A Updating the JDK After Installing and Configuring an Oracle Fusion Middleware Product

About Updating the JDK Location After Installing an Oracle Fusion Middleware Product A-1
Updating the JDK Location in an Existing Oracle Home A-2
This document describes how to upgrade an existing Oracle Internet Directory environment to 12c (12.2.1.4.0).

Audience

Identify the target audience for your book and learn more about this document intended for.

This document is intended for system administrators who are responsible for installing, maintaining, and upgrading Oracle Internet Directory. It is assumed that readers have knowledge of the following:

- Oracle Fusion Middleware system administration and configuration.
- Configuration parameters and expected behavior of the system being upgraded.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

Refer to the Oracle Fusion Middleware Library for additional information.

- For administration related information for Oracle Internet Directory, see Administering Oracle Internet Directory.
• For installation information, see Fusion Middleware Installation Documentation.
• For upgrade information, see Fusion Middleware Upgrade Documentation.
• For administration-related information, see Fusion Middleware Administration Documentation.
• For release-related information, see Fusion Middleware Release Notes.

Conventions

Introduction to Upgrading Oracle Internet Directory to 12c (12.2.1.4.0)

Before you begin, review all introductory information to understand the upgrade paths and process for Oracle Internet Directory 12c (12.2.1.4.0).

Following the pre-upgrade information and preparation steps, the procedure in this guide describes how to upgrade Oracle Internet Directory 12c (12.2.1.3.0) to 12c (12.2.1.4.0).

Note:

For general information about Fusion Middleware upgrade planning and other upgrade concepts and resources, see the following sections in Planning an Upgrade of Oracle Fusion Middleware:

- Planning an Upgrade to Oracle Fusion Middleware 12c (12.2.1.4.0)
- Understanding In-Place versus Out-of-Place Upgrades
- Understanding the Basic Upgrade Tasks

The following topics describe the concepts related to upgrading Oracle Internet Directory:

- **About the Starting Points for a Oracle Internet Directory Upgrade**
  You can upgrade to Oracle Internet Directory 12c (12.2.1.4.0) from 12c (12.2.1.3.0) release.

- **About the Oracle Internet Directory Upgrade Scenarios**
  The steps to upgrade Oracle Internet directory to 12c (12.2.1.4.0) depend on the existing 12c (12.2.1.3.0) production topology.

- **About the New Features for Oracle Internet Directory 12c (12.2.1.4.0)**
  Upgrade process for Oracle Internet Directory 12c (12.2.1.4.0) follows the Oracle Fusion Middleware upgrade framework. The upgrade steps have reduced compared to the earlier releases.

- **About Upgrade Restrictions**
  If you are using two or more Oracle Fusion Middleware products of the same or different versions in a single, supported, Oracle Fusion Middleware configuration, you must consider the interoperability and compatibility factors before planning the upgrade.
About the Starting Points for a Oracle Internet Directory Upgrade

You can upgrade to Oracle Internet Directory 12c (12.2.1.4.0) from 12c (12.2.1.3.0) release.

The upgrade procedures in this guide explain how to upgrade an existing Oracle Internet Directory 12c (12.2.1.3.0) domain to Oracle Fusion Middleware 12c (12.2.1.4.0). If your domain contains other components that also need to be upgraded, links to supporting documentation are provided.

If your existing version of Oracle Internet Directory is earlier than 12c (12.2.1.3.0), you must first upgrade your software to one of the following supported versions before you can upgrade to 12c (12.2.1.4.0):

To upgrade to 12c (12.2.1.3.0), see Oracle Fusion Middleware Upgrade Guide for Oracle Identity Management in the 12c (12.2.1.3.0) documentation library.

About the Oracle Internet Directory Upgrade Scenarios

The steps to upgrade Oracle Internet directory to 12c (12.2.1.4.0) depend on the existing 12c (12.2.1.3.0) production topology.

As a result, it is difficult to provide exact upgrade instructions for every possible Oracle Internet Directory installation. This document covers some of the standard upgrade use scenarios. Your actual topology may vary, but you can use the upgrade instructions provided in this document to upgrade similar topologies or deployments.

Note:

For additional information about the upgrade process and planning resources to ensure your upgrade is successful, see Preparing to Upgrade in Planning an Upgrade of Oracle Fusion Middleware.

You can upgrade the following deployments using the procedure described in this guide:

- Oracle Internet Directory single node environments
- Oracle Internet Directory highly available (multi-node) environments
- Oracle Directory Integration Platform (ODIP) single node environments

About the New Features for Oracle Internet Directory 12c (12.2.1.4.0)

Upgrade process for Oracle Internet Directory 12c (12.2.1.4.0) follows the Oracle Fusion Middleware upgrade framework. The upgrade steps have reduced compared to the earlier releases.
Refer to the following topics for information about the new features and enhancements in 12c (12.2.1.4.0):

- To understand what's new in general in 12c (12.2.1.4.0), see New and Changed Features in *Understanding Oracle Fusion Middleware*.
- To understand what's new in Oracle Internet Directory 12c (12.2.1.4.0), see What's New in Oracle Internet Directory? in *Administering Oracle Internet Directory*.
- To understand what's new in Oracle Directory Integration Platform 12c (12.2.1.4.0), see What's New in Oracle Directory Integration Platform? in *Administering Oracle Directory Integration Platform*.
- If your environment includes Oracle WebLogic Server with Oracle ADF, see Key Differences Between Application Developer 11g and Infrastructure 12c.

### About Upgrade Restrictions

If you are using two or more Oracle Fusion Middleware products of the same or different versions in a single, supported, Oracle Fusion Middleware configuration, you must consider the interoperability and compatibility factors before planning the upgrade.

#### Interoperability

In the context of Oracle Fusion Middleware products, interoperability is defined as the ability of two Oracle Fusion Middleware products or components of the same version (or release) to work together (interoperate) in a supported Oracle Fusion Middleware configuration. Specifically, interoperability applies when the first 4 digits of the release or version number are the same. For example, Oracle Fusion Middleware 12c (12.2.1.0) components are generally interoperable with other 12c (12.2.1.3) components.

#### Compatibility

In the context of Oracle Fusion Middleware products, compatibility is defined as the ability of two Oracle Fusion Middleware components of different versions (or releases) to interoperate.

For a list of products and features available in Oracle Fusion Middleware Release 12.2.1.4.0, see Products and Features Available in Oracle Fusion Middleware in *Understanding Interoperability and Compatibility*.

When performing the upgrade of your hardware or software, verify that your Oracle Fusion Middleware software is certified to support the new operating system or computer hardware. For more information, see:

- Oracle Fusion Middleware Supported System Configurations
- Oracle® Fusion Middleware System Requirements and Specifications
Pre-Upgrade Requirements

Before you begin to upgrade Oracle Internet Directory 12c (12.2.1.4.0), you must perform pre-upgrade tasks such as backing up, cloning your current environment, and verifying that your system meets certified requirements.

- **Pre-Upgrade Checklist**
  The Pre-Upgrade Checklist identifies tasks that can be performed before you begin your upgrade to ensure you have a successful upgrade and limited downtime.

- **Creating a Complete Backup**
  Before you start an upgrade, back up all system-critical files, including the databases that host your Oracle Fusion Middleware schemas.

- **Cloning Your Production Environment for Testing**
  Create a copy of your actual production environment, upgrade the cloned environment, verify that the upgraded components work as expected, and then (and only then) upgrade your production environment.

- **Verifying Certification and System Requirements**
  Review the certification matrix and system requirements documents to verify that your environment meets the necessary requirements for installation.

- **Updating Policy Files when Using Enhanced Encryption (AES 256)**
  If you plan to use enhanced encryption, such as Advanced Encryption Standard (AES) 256, in your upgraded environment, Oracle recommends that you apply the latest required policy files to the JDK before you upgrade.

- **Purging Unused Data**
  Purging unused data and maintaining a purging methodology before an upgrade can optimize the upgrade process.

- **Creating a Non-SYSDBA User to Run the Upgrade Assistant**
  Oracle recommends that you create a non-SYSDBA user called `FMW` to run the Upgrade Assistant. This user has the privileges required to modify schemas, but does not have full administrator privileges.

**Pre-Upgrade Checklist**

The Pre-Upgrade Checklist identifies tasks that can be performed before you begin your upgrade to ensure you have a successful upgrade and limited downtime.

Upgrades are performed while the servers are down. This checklist is meant to identify important — and often time-consuming — pre-upgrade tasks that you can perform before the upgrade to limit your downtime. The more preparation you can do before you begin the upgrade process, the less time you will spend offline.
The pre-upgrade procedures you perform will depend on the configuration of your existing system, the components you are upgrading, and the environment you want to create at the end of the upgrade and configuration process. Complete only those tasks that apply to your configurations or use cases.

<table>
<thead>
<tr>
<th>Table 2-1 Tasks to Perform Before You Upgrade to Oracle Fusion Middleware 12c (12.2.1.4.0)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Task</strong></td>
</tr>
<tr>
<td><strong>Required</strong></td>
</tr>
<tr>
<td>Create a complete backup of your existing environment.</td>
</tr>
<tr>
<td>• Make sure that your backup includes the schema version registry table. See Backing Up the Schema Version Registry Table.</td>
</tr>
<tr>
<td>• If you modified any of the startup scripts in your existing domain, you will need to copy them to temporary directory location (outside of the existing domain) during the upgrade and redeploy them after the upgrade.</td>
</tr>
<tr>
<td><strong>Optional</strong></td>
</tr>
<tr>
<td>Clone your production environment to use as an upgrade testing platform.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
</tr>
<tr>
<td>Verify that you are installing and upgrading your product on a supported hardware and software configuration.</td>
</tr>
<tr>
<td>Do not attempt an upgrade if you are unable to use the latest supported operating system. As with all supported configurations, failure to comply with these requirements may cause your upgrade to fail.</td>
</tr>
<tr>
<td><strong>Required for 32-bit Operating Systems Only</strong></td>
</tr>
<tr>
<td>Migrate to a 64-bit operating system before you can upgrade.</td>
</tr>
<tr>
<td><strong>Required for SUSE 11 or later</strong></td>
</tr>
<tr>
<td>Download and install the openmotif package.</td>
</tr>
</tbody>
</table>
### Table 2-1 (Cont.) Tasks to Perform Before You Upgrade to Oracle Fusion Middleware 12c (12.2.1.4.0)

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required for SUSE 11 or later</strong> Create a soft-link to <code>/lib64/libnsl.so.1</code></td>
<td>Create a soft-link from <code>/lib64/libnsl.so</code> to <code>/lib64/libnsl.so.1</code>.</td>
</tr>
<tr>
<td><strong>Optional</strong> Update security policy files if you are using enhanced encryption (AES 256).</td>
<td>Some of the security algorithms used in Fusion Middleware 12c (12.2.1.4.0) require additional policy files for the JDK. If you plan to use enhanced encryption, such as AES 256, Oracle recommends that you apply the latest required policy files to the JDK before you upgrade. See <a href="">Updating Policy Files when Using Enhanced Encryption (AES 256)</a>.</td>
</tr>
<tr>
<td><strong>Optional</strong> Purge any outdated or unused data before you upgrade.</td>
<td>To optimize performance, Oracle strongly recommends that you purge data and objects that will not be used in the upgraded environment. See <a href="#">Purging Unused Data</a>.</td>
</tr>
<tr>
<td><strong>Optional</strong> Create a Non-SYSDBA user to run the Upgrade Assistant.</td>
<td>Oracle recommends that you create the FMW user to run Upgrade Assistant. User FMW can run the Upgrade Assistant without system administration privileges. See <a href="#">Creating a Non-SYSDBA User to Run the Upgrade Assistant</a>.</td>
</tr>
</tbody>
</table>

### Creating a Complete Backup

Before you start an upgrade, back up all system-critical files, including the databases that host your Oracle Fusion Middleware schemas.

The backup must include the `SYSTEM.SCHEMA_VERSION_REGISTRY$` table so that you can restore the contents back to its pre-upgrade state if the upgrade fails.

The Upgrade Assistant Prerequisites screen prompts you to acknowledge that backups have been performed before you proceed with the actual upgrade. However, note that the Upgrade Assistant does not verify that a backup has been created.

