Preface

This preface describes the document accessibility features and conventions used in this guide—Understanding the WebLogic Scripting Tool.

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface</td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>italic</td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
What’s New in This Guide

This topic introduces the new, changed, and deprecated WLST features that are described in this guide and provides pointers to additional information.

The following are new, changed or deprecated features for WLST for Release 12.2.1.3:

- Support for enabling secured production mode.
  See Using WLST Online to Update an Existing WebLogic Domain.

The following are new, changed or deprecated features for WLST for Release 12.2.1.2:

- Implicit imports are deprecated, beginning in this release.
  In a future release, WLST will disable weblogic class auto-loading during WLST startup. At that point, you will need to explicitly import classes using from weblogic import class. For example:

```python
from weblogic.security.service import EJBResource
ejbRes = EJBResource('DDPoliciesEar', 'DDPolinEarMiniAppBean.jar', 'DDRolesAndPolicies', 'getSubject', 'Remote', None)
```

See Implicit Exports.
Introduction and Roadmap

Before you get started, you should understand the contents and organization of this guide.

Topics:

- Document Scope and Audience
- Guide to This Document
- Related Documentation
- WLST Sample Scripts

Document Scope and Audience

This document describes the Oracle WebLogic Scripting Tool (WLST). It explains how you use the WLST command-line scripting interface to configure, manage, and persist changes to WebLogic Server instances and WebLogic domains, and monitor and manage server run-time events.

This document is written for WebLogic Server administrators and operators who deploy Java EE applications using the Java Platform, Enterprise Edition (Java EE). It is assumed that readers are familiar with Web technologies and the operating system and platform where WebLogic Server is installed.

Guide to This Document

You should understand the organization of this document.

It is organized as follows:

- This chapter, Introduction and Roadmap, introduces the organization of this guide and lists related documentation.
- Using the WebLogic Scripting Tool describes how the scripting tool works, its modes of operation, and the basic steps for invoking it.
- Creating WebLogic Domains Using WLST Offline describes how to create a new WebLogic domain or update an existing WebLogic domain without connecting to a running WebLogic Server (that is, using WLST offline)—supporting the same functionality as the Configuration Wizard.
- Managing the Server Life Cycle describes using WLST to start and stop WebLogic Server instances and to monitor and manage the server life cycle.
- Navigating MBeans (WLST Online) describes how to retrieve WebLogic domain configuration and run-time information, and edit configuration or custom MBeans.
- Configuring Existing WebLogic Domains describes using scripts to automate the creation and management of WebLogic domains, servers, and resources.
- Updating the Deployment Plan describes using WLST to update an application's deployment plan.
• **Getting Runtime Information** describes using WLST to retrieve information about the run-time state of WebLogic Server instances.

• **WLST Deployment Objects** describes WLST deployment objects that you can use to update a deployment plan or access information about the current deployment activity.

• **FAQs: WLST** provides a list of common questions and answers.

• **WLST Deprecated Features** lists the deprecated features for WLST.

## Related Documentation

For information about the WLST commands and their syntax, see:

• WebLogic Server WLST Online and Offline Command Reference in the *WLST Command Reference for WebLogic Server* for the WLST commands that are available for WebLogic Server.

• Introduction and Roadmap to the Infrastructure WLST Commands in the *WLST Command Reference for Infrastructure Components* for the WLST commands that are available for Oracle Fusion Middleware infrastructure components, including Java Required Files (JRF), Web services, Metadata services (MDS), Application Development Framework (ADF), Dynamic Monitoring Service (DMS), Logging, Diagnostic Framework, and User Messaging Service (UMS).

• Introduction and Roadmap in the *WLST Command Reference for Infrastructure Security* for the WLST commands that are available for Oracle Fusion Middleware Infrastructure Security components, including Oracle Platform Security Services, Auditing, SSL, wallets, and OPSS Keystore Service.

• Introduction and Roadmap in the *WebCenter WLST Command Reference* for the WLST commands that are available for WebCenter components, including WebCenter Portal, WebCenter Content, and WebCenter Capture.

• Introduction and Roadmap in the *WLST Command Reference for SOA Suite* for the WLST commands that are available for SOA, Business Process Management (BPM), Enterprise Scheduler (ESS), and Managed File Transfer (MFT).

• Overview of the WebLogic Scripting Tool for Oracle Traffic Director in the *WebLogic Scripting Tool Command Reference for Oracle Traffic Director* for the WLST commands that are available for Oracle Traffic Director.

• Oracle HTTP Server WLST Custom Commands in the *Administering Oracle HTTP Server* for the WLST commands that are available for Oracle HTTP Server.

WLST is one of several interfaces for managing and monitoring WebLogic Server. For information about the other management interfaces, see:

• Using Ant Tasks to Configure and Use a WebLogic Server Domain in *Developing Applications for Oracle WebLogic Server*, describes using WebLogic Ant tasks for starting and stopping WebLogic Server instances and configuring WebLogic domains.

• Deployment Tools in *Deploying Applications to Oracle WebLogic Server* describes several tools that WebLogic Server provides for deploying applications and stand-alone modules.

• *Oracle WebLogic Server Administration Console Online Help* describes a Web-based graphical user interface for managing and monitoring WebLogic domains.
WLST Sample Scripts

Oracle Fusion Middleware provides both WLST online and offline sample scripts.

The following sections describe the sample scripts that you can run or use as templates for creating additional scripts:

- **WLST Online Sample Scripts**
- **WLST Offline Sample Scripts**

For information about running scripts, see Running Scripts.

**Note:**

The sample scripts are not installed by default. To install the server samples, you must select the **Complete With Examples** option when installing WebLogic Server.

WLST Online Sample Scripts

The WLST online sample scripts demonstrate how to perform administrative tasks and initiate WebLogic Server configuration changes while connected to a running server. WLST online scripts are located in the following directory:

`ORACLE_HOME\user_projects\applications\wl_server\examples\src\examples\wlst\online`

*Table 1-1* summarizes WLST online sample scripts.
Table 1-1  WLST Online Sample Scripts

WLST Offline Sample Scripts

The WLST offline sample scripts demonstrate how to create WebLogic domains using the domain templates that are installed with the software. The WLST offline scripts are located in the following directory: `ORACLE_HOME\wlserver\common\templates\scripts\wlst`. `Table 1-2` summarizes WLST offline sample scripts.

