Preface

This document describes how to use the Oracle Data Integrator installation program to install the Oracle Data Integrator software and configure a WebLogic domain.

If you are an existing Oracle Data Integrator user, your path to obtain the most recent version of the software will depend on the version of your existing software. For more information, refer to the Oracle Fusion Middleware Download, Installation, and Configuration Readme Files for the steps you need to take to update or upgrade your existing software.

Audience

This guide is intended for administrators who are responsible for installing and configuring components of Oracle Data Integrator. It is assumed that readers are comfortable running some system administration operations, such as creating users and groups, adding users to groups, and installing operating system patches on the computer where your products will be installed. Users in UNIX systems who are installing need root access to run some scripts.

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

Refer to the Oracle Fusion Middleware Library for additional information.

About the Oracle Data Integrator Installation

The standard installation for Oracle Data Integrator described in this guide creates the standard topology, which represents a sample starting topology for this product. This guide explains how to install Oracle Data Integrator (ODI) on your local system using your on-premises hardware. An alternative is to subscribe to the Oracle Cloud Java as a Service (JCS) and then install and configure ODI on JCS. See Provisioning ODI.

Note:
The product Oracle Identity Manager is referred to as Oracle Identity Manager (OIM) and Oracle Identity Governance (OIG) interchangeably in the guide.

Using the Standard Installation Topology as a Starting Point

The standard installation topology is a flexible topology that you can use as a starting point in production environments.

The information in this guide helps you to create a standard installation topology for Oracle Data Integrator. If required, you can later extend the standard installation topology to create a secure and highly available production environment, see Next Steps After Configuring the Domain.

The standard installation topology represents a sample topology for this product. It is not the only topology that this product supports. See About the Standard Installation Topology in Planning an Installation of Oracle Fusion Middleware.

About the Oracle Data Integrator Standalone Agent Standard Installation Topology

This topology represents a standalone agent configured in a standalone domain, managed by the WebLogic Management Framework. The domain is configured on a single host and requires a supported database where the required Fusion Middleware schemas are installed.

For configuration instructions, see Configuring the Domain for a Standalone Agent.

Table 1-1 describes all elements in this standard installation topology illustration.

About the Oracle Data Integrator Java EE Agent Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and a Managed Server on which the Infrastructure and Java EE agent are deployed.

The Managed Server is targeted to a machine inside a cluster. The domain is configured on a single host and requires a supported database where the required Fusion Middleware schemas are installed. The Java EE agent is installed into an existing Oracle home containing Oracle Fusion Middleware Infrastructure. ODI Console, ODI Studio, and the plugin for Fusion Middleware Control are also installed in the topology.

Note:

The infrastructure can use more than one machine for scalability and high-availability considerations. See Preparing Your Environment for High Availability for more information.

Figure 1-2 shows the standard installation topology for an Oracle Data Integrator Java EE agent.
Figure 1-2  Standard Installation Topology for an ODI Java EE Agent

For configuration instructions, see Configuring the Domain for a Java EE Agent. Table 1-3 describes all elements in this standard installation topology illustration.

• Metadata repository (MDS). This contains metadata for Oracle Fusion Middleware components, such as the Oracle Application Developer Framework. See What Is the Metadata Repository? in Understanding Oracle Fusion Middleware.  
• Oracle Application Developer Framework (Oracle ADF)  
• Oracle Web Services Manager (OWSM) |
| Java EE Agent    | The Java EE run-time agent. |

About the Oracle Data Integrator Topology

The Oracle Data Integrator topology is the physical and logical representation of the Oracle Data Integrator architecture and components.

Before you can begin developing using Oracle Data Integrator, you must first set up an Oracle Data Integrator topology, which is the physical and logical representation of the Oracle Data Integrator architecture and components. The Oracle Data Integrator topology defines where to find the sources and targets of the data that you are integrating.

Note that this topology is not the same as the standard installation topology, which is the layout of files installed and configured on your computer by the Oracle Universal Installer and the configuration wizard.
About Oracle Data Integrator Runtime Agents

At design time, developers generate scenarios from the business rules that they have designed. The code of these scenarios is then retrieved from the repository by a runtime agent. This agent then connects to the data servers and orchestrates the code execution on these servers.

The types of run-time agents that can be configured in the ODI installation topology are:

- Standalone agent
- Standalone collocated agent
- Java EE agent

See Runtime Agent in *Understanding Oracle Data Integrator*.

About Oracle Data Integrator Studio

Oracle Data Integrator Studio is a developer's interface for configuring and managing ODI.

To learn how to use ODI Studio to configure and manage your ODI topology, see *Configuring Oracle Data Integrator Studio*.

Using This Document to Extend an Existing Domain

The procedures in this guide describe how to create a new domain. The assumption is that no other Oracle Fusion Middleware products are installed on your system.

If you have installed and configured other Oracle Fusion Middleware products on your system (for example, Fusion Middleware Infrastructure, with a domain that is up and running) and wish to extend the same domain to include Oracle Data Integrator, see *Installing Multiple Products in the Same Domain*. 
Preparing to Install and Configure Oracle Data Integrator

To prepare for your Oracle Data Integrator installation, verify that your system meets the basic requirements, then obtain the correct installation software.

Roadmap for Installing and Configuring a Standard Installation Topology

This roadmap provides all the steps required to install and configure a standard Oracle Data Integrator installation topology.

Table 2-1 shows the high-level steps required to install and configure the topology.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify your system environment</td>

<tr>
<td>Install and configure a database for mid-tier schemas.</td>
<td>To configure your WebLogic domain, you must have access to a certified database that is configured for the schemas required by Oracle Data Integrator.</td>
<td>See About Database Requirements for an Oracle Fusion Middleware Installation.</td>
</tr>
</tbody>
</table>

### Verifying Certification, System, and Interoperability Requirements

Oracle recommends that you use the certification matrix and system requirements documents with each other to verify that your environment meets the requirements for installation.

1. **Verifying that your environment meets certification requirements:**

   Make sure that you install your product on a supported hardware and software configuration. See the certification document for your release on the Oracle Fusion Middleware Supported System Configurations page.

   Oracle has tested and verified the performance of your product on all certified systems and environments. Whenever new certifications are released, they are
2. **Using the system requirements document to verify certification:**

   Oracle recommends that you use the *Oracle Fusion Middleware System Requirements and Specifications* document to verify that the certification requirements are met. For example, if the certification document indicates that your product is certified for installation on 64-Bit Oracle Linux 6.5, use this document to verify that your system meets the required minimum specifications. These include disk space, available memory, specific platform packages and patches, and other operating system-specific requirements. System requirements can change in the future. Therefore, the system requirement documents are kept outside of the documentation libraries and are available on Oracle Technology Network.

3. **Verifying interoperability among multiple products:**

   To learn how to install and run multiple Fusion Middleware products from the same release or mixed releases with each other, see Oracle Fusion Middleware 12c Interoperability and Compatibility in *Understanding Interoperability and Compatibility*.

---

**Selecting an Installation User**

The user who installs and configures your system must have the required permissions and privileges.

**About User Permissions**

The user who installs a Fusion Middleware product owns the files and has certain permissions on the files.

- Read and write permissions on all non-executable files (for example, `.jar`, `.properties`, or `.xml`). All other users in the same group as the file owner have read permissions only.
- Read, write, and execute permissions on all executable files (for example, `.exe`, `.sh`, or `.cmd`). All other users in the same group as the file owner have read and execute permissions only.

This means that someone other than the person who installs the software can use the installed binaries in the Oracle home directory to configure a domain or set of Fusion Middleware products.

During configuration, the files generated by the configuration process are owned by the user who ran the Configuration Wizard. This user has the same permissions as described above for the installation user. However, security-sensitive files are not created with group permissions. Only the user that created the domain has read and write permissions and can administer the domain.

Consider the following examples:

- **Example 1: A Single User Installs the Software and Configures the Domain**
  This example explains the file permissions where the same user installs the software and configures the domain.
To ensure proper permissions and privileges for all files, Oracle recommends that the same owner perform both tasks: install the Oracle Fusion Middleware product and configure the WebLogic Server domain by using the Configuration Wizard.

**Figure 2-1  Directory Structure when a Single User Installs the Software and Configures the Domain**

If the user who creates the domain is different than the user who installed the software, then both users must have the same privileges, as shown in the next example.

- **Example 2: The Oracle Home Directory and Domain are Created by Different Users**

  This example explains the file permissions where one user creates the Oracle home and another user configures the domain.
The Oracle home is created by User1 during product installation. User1 has read/write/execute permissions on all executable files, and read/write permissions on all other files. All other users in User1’s group have read/execute permissions on all executable files, and read permissions on all other files.

The Domain home and Application home are created by User2 during product installation. User2 has read/write/execute permissions on all executable files, and read/write permissions on all other files. All other users in User2’s group (including User1) have read/execute permissions on all executable files, and read permissions on all other files.

Note:

Certain domain files do not have group permissions. For example, cwallet.sso.

Consider the following points before you run the installer:

• On UNIX operating systems, Oracle recommends that you set umask to 027 on your system before you install the software. This ensures that the file permissions are set properly during installation. Use the following command:

  umask 027

You must enter this command in the same terminal window from which you plan to run the product installer.

• On UNIX operating systems, do not run the installation program as a root user. If you run the installer as a root user, the startup validation may fail and you cannot continue the installation.

• When you manage a product installation (for example, applying patches or starting managed Servers), use the same user ID that you used to install the product.

• On Windows operating systems, you must have administrative privileges to install the product. See Verifying the Installation User has Administrator Privileges on Windows Operating Systems.

About Non-Default User Permissions on UNIX Operating Systems

Changing the default permission setting reduces the security of the installation and your system. Oracle does not recommend that change the default permission settings.

If other users require access to a particular file or executable, use the UNIX sudo command or other similar commands to change the file permissions.
Refer to your UNIX operating system Administrator’s Guide or contact your operating system vendor, if you need further assistance.

Verifying that the Installation User has Administrator Privileges on Windows Operating Systems

To update the Windows Registry, you must have administrator privileges.

By default, users with the administrator privilege sign in to the system with regular privileges, but can request elevated permissions to perform administrative tasks.

To perform a task with elevated privileges:

1. Find the Command Prompt icon, either from the Start menu or the Windows icon in the lower-left corner.
2. Right-click **Command Prompt** and select **Run as administrator**.
   
   This opens a new command prompt window, and all actions performed in this window are done with administrator privileges.

   **Note:**

   If you have User Access Control enabled on your system, you may see an additional window asking you to confirm this action. Confirm and continue with this procedure.

   **Note:**

   For Oracle Internet Directory, ensure that you have enabled User Account Control (UAC). If you have not done so already, enable UAC by following the instructions in the *Enabling User Account Control (UAC)* section from the appropriate version of *Oracle Fusion Middleware System Requirements and Specifications* for your installation.

   **Note:**

   For Oracle Identity and Access Management components, ensure that you have enabled User Account Control (UAC). If you have not done so already, enable UAC by following the instructions in the *Enabling User Account Control (UAC)* section from the appropriate version of *Oracle Fusion Middleware System Requirements and Specifications* for your installation.

3. Perform the desired task.
   
   For example, to start the product installer:

   For a jar file, enter:

   ```bash
   java -jar distribution_name.jar
   ```

   For an executable (`.exe`, `.bin`, or `.sh` file), enter:
About the Directories for Installation and Configuration

During the installation and domain configuration process, you must plan on providing the locations for these directories: Oracle home, Domain home, and the Application home.

About the Recommended Directory Structure

Oracle recommends specific locations for the Oracle Home, Domain Home, and Application Home.

Oracle recommends a directory structure similar to the one shown in Figure 2-3.

Figure 2-3  Recommended Oracle Fusion Middleware Directory Structure

A base location (Oracle base) should be established on your system (for example, /home/oracle). From this base location, create two separate branches, namely, the product directory and the config directory. The product directory should contain the product binary files and all the Oracle home directories. The config directory should contain your domain and application data.

Oracle recommends that you do not keep your configuration data in the Oracle home directory; if you upgrade your product to another major release, are required to create a new Oracle home for binaries. You must also make sure that your configuration data exists in a location where the binaries in the Oracle home have access.

The /home/oracle/product (for the Oracle home) and /home/oracle/config (for the application and configuration data) directories are used in the examples throughout the documentation; be sure to replace these directories with the actual directories on your system.
About the Oracle Home Directory

When you install any Oracle Fusion Middleware product, you must use an Oracle home directory.

This directory is a repository for common files that are used by multiple Fusion Middleware products installed on the same machine. These files ensure that Fusion Middleware operates correctly on your system. They facilitate checking of cross-product dependencies during installation. For this reason, you can consider the Oracle home directory a central support directory for all Oracle Fusion Middleware products installed on your system.

Fusion Middleware documentation refers to the Oracle home directory as ORACLE_HOME.

Oracle Home Considerations

Keep the following in mind when you create the Oracle home directory and install Fusion Middleware products:

- Do not include spaces in the name of your Oracle home directory; the installer displays an error message if your Oracle home directory path contains spaces.
- You can install only one instance of each Oracle Fusion Middleware product in a single Oracle home directory. If you need to maintain separate versions of a product on the same machine, each version must be in its own Oracle home directory.

Although you can have several different products in a single Oracle home, only one version of each product can be in the Oracle home.

Multiple Home Directories

Although in most situations, a single Oracle home directory is sufficient, it is possible to create more than one Oracle home directory. For example, you need to maintain multiple Oracle home directories in the following situations:

- You prefer to maintain separate development and production environments, with a separate product stack for each. With two directories, you can update your development environment without modifying the production environment until you are ready to do so.
- You want to maintain two different versions of a Fusion Middleware product at the same time. For example, you want to install a new version of a product while keeping your existing version intact. In this case, you must install each product version in its own Oracle home directory.
- You need to install multiple products that are not compatible with each other. See Oracle Fusion Middleware 12c (12.2.1.3.0) Interoperability and Compatibility in Understanding Interoperability and Compatibility.

Note:

If you create more than one Oracle home directory, you must provide non-overlapping port ranges during the configuration phase for each product.
About the Domain Home Directory

The Domain home is the directory where domains that you configure are created.

The default Domain home location is ORACLE_HOME/user_projects/domains/domain_name. However, Oracle strongly recommends that you do not use this default location. Put your Domain home outside of the Oracle home directory, for example, in /home/oracle/config/domains. The config directory should contain domain and application data. Oracle recommends a separate domain directory so that new installs, patches, and other operations update the ORACLE_HOME only, not the domain configuration.