See:

- Backing Up Your Environment in *Administering Oracle Fusion Middleware*
- Upgrading and Preparing Your Oracle Databases for 12c (12.2.1.4.0) in *Planning an Upgrade of Oracle Fusion Middleware*
- Backing Up the Schema Version Registry Table
  - Your system backup must include the `SYSTEM.SCHEMA_VERSION_REGISTRY$` table or the `FMWREGISTRY.SCHEMA_VERSION_REGISTRY$` table.
- Maintaining Customized Domain and Environment Settings
  - If you have modified any domain-generated, server startup scripts, or configuration files in your pre-upgrade environment, it is important to note that these changes are overwritten during the installation, domain upgrade, and reconfiguration operations. Save your customized files to a shared library location so that you can continue to use them after the upgrade.
Backing Up the Schema Version Registry Table

Your system backup must include the SYSTEM.SCHEMA_VERSION_REGISTRY$ table or the FMWREGISTRY.SCHEMA_VERSION_REGISTRY$ table.

Each Fusion Middleware schema has a row in the SYSTEM.SCHEMA_VERSION_REGISTRY$ table. If you run the Upgrade Assistant to update an existing schema and it does not succeed, you must restore the original schema before you can try again. Before you run the Upgrade Assistant, make sure you back up your existing database schemas and the schema version registry.

Note:
Before you upgrade a schema using the Upgrade Assistant, you must perform a complete database backup. During the upgrade, you are required to acknowledge that backups have been performed.

Maintaining Customized Domain and Environment Settings

If you have modified any domain-generated, server startup scripts, or configuration files in your pre-upgrade environment, it is important to note that these changes are overwritten during the installation, domain upgrade, and reconfiguration operations. Save your customized files to a shared library location so that you can continue to use them after the upgrade.

Every domain installation includes dynamically-generated domain and server startup scripts, such as setDomainEnv. These files are replaced by newer versions during the installation and upgrade process. To maintain your custom domain-level environment settings, Oracle recommends that you create a separate file to store the custom domain information before you upgrade, instead of modifying the scripts directly.

For example, if you want to customize server startup parameters that apply to all servers in a domain, you can create a file called setUserOverrides.cmd (Windows) or setUserOverrides.sh (UNIX) and configure it to add custom libraries to the WebLogic Server classpath, specify additional command-line options for running the servers, or specify additional environment variables. When using the pack and unpack commands, any custom settings that you add to this file are preserved during the domain upgrade operation and are carried over to the remote servers.

The following example illustrates startup customizations in a setUserOverrides file:

```bash
# add custom libraries to the WebLogic Server system classpath
if [ "${POST_CLASSPATH}" != "" ]; then
    POST_CLASSPATH="${POST_CLASSPATH}:${CLASSPATHSEP}${HOME}/foo/fooBar.jar"
    export POST_CLASSPATH
else
    POST_CLASSPATH="${HOME}/foo/fooBar.jar"
    export POST_CLASSPATH
fi

# specify additional java command-line options for servers
JAVA_OPTIONS="${JAVA_OPTIONS} -Dcustom.property.key=custom.value"
```
If the `setUserOverrides` file exists during a server startup, the file is included in the startup sequence and any overrides contained within this file take effect. You must store the `setUserOverrides` file in the `EXISTING_DOMAIN_HOME/bin` directory.

**Note:**

If you are unable to create the `setUserOverrides` script before an upgrade, you need to reapply your settings as described in Re-apply Customizations to Startup Scripts in *Upgrading to Oracle WebLogic Server 12.1.3*.

**Cloning Your Production Environment for Testing**

Create a copy of your actual production environment, upgrade the cloned environment, verify that the upgraded components work as expected, and then (and only then) upgrade your production environment.

Cloning your production environment for testing is recommended, but not required.

Upgrades cannot be reversed. In most cases, if an error occurs, you must stop the upgrade and restore the entire environment from backup and begin the upgrade process from the beginning. Identifying potential upgrade issues in a development environment can eliminate unnecessary downtime.

**Note:**

It is beyond the scope of this document to describe the cloning procedures for all components and operating systems. Cloning procedures are component and operating system-specific. At a high level, you install the pre-upgrade version of your component domain on a test machine, create the required schemas using the Repository Creation Utility (RCU), and perform the upgrade.

Additional benefits of running an upgrade in a cloned production environment include the following:

- Uncover and correct any upgrade issues.
- Practice completing an end-to-end upgrade.
- Understand the upgrade performance and how purge scripts can help.
- Understand the time required to complete the upgrade.
- Understand the database resource usage (such as temporary tablespace; PGA, and so on).
Verifying Certification and System Requirements

Review the certification matrix and system requirements documents to verify that your environment meets the necessary requirements for installation.

**Note:**

You can run the pre-upgrade Readiness Check on the cloned production environment to help identify potential upgrade issues with your data, but you must perform a complete test upgrade on a cloned environment to ensure a successful upgrade.

**Note:**

When checking the certification, system requirements, and interoperability information, be sure to check specifically for any 32-bit or 64-bit system requirements. It is important for you to download software specifically designed for the 32-bit or 64-bit environment, explicitly.

**WARNING:**

Make sure that your current environment has been patched to the latest patch set before you begin the upgrade. Certifications are based on fully patched environments, unless stated otherwise.

- **Verify Your Environment Meets Certification Requirements**
  Oracle has tested and verified the performance of your product on all certified systems and environments. Make sure that you are installing your product on a supported hardware or software configuration.

- **Verify System Requirements and Specifications**
  It is important to verify that the system requirements such as disk space, available memory, specific platform packages and patches, and other operating system-specific items are met.

- **Verify That the Database Hosting Oracle Fusion Middleware is Supported**
  You must have a supported Oracle database configured with the required schemas before you run Oracle Fusion Middleware 12c (12.2.1.4.0).

- **Verify That the JDK Is Certified for This Release of Oracle Fusion Middleware**
  At the time this document was published, the certified JDK for 12c (12.2.1.4.0) was 1.8.0_211.

Verify Your Environment Meets Certification Requirements

Oracle has tested and verified the performance of your product on all certified systems and environments. Make sure that you are installing your product on a supported hardware or software configuration.
Whenever new certifications occur, they are added to the appropriate certification
document right away. New certifications can occur at any time, and for this reason the
certification documents are kept outside of the documentation libraries and are
available on Oracle Technology Network. See the Certification Matrix for 12c
(12.2.1.4.0).

Verify System Requirements and Specifications

It is important to verify that the system requirements such as disk space, available
memory, specific platform packages and patches, and other operating system-specific
items are met.

Use the Oracle Fusion Middleware System Requirements and Specifications
document to verify that the requirements of the certification are met. For example, if
the Certification Matrix for 12c (12.2.1.4.0) indicates that your product is certified for
installation on 64-Bit Oracle Linux 7, the System Requirements and Specifications
document should be used to verify that your Oracle Linux 7 system has met the
required minimum specifications such as disk space, available memory, specific
platform packages and patches, and other operating system-specific items. This
document is updated as needed and resides outside of the documentation libraries on
the Oracle Technology Network (OTN).

**Note:**

When you install the Oracle Fusion Middleware Release 12c software in
preparation for upgrade, you should use the same user account that you
used to install and configure the existing, pre-upgrade Oracle Fusion
Middleware software. On UNIX operating systems, this ensures that the
proper owner and group is applied to new Oracle Fusion Middleware 12c
files and directories.

If you are running a 32–bit environment, you will need to perform an additional set of
steps:

- **Migrating from a 32-Bit to a 64-Bit Operating System**
  If you have a 32–bit operating system, then you must migrate your 32-bit
  environment to a 64-bit software environment before you upgrade.

**Migrating from a 32-Bit to a 64-Bit Operating System**

If you have a 32–bit operating system, then you must migrate your 32-bit environment
to a 64-bit software environment before you upgrade.

Make sure to validate the migration to ensure all your Oracle Fusion Middleware 12c
(12.2.1.3.0) software is working properly on the 64-bit machine, and only then perform
the upgrade to Oracle Fusion Middleware 12c (12.2.1.4.0).

In these tasks, host refers to the 32-bit source machine and target refers to the new
64-bit target machine.
Upgrading an operating system typically involves the following:

**Caution:**
These steps are provided as an example of the operating system upgrade process and may or may not include all of the procedures you must perform to update your specific operating system. Consult your operating system's upgrade documentation for more information.

- **Procure the Hardware That Supports the Upgrade's 64-bit Software Requirement**
  Make sure that you have supported target hardware in place before you begin the upgrade process.

- **Stop All Processes**
  Before upgrading, you must stop all processes, including Managed Servers, the Administration Server, and Node Manager, if they are started on the host.

- **Back Up All Files from the 32-bit Host Machine**
  Make sure that you have created a complete backup of your entire 12c (12.2.1.3.0) deployment before you begin the upgrade process. These files can be used if there is an issue during the migration and you have to restart the process.

- **Set Up the Target 64-bit Machine with the 12c (12.2.1.3.0) Host Name and IP Address**
  The host name and IP address of the target machine must be made identical to the host. This requires you to change the IP address and name of the source machine or decommission the source machine to avoid conflicts in the network.

- **Restore the 12c (12.2.1.3.0) Backup from 32-bit Host to 64-bit Host**
  Restore the files you backed from the 32-bit host using the same directory structure that was used in 12c (12.2.1.3.0). The directory structure on the target machine must be identical to the structure of the host machine.

- **Install the 12c (12.2.1.4.0) Product Distributions on the Target Machine**
  Oracle recommends an Out-of-Place approach for upgrade. Therefore, you must install the 12c (12.2.1.4.0) product distributions in a new Oracle home on the target machine.

- **Upgrade the Target 64-bit Environment Using the Standard Upgrade Procedure**
  After installing the product on the target machine, you must upgrade each product component individually using an Upgrade Utility specified in the component-specific upgrade guide and complete any post-upgrade tasks.

**Procure the Hardware That Supports the Upgrade's 64-bit Software Requirement**
Make sure that you have supported target hardware in place before you begin the upgrade process.
Stop All Processes

Before upgrading, you must stop all processes, including Managed Servers, the Administration Server, and Node Manager, if they are started on the host.

Stop the Managed Servers

To stop a WebLogic Server Managed Server, use the `stopManagedWebLogic` script:

- (UNIX) `EXISTING_DOMAIN_HOME/bin/stopManagedWebLogic.sh`
  
  managed_server_name admin_url

- (Windows) `EXISTING_DOMAIN_HOME\bin\stopManagedWebLogic.cmd`
  
  managed_server_name admin_url

When prompted, enter your user name and password.

Stop Oracle Internet Directory Server

To stop the Oracle Internet Directory Server:

- (UNIX) `INSTANCE_HOME/bin/stopComponent stop all`

- (Windows) `INSTANCE_HOME\bin\stopComponent stop all`

Stop the Administration Server

When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To stop the Administration Server, use the `stopWebLogic` script:

- (UNIX) `EXISTING_DOMAIN_HOME/bin/stopWebLogic.sh`

- (Windows) `EXISTING_DOMAIN_HOME\bin\stopWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.

Stop Node Manager

To stop Node Manager, close the command shell in which it is running.

Alternatively, after having set the `nodemanager.properties` attribute `QuitEnabled` to `true` (the default is `false`), you can use WLST to connect to Node Manager and shut it down. See `stopNodeManager` in `WLST Command Reference for WebLogic Server 12.1.3`.

Back Up All Files from the 32-bit Host Machine

Make sure that you have created a complete backup of your entire 12c (12.2.1.3.0) deployment before you begin the upgrade process. These files can be used if there is an issue during the migration and you have to restart the process.

**Note:**

If the upgrade from 32-bit to 64-bit takes place on the same machine, there is a risk of corrupting the source environment if the upgrade fails.
See Backing Up Your Environment in Oracle Fusion Middleware Administrator’s Guide.

During the upgrade you must have access to the contents of the following:

- `12c_DOMAIN_HOME`
- `12c/nodemanager` directory located in `12c_ORACLE_HOME/wlserver/common/

Some of the backup and recovery procedures described in Backing Up Your Environment in Oracle Fusion Middleware Administrator’s Guide are product-specific. Do not proceed with the upgrade until you have a complete backup.

Set Up the Target 64-bit Machine with the 12c (12.2.1.3.0) Host Name and IP Address

The host name and IP address of the target machine must be made identical to the host. This requires you to change the IP address and name of the source machine or decommission the source machine to avoid conflicts in the network.

The process of changing an IP address and host name vary by operating system. Consult your operating system’s administration documentation for more information.

Restore the 12c (12.2.1.3.0) Backup from 32-bit Host to 64-bit Host

Restore the files you backed from the 32-bit host using the same directory structure that was used in 12c (12.2.1.3.0). The directory structure on the target machine must be identical to the structure of the host machine.

See Recovering Your Environment in Oracle Fusion Middleware Administrator’s Guide.

Install the 12c (12.2.1.4.0) Product Distributions on the Target Machine

Oracle recommends an Out-of-Place approach for upgrade. Therefore, you must install the 12c (12.2.1.4.0) product distributions in a new Oracle home on the target machine.

