: See the [Pick Slip](#).

Contents: The INPUT_TYPE setting for your pick slip form in [Working with Customer Properties \(PROP\)](#) indicates the means by which your drop ship pick printing program obtains the data to print on the pick slip form. Each option is available only if your drop ship pick printing program supports it. Valid values are:

- XML = The program uses the Pick Message from Order Administration (CWPickOut) to generate the drop ship pick slip.
- DB = The program queries the database to generate the drop ship pick slip. The INPUT_TYPE setting for the standard printing program PICKG is DB.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Drop Ship Pick Slip Sold To Label (ORDERED By) Comments

Logo	You can include a company logo or an entity logo. See Setting Up Company Logos for Forms and the Print Entity Image (K35) system control value for background and setup information.
Order Number and Ship To Number	The order number and the ship-to number, separated by a hyphen. The ship to number is set to 1 if there is only one shipping address. From the order_nbr and order_shipto_nbr attributes in the Pick Message from Order Administration (CWPickOut) or the <i>Order #</i> and <i>Ship to #</i> fields in the Pick Control Header table.

Drop Ship Pick Slip Sold To Label (ORDERED By)	Comments
Barcode	<p>Formatted as 012-0003702-02, where 012 is the company number, 0003702 is the pick control number, and 02 is the label number.</p> <p>The <i>BARCODE_IMAGE</i> value for the PICKG and PICKDBG (graphical pick slip) settings in Working with Customer Properties (PROP) controls whether the system prints a barcode on the drop ship pick slip.</p> <p>From the <i>CMP Company</i>, <i>PCH Control #</i>, and <i>PCL Label Number</i> fields in the Pick Control Label table.</p>

Drop Ship Pick Slip Sold To Label (ORDERED By)	Comments
--	----------

Sold To
sold to name and address

The sold-to name and address has the label ORDERED BY: and is enclosed in a rounded box on the base graphical drop ship pick slip. Includes the following:

- **Company name:** The company name for the address of the sold to customer. From the `sold_to_company` attribute in the Pick Message from Order Administration (CWPickOut) or the *NAM Company name* field in the Customer Sold To table.
- **First name, middle initial, last name:** The first name, middle initial, and last name of the sold to customer. From the `sold_to_fname`, `sold_to_initial`, and `sold_to_lname` attributes in the Pick Message from Order Administration (CWPickOut) or the *NAM First name*, *NAM Initial*, and *NAM Last name* fields in the Customer Sold To table.
- **Address line 1 and Apartment:** The street address and apartment for the address of the sold to customer. From the `sold_to_addr1` and `sold_to_apt` attributes in the Pick Message from Order Administration (CWPickOut) or the *NAM Street address* and *NAM Apartment* fields in the Customer Sold To table.
- **Address line 2:** The second address line for the address of the sold to customer. From the `sold_to_addr2` attribute in the Pick Message from Order Administration (CWPickOut) or the *NAM Address line 2* field in the Customer Sold To table.

 **Note:**

Address lines 3 and 4 do not print on the drop ship pick form.

- **City, state, postal code:** The city, state code, and zip code for the address of the sold to customer. From the `sold_to_city`, `sold_to_state`, and `sold_to_postal_code` attributes in the Pick Message from Order Administration (CWPickOut) or the *NAM City*, *NAM State*, and *NAM Zip* fields in the Customer Sold To table.
- **Country description:** The country name for the address of the sold to customer. From the `sold_to_country_name` attribute in the Pick Message from Order Administration (CWPickOut) or the *Country description* field in the Country table.

 **Note:**

The country name prints only if you are shipping to a country other than the default specified in the Default Country for Customer Address (B17) system control value.

Drop Ship Pick Slip Ship To Label

A separate drop ship pick slip prints for each ship to customer on the order.

Logo

See Setting Up Company Logos for Forms for setup information.

Order Level Message	<p>The first four order level messages on the order whose <i>Print</i> flag is set to Print on Both or Print on Picks.</p> <p>See the Work with Order Messages Screen for more information on order level messages.</p> <p>From the <i>msg</i> attribute in the Pick Message from Order Administration (CWPickOut) for <i>msg_type</i> OH or the <i>OMS Message</i> field in the Order Message table.</p>
Drop Ship Pick Slip Header Information	
Date Of Order	<p>The date the order was placed.</p> <p>From the <i>order_date</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>OHD Order date</i> field in the Order Header table.</p>
Purchase Order No.	<p>The purchase order number, if any, that was provided by the sold-to customer. You can enter a purchase order number on the Work with Order screen in order entry.</p> <p>From the <i>po_nbr</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCH PO #</i> field in the Pick Control Header table.</p>
Source Code	<p>The source code from the order header.</p> <p>From the <i>source</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>OHD SRC Source code</i> field in the Order Header table.</p>
Packer	<p>Not currently implemented.</p>
Shipped Via	<p>The first 10 positions of the ship via description, such as UPS or Fed Ex.</p> <p>From the <i>ship_via_desc</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>VIA Shipper Name</i> field in the Ship Via table.</p>
Customer No.	<p>The number assigned by the system to identify the sold-to customer.</p> <p>From the <i>sold_to_customer_nbr</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>CST Customer #</i> field in the Pick Control Header table.</p>
Order No.	<p>The order number associated with the drop ship pick slip.</p> <p>From the <i>order_nbr</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>Order #</i> field in the Order Ship To table.</p>
Page No.	<p>The number of this drop ship pick slip page.</p>

Drop Ship Pick Slip Sold To Label (ORDERED By)	Comments
Drop Ship Pick Slip Detail Information	<p>The system uses the Pick Location table to determine the sequence in which to display the pick slip details on the pick slip. Pick slip details print on the pick slip in zone, location picking sequence number, location, line number sequence.</p> <p>NOTE: Each item prints on a separate drop ship pick slip if the Allow Only Single Line on Drop Ship Pick (C82) system control value is selected. Also, if the Print One Drop Ship Invoice per Ship Alone Item (E38) system control value is selected, a separate drop ship pick slip prints for each unit of a ship-alone item.</p>
Line No.	<p>A unique number to identify the pick slip line number for the item.</p> <p>From the <i>pick_line_nbr</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCD Line #</i> field in the Pick Control Detail table.</p>
Items Ordered	<p>The number of units ordered on the order line. From the <i>qty_ordered</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>ODT qty ordered</i> field in the Order Detail table.</p>
Items Shipped	<p>The quantity of the item to ship on this pick slip.</p> <p>NOTE:</p> <ul style="list-style-type: none"> • The system highlights the quantity if it is greater than 1. • If this is a ship-alone item and the Print One Drop Ship Invoice per Ship Alone Item (E38) system control value is selected, a separate drop ship pick slip prints for each unit. <p>From the <i>qty_printed</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCD Original qty printed</i> field in the Pick Control Detail table.</p>
Backordered	<p>This field is not currently used for drop ship pick slips.</p>
Location Code	<p>The location in the warehouse where the item is picked. Included only for items shipping on this pick slip.</p> <p>From the <i>whse_location</i> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>Location</i> field in the Pick Location table.</p>

Drop Ship Pick Slip Sold To Label (ORDERED By)	Comments
Item Number	<p>A code that represents a unit of inventory. A SKU code, such as RED MEDM, prints below the item number if the item contains SKUs.</p> <p>NOTE: The item may have been ordered using a different item number if it is part of a set, or if it was ordered by alias. From the item and sku attributes in the Pick Message from Order Administration (CWPickOut) or the <i>ITM Number</i> and <i>SKU Code</i> in the Pick Control Detail table.</p> <p>Set items: If the main set item or its component items are flagged as ship alone items, a separate pick slip prints for each item included in the set with the message <i>**Other Items Shipped Separately**</i>. The system includes the main set item with a component item that is assigned to the same ship via in order to avoid printing the main set item on its own pick slip. If the main set item and its component items are not flagged to ship alone, the main set item and components print on the same pick slip as the other items. The total for the set prints on one pick slip. For more information on set items, see Entering Set Information (WSET).</p> <p>Gift wrap: The message GIFT WRAP prints on a separate line if the item is flagged for gift wrap. The gift wrap charge is indicated in the <i>Unit price</i> and <i>Extension</i> columns.</p> <p>Special handling instructions: A detailed description of any special handling option, such as color, material, monogramming, engraving, style, or size prints underneath any item to receive special handling. The special handling charge is included in the <i>Shipping & Handling</i> total on the pick slip. Custom special handling information that prints on the pick slip is the <i>special handling option</i>, the <i>customer response</i>, and the <i>special handling charge</i>. Standard special handling instructions are preceded by the description of the additional charge code you use to identify standard special handling.</p> <p>Item or SKU comments: Only comments flagged to Print on picks and invoices or Print on picks only print on the pick slip. Comments can be entered at the base item level or SKU level by selecting Comments for an item at the Work with Items Screen.</p> <p>Order line message: Order line messages flagged to Print on Both or Print on Picks print on the pick slip. You can enter an order line message by selecting Messages for an item at the Work with Order Lines screen.</p>
Description	<p>A description of the item. A description of the SKU is also included if the item contains SKUs.</p> <p>From the item_desc and sku_desc attributes in the Pick Message from Order Administration (CWPickOut) or the <i>Description</i> field in the Item table and <i>Description</i> field in the SKU table.</p>
Unit Price	<p>The amount the customer pays for each unit of the item. Included only for items on this pick slip. Not included on drop ship pick slips for gift orders, or if the Print Amounts on Drop Ship Picks (C81) system control value is unselected.</p> <p>selling_price</p>

Drop Ship Pick Slip Sold To Label (ORDERED By)	Comments
Extension	<p>The item price times the quantity shipped on this pick slip. Not included on drop ship pick slips for gift orders, or if the Print Amounts on Drop Ship Picks (C81) system control value is selected.</p> <p>From the <code>selling_price_extended</code> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCD Extension</i> field in the Pick Control Detail table.</p>
Shipped Separately Message	<p>The message **Other Items Shipped Separately** prints above the pick slip totals if other items on the order shipped on a separate pick slip. See Splitting an Order Across Multiple Picks for more information on when the system splits an order into more than one pick.</p>
Drop Ship Pick Slip Totals	<p>Totals print on every page of multi-page drop ship pick slips. No totals print on drop ship pick slips for gift orders or if the Print Amounts on Drop Ship Picks (C81) system control value is unselected.</p>
Total Merchandise	<p>The total merchandise value of all items on the drop ship pick slip, after applying any discounts or repricing. This total does not include items shipping from your warehouse, backordered items, canceled or soldout items, items shipped separately, or items with stock allocation errors.</p> <p>From the <code>merch_amt</code> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Merch</i> field in the Pick Control Header table.</p>
Shipping & Handling	<p>The total shipping and handling for this shipment, including any freight, additional freight, duty, additional charges, and special handling.</p> <p>If the Prorate Freight Charges (D39) system control value is unselected, the system charges all freight charges on an order with the first shipment; in this situation, all freight charges are added to the first pick slip generated for the order. If the Prorate Freight Charges (D39) system control value is selected, the system charges a proportional amount of freight for partial shipments on an order. However, if the <i>Prorate Freight Charges (D39)</i> system control value is selected and all of the items on the order are exempt from freight, the system applies any item and weight charges defined for the ship via to the first pick slip generated for the order.</p> <p>NOTE: If a negative additional charge is applied to the order, the system deducts the amount from the shipping and handling total. From the <code>freight_amt + addl_freight_amt + addl_charge_amt + hand_charge_amt</code> attributes in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Freight + PCH Add'l Freight + PCH Add'l Charges + PCH Handling</i> fields in the Pick Control Header table.</p>

Drop Ship Pick Slip Sold To Label (ORDERED By)	Comments
Sales Tax	<p>The total tax for all items shipping on the pick slip. This total may include tax on shipping and handling, additional charges, and GST (Goods and Service tax) and PST (Provincial Service tax) tax rates which are specific to companies that operate in Canada and orders shipped to and within Canadian boundaries. For more information on GST and PST tax rates, see Setting Up Order Entry Values.</p> <p>NOTE: Sales tax does not include VAT (Value Added Tax), a taxing method that applies in only certain states and countries and includes the tax in the price of the item. For more information on VAT, see the description of the Tax Included in Price (E70) system control value.</p> <p>From the <code>tax_amt + gst_amt + pst_amt</code> attributes in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Tax + PCH GST + PCH PST</i> fields in the Pick Control Header table.</p>
Order Total	<p>Total merchandise, shipping and handling, additional charges, and tax, for this shipment.</p> <p>From the <code>total_order_amt</code> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Total Order Amount</i> field in the Pick Control Header table.</p>
Total Paid	<p>The amount the customer prepaid. This total is zero if the customer used a credit card.</p> <p>From the <code>amt_paid</code> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Amount Paid</i> field in the Pick Control Header table.</p>
Refund	<p>The amount you owe the customer if the prepaid amount is more than the amount due.</p> <p>From the <code>balance_due_amt</code> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Balance Due</i> field in the Pick Control Header table.</p>
Bal Due	<p>The amount the customer owes you if the prepaid amount is less than the amount due. This amount is zero if the total balance was prepaid or a credit card was applied to the order.</p> <p>From the <code>balance_due_amt</code> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Balance Due</i> field in the Pick Control Header table.</p>
Total	<p>Total merchandise, shipping and handling, tax, and additional charges.</p> <p>From the <code>total_order_amt</code> attribute in the Pick Message from Order Administration (CWPickOut) or the <i>PCH Total Order Amount</i> field in the Pick Control Header table.</p>

Gift order: You can define an order as a gift order by selecting the Gift field on the Work with Order screen in Order Entry. When you generate drop ship pick slips for the order, the system also generates a gift acknowledgement for the sold-to customer, with the message `***GIFT ACKNOWLEDGEMENT***` after all of the items. See the Gift Acknowledgement for more information.

Order Orchestration Drop Ship Integration

Chapters in this part: The following options are related to integration with Order Orchestration's Drop Ship Manager module.

- [Interface with Order Orchestration's Supplier Direct Fulfillment Module: Overview and Setup](#) describes the setup required for integration with Order Orchestration's Drop Ship Manager module.
- [Supplier Direct Fulfillment Processing](#) provides details on process flows and the communication between Order Administration and Order Orchestration's Drop Ship Manager.
- [Downloading Drop Ship Vendors \(ECSV\)](#) explains how to download initial vendor information for vendors using the Order Orchestration's Drop Ship Manager.
- [Working with Retail Brands \(WRBD\)](#) explains how to create and maintain retail brands for use with the Order Orchestration's Drop Ship Manager.
- [Displaying Unprocessed Drop Ship Items \(DUDS\)](#) describes the menu option you use to review all unprocessed drop ship items, including items fulfilled through integration with Order Orchestration's Drop Ship Manager.
- [Printing Drop Ship Reports \(PDSR\)](#) describes the reports you can use to print information related to orders fulfilled through integration with Order Orchestration's Drop Ship Manager.
- [Working with Drop Ship Background Jobs \(WPBJ\)](#) describes how to start, stop, and troubleshoot the CDC async job.
- [Working with Drop Ship Errors \(WDSE\)](#) describes the screen you use to review or delete records which went into error status when they were transferred between Order Orchestration's Drop Ship Manager and Order Administration.

Setting Up the Fulfillment Tables

Topics in this part:

- [Working with Ship Via Codes \(WVIA\)](#) describes creating, changing, deleting, and displaying shipper records. Additionally, you will find displaying ship via history; working with, creating, changing, and deleting shipper items; and working with SCF ship via values.
- [Working with SCF Codes \(WSCF\)](#) describes creating Sectional Center Facility (SCF) codes.
- [Working with SCF/Ship Via Values \(WSHV\)](#) explains how to create, change, delete, and display these codes.
- [Working with Shipping Rates \(WSHR\)](#) includes creating, changing, deleting, and displaying shipping rates.
- [Working with Drop Points \(WDPT\)](#) describes creating, changing, deleting, and displaying these codes.
- [Editing Warehouse Drop Points \(EWDP\)](#) describes creating, changing, and deleting warehouse drop point information.
- [Editing SCF Ship Via \(ESSV\)](#) describes how to create, change, or delete multiple SCF/ship via values quickly.

- [Working with Dunnage Weight \(WDUN\)](#) describes creating dunnage weights based on the cube of the items on a pick slip, and changing and deleting dunnage weights.
- [Working with Zip/Ship Via \(WZSV\)](#) describes how to cross-reference default shippers for specific destinations based on zip code; this allows you to assign carriers automatically.
- [Working with Tax Jurisdiction \(WTXJ\)](#) describes how to create and work with special tax jurisdiction areas, defined by zip code.
- [Working with Weight Tables for Order Weight \(WFTB\)](#) describes how to create and work with freight tables for the Freight by Order Weight freight method defined for a source code.
- [Working with Offer Ship Via Assignment \(WSVA\)](#) describes how to create and work with ship via overrides based on offer or source code, order or merchandise dollar total, and geographical area.
- [Working with Lines of Business \(WLOB\)](#) describes how to create and work with line of business codes and assignments and explains how the system assigns a line of business to an order.
- [Displaying the Line of Business Order Queue Summary \(DLOQ\)](#) describes the statistics on the Display Line of Business Order Queue Summary screen and explains how the system updates the information on this screen.
- [Creating SCF Ship Vias by SCF Range \(MSSV\)](#) describes how to create SCF ship via information for a selected SCF range, rather than entering this information for each SCF or drop point.
- [Load USPS Zip Code File \(LZPS\)](#) describes how to upload current postal code information from a CD provided by the U.S. Postal Service.

Interface with Order Orchestration's Supplier Direct Fulfillment Module: Overview and Setup

Oracle Retail Order Orchestration's Supplier Direct Fulfillment is a module of Order Orchestration that provides a collaborative, browser-based environment for retailers and vendors to share order, customer, and shipping information related to drop ship processing, and to automatically process drop ship orders. Order Orchestration is an Oracle application that provides distributed order fulfillment through its Order Broker module.

You can integrate with Order Orchestration's Supplier Direct Fulfillment module to fulfill drop ship purchase orders with any number of vendors, and at the same time use Order Administration to fulfill drop ship purchase orders with other vendors.

Order Orchestration and its Supplier Direct Fulfillment module are sold as a separate product. For more information about purchasing Order Orchestration, contact your Oracle representative.

For more information: See [Supplier Direct Fulfillment Processing](#) for details on process flows and the communication between Order Administration and Order Orchestration's Supplier Direct Fulfillment module.

In this topic:

- [Integration with Order Orchestration's Supplier Direct Fulfillment Module: Overview](#)

- [Setup for Integration with Order Orchestration's Supplier Direct Fulfillment Module](#)
 - [System Control Values Related to Order Orchestration's Supplier Direct Fulfillment Module](#)
 - [Related Secured Features](#)
 - [Related Menu Options](#)
 - [CDC Async](#)
 - [Property Settings for the Supplier Direct Fulfillment Integration](#)

Integration with Order Orchestration's Supplier Direct Fulfillment Module: Overview

Although Order Administration allows you to process drop ship orders in several ways, manual intervention is required to complete the business processes. The interface with Order Orchestration's Supplier Direct Fulfillment module creates a bridge between Order Administration and the Order Orchestration application so you can exchange information with drop ship vendors via the internet, track transactions, and automate the business process, without the need for manual intervention.

The interface with Order Orchestration's Supplier Direct Fulfillment module automatically sends drop ship purchase order information to Order Orchestration, which makes the information available to your vendors, creates packing slips when the vendors pull orders, and sends tracking and transaction information back to Order Administration. The interface bridge uses one of Order Orchestration's web services to pass information between the two systems.

Vendor Portal: Order Orchestration provides both the screens that you, as the retailer, use for configuration and inquiry, and also a separate Vendor Portal where vendors can log in and work with their assigned purchase orders; the tasks available include printing pack slips and confirming shipments. The Vendor Portal typically resides on a separate server outside your firewall.

Vendor integration: Optionally, you can enable a vendor to integrate with Order Orchestration in order to receive purchase orders and confirm shipments without the requirement to use the Vendor Portal screens for these tasks.

The interface in Order Administration enables you to:

- Identify vendors for whom you use Order Orchestration to process drop ship orders based on the *Drop ship output* setting in the Vendor table.
- Create or update vendor name and information in Order Orchestration based on the information in Order Administration.
- Use retail brands to identify the logos to print on packing documents, and sort purchase orders for review, pack slip generation, and shipment.
- Process drop ship orders using the [Selecting Vendors for Drop Ship Processing \(MDSP\)](#) menu option and:
 - Automatically create and send drop ship purchase orders to Order Orchestration, where they are available to their associated vendors.
 - Through Order Orchestration, automatically send email notifications to your vendors to inform them that there are purchase orders to be selected and fulfilled.
- From [Order Inquiry](#) or [Purchase Order Inquiry \(MPOI\)](#):
 - Initiate a request to cancel a drop ship item.

- Through Order Orchestration, automatically send an email notification to your vendor regarding the cancel request.
- Automatically cancel the drop ship purchase order line when the vendor accepts a cancel request.

Note:

If you send a cancel request before the vendor has begun working on the purchase order, Order Orchestration cancels the purchase order line automatically.

- Track the status of Order Orchestration drop ship orders to identify when they have been:
 - Created in Order Administration and sent to Order Orchestration.
 - Received by Order Orchestration but not yet selected by the vendor for fulfillment.
 - Updated by the vendor, including changes to the due date or to the hold status of a purchase order line.
 - Updated with information sent from Order Administration, such as cost changes or address changes.
 - Selected by the vendor for fulfillment.
 - Canceled or had a cancel request denied.
 - Shipped by the vendor.
- When you process backorder cards:
 - You can generate backorder notices with a meaningful expected ship date based on *Vendor lead days* and [Drop Ship Lead Days \(H36\)](#).
 - Optionally, send immediate backorder notices.

For more information: See [Supplier Direct Fulfillment Processing](#).

Setup for Integration with Order Orchestration's Supplier Direct Fulfillment Module

Purpose: Setup in Order Administration for integration with Order Orchestration's Supplier Direct Fulfillment module includes:

- [System Control Values Related to Order Orchestration's Supplier Direct Fulfillment Module](#)
- [Related Secured Features](#)
- [Related Menu Options](#)
- [CDC Async](#)
- [Property Settings for the Supplier Direct Fulfillment Integration](#)

In addition, you need to complete configuration in Order Orchestration. See [Setting Up Data for the Supplier Direct Fulfillment Module](#) in the Order Orchestration online help for more information.

System Control Values Related to Order Orchestration's Supplier Direct Fulfillment Module

System Control Value	Description
Drop Ship Integration Values (H20)	This umbrella system control value defines whether your system uses an interface to transmit information to Order Orchestration for processing drop ship orders. Also, you can use this screen to specify the system code identifying your company in Order Orchestration, and the location code identifying your default warehouse in Order Orchestration.
Use OROB Drop Shipping (H13)	Controls whether the CDC Async will become active, and whether you can set the Drop ship output field for a vendor to OROB drop shipping for integration with Order Orchestration's Supplier Direct Fulfillment module.
Drop Ship Lead Days (H36)	The number of days you want to add to the date passed to Order Orchestration to calculate <i>Expected ship date</i> in Order Administration.
OROB System (K50)	The code identifying your company as a system in Order Orchestration. Used in all communication with Order Orchestration.
OROB Default Location (K51)	The code identifying your default warehouse as a location in Order Orchestration. Used in the CreateDSOrder message to create a purchase order in Order Orchestration.
OROB Account (K49)	The name of the Order Orchestration database, as specified in the <i>Account</i> field at the Tenant screen in version 5.1 or later of Order Broker, or Order Orchestration. In prior Order Broker releases, the account is specified in the <code>locate-config.properties</code> file on the Order Orchestration server. This account name is passed as the <i>destination</i> in messages to Order Orchestration. NOTE: <ul style="list-style-type: none"> The Order Orchestration integration with Order Orchestration also uses the OROB Default Location (K51) system control values. The Drop Ship Integration Values (H20) also includes the OROB Account (K49) system control value; however, this system control value is not used by the Drop Ship Module integration.
Additional system control value: Allow Only Single Line on Drop Ship PO (M13)	If this system control value is selected, the system generates a separate drop ship purchase order for each item when you use Selecting Vendors for Drop Ship Processing (MDSP) .
System Control Values Related to Drop Ship Integration Backorder Card Processing	NOTE: System control values <i>FTC - Number of Days to Add for Special Handling (C67)</i> and <i>FTC - Number of Days to Add for Drop Ships (C68)</i> , and <i>Number of Days to Delay Initial Backorder Notice (D89)</i> , which define values used for drop ship processing within Order Administration rather than through an integration. For additional system control values related to backorder card processing for all items, see Purchase Order Layering and Backorder Notifications .
Unconditional Suppression of Backorder Card (F19)	Deselect this system control value if you want to generate backorder notices for any items, including drop ship items.