See About the Recommended Directory Structure for more on the recommended directory structure and locating your Domain home.

Fusion Middleware documentation refers to the Domain home directory as DOMAIN_HOME and includes all folders up to and including the domain name. For example, if you name your domain exampl domein and locate your domain data in the /home/oracle/config/domains directory, the documentation would use DOMAIN_HOME to refer to /home/oracle/config/domains/exampl domein.

About the Application Home Directory

The Application home is the directory where applications for domains you configure are created.

The default Application home location is ORACLE_HOME/user_projects/applications/domain_name. However, Oracle strongly recommends that you locate your Application home outside of the Oracle home directory; if you upgrade your product to another major release, you must create a new Oracle home for binaries.

See About the Recommended Directory Structure for more on the recommended directory structure and locating your Application home.

Fusion Middleware documentation refers to the Application home directory as APPLICATION_HOME and includes all folders up to and including the domain name. For example, if you name your domain exampl domein and you locate your application data in the /home/oracle/config/applications directory, the documentation uses APPLICATION_HOME to refer to /home/oracle/config/applications/exampl domein.

Installing Multiple Products in the Same Domain

There are two methods to install and configure multiple products in one domain. This is also known as extending a domain.

• Method 1.

Install and configure Product A, including creating the schemas and starting all servers in the domain to verify a successful domain configuration.

This is the method used in all installation guides in the Fusion Middleware library. You can repeat this process for as many products as necessary. It allows you to validate one product at a time and add more products incrementally.

To install Product B in the same domain as Product A:
1. Stop all servers to prevent any updates to the domain while you add the new product.
   See Starting and Stopping Oracle Fusion Middleware in *Administering Oracle Fusion Middleware*.

2. Follow the instructions in the installation guide for Product B, including creating the necessary schemas.

3. Run the Configuration Wizard to configure the domain.
   During configuration, the Configuration Wizard automatically detects the components that have been installed and offers you the option to extend the existing Product A domain to include Product B.

   • **Method 2.**

   Install all of the required products, then create the schemas for all of the products. After you create the schemas, configure the domain by using the necessary product templates, then start all the servers.

   This method of creating a multi-product domain may be slightly faster than Method 1; however, the installation guides in the Fusion Middleware library do not provide specific instructions for this method of domain creation.

   ✍️ **See Also:**

   • To update WebLogic domains, see Updating WebLogic Domains in *Creating WebLogic Domains Using the Configuration Wizard*.

   • For important information regarding the ability of Oracle Fusion Middleware products to function with previous versions of other Oracle Fusion Middleware, Oracle, or third-party products, see Oracle Fusion Middleware 12c (12.2.1.3.0) Interoperability and Compatibility in *Understanding Interoperability and Compatibility*.

---

### Preparing for Shared Storage

Oracle Fusion Middleware allows you to configure multiple WebLogic Server domains from a single Oracle home. This allows you to install the Oracle home in a single location on a shared volume and reuse the Oracle home for multiple host installations.

If you plan to use shared storage in your environment, see Using Shared Storage in *High Availability Guide* for more information.

For configuration requirements specific to Managed File Transfer, see High Availability Properties in *Using Oracle Managed File Transfer*.

### About JDK Requirements for an Oracle Fusion Middleware Installation

Most Fusion Middleware products are in `.jar` file format. These distributions do not include a JDK. To run a `.jar` distribution installer, you must have a certified JDK installed on your system.

Make sure that the JDK is installed *outside* of the Oracle home. If you install the JDK under the Oracle home, you may encounter problems when you try to perform tasks in...
Oracle Universal Installer validates that the Oracle home directory is empty; the install does not progress until you specify an empty directory. Oracle recommends that you locate your JDK installation in the /home/oracle/products/jdk directory.

Platform-specific distributions have a .bin (for UNIX operating systems) or .exe (for Windows operating systems) installer; in these cases, a platform-specific JDK is in the distribution and you do not need to install a JDK separately. However, you may need to upgrade this JDK to a more recent version, depending on the JDK versions that are certified.

Always verify the required JDK version by reviewing the certification information on the Oracle Fusion Middleware Supported System Configurations page. For 12c (12.2.1.3.0), the certified JDK is 1.8.0_131 and later.

To download the required JDK, navigate to the following URL and download the Java SE JDK:

About Database Requirements for an Oracle Fusion Middleware Installation

Many Oracle Fusion Middleware products require database schemas prior to configuration. If you do not already have a database where you can install these schemas, you must install and configure a certified database.

Note:

Multi-tenancy feature is supported in 12c, that is, Pluggable Database (PDB) and Container Database (CDB) are supported.

To find a certified database for your operating system, see the certification document for your release on the Oracle Fusion Middleware Supported System Configurations page on the Oracle Technology Network (OTN).

To make sure that your database is properly configured for schema creation, see Repository Creation Utility Requirements in the Oracle Fusion Middleware System Requirements and Specifications document.

After your database is properly configured, you use the Repository Creation Utility (RCU) to create product schemas in your database. This tool is available in the Oracle home for your Oracle Fusion Middleware product. See About the Repository Creation Utility in Creating Schemas with the Repository Creation Utility.

Note:

Based on your deployment topology and the work load, it is recommended that you refer to the following note on My Oracle Support, and take appropriate actions for your deployment.

Performance Tuning Guidelines and Diagnostics Collection for Oracle Identity Manager (OIM) (Doc ID 1539554.1)
About Product Distributions

You create the initial Oracle Data Integrator domain using the Oracle Fusion Middleware Infrastructure distribution, which contains both Oracle WebLogic Server software and Oracle Java Required Files (JRF) software.

Oracle JRF software consists of:

- Oracle Web Services Manager
- Oracle Application Development Framework (Oracle ADF)
- Oracle Enterprise Manager Fusion Middleware Control
- Repository Creation Utility (RCU)
- Other libraries and technologies required to support Oracle Fusion Middleware products

Installing Oracle Fusion Middleware Infrastructure is a prerequisite to installing Oracle Data Integrator.
Note:

- **Dependant Softwares for Oracle Access Management:**
  To configure Oracle Access Management, you must install Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0) prior to installing Oracle Identity and Access Management.

  For information about installing Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0), see Installing the Infrastructure Software in Installing and Configuring the Oracle Fusion Middleware Infrastructure.

- **Dependant Softwares for Oracle Identity Governance:**
  Oracle Identity Governance requires Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0) and Oracle SOA Suite 12c (12.2.1.3.0). A quick installer is available for Oracle Identity Governance 12c (12.2.1.3.0), which installs Infrastructure, Oracle SOA Suite, and Oracle Identity and Access Management 12c (12.2.1.3.0) in one go. In other words, no separate installers are required for installing all the three softwares. If you wish to use the simplified installation process for Oracle Identity Governance, see Installing and Configuring Oracle Identity Governance Using Simplified Installation Process.

  The other way is to install and configure Oracle Identity Governance in a traditional method, that is, installing Oracle Fusion Middleware Infrastructure and Oracle SOA Suite 12c (12.2.1.3.0) first, using their respective installers, and then installing Oracle Identity Governance.

  For information about installing Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0), see Installing the Infrastructure Software in Installing and Configuring the Oracle Fusion Middleware Infrastructure.

  For information about installing Oracle SOA Suite 12c (12.2.1.3.0), see Installing the Oracle SOA Suite and Oracle Business Process Management Software in Installing and Configuring Oracle SOA Suite and Business Process Management.

  For more information about the modes of installation supported for Oracle Identity and Access Management, see About the Modes of Installation.

---

**Obtaining the Product Distribution**

You can obtain the Oracle Fusion Middleware Infrastructure and Oracle Data Integrator distribution on the Oracle Technology Network (OTN).

To prepare to install Oracle Fusion Middleware Infrastructure and Oracle Data Integrator:

1. Enter `java -version` on the command line to verify that a certified JDK is installed on your system. For 12c (12.2.1.3.0), the certified JDK is 1.8.0_131 and later. See About JDK Requirements for an Oracle Fusion Middleware Installation.

2. Locate and download the Oracle Fusion Middleware Infrastructure and Oracle Data Integrator software. To configure Oracle Identity Governance in collocated mode, you must download Oracle SOA Suite 12.2.1.3.0.
See Obtaining Product Distributions in *Planning an Installation of Oracle Fusion Middleware*.
Installing the Oracle Data Integrator Software

Follow the steps in this section to install the Oracle Data Integrator software. Before beginning the installation, ensure that you have verified the prerequisites and completed all steps covered in Preparing to Install and Configure Oracle Data Integrator.

Note:
The product Oracle Identity Manager is referred to as Oracle Identity Manager (OIM) and Oracle Identity Governance (OIG) interchangeably in the guide.
Note:

The supported mode of installation for Oracle Access Management and Oracle Identity Governance 12c (12.2.1.3.0) is the collocated mode. The collocated mode requires some dependant softwares to be installed prior to installing Oracle Identity and Access Management.

- **Dependant Software for Oracle Access Management:**
  - Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0)
  
  In case of Oracle Access Management, install Infrastructure first, and then proceed with the Oracle Identity and Access Management installation.

- **Dependant Softwares for Oracle Identity Governance:**
  - Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0)
  
  For Oracle Identity Governance, a quick installer is available, which installs Infrastructure, Oracle SOA Suite, and Oracle Identity and Access Management 12c (12.2.1.3.0) in one go. You do not have to install these softwares using separate installers. If you wish to use a simplified installation process for Oracle Identity Governance, that is, installing Oracle Identity Governance using a quick installer, see Installing and Configuring Oracle Identity Governance Using Simplified Installation Process.

  If you choose to install Oracle Identity Governance using the generic Oracle Identity and Access Management installer, then you must manually install Infrastructure and Oracle SOA Suite using their respective installers.

  For information about installing Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0), see Installing the Infrastructure Software in Installing and Configuring the Oracle Fusion Middleware Infrastructure.

  For information about installing Oracle SOA Suite 12c (12.2.1.3.0), see Installing the Oracle SOA Suite and Oracle Business Process Management Software in Installing and Configuring Oracle SOA Suite and Business Process Management.

The standalone mode of installation is supported only for the Oracle Identity Governance Design Console. In other words, if you wish to configure only the Design Console, you can install Oracle Identity and Access Management in a standalone mode, and then configure the Design Console.

For more information about the modes of installation supported for Oracle Identity and Access Management, see About the Modes of Installation.
### Note:

If you wish to install Oracle Internet Directory in **Standalone** mode, you do not require Oracle Fusion Middleware Infrastructure. You can proceed with the Oracle Internet Directory installation.

If you wish to install Oracle Internet Directory in **Collocated** mode, ensure that you install Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0) first, followed by the Oracle Internet Directory 12c (12.2.1.3.0). Infrastructure and Oracle Internet Directory must be installed in the same Oracle Home.

For more information about installing Oracle Fusion Middleware Infrastructure 12c (12.2.1.3.0), see Installing the Infrastructure Software in the *Installing and Configuring the Oracle Fusion Middleware Infrastructure*

---

### Starting the Installation Program

Before running the installation program, you must verify the JDK and prerequisite software is installed.

To start the installation program:

1. Sign in to the host system.
2. Change to the directory where you downloaded the installation program.
3. Unzip the installer `fmw_12.2.1.3.0_odi_Disk1_1of2.zip` and `fmw_12.2.1.3.0_odi_Disk1_2of2.zip` files.
4. Start the installation program by running the `java` executable from the JDK directory. For example:

   - (UNIX) `/home/Oracle/Java/jdk1.8.0_131/bin/java -jar fmw_12.2.1.3.0_odi_generic.jar`
   - (Windows) `C:\home\Oracle\Java\jdk1.8.0_131\bin\java -jar fmw_12.2.1.3.0_odi_generic.jar`

### Note:

You can also start the installer in silent mode using a saved response file instead of launching the installer screens. For more about silent or command line installation, see Using the Oracle Universal Installer in Silent Mode in *Installing Software with the Oracle Universal Installer*.

When the installation program appears, you are ready to begin the installation.
Navigating the Installation Screens

The installer shows a series of screens where you verify or enter information.

The following table lists the order in which installer screens appear. If you need additional help with an installation screen, click Help.

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installation Inventory Setup</td>
<td>On UNIX operating systems, this screen opens if this is the first time you are installing any Oracle product on this host. Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location. See About the Oracle Central Inventory in Installing Software with the Oracle Universal Installer. This screen does not appear on Windows operating systems.</td>
</tr>
<tr>
<td>Welcome</td>
<td>Review the information to make sure that you have met all the prerequisites, then click Next.</td>
</tr>
<tr>
<td>Auto Updates</td>
<td>Select to skip automatic updates, select patches, or search for the latest software updates, including important security updates, through your My Oracle Support account.</td>
</tr>
<tr>
<td>Installation Location</td>
<td>Specify your Oracle home directory location. This Oracle home must include Oracle Fusion Middleware Infrastructure, along with any other 12c (12.2.1.3.0) products that have been installed.</td>
</tr>
<tr>
<td></td>
<td>• The Java EE and standalone collocated agent must be installed into an existing Oracle Home directory containing Oracle Fusion Middleware Infrastructure.</td>
</tr>
<tr>
<td></td>
<td>• The standalone agent must be installed into a new, empty Oracle Home directory.</td>
</tr>
<tr>
<td></td>
<td>You can click View to verify and ensure that you are installing Oracle Data Integrator in the correct Oracle home.</td>
</tr>
<tr>
<td>Note:</td>
<td>If you are installing Oracle Identity and Access Management, ensure that the Oracle Home path does not contain space.</td>
</tr>
<tr>
<td>Installation Type</td>
<td>To create the topology for Java EE or standalone collocated agents, select Enterprise Installation into an existing Oracle Home directory. To create the topology for standalone agents, select Standalone Installation. ODI Studio is available in all install types. See Configuring Oracle Data Integrator Studio for details.</td>
</tr>
<tr>
<td>JDK Selection</td>
<td>Note: This screen appears for certain distributions only. Use this screen to select the JDK to use for this installation.</td>
</tr>
</tbody>
</table>
Table 3-1  (Cont.) Oracle Data Integrator Install Screens

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prerequisite Checks</td>
<td>This screen verifies that your system meets the minimum necessary requirements. To view the list of tasks that gets verified, select View Successful Tasks. To view log details, select View Log. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click Rerun to try again. To ignore the error or the warning message and continue with the installation, click Skip (not recommended).</td>
</tr>
<tr>
<td>Specify Security Updates</td>
<td>Note: This screen appears only if you selected Standalone HTTP Server (Managed independently of WebLogic server) as the Installation Type. If you already have an Oracle Support account, use this screen to indicate how you would like to receive security updates. If you do not have one and are sure you want to skip this step, clear the check box and verify your selection in the follow-up dialog box.</td>
</tr>
<tr>
<td>Installation Summary</td>
<td>Use this screen to verify installation options you selected. If you want to save these options to a response file, click Save Response File and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time. Click Install to begin the installation.</td>
</tr>
<tr>
<td>Installation Progress</td>
<td>This screen shows the installation progress. When the progress bar reaches 100% complete, click Finish to dismiss the installer, or click Next to see a summary.</td>
</tr>
<tr>
<td>Installation Complete</td>
<td>This screen displays the Installation Location and the Feature Sets that are installed. Review this information and click Finish to close the installer.</td>
</tr>
</tbody>
</table>

Verifying the Installation

After you complete the installation, verify whether it was successful by completing a series of tasks.