Refer to the component-specific installation guides for the component(s) you are installing.

Upgrade the Target 64-bit Environment Using the Standard Upgrade Procedure

After installing the product on the target machine, you must upgrade each product component individually using an Upgrade Utility specified in the component-specific upgrade guide and complete any post-upgrade tasks.

If you are upgrading additional components, see the component-specific upgrade guide.

Note:

The Node Manager upgrade procedure requires access to the original Node Manager files. Use the 12c (12.2.1.3.0) Node Manager files that you backed up from the 32-bit source machine as part of Back Up All Files from the 32-bit Host Machine.
Verify That the Database Hosting Oracle Fusion Middleware is Supported

You must have a supported Oracle database configured with the required schemas before you run Oracle Fusion Middleware 12c (12.2.1.4.0).

Review the Fusion Middleware database requirements before starting the upgrade to ensure that the database hosting Oracle Fusion Middleware is supported and has sufficient space to perform an upgrade. See the Certification Matrix for 12c (12.2.1.4.0).

Note:

If your database version is no longer supported, you must upgrade to a supported version before starting an upgrade. See Upgrading and Preparing Your Oracle Databases for 12c (12.2.1.4.0) in Planning an Upgrade of Oracle Fusion Middleware.

Verify That the JDK Is Certified for This Release of Oracle Fusion Middleware

At the time this document was published, the certified JDK for 12c (12.2.1.4.0) was 1.8.0_211.

Refer to the Oracle Fusion Middleware Supported System Configurations information on the Oracle Technology Network (OTN) to verify that the JDK you are using is supported.

If your JDK is not supported, or you do not have a JDK installed, you must download the required Java SE JDK, from the following website:

Make sure that the JDK is installed outside of the Oracle home. The Oracle Universal Installer validates that the designated Oracle home directory is empty, and the install does not progress until an empty directory is specified. If you install JDK under Oracle home, you may experience issues in future operations. Therefore, Oracle recommends that you use install the JDK in the following directory: /home/oracle/products/jdk.

For more information on the difference between generic and platform-specific installers, see Understanding the Difference Between Generic and Platform-Specific Distributions in the Oracle Fusion Middleware Download, Installation, and Configuration Readme Files.
Updating Policy Files when Using Enhanced Encryption (AES 256)

If you plan to use enhanced encryption, such as Advanced Encryption Standard (AES) 256, in your upgraded environment, Oracle recommends that you apply the latest required policy files to the JDK before you upgrade.

The Java platform defines a set of APIs spanning major security areas, including cryptography, public key infrastructure, authentication, secure communication, and access control. These APIs allow developers to easily integrate security mechanisms into their application code.

Some of the security algorithms used in Fusion Middleware 12c (12.2.1.4.0) require additional policy files for the JDK. See Java Cryptography Architecture Oracle Providers Documentation.

**Note:**

If you attempt to use enhanced encryption without applying these policy files to the JDK before you begin the upgrade, the upgrade can fail and you must restore the entire pre-upgrade environment and start the upgrade from the beginning.

Purging Unused Data

Purging unused data and maintaining a purging methodology before an upgrade can optimize the upgrade process.

Some components have automated purge scripts. If you are using purge scripts, wait until the purge is complete before starting the upgrade process. The upgrade may fail if the purge scripts are running while using the Upgrade Assistant to upgrade your schemas.

Creating a Non-SYSDBA User to Run the Upgrade Assistant

Oracle recommends that you create a non-SYSDBA user called `FMW` to run the Upgrade Assistant. This user has the privileges required to modify schemas, but does not have full administrator privileges.

SYSDBA is an administrative privilege that is required to perform high-level administrative operations such as creating, starting up, shutting down, backing up, or recovering the database. The SYSDBA system privilege is for a fully empowered database administrator. When you connect with the SYSDBA privilege, you connect with a default schema and not with the schema that is generally associated with your user name. For SYSDBA, this schema is SYS. Access to a default schema can be a very powerful privilege. For example, when you connect as user SYS, you have unlimited privileges on data dictionary tables. Therefore, Oracle recommends that you
create a non-SYSDBA user to upgrade the schemas. The privileges listed below must be granted to user FMW before starting the Upgrade Assistant.

**Notes:**

The non-SYSDBA user FMW is created solely for the purpose of running the Upgrade Assistant. After this step is complete, drop the FMW user. Note that privileges required for running the Upgrade Assistant may change from release to release.

By default, the `v$xatrans$` table does not exist. You must run the `XAVIEW.SQL` script to create this table before creating the user. Moreover, the `grant select` privilege on the `v$xatrans$` table is required only by Oracle Identity Governance. If you do not require Oracle Identity Governance for configuration, or if you do not have the `v$xatrans$` table, then remove the following line from the script:

```
grant select on v$xatrans$ to FMW with grant option;
```

In the example below, `password` is the password that you set for the FMW user. When granting privileges, make sure that you specify your actual password.

```
create user FMW identified by password;
grant dba to FMW;
grant execute on DBMS_LOB to FMW with grant option;
grant execute on DBMS_OUTPUT to FMW with grant option;
grant execute on DBMS_STATS to FMW with grant option;
grant execute on sys.dbms_adgm to FMW with grant option;
grant execute on sys.dbms_aqin to FMW with grant option;
grant execute on sys.dbms_aqm to FMW with grant option;
grant execute on sys.dbms_ag to FMW with grant option;
grant execute on utl_file to FMW with grant option;
grant execute on dbms_lock to FMW with grant option;
grant select on sys.V$_INSTANCE to FMW with grant option;
grant select on sys.GV$_INSTANCE to FMW with grant option;
grant select on sys.V$_SESSION to FMW with grant option;
grant select on sys.GV$_SESSION to FMW with grant option;
grant select on dba_scheduler_jobs to FMW with grant option;
grant select on dba_scheduler_job_run_details to FMW with grant option;
grant select on dba_scheduler_running_jobs to FMW with grant option;
grant select on dba_ag_agents to FMW with grant option;
grant execute on sys.DBMS_SHARED_POOL to FMW with grant option;
grant select on dba_2pc_pending to FMW with grant option;
grant select on dba_pending_transactions to FMW with grant option;
grant execute on DBMS_FLASHBACK to FMW with grant option;
grant execute on dbms_crypto to FMW with grant option;
grant execute on DBMS_REPUTIL to FMW with grant option;
grant execute on dbms_job to FMW with grant option;
grant select on pending_trans$ to FMW with grant option;
grant select on dba_scheduler_job_classes to FMW with grant option;
grant select on sys.DBA_TABLESPACE_USAGE_METRICS to FMW with grant option;
grant select on SYS.DBA_DATA_FILES to FMW with grant option;
```
grant select on SYS.V_$ASM_DISKGROUP to FMW with grant option;
grant select on v$xatrans$ to FMW with grant option;
grant execute on sys.dbms_system to FMW with grant option;
grant execute on DBMS_SCHEDULER to FMW with grant option;
grant select on dba_data_files to FMW with grant option;
grant execute on UTL_RAW to FMW with grant option;
grant execute on DBMS_XMLDOM to FMW with grant option;
grant execute on DBMS_APPLICATION_INFO to FMW with grant option;
grant execute on DBMS_UTILITIES to FMW with grant option;
grant execute on DBMS_SESSION to FMW with grant option;
grant execute on DBMS_METADATA to FMW with grant option;
grant execute on DBMS_XMLGEN to FMW with grant option;
grant execute on DBMS_DATAPUMP to FMW with grant option;
grant execute on DBMS_AMINOACIDS to FMW with grant option;
grant select on ALL_ENCRYPTED_COLUMNS to FMW with grant option;
grant select on dba_queue_subscribers to FMW with grant option;
grant execute on SYSDBFMS_ASSERT to FMW with grant option;
grant select on dba_subscr_registrations to FMW with grant option;
grant manage scheduler to FMW;

If you are upgrading Oracle Identity Manager (OIM) schema, ensure that the FMW user has the following additional privileges:

grant execute on SYS.DBMS_FLASHBACK to fmw with grant option;
grant execute on sys.DBMS_SHARED_POOL to fmw with grant option;
grant execute on SYS.DBMS_XMLED to FMW with grant option;
grant execute on SYS.DBMS_DB_VERSION to FMW with grant option;
grant execute on SYS.DBMS_SCHEDULER to FMW with grant option;
grant execute on SYS.DBMS_SQL to FMW with grant option;
grant execute on SYS.DBMS_UTILITIES to FMW with grant option;
grant ctxapp to FMW with admin option;
grant execute on SYS.DBMS_FLASHBACK TO FMW with grant option;
grant create MATERIALIZED VIEW to FMW with admin option;
grant all on SCHEMA_VERSION_REGISTRY TO FMW with grant option;
grant create SYNONYM to FMW with admin option;
grant execute on CTXSYS.CTX_ADM TO FMW with grant option;
grant execute on CTXSYS.CTX_CLS TO FMW with grant option;
grant execute on CTXSYS.CTX_DDL TO FMW with grant option;
grant execute on CTXSYS.CTX_DOC TO FMW with grant option;
grant execute on CTXSYS.CTX_OUTPUT TO FMW with grant option;
grant execute on CTXSYS.CTX_QUERY TO FMW with grant option;
grant execute on CTXSYS.CTX_REPORT TO FMW with grant option;
grant execute on CTXSYS.CTX_THES TO FMW with grant option;
grant execute on CTXSYS.CTX_ULEXER TO FMW with grant option;
grant create JOB to FMW with admin option;
Part I

Upgrading Oracle Internet Directory Single Node Environments

You can upgrade the Oracle Internet Directory 12c (12.2.1.3.0) single node environments to 12c (12.2.1.4.0) using the procedure described in this part.

Topics

• **Upgrading Oracle Internet Directory Single Node 12c Environments**
  You can upgrade Oracle Internet Directory from an earlier Oracle Fusion Middleware 12c (12.2.1.3.0) version to the latest 12c (12.2.1.4.0) release version.

• **Upgrading Oracle Directory Integration Platform to 12c (12.2.1.4.0)**
  You can upgrade Oracle Directory Integration Platform from Oracle Fusion Middleware Release 12c (12.2.1.3.0) to 12c (12.2.1.4.0).
You can upgrade Oracle Internet Directory from an earlier Oracle Fusion Middleware 12c (12.2.1.3.0) version to the latest 12c (12.2.1.4.0) release version.

Oracle Fusion Middleware Upgrade Assistant supports an out-of-place upgrade to 12c (12.2.1.4.0) release for the following Oracle Internet Directory 12c (12.2.1.3.0) release:

- Oracle Internet Directory FMW 12c (12.2.1.3.0)

The following topics describe how to upgrade Oracle Internet Directory to 12c (12.2.1.4.0) release:

- **About the Oracle Internet Directory Upgrade Process**
  Review the roadmap for an overview of the upgrade process for Oracle Internet Directory.

- **Stopping Servers and Processes**
  Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must stop the Administration Server, Managed Servers, Oracle Internet Directory instances, processes, and the Node Managers.

- **Uninstalling the Software**
  Follow the instructions in this section to start the Uninstall Wizard and remove the software.

- **Installing Oracle Internet Directory**
  Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle Internet Directory (OID) 12c (12.2.1.4.0) distributions on the target system and install them using Oracle Universal Installer.

- **Running a Pre-Upgrade Readiness Check**
  To identify potential issues with the upgrade, Oracle recommends that you run a readiness check before you start the upgrade process. Be aware that the readiness check may not be able to discover all potential issues with your upgrade. An upgrade may still fail, even if the readiness check reports success.

- **Upgrading Product Schemas**
  After stopping servers and processes, use the Upgrade Assistant to upgrade supported product schemas to the current release of Oracle Fusion Middleware.

- **Starting Servers and Processes**
  After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

### About the Oracle Internet Directory Upgrade Process

Review the roadmap for an overview of the upgrade process for Oracle Internet Directory.
Caution:

Before upgrading to 12.2.1.4.0 release, ensure that the 12.2.1.3.0 EXISTING_DOMAIN_HOME is outside the MIDDLEWARE_HOME.

The steps you take to upgrade your existing domain will vary depending on how your domain is configured and which components are being upgraded. Follow only those steps that are applicable to your deployment.

