Preface

Java Platform, Standard Edition Installation Guide describes how to install the Java Development Kit (JDK) on Linux, Microsoft Windows, and macOS computers.

Audience

This document is intended for users who are installing any variant of the Java SE platform.

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

See JDK 14 Documentation.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Overview of JDK Installation

The type of installation depends on your requirement and the platform that you choose to install.

Installation Requirements and Related Tasks
To develop or run Java applications, download and install JDK.

Version-String Format
To understand the version-string scheme that is used to distinguish various JDK releases, see Version-String Format.

Installation
The JDK can be installed on the following platforms:

• Microsoft Windows
• Linux
• macOS

You can download JDK from Java SE Development Kit Downloads page.

For supported processors and browsers, see Oracle JDK Certified System Configurations.

The JDK documentation is a separate download. See Java SE Documentation.

Microsoft Windows

Installation of the JDK on Microsoft Windows Platforms: Instructions include steps to install the JDK on 64-bit Microsoft Windows operating systems.

Linux

Installation of the JDK on Linux Platforms: Instructions include installation from Archive binaries and Red Hat Package Manager (RPM).

macOS

The installation of the JDK 14 requires macOS 10.11 or later.

Installation of the JDK on macOS: Instructions include steps to install the JDK on the macOS platform.

Directory Structure
To learn about the files and directories that are created after JDK installation, see Installed Directory Structure of JDK.
Version-String Format

Java SE platform has adopted time-based release model with the JDK being released every six months.

As of JDK 10 and later, the format of the version string, which reflects the Java SE platform's time-based release model, is \$FEATURE.$INTERIM.$UPDATE.$PATCH.

- \$FEATURE is the version number that is incremented for every feature release. The feature release contains new features and changes to the existing features as specified by the Java SE platform specification. The version number is incremented every six months. For example, the version number for the March 2018 release is 10, the version number for the September 2018 release is 11, and so on.

- \$INTERIM is the version number that is incremented for every interim release, which contains bug fixes and enhancements. An interim release does not contain incompatible changes, feature removals, nor any changes to the standard APIs. The version number for the interim release is always zero (0) as the six-month release model does not include interim releases. However, this version number is reserved for future interim releases, if any.

- \$UPDATE is the version number that is incremented for an update release, which includes fixes for security issues, regressions, and bugs in new features. The version number is incremented one month after the \$FEATURE release and every three months thereafter. For example, the full version string for the October update release is 14.0.1, the full version string for the January update release is 14.0.2, and so on.

- \$PATCH is the version number that is incremented for an emergency patch release to fix a critical issue.

The version string doesn't have trailing zero elements. For example, if the value of \$FEATURE is 14, the value of \$INTERIM is 0, the value of \$UPDATE is 1, and the value of \$PATCH is 0, then the full version string is 14.0.1.
Installation of the JDK on Linux Platforms

This topic describes the installation procedures of the JDK on the Linux platform, along with the system requirements.

This topic includes the following sections:

- General Notes About Installing the JDK on Linux Platforms
- System Requirements for Installing JDK on Linux Platforms
- JDK Installation Instruction Notation for Linux Platforms
- Installing the JDK on Linux from Archive Binaries and RPM Packages

General Notes About Installing the JDK on Linux Platforms

This topic describes general information about installing JDK 14 on Linux platforms.

Root Access

Installing the JDK automatically creates a directory called `${jdk-14.interim.update.patch}`.

Note:

If you install Java SE Runtime Environment in a specific location such as `/usr/jdk` (for JDK) then you must log in with root credentials to gain the necessary permissions. If you do not have root access, then either install the Java SE Runtime Environment in your home directory or a subdirectory for which you have write permissions.

Overwriting Files

If you install the software in a directory that contains a subdirectory named `${jdk-14.interim.update.patch}`, then the new software overwrites files of the same name in that directory. Ensure that you rename the old directory if it contains files that you would like to keep.

System Preferences

By default, the installation script configures the system such that the backing store for system preferences is created inside the JDK installation directory as applicable. If the JDK is installed on a network-mounted drive, then the system preferences can be exported for sharing with Java runtime environments on other machines.
### System Requirements for Installing JDK on Linux Platforms

See Oracle JDK Certified Systems Configurations for information about supported platforms, operating systems, and browsers.

### JDK Installation Instruction Notation for Linux Platforms

Instructions for installing either JDK contains a version notation that represents the Feature, Interim, and Update version information.