System Control Value	Description
Backorder Card Print Program (D04)	Must be set to a valid program (the standard program is BOCARDS).
Drop Ship Lead Days (H36)	The number of days you want to add to the date passed to Order Orchestration to calculate <i>Expected ship date</i> in Order Administration.
FTC -- # of Days for Items without Expected Ship Date (C71)	The number of days the system will add to the backorder card processing date to create a new expected ship date.

Related Secured Features

Secured Feature	Description
Order Maintenance Access (A22)	You must have authority to this secured feature to initiate a cancel request.
Cancel OROB Drop Ship PO (J04)	Users with authority to this secured feature can cancel a drop ship purchase order using the Cancel option on the PO Maintenance - Maintain Detail Screen .

Related Menu Options

Menu Option	Description
Working with Drop Ship Background Jobs (WPBJ)	Use this option to start and stop the CDC async job, which processes drop ship transactions and updates passed between Order Administration and Order Orchestration.
Working with Retail Brands (WRBD)	<p>Use this option to create and maintain retail brands, and associate them with one or more entities in your company. You must set up at least one retail brand in order to integrate with the Supplier Direct Fulfillment module. Each retail brand must be associated with at least one entity. Entities are associated with divisions; the source code on an order must point to the division associated with the entity for which you have set up retail brands. See Working with Retail Brands (WRBD) for more information.</p> <p>NOTE: <i>Retail brands</i> appear on Order Orchestration screens as <i>Brands</i>.</p> <p>In Order Orchestration, you can use brands to specify a logo, packing slip messages, and a pack slip and pull sheet form type. Also, the vendor can restrict the display of purchase order information, or the purchase orders selected for pack slip generation.</p>

Menu Option	Description
Creating and Working with Items (MITM)	<p>Vendor item: The information for the vendor item, including the vendor item code, description, price, ship via, lead days, and unit of measure, defaults to the purchase order. If you do not set up a vendor item, the item number and description are passed as the vendor item ID and vendor item description in the CreateDSOrder message to create the purchase order generated through Selecting Vendors for Drop Ship Processing (MDSP), and the PO and vendor unit price are from the item/SKU's cost.</p> <p>Vendor item ship via: The ship via defined for the vendor item of the first line on a drop ship purchase order defaults to the header of a purchase order sent to Order Orchestration's Supplier Direct Fulfillment module; otherwise, if no ship via is defined for the vendor item on the first purchase order line, the ship via from the sales order header is assigned.</p> <p>Ship weight: The item or SKU's ship weight or sell weight defaults when the vendor uses the Integrated Shipping screen in the Vendor Portal to confirm shipment. From the:</p> <ul style="list-style-type: none"> • <i>Ship weight</i> from the SKU, if any; otherwise, the • <i>Ship weight</i> from the item, if any; otherwise, the • <i>Sell weight</i> from the SKU, if any; otherwise, the • <i>Sell weight</i> from the item, if any; otherwise, no weight is passed. <p>To Send Backorder Notices</p> <p>The Suppress backorder card field in the SKU table must be unselected for the item.</p>
Working with Vendors (WVEN)	<p>For each vendor who will use Order Orchestration's Supplier Direct Fulfillment module to process your drop ship orders, set the <i>Drop ship output field</i> on the Second Create Vendor Screen to OROB drop shipping. You also need to enter an email address for the vendor in the Vendor Contact table.</p>
Working with Entities (WENT)	<p>Use the <i>Retail brand</i> field on the Create/Change/Display Entities screens to associate a retail brand with an entity. Not displayed if the Use OROB Drop Shipping (H13) system control value is unselected. See Working with Retail Brands (WRBD).</p>
Downloading Drop Ship Vendors (ECSV)	<p>Use this option to transmit new or changed vendor information to Order Orchestration for all vendors whose <i>Drop ship output</i> field is set to OROB drop shipping. See the Order Administration Web Services Guide on My Oracle Support (ID 2953017.1) for the information sent to Order Orchestration through this menu option.</p>
Displaying Unprocessed Drop Ship Items (DUDS)	<p>Use this option to review all drop ship order detail lines that have been entered but not yet processed through the Selecting Vendors for Drop Ship Processing (MDSP) menu option.</p>
Working with Drop Ship Errors (WDSE)	<p>Use this option to review errors that occurred during the integration with the Supplier Direct Fulfillment module and delete the records in error from the CSF Transaction table (FLCSFT).</p>

Menu Option	Description
Printing Drop Ship Reports (PDSR)	Use this option to print the following reports: <ul style="list-style-type: none"> • Drop Ship Integration Items on Hold from Vendor Report • Drop Ship Integration Items with Revised Due Date Report • Drop Ship Integration Items Pending Cancellation Report • Drop Ship Integration Items Confirmed Cancellation Report • Drop Ship Integration Items Sent to Integrated System Report • Drop Ship Integration Items Pending Shipment Report • Drop Ship Integration Items Shipped Report

CDC Async

The CDC async job processes drop ship transactions between Order Orchestration and Order Administration. For each company that has the [Use OROB Drop Shipping \(H13\)](#) system control value selected, and for each vendor whose *Drop ship output field* is set to OROB drop shipping, the job processes:

- sending address changes to Order Orchestration (SetDSAddressChange message)
- sending cost changes to Order Orchestration (SetDSCostChange message)
- sending cancellation requests to Order Orchestration (SetDSCancel message)
- requesting activity updates from Order Orchestration (GetDSChanges message)

See the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1) for examples of these messages and additional background.

The CDC async job does not send new purchase orders (the CreateDSOrder message) or new/updated vendors (the CreateDSVendor message) to Order Orchestration. See [Sending Drop Ship Purchase Order Information to the Supplier Direct Fulfillment Module](#) and [Downloading Drop Ship Vendors \(ECSV\)](#) for information on these processes.

You can start and stop the CDC async job using the [Working with Drop Ship Background Jobs \(WPBJ\)](#) menu option. The CDC async job should be stopped and started each day.

Note:

You can start the CDC async job only if the [Use OROB Drop Shipping \(H13\)](#) system control value on the [Drop Ship Integration Values \(H20\)](#) is selected for at least one company in your environment.

For more information: See [Troubleshooting the CDC Async Job](#) for troubleshooting steps.

Property Settings for the Supplier Direct Fulfillment Integration

Complete the following settings in [Working with Customer Properties \(PROP\)](#).

- `OROB_PURCHASING_SERVICES_MESSAGE_VERSION`: Specifies the outbound message version to send to Order Orchestration for integration with the Supplier Direct Fulfillment module. Should be set to 4.5 or higher.

- **OROB_PURCHASING_SERVICES_WSDL_LOCATION:** Needs to specify the endpoint for the Purchasing Services web service. This entry should be set to `https://SERVER:8443/Locate/PurchasingServices`, where `SERVER` is the name of your Oracle Retail Order Orchestration server.
 - Required if you are integrating with Order Orchestration's Supplier Direct Fulfillment module.
 - If the purchasing web service requires basic web service authentication, you must define a valid web service authentication user and password in [Working with Web Service Authentication \(WWSA\)](#), or define a client ID if using OAuth.
- **OROB_PURCHASING_SERVICES_MAX_UPDATES:** Indicates the maximum number of drop ship updates for Order Orchestration to include in drop ship status inquiry responses. For example, you might set this number to 100 to prevent a large number of status updates from impeding system performance. If this property is blank, Order Orchestration does not limit the number of updates included in the response message.
- The **OROB_SERVICES_WSDL_LOCATION** property needs to specify the endpoint for the Services web service. This entry should be set to `https://SERVER:8443/Locate/LocateServices`, where `SERVER` is the name of your Oracle Retail Order Orchestration server.

For more information: See [Order Orchestration Configuration](#) for configuration requirements related to integration with Order Orchestration's Order Orchestration.

Shipping Zone Reservation

Topics in this part:

- [Shipping Zone Reservation Overview](#) provides a brief overview of the shipping zone reservation process, and provides a flow chart of the process of order entry for zone reservation items.
- [Creating and Maintaining Geographic Zones \(WGZN\)](#) describes how to set up and maintain geographic zones using zip codes or SCF codes.
- [Creating and Maintaining Zone Reservation Codes \(WZRC\)](#) shows you how to set up and maintain the zone reservation codes that will be assigned to weather-sensitive items to insure that they will ship at an optimal time for planting in the regions to which they are going.
- [Creating and Maintaining Zone Reservation Dates \(WZRD\)](#) describes zone reservation date windows and shows you how to set up and maintain zone reservation dates.

- [Establishing Security](#)
- [Using the Menu Driver](#)
 - [System Control Values and Number Assignments](#)
- [Setting Up Secured Features](#)

Establishing Security

Topics in this part:

- [Security Shell Components](#) provides an overview of the security features on the system.
- [Working with Companies \(WCMP\)](#) describes how to create a company and control security by company.
- [Setting Up User Classes \(WUCL\)](#) describes how to create user classes and control access to menus and menu options by groups of users. This topic also describes how to assign authority to companies, menu options, secured features and user-defined functions for a user class.
- [Working with User Records \(WUSR\)](#) describes how to create user profiles and control access to menus and menu options by individual user. This topic also describes how to assign authority to companies, menu options, secured features and user-defined functions for an user individual user.
- [Working with Threshold Values \(WTHR\)](#) describes how to create threshold values for defined functions in the system.

Security Shell Components

Purpose: Some security features in the system are set by Order Administration, while others require decisions and planning by your system administrator or security officer. You are not required to use every security feature that the system offers. Your company procedures will determine which features you need to implement.

It is recommended that you read this entire topic before performing any security related activities. Since access to system options relies on the level of security each user is assigned, security implementation requires well thought-out procedures.

In this topic:

- [Understanding System Security](#)
- [Security Levels](#)
- [Security Considerations](#)
- [Security Requirements](#)
- [Companies](#)
- [User Records](#)

- [Optional Security Procedures](#)
- [Security Procedures](#)

Understanding System Security

Security Levels

Security is established in three aspects of the system:

- Application security
- Menu security
- Feature security

Application security: (Defined by Order Administration.) Order Administration delivers the software with a built-in security code you must enter to operate the software. This code is generated by Order Administration and is provided to you at installation time. At installation, the menu driver checks the code you enter against the Order Administration code. If a mismatch is found, the menu driver does not allow you to access the software.

Menu security: Menu security is initially defined by Order Administration, until you change authority levels when setting up user records (and user classes, if applicable).

Access to menus depends upon whether the system is delivered in a 'closed' or 'open' environment. In a closed environment, users are not allowed to access a menu option until they are granted authority. In an open environment, all users are allowed access to menu options unless they are specifically prohibited by the authority level in their user or user class record.

You establish authority to menu options through user records and, if applicable, to user classes. Access to companies, secured features, and user defined options is also established at the user and user class level.

Feature security: You can establish feature security by user and user class, and also by individual feature. A feature is a procedure or action that occurs within a function. For example, the ability to maintain batch totals and override prices in the Order Entry function are examples of secured features.

The system allows you to assign a company-wide authority level to a single secured feature. A feature's authority level (*ALLOW, *EXCLUDE, or *DISPLAY) replaces the need for passwords for these features. If you permit authority to all features in the system, all users can perform the feature unless a user is specifically excluded from a feature on the user record or user class level.

Security Considerations

Before you begin: Read this entire topic. You'll find that some security setup is required, while other features are optional (although you might consider some optional features important to your business). Certain features require prior setup before you can use others. For example, user classes are not required, but if you plan to use them, you must establish user classes before setting up your user records, which is a required component of the system.

What is required? First, you must have access to the system and define yourself as the system administrator in your user record (selected System Administrator field). This means that you have access to all menu options, system control values, and secured features on the system, and that you have the authority to create user records and assign authority levels. At a minimum, you must:

- Create your primary company (and other companies if you are working in a multi-company environment)
- Create user records for all personnel who will use the system and assign company authority
- Define the system control values necessary to the running of your company

What is optional?

- Creating user classes
- Assigning menu option, secured feature, and user defined authority to individual users or user classes
- Creating menu options
- Creating and tailoring menus
- Creating additional application areas and application groups
- Setting up user defined functions

Security Requirements

Purpose: The security components you must set up to use the system are companies, user records, and system control values.

For more information:

- [Working with Companies \(WCMP\)](#)
- [Working with User Records \(WUSR\)](#)
- [User Configuration](#) in the Administration Guide
- [System Control Table Components](#).

Companies

Companies are single, isolated sets of data: an organization's financial information, inventory, and customers. The majority of tables includes COMPANY in the key, so you can establish unique sets of data without having separate libraries, although you can use separate libraries if you wish

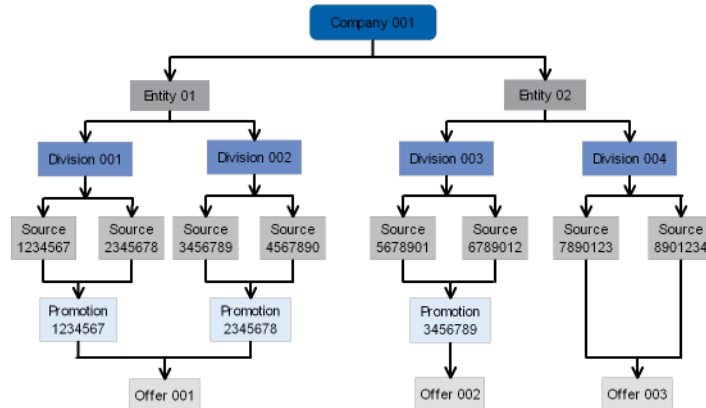

The tables that are not company-specific, but rather database-specific include:

- ZIP table. See [Setting Up the Zip/City/State \(Postal Code\) Table \(WZIP\)](#)
- Application Area table. See [Setting Up Application Areas](#)
- Application Group table. See [Setting Up Application Groups](#)
- Menu table. See [Customizing Menus \(WMNU\)](#)
- User table. See [Working with User Records \(WUSR\)](#)

If your company is providing fulfillment services for other companies, you can set up a separate company for each client you serve.

When should you create more than one company? You must create another company when you do not want data, (for example sales analysis figures, items, customers) to mix with another company's data. If you only want to separate sales analysis, you can handle that through entities and divisions. See [Sales Reporting Hierarchy](#)

Sales Reporting Hierarchy

User Records

User records allow an individual to sign on and access all or some of the features of the system. A user can be a customer service representative, an order entry operator, or a system administrator. Each user on the system must have both a user profile and a user control record.

What settings are in the user control record? The user control record (available through the Work with Users option) specifies the user's:

- ID code (the code that identifies the user to the system)
- authority to options available under My Jobs, My Docs, and Advanced Commands, including working with other user profiles or having access to other users' jobs
- name
- user class (optional), such as customer service representative or warehouse staff
- default menu (the first menu that appears when the user signs on to the system)
- default company (the company where a user automatically works after signing on to the system)
- default authority level (indicating either default global access to or exclusion from menu options and secured features)
- whether the user advances automatically to the [Customer Selection Screen](#) in order entry
- authority to companies, menu options, secured features and user defined functions

Background: See [User Configuration](#) in the Administration Guide for step-by-step instructions on how to set up users, and for additional setup scenarios.

System Control table: The System Control table is where you define many of the processing characteristics of the system. The options in this table are used to control special system information, such as:

- How the system will calculate pricing in Order Entry
- How SKU information will appear
- Whether you will use Cart/Bin picking
- How you will assign purchase order numbers

The information defined in the System Control table is confidential and critical to the operation of your system. Access to the System Control table is restricted to users who have system administrator access. This table should not be available to all users.

Optional Security Procedures

User classes are logical groupings of users, for example all Order Entry operators. Like the individual user record, a default menu and default company can be assigned so that all users in this user class will sign on to the same menu and work within the same company. Authority to companies, menu options, secured features and user defined functions can also be assigned at the user class level.

See [Setting Up User Classes \(WUCL\)](#).

Why use user classes? If you want all your Order Entry operators to have the same level of authority and access to the system, you might want to create a user class where you define the defaults that will apply to all users in this class. As you create user records, you need only assign the user class that you have created to each Order Entry user record. In this manner, classes can be established and assigned for each group of users in your company.

Note:

The authority level assigned to an individual user's record always overrides the authority defined in the user class record.

Creating menu options: Order Administration delivers a complete set of menus and menu options, but allows you to create options for commands, programs, and processing functions that you can add to existing menus, or menus that you create through the [Customizing Menu \(WMNU\)](#) menu option.

If you plan on creating menu options, you will need to do this before you can add them to an existing menu.

Creating or customizing menus: The system allows you to create your own menus or customize existing menus, by adding menu options or changing the arrangement of options on a menu. While menus are organized according to application, you might want to create a menu that only includes the options to perform certain specific tasks, such as customer service activities.

Security Procedures

Security Component	Status
Create a user profile record establishing yourself as the System Administrator. See User Configuration in the Administration Guide.	Required
Create company if in a single company environment, or more than one if in a multi-company environment. See Working with Companies (WCMP) .	Required
Create user classes, if you plan to group users according to user class. See Setting Up User Classes (WUCL) .	Optional
Define system control values. See System Control Table Components .	Required
Define secured features. See Setting Up Secured Features .	Required
Define company authority. See Setting Up User Classes (WUCL) and Working with User Records (WUSR) .	Required

Security Component	Status
Define menu option authority. See Setting Up User Classes (WUCL) and Working with User Records (WUSR)	Optional
Define secured feature authority. See Setting Up User Classes (WUCL) and Working with User Records (WUSR)	Optional
Define user-function authority. Working with User Records (WUSR) .	Optional
Create menu options. Delivered with the system, although you can create others. See Setting Up Menu Options (WOPT) .	Optional
Create menus. Delivered with the system, although you can create others. Customizing Menus (WMNU) .	Optional
Create application groups. Setting Up Application Groups .	Optional
Create application areas. Delivered with the system, although you can create others. Setting Up Application Areas .	Optional

Using the Menu Driver

Topics in this part: The following topics describe how to create and customize menus for individual or groups of users.

- [Menu Driver Screen](#) describes the features and functions of the Menu Driver.
- [Setting Up Menu Options \(WOPT\)](#) describes how to create and change menu options and their descriptions.
- [Customizing Menus \(WMNU\)](#) describes how to create and change menus, copy menus, and define menu details.
- [Setting Up Application Areas](#) describes how to create and change application areas and their descriptions.
- [Setting Up Application Groups](#) describes how to create and change application groups and their descriptions.
- [Working with Announcements \(WANN\)](#) describes how to set up the announcements to display on the home menu.

Note:

This part assumes that the individual performing the tasks described here has the appropriate security and authority to access all features and functions. For information on system and application security and authority setup, see [Establishing Security](#).

The Menu Driver checks the initial security code provided by Order Management System at the time of installation. If a mismatch is found, the Menu Driver does not allow access to the software.

Menu Driver Screen

Purpose: You can use any menu in the system to advance to a different menu or a menu option, scan for menus and menu options, display current order statistics, and advance to administrative options.

Some important features of the menu driver include:

- Quick Find Options: Fast Path, Menu selection, and menu advancement
- Link to log out of Order Administration
- Announcements
- Charts depicting open and held order dollar totals
- Company logo and default company image
- Order and shipment statistics for the day, week, month, year, and previous year, or a company-specific image for users who do not have authority to view this information
- Standard icons to change companies, advance to administration screens (My Docs, My Jobs, My Forms), or open the online help
- If the current company is not flagged as an Active company, the screen displays a message: This company is flagged as inactive and should not be used to process live orders. See the [Change Company Screen](#) for information on setting this flag.

Modern View: OACS Modern View is a separate component of Order Administration and includes the Contact Center. Your user configuration controls whether you advance automatically to Classic View or Modern View when you first log in.

Contact Center: A component of Modern View that provides the ability to create, work with, or review orders.

The [System Options](#) provide an option to advance to Modern View.

The screenshot displays the Oracle Menu Driver interface. At the top, there is a blue header with the 'Company' name and a set of icons. Below the header, the interface is divided into several sections:

- Quick Find Options:** Includes 'Fast Path' and 'Menu' input fields.
- Announcements:** A section with the text 'Hello, Example' and the Oracle logo below it.
- Order Amounts:** Two pie charts showing 'Open Order Recap Amount' and 'Held Order Recap Amount' as of 03/01/19. Each chart has a legend for Backordered, Reserved, and Printed.
- Order Stats:** A table showing order statistics for 03/19/19.
- Navigation:** A vertical menu on the left with options like 'HOME', 'Order Entry Menu', 'Customer Service Menu', etc., and a 'Log Off' button at the bottom.
- System Options:** A button in the top right corner.

Annotations with lines pointing to specific elements include: 'quick find options', 'company name', 'announcements', 'system options', 'open, held order recap dollars', 'company logo', 'order statistics', and 'other options'.

Period	Number	Ordered Units	Amount
Today	0	0	0.00
This Week	6	14	140.00
This Month	21	79	669.00
Y.T.D	61	377	2,668.00
2018	0	0	0.00

 **Note:**

When you sign on to the system, you advance to your default menu. To display the HOME menu (if it is not your default menu, or to return to it from a different menu), enter HOME in the Menu field.

In this topic:

- [Quick Find Options](#)
- [Announcements](#)
- [Company Logo](#)
- [System Options](#)
- [Open, Held Order Recap Amounts](#)
- [Order Statistics](#)
- [Other Options](#)

Quick Find Options

Purpose: Use the quick find options to advance to a menu option or a menu.

Quick Find Options	
Fast Path	<input type="text"/>
Menu	<input type="text"/>

HOME
Accounting Menu
Menu Maintenance
Purchase Order
Order Entry Menu
Periodic Processing Menu
Inventory
Background Jobs
Utilities Menu
Top Menu
Previous Menu

For more information: See Menu Driver Screen for the location of the quick find options, and links to other options available at the Menu Driver screen.

Field	Description
Fast Path	<p>Use this field to enter a unique code for a menu option, providing direct access without advancing through the menus. Each option on the system has a Fast Path name.</p> <p>For example, if you enter MITM in the Fast Path field, you advance to Work with Items/SKUs.</p> <p>If you do not know the option name, you can click on the arrow. You advance to the Select Menu Options Window, where you can search and select the desired option.</p> <p>When accessible to the user, the Fast Path and Menu fields can be displayed or hidden by selecting Toggle Fast Path/Menu.</p> <p>The Fast Path setting in the user's record controls whether menus display the Fast Path field. See User Configuration in the Administration Guide.</p> <p>Modern View options: Menu options with a Type of Modern View are not available in Order Administration Classic View. If you enter the Fast Path for a Modern View option, the screen displays an error.</p> <p>Alphanumeric, 4 positions; optional.</p>
Menu	<p>Use this field to enter a unique menu name to advance it directly without advancing through the menu tree. For example, if you enter INVENTORY in the Menu field, you advance to the Inventory Menu.</p> <p>If you do not know the menu name, you can click on the arrow to advance to the Select Menu Window, where you can search and select the desired menu.</p> <p>The Fast Path setting in the user's record controls whether menus display the Menu field. See User Configuration in the Administration Guide.</p> <p>Alphanumeric, 10 positions; optional.</p>
Menu	<p>The short name of the current menu.</p> <p>Alphanumeric, 10 positions; display-only.</p>
Menu names	<p>Use the links below the current menu name to advance through the menu tree to select a different menu or a menu option. The description of each menu or menu option assigned to the current menu through the Customizing Menus (WMNU) option is available for selection. For example, the Periodic Processing menu is assigned to the HOME menu. If you select this menu, the menus and menu options assigned to the Periodic Processing menu (such as Work with Periodic Processes) are listed. See Customizing Menus (WMNU) for information on assigning menus and menu options to menus.</p> <p>Modern View options: Menu options with a Type of Modern View are not available in Order Administration Classic View, and are not displayed if they are included in the current menu.</p> <p>Menu description: alphanumeric, 20 positions; optional.</p> <p>Menu option description: alphanumeric, 40 positions; optional.</p>
Top Menu	<p>Use this option to return to the Default menu from your user profile, as set up through Working with User Records (WUSR). See User Configuration in the Administration Guide for background.</p>
Previous Menu	<p>Use this option to return to the previously displayed menu.</p>

Announcements

Purpose: [Working with User Records \(WUSR\)](#)), and any announcements that you have set up through the [Working with Announcements \(WANN\)](#) menu option.