Table 1-2  WLST Offline Sample Script

<table>
<thead>
<tr>
<th>WLST Sample Script</th>
<th>Description</th>

<td>Creates a simple WebLogic SIP Server domain using the Geographic Redundancy Site 2 Domain template. The script demonstrates how to open a domain template, create and edit configuration objects, and write the domain configuration information to the specified directory. The sample consists of a single server, representing a typical development environment. This type of configuration is not recommended for production environments.</td>
</tr>
<tr>
<td>replicatedDomain.py</td>
<td>Creates a simple WebLogic SIP Server domain using the Oracle WebLogic SIP Server Replicated Domain template. The script demonstrates how to open a domain template, create and edit configuration objects, and write the domain configuration information to the specified directory. The sample consists of a single server, representing a typical development environment. This type of configuration is not recommended for production environments.</td>
</tr>
<tr>
<td>sampleMedRecDomain.py</td>
<td>Creates a WebLogic domain that defines resources similar to those used in the Avitek MedRec sample. This example does not recreate the MedRec example in its entirety, nor does it deploy any sample applications. The script uses the Basic WebLogic Server Domain template.</td>
</tr>
</tbody>
</table>
The WebLogic Scripting Tool (WLST) is a command-line scripting environment that you can use to create, manage, and monitor WebLogic domains. It is based on the Java scripting interpreter, Jython. In addition to supporting standard Jython features such as local variables, conditional variables, and flow control statements, WLST provides a set of scripting functions (commands) that are specific to WebLogic Server. You can extend the WebLogic scripting language to suit your needs by following the Jython language syntax (see http://www.jython.org).

Topics:

- Using WLST Online or Offline
- Interactive Mode, Script Mode, and Embedded Mode
- Security for WLST
- Main Steps for Using WLST in Interactive or Script Mode
- Redirecting Error and Debug Output to a File
- Getting Help
- Running WLST from Ant
- Importing WLST as a Jython Module
- Customizing WLST

Using WLST Online or Offline

You can use WLST as the command-line equivalent to the WebLogic Server Administration Console (WLST online) or as the command-line equivalent to the Configuration Wizard (WLST offline).

The following sections describe how to use WLST online or offline:

- Using WLST Online
- Using WLST Offline

Using WLST Online

You can use WLST to connect to a running Administration Server and manage the configuration of an active WebLogic domain, view performance data about resources in the domain, or manage security data (such as adding or removing users). You can also use WLST to connect to Managed Servers, but you cannot modify configuration data from Managed Servers.

WLST online is a Java Management Extensions (JMX) client. It interacts with a server’s in-memory collection of Managed Beans (MBeans), which are Java objects that provide a management interface for an underlying resource. For information on WebLogic Server MBeans, see Understanding WebLogic Server MBeans in Developing Custom Management Utilities Using JMX for Oracle WebLogic Server.
Using WLST Offline

Without connecting to a running WebLogic Server instance, you can use WLST to create domain templates, create a new domain based on existing templates, or extend an existing, inactive domain. You cannot use WLST offline to view performance data about resources in a WebLogic domain or modify security data (such as adding or removing users).

WLST offline provides read and write access to the configuration data that is persisted in the domain's config directory or in a domain template JAR created using Template Builder. See Browsing Information About the Configuration Hierarchy (Offline).

Note the following restrictions for modifying configuration data with WLST offline:

- Oracle recommends that you do not use WLST offline to manage the configuration of an active WebLogic domain. Offline edits are ignored by running servers and can be overwritten by JMX clients such as WLST online or the WebLogic Server Administration Console.
- As a performance optimization, WebLogic Server does not store most of its default values in the WebLogic domain's configuration files. In some cases, this optimization prevents management objects from being displayed by WLST offline (because WebLogic Server has never written the corresponding XML elements to the domain's configuration files). For example, if you never modify the default logging severity level for a WebLogic domain while the domain is active, WLST offline will not display the domain's Log management object.

If you want to change the default value of attributes whose management object is not displayed by WLST offline, you must first use the create command to create the management object. Then you can cd to the management object and change the attribute value. See create in WLST Command Reference for WebLogic Server.

Interactive Mode, Script Mode, and Embedded Mode

WLST can be invoked in a variety of ways.

You can use any of the following techniques to invoke WLST commands:

- Interactively, on the command line; see Interactive Mode
- In batches, supplied in a file; see Script Mode
- Embedded in Java code; see Embedded Mode

Interactive Mode

Interactive mode, in which you enter a command and view the response at a command-line prompt, is useful for learning the tool, prototyping command syntax, and verifying configuration options before building a script. Using WLST interactively is particularly useful for getting immediate feedback after making a critical configuration change. The WLST scripting shell maintains a persistent connection with an instance of WebLogic Server.
WLST can write all of the commands that you enter during a WLST session to a file. You can edit this file and run it as a WLST script. See startRecording and stopRecording in WLST Command Reference for WebLogic Server.

Script Mode

Scripts invoke a sequence of WLST commands without requiring your input, much like a shell script. Scripts contain WLST commands in a text file with a .py file extension, for example, filename.py. You use script files with the Jython commands for running scripts.

Using WLST scripts, you can:

- Automate WebLogic Server configuration and application deployment
- Apply the same configuration settings, iteratively, across multiple nodes of a topology
- Take advantage of scripting language features, such as loops, flow control constructs, conditional statements, and variable evaluations that are limited in interactive mode
- Schedule scripts to run at various times
- Automate repetitive tasks and complex procedures
- Configure an application in a hands-free data center

For information about sample scripts that WebLogic Server installs, see WLST Sample Scripts.

Embedded Mode

In embedded mode, you instantiate the WLST interpreter in your Java code and use it to run WLST commands and scripts. All WLST commands and variables that you use in interactive and script mode can be run in embedded mode. Prior to running the program with embedded WLST, you must invoke the following command to set the appropriate environment variables:

- **Windows**: WL_HOME\server\bin\setWLSEnv.cmd
- **UNIX**: WL_HOME/server/bin/setWLSEnv.sh

On UNIX operating systems, the setWLSEnv.sh command does not set the environment variables in all command shells. Oracle recommends that you execute this command using the Korn shell or bash shell.

**Example 2-1** illustrates how to instantiate the WLST interpreter and use it to connect to a running server, create two servers, and assign them to clusters.