Reviewing the Installation Log Files

Review the contents of the installation log files to make sure that the installer did not encounter any problems.

By default, the installer writes logs files to the Oracle_Inventory_Location/logs (on UNIX operating systems) or Oracle_Inventory_Location\logs (on Windows operating systems) directory.

For a description of the log files and where to find them, see Installation Log Files in Installing Software with the Oracle Universal Installer.
Checking the Directory Structure

The contents of your installation vary based on the options that you selected during the installation.

See What Are the Key Oracle Fusion Middleware Directories? in Understanding Oracle Fusion Middleware.

Viewing the Contents of the Oracle Home

You can view the contents of the Oracle home directory by using the `viewInventory` script.

See Viewing the Contents of an Oracle Home in Installing Software with the Oracle Universal Installer.

Installing Oracle Data Integrator in Silent Mode

You can install Oracle Data Integrator in silent mode by using the silent flag.

To install Oracle Data Integrator in silent mode, use the `-silent` flag on the command line when you start the installer.

For more information about silent or command line installation, see Using the Oracle Universal Installer in Silent Mode.

Example Response Files

The following are response file examples when installing Oracle Data Integrator in Silent mode:

For an Enterprise installation:

```plaintext
[ENGINE]

#DO NOT CHANGE THIS.
Response File Version=1.0.0.0

[GENERIC]

#The oracle home location. This can be an existing Oracle Home or a new Oracle Home
ORACLE_HOME=/scratch/aganeriw/odi1213enterprise

#Set this variable value to the Installation Type selected. e.g. Standalone Installation, Enterprise Installation.
INSTALL_TYPE=Enterprise Installation

#Type String (URL format) Indicates the OCM Repeater URL which should be of the format [scheme[Http/Https]]://[repeater host]:[repeater port]
COLLECTOR_SUPPORTHUB_URL=

For a Standalone Installation:

[ENGINE]

#DO NOT CHANGE THIS.
Response File Version=1.0.0.0
```
# The oracle home location. This can be an existing Oracle Home or a new Oracle Home
ORACLE_HOME=/scratch/aganeriw/odi1213standalone

# Set this variable value to the Installation Type selected. e.g. Standalone Installation,
INSTALL_TYPE=Standalone Installation

# Provide the My Oracle Support Username. If you wish to ignore Oracle Configuration Manager configuration provide empty string for user name.
MYORACLESUPPORT_USERNAME=

# Provide the My Oracle Support Password
MYORACLESUPPORT_PASSWORD=<SECURE VALUE>

# Set this to true if you wish to decline the security updates. Setting this to true and providing empty string for My Oracle Support username will ignore the Oracle Configuration Manager configuration
DECLINE_SECURITY_UPDATES=true

# Set this to true if My Oracle Support Password is specified
SECURITY_UPDATES_VIA_MYORACLESUPPORT=false

# Provide the Proxy Host
PROXY_HOST=

# Provide the Proxy Port
PROXY_PORT=

# Provide the Proxy Username
PROXY_USER=

# Provide the Proxy Password
PROXY_PWD=<SECURE VALUE>

# Type String (URL format) Indicates the OCM Repeater URL which should be of the format [scheme[Http/Https]]://[repeater host]:[repeater port]
COLLECTOR_SUPPORTHUB_URL=
Creating the Master and Work Repository Schemas

Before you can configure an Oracle Data Integrator domain, you must create the Master and Work Repository (Odi_REPO) schemas on a certified database for use with this release of Oracle Fusion Middleware.

Installing and Configuring a Certified Database

Before you create the database schemas, you must install and configure a certified database, and verify that the database is up and running.

See About Database Requirements for an Oracle Fusion Middleware Installation.

Starting the Repository Creation Utility

Start the Repository Creation Utility (RCU) after you verify that a certified JDK is installed on your system.

To start the RCU:

1. Verify that a certified JDK already exists on your system by running `java -version` from the command line. For 12c (12.2.1.3.0), the certified JDK is 1.8.0_131 and later.

   See About JDK Requirements for an Oracle Fusion Middleware Installation.

2. Ensure that the `JAVA_HOME` environment variable is set to the location of the certified JDK. For example:
   - (UNIX) `setenv JAVA_HOME /home/Oracle/Jdk/jdk1.8.0_131`
   - (Windows) `set JAVA_HOME=C:\home\Oracle\Java\jdk1.8.0_131`

3. Change to the following directory:
   - (UNIX) `ORACLE_HOME/oracle_common/bin`
   - (Windows) `ORACLE_HOME\oracle_common\bin`

4. Enter the following command:
   - (UNIX) `./rcu`
   - (Windows) `rcu.bat`

Navigating the Repository Creation Utility Screens to Create Schemas

Enter required information in the RCU screens to create the database schemas.
Introducing the RCU

The Welcome screen is the first screen that appears when you start the RCU.
Click Next.

Selecting a Method of Schema Creation

Use the Create Repository screen to select a method to create and load component schemas into the database.

On the Create Repository screen:

- If you have the necessary permissions and privileges to perform DBA activities on your database, select System Load and Product Load. This procedure assumes that you have SYSDBA privileges.
- If you do not have the necessary permissions or privileges to perform DBA activities in the database, you must select Prepare Scripts for System Load on this screen. This option generates a SQL script that you can give to your database administrator. See About System Load and Product Load in Creating Schemas with the Repository Creation Utility.
- If the DBA has already run the SQL script for System Load, select Perform Product Load.

Providing Database Connection Details

On the Database Connection Details screen, provide the database connection details for the RCU to connect to your database.

Note:
If you are unsure of the service name for your database, you can obtain it from the SERVICE_NAMES parameter in the initialization parameter file of the database. If the initialization parameter file does not contain the SERVICE_NAMES parameter, then the service name is the same as the global database name, which is specified in the DB_NAME and DB_DOMAIN parameters.

For example:

Database Type: Oracle Database
Connect String: examplehost.exampledomain.com:1521:Orcl.exampledomain.com
Host Name: examplehost.exampledomain.com
Port: 1521
Service Name: Orcl.exampledomain.com
User Name: sys
Password: ******
Role: SYSDBA
Click **Next** to proceed, then click **OK** in the dialog window that confirms a successful database connection.

## Specifying a Custom Prefix and Selecting Schemas

On the Select Components screen, specify a custom prefix and select the product database schema.

Select **Create new prefix**, specify a custom prefix, then select the **Oracle Data Integrator** schema.

Make a note of the custom prefix you choose to enter here; you will need this later on during the domain creation process.

The custom prefix logically groups these schemas together for use in this domain only; you must create a unique set of schemas for each domain as schema sharing across domains is not supported.

### See Also:

For more information, see the following topics in *Creating Schemas with the Repository Creation Utility*:

- Understanding Custom Prefixes
- Planning Your Schema Creation

### Note:

If you have already created the ODI repository using ODI Studio, uncheck the ODI entry here and create only the dependent schema. In the Configuration Wizard, after retrieving the dependent schema connectivity from STB schema, manually fill in the ODI repository details.

Click **Next** to proceed, then click **OK** to confirm that prerequisite checking for schema creation was successful.

## Specifying Schema Passwords

On the Schema Passwords screen, specify how you want to set the schema passwords on your database, then enter and confirm your passwords.

You must make a note of the passwords you set on this screen; you will need them later on during the domain creation process.
Specifying Custom Variables

On the Custom Variables screen, specify the custom variables for the Master and Work Repository.

For more information about the options on this screen, see Custom Variables in Creating Schemas with the Repository Creation Utility.

Completing Schema Creation

Navigate through the remaining RCU screens to complete schema creation.

On the Map Tablespaces screen, the Encrypt Tablespace check box appears only if you enabled Transparent Data Encryption (TDE) in the database (Oracle or Oracle EBR) when you start the RCU. Select the Encrypt Tablespace check box if you want to encrypt all new tablespaces that the RCU creates.

When you reach the Completion Summary screen, click Close to dismiss the RCU.
Configuring Oracle Data Integrator Studio

Oracle Data Integrator Studio (ODI Studio) is the interface you use to manage and configure Oracle Data Integrator (ODI).

About Oracle Data Integrator Studio

Oracle Data Integrator Studio (ODI Studio) is the developer’s interface that you use to configure and manage Oracle Data Integrator (ODI).

ODI Studio is installed as part of standalone or enterprise option under the specified ORACLE_HOME directory. ODI Studio provides four graphical Navigators for managing ODI artifacts: Designer, Operator, Topology, and Security. ODI Studio can also directly execute jobs on demand, and can be used for development and initial testing.

Creating the Database Schemas

Before you can configure an Oracle Data Integrator domain, you must create the Master and Work Repository (ODI_REPO) schemas on a certified database for use with this release of Oracle Fusion Middleware.

Follow the instructions in Creating the Master and Work Repository Schemas to create the required schemas.

Setting the Same Time Zone for the Agent and Repository

Ensure that schedules are not affected by out-of-sync time zones by setting the same time zone for your agent and for the repository.

Each database has its own way of identifying the configured time zone. To ensure that scheduling is not affected by out-of-sync time zones, make sure Oracle Data Integrator Studio and the agent are started with the time zones identical to the time zone of the repository.

Adding Libraries to ODI Studio

You can add third-party libraries to ODI Studio.

All files required by ODI Studio, such as third-party JDBC drivers, Open Tools, and libraries, should be deployed into the userlib directory. The location of this directory is:

- On UNIX systems: $HOME/.odi/oracledi/userlib
- On Windows systems: %APPDATA%\odi\oracledi\userlib

where %APPDATA% is C:\Documents and Settings\Application Data (in Windows XP), and C:\Users\myUserName\AppData\Roaming (on Windows 7 and Windows 8).
The `userlib` directory contains the `additional_path.txt` file, where you can declare additional files or folders outside of the `userlib` directory from which ODI Studio acquires other libraries and drivers, as illustrated in the following example:

```plaintext
; Additional paths file
; You can add here paths to additional libraries
; Examples:
; C:\java\libs\myjar.jar
; C:\java\libs\myzip.zip
; C:\java\libs\*.jar will add all jars contained in the C:\java\libs\ directory
; C:\java\libs\**\*.jar will add all jars contained in the C:\java\libs\ directory and subdirectories

D:\java\libs\*.jar
D:\ODI\JDBC_drivers\sqljdbc_1.2\enu\sqljdbc.jar
```

You must restart ODI Studio after editing the `additional_path.txt` file for the changes to take effect.

### Setting Java Home for ODI Studio

Set the `JAVA_HOME` environment variable to the location of the certified JDK before you start ODI Studio.

To set `JAVA_HOME` for ODI Studio:

1. Go to the `ORACLE_HOME/odi/studio/bin` directory.
2. Open the `odi.conf` file in an editor.
3. Add a line at the bottom of the file specifying the location of a certified JDK. For 12c (12.2.1.3.0), the certified JDK is 1.8.0_131 and later. For example:
   - (UNIX) `setenv JAVA_HOME/home/Oracle/Java/jdk1.8.0_131`
   - (Windows) `set JAVA_HOME=C:\home\Oracle\Java\jdk1.8.0_131`
4. Save the file.

### Starting ODI Studio

Start ODI Studio with the `odi` command.

To start ODI Studio:

1. Go to the `ORACLE_HOME/odi/studio` directory.
2. Enter the following command:
   - (UNIX) `./odi.sh`
   - (Windows) `odi.exe`

#### Note:

On Windows operating systems only the user who installed ODI can start ODI Studio. No other user has privileges to start ODI Studio.
Connecting to the Master Repository

Connect to the master repository before creating an agent.
Before you create an agent, you must connect to the master repository.

**Note:**

If you have installed any previous version of Oracle Data Integrator (ODI) on the same computer you are currently using, you may be asked whether or not you want to import preferences and settings from those previous installations into Oracle Data Integrator Studio (ODI Studio). The procedure assumes that no previous versions of ODI exist on your computer.

For more information, refer to the topics in the ODI Studio Help menu.

To connect to the master repository:

1. From the ODI Studio menu, select **File**, then select **New**.
   On the New gallery screen, select **Create a New ODI Repository Login**, then click **OK**.

2. On the Oracle Data Integrator Login screen, click the plus sign (+) icon to create a new login. On the Repository Connection Information screen:
   - **Oracle Data Integrator Connection section**:
     - **Login Name**: Specify a custom login name.
     - **User**: Specify SUPERVISOR (all capital letters).
     - **Password**: Specify the supervisor password of RCU Custom Variable screen.
   - **Database Connection (Master Repository) section**
     - **User**: Specify the schema user name for the Master repository. This should be *prefix_ODI_REPO* as specified on the Select Components screen in RCU.
     - **Password**: Specify the schema password for the Master repository. This was specified on the Schema Passwords screen in RCU.
     - **Driver List**: Select the appropriate driver for your database from the drop-down list.
     - **URL**: Specify the connection URL. Click on the magnifying glass icon for more information about the connection details for your driver.
   - **In the Work Repository section**, select **Master Repository Only**.

   Click **Test** to test the connection, and fix any errors. After the test is successful, click **OK** to create the connection.

4. After you have successfully created a new login, you are returned to ODI Studio.
Select Connect to Repository and, when prompted, provide your new wallet password.

After providing your wallet password, the Oracle Data Integrator Login screen appears. Provide the following information to log in:

a. In the drop-down menu in the Login Name field, select the name of the new login you just created.

b. Specify superuser as the user name.

c. Provide the password for the Supervisor user.