For more information: See [Working with Announcements \(WANN\)](#) for a discussion, and see Menu Driver Screen for the location of the announcements, and links to other options available at the Menu Driver screen.

Company Logo

Purpose: This area of the menu screen displays the company logo, if one has been set up; otherwise, the Oracle default company logo displays if you have not set up a company logo.

See [Setting Up Company Logos for Menu Screens and the Modern View Home Page](#) for setup information, and see the Menu Driver Screen for the location of the company logo on the screen, and for links to other options available at the Menu Driver screen.

System Options

Purpose: The upper right area of the menu screen includes various system options and information.

The system options, described below, are available at many other screens throughout Order Administration.

Option	Description
Modern View 	<p>Select this option to advance to Modern View, including the Contact Center. This option is not available at all screens. For example, it is available at the menu screen and at the initial search screen in order inquiry, but not at any subsequent screens in order inquiry.</p> <p>Retain company? When you advance to Modern View, the currently selected company is retained. For example, if your default company is company 2 but you had previously selected company 1, when you advance to Modern View, company 1 is retained.</p> <p>However, if you select a different company in Modern View, when you return from Modern View to Classic View, the company selected in Modern View is not retained. For example, if you were working in company 1 in Classic View and then selected company 2 in Modern View, you return to company 1 in Classic View.</p> <p>Note: If you do not have sufficient authority to review or work with orders, no customer or order search options are available. Contact your system administrator if this occurs.</p>

Option	Description
Change Company 	Select this option to display the Select Company window, where you can select another company to work in. Your user profile controls the companies available for selection at this window; See User Configuration in the Administration Guide for more information. This option is not available at all screens. For example, it is available at the menu screen and at the initial search screen in order inquiry, but not at any subsequent screens in order inquiry.
My Docs 	Select this option to advance to the Document Management (My Docs) screen.
My Jobs 	Select this option to advance to the Job Management (My Jobs) screen.
My Forms 	Select this option to advance to the Forms Management (My Forms) screen.
Help 	Select this option to display the online help in a separate browser window. When you select this option from a menu screen, it displays the Contents page. Trouble with online help? If online help pages are slow to load or if the search function doesn't work correctly, try clearing the browser's cache or history.

For more information: See the Menu Driver Screen for the location of the system options, and links to other options available at the Menu Driver screen.

Open, Held Order Recap Amounts

Purpose: These pie charts on the menu screen provide a graphical “snapshot” of your open and held orders as of the last time the Batch Order Control (ORD_CONTRL) job ran on or since the displayed current date.

Operations Control totals: These totals are also available for review at the [First Operations Control Summary Screen](#) in the [Reviewing Operations Control Summary \(FLSH\)](#) menu option.

User authority to order totals: The [Display Order Statistics and Recap \(J03\)](#) secured feature controls whether a user sees these totals and the [Order Statistics](#), a default company-specific image, or a blank area. See [Setting Up Menu Driver Images for Companies](#) for more information on setting up these images for users who do not have authority to view the open and held order totals.

Date displayed: The current date always displays in the user's date format.

Example: Today is August 27, and the charts display the Order Recap information from the [First Operations Control Summary Screen](#) as of the last time you ran the Batch Order Control job today. If the current time is 10:00 a.m. and you last ran the Batch Order Control job at 8:30 a.m., the charts display the totals from 8:30.

Updating the totals: If you use the [Reviewing Operations Control Summary \(FLSH\)](#) menu option to update current totals, the system submits the Batch Order Control job. Until this job has finished running, the totals will not be accurate. You can refresh (press F5) or review the job status at the [Job Management \(My Jobs\)](#) screen. There are also situations when the Batch Order Control job starts automatically; see [Reviewing Operations Control Summary \(FLSH\)](#) for an overview.

Totals mapping: Each of the totals that make up the pie charts is also listed on the bottom half of the [First Operations Control Summary Screen](#):

- Open Order Recap Amount pie chart
 - Backordered = [OBO \(Open/backordered\)](#) amounts
 - Printed = [Opn/Prt \(Open/Printed\)](#) amounts
 - Reserved = [Opn/Rsv \(Open/reserved\)](#) amounts
- Held Order Recap Amount pie chart:
 - Backordered = [HBO \(Held/backordered\)](#) amounts
 - Printed = [Hld/Prt \(Held/printed\)](#) amounts
 - Reserved = [Hld/Rsv \(Held/reserved\)](#) amounts

For more information: See [Reviewing Operations Control Summary \(FLSH\)](#) for background on Order Control Summary processing, and see [Menu Driver Screen](#) for the location of the Open, Held Order Recap Amount pie charts, and links to other options available at the Menu Driver screen.

 **Note:**

This area of the Home screen is blank when you select a company that does not yet have any existing orders.

Order Statistics

The setting of the FLASHPIECHARTS setting in [Working with Customer Properties \(PROP\)](#) defines the order statistics that display on the Menu Driver Screen.

- FLASHPIECHARTS = The order statistics section of the menu screen displays total numbers and amounts of orders created by the current date, current week,

current month, year to date, and previous year. Use this setting if the [Delay Billing Updates \(K85\)](#) system control value is selected.

Order Stats		17/11/16		
Period	Number	Ordered Units	Amount	
Today	0	0	0.00	
This Week	0	0	0.00	
This Month	0	0	0.00	
Y.T.D	315	690	46,526.24	
2016	86	141	2,062.42	

- **FLASHPIECHARTSFULL** = The order statistics section of the menu screen displays total numbers and amounts of orders created and shipped by the current date, current week, current month, year to date, and previous year. Use this setting if the [Delay Billing Updates \(K85\)](#) system control value is unselected.

Order Stats		17/11/16			
Period	Ordered		Shipped		
	Number	Amount	Number	Amount	
Today	7	4,764.14	0	0.00	
This Week	70	122,397.86	0	0.00	
This Month	102	159,222.07	19	5,541.54	
Y.T.D	217	175,382.16	25	5,750.91	
2016	108	20,620.85	31	7,465.33	

User authority to order statistics: The Display Order Statistics and Recap (J03) secured feature controls whether a user sees these statistics and the [Open, Held Order Recap Amounts](#), a default company-specific image, or a blank area. See [Setting Up Menu Driver Images for Companies](#) for more information on setting up these images for users who do not have authority to view order statistics.

Date displayed: The date always displays in the user's date format.

Continuous order updates: The background jobs update the totals displayed here throughout the day as you create and ship orders. This information corresponds to the Ord and Shp totals displayed on the top half of the [First Operations Control Summary Screen](#) in the [Reviewing Operations Control Summary \(FLSH\)](#) menu option. These totals do not include other types of order activity, such as cancels, returns, or selling out an existing order line.

Totals mapping: Each of the totals listed in the Order Statistics area is also listed on the top half of the [First Operations Control Summary Screen](#):

- Ordered
 - Number = [Ord \(Orders\)](#) Orders
 - Amount = [Ord \(Orders\)](#) Amounts
- Shipped

- Number = [Shp \(Shipped\) Orders](#)
- Amount = [Shp \(Shipped\) Amounts](#)

See the First Operations Control Summary Screen for more information.

Calculation of time periods: The time periods listed in the Order Statistics area are calculated as follows:

Date	Description
Today	The current system date.
This week	The current week runs from Monday through Sunday, and the totals displayed include all days for this period. Week crosses months and years: The calculation of totals for This week occurs regardless of whether a new month starts during the week. Example: Today is Sunday June 3. The totals displayed under This week include Monday May 28 through the current date.
This month	The totals for the current month.
Y.T.D.	The totals year-to-date.
Previous year (field name varies depending on the current year)	The totals for the previous year.

For more information: See Reviewing Operations Control Summary (FLSH) for background on the calculation of these totals, and see Menu Driver Screen for the location of the Order Statistics and links to other options available at the Menu Driver screen. Also, see [Sales Summary \(DSSS\)](#) for a menu option you can use to review shipment totals by date, week, or month, including the current day's totals broken out by order type and entity.

Other Options

Purpose: These additional options are:

- Log Off: Use this option to exit Order Administration and display the login screen.
- My Profile: Use this option to advance to the User Control screen. From this screen, you can change other user control records if you have the proper authority. The My Profile option is not available if you are using Oracle Identity Cloud Service for password authentication.

Setting Up Application Areas

Purpose: Application areas and application groups are used to group similar menu options, system control values and secured features.

Application areas categorize related functions, such as all functions that relate to the Purchase Order application area, Inventory application area, Order Entry application area, etc.

Application groups further define the functions within an application area. An example of an application area may be O/E (Order Entry); an example of an application group within the O/E application area may be FRE (freight).

When the software is delivered to you, Order Administration will have assigned application areas and application groups to menu options, system control values, and secured features in an effort to group these parameters and options by functional area.

Example: If you enter O/E in the Appl Area field and FRT in the Appl Group field, all options included within the Order Entry application area that relate to freight appear on the screen.

In this topic:

- [Work with System Values/Features Screen](#)
- [Create Application Area Screen](#)

Note:

Setting up application areas is not required to use the system. Application areas are helpful in sorting the many options the system provides by related function.

Work with System/Values Feature Screen

Purpose: Use this screen to review some of the application areas delivered with the system.

How to display this screen: Enter WSYS in the Fast path field at the top of a menu or select Work with System Values/Features from a menu.

Field	Description
Code	A code for the application area. Alphanumeric, 3 positions; optional.
Description	The application area description. Alphanumeric, 30 positions; optional.

Screen Options	Procedure
Create an application area	Select Create to advance to Create Application Area Screen
Change an application area	Select Change for an application area to advance to the Change Application Area screen. At this screen, you can only change the application area code description. See Create Application Area Screen for field descriptions.
Delete an application area	Select Delete for an application area to delete it.
Display an application area	Select Display for an application area to advance to the Display Application Area screen. You cannot change any information on this screen. See Create Application Area Screen for field descriptions.
Work with system control values	Select Control Values for an application area to advance to the Work with System Control Values Screen .
Work with secured features	Select Secured Features for an application area to advance to the Work with Secure Features Screen .
Work with application groups	Select Application Group for an application area to advance to the Work with Application Group Screen .

Screen Options	Procedure
Work with menu options	Select Menu Options for an application area to advance to the Work with Menu Options Screen .
Work with system control values by SCV code	Select SCV/Code to advance to the Work with System Control Values by Code Screen

Create Application Area Screen

Purpose: Use this screen to create an application area.

How to display this screen: Select Create on the [Work with System Values/Features Screen](#).

Field	Description
Code	The code that identifies this application area. This code can be used to sort menu options, system control values, and secured features. Example: O/E has been defined as the application area for Order Entry. Alphanumeric, 3 positions; required.
Area description	The description of this application area. Alphanumeric, 30 positions required.

Setting Up Application Groups

Purpose: You can use the Work With Application Group screen to create and change application groups and their descriptions.

Application areas and application groups are used to group similar menu options, system control values and secured features.

Application areas categorize related functions, such as all functions that relate to the Purchase Order application area, Inventory application area, Order Entry application area, etc.

Application groups further define functions within an application area. An example of an application area may be O/E (Order Entry); an example of an application group within the O/E application area may be FRE (freight).

When the software is delivered to you, Order Administration will have assigned application areas and application groups to menu options, system control values, and secured features in an effort to group these parameters and options by functional area.

Example: If you enter O/E in the Appl Area field and FRT in the Appl Group field, all options included within the Order Entry application area that relate to freight appear on the screen.

In this topic:

- [Work with Application Group Screen](#)
- [Create Application Group Screen](#)

**Note:**

Setting up application groups is not a required procedure in order to use the system. Application groups are helpful in sorting the many options the system provides by the feature to which they relate within an application area.

Work with Application Group Screen

How to display this screen: Select Application Group for an application area at the [Work with System Values/Features Screen](#).

Field	Description
Group Code	A code for the application group. Alphanumeric, 3 positions; optional.
Group description	The application group description. Alphanumeric, 30 positions; optional.

Screen Options	Procedure
Create an application group	Select Create to advance to Create Application Group Screen .
Change an application group	Select Change for an application group to advance to the Change Application Group screen. At this screen, you can only change the application group description. See Create Application Group Screen for field descriptions.
Delete an application group	Select Delete for an application group to delete it.
Display an application group	Select Display for an application group to advance to the Display Application Group screen. You cannot change any information on this screen. See Create Application Group Screen for field descriptions.

Create Application Group Screen

Purpose: Use this screen to create an application group.

How to display this screen: Select Create on the [Work with Application Group Screen](#). The application area to which this application group has been assigned, displays automatically.

Field	Description
Application area	The application area to which this option belongs. Application areas are categorized according to application/function (such as Customer Service, Order Entry etc.). Application areas allow you to sort menu options according to the application area to which they belong. Alphanumeric, 30 positions; display only.
Group Code	The code that identifies this application group. This code can be used to sort menu options, system control values, and secured features. Alphanumeric, 3 positions; required.

Field	Description
Group description	The description of this application group. An application group is a secondary category within an application area and sorts functions according to the feature to which they relate. Alphanumeric, 30 positions required.

Setting Up Offer Information

Topics in this part: The following topics describe how to set up and change offer information:

- [Introducing Offer and Source Codes](#) provides an overview of the steps you need to follow and the basic information you need to set up an offer.
- [Working with Offers \(WOFR\)](#) describes how to create and change offer information, set up free gifts, freight charges, service charges, and discounts for an offer.
- [Working with Season Codes \(WSEA\)](#) describes how to create and change season information.
- [Working with Promotions \(WPRO\)](#) describes how to create and change promotion value information, which is used in Source Code reporting.
- [Working with Source Categories \(WSCT\)](#) describes how to create and change source categories, which are used for source code reporting.
- [Working with Source Codes \(WSRC\)](#) describes how to create and change source code information, review source code history, set up free gifts, freight charges, service charges, and discounts for a source code.
- [Working with Dollar Chart by Offer \(WDCO\)](#) describes how to establish dollar discounts by offer.
- [Working with Dollar Chart by Source Code \(WDSC\)](#) describes how to establish dollar discounts by source code.
- [Initializing an Offer \(MOFI\)](#) describes how to save and then delete order history for an offer, and transfer data from one offer to another.
- [Working with Special Pricing by Source Code \(WSPP\)](#) describes how to define special price breaks for multiple items and/or source code quickly.
- [Generating Source Codes Using the Source Upload Table \(WSRW\)](#) explains how to create an Order Administration source code using information from the Source Code Work file.

About Discount Promotions

Purpose: You can set up the following types of discount promotions:

- BOGO (Buy One Get One): A discount amount or percentage, a special price, or free gift earned by ordering:

- a quantity in a particular item category or of a particular item or SKU: *BOGO (Buy One/Get One) Discount or Free Gift by Item Category or Item*
- a quantity or dollar value of items assigned to a particular price code: see *BOGO (Buy One/Get One) Discount or Free Gift by Price Code*
- *Item Category Discount*: A discount amount or percentage, or special price, applied to merchandise within a particular item category or multiple item categories.
- *Order Discount*: A discount amount or percentage applied to the order's merchandise total.
- *Freight Discount or Override*: A discount amount or percentage applied to the order's freight charges; or, a freight override amount; or free freight.
- *Additional Freight Discount*: A discount amount or percentage applied to the order's additional freight charges.
- *Tiered Discount or Free Gift*: A discount amount or percentage, or a free gift, of increasing value based on the total merchandise value of the order. For example, a tiered promotion might include an inexpensive free gift for an order of \$20.00 to \$29.99, a 5% discount for an order of \$30.00 to \$49.99, a 10% discount for an order of \$50.00 to \$99.99, and so on.

Ship Via Override: Although this is not a separate promotion type, you can also use a promotion code to assign a ship via override to an order. A ship via override can be set up as a separate promotion, or added to an order, freight, or additional freight discount promotion.

How does an order qualify? You can set up an order, freight, or additional freight promotion that will apply to every order you take; to do so, do not complete any of the qualifying fields for the promotion. The promotion can apply to the order as long as the current date falls within the date range specified for the promotion.

Use once?

For the other promotion types, or if you want to restrict an order, freight, or additional freight promotion to only certain orders, your selection criteria can include:

- source code (used on order header) *or* offer (associated with the source code used on the order header). You can also exclude source codes from a promotion by selecting the Exclude promotions field for the source code. Typically, you would exclude a source code from promotions when you have set up a promotion that specifies an offer, and you want to include most of the source codes associated with that offer except for a few.
- pay type (even if this pay type is not the only one on the order)
- merchandise total
- total item quantity (minimum or maximum)
- shipping location, such as restricting a freight or additional freight promotion to a range of SCF codes or to the continental U.S.A. (freight or additional freight promotions only)
- customer or customer price group
- order history (including first-time buyers who have never placed an order, or never received an order shipment)
- item categories

- ship via priority

 **Important:**

The system evaluates promotion qualifiers on an “all or nothing” basis; in other words, if you set up a promotion to qualify based on source code, pay type, *and* merchandise total, and an order does not match *all* of these qualifiers, none of the discounts or overrides of the promotion will apply to the order. To apply the promotion to any order matching *either* the source code, pay type, *or* merchandise total, set up a separate promotion for each.

See the [Cautions Related to Promotions](#).

Discount Promotions

BOGO (Buy One/Get One) Discount or Free Gift by Item Category or Item

BOGO promotions by item category or item apply a discount of up to 100% to an order line, apply a dollar discount or special price, or add a free item to the order. An order qualifies based on an item category's or item's ordered quantity.

Examples:

- Buy two of the same item, third one already on the order is 50% off
- Buy five within an item category, sixth one already on the order is free
- Buy any four SKU's of an item, get fifth SKU already on the order at \$1.00
- Buy five of the same item, get one free added to the order automatically

 **Note:**

Two different types of BOGO promotions: This discussion applies to BOGO promotions you set up when the [BOGO Grouping by Price Code or Category \(L62\)](#) system control value is set to *CATEGORY*. See [BOGO \(Buy One/Get One\) Discount or Free Gift by Price Code](#) for a discussion on BOGO promotions available when the [BOGO Grouping by Price Code or Category \(L62\)](#) system control value is set to *PRICE CODE*.

Discount applies to the lowest-priced item: If multiple order lines are eligible for the same entry in the BOGO promotion by item category or item, the lowest-priced eligible order line is discounted. For example, you set up a promotion for the toy item category: buy two, get one at 30% off. The customer orders two of item AB100 at \$10.00, one of item BC200 at \$12.00, and one of item CD300 at \$9.00. All these items are assigned to the specified item category. The discount applies to item CD300 at \$9.00.

Multiplying the BOGO discount: You can use the Allow mult flag so that the customer can multiply the BOGO discount: for example, buy five get one free; buy ten get two free; and so on.

BOGO promotions require an order line with the BOGO quantity: In order for a BOGO promotion by item category or item to apply to an order, there must be an order line that matches the BOGO quantity. For example, if you set up a BOGO promotion by item category or item as “buy two, get one at 50% off,” the order does not receive the 50% discount unless

there is an eligible order line with a quantity of 1. The BOGO promotion does not apply to an order with a quantity of two.

! **Important:**

If you select the Allow multiples setting for any BOGO promotions by item category or item, then the order line quantity must be 1 for every order line on an order that might be eligible for the promotion; otherwise, the BOGO promotion might not apply correctly. To help ensure that the order line quantity is always 1, you can set both the [Default Order Quantity \(B30\)](#) and [Maximum Order Quantity \(C60\)](#) system control values to 1.

Setting up multiple entries for a BOGO promotion: You can set up multiple entries for a BOGO promotion by item category or item: for example, buy two from category A, get one at 30% off; buy two from category B, get 40% off. When an order is eligible for this type of BOGO promotion, the system determines how to apply the discount as follows:

- *Entries with the same qualifying quantity:* If an order line qualifies for multiple entries (at item category, base item, or SKU level) but with the same qualifying quantity, only one of the entries applies:
 - If it is a SKU'd item, the BOGO entry set up for the base item takes precedence. If there is no entry for the base item, the entry for the specific SKU takes precedence; otherwise, the item category entry applies.
 - If it is a non-SKU'd item, the BOGO entry set up for the item takes precedence; otherwise, the item category entry applies.
- *Entries with different qualifying quantities but same qualifier:* If an order line qualifies for multiple entries for the same level (item category, base item, or SKU) but with different qualifying quantities, the promotion applies all entries for which the order line qualifies. For example, you set up a promotion with entries to buy one, get one at 50% off and buy five, get one free. If the order includes a line with a quantity of five and a line with a quantity of one, both discounts apply: the line for one unit is discounted 50% and a free line is added.
- **Preventing additional discounting:** If you specify a [Price Override Reason for Promotions \(K45\)](#), the system applies this price override reason code to order lines discounted or added free through a BOGO promotion by item category. This price override reason code prevents the order line from being discounted by any other system-applied method, in order to prevent “double dipping.” However, you can still discount these lines through the application of a coupon (set up through [Working with Coupon Promotions \(WCPR\)](#)); also, discounted lines can still count as part of the qualifying quantity, even if the pricing method is BOGO and the [Price Override Reason for Promotions \(K45\)](#) is used, as described below.

Multiple discounts for the same BOGO promotion can still apply to the order: When you create a BOGO promotion by item category or item with multiple entries, it is important to test it to make sure it is applying discounts as intended. For example, if you set up a BOGO promotion that specifies a discount for an item category and also adds a free item for a specific item, and the item is assigned to the item category, the promotion might both apply the discount and add the free item. The [Price Override Reason for Promotions \(K45\)](#) is applied to the free order line; however, the order line with the quantity of five is still eligible for subsequent discounting.

Similarly, you can set up a BOGO promotion to buy five, get one at 50% off. The promotion discounts the line with the quantity of one. However, if the order is also eligible for an item category promotion, the qualifying order line with the quantity of five can also be discounted through the item category promotion.

Does not produce negative price: A BOGO promotion by item category or item will not result in a negative price, even if the Disc \$ specified is more than the unit price of the order line.

 **Note:**

A BOGO promotion by item category or item cannot include a ship via override.

To set up a BOGO promotion by item category or item, complete the following fields at the [Create Promotion Screen](#):

- *Required:*
 - Type = *BOGO*, and
 - Priority
- *Any of the following qualifying fields (leave blank to apply to all orders that include the item category(ies) or item(s)):*
 - Source code or Offer
 - Dollar amount
 - Customer(s)
 - Customer price group(s)
 - First time buyer
 - Pay type
 - Ship via priority
- *Other optional fields:*
 - Promotion ID
 - Item or item category exclusions

You also need to enter information at the *Work with BOGO Discount Screen (Item Category or Item)*.

BOGO Promotion by Item Category or Item Examples

Summary	Setup	Order Entry
Order three plush toys, get one at 50% off	<i>Work with BOGO Discount Screen (Item Category or Item):</i> Item category = PLH (plush toys) Req qty = 3 BOGO qty = 1 Free = NO Disc % = 50.00	Order includes order lines for four plush toys. The order line for the lowest-priced plush toy is discounted 50%.