**Example 2-1    Running WLST From a Java Class**

```java
package wlst;
import java.util.*;
import weblogic.management.scripting.utils.WLSTInterpreter;
import org.python.util.InteractiveInterpreter;

/**
 * Simple embedded WLST example that will connect WLST to a running server,
 * create two servers, and assign them to a newly created cluster and exit.
 * <p>Title: EmbeddedWLST.java</p>
*/
public class EmbeddedWLST {
    static InteractiveInterpreter interpreter = null;
    EmbeddedWLST() {
        interpreter = new WLSTInterpreter();
    }
}

private static void connect() {
    StringBuffer buffer = new StringBuffer();
    buffer.append("connect('adminusername','adminpassword')");
    interpreter.exec(buffer.toString());
}

private static void createServers() {
    StringBuffer buf = new StringBuffer();
    buf.append(startTransaction());
    buf.append("man1=create('msEmbedded1','Server')\n");
    buf.append("man2=create('msEmbedded2','Server')\n");
    buf.append("clus=create('clusterEmbedded','Cluster')\n");
    buf.append("man1.setListenPort(8001)\n");
    buf.append("man2.setListenPort(9001)\n");
    buf.append("man1.setCluster(clus)\n");
    buf.append("man2.setCluster(clus)\n");
    buf.append(endTransaction());
    buf.append("print 'Script ran successfully ...' \n");
    interpreter.exec(buf.toString());
}

private static String startTransaction() {
    StringBuffer buf = new StringBuffer();
    buf.append("edit()\n");
    buf.append("startEdit()\n");
    return buf.toString();
}

private static String endTransaction() {
    StringBuffer buf = new StringBuffer();
    buf.append("save()\n");
    buf.append("activate(block='true')\n");
    return buf.toString();
}

public static void main(String[] args) {
    new EmbeddedWLST();
    connect();
    createServers();
}

Security for WLST

WLST uses the WebLogic Security Framework to prevent unauthorized users from modifying a WebLogic domain or from viewing encrypted data.

The following sections describe the actions you must take to satisfy WLST security requirements:
Securing the WLST Connection

If you use WLST to connect to a WebLogic Server instance, Oracle recommends that you connect to the server instance through the administration port. The administration port is a special, secure port that all WebLogic Server instances in a WebLogic domain can use for administration traffic.

By default, this port is not enabled, but Oracle recommends that you enable the administration port in a production environment. The default value for the administration port is 9002. Separating administration traffic from application traffic ensures that critical administration operations (starting and stopping servers, changing a server’s configuration, and deploying applications) do not compete with high-volume application traffic on the same network connection.

The administration port requires all communication to be secured using SSL. By default, all servers in a WebLogic domain use demonstration certificate files for SSL, but these certificates are not appropriate for a production environment.

For information about configuring the administration port, see Administration Port and Administrative Channel in Administering Server Environments for Oracle WebLogic Server.

Securing Access to Configuration Data

A WebLogic domain stores its configuration data in a collection of XML documents that are saved in the domain directory. For example, these configuration documents describe the names, listen addresses, and deployed resources in the domain. When one or more servers in a WebLogic domain are running, each server instance maintains an in-memory representation of the configuration data as a collection of Managed Beans (MBeans).

You must use your own security measures to make sure that only authorized users can access your domain’s configuration files through the file system. Anyone who is authorized to access the domain’s configuration files through the file system can use a text editor, WLST offline, or other tools to edit the configuration files.

Securing Access from WLST Online

If you use WLST to connect to a running instance of WebLogic Server, you must provide the credentials (user name and password) of a user who has been defined in the active WebLogic security realm. Once you are connected, a collection of security policies determine which configuration attributes you are permitted to view or modify. (See Default Security Policies for MBeans in the MBean Reference for Oracle WebLogic Server.)

When you invoke the WLST connect command, you can supply user credentials by doing any of the following:

- Enter the credentials on the command line. This option is recommended only if you are using WLST in interactive mode.
For example:

```java
connect('adminusername', 'adminpassword', 'localhost:7001')
```

See connect in WLST Command Reference for WebLogic Server.

- Enter the credentials on the command line, and then use the `storeUserConfig` command to create a user configuration file that contains your credentials in an encrypted form and a key file that WebLogic Server uses to unencrypt the credentials. On subsequent WLST sessions (or in WLST scripts), supply the name of the file instead of entering the credentials on the command line. This option is recommended if you use WLST in script mode because it prevents you from storing unencrypted user credentials in your scripts.

For example, to create the user configuration file and key file:

```java
connect('adminusername', 'adminpassword', 'localhost:7001')
storeUserConfig('c:/myFiles/myuserconfigfile.secure', 'c:/myFiles/myuserkeyfile.secure')
```

To use the user configuration file and key file:

```java
connect(userConfigFile='c:/myfiles/myuserconfigfile.secure', userKeyFile='c:/myfiles/myuserkeyfile.secure')
```

See connect and storeUserConfig in WLST Command Reference for WebLogic Server.

- Invoke the `connect` command from a directory that contains the domain's `boot.properties` file. By default, when you create an Administration Server, WebLogic Server encrypts the credentials and stores them in a `boot.properties` file. WLST can use this file only if you start WLST from the domain directory.

For example, if you have not deleted the domain's `boot.properties` file, you can start WLST and invoke the `connect` command as follows:

```java
c:\mydomain\> java weblogic.WLST
wls:offline> connect()
```

See connect in WLST Command Reference for WebLogic Server.

Writing and Reading Encrypted Configuration Values

Some attributes of a WebLogic domain's configuration are encrypted to prevent unauthorized access to sensitive data. For example, the password that a JDBC data source uses to connect to an RDBMS is encrypted.

The attribute values are saved in the domain's configuration document as an encrypted string. In a running server instance, the values are available as an MBean attribute in the form of an encrypted byte array. The names of encrypted attributes end with `Encrypted`. For example, the `ServerMBean` exposes the password that is used to secure access through the IIOP protocol in an attribute named `DefaultIIOPPasswordEncrypted`.

Oracle recommends the following pattern for writing and reading encrypted attributes:

With WLST offline:

- To write an encrypted value, pass the name of the encrypted attribute and an unencrypted string to the `set` command. For example:
set('DefaultIIOPPasswordEncrypted', 'mypassword')

WLST encrypts the string and writes the encrypted value to the domain's configuration file.

See set in *WLST Command Reference for WebLogic Server*.

- WLST offline does not display the unencrypted value of an encrypted attribute. If you use the `ls` command to display management attributes, WLST offline returns asterisks as the value of encrypted attributes. If you use the `get` command, WLST offline returns a byte array that represents asterisks.

For example:

```
wls:/offline/wl_server/Server/examplesServer>ls()
returns
...  DefaultIIOPPasswordEncrypted    ********
...  
```

While

```
wls:/offline/wl_server/Server/examplesServer>get('DefaultIIOPPasswordEncrypted')
returns
array([42, 42, 42, 42, 42, 42, 42, 42], byte)
```

See ls and get in *WLST Command Reference for WebLogic Server*.

With WLST online, for each encrypted attribute, an MBean also contains an unencrypted version. For example, ServerMBean contains an attribute named `DefaultIIOPPasswordEncrypted` which contains the encrypted value and an attribute named `DefaultIIOPPassword`, which contains the unencrypted version of the value.

To write and read encrypted values with WLST online:

- To write an encrypted value, start an edit session. Then do either of the following:
  - Pass the name of the **unencrypted** attribute and an **unencrypted** string to the `set` command. For example:
    ```
    set('DefaultIIOPPassword', 'mypassword')
    ```
  - Pass the name of the encrypted attribute and an encrypted byte array to the `set` command. You can use the `encrypt` command to create the encrypted byte array (see `encrypt` in *WLST Command Reference for WebLogic Server*). For example:
    ```
    set('DefaultIIOPPasswordEncrypted', encrypt('mypassword'))
    ```

  - **Note:**

    Do not pass an unencrypted string to the encrypted attribute. The encrypted attribute assumes that the value you pass to it is already encrypted.

When you activate the edit, WebLogic Server writes the encrypted value to the domain's configuration file.
• To read the encrypted value of the attribute, pass the name of the encrypted attribute to the get command. For example:

```java
get('DefaultIIOPPasswordEncrypted')
```

returns

```java
array([105, 114, 111, 110, 115, 116, 101, 101, 108], byte)
```

Securing Access to Security Data

The user names and passwords of WebLogic Server users, security groups, and security roles are not stored in a WebLogic domain's XML configuration files. Instead, a WebLogic domain uses a separate software component called an Authentication provider to store, transport, and provide access to security data. Authentication providers can use different types of systems to store security data. The Authentication provider that WebLogic Server installs uses an embedded LDAP server.

When you use WLST offline to create a domain template, WLST packages the Authentication provider's data store along with the rest of the domain documents. If you create a domain from the domain template, the new domain has an exact copy of the Authentication provider's data store from the domain template.

You cannot use WLST offline to modify the data in an Authentication provider's data store.

You can, however, use WLST online to interact with an Authentication provider and add, remove, or modify users, groups, and roles. See Managing Security Data (WLST Online).

Main Steps for Using WLST in Interactive or Script Mode

When you use WLST interactive or script mode, you should understand how to invoke it, exit it, and its syntax.

The following sections summarize the steps for setting up and using WLST:

• Invoking WLST
• Exiting WLST
• Syntax for WLST Commands
• Considerations When Invoking Multiple WLST Instances

Invoking WLST

You can invoke WLST in the following ways:

• Execute the appropriate shell script for your environment and enter WLST commands from the WLST shell. See Invoking WLST Using Provided Shell Scripts.
• Execute the java weblogic.WLST command. See Invoking WLST Using the java Command.
• Run a prepared WLST script when invoking the WLST shell script. See Running Scripts.
• Execute the **WebLogic Scripting Tool** command from the **Start** menu (Windows only).

---

**Note:**

If you notice that it takes a long time to create or update a domain using WLST on a UNIX or Linux operating system, set the `CONFIG_JVM_ARGS` environment variable to the following value to resolve this issue:

```
-Djava.security.egd=file:/dev/urandom
```

See also **Running WLST from Ant.**

---

**Invoking WLST Using Provided Shell Scripts**

To invoke WLST using a shell script, execute the command that is appropriate for your environment. This is the recommended way to invoke WLST. Environment variables are automatically set when you invoke WLST this way. You can then enter WLST commands from within the WLST shell.

---

**Note:**

The following commands apply only to standalone WebLogic Server installations (those that do not include other Fusion Middleware components). Many Fusion Middleware components supply custom WLST commands. To use them, you must invoke WLST from the appropriate directory. See Using Custom WLST Commands in **Administering Oracle Fusion Middleware.**

---

**UNIX**

```
cd ORACLE_HOME/oracle_common/common/bin
./wlst.sh
```

*ORACLE_HOME* is the Oracle Home directory you specified at installation.

To set WLST properties in a UNIX environment prior to running WLST:

```
export WLST_PROPERTIES="-Dweblogic.security.SSL.ignoreHostnameVerification=true,
-Dweblogic.security.TrustKeyStore=DemoTrust"
./wlst.sh
```

---

**Note:**

To avoid log file name collisions when multiple WLST offline processes are running, set the following property in the environment prior to invoking WLST:

```
export WLST_PROPERTIES="-Dwlst.offline.log=./logs/debug.log"
```
Invoking WLST Using the java Command

To invoke WLST using the java command, you must first set up your environment for WLST. To set up your environment for WLST:

1. Install and configure the WebLogic Server software, as described in Installing the Oracle WebLogic Server and Coherence Software in Installing and Configuring Oracle WebLogic Server and Coherence.

2. Add WebLogic Server classes to the CLASSPATH environment variable and \WL_HOME\server\bin to the PATH environment variable, where WL_HOME refers to the full path to the WebLogic Server home directory.

You can use the setWLSEnv script to set the required variables:

- **Windows**: WL_HOME\server\bin\setWLSEnv.cmd
- **UNIX**: WL_HOME/server/bin/setWLSEnv.sh

On UNIX operating systems, the setWLSEnv.sh command does not set the environment variables in all command shells. Oracle recommends that you execute this command using the Korn shell or bash shell.

After setting up your environment, use the following syntax to invoke WLST. See Table 2-1 for a description of the WLST command options. See Table 2-2 for a description of the SSL arguments. Table 2-3 lists additional optional startup arguments for WLST.