When you are logged in, follow the instructions in Creating an Agent in the Master Repository with ODI Studio to create the agent.

Add Proxy Configuration for ODI Studio

You can add proxy configuration for ODI studio.

Perform the following steps to add proxy configuration for ODI studio:

2. Add the proxy host and port number in the respective fields.

3. Click Save.
Configuring the Domain for a Standalone Agent

Create and configure a standalone domain for a standalone agent in the standard installation topology.

Creating the Database Schemas

Before you can configure an Oracle Data Integrator domain, you must create the Master and Work Repository (ODI_REPO) schemas on a certified database for use with this release of Oracle Fusion Middleware.

Follow the instructions in Creating the Master and Work Repository Schemas to create the required schemas.

Creating an Agent in the Master Repository with ODI Studio

A physical agent corresponds to a single standalone agent or a Java EE agent and should have a unique name in the topology. You create an ODI agent in the master repository with ODI Studio.

As part of its startup sequence, an agent connects to the master repository to verify that there is a physical agent defined in the master repository with its name. If it finds its entry, the agent continues with startup and, once started, it reads all the scheduled jobs of itself from the repository and starts processing them. If it does not find a physical agent entry for an agent, then the startup fails.

Before you can create an ODI agent, you must first start ODI Studio and connected to the master repository in ODI Studio. See:

- Starting ODI Studio
- Connecting to the Master Repository

To create a physical agent in the master repository with ODI Studio:

1. In the navigation pane on the left side, select the **Topology** tab, then right-click **Agents**, then select **New Agent**.

2. Specify the new agent details as summarized in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify OracleDIAgent1 as the agent name. This name must match the system component name.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the IP address or name of the machine where the agent is running. Do not use localhost.</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number on which the agent listens.</td>
</tr>
</tbody>
</table>
3. From the ODI Studio menu, select File then Save All to save your changes.

Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

For information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in Creating WebLogic Domains Using the Configuration Wizard.

Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:

1. Change to the following directory:
   (UNIX) `ORACLE_HOME/oracle_common/common/bin`
   (Windows) `ORACLE_HOME/oracle_common/common/bin`
   where `ORACLE_HOME` is your 12c (12.2.1.3.0) Oracle home.

2. Enter the following command:
   (UNIX) `./config.sh`
   (Windows) `config.cmd`

Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

Note:

You can use this procedure to extend an existing domain. If your needs do not match the instructions in the procedure, be sure to make your selections accordingly, or see the supporting documentation for more details.
Selecting the Domain Type and Domain Home Location

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Understanding Oracle Fusion Middleware, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or reinstall software.

To specify the Domain type and Domain home directory:

1. On the Configuration Type screen, select **Create a new domain**.
2. In the Domain Location field, specify your Domain home directory.

For more details about this screen, see Configuration Type in Creating WebLogic Domains Using the Configuration Wizard.

Selecting the Configuration Template

Use the Templates screen to select the templates you require.

On the Templates screen, select the following template:

- **Oracle Data Integrator - Standalone Agent**
  Selecting this template automatically selects the following dependencies:
  - Oracle JRF
  - Oracle Coherence Cluster extension

For more information about this screen, see Templates in Creating WebLogic Domains Using the Configuration Wizard.

Specifying the Domain Mode and JDK

Use the JDK Selection screen to specify the Java Development Kit (JDK).

On the JDK Selection screen:

- Select the JDK on your system that is certified for use with Oracle Fusion Middleware. For 12c (12.2.1.3.0), the certified JDK is 1.8.0_131 and later.

Configuring High Availability Options

Use this screen to configure service migration and persistence settings that affect high availability. This screen appears for the first time when you create a cluster that uses automatic service migration, persistent stores, or both, and all subsequent clusters that are added to the domain by using the Configuration Wizard, automatically apply the selected HA options.

**Enable Automatic Service Migration**

Select **Enable Automatic Service Migration** to enable pinned services to migrate automatically to a healthy Managed Server for failover. It configures migratable target
definitions that are required for automatic service migration and the cluster leasing. Choose one of these cluster leasing options:

- **Database Leasing** - Managed Servers use a table on a valid JDBC System Resource for leasing. Requires that the Automatic Migration data source have a valid JDBC System Resource. If you select this option, the Migration Basis is configured to Database and the Data Source for Automatic Migration is also automatically configured by the Configuration Wizard. If you have a high availability database, such as Oracle RAC, to manage leasing information, configure the database for server migration according to steps in High-availability Database Leasing.

- **Consensus Leasing** - Managed Servers maintain leasing information in-memory. You use Node Manager to control Managed Servers in a cluster. (All servers that are migratable, or which could host a migratable target, must have a Node Manager associated with them.) If you select this option, the Migration Basis is configured to Consensus by the Configuration Wizard.

See Leasing for more information on leasing.

See Service Migration for more information on Automatic Service Migration.

**JTA Transaction Log Persistence**

This section has two options: **Default Persistent Store** and **JDBC TLog Store**.

- **Default Persistent Store** - Configures the JTA Transaction Log store of the servers in the default file store.
- **JDBC TLog Store** - Configures the JTA Transaction Log store of the servers in JDBC stores.

Oracle recommends that you select **JDBC TLog Store**. When you complete the configuration, you have a cluster where JDBC persistent stores are set up for Transaction logs.

For more details on persistent and TLOG stores, see the following topics in Developing JTA Applications for Oracle WebLogic Server:

- Using the Default Persistent Store
- Using a JDBC TLOG Store

**JMS Service Persistence**

A persistent **JMS store** is a physical repository for storing persistent message data and durable subscribers. It can be either a disk-based **file store** or a JDBC-accessible database. You can use a **JMS file store** for paging of messages to disk when memory is exhausted.

- **JMS File Store** - Configures a component to use JMS File Stores. If you select this option, you can choose the **File Store** option in the Advanced Configuration Screen to change the settings, if required. In the File Stores screen, you can set file store names, directories, and synchronous write policies.
- **JMS JDBC Store** - Configures a component to use JDBC stores for all its JMS servers. When you complete the configuration, you have a cluster and JDBC persistent stores are configured for the JMS servers.

This is the recommended option for Oracle Identity and Access Management 12c (12.2.1.3.0).
Specifying the Database Configuration Type

Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select **RCU Data**. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.

**Note:**
If you select **Manual Configuration** on this screen, you must manually fill in parameters for your schema on the next screen.

After selecting **RCU Data**, specify details in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS/Service</td>
<td>Enter the database DBMS name, or service name if you selected a service type driver.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>orcl.exampledomain.com</code></td>
</tr>
<tr>
<td>Host Name</td>
<td>Enter the name of the server hosting the database.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>examplehost.exampledomain.com</code></td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number on which the database listens.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>1521</code></td>
</tr>
<tr>
<td>Schema Owner</td>
<td>Enter the username and password for connecting to the database's Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords).</td>
</tr>
<tr>
<td>Schema Password</td>
<td>The default username is <code>prefix_STB</code>, where <code>prefix</code> is the custom prefix that you defined in the RCU.</td>
</tr>
</tbody>
</table>

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

- Connecting to the database server...OK
- Retrieving schema data from database server...OK
- Binding local schema components with retrieved data...OK

Successfully Done.

For more information about the schema installed when the RCU is run, see About the Service Table Schema in *Creating Schemas with the Repository Creation Utility*.

See Database Configuration Type in *Creating WebLogic Domains Using the Configuration Wizard*.
Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values populated on the JDBC Component Schema screen are correct for all schemas. If you selected RCU Data on the previous screen, the schema table should already be populated appropriately. If you selected Manual configuration on the Database Configuration screen, you must configure the schemas listed in the table manually, before you proceed.

For high availability environments, see the following sections in High Availability Guide for additional information on configuring data sources for Oracle RAC databases:

- Configuring Active GridLink Data Sources with Oracle RAC
- Configuring Multi Data Sources

See JDBC Component Schema in Creating WebLogic Domains Using the Configuration Wizard for more details about this screen.

Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the Schema Password column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

For more information about this screen, see JDBC Component Schema Test in Creating WebLogic Domains Using the Configuration Wizard.

Creating a New ODI System Component

Use the System Component screen to create a new ODI system component.

On the System Component screen, click Add then:

1. Under System Component, either accept the default ODI component (OracleDIAgent1) name, or specify a name of your choice.
2. Under Component Type, ensure that ODI is selected from the drop-down list.

For more information about this screen, see System Components in Creating WebLogic Domains Using the Configuration Wizard.

Configuring the ODI Server Access

Use the ODI Server Configuration screen to configure access to your ODI server.

Set ODI Server configuration values as specified in the following table.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Component</td>
<td>Select the ODI system component (<em>OracleDIAgent1</em>).</td>
</tr>
<tr>
<td>Server Listen Address</td>
<td>Specify the IP address of the server where the ODI server should listen. Do not use <em>localhost</em>.</td>
</tr>
<tr>
<td>Server Listen Port</td>
<td>Enter the port number on which ODI server listens.</td>
</tr>
<tr>
<td>Supervisor Username</td>
<td>Specify <em>SUPERVISOR</em> as the user name.</td>
</tr>
<tr>
<td>Supervisor Password</td>
<td>Specify the Supervisor user password, as specified during schema creation.</td>
</tr>
<tr>
<td>Preferred Datasource</td>
<td>Use the default <em>OdiMasterRepository</em>; do not change this field.</td>
</tr>
</tbody>
</table>

For more information about the options on this screen, see ODI Server Configuration in *Creating WebLogic Domains Using the Configuration Wizard*.

### Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

For more information about this screen, see Node Manager in *Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Administering Node Manager for Oracle WebLogic Server*.

### Reviewing Your Configuration Specifications and Configuring the Domain

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the **Back** button or selecting the screen in the navigation pane. Domain creation does not start until you click **Create**.

For more details about options on this screen, see Configuration Summary in *Creating WebLogic Domains Using the Configuration Wizard*.

### Writing Down Your Domain Home and Administration Server URL

The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:

- Domain Location
- Administration Server URL

You need the domain location to access scripts that start Node Manager and Administration Server, and you need the URL to access the Administration Server.

Click **Finish** to dismiss the Configuration Wizard.
Add Proxy Configuration for Standalone Agent

You can add proxy configuration for a standalone agent.

Perform the following steps to add proxy configuration for standalone agent:

1. Open the instance file.
   - Linux: instance.sh
   - Windows: instance.cmd
   
   The instance file is located under `<DOMAIN>/config/fmwconfig/components/ODI/OracleDIAgent1/bin/`

2. Edit the file and add or modify the `ODI_INSTANCE_JAVA_OPTIONS` parameter.
   For example:

   ```
   ODI_INSTANCE_JAVA_OPTIONS="$ODI_ADDITIONAL_JAVA_OPTIONS $ODI_SSL_PROPERTIES -Doracle.odi.standalone.agent.useauthenticator=false -Dhttps.proxyHost=<proxy host> -Dhttp.proxyPort=<proxy port> -Dhttps.proxyHost=<proxy host> -Dhttp.proxyPort=<proxy port> -Dhttp.nonProxyHosts=<non proxy host>"
   ```

3. Restart the agent.

Adding Libraries to a Standalone or Standalone Collocated Agent

After configuring a standalone or standalone collocated agent, you can specify additional libraries if required.

To add libraries to a ODI standalone or standalone collocated agent:

1. Set the environment variable `ODI_ADDITIONAL_CLASSPATH` to locate additional jars before starting the agent. For example:

   ```
   ODI_ADDITIONAL_CLASSPATH=/share/libs/mytool.jar:/share/libs/drivers/mydriver.jar
   ```

2. Do one the following:

   - Copy the additional libraries to the `DOMAIN_HOME/lib` directory. The ODI standalone and standalone collocated agents will automatically add these libraries to the agent’s classpath.

   - Edit the `DOMAIN_HOME/config/fmwconfig/components/ODI/Agent Name/bin/instance.sh/cmd` command to add the libraries to the `ODI_POST_CLASSPATH` variable.

Starting a Standalone or Standalone Collocated Agent Using Node Manager

Start Node Manager, then start the standalone or standalone collocated agent.
Starting Node Manager

To start the per-domain Node Manager:

1. Change to the following directory:
   - (UNIX) `setenv JAVA_HOME /home/Oracle/Java/jdk1.8.0_131`
   - (Windows) `set JAVA_HOME=C:\home\Oracle\Java\jdk1.8.0_131`

2. Enter the following command:
   - (UNIX) Using `nohup` and `nm.out` as an example output file:
     
     ```
     nohup ./startNodeManager.sh > LOG_DIR/nm.out&
     ```
     where `LOG_DIR` is the location of directory in which you want to store the log files.
   - (Windows) `startNodeManager.cmd`

Note:

On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

See Running Node Manager as a Startup Service in Administering Node Manager for Oracle WebLogic Server.

Starting a Standalone or Standalone Collocated Agent

To start an ODI standalone agent when using Node Manager:

1. Go to the `DOMAIN_HOME/bin` directory.

2. Start the agent:
   - (UNIX) `./startComponent.sh OracleDIAgent1`
   - (Windows) `startComponent.cmd OracleDIAgent1`

3. At the prompt, enter the Administrator password for the domain.

To verify that your agent was started successfully, go to the following URL in your browser:

http://examplehost.exampledomain.com:port/oraclediagent
Starting a Standalone or Standalone Collocated Agent Without Node Manager

Start a standalone or standalone collocated agent without Node Manager, use the agent command.

To start a standalone agent without Node Manager:

1. Go to the `DOMAIN_HOME/bin` directory.
2. Start the agent:
   - (UNIX) `./agent.sh -NAME=OracleDIAgent1`
   - (Windows) `agent.cmd -NAME=OracleDIAgent1`

   where `-NAME` must be entered in all capital letters, and the name of the agent (in this example, `OracleDIAgent1`) is case-sensitive.

Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see Performing Additional Domain Configuration Tasks.
Configuring the Domain for a Standalone Collocated Agent

Create and configure a WebLogic domain for a standalone collocated agent in the standard installation topology.

Creating the Database Schemas

Before you can configure an Oracle Data Integrator domain, you must create the Master and Work Repository (ODI_REPO) schemas on a certified database for use with this release of Oracle Fusion Middleware.

Follow the instructions in Creating the Master and Work Repository Schemas to create the required schemas.

Creating an Agent in the Master Repository with ODI Studio

A physical agent corresponds to a single standalone agent or a Java EE agent and should have a unique name in the topology. You create an ODI agent in the master repository with ODI Studio.