Summary	Setup	Order Entry
Order two pens, get one for \$1.00	<p><i>Work with BOGO Discount Screen (Item Category or Item):</i></p> <p>Item = PEN Req qty = 2 BOGO qty = 1 Free = NO Price = 1.00</p>	Order includes a total of three order lines for SKU's of the PEN item. The lowest-priced order line is repriced to \$1.00.
Order five plush toys, get the sixth one free	<p><i>Work with BOGO Discount Screen (Item Category or Item):</i></p> <p>Item category = PLH (plush toys) Req qty = 5 BOGO qty = 1 Free = YES Allow mult = unselected</p>	Order includes an order line for five of one plush toy and one of another plush toy. The order line for the single plush toy is repriced to "no charge."
For orders totalling \$50.00 or more, order three pencils, get one added to the order free; order six, get two added free; and so on	<p><i>Create Promotion Screen</i> Qualifying \$ amount = 50.00</p> <p><i>Work with BOGO Discount Screen (Item Category or Item):</i></p> <p>Item = PENCIL) Req qty = 3 BOGO qty = 1 Free = Free Auto Add Allow mult = selected</p>	Order includes six order lines for the item PENCIL. An order line for the item PENCIL with a quantity of two is added to the order at "no charge."
Order two pens, get \$1.00 off two; also, order one sticker set, get 20% off another sticker set	<p><i>Work with BOGO Discount Screen (Item Category or Item) (for a single BOGO promotion or on separate BOGO promotions):</i></p> <p>1. Item category = UTN Req qty = 2 BOGO qty = 2 Free = NO Disc \$ = 1.00</p> <p>2. BOGO (Buy One/Get One) Discount or Free Gift by Price Code

BOGO promotions by price code apply a discount of up to 100% to one or more order lines, apply a dollar discount or special price, or add a free item to the order. An order qualifies based on a price code's ordered quantity, total merchandise value, or both.

Examples:

- Order at least two items assigned to the same price code, third one already on the order is free
- Order one item assigned to a price code, get another item from a different price code free
- Order an item priced at \$500 or more and assigned to a specific price code, get another item added to the order free

 **Note:**

Two different types of BOGO promotions: This discussion applies to BOGO promotions you set up when the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *PRICE CODE*. See *BOGO (Buy One/Get One) Discount or Free Gift by Item Category or Item* for a discussion on BOGO promotions available when the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *CATEGORY*.

Discount lowest-priced item(s): If multiple order lines are eligible for the same entry in the BOGO promotion by price code, the lowest-priced eligible order line is discounted. For example, you set up a promotion: buy two from men's fleece, get one from men's fleece at 30% off. The customer orders two of item AB100 at \$100.00, one of item BC200 at \$120.00, and one of item CD300 at \$90.00. All these items are assigned to the specified price code. The discount applies to item CD300.

Order line quantity must be 1: In order for a BOGO promotion by price code to apply to an order, the lines for the eligible items must be 1. To help ensure that the order line quantity is always 1, you can set both the *Maximum Order Quantity (C60)* system control values to 1.

Multiplying the BOGO discount: You can use the Allow mult flag so that the customer can multiply the BOGO discount: for example, buy five get one free; buy ten get two free; and so on.

Prorating the discount: Regardless of the type of discount, you can use the Prorate flag to prorate the discount across all of the items and order lines subject to the promotion. This option enables you to account for the proportional amount of the discount if you process a return against the discounted order. For example, you set up a BOGO promotion to buy \$500 in price code 22, get item EF123 (normally sold at \$100) added to the order free. If the Prorate flag is:

- unselected: item EF123 is added to the order at no charge, and the promotion does not change the prices of items assigned to price code 22.
- selected: the \$100 discount represented by adding EF123 at no charge is prorated across the order line for EF123 and the other order lines for items assigned to price code 22. If the item in price code 22 was \$1000, the promotion discounts it to \$909.09, and adds EF123 with a price of \$90.91.

Single discount for each promotion, but multiple promotions can apply to an order:

When you use BOGO promotions by price code, each BOGO promotion can specify just a single discount. It is not possible to set up multiple discounts for a single BOGO promotion by price code. However, different groups of lines on an order can qualify for different BOGO promotions (for example, buy \$500 in luggage and get a free travel bag, plus buy two sweaters and get one at 30% off).

Discount is always based on or applied to the lower-priced item(s): BOGO promotions by price code require that any discount calculation be based on the lower-priced items within the total BOGO quantity, and applied to the lower-priced items if the discount is not prorated, regardless of whether the lower-priced item is in the qualifying Price code or the BOGO PC. For example:

- If the promotion specifies "buy one, get one 30% off," the 30% discount is calculated based on the lower-priced item.
- If the promotion specifies "buy one, get \$20 off one" and is not prorated, the \$20 discount applies to the lower-priced item.

If the total discount from the promotion exceeds the price of the lower-priced item(s), then the actual discount applied is limited to the price of the lower-priced item(s). For example, if the promotion specifies “buy one, get \$20 off one” and is prorated, but the lower-priced item is \$15, then the total prorated discount is \$15.

Preventing additional discounting: If you specify a , the system applies this price override reason code to order lines discounted or added free through a BOGO promotion by price code. This price override reason code prevents the order line from being discounted by any other system-applied method, in order to prevent “double dipping.” However, you can still discount these lines through the application of a coupon (set up through [Working with Coupon Promotions \(WCPR\)](#)); also, discounted lines can still count as part of the qualifying quantity, even if the pricing method is BOGO and the *Price Override Reason for Promotions (K45)* is used, as described below.

Does not produce negative price: A BOGO promotion by price code does not result in a negative price, even if the Disc \$ specified is more than the unit price of the order line.

 **Note:**

A BOGO promotion by price code cannot include a ship via override.

To use BOGO promotions by price code without price code discounts: It is not necessary to use price code discounts in order to use BOGO promotions by price code. To group items by price code without applying discounts through the price code assignment:

- Set the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *PRICE CODE*.
- *Price Override Reason for Promotions (K45)*
- Use [Working with Price Codes \(WPCD\)](#) to create one or more price codes to group items for BOGO promotions:
 - Specify a Start date and End date that are in the past.
 - Set the Qty required to a number higher than your highest possible order line quantity.
 - Specify a very small discount: for example, specify a Percent discount of .01.
- Use [Assigning Price Codes \(APCD\)](#) to assign items to price codes.
- Use the [Create Promotion Screen](#) and the *BOGO Discount by Item/Price Code Screen* to create each BOGO promotion by price code.

To set up a BOGO promotion by price code, complete the following fields at the *Create Promotion Screen*:

- *Required:*
 - Type = *BOGO*, and
 - Priority
- *Any of the following qualifying fields (leave blank to apply to all orders that include the price code(s) or item:*

- Source code or Offer
- Customer(s) OR Customer price group(s)
- First time buyer
- Pay type
- Maximum quantity
- Ship via priority
- *Other optional fields:*
 - Promotion ID

You also need to enter information at the *Work with BOGO Discounts by Item/Price Code Screen*.

Important:

- The available options for configuring a BOGO promotion by price code are described in the table below. Using a different configuration option may produce unintended results when the promotion applies to an order.
- To use BOGO promotions by price code, you must create each order line with a quantity of one. Calculating discounts for a BOGO promotion by price code is not supported if the order line quantity is greater than one.

BOGO Promotion by Price Code Options and Samples

Summary	Setup	Order Entry
<p>Order two items assigned to a price code, get one item assigned to the same price code free if the third item is already on the order. Prorate the discount across the three order lines.</p>	<p><i>Work with BOGO Discounts by Item/Price Code Screen</i></p> <p>Price code, BOGO price code = same price code</p> <p>Req qty = 2</p> <p>BOGO qty = 1</p> <p>Prorate = selected</p> <p>Allow multiples = unselected</p> <p>Free = Free</p>	<p>Order includes three items assigned to price code 11:</p> <ul style="list-style-type: none"> • AB123 at \$100.00 • BC234 at \$90.00 • CD345 at \$80.00 • Total items for promotion: \$270.00 <p><i>Free item price is prorated:</i> When the promotion applies, the \$80 price of CD345 (the item with the lowest price) is prorated across the three items in the price code:</p> <ul style="list-style-type: none"> • AB123 is now \$70.37 • BC234 is now \$63.33 • CD345 is now \$56.30 • Total items for promotion: \$190.00

Note: The quantity allowed if you are prorating price code and discount calculation:

Note: If the order includes more than three items assigned to the price code, the discount is prorated across the three lowest-priced qualifying items.

Discount calculation: For each order line, the system calculates the discounted, prorated price by multiplying the item price by the discounted merchandise total, then dividing the result by the original merchandise total. For example,

Summary	Setup	Order Entry
		for AB123: (100.00 * 190.00) / 270.00 = 70.37. r i c e c o d e m u s t b e t h e s a m e .

Summary	Setup	Order Entry
Order one item assigned to a price code, get a lower-priced item assigned to a different price code free if this item is already on the order; order two or more items assigned to a price code, get two lower-priced items assigned to a different price code free if the latter two items are already on the order; and so on. Do not prorate the discount.	<p><i>Work with BOGO Discounts by Item/Price Code Screen:</i></p> <p>Price code = and BOGO price code = different price codes, with the BOGO price code specifying lower-priced items</p> <p>Req qty = 1</p> <p>BOGO qty = 1</p> <p>Prorate = unselected</p> <p>Allow multiples = selected</p> <p>Free = Free</p>	<p>Order includes:</p> <ul style="list-style-type: none"> • EF456 (price code 11) at \$100.00 • GH567 (price code 22) at \$90.00 <p><i>Free item:</i> When the promotion applies, the price of GH567 changes to .00.</p> <p><i>Multiple?</i> If the order also included:</p> <ul style="list-style-type: none"> • IJ678 (price code 11) at \$95.00 • KL789 (price code 22) at \$80.00 <p>Then the price of LK789 also changes to .00.</p>

 **Note:**

The free item(s) must be the lower-priced item(s); so if the item assigned to price code 22 is priced higher than the item assigned to price code 11, then the item assigned to price code 11 is discounted to .00.

Summary	Setup	Order Entry
Order one item assigned to a price code, get an item assigned to the same price code at 30% off; order two items assigned to the price code, get two items assigned to the same price code at 30% off; and so on. Prorate the discount across the order lines.	<p><i>Work with BOGO Discounts by Item/Price Code Screen:</i></p> <p>Price code and BOGO price code = the same price code</p> <p>Req qty = 1</p> <p>BOGO qty = 1</p> <p>Disc % = 30.00</p> <p>Prorate = selected</p> <p>Allow mult = selected</p>	<p>Order includes the following items assigned to price code 11:</p> <ul style="list-style-type: none"> • MN890: \$100.00 • OP901: \$90.00 • QR012: \$80.00 • ST123: \$70.00 • Total items for promotion: \$340.00 <p><i>Total discount:</i> When the promotion applies, the total discount is \$45.00, which is 30% \$150 (the total of the \$80 price of QR012 and the \$70.00 price of ST123, which are the items with the lowest prices.</p> <p><i>Discounted prices:</i> The discount of \$45.00 is prorated across the four items in the price code:</p> <ul style="list-style-type: none"> • MN890 is now \$86.76 • OP901 is now \$78.09 • QR012 is now \$69.41 • ST123 is now \$60.74 • Total items for promotion: \$295.00 <p><i>Prorated discount calculation:</i> For each order line, the system calculates the discounted, prorated price by multiplying the item price by the discounted merchandise total, then dividing the result by the original merchandise total. For example, MN890: $(100.00 * 295.00) / 340.00 = 86.76$.</p>

 **Note:**

If there is a single additional item assigned to price code 11 (for example, 5 units rather than 4), its

Summary

Order Entry

price is not included when prorating since it is not part of the total quantity for the promotion.

Summary	Setup	Order Entry
Order an item assigned to a price code and priced at \$498 or higher for one unit, get a specific item added to the order free, and prorate the price of the free item with the required item.	<p><i>Work with BOGO Discounts by Item/Price Code Screen:</i></p> <p>Price code = specified Req amt = \$498.00 Req qty = 1 BOGO quantity, BOGO price code = not specified Prorate = selected Allow multiple = unselected Free = Free Auto Add Auto Item = specified</p>	<p>Order includes item UV234, assigned to price code 333, for \$1000.</p> <p><i>Free item added:</i> When the promotion applies, it adds item XY345, normally \$100.00, to the order.</p> <p><i>Prorated discount applied:</i> The related order lines are:</p> <ul style="list-style-type: none"> • UV234 is now \$909.09 • XY345 is added at \$90.91 <p><i>Prorated discount calculation:</i> For each order line, the system calculates the discounted, prorated price by multiplying the item price by the discounted merchandise total, then dividing the result by the original merchandise total including the free item. For example, UV234: $(1000.00 * 1000.00) / 1100.00 = 909.09$.</p>

 **Note:**

The price of a single unit of the qualifying item must be at least the required amount. For example, if the required amount is \$498.00 and the order includes two items for \$250 each

Summary	Setup	Order Entry
---------	-------	-------------

assigned to the price code, the order does not qualify.

If not prorated? You can create a similar promotion with the Prorate flag unselected. In this case, the promotion does not discount the item from the required price code, and the free item is added at no charge.

If the free item is already on the order: The promotion adds an additional unit of the free item if there is already a unit on the order. The unit already on the order is not discounted.

If multiple qualifying items: If the order includes multiple qualifying items from the specified price code, the discount is prorated across all qualifying items.

Summary	Setup	Order Entry
Get 10% off any items assigned to a price code if their combined price is \$500 or higher, regardless of quantity on the order.	<p><i>Work with BOGO Discounts by Item/Price Code Screen:</i></p> <p>Price code and BOGO price code = the same price code</p> <p>Req amt = \$500.00</p> <p>BOGO qty = 99999</p> <p>Disc % = 10.00</p> <p>Prorate = unselected</p> <p>Allow multiples = unselected</p>	<p>Order includes items assigned to price code 44:</p> <ul style="list-style-type: none"> • ZA456: \$100.00 • BC456: \$150.00 • DE567: \$300.00 • Total: \$550.00 • <i>Discount applied:</i> <ol style="list-style-type: none"> 1. ZA456 is now \$90.00 2. BC456 is now \$135.00 3. DE567 is now \$270.00

Summary	Setup	Order Entry
<p>Order one item in a price code, get \$20.00 off a lower-priced item in a different price code. Prorate the discount across the order lines.</p>	<p><i>Work with BOGO Discounts by Item/Price Code Screen:</i></p> <p>Price code = and BOGO price code = different price codes, with the BOGO price code specifying lower-priced items</p> <p>Req qty = 1 BOGO qty = 1 Disc \$ = \$20.00 Prorate = selected Allow multiples = unselected</p>	<p style="text-align: center;">i f y a r e q u i r e d q u a n t i t y .</p> <p>Order includes:</p> <ul style="list-style-type: none"> • EF456 (price code 11) at \$250.00 • GH567 (price code 22) at \$100.00 <p><i>Prorated discount applied:</i> The related order lines are:</p> <ul style="list-style-type: none"> • EF456 is now \$235.71 • GH567 is now \$94.29 <p><i>Prorated discount calculation:</i> For each order line, the system calculates the discounted, prorated price by multiplying the item price by the discounted merchandise total, then dividing the result by the original merchandise total including the free item. For example, GH567: $(100.00 * 330.00) / 350.00 = 94.29$.</p> <p><i>Discount cannot exceed price:</i> The total amount of the Disc \$ cannot exceed the price of either of the items; otherwise, the promotion discounts the items by the price of that item. For example, if the Disc \$ is \$20.00 and one of the items is \$10.00, the promotion applies a discount of \$10.00.</p>

What if other repricing makes the order ineligible? It is possible for additional pricing options to make the items on an order ineligible for a promotion. For example:

- *price code*: A price code discount might make an order ineligible for a promotion that specifies a required merchandise amount. For example, a promotion specifies a BOGO qty of 1 and a Req amt of \$500.00. If the order includes an item priced at \$500.00 but discounted 15% through a price code, the order does not qualify for the promotion.
- *best price comparison*: When you use [Customer Price Group Best Price Comparison](#), if the calculated price for the Customer Price Group Code for CPG Pricing Only (L58) is lower than the price after applying the promotion, the order line uses the lower price.

Item Category Discount

You can set up item category promotions based on the merchandise total on the order or within the item category or categories, or on the quantity ordered within the item category(ies). You can specify a flat discount amount or a percentage to apply to items within the specified item category(ies), or a special price for items in the category(ies).

Example: Prorate a \$5.00 discount against items within an item category if you order \$30.00 or more within the category; or apply a 15% discount to items within a specific category when the order total is \$75.00 or higher.

Negative additional charge not an option: Unlike some of the other promotion types, an item category promotion cannot use an additional charge code to apply a discount as a negative additional charge on the order. The discount amount or percentage is applied directly to the order detail lines within the specified item category(ies).

Note:

An item category promotion cannot include a ship via override.

Applying to multiple item categories: You can set up an item category promotion to apply the same discount percentage, amount, or special price to multiple item categories. You can also specify whether to apply qualifiers such as total dollar value, minimum quantity, or maximum quantity based on the entire order or within an item category. See the examples, below, for more information.

Other discount rules: When an item category promotion applies a discount amount, it follows the same prorating logic and rules as an *Order Discount*, including the rules for sale items and non-discountable items. See the [Order Discount](#) discussion for more information.

To set up an item category promotion, complete the following fields at the [Create Promotion Screen](#):

- *Required*:
 - Type = *Item Category*, and
 - Priority
- *Any of the following qualifying fields (leave blank to apply to all orders that include the item category(ies))*:
 - Source code(s) or Offer
 - Pay type

- Qualifying dollar amount
- Qualifying dollar amount type
- Qualifying quantity
- Maximum quantity
- Customer(s)
- Customer price group(s)
- First time buyer based on LTD Orders or LTD Sales
- Ship via priority
- *Type of discount (one only):*
 - Item category special price
 - Discount percent
 - Discount amount
- *Other optional fields and options:*
 - Promotion ID
 - Item or item category exclusions

You also need to specify the eligible item category or categories at the [Work with Qualifying Item Categories Screen](#).

Item Category Promotion Examples

Summary	Setup	Order Entry
Order \$25.00 in stickers, get 15% off stickers	<p><i>Create Promotion Screen:</i> specify a Qualifying \$ amount of 25.00, a Qualifying type of Item Category, and a Discount percent of 15.00.</p> <p><i>Work with Qualifying Item Categories Screen:</i> specify the stickers item category</p>	Customer orders \$50.00 in stickers and \$10.00 in other merchandise. The 15% discount is applied to the sticker items on the order. The promotion does not discount any other merchandise on the order.

Summary	Setup	Order Entry
Order \$75.00 total merchandise, get \$5.00 off pencils and magnets	<p><i>Create Promotion Screen:</i> specify a Qualifying \$ amount of 75.00, a Qualifying type of Order, and a Discount amount of \$5.00.</p> <p><i>Work with Qualifying Item Categories Screen:</i> specify the pencils and magnets item categories</p>	<p>Customer orders \$80.00 in total merchandise, including \$15.00 in pencils and magnets. The \$5.00 discount is applied against the order line(s) within each of the item categories (\$5.00 across each category). The promotion does not discount any other merchandise on the order.</p>

 **Not e:**

If the Qualifying type was set to Item Category, then none of the items on the order would qualify for the promotion unless the total dollar value within the category

Summary	Setup	Order Entry
		was at least \$75.0 0.
Order five sticker sets or pencil sets, get 20% off.	<p><i>Create Promotion Screen:</i> specify a Qualifying qty of 5, a Qualifying type of Order, and a Discount percent of 20.00.</p> <p><i>Work with Qualifying Item Categories Screen:</i> specify the item categories for the sticker sets and pencil sets</p>	Customer orders three sticker sets, four pencil sets, and a magnet set. The 20% discount is applied against both the sticker sets and pencil sets because they are within the specified categories and the total unit quantity on the order is greater than five.
Order at least 5 stickers, magnets, or pencils, get \$2.00 off each category	<p><i>Create Promotion Screen:</i> specify a Qualifying qty of 5, a Qualifying type of Item category, and a Discount amount of 2.00.</p> <p><i>Work with Qualifying Item Categories Screen:</i> specify the item categories for the sticker sets, magnet sets, and pencil sets</p>	Customer orders six sticker sets, five magnet sets, and a pencil set. A \$2.00 discount is prorated across the sticker set lines, and a \$2.00 discount is also prorated across the magnet set lines. No discount applies to the pencils because this item category does not meet the qualifying quantity of five.
Get stickers or magnets at \$1.99 each (limit 5).	<p><i>Create Promotion Screen:</i> specify a Maximum qty of 5, a Qualifying type of Item category, and an Item category special price of 1.99.</p> <p><i>Work with Qualifying Item Categories Screen:</i> specify the item categories for the sticker sets and magnet sets</p>	Customer orders five sticker sets and six magnet sets. The sticker sets are repriced to \$1.99, but the magnet sets are not because the total quantity for the item category exceeds the maximum.

Can you combine item category promotions? You can offer more than one item category promotion at a time by setting up:

- a single item category promotion for two or more categories if all item categories should receive the same discounting. For example, you can offer 10% off stickers, magnets, and pencils.
- a separate item category promotion for each category, especially if each item category should receive a different type of discount: For example, you can offer 10% off stickers and \$5.00 magnets. Both promotions can apply to the same order if it qualifies.

 **Note:**

The system does not apply two item category promotions to an order if they specify the same item category. See [Promotion Logic and Processing](#) for information on how the system selects a promotion to apply.

Preventing additional discounting: If you specify a *Price Override Reason for Promotions (K45)*, the system applies this price override reason code to order lines discounted through an item category promotion. This price override reason code prevents the order line from being discounted by any other system-applied method, in order to prevent “double dipping.” However, you can still discount these lines through the application of a coupon (set up through [Working with Coupon Promotions \(WCPR\)](#)).

 **Note:**

It is possible to produce a negative merchandise total on an order by applying an item category promotion whose Discount amount exceeds the current merchandise total. To avoid this situation, specify a qualifying dollar amount.

Can you set up a buy one/get one promotion for an item category? You can also use item category as a qualifier for a BOGO promotion if the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *CATEGORY*. See *BOGO (Buy One/Get One) Discount or Free Gift by Item Category or Item* for more information.

How do you assign items to item categories? Item category assignment is at the SKU level, and you specify an item category assignment at the [Create Item \(Base Information\) Screen](#) (non-SKU'd item) or the [Create SKU 1 of 2 \(With Overrides\) Screen](#) (SKU'd item). You can also assign an item category through [Using the SKU Generator \(ESKG\)](#).

Item category codes are defined in and validated against the Item Category table. See [Working with Item Category Codes \(WITG\)](#) for more information.

Order Discount

Order discount promotions apply to the merchandise on the order. You can specify either a flat discount amount or a percentage.

Example: Apply a \$5.00 discount to orders with source code AB1234 with merchandise totals of \$50.00 or more.

Prorate discounts? If you specify an additional charge code for the promotion, the discount will appear on the order as a credit additional charge; otherwise, the discount amount is prorated against the items on the order.

Example:

An order contains the following items, and a \$4.00 discount applies based on the promotion:

- AB100: 2 @ \$5.00 (\$10.00)
- BB200: 1 @ \$10.00
- CC300: 1 @ \$20.00

Merchandise total: \$40.00

If you specify an additional charge code, the discount appears as a \$4.00 negative additional charge on the order; the extended price of each line remains unchanged.

If you do not specify an additional charge code, the extended price of each order line is:

- \$10.00 - \$1.00 = \$9.00 (2 @\$4.50)
- \$10.00 - \$1.00 = \$9.00
- \$10.00 = \$2.00 = \$18.00

Prorating discounts and sale items: The [Exclude Sale Item When Prorating Discounts \(I65\)](#) system control value affects the discounting only for an order-level percentage discount, or for a dollar discount if there is no additional charge code specified. See that system control value for more information and examples.

The [Sale item](#) flag for the Item Offer or the [Sale item](#) flag for the SKU Offer indicates whether an item is a sale item.

 **Note:**

This system control value also controls whether the system includes sale items when determining if an order qualifies for a promotion based on quantity. If the system control value is *selected*, sale items are not included when the promotion is based on quantity; however, they are included when evaluating an order for a promotion based on dollar value.