Table 3-1 Tasks for Upgrading Oracle Internet Directory

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>If you have not done so already, review the introductory topics in this guide and complete the required pre-upgrade tasks. See:</td>
</tr>
<tr>
<td></td>
<td>• Introduction to Upgrading Oracle Internet Directory to 12c (12.2.1.4.0)</td>
</tr>
<tr>
<td></td>
<td>• Pre-Upgrade Requirements</td>
</tr>
<tr>
<td>Required</td>
<td>Stop all servers and processes in the 12c environment. This includes Administration Server, Managed Servers, OID Servers, Node Manager, and any other system components. WARNING: Failure to shut down your servers during an upgrade may lead to data corruption. See Stopping Servers and Processes.</td>
</tr>
<tr>
<td>Required</td>
<td>Uninstall Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.3.0) in the existing Oracle home. See Uninstalling the Software.</td>
</tr>
<tr>
<td>Required</td>
<td>Install Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.4.0) in the existing Oracle home. You must install the Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.4.0) distributions to upgrade OID. See Installing Oracle Internet Directory.</td>
</tr>
<tr>
<td>Required</td>
<td>Run a pre-upgrade readiness check. See Running a Pre-Upgrade Readiness Check.</td>
</tr>
<tr>
<td>Required</td>
<td>Start the Upgrade Assistant to upgrade the 12c database schemas. See Upgrading Product Schemas. The upgrade of active instance data is started automatically when running the Upgrade Assistant. Once the data is successfully upgraded to the new 12c (12.2.1.4.0) environment, you can close the Upgrade Assistant. The closed instances will continue to upgrade through a background process.</td>
</tr>
<tr>
<td>Required</td>
<td>Start the servers and system components. When the upgrade process is complete, restart the 12c (12.2.1.4.0) instance. See Starting Servers and Processes.</td>
</tr>
</tbody>
</table>

Stopping Servers and Processes

Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must stop the Administration Server, Managed Servers, Oracle Internet Directory instances, processes, and the Node Managers.

An Oracle Fusion Middleware environment can consist of an Oracle WebLogic Server domain, an Administration Server, multiple managed servers, Java components,
system components such as Identity Management components, and a database used as a repository for metadata. The components may be dependent on each other, so they must be stopped in the correct order.

Note:
The procedures in this section describe how to stop the existing, pre-upgrade servers and processes using the WLST command-line utility or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager.

To stop your pre-upgrade Fusion Middleware environment, navigate to the pre-upgrade domain and follow the steps below.

Step 1: Stop the Managed Servers
To stop a WebLogic Server Managed Server, use the `stopManagedWebLogic` script:

- (UNIX)  `EXISTING_DOMAIN_HOME/bin/stopManagedWebLogic.sh managed_server_name admin_url`
- (Windows)  `EXISTING_DOMAIN_HOME\bin\stopManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

Step 2: Stop Oracle Internet Directory Servers
Stop the Oracle Internet Directory servers using the following command:

- (UNIX)  `DOMAIN_HOME/bin/stopComponent.sh oid1`
- (Windows)  `DOMAIN_HOME\bin\stopComponent.cmd oid1`

Step 3: Stop the Administration Server
When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To stop the Administration Server, use the `stopWebLogic` script:

- (UNIX)  `EXISTING_DOMAIN_HOME/bin/stopWebLogic.sh`
- (Windows)  `EXISTING_DOMAIN_HOME\bin\stopWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.

Step 4: Stop Node Manager
To stop Node Manager, close the command shell in which it is running.

Alternatively, after having set the `nodemanager.properties` attribute `QuitEnabled` to `true` (the default is `false`), you can use WLST to connect to Node Manager and shut it down. See `stopNodeManager` in *WLST Command Reference for WebLogic Server 12.1.3*. 
Uninstalling the Software

Follow the instructions in this section to start the Uninstall Wizard and remove the software.

If you want to uninstall the product in a silent (command-line) mode, see Running the Oracle Universal Installer for Silent Uninstallation in Installing Software with the Oracle Universal Installer.

• Starting the Uninstall Wizard
• Selecting the Product to Uninstall
• Navigating the Uninstall Wizard Screens

Starting the Uninstall Wizard

Start the Uninstall Wizard:

1. Change to the following directory:
   (UNIX) ORACLE_HOME/oui/bin
   (Windows) ORACLE_HOME\oui\bin

2. Enter the following command:
   (UNIX) ./deinstall.sh
   (Windows) deinstall.cmd

Selecting the Product to Uninstall

Because multiple products exist in the Oracle home, ensure that you are uninstalling the correct product.

After you run the Uninstall Wizard, the Distribution to Uninstall screen opens. From the dropdown menu, select the Oracle Internet Directory 12.2.1.3.0 product and click Uninstall. The uninstallation program shows the screens listed in Navigating the Uninstall Wizard Screens.

Run the Uninstall Wizard again to uninstall the Oracle Fusion Middleware Infrastructure. For instructions see, Uninstalling Oracle Fusion Middleware Infrastructure in Installing and Configuring the Oracle Fusion Middleware Infrastructure.

Navigating the Uninstall Wizard Screens

The Uninstall Wizard shows a series of screens to confirm the removal of the software.

If you need help on screen listed in Table 4-2, click Help on the screen.

Table 3-2 Uninstall Wizard Screens and Descriptions

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>Introduces you to the product Uninstall Wizard.</td>
</tr>
</tbody>
</table>
Table 3-2  (Cont.) Uninstall Wizard Screens and Descriptions

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uninstall Summary</td>
<td>Shows the Oracle home directory and its contents that are uninstalled. Verify that this is the correct directory. If you want to save these options to a response file, click <strong>Save Response File</strong> and enter the response file location and name. You can use the response file later to uninstall the product in silent (command-line) mode. See Running the Oracle Universal Installer for Silent Uninstall in <em>Installing Software with the Oracle Universal Installer</em>. Click <strong>Deinstall</strong>, to begin removing the software.</td>
</tr>
<tr>
<td>Uninstall Progress</td>
<td>Shows the uninstallation progress.</td>
</tr>
<tr>
<td>Uninstall Complete</td>
<td>Appears when the uninstallation is complete. Review the information on this screen, then click <strong>Finish</strong> to close the Uninstall Wizard.</td>
</tr>
</tbody>
</table>

**Note:**

After the product is uninstalled, ensure that the **ORACLE_HOME** folder exists and it does not contain any files or folders. If there are any remaining files or folders in the **ORACLE_HOME** folder, delete them.

## Installing Oracle Internet Directory

Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle Internet Directory (OID) 12c (12.2.1.4.0) distributions on the target system and install them using Oracle Universal Installer.

**Note:**

Oracle Internet Directory 12c (12.2.1.4.0) should be installed in the existing **ORACLE_HOME** location.

For example: If 12.2.1.3 is installed in **ORACLE_HOME**: `/u01/oid/12c`, uninstall 12.2.1.3 **ORACLE_HOME** and install Oracle Internet Directory 12c (12.2.1.4.0) into `/u01/oid/12c`.

To install the 12c (12.2.1.4.0) distributions:

1. Sign in to the target system.
2. Download the following from Oracle Technology Network or Oracle Software Delivery Cloud to your target system:
   - Oracle Fusion Middleware Infrastructure (`fmw_12.2.1.4.0_infrastructure.jar`)
   - Oracle Internet Directory (UNIX: `fmw_12.2.1.4.0_oid_<platform>.bin`), (Windows: `fmw_12.2.1.4.0_oid_win64.exe`)
3. Change to the directory where you downloaded the 12c (12.2.1.4.0) product distribution.

4. Start the installation program for Oracle Fusion Middleware Infrastructure:
   • (UNIX) `JDK_HOME/bin/java -jar fmw_12.2.1.4.0_infrastructure.jar`
   • (Windows) `JDK_HOME\bin\java -jar fmw_12.2.1.4.0_infrastructure.jar`

5. On UNIX operating systems, the Installation Inventory Setup screen is displayed. If prompted, specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location, and click **Next**.

   **Note:**
   The Installation Inventory Setup screen does not appear on Windows operating systems.

6. On the Welcome screen, review the information to make sure that you have met all the prerequisites. Click **Next**.

7. On the Auto Updates screen, select an option:
   • **Skip Auto Updates**: If you do not want your system to check for software updates at this time.
   • **Select patches from directory**: To navigate to a local directory if you downloaded patch files.
   • **Search My Oracle Support for Updates**: To automatically download software updates if you have a My Oracle Support account. You must enter Oracle Support credentials then click **Search**. To configure a proxy server for the installer to access My Oracle Support, click **Proxy Settings**. Click **Test Connection** to test the connection.

   Click **Next**.

8. On the Installation Location screen, specify the location for the Oracle home directory and click **Next**.

   For more information about Oracle Fusion Middleware directory structure, see Understanding Directories for Installation and Configuration in *Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware*.

9. On the Installation Type screen, select the following:
   • For Infrastructure, select **Fusion Middleware Infrastructure**.

   Click **Next**.

   **Note:**
   The topology in this document does not include server examples. Oracle strongly recommends that you do not install examples into a production environment.

10. The Prerequisite Checks screen analyzes the host computer to ensure that the specific operating system prerequisites have been met.
To view the list of tasks that are verified, select **View Successful Tasks**. To view log details, select **View Log**. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click **Rerun** to try again. To ignore the error or the warning message and continue with the installation, click **Skip** (not recommended).

11. On the Installation Summary screen, verify the installation options that you selected.

If you want to save these options to a response file, click **Save Response File** and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time.

Click **Install** to begin the installation.

12. On the Installation Progress screen, when the progress bar displays 100%, click **Finish** to dismiss the installer, or click **Next** to see a summary.

13. The Installation Complete screen displays the Installation Location and the Feature Sets that are installed. Review this information and click **Finish** to close the installer.

14. After you have installed Oracle Fusion Middleware Infrastructure, enter the following command to start the installer for Oracle Internet Directory and repeat the steps above to navigate through the installer screens:
   - (UNIX) `. /fmw_12.2.1.4.0_oid_<platform>.bin`
   - (Windows) `fmw_12.2.1.4.0_oid_win64.exe`

---

**Note:**

- For more information about installing Oracle Internet Directory, see Installing the Oracle Internet Directory Software in the *Installing Oracle Internet Directory*.
- For more information about installing Oracle Fusion Middleware Infrastructure, see Installing the Infrastructure Software in the in *Installing and Configuring the Oracle Fusion Middleware Infrastructure*.

---

**Running a Pre-Upgrade Readiness Check**

To identify potential issues with the upgrade, Oracle recommends that you run a readiness check before you start the upgrade process. Be aware that the readiness check may not be able to discover all potential issues with your upgrade. An upgrade may still fail, even if the readiness check reports success.

**Note:**

This is applicable only for a collocated Oracle Internet Directory deployment scenario and not for a standalone deployment upgrade.
• **About Running a Pre-Upgrade Readiness Check**
  You can run the Upgrade Assistant in `-readiness` mode to detect issues before you perform the actual upgrade. You can run the readiness check in GUI mode using the Upgrade Assistant or in silent mode using a response file.

• **Starting the Upgrade Assistant in Readiness Mode**
  Use the `-readiness` parameter to start the Upgrade Assistant in readiness mode.

• **Performing a Readiness Check with the Upgrade Assistant**
  Navigate through the screens in the Upgrade Assistant to complete the pre-upgrade readiness check.

• **Understanding the Readiness Report**
  After performing a readiness check for your domain, review the report to determine whether you need to take any action for a successful upgrade.

---

**About Running a Pre-Upgrade Readiness Check**

You can run the Upgrade Assistant in `-readiness` mode to detect issues before you perform the actual upgrade. You can run the readiness check in GUI mode using the Upgrade Assistant or in silent mode using a response file.

The Upgrade Assistant readiness check performs a read-only, pre-upgrade review of your Fusion Middleware schemas and WebLogic domain configurations that are at a supported starting point. The review is a read-only operation.

The readiness check generates a formatted, time-stamped readiness report so you can address potential issues before you attempt the actual upgrade. If no issues are detected, you can begin the upgrade process. Oracle recommends that you read this report thoroughly before performing an upgrade.

You can run the readiness check while your existing Oracle Fusion Middleware domain is online (while other users are actively using it) or offline.

You can run the readiness check any number of times before performing any actual upgrade. However, do not run the readiness check after an upgrade has been performed, as the report results may differ from the result of pre-upgrade readiness checks.

---

**Note:**

To prevent performance from being affected, Oracle recommends that you run the readiness check during off-peak hours.

---

**Starting the Upgrade Assistant in Readiness Mode**

Use the `-readiness` parameter to start the Upgrade Assistant in readiness mode.