As part of its startup sequence, an agent connects to the master repository to verify that there is a physical agent defined in the master repository with its name. If it finds its entry, the agent continues with startup and, once started, it reads all the scheduled jobs of itself from the repository and starts processing them. If it does not find a physical agent entry for an agent, then the startup fails.

Before you can create an ODI agent, you must first start ODI Studio and connected to the master repository in ODI Studio. See:

- Starting ODI Studio
- Connecting to the Master Repository

To create a physical agent in the master repository with ODI Studio:

1. In the navigation pane on the left side, select the **Topology** tab, then right-click **Agents**, then select **New Agent**.
2. Specify the new agent details as summarized in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify OracleDIagent1 as the agent name. This name must match the system component name.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the IP address or name of the machine where the agent is running. Do not use localhost.</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number on which the agent listens.</td>
</tr>
</tbody>
</table>
Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

For information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in Creating WebLogic Domains Using the Configuration Wizard.

Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:

1. Change to the following directory:
   (UNIX) ORACLE_HOME/oracle_common/common/bin
   (Windows) ORACLE_HOME\oracle_common\common\bin
   where ORACLE_HOME is your 12c (12.2.1.3.0) Oracle home.

2. Enter the following command:
   (UNIX) ./config.sh
   (Windows) config.cmd

Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

Note:

You can use this procedure to extend an existing domain. If your needs do not match the instructions in the procedure, be sure to make your selections accordingly, or see the supporting documentation for more details.
Selecting the Domain Type and Domain Home Location

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Understanding Oracle Fusion Middleware, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or reinstall software.

To specify the Domain type and Domain home directory:

1. On the Configuration Type screen, select **Create a new domain**.
2. In the Domain Location field, specify your Domain home directory.

For more details about this screen, see Configuration Type in Creating WebLogic Domains Using the Configuration Wizard.

Selecting the Configuration Template

Use the Templates screen to select the templates you require.

On the Templates screen, make sure **Create Domain Using Product Templates** is selected, then select the following templates:

- **Oracle Enterprise manager Plugin for ODI**
  
  Selecting this template automatically selects the following as dependencies:
  
  - Oracle Enterprise Manager
  - Oracle JRF
  - Weblogic Coherence Cluster Extension

- **Oracle Data Integrator Agent**
  
  Selecting this template automatically selects the following dependencies:
  
  - Oracle Data Integrator — JRF
  - Oracle Data Integrator — REST Services

- **Oracle Data Integrator Console**

**Note:**

The Standalone template appears only if your ORACLE_HOME is an ODI Standalone installation. With the Enterprise installation, the Collocated Agent and JEE Agent templates appear.

For more information about this screen, see Templates in Creating WebLogic Domains Using the Configuration Wizard.

- Oracle Data Integrator - Agent
- Oracle Data Integrator SDK Shared Library Template
Selecting this template automatically selects the following as dependencies:

- Oracle JRF
- Oracle Coherence Cluster Extension

**Note:**

For information about configuring and managing a secondary topology using the Oracle Data Integrator Console see Oracle Data Integrator Components.

For more information about this screen, see Templates in Creating WebLogic Domains Using the Configuration Wizard.

**Configuring the Administrator Account**

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Oracle recommends that you make a note of the user name and password that you enter on this screen; you need these credentials later to boot and connect to the domain’s Administration Server.

**Specifying the Domain Mode and JDK**

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

On the Domain Mode and JDK screen:

- Select **Production** in the Domain Mode field.
- Select the **Oracle HotSpot JDK** in the JDK field.

For more information about this screen, see Domain Mode and JDK in Creating WebLogic Domains Using the Configuration Wizard.

**Specifying the Database Configuration Type**

Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select **RCU Data**. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.

**Note:**

If you select **Manual Configuration** on this screen, you must manually fill in parameters for your schema on the next screen.
After selecting **RCU Data**, specify details in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DBMS/Service</strong></td>
<td>Enter the database DBMS name, or service name if you selected a service type driver. Example: orcl.exampledomain.com</td>
</tr>
<tr>
<td><strong>Host Name</strong></td>
<td>Enter the name of the server hosting the database. Example: examplehost.exampledomain.com</td>
</tr>
<tr>
<td><strong>Port</strong></td>
<td>Enter the port number on which the database listens. Example: 1521</td>
</tr>
<tr>
<td><strong>Schema Owner</strong></td>
<td>Enter the username and password for connecting to the database's Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords). The default username is prefix_STB, where prefix is the custom prefix that you defined in the RCU.</td>
</tr>
<tr>
<td><strong>Schema Password</strong></td>
<td></td>
</tr>
</tbody>
</table>

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

- Connecting to the database server...OK
- Retrieving schema data from database server...OK
- Binding local schema components with retrieved data...OK

Successfully Done.

For more information about the schema installed when the RCU is run, see About the Service Table Schema in *Creating Schemas with the Repository Creation Utility*.

See Database Configuration Type in *Creating WebLogic Domains Using the Configuration Wizard*.

**Specifying JDBC Component Schema Information**

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values populated on the JDBC Component Schema screen are correct for all schemas. If you selected **RCU Data** on the previous screen, the schema table should already be populated appropriately. If you selected **Manual configuration** on the Database Configuration screen, you must configure the schemas listed in the table manually, before you proceed.

For high availability environments, see the following sections in *High Availability Guide* for additional information on configuring data sources for Oracle RAC databases:

- Configuring Active GridLink Data Sources with Oracle RAC
- Configuring Multi Data Sources

See JDBC Component Schema in *Creating WebLogic Domains Using the Configuration Wizard* for more details about this screen.
Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the Schema Password column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

For more information about this screen, see JDBC Component Schema Test in Creating WebLogic Domains Using the Configuration Wizard.

Selecting Advanced Configuration

Use the Advanced Configuration screen to complete the domain configuration.

On the Advanced Configuration screen, select:

- Administration Server — Required to properly configure the listen address of the Administration Server.
- Node Manager — Required to configure Node Manager.
- System Components — Required to configure the standalone agent.

Optionally, select other available options as required for your desired installation environment. The steps in this guide describe a standard installation topology, but you may choose to follow a different path. If your installation requirements extend to additional options outside the scope of this guide, you may be presented with additional screens to configure those options. For information about all Configuration Wizard screens, see Configuration Wizard Screens in Creating WebLogic Domains Using the Configuration Wizard.

Configuring the Administration Server Listen Address

Use the Administration Server screen to select the IP address of the host.

Select the drop-down list next to Listen Address and select the IP address of the host where the Administration Server will reside, or use the system name or DNS name that maps to a single IP address. Do not use All Local Addresses.

Do not specify any server groups for the Administration Server.

Note:

Use the Mozilla Firefox browser to access Internet Protocol Version 6 (IPv6) URLs. You must enter the Global IPv6 address to create a domain and access URLs. (You should not use the local IPv6 address.)
Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

For more information about this screen, see Node Manager in *Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Administering Node Manager for Oracle WebLogic Server*.

Creating a New ODI System Component

Use the System Component screen to create a new ODI system component.

On the System Component screen, click **Add** then:

1. Under **System Component**, either accept the default ODI component (OracleDIAgent1) name, or specify a name of your choice.
2. Under **Component Type**, ensure that **ODI** is selected from the drop-down list.

For more information about this screen, see System Components in *Creating WebLogic Domains Using the Configuration Wizard*.

Configuring the ODI Server Access

Use the ODI Server Configuration screen to configure access to your ODI server.

Set ODI Server configuration values as specified in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Component</td>
<td>Select the ODI system component (OracleDIAgent1).</td>
</tr>
<tr>
<td>Server Listen Address</td>
<td>Specify the IP address of the server where the ODI server should listen. Do not use localhost.</td>
</tr>
<tr>
<td>Server Listen Port</td>
<td>Enter the port number on which ODI server listens.</td>
</tr>
<tr>
<td>Supervisor Username</td>
<td>Specify SUPERVISOR as the user name.</td>
</tr>
<tr>
<td>Supervisor Password</td>
<td>Specify the Supervisor user password, as specified during schema creation.</td>
</tr>
<tr>
<td>Preferred Datasource</td>
<td>Use the default OdiMasterRepository; do not change this field.</td>
</tr>
</tbody>
</table>

For more information about the options on this screen, see ODI Server Configuration in *Creating WebLogic Domains Using the Configuration Wizard*.

Specifying the Node Manager Host Address

Use the Machines screen to select the IP address of the host running Node Manager.

The system component you just created is automatically assigned to a machine called LocalODIMachine. The Machines screen shows that this machine is already created.
In the **Node Manager Listen Address** field, select the IP address of the host running Node Manager. Do not use `localhost`.

For more information about the options on this screen, see Machines in *Creating WebLogic Domains Using the Configuration Wizard*.

**Assigning System Components to Machines**

Use the Assign System Components to Machines screen to assign the system component to the ODI machine.

On the Assign System Components to Machines screen, verify that the system component `OracleDIAgent1` is assigned to the `LocalODIMachine`.

For more information about the options on this screen, see Assign System Components to Machines in *Creating WebLogic Domains Using the Configuration Wizard*.

**Reviewing Your Configuration Specifications and Configuring the Domain**

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the **Back** button or selecting the screen in the navigation pane. Domain creation does not start until you click **Create**.

For more details about options on this screen, see Configuration Summary in *Creating WebLogic Domains Using the Configuration Wizard*.

**Writing Down Your Domain Home and Administration Server URL**

The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:

- Domain Location
- Administration Server URL

You need the domain location to access scripts that start Node Manager and Administration Server, and you need the URL to access the Administration Server.

Click **Finish** to dismiss the Configuration Wizard.

**Add Proxy Configuration for Collocated Standalone Agent**

You can add proxy configuration for a collocated standalone agent.

Perform the following steps to add proxy configuration for standalone agent:

1. Open the instance file.
   - **Linux**: `instance.sh`
   - **Windows**: `instance.cmd`

   The instance file is located under `<DOMAIN>/config/fmwconfig/components/ODI/OracleDIAgent1/bin/`
2. Edit the file and add or modify the ODI_INSTANCE_JAVA_OPTIONS parameter.

For example:

```
ODI_INSTANCE_JAVA_OPTIONS="$ODI_ADDITIONAL_JAVA_OPTIONS $ODI_SSL_PROPERTIES -Doracle.odi.standalone.agent.useauthenticate=false -Dhttp.proxyHost=<proxy host> -Dhttp.proxyPort=<proxy port> -Dhttps.proxyHost=<proxy host> -Dhttps.proxyPort=<proxy port> -Dhttp.nonProxyHosts=<non proxy host>"
```

3. Restart the agent.

Adding Libraries to a Standalone or Standalone Collocated Agent

After configuring a standalone or standalone collocated agent, you can specify additional libraries if required.

To add libraries to a ODI standalone or standalone collocated agent:

1. Set the environment variable ODI_ADDITIONAL_CLASSPATH to locate additional jars before starting the agent. For example:

```
ODI_ADDITIONAL_CLASSPATH=/share/libs/mytool.jar:/share/libs/drivers/mydriver.jar
```

2. Do one the following:

- Copy the additional libraries to the DOMAIN_HOME/lib directory. The ODI standalone and standalone collocated agents will automatically add these libraries to the agent’s classpath.
- Edit the DOMAIN_HOME/config/fmwconfig/components/ODI/Agent Name/bin/instance.sh/cmd command to add the libraries to the ODI_POST_CLASSPATH variable.

Starting a Standalone or Standalone Collocated Agent Using Node Manager

Start Node Manager, then start the standalone or standalone collocated agent.

**Note:**

If you have not yet configured the physical agent in the master repository, go to Creating an Agent in the Master Repository with ODI Studio.

Starting Node Manager

To start the per-domain Node Manager:

1. Change to the following directory:

```
(setenv JAVA_HOME /home/Oracle/Java/jdk1.8.0_131
```
2. Enter the following command:
   • (UNIX) Using `nohup` and `nm.out` as an example output file:
     ```bash
     nohup ./startNodeManager.sh > LOG_DIR/nm.out
     ```
     where `LOG_DIR` is the location of directory in which you want to store the log files.
   • (Windows) `startNodeManager.cmd`

   **Note:**
   On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.
   See Running Node Manager as a Startup Service in *Administering Node Manager for Oracle WebLogic Server*.

Starting a Standalone or Standalone Collocated Agent

To start an ODI standalone agent when using Node Manager:
1. Go to the `DOMAIN_HOME/bin` directory.
2. Start the agent:
   • (UNIX) `./startComponent.sh OracleDIAgent1`
   • (Windows) `startComponent.cmd OracleDIAgent1`
3. At the prompt, enter the Administrator password for the domain.
To verify that your agent was started successfully, go to the following URL in your browser:
```text
http://examplehost.exampledomain.com:port/oraclediagent
```

Starting a Standalone or Standalone Collocated Agent Without Node Manager

Start a standalone or standalone collocated agent without Node Manager, use the `agent` command.

To start a standalone agent without Node Manager:
1. Go to the `DOMAIN_HOME/bin` directory.
2. Start the agent:
   • (UNIX) `./agent.sh -NAME=OracleDIAgent1`
   • (Windows) `agent.cmd -NAME=OracleDIAgent1`
where -NAME must be entered in all capital letters, and the name of the agent (in this example, OracleDIAgent1) is case-sensitive.

Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see Performing Additional Domain Configuration Tasks.
8

Configuring the Domain for a Java EE Agent

Create and configure a WebLogic domain for a Java EE agent in the standard installation topology.

Creating the Database Schemas

Before you can configure an Oracle Data Integrator domain, you must create the Master and Work Repository (ODI_REPO) schemas on a certified database for use with this release of Oracle Fusion Middleware.

Follow the instructions in Creating the Master and Work Repository Schemas to create the required schemas.

Generating a Template for a Java EE Agent

Use the Server Template Generation wizard to generate the non-default template for deploying a Java EE agent defined in the ODI master repository.

Use this procedure if you require changes to the default template that deploys a Java EE agent with default name and settings. To create a Java EE agent with the Server Template Generation wizard:

1. From the Physical Agent Editor menu, select Generate Server Template to start the Template Generation wizard.

2. In the Agent Information step, review the agent information and modify the default configuration as appropriate. This information includes the following parameters: the Agent Name, the Datasource JNDI Name, the Connection Retry Count, the Retry Delay, and the Supervisor Key.

   • The Connection Retry Count specifies the number of retry attempts if the agent loses the connection to the repository. Note that setting this parameter to a non-zero value enables a high availability connection retry feature if the ODI repository resides on an Oracle RAC database. If this feature is enabled, the agent can continue to execute sessions without interruptions even if one or more Oracle RAC nodes become unavailable.