Non-discountable items: Items that are flagged as non-discountable (based on the setting of the [Discountable](#) flag) are always excluded from prorating of discounts; also, they are not included in the merchandise total or the qualifying quantity when the system determines whether an order meets the [Qualifying \\$ amount \(Qualifying dollar amount\)](#) required to apply a promotion.

Meeting a quantity requirement for an order discount: Items that are sold out or free of charge, or that are non-discountable as described above, are not included in the Qualifying quantity, if any, specified for an order discount promotion. Also, if the [Exclude Sale Item When Prorating Discounts \(I65\)](#) system control value is *selected*, items which are flagged as sale items for the Item Offer or SKU Offer are not included in the qualifying quantity.

To set up an order discount promotion, complete the following fields at the *Create Promotion Screen*:

- *Required:*
 - Type = *Order*, and
 - Priority
- *Any of the following qualifying fields (leave blank to apply to all orders that include the item category(ies)):*
 - Source code(s) or Offer
 - Pay type
 - Qualifying dollar amount
 - Qualifying dollar amount type
 - Qualifying quantity
 - Maximum quantity
 - Customer(s)

- Customer price group(s)
- First time buyer based on LTD Orders or LTD Sales
- Ship via priority
- *Type of discount (one only):*
 - Item category special price
 - Discount percent
 - Discount amount
- *Other optional fields and options:*
 - Promotion ID
 - Additional charge code (leave blank to prorate the discount)
 - Ship via override and related fields (see description below)
 - Item or item category exclusions

**Note:**

An order cannot qualify for both an order promotion and a tiered promotion.

Order Discount Example

Discount description: The system subtracts 10% off the extended price of all items (Discount percent field) on any order whose header-level source code points to offer SP8 (Qualifying offer field) if the merchandise total is \$50.00 or more (Qualifying dollar amount field). Additionally, if you assign this promotion code to the source code through [Working with Source Codes \(WSRC\)](#), the pop-up message (Pop-up message fields) will open in order entry after you enter the order header information.

The discount total will be added to the order as a negative additional charge because a code is specified in the Additional charge code field. If this field is blank, the discount would be subtracted from each order detail line extended price.

Tiered Discount or Free Gift

Tiered promotions are based on the merchandise total on the order. You can specify a flat discount amount or a percentage, or add a free gift, for each tier specified for the promotion.

Example: Apply a \$5.00 discount to orders with merchandise totals of \$50.00 or more; \$15 to orders with merchandise totals of \$100.00 or more; or add a free gift to orders with merchandise totals over \$150.00.

Tier logic: The system applies the discount or free gift specified for the highest tier that the order qualifies for based on total merchandise value. Discounts or free gifts specified for lower tiers do not apply.

Example: A promotion has two tiers: a 10% discount for merchandise values of \$75.00 or more, and a free gift for merchandise values over \$100.00. If an order has a total merchandise value of \$95.00, the 10% discount is applied. If an order has a total merchandise value of \$120.00, the free gift is added but the 10% discount is not applied.

 **Note:**

A tiered promotion cannot include a ship via override.

Other discount rules: When a tiered promotion applies a discount, it follows the same prorating logic and rules as an *Order Discount*, including the rules for sale items and non-discountable items. See the *Order Discount* discussion for more information.

To set up a tiered promotion, complete the following fields at the *Create Promotion Screen*:

- *Required:*
 - Type = *Tiered Discount*, and
 - Priority
- *Any of the following qualifying fields (leave blank to apply to all orders that include the item category(ies)):*
 - Source code(s) or Offer
 - Pay type
 - Customer(s)
 - Customer price group(s)
 - First time buyer based on LTD Orders or LTD Sales
 - Ship via priority
- *Other optional fields and options:*
 - Promotion ID
 - Additional charge code (leave blank to prorate the discount)
 - Item or item category exclusions

You also need to enter information on the tiers at the *Work with Promotion Discounts Screen*.

 **Note:**

An order cannot qualify for both an order promotion and a tiered promotion.

Tiered Promotion Example

Promotion description: The promotion includes the following tiers:

- free gift of a pen for orders whose total merchandise value is from \$10.00 to \$49.99
- 10% discount for orders whose total merchandise value is from \$50.00 to \$99.00, prorated against the order detail lines
- 15% discount for orders whose total merchandise value is \$100.00 or more, prorated against the order detail lines

The promotion applies to source code *SOURCE8* (Qualifying source field). Additionally, if you assign this promotion code to the source code through *Working with Source Codes (WSRC)*, the pop-up message (Pop-up message fields) will display in order entry after you enter the order header information.

Because no additional charge code is specified, the discount percentage will be subtracted from each order detail line, with the exception of sale items and non-discountable items. If an additional charge code is specified, the entire discount amount would be added to the order as a negative additional charge.

Freight Discount or Override

A freight discount applies to the freight charges on an order.

You can set up the following types of freight discounts:

1. *Discount amount or discount percentage applied to freight total:*

Example: \$5.00 off shipping if you order by the end of June; or, 50% off shipping charges if your order totals \$50.00 or more.

Note:

The discount will appear on the order as a credit additional charge.

2. *Freight override amount to replace freight total:*

Example: Order by November 15 and pay only \$3.00 in freight, regardless of order total.

3. *Free freight:*

Example: Free shipping for our valued customers.

You can also set up a ship via override independently of, or in addition to, a freight discount. See the description below for more information.

Meeting a quantity requirement for a freight discount or override: Items that are sold out, free of charge, drop ship, or have a ship via item charge are not included in the Qualifying quantity, if any, specified for a freight discount promotion. Also, if the [Exclude Sale Item When Prorating Discounts \(I65\)](#) system control value is selected, items which are flagged as sale items for the Item Offer or SKU Offer are not included in the qualifying quantity.

Additional freight: If an order qualifies for a freight promotion, the system updates the freight charges on the order; however, any additional freight that has been assigned to the order will remain on the order. For example, if the order qualifies for a free freight promotion and the ship via on the order has an additional freight charge, the system removes the freight charges from the order, but keeps the additional freight charge. You can create an additional freight discount promotion to discount the additional freight on an order; see *Additional Freight Discount*.

To set up a freight discount, complete the following fields at the *Create Promotion Screen*:

- *Required:*
 - Type = *Freight*, and
 - Priority
- *Any of the following qualifying fields (leave blank to apply to all orders that include the item category(ies)):*

- Source code(s) or Offer
- Pay type
- Qualifying dollar amount
- Qualifying dollar amount type
- Qualifying quantity
- Maximum quantity
- Customer(s)
- Customer price group(s)
- First time buyer based on LTD Orders or LTD Sales
- Ship via priority
- *Other optional fields and options:*
 - Promotion ID
 - Additional charge code
 - Continental USA Only
 - Ship via override and related fields (see description below)

Freight Discount Example

Discount description: The system changes the freight amount charged on an order to \$3.50 if the header-level source code is *SUMMER*. An additional charge code is not used in this case, because the freight amount is simply overridden.

Additional Freight Discount

An additional freight discount applies to the additional freight charges on an order. You might use this type of discount for ship vias set up as *Add'l freight only*, or to offer express shipping at a reduced cost.

Example: Overnight shipping for the same price as ground shipping, this catalog only.

You can also set up a ship via override independently of, or in addition to, an additional freight discount:

Example: Free upgrade to Federal Express.

Meeting a quantity requirement for a freight discount or override: Items that are sold out, free of charge, drop ship, or have a ship via item charge are not included in the Qualifying quantity, if any, specified for a freight discount promotion. Also, if the *Exclude Sale Item When Prorating Discounts (I65)* system control value is *selected*, items which are flagged as sale items for the Item Offer or SKU Offer are not included in the qualifying quantity.

To set up an additional freight discount, complete the following fields at the *Create Promotion Screen*:

- *Required:*
 - Type = *Additional Freight*
 - Priority
- *Type of additional freight discount (one only):*
 - Discount amount (requires additional charge code)

- Discount percent (requires additional charge code)
- *Any of the following qualifying fields (leave blank to apply to all orders):*
 - Source code(s) or Offer
 - Pay type
 - Qualifying dollar amount
 - Qualifying quantity
 - Maximum quantity
 - Customer(s)
 - Customer price group(s)
 - First time buyer based on LTD Orders or LTD Sales
 - Ship via priority
- *Other optional fields:*
 - Promotion ID
 - Continental USA only
 - Ship via override and related fields (see description below)

Additional Freight Discount Example

 **Note:**

This example also includes a ship via override, described in the following pages. You can set up a ship via override as part of a freight or additional freight discount, or you can set it up independently.

Discount description: The system adds a negative additional charge of \$7.50 (as a discount against the additional freight amount) *and* overrides the ship via on the order to ship via number 4 for any order that:

- has an additional freight charge, and
- uses pay type 7 (Qualifying pay type), and
- is shipping to the continental USA only (Continental USA only).

Ship Via Override

You can set up an order, freight, or additional freight promotion type to also include a ship via override. Alternatively, you can set up a freight or additional freight promotion type to provide a ship via override only, with no additional discounting.

 **Note:**

You cannot include a ship via override in a tiered, item category, or BOGO discount promotion.

The system applies this ship via override to the order unless another ship via override takes precedence; see [Ship Via Override Hierarchy](#) for a list of ways the system can

override the shipper specified on the order with another shipper and the hierarchy in which the ship via overrides take precedence.

Example: Free upgrade to Federal Express.

See the [Cautions Related to Promotions](#) for more information on how to set up a promotion that constitutes or includes a ship via override.

To set up a ship via override, complete the following fields:

- *Required:*
 - Type (*Order*, *Freight*, or *Additional Freight* to set up in combination with a discount; enter *Freight* or *Additional Freight* to set up as a separate promotion)
 - Priority
 - Ship via override
- *Ship via override qualifying fields (leave blank to apply to all orders):*
 - Country of shipping address
 - From and To SCFs for shipping address
- *Additional optional qualifying fields:*
 - Source code(s) or Offer
 - Pay type
 - Qualifying dollar amount
 - Qualifying quantity
 - Maximum quantity
 - Qualifying customer or customer price group
 - First time buyer based on LTD Orders or LTD Sales
 - Ship via priority
 - Promotion ID
 - Continental USA only (valid for freight or additional freight promotions only)

Promotion Logic and Processing

Your options in setting up promotions and the logic that the system uses in applying promotions to orders are described below.

- [When Promotions can be Either Manually-Assigned or System-Assigned](#)
- [When Promotions Must be Assigned by the System](#)
- [Promotion Hierarchy: Best Way](#)
- [Promotion Hierarchy: Regular Priority](#)
- [Using the Order Total to Evaluate Different Promotion Types](#)
- [Additional Notes about Promotion Selection Hierarchy](#)
- [Order Transaction History Message](#)
- [System Control Values Related to Promotions](#)
- [Cautions Related to Promotions](#)

When Promotions can be Either Manually-Assigned or System-Assigned

If the [Allow Manual Entry of Promotion Code \(I63\)](#) system control value is *selected* and the promotion's *Required entry* flag is *selected*, then the system does not automatically assign the promotion to an order. Instead, you need to use the [Enter Promotion Code Screen](#) to assign the promotion.

Applying the promotion in interactive order entry: The [Enter Promotion Code Screen](#) opens automatically when you select *Reprice* at the [Work with Order Lines Screen \(Adding Items to the Order\)](#) or select *Accept* or *Exit* at the [Coupon Discount Window](#) if the [Prorate Dollar Discounts and Coupons \(D90\)](#) system control value is *selected*. See [Repricing Screen Flow](#).

At the Enter Promotion Code screen, you can specify one or more promotions to apply to the order. You can prompt on the Promotion code field to advance to the Select Promotion window. The setting of the [Search Promotions by Start Date in Order Entry \(M27\)](#) system control value defines how promotions sort on the Select Promotion window:

- If selected, the Select Promotion window sorts promotions in ascending start date sequence.
- If unselected, the Select Promotion window sorts promotions in ascending promotion code sequence.

The system confirms that the order qualifies for each promotion you select based on the basic qualifiers (those set up at the [Create Promotion Screen](#)) at the time you enter it.

Important:

In order for you to advance to the [Enter Promotion Code Screen](#) during interactive order entry, or for promotions to apply to orders automatically, the price method for the source code on the order must be set to *Reg Plus Reprice*.

The system also applies promotions that are not flagged for required entry if the order qualifies. See [Promotion Hierarchy: Best Way](#) and [Promotion Hierarchy: Regular Priority](#) for information on how the system determines which promotion(s) to apply to an order.

At final acceptance of the order, the system re-evaluates the order for qualifying promotions, including both those manually entered and those assigned by the system. At this time, discounts on order lines, negative additional charges, free gifts, and freight or additional freight overrides might be removed or added to the order to reflect the promotions that ultimately apply to the order.

Applying promotions to web orders: To apply a promotion flagged for required entry to an order processed through the [Generic Order Interface \(Order API\)](#), specify the promotion in the promotion attribute or through the Promotions element. To apply multiple promotions, you need to use the Promotions element.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Order maintenance: You cannot apply a promotion to an order in order maintenance.

When Promotions Must be Assigned by the System

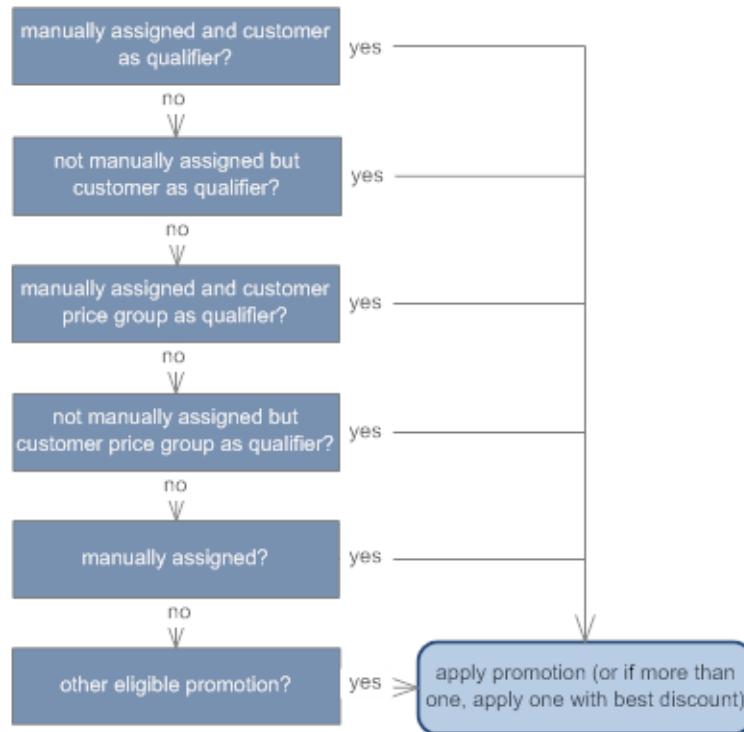

Combining promotions: If the *Allow Manual Entry of Promotion Code (I63)* system control value is *unselected*, the *Enter Promotion Code Screen* does not open in order entry, and you cannot specify promotion codes through the order API. Instead, the system selects the promotion(s) to apply to an order. Only promotions whose *Required entry* flag is unselected are eligible for selection. See *Promotion Hierarchy: Best Way* and *Promotion Hierarchy: Regular Priority* for information on how the system determines which promotion(s) to apply to an order.

Promotion Hierarchy: Best Way

Best way promotion hierarchy: The *Best Way Promotions (K44)* system control value indicates whether to try to apply the promotion of each type (with the exception of BOGO promotions; see *Best Way Promotion Hierarchy for BOGO Promotions* specifically called out for the order or customer, or that provides the highest discount. With this system control value selected, the system uses three basic criteria:

- **Manual entry?** Manually-entered promotions (entered at the *Enter Promotion Code Screen* or passed in the inbound order message) are preferred over system-assigned promotions (applied automatically because the order is eligible and the *Required entry* flag is unselected). However, if the *Allow Manual Entry of Promotion Code (I63)* system control value is unselected, it is not possible to manually enter a promotion code.
- **Customer or customer price group assignment?** When you specify a customer price group for a promotion, the system prefers this promotion to those without a customer price group assignment. However, when you specify a particular customer number for a promotion, this gives the promotion higher priority than promotions with just a customer price group promotion.
- **Best savings?** If a promotion is not differentiated through manual entry, customer assignment, or customer price group assignment, the system selects the promotion of each type that provides the highest total discount dollar value. In the case of a freight promotion, a ship via override is determined to be the best value.

As a result, the system selects among eligible promotions using the hierarchy illustrated below:

If the *Allow Manual Entry of Promotion Code (I63)* system control value is unselected, manual entry of a promotion is not possible, so the hierarchy is simpler:

- **Customer qualifier?** Is the customer specified at the [Work with Qualifying Customer/Price Groups Screen](#)?
- **Customer price group qualifier?** Is the customer assigned to a customer price group specified at the *Work with Qualifying Customer/Price Groups Screen*?
- **Best savings?** If the customer does not qualify based on customer number or price group, or if the system must select among more than one promotion with the same qualifier, it selects the promotion of each type that provides the highest total discount dollar value.

Examples of best discount calculation:

- Tiered promotion TA offers 10% off an order with a total merchandise value of \$100.00, for a total discount of \$10.00. Tiered promotion TB offers a free item; the item's regular price is \$15.00. Promotion TB provides the best discount (\$15.00 is more than \$10.00).
- Item category promotion IA offers 15% off a minimum order of \$25.00. Item category promotion IB offers a special item category price of \$1.99. The order includes 12 units of qualifying items at \$2.50 each for a total merchandise value of \$30.00 in the category. Promotion IB (\$1.99 * 12, or \$23.88, for a total savings of \$6.12) offers a better discount than promotion IA (15% of \$30.00, or \$4.50).

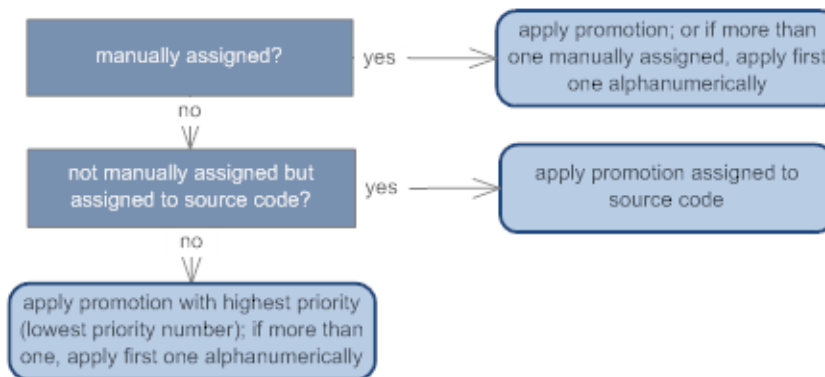

Best Way Promotion Hierarchy for BOGO Promotions

When the *Best Way Promotions (K44)* system control value is selected, BOGO promotions do not use the same hierarchy as other promotion types; instead, they use a simpler hierarchy:

- **Manually assigned?** Manually-entered BOGO promotions (entered at the [Enter Promotion Code Screen](#) or passed in the inbound order message) are given

higher priority than system-assigned promotions (applied automatically because the order is eligible and the *Required entry* flag is unselected). However, if the *Allow Manual Entry of Promotion Code (I63)* system control value is unselected, it is not possible to manually enter a promotion code.

- **Assigned to source code:** If there is a BOGO promotion specified for the source code and no other BOGO promotion was manually entered, the promotion from the source code applies. (The promotion must be manually entered or passed in the order API, or have the *Required entry* flag unselected, as described above.)
- **Priority:** If no BOGO promotions are manually applied or assigned to the source code, the system checks for BOGO promotions that are not flagged for *Required entry*. If there is more than one, the BOGO promotion with the highest priority (lowest priority number) applies. If the eligible BOGO promotions have the same priority number, the system applies the first one alphanumerically.

Promotion Hierarchy: Regular Priority

When the *Best Way Promotions (K44)* system control value is unselected, the system does not check whether the promotion is assigned to a particular customer number or customer type, or whether it offers the best discount. Instead, it uses two different possible hierarchies, depending on the setting of the *Allow Manual Entry of Promotion Code (I63)* system control value:

If the *Allow Manual Entry of Promotion Code (I63)* system control value is selected:

#	Step
1.	<i>Promotion assigned to source code:</i> Is there a promotion of this type assigned to the source code on the order header? If the order qualifies for the promotion you have defined in the Source Code table, this promotion applies to the order. Also, if the promotion is flagged for Required entry, it must be entered on the order or passed in the order API; otherwise...
2.	<i>Manually entered:</i> If there is no promotion assigned to the source code, look first to promotions that are manually entered at the <i>Enter Promotion Code Screen</i> or passed in the order API. If more than one promotion of the same type is manually entered or passed in the order API, select the promotion based on the: <ul style="list-style-type: none"> • lowest priority number (highest priority); if more than one, • latest start date; if more than one, • first one alphanumerically.

#	Step
3.	<p><i>System-assigned:</i> If there is no promotion of the type manually entered or passed in the order API, look for eligible promotions that are not flagged for Required entry. If there is more than one, select the promotion based on the:</p> <ul style="list-style-type: none"> • lowest priority number; if more than one, • latest start date; if more than one, • first one alphanumerically.

If the *Allow Manual Entry of Promotion Code (I63)* system control value is unselected:

Example #	Description
1.	<p><i>Promotion assigned to source code:</i> Is there a promotion of this type assigned to the source code on the order header? If the order qualifies for the promotion you have defined in the Source Code table (and not flagged for Required entry), this promotion applies to the order. Otherwise...</p>
2.	<p><i>System-assigned:</i> If there is no promotion of the type assigned to the source code, look for eligible promotions that are not flagged for Required entry. If there is more than one, select the promotion based on the:</p> <ul style="list-style-type: none"> • lowest priority number; if more than one, • latest start date; if more than one, • first one alphanumerically.

Using the Order Total to Evaluate Different Promotion Types

Determining the merchandise total when evaluating for promotions: In evaluating an order to see if it qualifies for a promotion based on merchandise total, provided you do not use *Customer Price Group Best Price Comparison*, the system:

- Applies any BOGO promotion(s) and reduces the merchandise total based on the BOGO promotions if appropriate; next,
- Applies any item category promotion(s) based on the newly-calculated merchandise total after subtracting any BOGO promotion discounts; then,
- Applies any additional promotions based on the merchandise total after applying the BOGO and item category promotions, but ignoring the effects of any other promotion types. For example, if the order qualifies for a freight promotion based on merchandise total, and also qualifies for an order promotion that discounts the merchandise total, the freight promotion applies based on the total before applying the order promotion.

Example:

BOGO promotion: Buy five pencil sets, get one 50% off

Item category promotion: Buy \$50.00 in item category UTN, get \$10.00 off

Order promotion: 20% off \$50.00 order total

Freight promotion: free shipping on orders over \$80.00

Order includes six pencil sets, each on a separate order line for \$10.00 each, plus four sticker sets at \$10.00 each = \$100.00 merchandise total. The pencil sets are in item category UTN, but the sticker sets are not.

1. BOGO promotion: Reduces one of the pencil sets by 50%, to \$5.00. New merchandise total: \$95.00.
2. Item category promotion: Prorates \$10.00 discount across five remaining pencil sets currently priced at \$10.00, reducing them to \$8.00 each; the line discounted through the BOGO promotion is not eligible for further discounting. The sticker sets are not discounted. New merchandise total: \$85.00.
3. Order promotion: Applies 20% discount to the four sticker sets, reducing them to \$8.00 each. New merchandise total: \$77.00 (nine lines at \$8.00 plus one line at \$5.00).
4. Freight promotion: Changes freight charges to zero. Order still meets qualifying dollar total of \$80.00 based on merchandise total before applying order promotion.

Applying order or tiered promotions after BOGO or item category promotions: If you use the *Price Override Reason for Promotions (K45)* system control value to prevent further discounting when you apply a BOGO or item category promotion, these order lines are not eligible for discounting through an order or tiered promotion. However, if you set up an order or tiered promotion to apply a discount through a negative additional charge code, this negative additional charge can still apply to the order.