For example, if you are installing JDK 14 Interim 0, Update 0, and Patch 0, then the following string represents the name of the bundle:

```
jdk-14.interim.update.patch-linux-x64_bin.tar.gz
```

This string becomes:

```
jdk-14-linux-x64_bin.tar.gz
```

### Installing the JDK on Linux from Archive Binaries and RPM Packages

You can install the Java Development Kit (JDK) on a Linux platform from archive binary files or from Red Hat Package Manager (RPM) packages.

Installation can be performed by using one of the following processes:

- **From archive binaries** (.tar.gz): This allows you to install a private version of the JDK for the current user into any location, without affecting other JDK installations. However, it may involve manual steps to get some of the features to work. See the following table for the options available for downloading and installing the JDK from archive binaries.

- **From RPM packages** (.rpm): This allows you to perform a systemwide installation of the JDK for all users, and requires root access. RPM-based Oracle Linux platforms are based on Red Hat and SuSE. See the following table for the options available for downloading and installing the JDK from RPM packages.

The following table lists the options and instructions for downloading and installing the JDK 14 release on a Linux platform:

<table>
<thead>
<tr>
<th>Download File</th>
<th>Instructions</th>
<th>Architecture</th>
<th>Who Can Install</th>
</tr>
</thead>
<tbody>
<tr>
<td>jdk-14.interim.update.patch-linux-x64.tar.gz</td>
<td>Installing the 64-Bit JDK 14 on Linux Platforms</td>
<td>64-bit</td>
<td>Anyone</td>
</tr>
<tr>
<td>jdk-14.interim.update.patch-linux-x64.rpm</td>
<td>Installing the 64-Bit JDK on RPM-Based Linux Platforms</td>
<td>64-bit RPM-based Linux</td>
<td>Root</td>
</tr>
</tbody>
</table>
Installing the 64-Bit JDK 14 on Linux Platforms

You can install the JDK for 64-bit Linux from an archive binary file (.tar.gz).

To install the 64-bit JDK on a Linux platform:
1. Download the file, jdk-14.interim.update.patch_linux-x64_bin.tar.gz.
   Before you download a file, you must accept the license agreement. Anyone (not only by root users) can install the archive binary in any location having write access.
   The .tar.gz archive file (also called a tarball) is a file that can be uncompressed and extracted in a single step.
2. Change the directory to the location where you want to install the JDK, then move the .tar.gz archive binary to the current directory.
3. Unpack the tarball and install the JDK:
   $ tar zxvf jdk-14.interim.update.patch_linux-x64_bin.tar.gz
   The Java Development Kit files are installed in a directory called jdk-14.interim.update.patch.
4. Delete the .tar.gz file if you want to save disk space.

Installing the 64-Bit JDK on RPM-Based Linux Platforms

You can install the JDK on 64-bit RPM-based Linux platforms, such as Red Hat and SuSE by using an RPM binary file (.rpm) in the system location.

Use the sudo command to run the RPM-based installation as a root user.

To install the 64-bit JDK on an RPM-based Linux platform:
1. Download the file, jdk-14.interim.update.patch_linux-x64_bin.rpm.
   Before you download a file, you must accept the license agreement.
2. Ensure that you have root user access by running the command su and entering the superuser password.
3. Install the package using the following command:
   $ rpm -ivh jdk-14.interim.update.patch_linux-x64_bin.rpm

   Note:
   JDK 14 can coexist with earlier versions of JDK. For each version, a new directory is created, the default directory being /usr/java/jdk-13.interim.update.patch.

Upgrade the package using the following command:
   $ rpm -Uvh jdk-14.interim.update.patch_linux-x64_bin.rpm
4. Delete the .rpm file if you want to save disk space.
5. Exit the root shell.
It is not required to reboot.

The JDK installation is integrated with the *alternatives* framework. After installation, the *alternatives* framework is updated to reflect the binaries from the recently installed JDK. Java commands such as `java`, `javac`, `javadoc`, and `javap` can be called from the command line.

Using the `java -version` command, users can confirm the default (recently installed) JDK version.

In addition, users can check which specific RPM package provides the .java files:

```
$ rpm -q --whatprovides java
```
4

Installation of the JDK on macOS

This topic includes the following sections:

• System Requirements for Installing the JDK on macOS
• Determining the Default JDK Version on macOS
• Installing the JDK on macOS
• Uninstalling the JDK on macOS
• Installation FAQ on macOS Platform

System Requirements for Installing the JDK on macOS

The following are the system requirements for installing the JDK on macOS:

• Any Intel-based computer running macOS.
• Administrator privileges.