   • The Retry Delay specifies the number of milliseconds between connection retry attempts.

   • The Supervisor Key specifies the name of the key in the application server credential store that contains the login and the password of an ODI user with Supervisor privileges. The agent uses these credentials to connect to the repository.

3. Click Next.

4. To add domain and shared libraries for the agent, navigate to the Libraries and Drivers page, and then check the libraries you want to deploy with your agent.
Libraries can be any JAR or ZIP files required by the agent. Select any additional JDBC drivers or libraries for accessing the source and target data servers in this page. Note that library name validation is limited within the newly added libraries, not against already deployed shared libraries.

- Domain libraries are the libraries deployed in a domain that are available to all applications running in the domain. This approach to adding libraries is typically used when adding infrequently changed JAR files. Note that when using this approach, you must reboot all servers in the domain for the change to take effect.

- Shared libraries are libraries you specify in the agent deployment descriptor before deploying the agent to the domain. In this way, multiple applications can use the libraries resources and duplication is avoided. This approach to adding libraries is used for libraries that may need modifications or upgrade. Shared libraries allow you to change libraries without restarting the server, but you may need to restart the application.

5. Click **Next**.

6. In **Template Target and Summary** step, enter the **Target Template Path** that specifies the location where the server template is generated.

7. Click **Finish** to close the wizard and generate the server template with your specifications.

The generated template can be used to deploy the agent in an Oracle WebLogic Server domain.

**Creating an Agent in the Master Repository with ODI Studio**

A physical agent corresponds to a single standalone agent or a Java EE agent and should have a unique name in the topology. You create an ODI agent in the master repository with ODI Studio.

As part of its startup sequence, an agent connects to the master repository to verify that there is a physical agent defined in the master repository with its name. If it finds its entry, the agent continues with startup and, once started, it reads all the scheduled jobs of itself from the repository and starts processing them. If it does not find a physical agent entry for an agent, then the startup fails.

Before you can create an ODI agent, you must first start ODI Studio and connected to the master repository in ODI Studio. See:

- **Starting ODI Studio**
- **Connecting to the Master Repository**

To create a physical agent in the master repository with ODI Studio:

1. In the navigation pane on the left side, select the **Topology** tab, then right-click **Agents**, then select **New Agent**.

2. Specify the new agent details as summarized in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify OracleDIAgent1 as the agent name.</td>
</tr>
<tr>
<td></td>
<td>This name must match the system component name.</td>
</tr>
</tbody>
</table>
### Field Description

- **Host**: Enter the IP address or name of the machine where the agent is running. Do not use `localhost`.
- **Port**: Enter the port number on which the agent listens.

**Note:**
If your environment includes a cluster with Oracle HTTP Server acting as a front-end to the cluster, provide the host name and port of the Oracle HTTP Server host instead. The name should be `OracleDIAgent`, not `OracleDIAgent1`.

3. From the ODI Studio menu, select **File** then **Save All** to save your changes.

## Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

For information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in *Creating WebLogic Domains Using the Configuration Wizard*.

### Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:

1. Change to the following directory:
   - *(UNIX)* `ORACLE_HOME/oracle_common/common/bin`
   - *(Windows)* `ORACLE_HOME\oracle_common\common\bin`

   where `ORACLE_HOME` is your 12c (12.2.1.3.0) Oracle home.

2. Enter the following command:
   - *(UNIX)* `.config.sh`
   - *(Windows)* `config.cmd`

### Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.
Selecting the Domain Type and Domain Home Location

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Understanding Oracle Fusion Middleware, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or reinstall software.

To specify the Domain type and Domain home directory:

1. On the Configuration Type screen, select **Create a new domain**.
2. In the Domain Location field, specify your Domain home directory.

For more details about this screen, see Configuration Type in Creating WebLogic Domains Using the Configuration Wizard.

Selecting the Configuration Template

Use the Templates screen to select the templates you require.

On the Templates screen, select the following template:

- **Oracle Enterprise Manager Plugin for ODI**
  
  Selecting this template automatically selects the following as dependencies:
  
  - Oracle Enterprise Manager
  - Oracle JRF
  - WebLogic Coherence Cluster Extension

- **Oracle Data Integrator - Agent**

  Selecting this template automatically selects the following as dependencies:

  - Oracle Data Integrator - Agent Libraries

  In addition, select the following templates:

  - Oracle Data Integrator - JRF
  - Oracle Data Integrator - REST Services

- **Oracle Data Integrator - Console**

For more information about this screen, see Templates in Creating WebLogic Domains Using the Configuration Wizard.
Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the *Application home* directory.

Oracle recommends that you locate your Application home in accordance with the directory structure in *What Are the Key Oracle Fusion Middleware Directories?* in *Understanding Oracle Fusion Middleware*, where the Application home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or re-install your software.

For more about the Application home directory, see *About the Application Home Directory*.

For more information about this screen, see Application Location in *Creating WebLogic Domains Using the Configuration Wizard*.

Configuring the Administrator Account

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Oracle recommends that you make a note of the user name and password that you enter on this screen; you need these credentials later to boot and connect to the domain's Administration Server.

Specifying the Domain Mode and JDK

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

On the Domain Mode and JDK screen:

- Select **Production** in the **Domain Mode** field.
- Select the **Oracle HotSpot JDK** in the **JDK** field.

For more information about this screen, see Domain Mode and JDK in *Creating WebLogic Domains Using the Configuration Wizard*.

Specifying the Database Configuration Type

Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select **RCU Data**. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.

---

**Note:**

If you select **Manual Configuration** on this screen, you must manually fill in parameters for your schema on the next screen.
After selecting **RCU Data**, specify details in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| DBMS/Service    | Enter the database DBMS name, or service name if you selected a service type driver.  
Example: orcl.exampledomain.com |
| Host Name       | Enter the name of the server hosting the database.                           
Example: examplehost.exampledomain.com |
| Port            | Enter the port number on which the database listens.                          
Example: 1521 |
| Schema Owner    | Enter the username and password for connecting to the database's Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords). The default username is *prefix_STB*, where *prefix* is the custom prefix that you defined in the RCU. |
| Schema Password |                                                                               |

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

- Connecting to the database server...OK
- Retrieving schema data from database server...OK
- Binding local schema components with retrieved data...OK

Successfully Done.

For more information about the schema installed when the RCU is run, see About the Service Table Schema in *Creating Schemas with the Repository Creation Utility*.

See Database Configuration Type in *Creating WebLogic Domains Using the Configuration Wizard*.

### Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values populated on the JDBC Component Schema screen are correct for all schemas. If you selected **RCU Data** on the previous screen, the schema table should already be populated appropriately. If you selected **Manual configuration** on the Database Configuration screen, you must configure the schemas listed in the table manually, before you proceed.

For high availability environments, see the following sections in *High Availability Guide* for additional information on configuring data sources for Oracle RAC databases:

- Configuring Active GridLink Data Sources with Oracle RAC
- Configuring Multi Data Sources

See JDBC Component Schema in *Creating WebLogic Domains Using the Configuration Wizard* for more details about this screen.
Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections. A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the **Schema Password** column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

For more information about this screen, see JDBC Component Schema Test in *Creating WebLogic Domains Using the Configuration Wizard*.

Creating Credential Keys

Use the Credentials screen to create two keys.

On the Credentials screen:

1. A key for the Supervisor user already exists. Modify the credential as follows:
   a. Specify SUPERVISOR (all CAPS) as the user name. This is the default name initially assigned to the SUPERVISOR account and cannot be changed unless you create a new SUPERVISOR account.
   b. The password must be the same password specified on the Custom Variables screen in RCU during schema creation.

2. Create a second credential:
   a. Click the plus sign (+) icon to add a new credential.
   b. In the **Key Name** field, enter the name of this domain as the key.
   c. In the **Username** and **Password** fields, provide the Administrator user's user name and password.
   d. Select oracle.odi.credmap as the store name.

   **Note:**

   If the repository is configured in external authentication mode, then the SUPERVISOR user name and password should be entered according to your external authentication settings.

   For more information about this screen, see Credentials in *Creating WebLogic Domains Using the Configuration Wizard*. 

---

**Oracle**

8-7
Selecting Advanced Configuration

Use the Advanced Configuration screen to complete the domain configuration.

On the Advanced Configuration screen, select:

- **Administration Server**
  Required to properly configure the listen address of the Administration Server.

- **Node Manager**
  Required to configure Node Manager.

- **Topology**
  Required to configure the Oracle Data Integrator Managed Server.

Optionally, select other available options as required for your desired installation environment. The steps in this guide describe a standard installation topology, but you may choose to follow a different path. If your installation requirements extend to additional options outside the scope of this guide, you may be presented with additional screens to configure those options. For information about all Configuration Wizard screens, see Configuration Wizard Screens in *Creating WebLogic Domains Using the Configuration Wizard*.

Configuring the Administration Server Listen Address

Use the Administration Server screen to select the IP address of the host.

Select the drop-down list next to **Listen Address** and select the IP address of the host where the Administration Server will reside, or use the system name or DNS name that maps to a single IP address. Do **not** use All Local Addresses.

Do **not** specify any server groups for the Administration Server.

**Note:**

Use the Mozilla Firefox browser to access Internet Protocol Version 6 (IPv6) URLs. You must enter the Global IPv6 address to create a domain and access URLs. (You should not use the local IPv6 address.)

Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

For more information about this screen, see Node Manager in *Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Administering Node Manager for Oracle WebLogic Server*.
Configuring Managed Servers for Oracle Data Integrator

Use the Managed Servers screen to configure Managed Servers.

On the Managed Servers screen, a Managed Server named ODI_server1 is automatically created by default.

To configure Managed Servers for Oracle Data Integrator:

1. In the Listen Address drop-down list, select the IP address of the host on which the Managed Server will reside. Do not use All Local Addresses.

2. In the Server Groups drop-down list, make sure that ODI-MGD-SVRS is selected. This server group ensures that the Oracle JRF services are targeted to the Managed Servers you are creating.

Server groups target Fusion Middleware applications and services to one or more servers by mapping defined application service groups to each defined server group. A given application service group may be mapped to multiple server groups if needed. Any application services that are mapped to a given server group are automatically targeted to all servers that are assigned to that group. See Application Service Groups, Server Groups, and Application Service Mappings in Domain Template Reference.

These server names are referenced in examples throughout this document; if you choose different names be sure to replace them as needed.

Note:

You must make a note of the IP address and port number for the Managed Server. You will need this information when you configure the ODI agent.

3. Configuring a second Managed Server is one of the steps needed to configure the standard topology for high availability. If you are not creating a highly available environment, then this step is optional.

Click Add and select ODI-MGD-SVRS to create a second Managed Server named ODI_server2.

For more information about the high availability standard topology, see Understanding the Fusion Middleware Standard HA Topology in High Availability Guide.

For more information about the next steps to prepare for high availability after your domain is configured, see Preparing Your Environment for High Availability.

For more information about this screen, see Managed Servers in Creating WebLogic Domains Using the Configuration Wizard.

Configuring a Cluster for Oracle Data Integrator

Use the Clusters screen to create a new cluster.

On the Clusters screen:

1. Click Add.
2. Specify ODI_cluster1 in the Cluster Name field.

3. Leave the Cluster Address field blank.

Repeat the preceding steps to create three more clusters: cpt_cluster1, ibr_cluster1, and wccui_cluster1.

By default, server instances in a cluster communicate with one another using unicast. If you want to change your cluster communications to use multicast, see Considerations for Choosing Unicast or Multicast in Administering Clusters for Oracle WebLogic Server.

You can also create clusters using Fusion Middleware Control. In this case, you can configure cluster communication (unicast or multicast) when you create the new cluster. See Create and configure clusters in Oracle WebLogic Server Administration Console Online Help.

For more information about this screen, see Clusters in Creating WebLogic Domains Using the Configuration Wizard.

Defining Server Templates

If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

To continue configuring the domain, click Next.

For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in High Availability Guide.

Configuring Dynamic Servers

If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

If you are not configuring a dynamic cluster, click Next to continue configuring the domain.

Note:

When you create dynamic clusters, keep in mind that after you assign the Machine Name Match Expression, you do not need to create machines for your dynamic cluster.

To create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in High Availability Guide.

Assigning Oracle Data Integrator Managed Servers to the Cluster

Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not
use this screen if you are configuring a *dynamic cluster*, a cluster that contains one or more generated server instances that are based on a server template.

---

**Note:**

All Managed Servers of a component type in the domain must belong to that cluster. For example, Oracle Data Integrator domains support only a single Oracle Data Integrator cluster inside each domain.

For more on configured cluster and dynamic cluster terms, see About Dynamic Clusters in *Understanding Oracle WebLogic Server*.

On the Assign Servers to Clusters screen:

1. In the Clusters pane, select the cluster to which you want to assign the Managed Servers; in this case, ODI_cluster1.
2. In the Servers pane, assign ODI_server1 to ODI_cluster1 by doing one of the following:
   - Click once on ODI_server1 to select it, then click the right arrow to move it beneath the selected cluster (ODI_cluster1) in the Clusters pane.
   - Double-click on ODI_server1 to move it beneath the selected cluster (ODI_cluster1) in the Clusters pane.
3. Repeat to assign ODI_server2 to ODI_cluster1.

The following image shows a generic example of the Clusters pane after Managed Servers are assigned to clusters.

For more information about this screen, see Assign Servers to Clusters in *Creating WebLogic Domains Using the Configuration Wizard*.

### Configuring Coherence Clusters

Use the Coherence Clusters screen to configure the Coherence cluster.

Leave the default port number as the Coherence cluster listen port. After configuration, the Coherence cluster is automatically added to the domain.

---

**Note:**

Setting the unicast listen port to 0 creates an offset for the Managed Server port numbers. The offset is 5000, meaning the maximum allowed value that you can assign to a Managed Server port number is 60535, instead of 65535.

See *Table 5-2* for more information and next steps for configuring Coherence.

For Coherence licensing information, see Oracle Coherence Products in *Licensing Information*.
Creating a New Oracle Data Integrator Machine

Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

If you plan to create a high availability environment and know the list of machines your target topology requires, you can follow the instructions in this section to create all the machines at this time. For more about scale out steps, see Optional Scale Out Procedure in High Availability Guide.