To perform a readiness check on your pre-upgrade environment with the Upgrade Assistant:

1. Go to the `oracle_common/upgrade/bin` directory:
   - (UNIX) `NEW_ORACLE_HOME/oracle_common/upgrade/bin`
   - (Windows) `NEW_ORACLE_HOME\oracle_common\upgrade\bin`
2. Start the Upgrade Assistant.
   - (UNIX) `./ua -readiness`
   - (Windows) `ua.bat -readiness`

   **Note:**

   If the `DISPLAY` environment variable is not set up properly to allow for GUI mode, you may encounter the following error:

   Xlib: connection to ":1.0" refused by server
   Xlib: No protocol specified

   To resolve this issue, set the `DISPLAY` environment variable to the system name or IP address of your local workstation, and rerun Upgrade Assistant.

   If you continue to receive these errors after setting `DISPLAY`, try launching another GUI tool, such as `vncconfig`. If you see the same errors, your `DISPLAY` environment variable may still not be set correctly.

For information about other parameters that you can specify on the command line, see:
- Upgrade Assistant Parameters

### Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.

#### Table 3-3 Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-readiness</code></td>
<td>Required for readiness checks <strong>Note</strong>: Readiness checks cannot be performed on standalone installations (those not managed by the WebLogic Server).</td>
<td>Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the <code>-examine</code> parameter.</td>
</tr>
<tr>
<td><code>-threads</code></td>
<td>Optional</td>
<td>Identifies the number of threads available for concurrent schema upgrades or readiness checks of the schemas. The value must be a positive integer in the range 1 to 8. The default is 4.</td>
</tr>
</tbody>
</table>
### Table 3-3  (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-response</td>
<td>Required</td>
<td>Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in silent mode (without displaying Upgrade Assistant screens).</td>
</tr>
<tr>
<td>-examine</td>
<td>Optional</td>
<td>Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the -readiness parameter.</td>
</tr>
<tr>
<td>-logLevel attribute</td>
<td>Optional</td>
<td>Sets the logging level, specifying one of the following attributes: • TRACE • NOTIFICATION • WARNING • ERROR • INCIDENT_ERROR The default logging level is NOTIFICATION. Consider setting the -logLevel TRACE attribute to so that more information is logged. This is useful when troubleshooting a failed upgrade. The Upgrade Assistant's log files can become very large if -logLevel TRACE is used.</td>
</tr>
</tbody>
</table>
Performing a Readiness Check with the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to complete the pre-upgrade readiness check.

Readiness checks are performed only on schemas or component configurations that are at a supported upgrade starting point.

To complete the readiness check:

1. On the Welcome screen, review information about the readiness check. Click Next.

2. On the Readiness Check Type screen, select the readiness check that you want to perform:
   - **Individually Selected Schemas** allows you to select individual schemas for review before upgrade. The readiness check reports whether a schema is supported for an upgrade or where an upgrade is needed. When you select this option, the screen name changes to Selected Schemas.
   - **Domain Based** allows the Upgrade Assistant to discover and select all upgrade-eligible schemas or component configurations in the domain specified in the **Domain Directory** field.

---

Table 3-3  (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-logDir location</code></td>
<td>Optional</td>
<td>Sets the default location of upgrade log files and temporary files. You must specify an existing, writable directory where the Upgrade Assistant creates log files and temporary files. The default locations are: (UNIX) <code>ORACLE_HOME/oracle_common/upgrade/logs</code> <code>ORACLE_HOME/oracle_common/upgrade/temp</code> (Windows) <code>ORACLE_HOME/oracle_common\upgrade\logs</code> <code>ORACLE_HOME/oracle_common\upgrade\temp</code></td>
</tr>
<tr>
<td><code>-help</code></td>
<td>Optional</td>
<td>Displays all of the command-line options.</td>
</tr>
</tbody>
</table>
When you select this option, the screen name changes to Schemas and Configuration.

Leave the default selection if you want the Upgrade Assistant to check all schemas and component configurations at the same time, or select a specific option:

- **Include checks for all schemas** to discover and review all components that have a schema available to upgrade.
- **Include checks for all configurations** to review component configurations for a managed WebLogic Server domain.

Click **Next**.

3. If you selected **Individually Selected Schemas**: On the Available Components screen, select the components that have a schema available to upgrade for which you want to perform a readiness check.

   If you selected **Domain Based**: On the Component List screen, review the list of components that are present in your domain for which you want to perform a readiness check.

   If you select a component that has dependent components, those components are automatically selected. For example, if you select Oracle Platform Security Services, Oracle Audit Services is automatically selected.

   Depending on the components you select, additional screens may display. For example, you may need to:
   - Specify the domain directory.
   - Specify schema credentials to connect to the selected schema: **Database Type**, **DBA User Name**, and **DBA Password**. Then click **Connect**.

   **Note:**

   Oracle database is the default database type. Make sure that you select the correct database type before you continue. If you discover that you selected the wrong database type, do not go back to this screen to change it to the correct type. Instead, close the Upgrade Assistant and restart the readiness check with the correct database type selected to ensure that the correct database type is applied to all schemas.

   - Select the **Schema User Name** option and specify the **Schema Password**.

   **Note:**

   The Upgrade Assistant automatically enables default credentials. If you are unable to connect, make sure that you manually enter the credentials for your schema before you continue.

   Click **Next** to start the readiness check.

4. On the Readiness Summary screen, review the summary of the readiness checks that will be performed based on your selections.
If you want to save your selections to a response file to run the Upgrade Assistant again later in response (or silent) mode, click **Save Response File** and provide the location and name of the response file. A silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again.

For a detailed report, click **View Log**.

Click **Next**.

5. On the Readiness Check screen, review the status of the readiness check. The process can take several minutes.

If you are checking multiple components, the progress of each component displays in its own progress bar in parallel.

When the readiness check is complete, click **Continue**.

6. On the End of Readiness screen, review the results of the readiness check (**Readiness Success** or **Readiness Failure**):
   - If the readiness check is successful, click **View Readiness Report** to review the complete report. Oracle recommends that you review the Readiness Report before you perform the actual upgrade even when the readiness check is successful. Use the **Find** option to search for a particular word or phrase within the report. The report also indicates where the completed Readiness Check Report file is located.
   - If the readiness check encounters an issue or error, click **View Log** to review the log file, identify and correct the issues, and then restart the readiness check. The log file is managed by the command-line options you set.

### Understanding the Readiness Report

After performing a readiness check for your domain, review the report to determine whether you need to take any action for a successful upgrade.

The format of the readiness report file is:

```
readiness<timestamp>.txt
```

Where, *timestamp* indicates the date and time of when the readiness check was run.

A readiness report contains the following information:

**Table 3-4  Readiness Report Elements**

<table>
<thead>
<tr>
<th>Report Information</th>
<th>Description</th>
<th>Required Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall Readiness Status: SUCCESS or FAILURE</td>
<td>The top of the report indicates whether the readiness check passed or completed with one or more errors.</td>
<td>If the report completed with one or more errors, search for FAIL and correct the failing issues before attempting to upgrade. You can re-run the readiness check as many times as necessary before an upgrade.</td>
</tr>
<tr>
<td>Timestamp</td>
<td>The date and time that the report was generated.</td>
<td>No action required.</td>
</tr>
</tbody>
</table>
### Table 3-4  (Cont.) Readiness Report Elements

<table>
<thead>
<tr>
<th>Report Information</th>
<th>Description</th>
<th>Required Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log file location</td>
<td>The directory location of the generated log file.</td>
<td>No action required.</td>
</tr>
<tr>
<td>/oracle_common/upgrade/logs</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Domain Directory</td>
<td>Displays the domain location</td>
<td>No action required.</td>
</tr>
<tr>
<td>Readiness report location</td>
<td>The directory location of the generated readiness report.</td>
<td>No action required.</td>
</tr>
<tr>
<td>/oracle_common/upgrade/logs</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Names of components that were checked</td>
<td>The names and versions of the components included in the check and status.</td>
<td>If your domain includes components that cannot be upgraded to this release, such as SOA Core Extension, do not attempt an upgrade.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Names of schemas that were checked</td>
<td>The names and current versions of the schemas included in the check and status.</td>
<td>Review the version numbers of your schemas. If your domain includes schemas that cannot be upgraded to this release, do not attempt an upgrade.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Individual Object Test Status: FAIL</td>
<td>The readiness check test detected an issue with a specific object.</td>
<td>Do not upgrade until all failed issues have been resolved.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Individual Object Test Status: PASS</td>
<td>The readiness check test detected no issues for the specific object.</td>
<td>If your readiness check report shows only the PASS status, you can upgrade your environment. Note, however, that the Readiness Check cannot detect issues with externals such as hardware or connectivity during an upgrade. You should always monitor the progress of your upgrade.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Completed Readiness Check of &lt;Object&gt; Status: FAILURE</td>
<td>The readiness check detected one or more errors that must be resolved for a particular object such as a schema, an index, or datatype.</td>
<td>Do not upgrade until all failed issues have been resolved.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Completed Readiness Check of &lt;Object&gt; Status: SUCCESS</td>
<td>The readiness check test detected no issues.</td>
<td>No action required.</td>
</tr>
</tbody>
</table>

Here is a sample Readiness Report file. Your report may not include all of these checks.

Upgrade readiness check completed with one or more errors.

This readiness check report was created on Fri Aug 16 13:29:41 PDT 2019
Log file is located at: /oracle/work/middleware_latest/oracle_common/upgrade/logs/ua2019-08-16-13-23-36PM.log
Domain Directory: /oracle/work/middleware_1212/user_projects/domains/jrf_domain
Starting readiness check of components.
Oracle Platform Security Services
Starting readiness check of Oracle Platform Security Services.
   Schema User Name: DEV3_OPSS
   Database Type: Oracle Database
   Database Connect String:
   VERSION Schema DEV3_OPSS is currently at version 12.1.2.0.0.
Readiness checks will now be performed.
Starting schema test:  TEST_DATABASE_VERSION Test that the database
server version number is supported for upgrade
   INFO   Database product version: Oracle Database 12c Enterprise
   Edition Release 12.1.0.2.0 - 64bit Production
   With the Partitioning, OLAP, Advanced Analytics and Real Application
   Testing options
   Completed schema test: TEST_DATABASE_VERSION --> Test that the database
   server version number is supported for upgrade +++ PASS
Starting schema test:  TEST_REQUIRED_TABLES Test that the schema
contains all the required tables
   Completed schema test: TEST_REQUIRED_TABLES --> Test that the schema
   contains all the required tables +++ PASS
Starting schema test:  Test that the schema does not contain any
unexpected tables  TEST_UNEXPECTED_TABLES
   Completed schema test: Test that the schema does not contain any
unexpected tables --> TEST_UNEXPECTED_TABLES +++ Test that the schema does
not contain any unexpected tables
Starting schema test:  TEST_ENOUGH_TABLESPACE Test that the schema
tablespaces automatically extend if full
   Completed schema test: TEST_ENOUGH_TABLESPACE --> Test that the schema
   tablespaces automatically extend if full +++ PASS
Starting schema test:  TEST_USER_TABLESPACE_QUOTA Test that tablespace
quota for this user is sufficient to perform the upgrade
   Completed schema test: TEST_USER_TABLESPACE_QUOTA --> Test that
   tablespace quota for this user is sufficient to perform the upgrade +++
   PASS
Starting schema test:  TEST_ONLINE_TABLESPACE Test that schema
tablespaces are online
   Completed schema test: TEST_ONLINE_TABLESPACE --> Test that schema
   tablespaces are online +++ PASS
Starting permissions test:  TEST_DBA_TABLE_GRANTS Test that DBA user
has privilege to view all user tables
   Completed permissions test: TEST_DBA_TABLE_GRANTS --> Test that DBA
   user has privilege to view all user tables +++ PASS
Starting schema test:  SEQUENCE_TEST Test that the Oracle Platform
Security Services schema sequence and its properties are valid
   Completed schema test: SEQUENCE_TEST --> Test that the Oracle Platform
Security Services schema sequence and its properties are valid +++ PASS
Finished readiness check of Oracle Platform Security Services with
status: SUCCESS.

Oracle Audit Services
Starting readiness check of Oracle Audit Services.
   Schema User Name: DEV3_IAU
   Database Type: Oracle Database
   Database Connect String:
   VERSION Schema DEV3_IAU is currently at version 12.1.2.0.0.
Readiness checks will now be performed.