Example: An item category promotion has discounted the items on an order and applied the *Price Override Reason for Promotions (K45)* to prevent further discounting. If there is also an order promotion offering a 10% discount without an additional charge code, the order lines that have been discounted through the item category promotion are not discounted any further. However, if the order promotion specifies an additional charge code, a negative additional charge for 10% of the merchandise total applies to the order.

Additional Notes about Promotion Selection Hierarchy

When selection takes place in order entry: An order's qualification for a promotion may change at any time during order entry. For example, an order's qualification for a promotion based on merchandise total may change as you add or delete items from the order, change quantities, select a different ship via, or apply a payment method.

Pop-up message: A promotion's pop-up message opens when you first enter the order's header information if the promotion is assigned in the Source Code table. However, this promotion may not actually apply to the order once you have completed entry if, for example, the promotion is qualified based on pay type and this pay type is not used on the order, or if another promotion of that type has a higher priority.

Manual entry of a promotion: Even when you enter a promotion at the *Enter Promotion Code Screen*, the promotion still might not apply to the order if, for example, the order does not meet the required merchandise amount for the promotion. In this situation, the screen does not necessarily display an error message indicating that the order does not qualify.

Order maintenance: The system does not evaluate the order for promotions in order maintenance or make any changes.

Applying Promotions through the Order API

Specifying one or more promotions: If the *Allow Manual Entry of Promotion Code (I63)* system control value is *selected*, you can pass one or more promotions that are flagged for *Required entry* and apply them to the order through the *Inbound Order XML Message (CWORDERIN)*. The *Promotion* attribute enables you to pass a single promotion, and the *Promotion* element enables you to pass a single promotion or multiple promotions. If the system control value is *unselected*, the order API ignores any promotions passed in the inbound order message.

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Promotion validation: If the order does not qualify for any of the promotions passed in the inbound order message and the *Allow Manual Entry of Promotion Code (I63)* system control value is *selected*, the order API does not apply the unqualified promotions; instead, it writes an *Order Transaction History Message* indicating that the promotion was not applied. The order does not go into error status. However, if a promotion code passed in the inbound order message is invalid, the order does go into error status.

Promotions logic: The order API uses the same logic as regular order entry to determine if an order qualifies for a promotion, and to select a promotion if the order qualifies for more than one of each type. See *Promotion Logic and Processing* for an overview.

Promotion discounts indicated in response message: If you receive the *Detailed Order XML Response (CWORDEROUT)* from the initial message (based on a *response_type* of *D* or *E*), the response message indicates the effects of any promotions applied to the order. Certain promotions are listed by name in the *Promotion* element, while others are indicated purely through the discounts or free gifts applied; see *Discounted and Added Items in the CWordOrderOut Response Message* for more information.

**Note:**

The *Promotion* element is included in the CWORDEROUT response message only if the outbound XML version is 3.0 or higher (available in release 2.0 or later of Order Management System, or Order Administration).

For more information see the Order Administration Web Services Guide on [My Oracle Support](#) (ID 2953017.1).

Promotions applied automatically: If promotions apply automatically because the *Required entry* flag is *unselected*, these promotions are indicated in the CWORDEROUT response message in the same way as promotions passed in the inbound order message.

Order Transaction History Message

You can review the promotions that apply to an order in standard order inquiry by selecting *Order History* to advance to the [Display Order History Screen](#). The same information is available in streamlined order inquiry by selecting *History*.

This screen includes an *UPSELL PROMO* entry for each promotion that applies to the order, including the dollar amount, if any (**Note:** Discounts added as additional charges are listed as negative amounts, while prorated discounts are listed as positive amounts). The screen also includes an entry for any merchandise discount that is prorated.

Order promotions are included in the total listed as `Total Prorated Order Level Discount`. This total also includes any dollar discount by source or offer or manually-entered discount amount.

You can also review the additional charge codes used to apply promotion discounts, if any, by selecting *Charges* in standard order inquiry.

 **Note:**

There may be a rounding discrepancy on the total discount applied to an order when you prorate against the order lines if the amounts do not divide evenly. This discrepancy should be no more than a few pennies. The likelihood of the rounding discrepancy occurring increases if there are multiple discounts that apply to an order, such as a promotion percentage discount and a dollar discount by source.

System Control Values Related to Promotions

As part of your setup for using promotions, complete the following system control values:

- *Allow Manual Entry of Promotion Code (I63)*: Controls the ability to manually specify promotions to apply to an order.
- *Exclude Sale Item When Prorating Discounts (I65)*: Determines whether to apply promotion discounts to sale items.
- *Best Way Promotions (K44)*: Controls the logic the system uses to select the promotions to apply to an order.
- *Price Override Reason for Promotions (K45)*: Specifies the price override reason code that prevents an item discounted through an Item Category or BOGO promotion from being discounted by any subsequent promotions that apply to the order.
- *BOGO Grouping by Price Code or Category (L62)*: Specifies whether to use BOGO promotions by item category or by price code.
- *Search Promotions by Start Date in Order Entry (M27)*: Defines how promotions sort on the Select Promotion window in interactive Order Entry.

See the description of each system control value and the discussion under *Promotion Logic and Processing* for more information.

Cautions Related to Promotions

The following cautions provide more detail on how promotions apply to orders:

- *Cautions for All Promotions*
- *Caution for Order and Tiered Promotions*
- *Cautions for Freight Promotions and Ship Via Overrides*
- *Cautions for One-Time-Use Promotions*
- *Cautions for BOGO Promotions by Item Category or Item*
- *Cautions for BOGO Promotions by Price Code*
- *Cautions for Item Category Promotions*

Cautions for All Promotions

- **Promotions as order credits:** It is possible for some promotions to result in a net credit against an order if you set the promotion up as a discount amount. For example, if you set up a freight discount as a \$5.00 credit, and the freight on the order is only \$3.95, the promotion will represent free freight plus a \$1.05 credit on the order.
- **Must qualify based on all criteria:** Whether you set up a promotion to offer a single type of discount or override, or to offer a discount and override in combination, it is important to remember that the order must qualify for *all* criteria, in which case the order

receives *all* of the promotion benefits. If the order fails to qualify for *any* of the promotion qualifiers, the order receives *none* of the promotion benefits.

- **Required price method:** In order for promotions to apply to an order, the Price method for the source code on the order header must be set to *Reg Plus Reprice*.
- **When promotions are applied:** If the [Allow Manual Entry of Promotion Code \(I63\)](#) system control value is:
 - *unselected*: the system evaluates the order for during repricing, the initial order accept, and the final order accept.
 - *selected*: the system evaluates the order for promotions during repricing when you complete the *Enter Promotion Code Screen* and again at order acceptance.
- **Setting the Max qty too low:** It is possible to set a maximum quantity that is less than the Qualifying quantity, or less than the Req qty for a BOGO promotion; however, in this situation, an order can never be eligible for the promotion discount.
- **Cannot override price matrix customer specials:** Any order line that is repriced with the [Price Override Reason for Price Matrix Customer Specials \(K42\)](#) is not eligible for a promotion discount.
- **Tax calculation:** If a promotion is prorated against the merchandise total, the tax amount is calculated based on the discounted merchandise price; otherwise, the tax amount is calculated based on the original item price because the discount appears as a negative additional charge.

Example:

If prorating: original item price = \$10.00

price after applying discount = \$9.00

tax = \$.45 (5% of \$9.00)

If not prorating: original item price = \$10.00

discount appears as \$1.00 negative additional charge; item price remains \$10.00

tax = \$.50 (5% of \$10.00)

- **Pricing sequence:** Discounts are applied to the order line price after all other price methods, *except* for a coupon percentage discount or a dollar discount by source code or offer. Also, unlike some other repricing options, repricing through an order promotion does not display a message on the screen and it is not described on the [Work with Order Line Screen \(Changing/Adding an Item\)](#).
- **Sale items excluded?** The [Exclude Sale Item When Prorating Discounts \(I65\)](#) system control value controls whether to include sale items when prorating discounts. This system control value affects the discounting only for a percentage discount, or for a dollar discount if there is no additional charge code specified. See that system control value for more information and examples. The [Sale item](#) flag for the Item Offer or the [Sale item](#) flag for the SKU Offer indicates whether an item is a sale item.
- **Non-discountable items excluded from prorating and qualifying dollar total:** Items that are flagged as non-discountable (based on the setting of the [Discountable](#) flag) are always excluded from prorating of discounts and from the qualifying dollar total.

- **Items excluded from qualifying quantity:** The system does not include items in the qualifying quantity if they are:
 - added to the order in sold out status
 - added to the order at “no charge” (However, items added with a discount, such as through promotional pricing or by source, are still included)
 - flagged as a *Sale item* flag for the Item Offer or the *Sale item* flag for the SKU Offer, if the *Exclude Sale Item When Prorating Discounts (I65)* system control value is *selected*
 - flagged as non-discountable (based on the setting of the *Discountable* flag)
 - drop ship (freight and additional freight promotions only)
 - identified as heavy items by on a ship via/item charge assignment through the [Work with Ship Via/Item Screen](#) (freight and additional freight promotions only)
- **No re-evaluation in order maintenance:** The system does not evaluate whether the order still qualifies for the promotion if you make any changes in order maintenance. For example, if the order total decreases due to a cancellation and no longer meets the requirement for the promotion, the promotion is not automatically removed.

Caution for Order and Tiered Promotions

The following additional caution applies to order and tiered promotions that apply a discount to the order:

- **Manual price overrides:** The system applies order discounts, regardless of whether they are prorated, even to items whose price you have overridden in order entry, with the exception of order lines using the [Price Override Reason for Promotions \(K45\)](#).
- **Price override reason required for free items:** The system applies the [Price Override Code for Promotional Priced Lines \(B61\)](#) when it adds a free item through a tiered promotion. If this system control value is blank, the system does not add the free item to the order.
- **Best price comparison:** When you use [Customer Price Group Best Price Comparison](#), if the calculated price for the Customer Price Group Code for CPG Pricing Only (L58) is lower than the price after applying any promotions, the order line uses the lower price.

Cautions for Freight Promotions and Ship Via Overrides

The following additional cautions apply to freight promotions and other promotion types that apply a ship via override:

- **Freight overrides:** An order is not eligible for a freight promotion if:
 - you set the Calculate freight field on the order header to *unselected*, or
 - you enter an override amount in the Freight override (current ship to) field on the [Work with Order Ship to Properties Screen \(Properties\)](#).
- The customer is eligible for free freight through a loyalty program. See [Loyalty Memberships](#) for background.
- **Valid SCF/Ship Via required:** In order for the ship via override to apply to an order, the override ship via must already be set up with the SCF on the order shipping address as a valid SCF/ship via combination. If the SCF/ship via is not valid combination, the ship via override does not apply to the order; additionally, if the ship via override is set up as part of a discount promotion (such as a freight discount promotion), the discount does not apply to the order either.

You use [Working with SCF/Ship Via Values \(WSHV\)](#) to set up SCF/ship via combinations.

- **PO Boxes:** If the override ship via does not accept a PO box as a valid delivery address, the ship via override does not take place on an order with a PO box; additionally, if the ship via override is set up as part of a discount promotion (such as a freight discount promotion), the discount does not apply to the order either.
- **If more than one qualifying promotion has a ship via override:** If more than one promotion type that applies to the order includes a ship via override, the system uses the override of the *last* promotion in the following order:
 - *Additional Freight*
 - *Freight*
 - *Order*
- **Ship via override:** The system applies the promotion's ship via override to the order unless another ship via override takes precedence; see [Ship Via Override Hierarchy](#) for a list of ways the system can override the shipper specified on the order with another shipper and the hierarchy for ship via overrides.

Cautions for One-Time-Use Promotions

Any type of promotion can be flagged for one-time use. Things to note:

- If the promotion's *Use once* flag is selected:
- If the [Allow Manual Entry of Promotion Code \(I63\)](#) system control value is *selected*: You can apply the promotion more than once only if you have authority under the [Override One Time Use Promotion \(J08\)](#) secured feature.
- The ability to override the one-time-use option is available only in interactive order entry; the order API never applies a one-time-use promotion a second time for a customer.
- If the [Allow Manual Entry of Promotion Code \(I63\)](#) system control value is *unselected*, the system never applies the same one-time-use promotion twice for a customer, even if the promotion is passed in the CWOrderIn message. If the promotion is passed and has already been applied to a prior order, the system writes an Order Transaction History message such as `Promotion 1TFRT not applied.`

About the Customer Sold To Promo table: The system uses this table to track the orders on which customers used promotions flagged for one-time use. You can review these promotions for a customer at the [Display One Time Use Promotions Screen](#) in customer maintenance.

- The Customer Sold To Promo record is not deleted when the order where the promotion was used is canceled, or the item(s) on the order sold out. It is possible to apply the promotion to an additional order only if the [Allow Manual Entry of Promotion Code \(I63\)](#) system control value is *selected* and you have authority under the [Override One Time Use Promotion \(J08\)](#) secured feature.
- The Customer Sold To Promo record is initially created when you complete creation of a suspended order; however, the promotion is not applied, and the Customer Sold To Promo record is not created, when the order is in error.
- The Customer Sold To Promo record is not retained if:
- an order initially received through the order API is not ultimately accepted.

- the order no longer qualifies for the one-time-use promotion at acceptance, so the promotion is removed.
- you delete a suspended order from a batch or delete the batch.
- Purging orders deletes the related Customer Sold To Promo records. See [Purging Orders \(MPOR\)](#).
- Performing a customer merge/purge merges the Customer Sold To Promo records. See [Working with Merge/Purge Sold-to Names \(MMCS\)](#).

Cautions for BOGO Promotions by Item Category or Item

The following additional cautions apply to BOGO promotions by item category or item (if the [BOGO Grouping by Price Code or Category \(L62\)](#) system control value is set to *ITEM CATEGORY*):

- **Sale or non-discountable items:** The BOGO repricing does not apply to an order line for a Sale item or an item flagged as Non-discountable.
- **BOGO item quantity and item/SKU or quantity must match:** A BOGO promotion set up to discount an existing line on the order does not apply if there is no order line with the correct quantity and item, SKU, or item category. For example, you set up a BOGO promotion as: buy five in an item category, get one at 50% off. An order includes three lines, each for two units within the item category. Because there is no eligible order line with a quantity of one, the BOGO promotion does not apply.
- **Confirming that the order qualifies for the promotion:** The *Enter Promotion Code Screen* does not display an error message when you enter a BOGO promotion if the order does not currently qualify for the promotion based on the criteria set up at the *Work with BOGO Discount Screen (Item Category or Item)*; however, if the order does not qualify when you accept the order, the promotion discount is not applied.

! Important:

If you select the Allow multiples setting for any BOGO promotions, then the order line quantity should be 1 for every order line on an order that might be eligible for the promotion; otherwise, the BOGO promotion might not apply correctly. To help ensure that the order line quantity is always 1, you can set both the [Default Order Quantity \(B30\)](#) and [Maximum Order Quantity \(C60\)](#) system control values to 1.

Cautions for BOGO Promotions by Price Code

The following additional cautions apply to BOGO promotions by price code (if the [BOGO Grouping by Price Code or Category \(L62\)](#) system control value is set to *PRICE CODE*):

- **Sale or non-discountable items:** The BOGO repricing does not apply to an order line for a Sale item or an item flagged as Non-discountable.
- **Order line quantity must be 1:** If the order line quantity is greater than 1, the promotion might not apply correctly. To help ensure that the order line quantity is always 1, you can set both the [Default Order Quantity \(B30\)](#) and [Maximum Order Quantity \(C60\)](#) system control values to 1.
- **Only specific promotion variations are supported:** See [BOGO \(Buy One/Get One\) Discount or Free Gift by Price Code](#) for a listing of the specific options that are supported for BOGO promotions by price code.

- **BOGO quantity must meet the required amount:** If the promotion specifies a Req amt, then the Req qty of qualifying items on the order must meet or exceed the Req amt within that quantity. For example, if the promotion specifies a Req amt of \$500 and a Req qty of 1, and an order includes 2 qualifying items for \$250 each, the order is not eligible for the promotion; it would need to include a single qualifying item for \$500 or more to be eligible.
- **Discount is always based on or applied to the lower-priced item(s):** BOGO promotions by price code require that any discount calculation be based on the lower-priced items within the total BOGO quantity, and applied to the lower-priced items if the discount is not prorated, regardless of whether the lower-priced item is in the qualifying Price code or the BOGO PC. For example:
 - If the promotion specifies “buy one, get one 30% off,” the 30% discount is calculated based on the lower-priced item.
 - If the promotion specifies “buy one, get \$20 off one” and is not prorated, the \$20 discount applies to the lower-priced item.

If the total discount from the promotion exceeds the price of the lower-priced item(s), then the actual discount applied is limited to the price of the lower-priced item(s). For example, if the promotion specifies “buy one, get \$20 off one” and is prorated, but the lower-priced item is \$15, then the total prorated discount is \$15.

Cautions for Item Category Promotions

The following additional caution applies to item category promotions:

- **Confirming that the order qualifies for the promotion:** The *Enter Promotion Code Screen* does not display an error message when you enter an item promotion and the order does not currently qualify for the promotion based on the item categories specified at the [Work with Qualifying Item Categories Screen](#); however, if the order does not qualify when you accept the order, the promotion discount is not applied.

Work with Promotions Screen

Purpose: Use this screen to review and work with promotions. See [Working with Promotions \(WPRO\)](#) for an overview of how promotions work, examples of each type, and setup instructions.

Additional screens: You can advance to the following screens from the Work with Promotions screen:

- [Create Promotion Screen](#)
- [Work with Qualifying Source Codes Screen](#)
- [Work with Promotion Discounts Screen](#)
- [Copy Promotion Screen](#)
- [Work with Qualifying Customer/Price Groups Screen](#)
- [Work with Qualifying Item Categories Screen](#)
- [Work with BOGO Discount Screen \(Item Category or Item\)](#)
 - [Change BOGO Discount Screen](#)
- [Work with BOGO Discounts by Item/Price Code Screen](#)
 - [BOGO Discount by Item/Price Code Screen](#)

- [BOGO Discount by Item/Price Code Screen \(Display Mode\)](#)
- [Work with Item/Category Exclusions Screen](#)
- [Work with Promotions by Start Date Screen](#)
- [Work with Promotions by End Date Screen](#)

How to display this screen: Enter *WPRO* in the Fast path field at the top of any menu or select Work with Promotion Values option from a menu.

Note:

The system retains the last view you used in Work with Promotions; instead of advancing to the Work with Promotions screen, you may advance to the *Work with Promotions by Start Date Screen* or *Work with Promotions by End Date Screen*.

Promotions display on the Work with Promotions screen in ascending promotion code sequence; see *Work with Promotions by Start Date Screen* to display promotions in ascending start date sequence and see *Work with Promotions by End Date Screen* to display promotions in ascending end date sequence.

Field	Description
Promotion	A code to identify the promotion. Enter a full or partial promotion code to display promotions in ascending promotion code sequence, starting with your entry. Alphanumeric, 7 positions; optional.
Description	The description of the promotion. Enter a full or partial description to display promotions that contain your entry. Alphanumeric, 30 positions; optional.
Start Date	The date when the promotion first becomes effective. Enter a start date to display promotions whose start date is equal to or later than the date you entered. Note: This sort is available <i>Work with Promotions by Start Date Screen</i> only on the. Numeric, 6 positions (in user date format); display-only.
End Date	The last date when the promotion is effective. Enter an end date to display promotions whose end date is equal to or later than the date you entered. Note: This sort is available only on the <i>Work with Promotions by End Date Screen</i> . Numeric, 6 positions (in user date format); display-only.

Field	Description
Type	<p>The type of promotion. Valid values are:</p> <ul style="list-style-type: none"> • <i>Additional freight</i> • <i>BOGO</i> • <i>Freight</i> • <i>Item Category</i> • <i>Order</i> • <i>Tiered discount</i> • '' = messaging or reporting promotion <p>Select a promotion type to display promotions assigned to that type. Optional.</p>
Excl	<p>Indicates whether you have specified item or item category exclusions for the promotion. N = There are currently no item or item category exclusions. Y = There is at least one item or item category exclusion. See Work with Item/Category Exclusions Screen for more information.</p>

Screen Options	Procedure
Create a promotion	Select <i>Create</i> to advance to the Create Promotion Screen .
Change a promotion	Select <i>Change</i> for a promotion to advance to the Change Promotion screen. For field descriptions, see Create Promotion Screen . You can change all of the information except the Promotion code field.
Copy an existing promotion	Select <i>Copy</i> for a promotion to advance to the Copy Promotion Screen .
Delete a promotion	Select <i>Delete</i> for a promotion to delete it. You can also run the PURGEPR periodic function to delete completed promotions whose end date is equal to or earlier than a calculated purge date.
Display a promotion	Select <i>Display</i> for a promotion to advance to the Display Promotion screen. You cannot change any fields on this screen. For field descriptions, see the Create Promotion Screen .
Work with item/category exclusions	Select <i>Item/Item Category Exclusions</i> to advance to the Work with Item/Category Exclusions Screen .
View promotions in ascending start date sequence	Select <i>By Start Date</i> to advance to the Work with Promotions by Start Date Screen .

 **Note:**

This option is available only on the [Work with Promotions by End Date Screen](#) and [Work with Promotions Screen](#).

Screen Options	Procedure
View promotions in ascending end date sequence	Select <i>By End Date</i> to advance to the <i>Work with Promotions by End Date Screen</i> .
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option is available only on the <i>Work with Promotions by Start Date Screen</i> and <i>Work with Promotions Screen</i>.</p> </div>
View promotions in ascending promotion code sequence	Select <i>By Promotion</i> to advance to the <i>Work with Promotions Screen</i> .
	<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option is available only on the <i>Work with Promotions by Start Date Screen</i> and <i>Work with Promotions by End Date Screen</i>.</p> </div>
Create or delete promotions based on the information in the Promotion Upload table.	Select <i>Upload</i> to submit the program that creates or deletes promotions based on the information in the Promotion Upload table. See Promotion Upload for more information.

Create Promotion Screen

Purpose: To create a new promotion, Select *Create* at the *Work with Promotions Screen*.

Field	Description
Promotion code	A code used to group source codes together for reporting analysis, to display a pop-up message in order entry, to provide a merchandise, freight, or additional freight override, apply a negative additional charge, add a free or discounted item, or to override the ship via on an order. Numeric, 7 positions. Create screen: required. Change screen: display-only.

Field	Description
Required entry	<p>Indicates whether you must enter this promotion at the Enter Promotion Code Screen in interactive order entry or include it in the inbound order message for the order API in order to have the promotion apply to the order.</p> <ul style="list-style-type: none"> <i>Selected</i> = If the Allow Manual Entry of Promotion Code (I63) system control value is: <i>selected</i> = the system does not evaluate the order to see if it qualifies for the promotion unless you enter the promotion code at the Enter Promotion Code Screen in interactive order entry or include it in the inbound order message for the order API <i>unselected</i> = this promotion cannot apply to any orders <i>Unselected</i> = The system evaluates the order to see if it qualifies for the promotion <p>See Promotion Logic and Processing for more information on how the system determines whether to apply a promotion to an order.</p>
Use once	<p>Indicates whether the promotion can apply to more than one order for a customer.</p> <ul style="list-style-type: none"> <i>Selected</i> = The promotion can apply just once for a customer; however, if the Allow Manual Entry of Promotion Code (I63) system control value is <i>selected</i> and you have authority to the Override One Time Use Promotion (J08) secured feature, you can apply the promotion to an additional order for the customer in order entry. <i>Unselected</i> = There is no restriction on how many times the promotion can apply for a customer. <p>See Cautions for One-Time-Use Promotions.</p>
Description	<p>The description of the promotion code. Alphanumeric, 30 positions; required.</p>
Start date	<p>The date when the promotion becomes effective. This date might be used in the promotion selection hierarchy; see Promotion Logic and Processing for more information. Numeric 6 positions (in user date format), required.</p>
End date	<p>The last date when the promotion is effective. Numeric 6 positions (in user date format), required.</p>
Pop up window messages 1-4	<p>Up to four messages that appear in a pop-up window in order entry if this promotion is assigned to the source code on the order header. Alphanumeric, 4 lines, 30 positions each line; optional.</p> <p>Non-Messaging Promotion Values:</p>

**Note:**

Complete the following fields only for promotions that apply some sort of a discount, free gift, or ship via override. See [About Discount Promotions](#) and [Promotion Logic and Processing](#) for more information on setting up and using discount promotions.