```
java
  [ -Dweblogic.security.SSL.ignoreHostnameVerification=true
  -Dweblogic.security.TrustKeyStore=DemoTrust ]
  [ -Dweblogic.security.JavaStandardTrustKeyStorePassPhrase=password]
  [ -Dweblogic.security.CustomTrustKeyStoreFileName=filename
  -Dweblogic.security.TrustKeystoreType=jks ]
  [ -Dweblogic.security.CustomTrustKeyStorePassPhrase=password]
  [ -Dweblogic.security.SSL.hostnameVerifier=classname ]
  weblogic.WLST
  [ -loadProperties propertyFilename ]
  [ -skipWLSModuleScanning ]
  [ [-i] filePath.py ]
```

Table 2-1 describes the WLST command options.
**Table 2-1** Command Options for WLST

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-loadProperties propertyFilename</code></td>
<td>Use this option to load properties into the WLST session, where <code>propertyFilename</code> is the name of a file that contains <code>name=value</code> pairs. You cannot use this option when you are importing WLST as a Jython module (see Importing WLST as a Jython Module). Instead of using this command-line option, you can use the <code>loadProperties</code> WLST command. See <code>loadProperties</code> in WLST Command Reference for WebLogic Server.</td>
</tr>
<tr>
<td><code>-skipWLSModuleScanning</code></td>
<td>Use this option to reduce startup time by skipping package scanning and caching for WebLogic Server modules.</td>
</tr>
<tr>
<td><code>[-i] filePath.py</code></td>
<td>Use this option to run a WLST script, where <code>filePath.py</code> is an absolute or relative pathname for the script. By default, WLST exits (stops the Java process) after it executes the script. Include <code>-i</code> to prevent WLST from exiting. Note: If a WLST script named <code>wlstProfile.py</code> exists in the directory from which you invoke WLST or in <code>user.home</code> (the home directory of the operating system user account as determined by the JVM), WLST automatically runs the <code>wlstProfile.py</code> script; you do not need to specify the name of this WLST script file on the command-line. Instead of using this command-line option, you can use the following command after you start WLST: <code>execfile('filePath.py')</code>.</td>
</tr>
</tbody>
</table>

**Table 2-2** describes the SSL arguments.

**Table 2-2** SSL Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-Dweblogic.security.SSL.ignoreHostnameVerification=true</code></td>
<td>Use these system properties if you plan to connect WLST to a WebLogic Server instance through an SSL listen port, and if the server instance is using the demonstration SSL keys and certificates. <code>ignoreHostNameVerification</code> disables host name verification. <code>TrustKeyStore</code> causes WLST to trust the CA certificates in the demonstration trust keystore (<code>WL_HOME\server\lib\DemoTrust.jks</code>). <code>TrustKeyStore</code> is required if the server instance to which you want to connect is using the demonstration identity and certificates. By default, WLST trusts only the CA certificates in the Java Standard Trust keystore (<code>SDK_HOME\jre\lib\security\cacerts</code>).</td>
</tr>
<tr>
<td><code>-Dweblogic.security.JavaStandardTrustKeyStorePassPhrase=password</code></td>
<td>Password that was used to secure the Java Standard Trust keystore. If the Java Standard Trust keystore is protected by a password, and if you want to trust its CA certificates, you must use this argument. By default, the Java Standard Trust keystore is not protected by a password.</td>
</tr>
</tbody>
</table>
Table 2-2   (Cont.) SSL Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Dweblogic.security. CustomTrustKeyStoreFileName=filename</td>
<td>Causes WLST to trust the CA certificates in a custom keystore that is located at filename. You must use both arguments to trust custom keystores. The filename must match exactly the ServerMBean.CustomTrustKeyStoreFileName value persisted in config.xml; if the value specified in the CustomTrustKeyStoreFileName attribute is a relative pathname, you must also specify the same relative pathname in this argument.</td>
</tr>
<tr>
<td>-Dweblogic.security. CustomTrustKeyStorePassPhrase=password</td>
<td>Password that was used to secure the custom keystore. You must use this argument only if the custom keystore is protected by a password.</td>
</tr>
<tr>
<td>-Dweblogic.security.SSL.hostnameVerifier=classname</td>
<td>Name of a custom Host Name Verifier class. The class must implement the weblogic.security.SSL.HostnameVerifier interface.</td>
</tr>
</tbody>
</table>

Table 2-3 describes additional optional startup arguments for WLST.

Table 2-3   Additional WLST Startup Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Dwlst.debug.init=value</td>
<td>If true, debug mode is turned on. If false, debug mode is turned off. The default is false.</td>
</tr>
<tr>
<td>-Dweblogic.wlstHome=path1: path2: ...: pathn</td>
<td>A comma-separated list of directory paths from which to load .py files at startup. Note that the path separator is ‘:’ on UNIX operating systems and ‘;’ on Windows.</td>
</tr>
<tr>
<td>-Dwlst.offline.log=path</td>
<td>Sets the path and file name for WLST offline logging, for example, -Dwlst.offline.log=./logs/debug.log.</td>
</tr>
<tr>
<td>-Dwlst.offline.log.priority=debug</td>
<td>Sets the log priority level to debug for WLST offline logging.</td>
</tr>
</tbody>
</table>

Example 2-2   Examples of Invoking WLST Using the Java Command

To use WLST in script mode:

```
java weblogic.WLST c:/Oracle/Middleware/wlserver/common/templates/scripts/wlst/ distributeQueues.py
```

To run a WLST script on a WebLogic Server instance that uses the SSL listen port and the demonstration certificates:

```
java -Dweblogic.security.SSL.ignoreHostnameVerification=true
-Dweblogic.security.TrustKeyStore=DemoTrust weblogic.WLST
c:/Oracle/Middleware/wlserver/common/templates/scripts/wlst/distributeQueues.py
```

To use WLST in interactive mode:

```
java weblogic.WLST
```

To connect to a WebLogic Server instance after you start WLST in interactive mode:
Running Scripts

You can run WLST scripts in the following ways:

• Include the script in the `wlst.cmd` or `wlst.sh` command:

```bash
wlst.sh /oracle/middleware/wlserver/common/templates/scripts/wlst/
distributedQueues.py
```

• Include the script in the `java weblogic.WLST` command. You can either include the full path to the script, as shown here:

```bash
java weblogic.WLST c:/Oracle/Middleware/wlserver/common/templates/scripts/wlst/
distributedQueues.py
```

or you can navigate to the directory where the script is located before invoking WLST, in which case you only need to include the script name in the command:

```bash
cd C:/Oracle/Middleware/wlserver/common/templates/scripts/wlst
java weblogic.WLST distributeQueues.py
```

• After invoking interactive WLST, use the `execfile()` command:

```bash
wls:offlne> execfile('c:/Oracle/Middleware/wlserver/common/templates/scripts/
wlst/distributedQueues.py')
```

**Note:**

If you use backslashes (`\`) in the path name, be aware that WLST interprets them as a special character, which you must escape. See Syntax for WLST Commands.

Invoking WLST From the Start Menu

On Windows, a shortcut on the Start menu sets the environment variables and invokes WLST (Oracle WebLogic > WebLogic Server > Tools > WebLogic Scripting Tool).

Exiting WLST

To exit WLST, enter the `exit()` command:

```bash
wls:/mydomain/serverConfig> exit()
Exiting WebLogic Scripting Tool ...
```

Syntax for WLST Commands

Follow this syntax when entering WLST commands or writing them in a script:

• Command names and arguments are case sensitive.

• Enclose arguments in single or double quotes. For example, 'newServer' or "newServer".
If you specify a backslash character (\) in a string, either precede the backslash with another backslash or precede the entire string with a lower-case _r_ character. The \ or _r_ prevents Jython from interpreting the backslash as a special character.

For example when specifying a file path name that contains a backslash:

```python
readTemplate('c:\userdomains\mytemplates\mytemplate.jar', 'Expanded')
```

or

```python
readTemplate(r'c:\userdomains\mytemplates\mytemplate.jar', 'Expanded')
```

**Note:**

When specifying path names in WLST commands on a Windows machine, you can use a forward slash (/). For example:

```python
readTemplate('c:/userdomains/templates/template.jar', 'Expanded')
```

is as valid as

```python
readTemplate('c:\userdomains\templates\template.jar', 'Expanded')
```

When using WLST offline, the following characters are not valid in names of management objects: period (.), forward slash (/), or backward slash (\).

If you need to _cd_ to a management object whose name includes a forward slash (/), surround the object name in parentheses. For example:

```python
cd('JMSQueue/(jms/REGISTRATION_MDB_QUEUE)')
```

Considerations When Invoking Multiple WLST Instances

At WLST startup, Jython stores information in a temporary directory based on the username of the person who started WLST. If the same user invokes two different WLST instances which will run at the same time, conflicts may occur when saving this information in the temporary directory.

If you plan to invoke multiple WLST instances with the same username, Oracle recommends that you define the `java.io.tmpdir` system property to point to a temporary directory that will not be shared by other WLST instances that are running at the same time. For example, include the following parameter in the Java command you use to start WLST:

```
-Djava.io.tmpdir=C:\mytempdir
```

Redirecting Error and Debug Output to a File

You can redirect error and debug information to a file.

To redirect WLST information, error, and debug messages from standard output to a file, enter

```python
redirect(outputFile, [toStdOut])
```

```python
stopRedirect()
```
This command also redirects the output of the dumpStack() and dumpVariables() commands.

For example, to redirect WLST output to the logs/wlst.log file under the directory from which you started WLST, enter the following command:

```
wlst:/mydomain/serverConfig> redirect('./logs/wlst.log')
```

See redirect and stopRedirect in WLST Command Reference for WebLogic Server.

**Getting Help for WLST**

WLST provides command line help for each command.

To display information about WLST commands and variables, enter the help command.

If you specify the help command without arguments, WLST summarizes the command categories. To display information about a particular command, variable, or command category, specify its name as an argument to the help command. To list a summary of all online or offline commands from the command line using the following commands, respectively:

```
help('online')
help('offline')
```

The help command supports a query. For example, `help('get*')` displays the syntax and usage information for all commands that begin with `get`.

For example, to display information about the `disconnect` command, enter the following command:

```
wlst:/mydomain/serverConfig> help('disconnect')
```

The command returns the following:

Description:
Disconnect from a WebLogic Server instance.
Syntax:
disconnect()
Example:
```
wls:/mydomain/serverConfig> disconnect()
```

**Running WLST from Ant**

WebLogic Server provides a custom Ant task, `wlst`, which invokes a WLST script from an Ant build file. You can create a WLST script (.py) file and then use this task to invoke the script file, or you can create a WLST script in a nested element within this task.

The `wlst` task is predefined in the version of Ant that is installed with WebLogic Server. To add this version of Ant to your build environment, run the following script, where `WL_HOME` is the directory in which you installed WebLogic Server.

```
WL_HOME\server\bin\setWLSEnv.cmd (or setWLSEnv.sh on UNIX)
```
On UNIX operating systems, the `setWLSEnv.sh` command does not set the environment variables in all command shells. Oracle recommends that you execute this command using the Korn shell or bash shell.

If you want to use the `wlst` task with your own Ant installation, include the following task definition in your build file:

```
<taskdef name="wlst"
    classname="weblogic.ant.taskdefs.management.WLSTTask" />
```

### WLST Task Parameters

`Table 2-4` lists the `wlst` task parameters that you specify as attributes of the `<wlst>` element.

#### Table 2-4  `wlst` Parameters

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties=&quot;propsFile&quot;</td>
<td>Name and location of a properties file that contains name-value pairs that you can reference in your WLST script.</td>
<td>No</td>
</tr>
<tr>
<td>fileName=&quot;fileName&quot;</td>
<td>Name and location of the WLST script file that you would like to execute. If the specified WLST script file does not exist, this task fails.</td>
<td>Yes, if no nested <code>&lt;script&gt;</code> is used.</td>
</tr>
<tr>
<td>arguments=&quot;arglist&quot;</td>
<td>List of arguments to pass to the script. These arguments are accessible using the <code>sys.argv</code> variable.</td>
<td>No</td>
</tr>
<tr>
<td>failOnError=&quot;value&quot;</td>
<td>Boolean value specifying whether the Ant build will fail if this task fails.</td>
<td>No; default is true.</td>
</tr>
<tr>
<td>executeScriptBeforeFile=&quot;value&quot;</td>
<td>Boolean value specifying whether this task invokes the script in the nested <code>&lt;script&gt;</code> element before the script file specified by the <code>fileName</code> attribute. This attribute defaults to <code>true</code>, specifying that the embedded script is invoked first.</td>
<td>No; default is true.</td>
</tr>
<tr>
<td>debug=&quot;value&quot;</td>
<td>Boolean value specifying whether debug statements should be output when this task is executed.</td>
<td>No; default is false.</td>
</tr>
<tr>
<td>replaceProperties=&quot;value&quot;</td>
<td>Boolean value that specifies whether ant property expansion will work in the specified WLST script.</td>
<td>No; default is true.</td>
</tr>
</tbody>
</table>

### WLST Task Parameters Specified as Nested Elements

`Table 2-5` describes the `wlst` task parameters that you specify as nested elements of the `<wlst>` element.

#### Table 2-5  Parameters Specified as Nested Elements

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>The script to be executed.</td>
<td>Required, if you do not use the <code>fileName</code> attribute to name a script file.</td>
</tr>
</tbody>
</table>
Table 2-5 (Cont.) Parameters Specified as Nested Elements

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>classpath</td>
<td>The classes to add to the classpath. This element is the standard Ant <code>classpath</code> element. You can specify a reference to a <code>path</code> element that you have defined elsewhere in the build file or nest elements that specify the files and directories to add to the classpath. See &quot;Path-like Structures&quot; in Apache Ant 1.7.1 Manual at <a href="http://ant.apache.org/manual/using.html#path">http://ant.apache.org/manual/using.html#path</a></td>
<td>No. Use if your script requires classes that are not already on the classpath.</td>
</tr>
</tbody>
</table>

WLST Ant Task Examples

The following sections show examples for the createServer, loop, and error targets.

CreateServer Target Example

In the following example, the createServer target does the following:

- Adds classes to the task’s classpath.
- Executes the script in the nested `script` element. This script connects to a WebLogic domain’s Administration Server at t3://localhost:7001. (Note that `executeScriptBeforeFile` is set to `true`, so this is invoked before the specified WLST script file.)
- Executes the script file `myscript.py` that is specified by the `fileName` attribute. The script file is located in the directory from which you started Ant. You could use such a file to start an edit session, create a new server, save, and activate the configuration changes.
- Defines three arguments that are passed to the script. These arguments are accessible using the `sys.argv` variable.
- Continues execution, as per the `failOnError="false"` setting, even if the `wlst` Ant task fails to execute.
- Disables debugging.

```xml
<target name="configServer">
  <wlst debug="false" failOnError="false" executeScriptBeforeFile="true" fileName="/myscript.py">
    <classpath>
      <pathelement location="${my.classpath.dir}"/>
    </classpath>
    <script>
      connect('adminusername','adminpassword','t3://localhost:7001')
    </script>
  </wlst>
</target>
```
Loop Target Example

In the following example, the loop target does the following:

- Adds classes to the task's classpath using a path reference.
- Executes the WLST script file myscript.py in the directory from which you started Ant. (Note that executeScriptBeforeFile is set to false, so the WLST script file is executed first, before the embedded script.)
- Executes the embedded script to connect to the server at t3://localhost:7001 and access and print the list of servers in the WebLogic domain.
- Results in a build failure if the wlst task fails to execute, as per the failOnError="true" setting.
- Enables debugging.