Starting schema test: TEST_DATABASE_VERSION  Test that the database server version number is supported for upgrade
INFO  Database product version: Oracle Database 12c Enterprise Edition Release 12.1.0.2.0 - 64bit Production
With the Partitioning, OLAP, Advanced Analytics and Real Application Testing options
Completed schema test: TEST_DATABASE_VERSION --> Test that the database server version number is supported for upgrade +++ PASS
Starting schema test: TEST_REQUIRED_TABLES  Test that the schema contains all the required tables
Completed schema test: TEST_REQUIRED_TABLES --> Test that the schema contains all the required tables +++ PASS
Starting schema test: TEST_UNEXPECTED_TABLES  Test that the schema does not contain any unexpected tables
Completed schema test: TEST_UNEXPECTED_TABLES --> Test that the schema does not contain any unexpected tables +++ PASS
Starting schema test: TEST_ENOUGH_TABLESPACE  Test that the schema tablespaces automatically extend if full
Completed schema test: TEST_ENOUGH_TABLESPACE --> Test that the schema tablespaces automatically extend if full +++ PASS
Starting schema test: TEST_USER_TABLESPACE_QUOTA  Test that tablespace quota for this user is sufficient to perform the upgrade
Completed schema test: TEST_USER_TABLESPACE_QUOTA --> Test that tablespace quota for this user is sufficient to perform the upgrade +++ PASS
Starting schema test: TEST_ONLINE_TABLESPACE  Test that schema tablespaces are online
Completed schema test: TEST_ONLINE_TABLESPACE --> Test that schema tablespaces are online +++ PASS
Starting permissions test: TEST_DBA_TABLE_GRANTS  Test that DBA user has privilege to view all user tables
Completed permissions test: TEST_DBA_TABLE_GRANTS --> Test that DBA user has privilege to view all user tables +++ PASS
Starting schema test: TEST_MISSING_COLUMNS  Test that tables and views are not missing any required columns
Completed schema test: TEST_MISSING_COLUMNS --> Test that tables and views are not missing any required columns +++ PASS
Starting schema test: TEST_UNEXPECTED_COLUMNS  Test that tables and views do not contain any unexpected columns
Completed schema test: TEST_UNEXPECTED_COLUMNS --> Test that tables and views do not contain any unexpected columns +++ PASS
Starting datatype test for table OIDCOMPONENT: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes
Completed datatype test for table OIDCOMPONENT: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes +++ PASS
Starting datatype test for table IAU_CUSTOM_01: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes
Completed datatype test for table IAU_CUSTOM_01: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes +++ PASS
Starting datatype test for table IAU_BASE: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes
> Test that all table columns have the proper datatypes
  Completed datatype test for table IAU_BASE: TEST_COLUMN_DATATYPES_V2 --
> Test that all table columns have the proper datatypes +++ PASS
  Starting datatype test for table WS_POLICYATTACHMENT: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes
  Completed datatype test for table WS_POLICYATTACHMENT: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes +++ PASS
  Starting datatype test for table OWSM_PM_EJB: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes
  Completed datatype test for table OWSM_PM_EJB: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes +++ PASS
  Starting datatype test for table XMLPSERVER: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes
  Completed datatype test for table XMLPSERVER: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes +++ PASS
  Starting datatype test for table SOA_HCFP: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes
  Completed datatype test for table SOA_HCFP: TEST_COLUMN_DATATYPES_V2 -->
> Test that all table columns have the proper datatypes +++ PASS
  Starting schema test: SEQUENCE_TEST Test that the audit schema sequence and its properties are valid
  Completed schema test: SEQUENCE_TEST --> Test that the audit schema sequence and its properties are valid +++ PASS
  Starting schema test: SYNONYMS_TEST Test that the audit schema required synonyms are present
  Completed schema test: SYNONYMS_TEST --> Test that the audit schema required synonyms are present +++ PASS

Finished readiness check of Oracle Audit Services with status: FAILURE.

Common Infrastructure Services
Starting readiness check of Common Infrastructure Services.
  Schema User Name: DEV3_STB
  Database Type: Oracle Database
  Database Connect String:
  Starting schema test: TEST_REQUIRED_TABLES Test that the schema contains all the required tables
  Completed schema test: TEST_REQUIRED_TABLES --> Test that the schema contains all the required tables +++ PASS
  Completed schema test: ALL_TABLES --> TEST_REQUIRED_TABLES +++ Test that the schema contains all the required tables
  Starting schema test: TEST_UNEXPECTED_TABLES Test that the schema does not contain any unexpected tables
  Completed schema test: ALL_TABLES --> TEST_UNEXPECTED_TABLES +++ Test that the schema does not contain any unexpected tables
  Starting schema test: TEST_REQUIRED_VIEWS Test that the schema contains all the required database views
  Completed schema test: ALL_TABLES --> TEST_REQUIRED_VIEWS +++ Test that the schema contains all the required database views
  Starting schema test: TEST_MISSING_COLUMNS Test that tables and views are not missing any required columns
  Completed schema test: ALL_TABLES --> TEST_MISSING_COLUMNS +++ Test that tables and views are not missing any required columns
  Starting schema test: TEST_DATABASE_VERSION Test that the database...
server version number is supported for upgrade

Starting schema test:  TEST_DATABASE_VERSION  Test that the database server version number is supported for upgrade

INFO  Database product version: Oracle Database 12c Enterprise Edition Release 12.1.0.2.0 - 64bit Production
With the Partitioning, OLAP, Advanced Analytics and Real Application Testing options

Completed schema test: TEST_DATABASE_VERSION  -->  Test that the database server version number is supported for upgrade  +++ PASS

Completed schema test: ALL_TABLES  -->  TEST_DATABASE_VERSION  +++ Test that the database server version number is supported for upgrade

Finished readiness check of Common Infrastructure Services with status: SUCCESS.

Oracle JRF

Starting readiness check of Oracle JRF.

Finished readiness check of Oracle JRF with status: SUCCESS.

System Components Infrastructure

Starting readiness check of System Components Infrastructure.

Starting config test:  TEST_SOURCE_CONFIG  Checking the source configuration.

INFO  /oracle/work/middleware_1212/user_projects/domains/jrf_domain/opmn/topology.xml was not found. No upgrade is needed.

Completed config test: TEST_SOURCE_CONFIG  -->  Checking the source configuration.  +++ PASS

Finished readiness check of System Components Infrastructure with status: ALREADY_UPGRADED.

Common Infrastructure Services

Starting readiness check of Common Infrastructure Services.

Starting config test:  CIEConfigPlugin.readiness.test  This tests the readiness of the domain from CIE side.

Completed config test: CIEConfigPlugin.readiness.test  -->  This tests the readiness of the domain from CIE side.  +++ PASS

Finished readiness check of Common Infrastructure Services with status: SUCCESS.

Finished readiness check of components.

Upgrading Product Schemas

After stopping servers and processes, use the Upgrade Assistant to upgrade supported product schemas to the current release of Oracle Fusion Middleware.

The Upgrade Assistant allows you to upgrade individually selected schemas or all schemas associated with a domain. The option you select determines which Upgrade Assistant screens you will use.
Note:
Upgrading product schemas is required only when OID is the backend Server. Do not perform this step when using DIP with OUD as the backend Server. As one of the steps requires connecting to the database for the ODS Schema, which does not exist in an OUD or DIP configuration.

- Starting the Upgrade Assistant
  Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.4.0).

- Upgrading Oracle Internet Directory Schemas
  Navigate through the screens in the Upgrade Assistant to upgrade the product schemas.

- Verifying the Schema Upgrade
  After completing all the upgrade steps, verify that the upgrade was successful by checking that the schema version in `schema_version_registry` has been properly updated.

Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.4.0).

Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time. For information about creating a user for running Upgrade Assistant, see Creating a Non-SYSDBA User to Run the Upgrade Assistant.

To start the Upgrade Assistant:

1. Go to the `oracle_common/upgrade/bin` directory:
   - (UNIX) `ORACLE_HOME/oracle_common/upgrade/bin`
   - (Windows) `ORACLE_HOME\oracle_common\upgrade\bin`

2. Start the Upgrade Assistant:
   - (UNIX) `./ua`
   - (Windows) `ua.bat`

Upgrading Oracle Internet Directory Schemas

Navigate through the screens in the Upgrade Assistant to upgrade the product schemas.

To upgrade product schemas with the Upgrade Assistant:

1. On the Welcome screen, review an introduction to the Upgrade Assistant and information about important pre-upgrade tasks. Click **Next**.
2. On the Selected Schemas screen, select the schema upgrade operation that you want to perform:

- **Individually Selected Schemas** if you want to select individual schemas for upgrade and you do not want to upgrade all of the schemas used by the domain.

- **All Schemas Used by a Domain** to allow the Upgrade Assistant to discover and select all components that have a schema available to upgrade in the domain specified in the Domain Directory field. This is also known as a domain assisted schema upgrade. Additionally, the Upgrade Assistant pre-populates connection information on the schema input screens.

   ![Note:]
   
   Oracle recommends that you select All Schemas Used by a Domain for most upgrades to ensure all of the required schemas are included in the upgrade.

   Click Next.

3. If you selected Individually Selected Schemas: On the Available Components screen, select the components for which you want to upgrade schemas. When you select a component, the schemas and any dependencies are automatically selected.

4. On the Prerequisites screen, acknowledge that the prerequisites have been met by selecting all the check boxes. Click Next.

   ![Note:]
   
   The Upgrade Assistant does not verify whether the prerequisites have been met.

5. On the Schema Credentials screen(s), specify the database connection details for each schema you are upgrading (the screen name changes based on the schema selected):

   - Select the database type from the Database Type drop-down menu.
Enter the database connection details, and click **Connect**.

Select the schema you want to upgrade from the **Schema User Name** drop-down menu, and then enter the password for the schema. Be sure to use the correct schema prefix for the schemas you are upgrading.

6. On the Examine screen, review the status of the Upgrade Assistant as it examines each schema, verifying that the schema is ready for upgrade. If the status is **Examine finished**, click **Next**.

   If the examine phase fails, Oracle recommends that you cancel the upgrade by clicking **No** in the Examination Failure dialog. Click **View Log** to see what caused the error and refer to Troubleshooting Your Upgrade in *Upgrading with the Upgrade Assistant* for information on resolving common upgrade errors.

   **Note:**
   - If you resolve any issues detected during the examine phase without proceeding with the upgrade, you can start the Upgrade Assistant again without restoring from backup. However, if you proceed by clicking **Yes** in the Examination Failure dialog box, you need to restore your pre-upgrade environment from backup before starting the Upgrade Assistant again.
   - Canceling the examination process has no effect on the schemas or configuration data; the only consequence is that the information the Upgrade Assistant has collected must be collected again in a future upgrade session.

7. On the Upgrade Summary screen, review the summary of the schemas that will be upgraded and/or created.

   Verify that the correct Source and Target Versions are listed for each schema you intend to upgrade.

   If you want to save these options to a response file to run the Upgrade Assistant again later in response (or silent) mode, click **Save Response File** and provide the location and name of the response file. A silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again.

   Click **Next**.

8. On the Upgrade Progress screen, monitor the status of the upgrade.

   **Caution:**
   Allow the Upgrade Assistant enough time to perform the upgrade. Do not cancel the upgrade operation unless absolutely necessary. Doing so may result in an unstable environment.

   If any schemas are not upgraded successfully, refer to the Upgrade Assistant log files for more information.
Click Next.

9. If the upgrade is successful: On the Upgrade Success screen, click Close to complete the upgrade and close the wizard.

If the upgrade fails: On the Upgrade Failure screen, click View Log to view and troubleshoot the errors. The logs are available at ORACLE_HOME/oracle_common/upgrade/logs.

Note:

If the upgrade fails, you must restore your pre-upgrade environment from backup, fix the issues, then restart the Upgrade Assistant.

Verifying the Schema Upgrade

After completing all the upgrade steps, verify that the upgrade was successful by checking that the schema version in schema_version_registry has been properly updated.

If you are using an Oracle database, connect to the database as a user having Oracle DBA privileges, and run the following from SQL*Plus to get the current version numbers:

```sql
SET LINE 120
COLUMN MRC_NAME FORMAT A14
COLUMN COMP_ID FORMAT A20
COLUMN VERSION FORMAT A12
COLUMN STATUS FORMAT A9
COLUMN UPGRADED FORMAT A8
SELECT MRC_NAME, COMP_ID, OWNER, VERSION, STATUS, UPGRADED FROM
SCHEMA_VERSION_REGISTRY ORDER BY MRC_NAME, COMP_ID ;
```

In the query result:

- Check that the number in the VERSION column matches the latest version number for that schema. For example, verify that the schema version number is 12.2.1.4.0.

Note:

However, that not all schema versions will be updated. Some schemas do not require an upgrade to this release and will retain their pre-upgrade version number.

- The STATUS field will be either UPGRADING or UPGRADED during the schema patching operation, and will become VALID when the operation is completed.
• If the status appears as INVALID, the schema update failed. You should examine the logs files to determine the reason for the failure.

• Synonym objects owned by IAU_APPEND and IAU_VIEWER will appear as INVALID, but that does not indicate a failure.