Field	Description
Type	<p>The type of discount to apply to orders that qualify for this promotion. Valid values are:</p> <ul style="list-style-type: none">• <i>Additional freight</i>• <i>Freight</i>• <i>Item Category</i>• <i>Order</i>• <i>Tiered discount</i>• <i>BOGO</i>• '' = messaging or reporting promotion
	<div style="border-left: 2px solid #0070C0; padding-left: 10px;"><p> Note:</p><p>You cannot change this setting once you have created the promotion.</p></div>
Priority	<p>Required if you define any order promotion values.</p> <p>The priority in which the system evaluates whether this promotion applies to an order. Lower numbers indicate higher priorities; that is, promotions with the lowest priority numbers are evaluated first. Depending on your setup, the system might not use the priority as a criterion to compare promotions; see <i>Promotion Logic and Processing</i> for more information.</p>
Promotion ID	<p>Numeric, 3 positions; required if you enter a discount Type.</p> <p>A code used to identify or group promotion codes for reporting and analysis.</p> <p>Alphanumeric, 5 positions; optional.</p>

Field	Description
Qualifying source	<p>Optionally, enter a source code that must be used on the order header for an order to qualify for the promotion. If you enter a qualifying source code here, you advance automatically to the Work with Qualifying Source Codes Screen, where you have the option of entering additional qualifying source codes for the promotion.</p> <p>If you complete more than one qualifying field, the order must meet all criteria to qualify for the promotion. You can qualify a promotion by source code(s) or offer, but not both. See About Discount Promotions and Promotion Logic and Processing.</p>

**Note:**

Qualifying a promotion by source code differs from assigning the promotion to the source code to force a pop-up message to open or give the promotion highest priority in order entry.

An error message indicates if you enter a source code that has the Exclude promotion field *selected*: Source code flagged to exclude promotions.

Source codes are defined in and validated against the Source table. See [Working with Source Codes \(WSRC\)](#).

You can qualify a promotion by source code *or* offer, but not both. See [About Discount Promotions](#) and [Promotion Logic and Processing](#).

More than one qualifying source? If you have specified more than one qualifying source code for the promotion, the first qualifying source code alphanumerically is displayed in this field at the Change Promotion and Display Promotion screens and is display-only.

If you flagged a source code to exclude promotions after assigning it as a qualifying source and it is the first qualifying source for the promotion alphanumerically, you will not be able to edit the promotion. The work around is to:

- change the setting of the Exclude promotion flag for the source code
- remove the source code as a qualifying source for the promotion
- reset the Exclude promotion flag for the source code

Alphanumeric, 7 positions; optional or display-only.

Qualifying offer	Optionally, enter the offer that must be associated with the source code used on the order header for an order to qualify for the promotion.
-------------------------	--

If you complete more than one qualifying field, the order must meet all criteria to qualify for the promotion.

Offer codes are defined in and validated against the Offer table. See [Working with Offers \(WOFR\)](#).

You can qualify a promotion by source code *or* offer, but not both. See [About Discount Promotions](#) and [Promotion Logic and Processing](#).

Alphanumeric, 3 positions; optional.

Field	Description
Qualifying pay type	<p>Optionally, enter the pay type that must be used on an order for the order to qualify for the promotion. There can be other pay types used on the order as well.</p> <p>If you complete more than one qualifying field, the order must meet all criteria to qualify for the promotion.</p> <p>Pay type codes are defined in and validated against the Pay Type table. See Working with Pay Types (WPAY).</p> <p>When you use a pay type as a qualifier, you typically do not see the effect of the promotion until you accept the order.</p> <p>See About Discount Promotions and Promotion Logic and Processing.</p> <p>Numeric, 2 positions; optional.</p>
Qualifying \$ amount (Qualifying dollar amount)	<p>Optionally, enter the total merchandise dollar amount an order must have to qualify for the promotion. The system evaluates the qualifying dollar amount after other repricing, such as price tables or an order-level discount percentage, is applied to the merchandise total.</p> <p><i>Exclusions:</i> Non-discountable items are not included in the qualifying merchandise dollar total.</p> <p>If you complete more than one qualifying field, the order must meet all criteria to qualify for the promotion.</p> <p><i>Item category promotions:</i> For an item category promotion, you can specify whether to evaluate an order based on the entire merchandise total on the order, or only the merchandise total within that specific category. See the Qualifying \$ amount type, below.</p> <p>See About Discount Promotions and Promotion Logic and Processing.</p> <p>Not a valid entry for a tiered promotion or a BOGO promotion by price code. See the Work with Promotion Discounts Screen for information on specifying qualifying dollar amounts for tiered promotions, and see the BOGO Discount by Item/Price Code Screen for more information on setting up BOGO promotions by price code.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Qualifying \$ amount type	<p>For an item category promotion, use this field to indicate whether the system uses the entire merchandise order total or quantity to determine whether the order qualifies for the promotion, or only the merchandise total or quantity within a specific item category. Valid values are:</p> <ul style="list-style-type: none"> <i>Item Categ</i> = Only order lines for items assigned to a qualifying item category are included in determining the qualifying dollar amount, qualifying quantity, or maximum quantity. If the promotion specifies multiple item categories, each item category is evaluated independently. <p><i>Example:</i> The promotion offers a 10% discount for a Qualifying \$ amount of \$50.00 and two item categories, IT1 and IT2. There must be at least \$50.00 worth of merchandise in IT1 for these order lines to receive the 10% discount; similarly, there must be at least \$50.00 worth of merchandise in IT2 for these order lines to receive the discount.</p> <ul style="list-style-type: none"> <i>Order</i> = All order lines (except for non-discountable items) are eligible to be included in the qualifying dollar amount, qualifying quantity, or maximum quantity, regardless of item category assignment. <p><i>Example:</i> The promotion offers an Item category special price for Qualifying quantity of 5 and a Maximum quantity of 10 for item categories IT1 and IT2. The order includes 7 order lines, including 5 for IT1 and 2 for IT2. Each of the order lines receives the special price.</p>

Note:

When evaluating an order for an item category promotion that specifies a qualifying quantity or maximum quantity, the system treats a blank Qualifying \$ amount type as if it is set to *Order*.

Required for an Item category promotion if you specify a Qualifying \$ amount.

Field	Description
Qualifying quantity	<p data-bbox="613 275 1458 331">Optionally, enter the total unit quantity required for an order to qualify for the promotion.</p> <p data-bbox="613 338 1458 369"><i>Example:</i> If the qualifying quantity is five, an order can qualify with:</p> <ul data-bbox="613 375 1458 495" style="list-style-type: none"> <li data-bbox="613 375 1458 407">• a single order line with a quantity of five <li data-bbox="613 413 1458 445">• five order lines, each for a quantity of one <li data-bbox="613 451 1458 495">• any other combination of order lines with a total unit quantity of 5 or more <p data-bbox="613 501 1458 558"><i>Exclusions:</i> The system does not include items in the qualifying quantity if they are:</p> <ul data-bbox="613 564 1458 1087" style="list-style-type: none"> <li data-bbox="613 564 1458 596">• added to the order in sold out status <li data-bbox="613 602 1458 684">• added to the order at “no charge” (However, items added with a discount, such as through promotional pricing or by source, are still included) <li data-bbox="613 690 1458 779">• flagged as a <i>Sale item</i> flag for the Item Offer or the <i>Sale item</i> flag for the SKU Offer, if the <i>Exclude Sale Item When Prorating Discounts (I65)</i> system control value is <i>selected</i> <li data-bbox="613 785 1458 842">• flagged as non-discountable (based on the setting of the <i>Discountable</i> flag) <li data-bbox="613 848 1458 879">• drop ship (freight and additional freight promotions only) <li data-bbox="613 886 1458 968">• identified as heavy items by on a ship via/item charge assignment through the <i>Work with Ship Via/Item Screen</i> (freight and additional freight promotions only) <li data-bbox="613 974 1458 1031">• You cannot specify a qualifying quantity for a tiered or a BOGO promotion. <li data-bbox="613 1037 1458 1087">• The system does not prevent you from entering a qualifying quantity that is greater than the maximum quantity, below. <p data-bbox="613 1094 1458 1325">Item category promotions: When you specify a qualifying quantity for an item category promotion, the system uses the Qualifying \$ amount type to determine whether to include the total quantity of all items on the order to evaluate whether each item category qualifies for the promotion, or evaluates the quantity of each item category separately. For example, if the qualifying quantity is 5, the Qualifying \$ amount type is set to <i>Item Category</i>, and the order includes 3 of IT1 and 6 of IT2, only IT2 qualifies for the promotion.</p> <p data-bbox="613 1331 1458 1413">If the Qualifying \$ amount type is blank, then the system uses the quantity of all items on the order to determine whether each item category qualifies for the promotion.</p> <p data-bbox="613 1419 1458 1457">Numeric, 5 positions; optional.</p>

Field	Description
Max qty	<p>Optionally, enter the maximum number of units an order can have in order to qualify for the promotion. You might use this field to restrict orders from a promotion if they are already receiving a deep discount through a quantity break price or other pricing option. If the order exceeds the maximum quantity, none of the items on the order are eligible for the promotion.</p> <p><i>Which items on the order are included in evaluation?</i> This total follows the same rules as those described for the Qualifying quantity, except that “no charge” items are included in the total when evaluating the order for the Max qty.</p> <p><i>How does the maximum work for item category promotions?</i> If you set up an Item category promotion that also specifies a <i>Qualifying \$ amount (Qualifying dollar amount)</i> with the <i>Qualifying \$ amount type</i> set to Item Category, the evaluation for maximum quantity is against the item category rather than the whole order; however, the evaluation takes place at final order acceptance, and not at the Enter Promotion Code Screen.</p>

 **Note:**

The screen does not prevent you from entering a maximum quantity that is less than the Qualifying quantity, or less than the Req qty for a BOGO promotion; however, in this situation, an order can never be eligible for the promotion discount.

Item category promotions: When you specify a maximum quantity for an item category promotion, the system uses the Qualifying \$ amount type to determine whether to include the total quantity of all items on the order to evaluate whether each item category qualifies for the promotion, or evaluates the quantity of each item category separately. For example, if the maximum quantity is 10, the Qualifying \$ amount type is set to *Item Category*, and the order includes 12 of IT1 and 7 of IT2, only IT2 qualifies for the promotion.

If the Qualifying \$ amount type is blank, then the system uses the quantity of all items on the order to determine whether each item category qualifies for the promotion.

Numeric, 5 positions; optional.

Field	Description
Qualifying customer#	<p>Optionally, use this field to restrict the promotion to one or more specific customers. If you enter a customer number in this field or a customer price group in the next field, you advance to the <i>Work with Qualifying Customer/Price Groups Screen</i>. At this subsequent screen, you can specify any number of individual customers or customer price groups.</p> <p>Customer numbers are defined in and validated against the Customer table. See <i>Creating and Updating Sold-to Customers (WCST)</i> for more information.</p> <p>If you have previously specified a qualifying customer and you specified this qualifier before specifying any customer price groups, this first customer is listed in this field and is display-only; otherwise, this field is blank.</p> <p>Numeric, 9 positions; optional.</p>
Qualifying customer group	<p>Optionally, use this field to restrict the promotion to one or more specific customer price groups. If you enter a customer price group in this field or a customer number in the previous field, you advance to the <i>Work with Qualifying Customer/Price Groups Screen</i>. At this subsequent screen, you can specify any number of individual customers or customer price groups.</p> <p>Customer price groups are defined in and validated against the Customer Price Group table. See <i>Working with Customer Price Groups (WCPG)</i> for more information.</p> <p>If you have previously specified a qualifying customer price group, and you specified this qualifier before specifying any individual customer numbers, this first customer price group is listed in this field and is display-only; otherwise, this field is blank.</p> <p>Alphanumeric, 4 positions; optional.</p>

**Note:**

At this screen you can enter either a single qualifying customer number or customer group, but not both. To enter additional customer numbers or groups, use the *Work with Qualifying Customer/Price Groups Screen*. If you have previously entered any qualifying customer numbers or groups, the first customer number or group (but not both) is listed here; use the *Work with Qualifying Customer/Price Groups Screen* to review any additional customer numbers or groups.

Field	Description
First time buyer	<p>Optionally, use this field to restrict the promotion to first-time customers. Valid values are:</p> <ul style="list-style-type: none"> <i>LTD orders</i>: The promotion is available only if the customer placing the order has not placed any previous orders. A customer who has placed an order is not eligible, even if the order is subsequently canceled or if all items on the order are sold out; however, the customer is eligible if the previous order is still in suspended or error status, or if it consisted of a return processed as a new order with a negative quantity. <i>LTD sales</i>: The promotion is available only if the customer placing the order has not previously had an order shipment. A customer whose only previous orders have not yet been shipped, or if they consisted of a return processed as a new order with a negative quantity, is still eligible for the promotion. <p>This qualifier applies to the customer placing the order only (customer sold-to); it does not apply to order recipients.</p>
Continental USA only	<p>Optionally, use this field to restrict a freight or additional freight promotion discount, or ship via override, to states in the continental U.S.A. Valid values are:</p> <ul style="list-style-type: none"> <i>selected</i> = Promotion applies only when the shipping address is in the continental U.S.A. <i>unselected</i> = Promotion is not restricted to the continental U.S.A.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option is available only for freight or additional freight promotions.</p> </div>
Qualifying via priority	<p>Optionally, enter the priority that must be assigned to the ship via on the order header for the order to qualify for the promotion. The ship via priority is a one-position number that controls how the system allocates inventory to backorders or reserves inventory during Batch Reservation.</p> <p><i>Example:</i> You can create a promotion to offer \$.99 ground shipping for orders over \$25.00, and use this field to specify the ship via priority for these ship vias.</p> <p>If the ship via changes for any reason before you accept the order and the current ship via's priority does not match this setting, the system removes the promotion from the order.</p> <p>See Working with Ship Via Codes (WVIA) for more information on setting up ship vias, and see Ship Via Override Hierarchy for a discussion on how the ship via on an order might be overridden in order entry.</p> <p>Numeric, 1 position; optional.</p>

Field	Description
Item category special price	<p>Indicates the price to apply for items within an item category specified at the <i>Work with Qualifying Item Categories Screen</i> for this promotion.</p> <p><i>Example:</i> Enter 4.99 have the promotion discount all items within the item category to \$4.99, regardless of their regular price.</p> <p>You can enter an Item category special price only for Item Category promotions; in this case, you do not enter a Discount amount or a Discount percent.</p>

**Note:**

If there is an item on the order whose price is lower than the special price, the promotion does not change the price. For example, the special price is \$4.99 and item AB100 is priced at \$4.00: the promotion does not reprice the item.

Additional charge code	<p>Numeric, 13 positions with a 2-place decimal; optional.</p> <p>Optionally, enter an additional charge code to use when adding a non-prorated discount to an order. You should specify an additional charge code when:</p> <ul style="list-style-type: none"> • an order, tiered, or freight type discount should not be prorated • a freight discount uses a discount amount or percentage (<i>not</i> a freight override amount or free freight) • any additional freight discount applies to an order; all additional freight discounts use either a discount amount or percentage <p>In these situations, the discount is added to the order as a negative additional charge using the code you specify here.</p>
-------------------------------	--

**Note:**

If you use an additional charge code to apply a discount against an order, this negative additional charge code reduces the total the customer pays even if you have used the [Price Override Reason for Promotions \(K45\)](#) to prevent additional discounting against the prices of the order lines.

You cannot specify an additional charge code for an Item Category or BOGO promotion.

Additional charge codes are defined in and validated against the Additional Charge table; see [Establishing Additional Charge Codes \(WADC\)](#).

Alphanumeric, 2 positions; may be optional or required, depending on other field settings.

Field	Description
Discount amount	<p>The dollar discount amount to apply to the order:</p> <ul style="list-style-type: none"> • <i>Order discount</i>: This amount is prorated against the dollar value of order lines if you do not enter an additional charge code; otherwise, the discount is added to the order as a negative additional charge. • <i>Item category</i>: This amount is prorated against the order lines in that item category (or categories). See Prorating Logic for more information on the prorating calculation. • <i>Freight or additional freight discount</i>: This amount is added to the order as a negative additional charge. <p>Not a valid entry for a tiered or BOGO promotion. See the <i>Work with Promotion Discounts Screen</i> for information on specifying discount amounts for tiered promotions, and see the <i>Work with BOGO Discount Screen (Item Category or Item)</i> for information on specifying discount amounts for BOGO promotions.</p> <p><i>Include sale item?</i> The specified discount applies to sale items if the Exclude Sale Item When Prorating Discounts (I65) is <i>unselected</i>. See that system control value for more information.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Discount percent	<p>The percentage discount to apply to the items on the order.</p> <ul style="list-style-type: none"> • <i>Order discount</i>: This percentage is applied to each order line's unit price if you do not enter an additional charge code; otherwise, the total merchandise discount is added to the order as a negative additional charge. • <i>Item category</i>: This percentage is applied to the unit price of each order line for the item category(ies). • <i>Freight or additional freight discount</i>: This percentage of the freight or additional freight charge is added to the order as a negative additional charge. <p><i>Include sale item?</i> The specified discount applies to sale items if the Exclude Sale Item When Prorating Discounts (I65) is <i>unselected</i>. See that system control value for more information.</p> <p>Not a valid entry for a tiered or BOGO promotion. See the <i>Work with Promotion Discounts Screen</i> for information on specifying discount amounts for tiered promotions, and see the <i>Work with BOGO Discount Screen (Item Category or Item)</i> for information on specifying discount amounts for BOGO promotions.</p> <p>Numeric, 5 positions with a 2-place decimal; optional.</p>
Freight override amount	<p>The freight amount to charge on the order, overriding the freight charge based on the calculation methods that would normally apply. You use this field only for a freight discount.</p> <p>You cannot enter an additional charge code if you enter a freight override amount.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Free freight	<p>Indicates whether to provide freight free of charge. You use this field only for a freight discount. Valid values are:</p> <p><i>selected</i> = This is a free freight discount promotion</p> <p><i>unselected</i> = This is not a free freight discount promotion</p> <p>You cannot enter an additional charge code if you enter <i>Y</i> in this field.</p> <div data-bbox="812 472 1458 709" style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>If the customer is eligible for free freight through a loyalty program, you cannot apply a promotion that includes free freight. See Loyalty Memberships for background.</p> </div>
Ship via override	<p>Use this field to have the promotion replace the ship via on the order with the ship via you enter here. You can combine a ship via with an order, freight, or additional freight discount promotion, or set it up as the only discount/override for a freight or additional freight discount promotion. See Ship Via Override for information on how to set up a ship via override, and for some of the cautions to observe.</p> <p>The system applies the promotion ship via override to the order unless another ship via override takes precedence; see Ship Via Override Hierarchy for a list of ways the system can override the shipper specified on the order with another shipper and the hierarchy in which the ship via overrides take precedence.</p> <p>Ship via codes are defined in and validated against the Ship Via table. See Working with Ship Via Codes (WVIA).</p> <p>Not a valid entry for a BOGO, item category, or tiered promotion.</p> <p>Item Ship Via Override</p> <p>Item ship via overrides define the shippers that are eligible to ship an item to its destination. If the ship via override defined for the promotion is not a valid shipper for one or more of the items on the order, the system will <i>not</i> apply the ship via override from the promotion to the order. See Working with Item Ship Via Overrides.</p> <p>Numeric, 2 positions; optional.</p>
Ship via country	<p>The country eligible to receive the ship via override. Only orders you are shipping to this country will receive the ship via override, or any additional discounts included in the promotion.</p> <p>You use this field only for a ship via override.</p> <p>Country codes are defined in and validated against the Country table; see Setting Up the Country Table (WCTY).</p> <p>Not a valid entry for a BOGO, item category, or tiered promotion.</p> <p>Alphanumeric, 3 positions; optional.</p>

Field	Description
From SCF	<p>The first (lowest) SCF eligible to receive the ship via override. Only orders you are shipping to zip codes that fall within this SCF up to the To SCF will receive the ship via override, or any additional discounts included in the promotion.</p> <p>You use this field only for a ship via override. Not a valid entry for a BOGO, item category, or tiered promotion.</p> <p>SCF codes are defined in and validated against the SCF table; see Working with SCF Codes (WSCF). The system also requires that:</p> <ul style="list-style-type: none"> • a SCF/ship via record exists for the <i>Ship via override</i>; see Working with SCF/Ship Via Values (WSHV) for background. • the SCF is valid for the <i>Ship via country</i>, if specified; otherwise, for the Default Country for Customer Address (B17). <p>Alphanumeric, 3 positions; optional.</p>
To SCF	<p>The last (highest) SCF eligible to receive the ship via override. Only orders you are shipping to zip codes that fall within the From SCF to this SCF will receive the ship via override, or any additional discounts included in the promotion.</p> <p>You use this field only for a ship via override. Not a valid entry for a BOGO, item category, or tiered promotion.</p> <p>SCF codes are defined in and validated against the SCF table; see Working with SCF Codes (WSCF). The system also requires that:</p> <ul style="list-style-type: none"> • a SCF/ship via record exists for the <i>Ship via override</i>; see Working with SCF/Ship Via Values (WSHV) for background. • the SCF is valid for the <i>Ship via country</i>, if specified; otherwise, for the Default Country for Customer Address (B17). <p>Alphanumeric, 3 positions; optional.</p>

Completing the Create or Change Promotion Screen

Completing this screen: Once you create or change a promotion, you might advance to the:

- [Work with Qualifying Source Codes Screen](#): if you have specified a [Qualifying source](#).
- [Work with Promotion Discounts Screen](#): if you are setting up a [Tiered Discount or Free Gift](#) promotion.
- [Work with Qualifying Customer/Price Groups Screen](#): if you have specified a [Qualifying customer#](#) or [Qualifying customer group](#).
- [Work with Qualifying Item Categories Screen](#): if you are setting up an [Item Category Discount](#) promotion.
- [Work with BOGO Discount Screen \(Item Category or Item\)](#): if you are setting up a [BOGO \(Buy One/Get One\) Discount or Free Gift by Item Category or Item](#) promotion.

Work with Qualifying Source Codes Screen

Purpose: Use this screen to review and work with the qualifying source codes for a promotion. An order qualifies for a promotion if one of the source codes listed is on the order header, and the order also meets all other criteria specified at the *Create*

Promotion Screen or the Change Promotion screen. See *Promotion Logic and Processing* for a discussion.

How to display this screen: Complete the *Create Promotion Screen*, *Change Promotion screen*, *Copy Promotion Screen*, or the *Display Promotion screen* for a promotion that has a Qualifying source.

Note:

If you advance to this screen from the Display Promotion screen, all fields are display-only.

Field	Description
Promotion code	The code identifying the promotion you are currently working with. The description is to the right. Code: alphanumeric, 7 positions; display-only. Description: alphanumeric, 30 positions; display-only.
Source code	A source code that must be used on the order header for an order to qualify for the promotion. The first qualifying source code alphanumerically is displayed in the <i>Qualifying source</i> field on the Change Promotion screen and the Display Promotion screen. <i>Adding a qualifying source:</i> Enter a source code in the Source code field at the top of the screen to add it as a qualifying source code for the promotion. An error message indicates if you enter a source code that has the Exclude promotion field <i>selected</i> : Source code flagged to exclude promotions.
Description	Source codes are defined in and validated against the Source file. See <i>.Working with Source Codes (WSRC)</i> Alphanumeric, 7 positions; optional. The description of the source code. Alphanumeric, 30 positions; display-only.

Note:

Qualifying a promotion by source code differs from assigning the promotion to the source code in order to force a pop-up message to open or give the promotion highest priority in order entry.

Instructions: Enter a source code in the Source code field to add it as a qualifying source code for the selected promotion.