To create a new Oracle Data Integrator machine so that Node Manager can start and stop servers:

1. Select the Machine tab (for Windows) or the UNIX Machine tab (for UNIX), then click Add to create a new machine.
2. In the Name field, specify a machine name, such as ODI_machine1.
3. In the Node Manager Listen Address field, select the IP address of the machine in which the Managed Servers are being configured.
   
   You must select a specific interface and not localhost. This allows Coherence cluster addresses to be dynamically calculated.
4. Verify the port in the Node Manager Listen Port field.
5. Repeat these steps to add more machines, if required.

**Note:**

If you are extending an existing domain, you can assign servers to any existing machine. It is not necessary to create a new machine unless your situation requires it.

For more information about this screen, see Machines in Creating WebLogic Domains Using the Configuration Wizard.

Assigning Servers to Oracle Data Integrator Machines

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created.

On the Assign Servers to Machines screen:

1. In the Machines pane, select the machine to which you want to assign the servers; in this case, ODI_machine1.
2. In the Servers pane, assign AdminServer to ODI_machine1 by doing one of the following:
   - Click once on AdminServer to select it, then click the right arrow to move it beneath the selected machine (ODI_machine1) in the Machines pane.
   - Double-click on AdminServer to move it beneath the selected machine (ODI_machine1) in the Machines pane.
3. Repeat these steps to assign all Managed Servers to their respective machines.
For more information about this screen, see Assign Servers to Machines in Creating WebLogic Domains Using the Configuration Wizard.

Virtual Targets

If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select Next.

For details about this screen, see Virtual Targets in Creating WebLogic Domains Using the Configuration Wizard.

Partitions

The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.

For details about options on this screen, see Partitions in Creating WebLogic Domains Using the Configuration Wizard.

Reviewing Your Configuration Specifications and Configuring the Domain

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the Back button or selecting the screen in the navigation pane. Domain creation does not start until you click Create.

For more details about options on this screen, see Configuration Summary in Creating WebLogic Domains Using the Configuration Wizard.

Writing Down Your Domain Home and Administration Server URL

The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:

- Domain Location
- Administration Server URL

You need the domain location to access scripts that start Node Manager and Administration Server, and you need the URL to access the Administration Server.

Click Finish to dismiss the Configuration Wizard.

Add Proxy Configuration for JEE Agent

You can add proxy configuration for JEE agent.

Perform the following steps to add proxy configuration for JEE agent.

1. Open the setDomainEnv file.
   - Linux: setDomainEnv.sh
Adding Libraries to a Java EE Agent

After configuring a Java EE agent, you can specify additional libraries if required.

To add libraries to a Java EE agent:

1. Set the environment variable `ODI_ADDITIONAL_CLASSPATH` to locate additional jars before starting the agent. For example:
   ```
   ODI_ADDITIONAL_CLASSPATH=/share/libs/mytool.jar:/share/libs/drivers/mydriver.jar
   ```

2. Do one the following:
   - Copy the additional libraries to the `DOMAIN_HOME/lib` directory. The Java EE will automatically add these libraries to the agent’s classpath.
   - Follow the steps below to use the `generate_agent_wls_template.sh` script or ODI Studio to generate an agent template and then create/extend a WebLogic domain with that template.

   To generate a template for a Java EE agent using the `generate_agent_wls_template.sh` script, specify domain and shared libraries with the `-domainLibraries` and `-sharedLibraries` arguments as illustrated in the following example:
   ```
   ./generate_agent_wls_template.sh
   -agentName sample
   -agentContextName context
   -odiUser SUPERVISOR
   -destinationJar /home/userName/NewFormaterJar.jar
   -retryCount 10
   -retryDelayMS 1
   -createDatasourceForMasterRepository false
   -masterDataSource jdbc/odiMasterRepository,oracle.jdbc.OracleDriver,jdbc:oracle:thin:@mycompany.com-
   -isESSDependency false
   -addToPath /home/userName
   -domainLibraries /home/userName/odi/myDomain/userlib/myLib.jar
   -sharedLibraries MessageBox
   ```
To generate a template for a Java EE agent and specify additional libraries for the agent using ODI Studio:

1. Start ODI Studio.
2. Select **Generate Server Template**, to start the Template Generation wizard.
3. In the **Agent Information** page, enter the agent information, such as the Java EE agent name, the datasource JNDI name, the connection retry count, and the Supervisor key.
4. In the **Libraries and Drivers** page, select the libraries you want to deploy with your Java EE agent from the list of external libraries. Note that library name validation is limited within the newly added libraries, not against already deployed shared libraries. You can select a domain library or a shared library. **Domain** libraries are the libraries deployed in the WebLogic domain and are available to a Java EE agent, since they are available to all applications running in the domain. Domain libraries are typically used when adding infrequently changed JAR files. Note that when using this approach, you must reboot all servers in the domain for the change to take effect. **Shared** libraries are libraries you specify in the agent deployment descriptor, before deploying the agent to the domain. With shared libraries, multiple applications can use the libraries resources and duplication is avoided. Shared libraries are used for libraries that may need modifications or upgrade. These libraries allow you to change libraries without restarting the server, but you may need to restart the application.
5. Click **Next** to display the **Datasources** page.
6. In that page, select the datasource definitions that you want to include in the agent template. You can only select datasources using this wizard. To add datasources use the **Data Sources** tab.
7. Click **Next** to display the **Template Target and Summary** page.
8. In that page, specify where the template should be generated in the **Target Template Path** box.
9. Click **Finish** to close the wizard and generate the agent template.

**Starting the Servers**

After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

For more information on additional tools you can use to manage your domain, see *Overview of Oracle Fusion Middleware Administration Tools in Administering Oracle Fusion Middleware*.

**Starting Node Manager**

To start the per-domain Node Manager:

1. Change to the following directory:
   - (UNIX) `setenv JAVA_HOME /home/Oracle/Java/jdk1.8.0_131`
   - (Windows) `set JAVA_HOME=C:\home\Oracle\Java\jdk1.8.0_131`
2. Enter the following command:
   - (UNIX) Using `nohup` and `nm.out` as an example output file:
nohup ./startNodeManager.sh > LOG_DIR/nm.out&

where \textit{LOG\_DIR} is the location of directory in which you want to store the log files.

- (Windows) startNodeManager.cmd

\textbf{Note:}

On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

See Running Node Manager as a Startup Service in \textit{Administering Node Manager for Oracle WebLogic Server}.

Starting the Administration Server

To start the Administration Server:

1. Change to the following directory:
   - (UNIX) \texttt{setenv JAVA\_HOME /home/Oracle/Java/jdk1.8.0_131}
   - (Windows) \texttt{set JAVA\_HOME=C:\home\Oracle\Java\jdk1.8.0_131}

2. Enter the following command:
   - (UNIX) \texttt{./startWebLogic.sh}
   - (Windows) \texttt{startWebLogic.cmd}

If you selected \textbf{Production Mode} on the Domain Mode and JDK screen when you created the domain, you see a prompt for the Administrator user login credentials as the Administrator Account screen provides.

For more information about starting the Administration Server, see Starting and Stopping Administration Server in \textit{Administering Oracle Fusion Middleware}.

In production mode, you can create a boot identity file to bypass the need to provide a user name and password when starting the Administration Server. See Creating a Boot Identity File for an Administration Server in \textit{Administering Server Startup and Shutdown for Oracle WebLogic Server}.

You can verify that the Administration Server is up and running by accessing the Administration Server Console. The URL is provided on the End of Configuration screen (http://administration_server_host:administration_server_port/console). The default Administration Server port number is 7001.

\textbf{Note:}

Make sure that the database hosting your product schemas is up and running and accessible by the Administration Server.
For more information about how to use the Administration Console, see Getting Started Using Oracle WebLogic Server Administration Console in Administering Oracle Fusion Middleware.

Starting the Managed Servers

To start the Managed Servers:

1. Log in to Oracle Fusion Middleware Control:
   
   http://administration_server_host:administration_server_port/em

   The Administration Server host and port number were in the URL on the End of Configuration screen (Writing Down Your Domain Home and Administration Server URL). The default Administration Server port number is 7001.

   The login credentials were provided on the Administrator Account screen (Configuring the Administrator Account).

2. The Enterprise Manager landing page lists servers configured for this domain and shows their status (such as Running or Shutdown). For a newly configured domain, only the AdminServer(admin) will be running.

3. Select the first Managed Server.

5. Repeat Steps 3 and 4 to start all Managed Servers.

6. On the main landing page, verify that all Managed Servers are up and running.

Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see Performing Additional Domain Configuration Tasks.
Next Steps After Configuring the Domain

After you configure a product domain, there are additional tasks that you may want to perform.

Performing Basic Administrative Tasks

Review the administrative tasks you will likely want to perform on a new domain.

</tr>
</thead>
<tbody>
<tr>
<td>Configuring high availability for Oracle BI components</td>
<td>To configure Oracle BI for high availability, ensure that the system has no single points of failure by scaling out the Oracle BI Server, Presentation Services, and the JavaHost so that you have at least two of each component types, distributed across at least two computers.</td>
<td>See Deploying Oracle Business Intelligence for High Availability in <em>System Administrator's Guide for Oracle Business Intelligence Enterprise Edition</em>.</td>
</tr>
<tr>
<td>Managing performance tuning and query caching</td>
<td>For Oracle BI Server database queries to return quickly, the underlying databases must be configured, tuned, and indexed correctly. The BI Server can store query results for reuse by subsequent queries. Query caching can dramatically improve the performance of the system for users, particularly for commonly used dashboards. However, it does not improve performance for most ad-hoc analysis.</td>
<td>See Managing Performance Tuning and Query Caching in <em>System Administrator's Guide for Oracle Business Intelligence Enterprise Edition</em>.</td>
</tr>
</tbody>
</table>
Uninstalling or Reinstalling Oracle Data Integrator

Follow the instructions in this section to uninstall or reinstall Oracle Data Integrator.

### Note:

This task applies only to **standalone** Oracle Data Integrator. You cannot uninstall Oracle Data Integrator when it is collocated in a WebLogic Server domain, as partial deconfiguration of a configured domain is not supported.

Oracle recommends that you always use the instructions in this section to remove the software. If you try to remove the software manually, you may encounter problems when you try to reinstall the software again at a later time. Following the procedures in this section ensures that the software is properly removed.

### Stopping the Oracle Data Integrator Agents

Before running the uninstaller, stop all running agents.

To stop agents:

1. Go to the `DOMAIN_HOME/bin` directory.
2. Enter the following command:
   - (UNIX) `./stopComponent.sh OracleDIAgent1`
   - (Windows) `stopComponent.cmd OracleDIAgent1`

### Stopping Oracle Fusion Middleware

Before running the Uninstall Wizard, Oracle recommends that you stop all servers and processes associated with the Oracle home you are going to remove.

See Stopping an Oracle Fusion Middleware Environment in *Administering Oracle Fusion Middleware*.

### Removing Your Database Schemas

Before you remove the Oracle home, Oracle recommends that you run the Repository Creation Utility (RCU) to remove database schemas associated with this domain.

Each domain has its own set of schemas, uniquely identified by a custom prefix. For more information about custom prefixes, see About Custom Prefixes in *Creating Schemas with the Repository Creation Utility*. This set of schemas cannot be shared with any other domain. For more information about creating schemas with the RCU,
see Planning Your Schema Creation in *Creating Schemas with the Repository Creation Utility*.

If there are multiple sets of schemas on your database, be sure to identify the schema prefix associated with the domain that you are removing.

For schema removal steps, see Dropping Schemas in *Creating Schemas with the Repository Creation Utility*.

### Uninstalling the Software

Follow the instructions in this section to start the Uninstall Wizard and remove the software.

![Note:](image) This task applies only to *standalone* Oracle Data Integrator. You cannot uninstall Oracle Data Integrator when it is collocated in a WebLogic Server domain, as partial deconfiguration of a configured domain is not supported.

If you want to uninstall the product in a silent (command-line) mode, see Running the Oracle Universal Installer for Silent Uninstallation in *Installing Software with the Oracle Universal Installer*.

### Starting the Uninstall Wizard

To start the Uninstall Wizard:

1. Change to the following directory:
   - (UNIX) `ORACLE_HOME/oui/bin`
   - (Windows) `ORACLE_HOME\oui\bin`

2. Enter the following command:
   - (UNIX) `.deinstall.sh`
   - (Windows) `deinstall.cmd`

### Selecting the Product to Uninstall

Because multiple products exist in the Oracle home, ensure that you are uninstalling the correct product.

After you run the Uninstall Wizard, the Distribution to Uninstall screen opens. From the dropdown menu, select **ODI 12.2.1.3.0** and click **Uninstall**. The uninstallation program shows the screens listed in *Navigating the Uninstall Wizard Screens*.
Note:

You can uninstall Oracle Fusion Middleware Infrastructure after you uninstall Oracle Data Integrator software by running the Uninstall Wizard again. Before doing so, make sure that there are no other products using the Infrastructure; those products will no longer function once the Infrastructure is removed. You will not encounter the Distribution to Uninstall screen if no other software depends on Oracle Fusion Middleware Infrastructure. See Uninstalling Oracle Fusion Middleware Infrastructure in Installing and Configuring the Oracle Fusion Middleware Infrastructure.

Navigating the Uninstall Wizard Screens

The Uninstall Wizard shows a series of screens to confirm the removal of the software.

If you need help on screen listed in Table 10-1, click Help on the screen.

Table 10-1 Uninstall Wizard Screens and Descriptions

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>Introduces you to the product Uninstall Wizard.</td>
</tr>
<tr>
<td>Uninstall Summary</td>
<td>Shows the Oracle home directory and its contents that are uninstalled. Verify that this is the correct directory. If you want to save these options to a response file, click Save Response File and enter the response file location and name. You can use the response file later to uninstall the product in silent (command-line) mode. See Running the Oracle Universal Installer for Silent Uninstall in Installing Software with the Oracle Universal Installer. Click Deinstall, to begin removing the software.</td>
</tr>
<tr>
<td>Uninstall Progress</td>
<td>Shows the uninstallation progress.</td>
</tr>
<tr>
<td>Uninstall Complete</td>
<td>Appears when the uninstallation is complete. Review the information on this screen, then click Finish to close the Uninstall Wizard.</td>
</tr>
</tbody>
</table>

Removing the Oracle Home Directory Manually

After you uninstall the software, you must manually remove your Oracle home directory and any existing subdirectories that the Uninstall Wizard did not remove.