They become invalid because the target object changes after the creation of the synonym. The synonyms objects will become valid when they are accessed. You can safely ignore these INVALID objects.

Starting Servers and Processes

After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

The components may be dependent on each other so they must be started in the correct order.

Note:

The procedures in this section describe how to start servers and process using the WLST command line or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in Administering Oracle Fusion Middleware.

To start your Fusion Middleware environment, follow the steps below.

Step 1: Start the Administration Server

When you start the Administration Server, you also start the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To start the Administration Server, use the startWebLogic script:

• (UNIX) $DOMAIN_HOME/bin/startWebLogic.sh
• (Windows) $DOMAIN_HOME\bin\startWebLogic.cmd

When prompted, enter your user name, password, and the URL of the Administration Server.

Step 2: Start Node Manager

To start Node Manager, use the startNodeManager script:

• (UNIX) $DOMAIN_HOME/bin/startNodeManager.sh
• (Windows) $DOMAIN_HOME\bin\startNodeManager.cmd

Step 3: Start Oracle Internet Directory Components

To start the Oracle Internet Directory components, use the startComponent script:

• (UNIX) $DOMAIN_HOME/bin/startComponent.sh component_name
• (Windows) $DOMAIN_HOME\bin\startComponent.cmd component_name
Upgrading Oracle Directory Integration Platform to 12c (12.2.1.4.0)

You can upgrade Oracle Directory Integration Platform from Oracle Fusion Middleware Release 12c (12.2.1.3.0) to 12c (12.2.1.4.0).

Complete the steps in the following topics to perform the upgrade:

• **About the Oracle Directory Integration Platform Upgrade Process**
  Review the flowchart and roadmap for an overview of the upgrade process for Oracle Directory Integration Platform.

• **Stopping Servers and Processes**
  Before you proceed, you must shut down all of the pre-upgrade processes and servers, including the Administration Server and any managed servers.

• **Uninstalling the Software**
  Follow the instructions in this section to start the Uninstall Wizard and remove the software.

• **Installing Oracle Internet Directory**
  Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle Internet Directory (OID) 12c (12.2.1.4.0) distributions on the target system and install them using Oracle Universal Installer.

• **Starting Servers and Processes**
  After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

About the Oracle Directory Integration Platform Upgrade Process

Review the flowchart and roadmap for an overview of the upgrade process for Oracle Directory Integration Platform.

⚠️ **Caution:**

Before upgrading to 12.2.1.4.0 release, ensure that the 12.2.1.3.0 `EXISTING_DOMAIN_HOME` is outside the `MIDDLEWARE_HOME`.

The steps you take to upgrade your existing domain will vary depending on how your domain is configured and which components are being upgraded. Follow only those steps that are applicable to your deployment.
Table 4-1  Tasks for Upgrading Oracle Directory Integration Platform

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
</table>
| Required | If you have not done so already, review the introductory topics in this guide and complete the required pre-upgrade tasks. See:  
  • About the Oracle Directory Integration Platform Upgrade Process  
  • Pre-Upgrade Requirements |
| Required | Shut down the 12c (12.2.1.3.0) environment (stop all Administration and Managed Servers). WARNING: Failure to shut down your servers during an upgrade may lead to data corruption. See Stopping Servers and Processes . |
| Required | Uninstall Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.3.0) in the existing Oracle home. See Uninstalling the Software. |
| Required | Install Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.4.0) in the new Oracle home. See Installing Oracle Internet Directory. |
| Required | Start the servers. When the upgrade process is complete, restart the 12c (12.2.1.4.0) instance. See Starting Servers and Processes. |

Stopping Servers and Processes

Before you proceed, you must shut down all of the pre-upgrade processes and servers, including the Administration Server and any managed servers.

An Oracle Fusion Middleware environment can consist of an Oracle WebLogic Server domain, an Administration Server, multiple managed servers, Java components, system components such as Identity Management components, and a database used as a repository for metadata. The components may be dependent on each other, so they must be stopped in the correct order.

Note:

The procedures in this section describe how to stop the existing, pre-upgrade servers and processes using the WLST command-line utility or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager.

To stop your pre-upgrade Fusion Middleware environment, navigate to the pre-upgrade domain and follow the steps below:

**Step 1: Stop System Components**

To stop system components, such as Oracle HTTP Server, use the `stopComponent` script:
• (UNIX) \EXISTING\DOMAIN\HOME/bin/stopComponent.sh component_name
• (Windows) \EXISTING\DOMAIN\HOME\bin\stopComponent.cmd component_name

You can stop system components in any order.

Step 2: Stop the Managed Servers

To stop a WebLogic Server Managed Server, use the stopManagedWebLogic script:

• (UNIX) \EXISTING\DOMAIN\HOME/bin/stopManagedWebLogic.sh
  managed_server_name admin_url
• (Windows) \EXISTING\DOMAIN\HOME\bin\stopManagedWebLogic.cmd
  managed_server_name admin_url

When prompted, enter your user name and password.

Step 3: Stop Oracle Identity Management Components

Stop any Oracle Identity Management components, such as Oracle Internet Directory:

• (UNIX) \EXISTING\DOMAIN\HOME/bin/stopComponent.sh component_name
• (Windows) \EXISTING\DOMAIN\HOME\bin\stopComponent.cmd component_name

Step 4: Stop the Administration Server

When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To stop the Administration Server, use the stopWebLogic script:

• (UNIX) \EXISTING\DOMAIN\HOME/bin/stopWebLogic.sh
• (Windows) \EXISTING\DOMAIN\HOME\bin\stopWebLogic.cmd

When prompted, enter your user name, password, and the URL of the Administration Server.

Step 5: Stop Node Manager

To stop Node Manager, close the command shell in which it is running.

Alternatively, after setting the nodemanager.properties attribute QuitEnabled to true (the default is false), you can use WLST to connect to Node Manager and shut it down. See stopNodeManager in WLST Command Reference for WebLogic Server 12.1.3.

Uninstalling the Software

Follow the instructions in this section to start the Uninstall Wizard and remove the software.

If you want to uninstall the product in a silent (command-line) mode, see Running the Oracle Universal Installer for Silent Uninstallation in Installing Software with the Oracle Universal Installer.

• Starting the Uninstall Wizard
• Selecting the Product to Uninstall
Navigating the Uninstall Wizard Screens

Starting the Uninstall Wizard

Start the Uninstall Wizard:

1. Change to the following directory:
   - (UNIX) `ORACLE_HOME/oui/bin`
   - (Windows) `ORACLE_HOME\oui\bin`

2. Enter the following command:
   - (UNIX) `./deinstall.sh`
   - (Windows) `deinstall.cmd`

Selecting the Product to Uninstall

Because multiple products exist in the Oracle home, ensure that you are uninstalling the correct product.

After you run the Uninstall Wizard, the Distribution to Uninstall screen opens. From the dropdown menu, select the Oracle Internet Directory 12.2.1.3.0 product and click **Uninstall**. The uninstallation program shows the screens listed in Navigating the Uninstall Wizard Screens.

Run the Uninstall Wizard again to uninstall the Oracle Fusion Middleware Infrastructure. For instructions see, Uninstalling Oracle Fusion Middleware Infrastructure in *Installing and Configuring the Oracle Fusion Middleware Infrastructure*.

Navigating the Uninstall Wizard Screens

The Uninstall Wizard shows a series of screens to confirm the removal of the software.

If you need help on screen listed in Table 4-2, click **Help** on the screen.

### Table 4-2  Uninstall Wizard Screens and Descriptions

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>Introduces you to the product Uninstall Wizard.</td>
</tr>
</tbody>
</table>
| Uninstall Summary | Shows the Oracle home directory and its contents that are uninstalled. Verify that this is the correct directory.  
  If you want to save these options to a response file, click **Save Response File** and enter the response file location and name. You can use the response file later to uninstall the product in silent (command-line) mode. See Running the Oracle Universal Installer for Silent Uninstall in *Installing Software with the Oracle Universal Installer*.  
  Click **Deinstall**, to begin removing the software. |
| Uninstall Progress | Shows the uninstallation progress. |
| Uninstall Complete | Appears when the uninstallation is complete. Review the information on this screen, then click **Finish** to close the Uninstall Wizard. |
Installing Oracle Internet Directory

Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle Internet Directory (OID) 12c (12.2.1.4.0) distributions on the target system and install them using Oracle Universal Installer.

To install the 12c (12.2.1.4.0) distributions:

1. Sign in to the target system.
2. Download the following from Oracle Technology Network or Oracle Software Delivery Cloud to your target system:
   - Oracle Fusion Middleware Infrastructure
     (fmw_12.2.1.4.0_infrastructure.jar)
   - Oracle Internet Directory (UNIX: fmw_12.2.1.4.0_oid_<platform>.bin),
     (Windows: fmw_12.2.1.4.0_oid_win64.exe)
3. Change to the directory where you downloaded the 12c (12.2.1.4.0) product distribution.
4. Start the installation program for Oracle Fusion Middleware Infrastructure:
   - (UNIX) JDK_HOME/bin/java -jar fmw_12.2.1.4.0_infrastructure.jar
   - (Windows) JDK_HOME\bin\java -jar fmw_12.2.1.4.0_infrastructure.jar
5. On UNIX operating systems, the Installation Inventory Setup screen is displayed.
   If prompted, specify the location where you want to create your central inventory.
   Make sure that the operating system group name selected on this screen has write permissions to the central inventory location, and click Next.

The Installation Inventory Setup screen does not appear on Windows operating systems.
6. On the Welcome screen, review the information to make sure that you have met all the prerequisites. Click Next.

7. On the Auto Updates screen, select an option:
   - **Skip Auto Updates**: If you do not want your system to check for software updates at this time.
   - **Select patches from directory**: To navigate to a local directory if you downloaded patch files.
   - **Search My Oracle Support for Updates**: To automatically download software updates if you have a My Oracle Support account. You must enter Oracle Support credentials then click Search. To configure a proxy server for the installer to access My Oracle Support, click Proxy Settings. Click Test Connection to test the connection.

   Click Next.

8. On the Installation Location screen, specify the location for the Oracle home directory and click Next.

   For more information about Oracle Fusion Middleware directory structure, see Understanding Directories for Installation and Configuration in *Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware*.

9. On the Installation Type screen, select the following:
   - For Infrastructure, select **Fusion Middleware Infrastructure**.

   Click Next.

   **Note:**
   
   The topology in this document does not include server examples. Oracle strongly recommends that you do not install examples into a production environment.

10. The Prerequisite Checks screen analyzes the host computer to ensure that the specific operating system prerequisites have been met.

    To view the list of tasks that are verified, select View Successful Tasks. To view log details, select View Log. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click Rerun to try again. To ignore the error or the warning message and continue with the installation, click Skip (not recommended).

11. On the Installation Summary screen, verify the installation options that you selected.

    If you want to save these options to a response file, click Save Response File and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time.

    Click Install to begin the installation.

12. On the Installation Progress screen, when the progress bar displays 100%, click Finish to dismiss the installer, or click Next to see a summary.
13. The Installation Complete screen displays the Installation Location and the Feature Sets that are installed. Review this information and click **Finish** to close the installer.

14. After you have installed Oracle Fusion Middleware Infrastructure, enter the following command to start the installer for Oracle Internet Directory and repeat the steps above to navigate through the installer screens:

   (UNIX)  
   ./fmw_12.2.1.4.0_oid_<platform>.bin
   
   (Windows)  
   fmw_12.2.1.4.0_oid_win64.exe

---

**Note:**

- For more information about installing Oracle Internet Directory, see Installing the Oracle Internet Directory Software in the *Installing Oracle Internet Directory*.
- For more information about installing Oracle Fusion Middleware Infrastructure, see Installing the Infrastructure Software in the *Installing and Configuring the Oracle Fusion Middleware Infrastructure*.

---

### Starting Servers and Processes

After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

The components may be dependent on each other so they must be started in the correct order.

---

**Note:**

The procedures in this section describe how to start servers and process using the WLST command line or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in *Administering Oracle Fusion Middleware*.

---

To start your Fusion Middleware environment, follow the steps below:

**Step 1: Start the Administration Server**

When you start the Administration Server, you also start the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To start the Administration Server, use the `startWebLogic` script:

- (UNIX)  
  `NEW_DOMAIN_HOME/bin/startWebLogic.sh`
- (Windows)  
  `NEW_DOMAIN_HOME\bin\startWebLogic.cmd`
When prompted, enter your user name, password, and the URL of the Administration Server.