After you complete this screen, you might advance to a subsequent screen. See *Completing the Create or Change Promotion Screen* for more information.

Work with Promotion Discounts Screen

Purpose: Use this screen to identify the discounts or free items available for each tier in a tiered promotion, and the required merchandise amount for each. See [Tiered Discount or Free Gift](#) for more information on how tiered promotions work.

How to display this screen: Complete the [Create Promotion Screen](#), Change Promotion screen, [Copy Promotion Screen](#), or the Display Promotion screen for a tiered promotion.

Field	Description
Promotion code	<p>The code identifying the promotion you are currently working with. The description is to the right.</p> <p>Code: alphanumeric, 7 positions; display-only.</p> <p>Description: alphanumeric, 30 positions; display-only.</p>
Merch amount	<p>The total merchandise value required for an order to qualify for this tier of a promotion. The system evaluates the qualifying dollar amount after other repricing, such as price tables or an order-level discount percentage, is applied to the merchandise total. If there are multiple shipping addresses on the order, this is the merchandise total required for the shipping address.</p> <p><i>Highest tier only:</i> When assigning the promotion to an order, the system assigns the highest tier for which the order qualifies. For example, if there is a discount of 10% for a merchandise amount of \$50.00, and a discount of 15% for a merchandise amount of \$75.00, an order with a merchandise total of \$75.00 receives a 15% discount.</p> <p><i>Which items count toward total?</i> When evaluating an order to see if it meets the required merchandise total, the system does not include non-discountable items (based on the setting of the Discountable flag for the item).</p> <p>Numeric, 13 positions with a 2-place decimal; required.</p> <p>Enter either a dollar discount, percent discount, or free item for each tier.</p>
Dollar discount	<p>The dollar discount amount to apply to the order when the merchandise value meets the requirement for this tier but not for the next tier. This amount is prorated against the dollar value of order lines if you do not enter an additional charge code at the Create Promotion Screen; otherwise, the discount is added to the order as a negative additional charge. See Prorating Logic for more information on the prorating calculation.</p> <p><i>Include sale item?</i> The specified discount applies to sale items if the Exclude Sale Item When Prorating Discounts (I65) is <i>unselected</i>. See that system control value for more information.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Field	Description
Percent discount	<p>The percentage to discount the merchandise on the order when the merchandise value meets the requirement for this tier but not for the next tier. This percentage is applied proportionally to each order line's extended price if the discount is prorated (that is, you do not enter an additional charge code); otherwise, the total merchandise discount is added to the order as a negative additional charge.</p> <p><i>Include sale item?</i> The specified discount applies to sale items if the <i>Exclude Sale Item When Prorating Discounts (I65)</i> is <i>unselected</i>. See that system control value for more information.</p> <p>Numeric, 5 positions with a 2-place decimal; optional.</p>
Free item	<p>The free item to add to the order when the merchandise value meets the requirement for this tier but not for the next tier. The system adds the item to the order after you select the <i>Reprice</i> option or accept the order.</p> <p>Price override reason: The system applies the Price Override Code for Promotional Priced Lines (B61) to the order line when it adds the free gift. If this system control value is blank, the free gift is not added to the order.</p>

 **Note:**

If you are using [Promotion Hierarchy: Best Way](#) and an order qualifies for multiple tiered promotions offering free gifts, the promotion offering the free gift with the highest value applies to the order.

Item: alphanumeric, 12 positions; optional.

SKU: alphanumeric, three 4-position fields; required if the item has SKUs.

Option	Procedure
Switch between the display of existing tiers and enterable fields to add new promotion tiers	<p>Select <i>Change</i> to switch between <i>ADD</i> and <i>CHANGE</i> mode.</p> <p>Options in ADD mode: This is the default mode when you advance to this screen from the <i>Create Promotion Screen</i>. In this mode, you can add new tiers for the promotion. If a tier already exists for the Merch amount specified for your entry, the system displays an error message.</p> <p>Options in CHANGE mode: This is the default mode when you advance to this screen from the Change Promotion screen. In this mode, you can:</p> <ul style="list-style-type: none"> • review existing tiers for the promotion • change the type of discount for a Merch amount (Dollar discount, Percent discount, or Free item), including changing the value for each field or switching from one type of discount to another. You cannot change the Merch amount; instead, you need to delete it and create a new tier. • delete a tier by selecting <i>Delete</i> for it

Copy Promotion Screen

Purpose: Use this screen to copy an existing promotion.

How to display this screen: Select *Copy* for a promotion at the *Work with Promotions Screen*.

To copy: Complete the *Promotion code* field and change any desired settings from the original promotion. See *Create Promotion Screen* for field descriptions, and see [Working with Promotions \(WPRO\)](#) for information about setting up and using promotions.

When you copy a promotion with additional sub tables, you advance to a subsequent screen for each sub-table you would need to copy, so that you can revise the sub-table as needed. For example, when you copy a tiered promotion, you advance to the *Work with Promotion Discounts Screen*, where you can revise the copied tiers as needed. See *Completing the Create or Change Promotion Screen* for a listing of additional screens.

Work with Qualifying Customer/Price Groups Screen

Purpose: Use this screen to specify the individual customers or customer price groups that are eligible for a promotion. The promotion is available only to the specific customers or members of the price groups you specify here.

How to display this screen: Enter a customer number or a customer price group at the *Create Promotion Screen* or the Change Promotion screen.

 **Note:**

You can also advance to this screen in display mode by advancing from the Display Promotion screen.

Field	Description
Promotion code	The promotion that you are creating, or that you selected at the <i>Work with Promotions Screen</i> . Alphanumeric, 7 positions; display-only
Promotion description (unlabeled field to the right of the promotion code)	The description of the promotion. Alphanumeric, 30 positions; display-only.
Group	Enter a customer price group code to make members of the group eligible for the promotion. Group codes are defined in and validated against the Customer Price Group table. See <i>Working with Customer Price Groups (WCPG)</i> for more information. Alphanumeric, 4 positions; optional.
Customer	Enter a customer number to make that customer eligible for the promotion. Customer numbers are defined in and validated against the Customer table. See <i>Creating and Updating Sold-to Customers (WCST)</i> for more information. Numeric, 9 positions; optional.
Name	The name of the customer or the description of the customer price group. <i>First 30 positions of customer last name, first name, and company name: If the customer has a last and first name, this information is displayed first; then if the customer has a company name, the company name follows the text ATTN. Otherwise, if the customer has just a company name, the company name is displayed.</i> Alphanumeric, 30 positions; display-only.

Instructions: Enter a customer price group code or enter a customer number to add a record to the Promotion Customer table. If you enter a customer or price group in error, or if the customer or price group is no longer eligible for the promotion, you can *Delete* it.

 **Note:**

You cannot scan for additional records at this screen by entering information in search fields; pressing *Enter* adds your entry to the Promotion Customer table.

Reviewing through customer maintenance: You can also view the promotions associated with a specific customer or customer group through *Creating and Updating Sold-to Customers (WCST)*. See the *Display Customer Promotions Screen* and the *Display Customer Price Group Promotions Screen*.

Work with Qualifying Item Categories Screen

Purpose: Use this screen to specify the item categories eligible for an item category promotion.

How to display this screen: Complete the *Create Promotion Screen* or Change Promotion screen for an item category promotion.

Note:

When you advance to this screen from the Display Promotion screen, it is display-only.

For more information: See [Item Category Discount](#) for an overview of item category promotions.

Field	Description
Promotion code	The promotion code you are creating, or selected to change or display from the <i>Work with Promotions Screen</i> . Alphanumeric, 7 positions; display-only.
Promotion description (unlabeled field to the right of the promotion code)	The description of the promotion. Alphanumeric, 30 positions; display-only.
Category	Enter an item category in this field to specify it for the promotion. An item must be assigned to a category specified here in order to qualify for the promotion. Item category assignment is at the SKU level, and you specify an item category assignment at the Create Item (Base Information) Screen (non-SKU'd item) or the Create SKU 1 of 2 (With Overrides) Screen (SKU'd item). Item category codes are defined in and validated against the Item Category table. See Working with Item Category Codes (WITG) for more information. Alphanumeric, 3 positions; required to add a category.
Description	The description of the item category. Alphanumeric, 30 positions; display-only.

Option	Procedure
Add a qualifying item category	Enter an item category code in the Category field.
Delete a qualifying item category	Select the <i>Delete</i> option for an item category.

Work with BOGO Discount Screen (Item Category or Item)

Purpose: Use this screen to work with the discounts or free gifts to apply through a BOGO (Buy One/Get One) promotion based on item category or item. A BOGO promotion first identifies one or more qualifying order line (based on item category, base item, or SKU) and then identifies the type of discount to apply to a matching order line.

For more information: See [BOGO \(Buy One/Get One\) Discount or Free Gift by Item Category or Item](#) for more information on how BOGO promotions apply to orders and on possible setup options.

How to display this screen: Complete the *Create Promotion Screen* or *Change Promotion* screen for a BOGO promotion. When you advance to this screen from the *Display Promotion* screen, all fields are display-only.

Note:

You advance to this screen only if the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *CATEGORY*; otherwise, if the system control value is set to *PRICE CODE*, you advance to the *Work with BOGO Discounts by Item/Price Code Screen*.

Field	Description
Promotion	The promotion code you are creating, or selected to change or display from the <i>Work with Promotions Screen</i> . Alphanumeric, 7 positions; display-only.
Promotion description (unlabeled field to the right of the promotion code)	The description of the promotion. Alphanumeric, 30 positions; display-only.
Item category	<p>Use the following fields to specify an item category, the base item of a SKU'd item, a particular SKU, or a non-SKU'd item to include in the BOGO promotion.</p> <p>Optionally, enter an item category in this field to set up a BOGO promotion. You can set up BOGO promotions for item categories, for all SKU's of a SKU'd item, or for specific non-SKU'd items or SKU's. If you set up a promotion based on item category, you cannot select the Allow mult flag or set the Free flag to <i>Free Auto Add</i>; these options are available only when you set up the promotion for a non-SKU'd item or an individual SKU of a SKU'd item.</p> <p><i>About item categories:</i> Item category assignment is at the SKU level, and you specify an item category assignment at the <i>Create Item (Base Information) Screen</i> (non-SKU'd item) or the <i>Create SKU 1 of 2 (With Overrides) Screen</i> (SKU'd item). Item category codes are defined in and validated against the Item Category table. See <i>Working with Item Category Codes (WITG)</i> for more information.</p> <p>Alphanumeric, 3 positions; required to add a category.</p>
Item	<p>Optionally, enter an item code in this field to include it in the BOGO promotion. If the item has SKU's, you can enter a particular SKU to restrict the BOGO promotion to that SKU only; or you can leave the SKU fields blank to apply the promotion to all SKU's on the order. If you set up a promotion based on all SKU's of a SKU'd item, you cannot select the Allow mult flag or set the Free flag to <i>Free Auto Add</i>; these options are available only when you set up the promotion for a non-SKU'd item or an individual SKU of a SKU'd item.</p> <p>Item: alphanumeric, 12 positions; required to set up a promotion based on item. SKU: alphanumeric, three 4-position fields; optional.</p>
Req qty (required quantity)	The quantity of the items in the item category, or of the particular item or SKU, required for the order to qualify for the promotion. Numeric, 5 positions; required.

Field	Description
BOGO qty	The quantity of the item to receive the BOGO discount, to be set to no charge, or to be added at no charge. Numeric, 5 positions; required.
Free	Indicates whether the BOGO order line is discounted, changed to no charge, or added automatically at no charge. <ul style="list-style-type: none"> <i>No</i> = The item is discounted but not free <i>Free</i> = The promotion changes an existing item on the order to no charge <i>Free auto add</i> = The system adds an item to the order at no charge. This option is available only when your entry is for a non-SKU'd item, or for a specific SKU of a SKU'd item.
Allow mult (allow multiples)	Indicates whether to apply the discount more than once if the ordered quantity is a multiple of the qualifying quantity. <ul style="list-style-type: none"> <i>Selected</i> = Orders can qualify for this BOGO discount multiple times. For example, if the promotion specifies “buy five, get one free,” selecting this field enables the customer to also buy ten, get two free; buy 15, get three free; and so on. <i>Unselected</i> = Apply this BOGO discount once only per order. For example, if the promotion specifies “buy five, get one free,” the customer still receives the BOGO discount on just one unit even if the order includes ten, 15, or more units.
<div style="border-left: 2px solid #0070C0; padding-left: 10px; margin-left: 20px;"> <p> Note:</p> <p>Allowing multiples is supported only for BOGO discounts based on a non-SKU'd item or a specific SKU of an item.</p> </div>	
<p>IMPORTANT: If you select the Allow multiples setting for any BOGO promotions, then the order line quantity should be 1 for every order line on an order that might be eligible for the promotion; otherwise, the BOGO promotion might not apply correctly. To help ensure that the order line quantity is always 1, you can set both the Default Order Quantity (B30) and Maximum Order Quantity (C60) system control values to 1.</p> <p>Provided you have not set up the BOGO discount as free, use one of the following fields to specify a discount percentage, discount dollar amount, or discount price.</p>	
Disc %	The percentage discount to apply to the BOGO order line. For example, if the promotion is buy two, get one at 25% off, you enter 25.00 here. Numeric, 5 positions with a 2-place decimal; optional.
Disc \$	The per-unit discount amount to apply to the BOGO order line. For example, if the promotion is buy five, get two at \$1.00 off, you enter 1.00 here. Numeric, 13 positions with a 2-place decimal; optional.
Price	The override price to apply to the BOGO order line. For example, if the promotion is buy eight, get one at \$7.99, you enter 7.99 here. Numeric, 13 positions with a 2-place decimal; optional.

Option	Procedure
Add a BOGO discount entry	<p>Complete the fields at the top of the screen, including:</p> <ul style="list-style-type: none"> • an Item category OR an Item and, optionally, a SKU • the Req qty • the BOGO qty • A setting for the Free field • Optionally, select the Allow mult flag if the entry is not for an item category • Disc % OR Disc \$ OR Price if the BOGO is not free <p>See the field descriptions above for more information.</p>
Change an existing BOGO discount entry	Select <i>Change</i> for an entry to advance to the Work with BOGO Discount Screen (Item Category or Item) .
Delete a BOGO discount entry	Select <i>Delete</i> for an entry to delete it from the promotion.

 **Note:**

You cannot scan for additional records at this screen by entering information in search fields; pressing *Enter* adds your entry to the Promotion Item Exclusion table.

Change BOGO Discount Screen

Purpose: Use this screen to change an existing entry for a BOGO promotion based on item category or item. At this screen, you can change only the benefits of the entry; you cannot change the qualifying item category, item, SKU, or required quantity. To change this information, delete the BOGO entry at the [Work with BOGO Discount Screen \(Item Category or Item\)](#) and enter a new one.

This screen is available only if the [BOGO Grouping by Price Code or Category \(L62\)](#) system control value is set to *ITEM CATEGORY*.

How to display this screen: Select *Change* for an entry at the [Work with BOGO Discount Screen \(Item Category or Item\)](#).

Field	Description
Promotion	The promotion code you are creating, or selected to change or display from the Work with Promotions Screen . Alphanumeric, 7 positions; display-only.

Field	Description
Promotion description (unlabeled field to the right of the promotion code)	The description of the promotion. Alphanumeric, 30 positions; display-only.
Item category	The item category, if any, you selected at the <i>Work with BOGO Discount Screen (Item Category or Item)</i> . Alphanumeric, 3 positions; display-only.
Item	The item and SKU, if any, you selected at the <i>Work with BOGO Discount Screen (Item Category or Item)</i> . Item: alphanumeric, 12 positions; display-only. SKU: alphanumeric, three 4-position fields; display-only.
Req qty (required quantity)	The quantity of the items in the item category, or of the particular item or SKU, required for the order to qualify for the promotion. Numeric, 5 positions; display-only.
BOGO qty	The quantity of the item to receive the BOGO discount to be set to no charge, or to be added at no charge. Optionally, enter a different quantity to change it. Numeric, 5 positions; required.
Free	Indicates whether the BOGO order line is discounted, changed to no charge, or added automatically at no charge. <ul style="list-style-type: none"> • <i>No</i> = The item is discounted but not free • <i>Free</i> = The promotion changes an existing item on the order to no charge • <i>Free auto add</i> = The system adds an item to the order at no charge. This option is available only when your entry is for a specific item, or a SKU of a SKU'd item.

Field	Description
Allow mult (allow multiples)	<p>Indicates whether to apply the discount to the BOGO order line more than once if the ordered quantity is a multiple of the qualifying quantity.</p> <ul style="list-style-type: none"> <i>Selected</i> = Orders can qualify for this BOGO discount multiple times. For example, if the promotion specifies “buy five, get one free,” selecting this field enables the customer to also buy ten, get two free; buy 15, get 3 free; and so on. <i>Unselected</i> = Apply this BOGO discount once only per order. For example, if the promotion specifies “buy five, get one free,” the customer still receives the BOGO discount on just one unit even if the order includes ten, 15, or more units.
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>Allowing multiples is supported only for BOGO discounts based on a non-SKU'd item or a specific SKU of an item.</p> </div>
	<p>IMPORTANT: If you select the Allow multiples setting for any BOGO promotions, then the order line quantity should be 1 for every order line on an order that might be eligible for the promotion; otherwise, the BOGO promotion might not apply correctly. To help ensure that the order line quantity is always 1, you can set both the <i>Default Order Quantity (B30)</i> and <i>Maximum Order Quantity (C60)</i> system control values to 1.</p> <p>Provided you have not set up the BOGO discount as free, use one of the following fields to specify a discount percentage, discount dollar amount, or discount price.</p>
Disc %	<p>The percentage discount to apply to the BOGO order line. For example, if the promotion is buy two, get one at 25% off, you enter 25.00 here.</p> <p>Numeric, 5 positions with a 2-place decimal; optional.</p>
Disc \$	<p>The per-unit discount amount to apply to the BOGO order line. For example, if the promotion is buy five, get two at \$1.00 off, you enter 1.00 here.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Price	<p>The override price to apply to the BOGO order line. For example, if the promotion is buy eight, get one at \$7.99, you enter 7.99 here.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>

Work with BOGO Discounts by Item/Price Code Screen

Purpose: Use this screen to work with the discount or free gift to apply through a BOGO (Buy One/Get One) promotion based on price code. A BOGO promotion first identifies one or more qualifying order lines (based on price code, base item, or SKU) and then identifies the type of discount to apply to a matching order line.

Single discount or free gift: This screen enables you to set up only a single discount or free gift for the promotion. If a discount or free gift already exists for the promotion, it is displayed in the lower portion of the screen. You can select *Change* or *Display* to review the details.

For more information: See [Working with Price Codes \(WPCD\)](#) for information on setting up price codes, and see [Assigning Price Codes \(APCD\)](#) for information on assigning price codes to items.

How to display this screen: Complete the *Create Promotion Screen* or *Change Promotion* screen for a BOGO promotion. When you advance to this screen from the *Display Promotion* screen, all fields are display-only.

Note:

You advance to this screen only if the *BOGO Grouping by Price Code or Category (L62)* system control value is set to *PRICE CODE*; otherwise, you advance to the *Work with BOGO Discount Screen (Item Category or Item)*.

Important:

The available options for configuring a BOGO promotion by price code are described under [BOGO \(Buy One/Get One\) Discount or Free Gift by Price Code](#). Using a different configuration option may produce unintended results when the promotion applies to an order.

Field	Description
Promotion	The promotion code you are creating, or selected to change or display from the <i>Work with Promotions Screen</i> . Alphanumeric, 7 positions; display-only.
Promotion description (unlabeled field to the right of the promotion code)	The description of the promotion. Alphanumeric, 30 positions; display-only.
Price code	Use the following fields to specify a price code, the base item of a SKU'd item, a particular SKU, or a non-SKU'd item that qualifies an order for the BOGO promotion. The price code that items must be assigned to in order to qualify for the promotion. Defined in and validated against the Price Code table. Numeric, 7 positions; required if you do not specify an item as a qualifier.

Field	Description
Item	<p>The required item for the promotion. Defined in and validated against the Item table. You can enter either an item or a price code as a qualifier.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Using an item as a qualifier for a BOGO promotion by price code is not currently supported.</p> </div>
SKU (unlabeled fields to the right of the Item field)	<p>Alphanumeric, 12 positions; required if you do not specify a price code as a qualifier.</p> <p>Optionally, use the SKU fields to identify a particular SKU of the item, if any, required for the promotion. Defined in and validated against the SKU table.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p> Note:</p> <p>Using an item as a qualifier for a BOGO promotion by price code is not currently supported.</p> </div>
Req amt	<p>Alphanumeric, three 4-position fields; optional.</p> <p>Use either the Req amt and Req qty fields, or both fields in combination, to specify the total unit quantity or dollar value required of the price code or item to qualify for the promotion.</p> <p>Optionally, enter the required total dollar value of the required items from the specified price code. If you specify a required amount, the required quantity must meet or exceed this amount.</p> <p><i>Example:</i> You specify a price code of 123, a required amount of \$500.00, and a required quantity of 1. The order needs to include 1 unit assigned to price code 123 whose dollar value is \$500.00 or more. The order does not qualify if it includes 5 units whose combined total dollar value is \$500, since the requirement must be met within the 1 unit specified in the Req qty field.</p>
Req qty (required quantity)	<p>Numeric, 13 positions with a 2-place decimal; optional if you specify a required quantity.</p> <p>The quantity of the items assigned to the price code required for the promotion. See the Req amt field, above for more information.</p> <p>Numeric, 5 positions; optional if you specify a required amount.</p> <p>Use the remaining fields to specify the discount, special price, or free item available to qualifying orders. Any discounts apply to the lowest-priced items on the order.</p>

Field	Description
BOGO qty	<p>The quantity of the items assigned to the BOGO price code to receive the BOGO discount or special price or to be set to no charge. If you select the Prorate flag, this is the quantity of the item used to calculate the total discount to prorate across the required quantity and the BOGO quantity.</p> <p>If you want to make the promotion available to a required merchandise amount of a specified price code without specifying a required quantity, set this field to 99999. For example, set the Req amt to \$500 and set this field to 99999 for a promotion that provides a discount to a total purchase of \$500 within a specified price code.</p> <p>Numeric, 5 positions; required.</p>
BOGO price code	<p>The price code identifying the items eligible for the discount, special price, or to be set to no charge. Required if you do not specify an Auto add item. Can be the same as the qualifying Price code. Defined in and validated against the Price Code table.</p> <p>Numeric, 7 positions; required if you do not specify an Auto add item.</p>
Disc %	<p>The discount percentage to apply to the BOGO quantity, or to use when calculating the total discount to apply against the required quantity and the BOGO quantity if the Prorate field is selected. Required if you do not specify a discount dollar amount or price, or if the Free field is not set to <i>Free</i> or <i>Free auto add</i>.</p> <p>Numeric, 5 positions with a 2-place decimal; optional.</p>
Disc \$	<p>The total discount amount to apply to the BOGO quantity, or to prorate against the required quantity and the BOGO quantity if the Prorate field is selected. Required if you do not specify a discount percentage or price, or if the Free field is not set to <i>Free</i> or <i>Free auto add</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Price	<p>The discounted price to apply to the BOGO quantity. If the Prorate flag is selected, The system subtracts this price from the price currently on the order line, and prorates the difference across the required quantity and the BOGO quantity. For example, if both order lines are currently priced at \$10.00, the Price specified here is \$6.00, and the Prorate flag is selected, the system subtracts \$6.00 from \$10.00, and then prorates the result (\$4.00) across the 2 order lines, resulting in a price of \$8.00 for each. Required if you do not specify a discount percentage or amount, or if the Free field is not set to <i>Free</i> or <i>Free auto add</i>.</p> <p>Numeric, 13 positions with a 2-place decimal; optional.</p>
Prorate	<p>Indicates whether to prorate the total discount applied through the promotion:</p> <ul style="list-style-type: none"> • <i>Selected</i> = prorate the total discount for the promotion across the required quantity and the BOGO quantity or free item • <i>Unselected</i> = apply the entire discount to the BOGO quantity or the free item

Field	Description