You cannot install Java for a single user. Installing the JDK on macOS is performed on a systemwide basis for all users. Administrator privileges are required to install the JDK on macOS.

Determining the Default JDK Version on macOS

When starting a Java application through the command line, the system uses the default JDK.

There can be multiple JDKs installed on the macOS system.

You can determine which version of the JDK is the default by entering `java -version` in a Terminal window. If the installed version is 14 Interim 0, Update 0, and Patch 0, then you see a string that includes the text 14. For example:

```
$ java -version
java version "14"
Java(TM) SE Runtime Environment (build 14)
Java HotSpot(TM) 64-Bit Server VM (build 23.2-b04, mixed mode)
```

To run a different version of Java, either specify the full path, or use the `java_home` tool. For example:

```
$ /usr/libexec/java_home -v 14 --exec javac -version
```

Installing the JDK on macOS

To install the JDK on macOS:
1. Download the JDK .dmg file, jdk-14.interim.update.patch_osx-x64_bin.dmg. Before the file can be downloaded, you must accept the license agreement.

2. From either the browser Downloads window or from the file browser, double-click the .dmg file to start it.

A Finder window appears that contains an icon of an open box and the name of the .pkg file.

3. Double-click the JDK 14.pkg icon to start the installation application.

The installation application displays the Introduction window.

4. Click Continue.

The Installation Type window appears.

5. Click Install.

A window appears that displays the message: Installer is trying to install new software. Enter your password to allow this.

6. Enter the Administrator user name and password and click Install Software.

The software is installed and a confirmation window is displayed.

After the software is installed, you can delete the .dmg file if you want to save disk space.

Uninstalling the JDK on macOS

To uninstall the JDK on macOS:

You must have Administrator privileges.

Note:

Do not attempt to uninstall Java by removing the Java tools from /usr/bin. This directory is part of the system software and any changes will be reset by Apple the next time that you perform an update of the OS.

1. Go to /Library/Java/JavaVirtualMachines.

2. Remove the directory whose name matches the following format by executing the rm command as a root user or by using the sudo tool:

/Library/Java/JavaVirtualMachines/jdk-14.interim.update.patch.jdk

For example, to uninstall 14 Interim 0 Update 0 Patch 0:

$ rm -rf jdk-14.jdk

Installation FAQ on macOS Platform

This topic provides answers for the following frequently asked questions about installing JDK on macOS computers.
1. How do I find out which version of Java is the system default?

When you run a Java application from the command line, it uses the default JDK. If you do not develop Java applications, then you do not need to worry about this. See Determining the Default JDK Version on macOS.

2. How do I uninstall Java?

See Uninstalling the JDK on macOS.

3. After installing Java for macOS 2012-006, can I continue to use Apple's Java 6 alongside the macOS JDK for Java 14?

If you want to continue to develop with Java 6 using command-line, then you can modify the startup script for your favorite command environment. For bash, use this:

```bash
$ export JAVA_HOME=’/usr/libexec/java_home -v 14’
```

Some applications use `/usr/bin/java` to call Java. After installing Java for macOS 2012-006, `/usr/bin/java` will find the newest JDK installed, and will use that for all of the Java-related command-line tools in `/usr/bin`. You may need to modify those applications to find Java 6, or contact the developer for a newer version of the application.

4. What happened to the Java Preferences app in Application Utilities?

The Java Preferences app was part of the Apple Java installation and is not used by Oracle Java. Therefore, macOS releases from Apple that do not include Apple Java will not include Java Preferences.
Installation of the JDK on Microsoft Windows Platforms

This topic includes the following sections:

- System Requirements for Installing the JDK on 64-Bit Windows Platform
- JDK Installation Instruction Notation for Windows
- JDK Installation Instructions for Windows
- Beginning to Use the JDK
- Uninstalling the JDK on Windows
- JDK Installation Troubleshooting

System Requirements for Installing the JDK on 64-Bit Windows Platform

For supported processors and browsers, see Oracle JDK Certified Systems Configurations.

JDK Installation Instruction Notation for Windows

For any text in this document that contains the following notation, you must substitute the appropriate update version number:

`interim.update.patch`

For example, if you are downloading the JDK installer for 64-bit systems for update 14 Interim 0, Update 0, and Patch 0, then the file name `jdk-14.interim.update.patch_windows-x64_bin.exe` becomes `jdk-14_windows-x64_bin.exe`.