**Step 2: Start Node Manager**

To start Node Manager, use the `startNodeManager` script:

- (UNIX) `NEW_DOMAIN_HOME/bin/startNodeManager.sh`
- (Windows) `NEW_DOMAIN_HOME\bin\startNodeManager.cmd`

**Step 3: Start Oracle Identity Management Components**

Start any Oracle Identity Management components, such as Oracle Internet Directory, that form part of your environment:

- (UNIX) `NEW_DOMAIN_HOME/bin/startComponent.sh component_name`
- (Windows) `NEW_DOMAIN_HOME\bin\startComponent.cmd component_name`

**Step 4: Start the Managed Servers**

```
Note:
Do not start the ODIP managed server (for example, wls_ods1) at this stage. As additional configuration is required as described in Updating ODIP Domain Configuration Details.
```

To start a WebLogic Server Managed Server, use the `startManagedWebLogic` script:

- (UNIX) `NEW_DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `NEW_DOMAIN_HOME\bin\startManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

```
Note:
The startup of a Managed Server will typically start the applications that are deployed to it. Therefore, it should not be necessary to manually start applications after the Managed Server startup.
```

**Step 5: Start System Components**

To start system components, such as Oracle HTTP Server, use the `startComponent` script:

- (UNIX) `NEW_DOMAIN_HOME/bin/startComponent.sh component_name`
- (Windows) `NEW_DOMAIN_HOME\bin\startComponent.cmd component_name`

You can start system components in any order.
Part II

Upgrading Oracle Internet Directory Highly Available Environments

You can upgrade Oracle Internet Directory highly available 12c (12.2.1.3.0) environments to 12c (12.2.1.4.0) using the procedure described in this part.

Topics

• **Upgrading Oracle Internet Directory Highly Available Environments**
  Describes the process of upgrading an Oracle Internet Directory highly available environment from 12c (12.2.1.3.0) to Oracle Internet Directory 12c (12.2.1.4.0).
Upgrading Oracle Internet Directory Highly Available Environments

Describes the process of upgrading an Oracle Internet Directory highly available environment from 12c (12.2.1.3.0) to Oracle Internet Directory 12c (12.2.1.4.0).

Topics

• **About the Oracle Internet Directory Multinode Upgrade Process**
  Follow the steps in the task roadmap for upgrading Oracle Internet Directory highly available environments to 12c (12.2.1.4.0).

• **Packing the domain on OIDHOST1**
  Pack the upgraded domain configurations on OIDHOST1. You would later unpack these domain configurations on OIDHOST2.

• **Replicating the Domain Configurations on OIDHOST2**
  Replicate the domain configurations on OIDHOST2. This unpacking the domain configurations on OIDHOST2, which was packed in OIDHOST1.

### About the Oracle Internet Directory Multinode Upgrade Process

Follow the steps in the task roadmap for upgrading Oracle Internet Directory highly available environments to 12c (12.2.1.4.0).

The steps you take to upgrade your existing domain will vary depending on how your domain is configured and which components are being upgraded. Follow only those steps that are applicable to your deployment.

<table>

## Table 5-1  (Cont.) Tasks for Upgrading Oracle Internet Directory Highly Available Environments

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required on OIDHOST1</strong></td>
<td>Stop all servers and processes on OIDHOST1.</td>
</tr>
<tr>
<td></td>
<td><strong>WARNING:</strong> Failure to shut down your servers during an upgrade may lead to data corruption. See <strong>Stopping Servers and Processes</strong>.</td>
</tr>
<tr>
<td><strong>Required on OIDHOST1</strong></td>
<td>Uninstall Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.3.0) in the existing Oracle home. See <strong>Uninstalling the Software</strong>.</td>
</tr>
<tr>
<td><strong>Required on OIDHOST1</strong></td>
<td>Install the product distributions on OIDHOST1. You must install Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.4.0) in the existing Oracle home, for both standalone and collocated deployments. See <strong>Installing Oracle Internet Directory</strong>.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td>Run a pre-upgrade readiness check See <strong>Running a Pre-Upgrade Readiness Check</strong>.</td>
</tr>
<tr>
<td><strong>Required on OIDHOST1</strong></td>
<td>Run the Upgrade Assistant (UA) on OIDHOST1 to upgrade the necessary schemas to 12c (12.2.1.4.0). See <strong>Upgrading Product Schemas</strong>.</td>
</tr>
<tr>
<td><strong>Required on OIDHOST1</strong></td>
<td>Pack the domain See <strong>Packing the domain on OIDHOST1</strong>.</td>
</tr>
</tbody>
</table>
| **Required on OIDHOST1** | Start the servers in the following order:  
1. Start the Administration Server and the Managed Servers on OIDHOST1.  
2. Start the Node Managers on OIDHOST1.  
3. Start the Oracle Internet Directory system component on OIDHOST1. See **Starting the Servers**. |
| **Required on OIDHOST2** | Stop all managed servers on OIDHOST2. See **Stopping Servers and Processes**. |
Table 5-1  (Cont.) Tasks for Upgrading Oracle Internet Directory Highly Available Environments

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required on OIDHOST2</strong></td>
<td>Uninstall Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.3.0) in the existing Oracle home. See Uninstalling the Software.</td>
</tr>
<tr>
<td><strong>Required on OIDHOST2</strong></td>
<td>Install the product distributions on OIDHOST2. You must install Oracle Fusion Middleware Infrastructure and Oracle Internet Directory 12c (12.2.1.4.0) in the existing Oracle home, for both standalone and collocated deployments. See Installing Oracle Internet Directory.</td>
</tr>
<tr>
<td><strong>Required on OIDHOST2</strong></td>
<td>Replicate the domain configurations on OIDHOST2 using unpack commands. This includes unpacking the domain on OIDHOST2. See Replicating the Domain Configurations on OIDHOST2.</td>
</tr>
<tr>
<td><strong>Required on OIDHOST2</strong></td>
<td>Start the Oracle Internet Directory system component on OIDHOST2 from OIDHOST1. See Starting the Servers.</td>
</tr>
</tbody>
</table>

**Note:**
Ensure that you start the OID server on OIDHOST2 from OIDHOST1.

From `DOMAIN_HOME/bin` directory on OIDHOST1, start oid2 instance by executing `startComponent.sh` script:

```
./startComponent.sh oid2
```

Execute the script from OIDHOST1 machine, where AdminServer is setup and not from OIDHOST2.

---

**Packing the domain on OIDHOST1**

Pack the upgraded domain configurations on OIDHOST1. You would later unpack these domain configurations on OIDHOST2.

Complete the following steps:

1. On OIDHOST1, run the following command from the location `$MW_HOME/oracle_common/common/bin` to pack the upgraded domain:

   - **On UNIX:**
     ```
     sh pack.sh -domain=<Location_of_OID_domain> -template=<Location_where_domain_configuration_jar_to_be_created> -template_name="OID Domain" -managed=true
     ```
   - **On Windows:**
2. Copy the domain configuration jar file created by the pack command on OIDHOST1 to any accessible location on OIDHOST2.

Replicating the Domain Configurations on OIDHOST2

Replicate the domain configurations on OIDHOST2. This unpacking the domain configurations on OIDHOST2, which was packed in OIDHOST1.

Complete the following steps:

1. In Packing the domain on OIDHOST1 section you copied the domain configuration jar file created by the pack command on OIDHOST1 to any accessible location on OIDHOST2.

   Go to this location on OIDHOST2.

2. On OIDHOST2, run the following command from the location $MW_HOME/oracle_common/common/bin to unpack the domain:

   - **On UNIX:**
     ```
     sh unpack.sh -domain=<Location_of_OID_domain> -
     template=<Location_where_domain_configuration_jar_to_be_created> -
     overwrite_domain=true
     ```

   - **On Windows:**
     ```
     unpack.cmd -domain=<Location_of_OID_domain> -
     template=<Location_where_domain_configuration_jar_to_be_created> -
     overwrite_domain=true
     ```
Updating the JDK After Installing and Configuring an Oracle Fusion Middleware Product

Consider that you have a JDK version jdk1.8.0_191 installed on your machine. When you install and configure an Oracle Fusion Middleware product, the utilities, such as Configuration Wizard (config.sh|exe), OPatch, or RCU point to a default JDK, for example, jdk1.8.0_191. After some time, Oracle releases a new version of the JDK, say jdk1.8.0_211 that carries security enhancements and bug fixes. From 12c (12.2.1.4.0) onwards, you can upgrade the existing JDK to a newer version, and can have the complete product stack point to the newer version of the JDK.

You can maintain multiple versions of JDK and switch to the required version on need basis.

- **About Updating the JDK Location After Installing an Oracle Fusion Middleware Product**
  
  The binaries and other metadata and utility scripts in the Oracle home and Domain home, such as RCU or Configuration Wizard, use a JDK version that was used while installing the software and continue to refer to the same version of the JDK. The JDK path is stored in a variable called JAVA_HOME which is centrally located in .globalEnv.properties file inside the ORACLE_HOME/oui directory.

## About Updating the JDK Location After Installing an Oracle Fusion Middleware Product

The binaries and other metadata and utility scripts in the Oracle home and Domain home, such as RCU or Configuration Wizard, use a JDK version that was used while installing the software and continue to refer to the same version of the JDK. The JDK path is stored in a variable called JAVA_HOME which is centrally located in .globalEnv.properties file inside the ORACLE_HOME/oui directory.

The utility scripts such as config.sh|cmd, launch.sh, or opatch reside in the ORACLE_HOME, and when you invoke them, they refer to the JAVA_HOME variable located in .globalEnv.properties file. To point these scripts and utilities to the newer version of JDK, you must update the value of the JAVA_HOME variable in the .globalEnv.properties file by following the directions listed in **Updating the JDK Location in an Existing Oracle Home**.

To make the scripts and files in your Domain home directory point to the newer version of the JDK, you can follow one of the following approaches:

- Specify the path to the newer JDK on the Domain Mode and JDK screen while running the Configuration Wizard.

  For example, consider that you installed Oracle Fusion Middleware Infrastructure with the JDK version 8u191. So while configuring the WebLogic domain with the Configuration Assistant, you can select the path to the newer JDK on the Domain
Mode and JDK screen of the Configuration Wizard. Example: `/scratch/jdk/jdk1.8.0_211`.

- Manually locate the files that have references to the JDK using `grep` (UNIX) or `findstr` (Windows) commands and update each reference. See Updating the JDK Location in an Existing Oracle Home.

**Note:**

If you install the newer version of the JDK in the same location as the existing JDK by overwriting the files, then you don’t need to take any action.

- **Updating the JDK Location in an Existing Oracle Home**
  
The `getProperty.sh|cmd` script displays the value of a variable, such as `JAVA_HOME`, from the `.globalEnv.properties` file. The `setProperty.sh|cmd` script is used to set the value of variables, such as `OLD_JAVA_HOME` or `JAVA_HOME` that contain the locations of old and new JDKs in the `.globalEnv.properties` file.

The `getProperty.sh|cmd and setProperty.sh|cmd` scripts are located in the following location:

(UNIX) `ORACLE_HOME/oui/bin`
(Windows) `ORACLE_HOME\oui\bin`

Where, `ORACLE_HOME` is the directory that contains the products using the current version of the JDK, such as `1.8.0_191`.

To update the JDK location in the `.globalEnv.properties` file:

1. Use the `getProperty.sh|cmd` script to display the path of the current JDK from the `JAVA_HOME` variable. For example:

   (UNIX) `ORACLE_HOME/oui/bin/getProperty.sh JAVA_HOME`
   (Windows) `ORACLE_HOME\oui\bin\getProperty.cmd JAVA_HOME`
   `echo JAVA_HOME`

   Where `JAVA_HOME` is the variable in the `.globalEnv.properties` file that contains the location of the JDK.

2. Back up the path of the current JDK to another variable such as `OLD_JAVA_HOME` in the `.globalEnv.properties` file by entering the following commands:

   (UNIX) `ORACLE_HOME/oui/bin/setProperty.sh -name OLD_JAVA_HOME
   -value specify_the_path_of_current_JDK`
   (Windows) `ORACLE_HOME\oui\bin\setProperty.cmd -name
   OLD_JAVA_HOME -value specify_the_path_of_current_JDK`

   This command creates a new variable called `OLD_JAVA_HOME` in the `.globalEnv.properties` file, with a value that you have specified.
3. Set the new location of the JDK in the JAVA_HOME variable of the .globalEnv.properties file, by entering the following commands:

(UNIX) `ORACLE_HOME/oui/bin/setProperty.sh -name JAVA_HOME -value specify_the_location_of_new_JDK`

(Windows) `ORACLE_HOME\oui\bin\setProperty.cmd -name JAVA_HOME -value specify_the_location_of_new_JDK`

After you run this command, the JAVA_HOME variable in the .globalEnv.properties file now contains the path to the new JDK, such as jdk1.8.0_211.