For example, if your Oracle home directory is /home/Oracle/product/ ORACLE_HOME on a UNIX operating system, enter the following commands:

cd /home/Oracle/product
rm -rf ORACLE_HOME

On a Windows operating system, if your Oracle home directory is C:\Oracle\Product \ORACLE_HOME, use a file manager window and navigate to the C:\Oracle\Product directory. Right-click on the ORACLE_HOME folder and select Delete.
Removing the Program Shortcuts on Windows Operating Systems

On Windows operating systems, you must also manually remove the program shortcuts; the Deinstallation Wizard does not remove them for you.

To remove the program shortcuts on Windows:

1. Change to the following directory: `C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Oracle\ORACLE_HOME\Product`  
2. If you only have one product installed in your Oracle home, delete the `ORACLE_HOME` directory. If you have multiple products installed in your Oracle home, delete all products before you delete the `ORACLE_HOME` directory.

Removing the Domain and Application Data

After you uninstall the software, you must remove the domain and application data.

To remove the domain and application data:

1. Manually remove your Domain home directory. For example:
   On a UNIX operating system, if your Domain home directory is `/home/Oracle/config/domains/odi_domain`, enter the following command:
   ```bash
   cd /home/Oracle/config/domains
   rm -rf odi_domain
   ```
   On a Windows operating system, if your Domain home directory is `C:\Oracle\Config\domains\odi_domain`, use a file manager window and navigate to the `C:\Oracle\Config\domains` directory. Right-click on the `odi_domain` folder and select **Delete**.

2. Manually remove your Application home directory. For example:
   On a UNIX operating system, if your Application home directory is `/home/Oracle/config/applications/odi_domain`, enter the following commands:
   ```bash
   cd /home/Oracle/config/applications
   rm -rf odi_domain
   ```
   On a Windows operating system, if your Application home directory is `C:\Oracle\Config\applications\odi_domain`, use a file manager window and navigate to the `C:\Oracle\Config\applications` directory. Right-click on the `odi_domain` folder and select **Delete**.

3. Back up the `domain_registry.xml` file in your Oracle home, then edit the file and remove the line associated with the domain that you are removing. For example, to remove the `odi_domain`, find the following line and remove it:
   ```xml
   <domain location="/home/Oracle/config/domains/odi_domain"/>
   ```

Save and exit the file when you are finished.
Removing Oracle Data Integrator Wallet Information

The ODI wallet holds encrypted data credentials that must be removed manually.

The uninstaller does not remove the ODI wallet, and it must be manually removed. Wallet information is stored in a directory inside the user's home directory as follows:

- (UNIX) /home/exampleuser/.odi
- (Windows) C:\Users\exampleuser\AppData\Roaming\odi

Reinstalling the Software

You can reinstall your software into the same Oracle home as a previous installation only if you uninstalled the software by following the instructions in this section, including manually removing the Oracle home directory.

When you reinstall, you can then specify the same Oracle home as your previous installation.

If ODI is installed again in the same location where it was previously deleted, delete the entire Oracle Home where it was previously installed.

Consider the following cases where the Oracle home is not empty:

- Installing in an existing Oracle home that contains the same feature sets.
  
  The installer warns you that the Oracle home that you specified during installation already contains the same software you are trying to install.
  
  You can either:
  
  - Select a different installation type. In this case, only the feature sets that do not exist in the Oracle home directory are installed.
  
  - Select a different Oracle home directory.

- Installing in an existing, non-empty Oracle home.
  
  For example, suppose you chose to create your Domain home or Application home somewhere inside your existing Oracle home. This data is not removed when you uninstall a product, so if you try to reinstall into the same Oracle home, the installer does not allow it. Your options are:
  
  - Uninstall your software from the Oracle home (as this section describes) and then remove the Oracle home directory. After you uninstall the software and remove the Oracle home directory, you can reinstall and reuse the same Oracle home location. Any domain or application data that was in the Oracle home must be re-created.
  
  - Select a different Oracle home directory.
Oracle Data Integrator Components

The Oracle Data Integrator (ODI) distribution includes several products and feature sets.

The ODI distribution contains the products and feature sets described in Table A-1. Unless otherwise noted, all products and feature sets are available with both the **Standalone Installation** and the **Enterprise Installation** types.

<table>
<thead>
<tr>
<th>Product</th>

</tr>
</tbody>
</table>
Troubleshooting Oracle Data Integrator

Learn techniques for troubleshooting issues with Oracle Data Integrator (ODI).

General Troubleshooting Tips

Troubleshoot most common issues with Oracle Data Integrator installation.

If you encounter an error during installation:

- Read the *Oracle Fusion Middleware Release Notes* for the latest updates. The most current version of the release notes is available on the Oracle Technology Network (OTN) at:
  
  http://www.oracle.com/technetwork/documentation/index.html#middleware

- Verify your system and configuration is certified. Refer to the *System Requirements and Supported Platforms for Oracle Fusion Middleware* document on the Oracle Fusion Middleware Supported System Configurations page:
  

- Verify your system meets the minimum system requirements. Refer to the *System Requirements and Specifications* document:
  

- If you entered incorrect information on one of the installation screens, return to that screen by clicking **Back** until you see the screen.

- If an error occurred while the installer is copying or linking files:
  
  1. Note the error and review the installation log files.
  2. Remove the failed installation by following the steps in: .
     
     Uninstalling or Reinstalling Oracle Data Integrator
      
      Deinstalling or Reinstalling Oracle Data Integrator
  3. Correct the issue that caused the error.
  4. Restart the installation.

Troubleshooting Using Installation and Configuration Log Files

Use the installation and configuration log files to troubleshoot Oracle Data Integrator issues.

The installation and configuration log files contain useful information to help troubleshoot any issues you may encounter. For more information about these log files...
and their contents, see Configuring Installation and Configuration Log Files in *Installing Software with the Oracle Universal Installer*.

## Verifying ODI Client and Repository Compatibility

Troubleshoot potential compatibility issues between Oracle Data Integrator (ODI) and Repository versions.

If you are using Oracle Data Integrator with other Oracle Fusion Middleware products, make sure you have read Oracle Data Integration Interoperability with Other Fusion Middleware Products in *Understanding Interoperability and Compatibility*.

Oracle strongly recommends that you use identical versions of different ODI components such as ODI Studio, ODI Console, standalone and J2EE Agents, and executable scripts for a specific site or platform. In addition, you should make sure your Master and Work Repository versions are compatible with these components (*Table B-1*).

### Table B-1  ODI and Repository Compatible Versions

<table>
<thead>
<tr>
<th>ODI Version</th>

## Need More Help?

Access additional help through My Oracle Support.

If this appendix does not solve the problem you encountered, try looking for a solution on My Oracle Support (formerly OracleMetaLink):

https://support.oracle.com/

If you are unable to find a solution for your problem, open a service request.
Secondary Topologies for Oracle Data Integrator

This appendix describes secondary (alternate) topologies for Oracle Data Integrator.

Oracle Data Integrator Topology with the Oracle Data Integrator Console

Oracle Data Integrator (ODI) Console is a web-based console that administrators and developers can use to configure the ODI topology and browse development artifacts.

ODI Console is a web-based console available to:

- Administrators use Oracle Data Integrator Console to create and import repositories and to configure the topology.
- Business users and developers to browse development artifacts in this interface, using, for example, the Data Lineage and Flow Map features.

This ODI Console integrates with Oracle Fusion Middleware Control Console and allows Fusion Middleware administrators to drill down into the details of Oracle Data Integrator components and sessions.

Figure C-1 illustrates an Oracle Data Integrator topology including the ODI Console.
Using the Oracle Data Integrator Console

The Oracle Data Integrator (ODI) Console is available for selection in the Configuration Wizard.

To access the ODI Console, select **Oracle Data Integrator - Console - 12.2.1.3.0[odi]** in the Configuration Wizard Templates screen.

To use the ODI Console, follow the instructions in Using Oracle Data Integrator Console in *Administering Oracle Data Integrator*. 
D

Updating the JDK After Installing and Configuring an Oracle Fusion Middleware Product

Consider that you have a JDK version jdk1.8.0_121 installed on your machine. When you install and configure an Oracle Fusion Middleware product, the utilities, such as Configuration Wizard (config.sh|exe), OPatch, or RCU point to a default JDK, for example, jdk1.8.0_121. After some time, Oracle releases a new version of the JDK, say jdk1.8.0_131 that carries security enhancements and bug fixes. From 12c (12.2.1.3.0) onwards, you can upgrade the existing JDK to a newer version, and can have the complete product stack point to the newer version of the JDK.

You can maintain multiple versions of JDK and switch to the required version on need basis.

About Updating the JDK Location After Installing an Oracle Fusion Middleware Product

The binaries and other metadata and utility scripts in the Oracle home and Domain home, such as RCU or Configuration Wizard, use a JDK version that was used while installing the software and continue to refer to the same version of the JDK. The JDK path is stored in a variable called JAVA_HOME which is centrally located in .globalEnv.properties file inside the ORACLE_HOME/oui directory.

The utility scripts such as config.sh|cmd, launch.sh, or opatch reside in the ORACLE_HOME, and when you invoke them, they refer to the JAVA_HOME variable located in .globalEnv.properties file. To point these scripts and utilities to the newer version of JDK, you must update the value of the JAVA_HOME variable in the .globalEnv.properties file by following the directions listed in Updating the JDK Location in an Existing Oracle Home.

To make the scripts and files in your Domain home directory point to the newer version of the JDK, you can follow one of the following approaches:

• Specify the path to the newer JDK on the Domain Mode and JDK screen while running the Configuration Wizard.
  
  For example, consider that you installed Oracle Fusion Middleware Infrastructure with the JDK version 8u121. So while configuring the WebLogic domain with the Configuration Assistant, you can select the path to the newer JDK on the Domain Mode and JDK screen of the Configuration Wizard. Example: /scratch/jdk/jdk1.8.0_131.

• Manually locate the files that have references to the JDK using grep (UNIX) or findstr (Windows) commands and update each reference. See Updating the JDK Location in an Existing Domain Home.
When you upgrade Oracle Identity Manager in an integrated environment, you may encounter the OPSS processing error. The following exception is seen when you run reconfig.sh command to reconfigure the Oracle Identity Manager domain:

```
java.lang.IllegalStateException: SecurityContext: Domain Name: IAMGovernanceDomain
JDBC URL: opss-audit-DBDS:jdbc:oracle:thin:@//slc03rmj.us.oracle.com:1521/
IDMDB.US.ORACLE.COM
idmdb.us.oracle.com
Caused by: java.security.InvalidKeyException: Illegal key size
at javax.crypto.Cipher.checkCryptoPerm(Cipher.java:1039)
at javax.crypto.Cipher.implInit(Cipher.java:805)
at javax.crypto.Cipher.chooseProvider(Cipher.java:864)
at javax.crypto.Cipher.init(Cipher.java:1396)
at javax.crypto.Cipher.init(Cipher.java:1327)
```

To resolve this issue:

1. Install the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files from the following location: Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files 8 Download.

2. Copy the local_policy.jar and the US_export_policy.jar files to the location JAVA_HOME/jre/lib/security/. If the files already exist in the destination folder, overwrite them.

### Updating the JDK Location in an Existing Oracle Home

The `getProperty.sh|cmd` script displays the value of a variable, such as JAVA_HOME, from the .globalEnv.properties file. The `setProperty.sh|cmd` script is used to set the value of variables, such as OLD_JAVA_HOME or JAVA_HOME that contain the locations of old and new JDKs in the .globalEnv.properties file.

The `getProperty.sh|cmd` and `setProperty.sh|cmd` scripts are located in the following location:

(UNIX) `ORACLE_HOME/oui/bin`
(Windows) `ORACLE_HOME\oui\bin`

Where, `ORACLE_HOME` is the directory that contains the products using the current version of the JDK, such as jdk1.8.0_121.

To update the JDK location in the .globalEnv.properties file:

1. Use the `getProperty.sh|cmd` Script to display the path of the current JDK from the JAVA_HOME variable. For example:

   (UNIX) `ORACLE_HOME/oui/bin/getProperty.sh JAVA_HOME`
   (Windows) `ORACLE_HOME\oui\bin\getProperty.cmd JAVA_HOME`
echo JAVA_HOME
Where JAVA_HOME is the variable in the .globalEnv.properties file that contains the location of the JDK.

2. Back up the path of the current JDK to another variable such as OLD_JAVA_HOME in the .globalEnv.properties file by entering the following commands:

(UNIX) ORACLE_HOME/oui/bin/setProperty.sh -name OLD_JAVA_HOME -value specify_the_path_of_current_JDK
(Windows) ORACLE_HOME\oui\bin\setProperty.cmd -name OLD_JAVA_HOME -value specify_the_path_of_current_JDK

This command creates a new variable called OLD_JAVA_HOME in the .globalEnv.properties file, with a value that you have specified.

3. Set the new location of the JDK in the JAVA_HOME variable of the .globalEnv.properties file, by entering the following commands:

(UNIX) ORACLE_HOME/oui/bin/setProperty.sh -name JAVA_HOME -value specify_the_location_of_new_JDK
(Windows) ORACLE_HOME\oui\bin\setProperty.cmd -name JAVA_HOME -value specify_the_location_of_new_JDK

After you run this command, the JAVA_HOME variable in the .globalEnv.properties file now contains the path to the new JDK, such as jdk1.8.0_131.

Updating the JDK Location in an Existing Domain Home

You must search the references to the current JDK, for example jdk1.8.0_121 manually, and replace those instances with the location of the new JDK.

You can use the grep (UNIX) or findstr (Windows) commands to search for the jdk-related references.

You'll likely be required to update the location of JDK in the following three files:

(UNIX) DOMAIN_HOME/bin/setNMJavaHome.sh
(Windows) DOMAIN_HOME\bin\setNMJavaHome.cmd

(UNIX) DOMAIN_HOME/nodemanager/nodemanager.properties
(Windows) DOMAIN_HOME\nodemanager\nodemanager.properties

(UNIX) DOMAIN_HOME/bin/setDomainEnv.sh
(Windows) DOMAIN_HOME\bin\setDomainEnv.cmd
Note:

- If you change the value of JAVA_HOME for the Node Manager in the `setNMJavaHome.sh` file, then the Oracle BI system components that you have started using the Node Manager will automatically use the new JAVA_HOME that you specify in the `setNMJavaHome.sh` file.

- Observe caution while updating the `setDomainEnv.sh` file. Any incorrect updates may undo the manual operations, such as scale-out, upgrade, or extending the domain, that were performed on the domain.