JDK Installation Instructions for Windows

You run a self-installing executable file to unpack and install the JDK on Windows computers.

Install JDK on Windows computers by performing the actions described in the following topics:

- Downloading the JDK Installer
- Running the JDK Installer
- Installing the JDK Silently
- Setting the PATH Environment Variable
Downloading the JDK Installer

Access Java SE Downloads page and click Accept License Agreement. Under the Download menu, click the Download link that corresponds to the .exe for your version of Windows.

Download the file jdk-14.interim.update.patch_windows-x64_bin.exe.

**Note:**

Verify the successful completion of file download by comparing the file size on the download page and your local drive. Alternatively, you can ensure that the downloaded file’s checksum matches the one provided on the Java SE Downloads page.

Running the JDK Installer

You must have administrator privilege to install the JDK on Microsoft Windows.

To run the JDK installer:

1. Start the JDK 14 installer by double-clicking the installer’s icon or file name in the download location.
2. Follow the instructions provided by the Installation wizard.
3. After the installation is complete, delete the downloaded file to recover the disk space.

Installing the JDK Silently

Instead of double-clicking or opening the JDK installer, you can perform a silent, noninteractive, JDK installation by using command-line arguments.

Install JDK in silent mode using the command:

```
jdk.exe /s
```

**Note:**

The notation jdk stands for the downloaded installer file base name, such as jdk-14_windows-x64_bin.exe.
Setting the PATH Environment Variable

It is useful to set the PATH variable permanently for JDK 14 so that it is persistent after rebooting.

If you do not set the PATH variable, then you must specify the full path to the executable file every time that you run it. For example:

```
C:\> "C:\Program Files\Java\jdk-14\bin\javac" MyClass.java
```

To set the PATH variable permanently, add the full path of the jdk-14\bin directory to the PATH variable. Typically, the full path is:

```
C:\Program Files\Java\jdk-14\bin
```

To set the PATH variable on Microsoft Windows:

1. Select Control Panel and then System.
2. Click Advanced and then Environment Variables.
3. Add the location of the bin folder of the JDK installation to the PATH variable in System Variables.

Note:
The PATH environment variable is a series of directories separated by semicolons (;) and is not case-sensitive. Microsoft Windows looks for programs in the PATH directories in order, from left to right.

You should only have one bin directory for a JDK in the path at a time. Those following the first instance are ignored.

If you are not sure where to add the JDK path, append it.

The new path takes effect in each new command window that you open after setting the PATH variable.

The following is a typical value for the PATH variable:

```
C:\WINDOWS\system32;C:\WINDOWS;"C:\Program Files\Java\jdk-14\bin"
```

Beginning to Use the JDK

Use the Java Development Kit in the Windows Start menu to access information related to Reference Documentation.

During JDK install, Java menu items are added to the Windows Start menu to provide easy access to Reference Documentation, which is online documentation web page.

During JDK installation and uninstallation processes, the appropriate start menu items are updated so that they are associated with the latest JDK version on the system.
Note:
The Windows 7 and Windows 10 have a Start menu; however, the menu is not available in Windows 8 and Windows 8.1. The JDK and Java information in Windows 8 and Windows 8.1 is available in the following Start directory: %ALLUSERSPROFILE%\Microsoft\Windows\Start Menu\Programs.

Uninstalling the JDK on Windows

To uninstall JDK 14, use the Add/Remove Programs utility in the Microsoft Windows Control Panel.

Uninstalling the JDK in Silent Mode

You can use the command line for uninstalling the JDK.

Use the following command to uninstall the JDK in silent mode:

msiexec.exe/X{<UninstallString>}

For example, to uninstall JDK 14, run the command:

msiexec.exe/X{3552AC04-4EFC-51F1-AA92-9D1A99E02C95}

To find the UninstallString, see Finding the JDK Registry Key and UninstallString Value.

Note:

• This command can be run from anywhere.
• The msiexec.exe executable is located in the windows system directory.
• A reboot is required only if some files are in use during uninstallation; it is not necessary everytime. However, to manually suppress reboot while uninstalling, append REBOOT=R option to the command.
• Append /l "C:\<path>setup.log" option to the command if you want to create a log file describing the uninstallation status.

Windows Installer dialog appears prompting you for confirmation. Click Yes to uninstall JDK.

Finding the JDK Registry Key and UninstallString Value

1. Go to Start and type Regedit.
2. In the Registry Editor, go to HKEY_LOCAL_MACHINE/Software/Microsoft/Windows/CurrentVersion-Uninstall.
Under the Uninstall folder, you will find many registry entries within curly brackets.

3. Click Edit and then Find.

**Note:**

Highlight Uninstall folder before performing search for a particular registry.

4. Enter version string as value to find corresponding registry key. For example, enter jdk-14.

The registry key is highlighted on the right-hand side of the pane and values of various uninstall strings are displayed on the left-hand pane.

5. Note the value of the UninstallString.

**JDK Installation Troubleshooting**

The following sections provide tips for resolving issues, if any, while installing JDK.

**System Error During Decompression**

If you see the error message: system error during decompression, then there might not be enough space on the disk that contains the TEMP directory.

**Program Cannot Be Run in DOS Mode**

If you see the error message: This program cannot be run in DOS mode, then do the following:

1. Open the MS-DOS shell or command prompt window.
2. Right-click the title bar.
4. Select the Program tab.
5. Click Advanced.
6. Ensure that the item Prevent MS-DOS-based programs from detecting Windows is not selected.
7. Select OK.
8. Select OK again.
9. Exit the MS-DOS shell.
10. Restart your computer.

**Characters That Are Not Part of the System Code Page**

A 1722 error may occur if the installation directory is not part of the system locale’s code page. To prevent this, ensure that the user and system locales are identical, and that the installation path contains only characters that are part of the system locale’s code page. User and system locales can be set in the Regional Options or Regional Settings control panel.
The associated bug number is 4895647.

**Cleanup the Registry After a Failed JDK Uninstall**

Sometimes, attempts to uninstall JDK through the Windows Add/Remove program leave behind some Java entries in the registry that are not fully removed. These left behind registry entries can cause problems in installing a new version of Java. The following are the methods to cleanup registry entries:

- Program Install and Uninstall troubleshooter (Recommended Method)
- Manual Registry Edit

**Program Install and Uninstall troubleshooter (Recommended Method)**

Run the Program Install and Uninstall troubleshooter to repair the corrupted registry keys that prevent programs from being completely uninstalled, or blocks new installations and updates.

**Manually edit the registry (Use this only if the Fix It utility does not work)**

Incorrectly editing your registry may severely damage your system. You should back up any valued data from your computer before making changes to the registry.

Use the File->Export functionality of the registry editor to save the registry key before deleting. In case you deleted the wrong registry key, you can restore the registry from your saved backup file, by using the File->Import functionality.

To delete the registry key:

1. Determine the correct Registry Key. See Finding the JDK Registry Key and UninstallString Value.
2. Highlight the key, Right click and select Delete.
3. Click Yes when prompted.

The JDK gets uninstalled.
Installed Directory Structure of JDK

The modular runtime image of JDK 14 contains the following folders:

**Note:**

In macOS, the JDK installation path is `/Library/Java/JavaVirtualMachines/jdk-interim.update.patch.jdk/Contents/Home`.

- `/jdk-interim.update.patch.jdk`
  The root directory of the JDK software installation. This directory also contains Copyright, README, and Release files.

- `/jdk-interim.update.patch.jdk/Contents/Home/`
  The root directory of the JDK software installation on macOS.

- `/jdk-interim.update.patch.jdk/bin`
  The executable and command-line launchers that are defined by the modules linked to the image.

- `/jdk-interim.update.patch.jdk/conf`
  The `.properties`, `.policy`, and other configuration files intended to be edited by developers, deployers, and end users.

- `/jdk-interim.update.patch.jdk/lib`
  The private implementation details of the runtime system. These files are not intended for external use and must not be modified. The `lib` directory on macOS or the `lib/$ARCH` directory on Linux and Solaris contains the runtime system’s dynamically linked native libraries.

- `/jdk-interim.update.patch.jdk/jmods`
  The compiled module definitions.

- `/jdk-interim.update.patch.jdk/legal`
  The copyright and license files for each module.

- `/jdk-interim.update.patch.jdk/lib/src.zip`
  The archive that contains the source code for the Java platform.

- `/jdk-interim.update.patch.jdk/include`
  The C-language header files that support native-code programming with the Java Native Interface and the Java Virtual Machine (JVM) Debugger Interface.
Note:

You can install two versions of JDK simultaneously. Update version of JDK does not replace the previous version, however, a new directory is created. For example, you can install JDK 14 and JDK 13.0.1 simultaneously. In the JDK installation location, jdk-14 and jdk-13.0.1 directories get created.