```xml
<path id="my.classpath">
  <pathelement location="${my.classpath.dir}"/>
</path>

<target name="loop">
  <wlst debug="true" executeScriptBeforeFile="false" fileName="./myscript.py" failOnError="true">
    <classpath>
      <pathelement location="${my.classpath.dir}"/>
    </classpath>
    <script replaceProperties="true">
      print 'In the target loop'
      connect('${admin.user}','${admin.password}','t3://localhost:7001')
      svrs = cmo.getServers()
      print 'Servers in the domain are'
      for x in svrs: print x.getName()
    </script>
  </wlst>
</target>
```

Error Target Example

In the following example, the error target:

- Executes the embedded script to print the variable, thisWillCauseNameError.
- Continues execution, as per the failOnError="false" setting, even if the thisWillCauseNameError variable does not exist and the wlst Ant task fails to execute.
- Enables debugging.

```xml
<target name="error">
  <wlst debug="true" failOnError="false">
    <script>print thisWillCauseNameError</script>
  </wlst>
</target>
```
Importing WLST as a Jython Module

Advanced users can import WLST from WebLogic Server as a Jython module. After importing WLST, you can use it with your other Jython modules and invoke Jython commands directly using Jython syntax.

The main steps include converting WLST definitions and method declarations to a .py file, importing the WLST file into your Jython modules, and referencing WLST from the imported file.

To import WLST as a Jython module:

1. Invoke WLST.
   ```
   cd ORACLE_HOME/oracle_common/common/bin
   ./wlst.sh
   wls:/offline>
   ```

2. Use the `writeIniFile` command to convert WLST definitions and method declarations to a .py file.
   ```
   wls:/offline> writeIniFile("wl.py")
   The Ini file is successfully written to wl.py
   wls:/offline>
   ```

3. Open a new command shell and invoke Jython directly by entering the following command:
   ```
   c:\> java org.python.util.jython
   ```
   The Jython package manager processes the JAR files in your classpath. The Jython prompt appears:
   ```
   >>>
   ```

4. Import the WLST module into your Jython module using the Jython `import` command.
   ```
   >>>import wl
   ```

5. Now you can use WLST methods in the module. For example, to connect WLST to a server instance:
   ```
   wl.connect('username','password')
   ....
   ```
Customizing WLST

You can customize WLST using the WLST home directory, which is located at \texttt{WL\_HOME/common/wlst}, by default, where \texttt{WL\_HOME} refers to the top-level installation directory for WebLogic Server. All Python scripts that are defined within the WLST home directory are imported at WLST startup.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|l|}
\hline

\hline
WLST commands & Create a Python script defining the new commands and copy that file to \texttt{WL\_HOME/common/\_wlst}. & Sample Scripts For Defining new WLST Commands
\hline
WLST commands within a library & Create a Python script defining the new commands and copy that file to \texttt{WL\_HOME/common/\_wlst/lib}. The scripts located within this directory are imported as Jython libraries. & Sample Scripts For Defining new WLST Commands
\hline
\end{tabular}
\end{table}

Table 2-6 describes ways to customize WLST.
### Table 2-6  (Cont.) Customizing WLST

<table>
<thead>
<tr>
<th>To define custom...</th>
<th>Do the following...</th>
<th>For a sample script, see...</th>
</tr>
</thead>
<tbody>
<tr>
<td>WLST commands as a Jython module</td>
<td>Create a Python script defining the new commands and copy that file to <code>WL_HOME/common/wlst/modules</code>. This script can be imported into other Jython modules, as described in Importing WLST as a Jython Module.</td>
<td><code>WL_HOME/common/wlst/modules/wlstModule.py</code> A JAR file, <code>jython-modules.jar</code>, which contains all of the Jython modules that are available in Jython 2.2.1, is also available within this directory.</td>
</tr>
<tr>
<td>Integrated help for custom WLST commands</td>
<td>Define the help text for each command group and command in a resource bundle. Use <code>addHelpCommandGroup</code> to add a command group to the list of command groups that are displayed by the <code>help()</code> command. Use <code>addHelpCommand</code> to add a command to the list of commands that is displayed by the <code>help('commandGroup')</code> command. Typically, you will call the <code>addHelpCommandGroup</code> and <code>addHelpCommand</code> from the <code>.py</code> file that contains the definition of your custom commands. See Adding Integrated Help for Custom Commands.</td>
<td>Not applicable.</td>
</tr>
</tbody>
</table>

### Adding Integrated Help for Custom Commands

You can customize WLST to include integrated help for any custom WLST commands you've defined. To add integrated help, you define the help text for each command group and command in a resource bundle, which can be either a class or a property resource file. You can define the help for multiple command groups in the same resource bundle.

#### Note:
The resource bundle must be present in the classpath.

The resource bundle contains the following entries for each command group:

```xml
<commandGroup>_ShortDescription=
<short description of command group>
<commandGroup>_Description=
\n<description of command group>
```

For example, the following lines define the short description and description for the command group `navigate`:

```python
navigate_ShortDescription=
Lists commands for navigating the hierarchy of beans.
navigate_Description=
\nNavigates the hierarchy of beans and controls the prompt display. \n```
When you enter the `help()` command to display a list of command groups, the short description for `navigate` is displayed in the listing:

```plaintext
wls:/offline> help()
WLST is a command line scripting tool to configure and administer a WebLogic Server. Try:
  help('all') List all WLST commands available.
  help('browser') List commands for browsing the hierarchy.
  help('navigate') List commands for navigating the bean hierarchy.
```

When you enter the `help('navigate')` command, the description is displayed above the list of commands in the group:

```plaintext
wls:/offline> help('navigate')
Navigates the hierarchy of beans and controls the prompt display.
  help('mycd') Navigate the hierarchy of beans.
  help('myprmpt') Toggle the display of path information at the prompt.
```

The resource bundle contains help text entries for commands using a standard pattern. For each command name, there are several entries:

- `<commandName>_ShortDescription`
- `<commandName>_Description`
- `<commandName>_Example`
- `<commandName>_Syntax`

The following defines the help for `mycd` command:

```plaintext
mycd_ShortDescription=
  Navigate the hierarchy of beans.

mycd_Description=
  \n  Navigate the hierarchy of configuration or runtime beans. This \n  command uses a model that is similar to navigating a file system \n  in a Windows or UNIX command shell. For example, to navigate back \n  to a parent configuration or runtime bean, enter `mycd("..")`. The \n  character string .. (dot-dot) refers to the directory immediately \n  above the current directory. To get back to the root configuration \n  bean after navigating to a configuration or runtime bean that is \n  deep in the hierarchy, enter `mycd("/")`. \n
mycd_Example=
  wls:/mydomain/serverConfig> mycd('Servers')\n  wls:/mydomain/serverConfig/Servers> mycd('myserver')\n  wls:/mydomain/serverConfig/Servers/myserver>mycd('..//..')\n  wls:/mydomain/serverConfig>

mycd_Syntax=
  mycd(mbeanName)
  \n  - mbeanName = Path to the configuration or runtime bean in the namespace.\n```

The short description is shown to the right of the command name when you enter the `help('commandGroup')` command to list all commands in a group:

```plaintext
wls:/offline> help('navigate')
Navigates the hierarchy of beans and controls the prompt display.
  help('mycd') Navigate the hierarchy of beans.
  help('myprmpt') Toggle the display of path information at the prompt.
```
The description, example, and syntax are displayed when you enter the
help('commandName') command:

wls:/offline> help('mycd')

Description:

Navigate the hierarchy of configuration or runtime beans. This
command uses a model that is similar to navigating a file system
in a Windows or UNIX command shell. For example, to navigate back
to a parent configuration or runtime bean, enter mycd(".."). The
character string .. (dot-dot) refers to the directory immediately
above the current directory. To get back to the root configuration
bean after navigating to a configuration or runtime bean that is
deep in the hierarchy, enter mycd("/").

Syntax:
mycd(mbeanName)
- mbeanName = Path to the configuration or runtime bean in the namespace.

Example:

wls:/mydomain/serverConfig> mycd('Servers')
wls:/mydomain/serverConfig/Servers> mycd('myserver')
wls:/mydomain/serverConfig/Servers/myserver>mycd('..../..')
wls:/mydomain/serverConfig>

After defining the help text in the resource bundle, use addHelpCommandGroup to add the
command group name to the list of command groups output by the help() command. Use
addHelpCommand to add each command in a group to the list of commands
displayed by the help('commandGroup') command. See addHelpCommandGroup and
addHelpCommand in the WLST Command Reference for WebLogic Server.

For more information on resource bundles and localization, refer to http://
download.oracle.com/javase/6/docs/api/java/util/ResourceBundle.html.

Sample Scripts For Defining new WLST Commands

The following sample script demonstrates how to define a new WLST command.

def wlstHomeSample():
    print 'Sample wlst home command'

Within this script, the wlstHomeSample() command is defined, which prints a text string:

wls:/offline> wlstHomeSample()
Sample wlst home command

When defining new WLST commands in this way, store the .py file in the WL_HOME/
common/wlst directory.

The following sample script demonstrate usage of the WLST lib directory, where
layered products and ISVs can add commands to WLST in their namespace. The
script has the same structure as the previous example. It differs only in that it is stored
in the WL_HOME/common/wlst/lib directory instead of the WL_HOME/common/wlst
directory.

def wlstExampleCmd():
    print 'Example command'
Within this script, the `wlstExampleCmd()` command is defined, which prints a text string:

```
wlst:/offline> wlstLibSample.wlstExampleCmd()
Example command
```

Note that you must create the WLST `lib` directory if it does not already exist.
Creating WebLogic Domains Using WLST Offline

You can create and configure WebLogic domains using WebLogic Scripting Tool (WLST) offline. WLST enables you to create a new WebLogic domain or update an existing WebLogic domain without connecting to a running WebLogic Server (that is, using WLST offline)—supporting the same functionality as the Configuration Wizard.

Topics:

• Creating and Using a Domain Template (Offline)
• Creating and Updating a WebLogic Domain
• Browsing Information About the Configuration Hierarchy (Offline)
• Editing a WebLogic Domain (Offline)
• Alternative: Using the configToScript Command
• Considerations for Clusters, JDBC, and JMS Resources
• Creating a Managed Server Domain on a Remote Machine

For information about sample scripts that you can use to create WebLogic domains, see WLST Offline Sample Scripts.

For more information about the Configuration Wizard, see Overview of the Configuration Wizard in Creating WebLogic Domains Using the Configuration Wizard.

Creating and Using a Domain Template (Offline)

A domain template is a JAR file that contains domain configuration documents, applications, security data, startup scripts, and other information needed to create a WebLogic domain.

Note:

If you notice that it takes a long time to create or update a domain using WLST, set the CONFIG_JVM_ARGS environment variable to the following value to resolve this issue:

-Djava.security.egd=file:/dev/urandom

To create and use a domain template, perform the steps described in Table 3-1.
Table 3-1  Steps for Creating a Domain Template (Offline)

<table>
<thead>
<tr>
<th>To...</th>
<th>Use this command...</th>
<th>See...</th>
</tr>
</thead>
</table>
| Open an existing WebLogic domain or select the templates for the domain | readDomain(domainDirName)  
selectTemplate(templateName, TemplateVersion)  
loadTemplates() | readDomain, selectTemplate and loadTemplates in WLST Command Reference for WebLogic Server |
| (Optional) Modify the WebLogic domain | Browsing and editing commands | Browsing Information About the Configuration Hierarchy (Offline)  
Editing a WebLogic Domain (Offline) |
| Set the password for the default user, if it is not already set.  
The default username and password must be set before you can write the domain template. | cd(''/Security/domainname/User/username')  
cmo.setPassword('password') | WLST Offline Sample Scripts |
| Write the domain configuration information to a domain template. | writeTemplate(templateName) | writeTemplate in WLST Command Reference for WebLogic Server |
| Use the template to create a domain. | createDomain(domainTemplate,  
domainDir, user, password) | createDomain in WLST Command Reference for WebLogic Server |

Example 3-1 shows the basic commands needed to create a domain template from an existing domain:

Example 3-1  Creating a Domain Template From an Existing Domain

```
# Read the domain from the domain home located at /domains/mydomain
readDomain('/domains/mydomain')

# Create the template jar mydomain.jar in /templates
writeTemplate('/templates/mydomain.jar')
```

Creating and Updating a WebLogic Domain

When creating or updating a WebLogic domain, there are three phases to the configuration session:

- Load and merge the configuration using readTemplate (for creating) or readDomain (for updating) optionally followed by one or more addTemplate() calls.
- Modify the configuration by navigating the configuration tree and updating attributes.
- Save the configuration using writeDomain (for creating), updateDomain (for updating), or writeTemplate (for creating a template), followed by closeTemplate or closeDomain as appropriate.
The following examples demonstrate the sequence of commands for creating a domain from a single template and creating a domain from multiple templates. More extensive sample WLST offline scripts are available in the following directory:

```
ORACLE_HOME/wlsserver/common/templates/scripts/wlst
```

Example 3-2 shows the basic sequence of commands needed to create a domain from a single template. This example creates a basic WebLogic Server domain from the wls.jar template.

**Example 3-2  Creating a Domain From a Single Template**

```
# Read the template to use for creating the domain
readTemplate('oracle_home/middleware/wlserver/common/templates/wls/wls.jar')

# Set the listen address and listen port for the Administration Server
set('ListenAddress', 'admin_username')
set('ListenPort', 7001)

# Enable SSL on the Administration Server and set the SSL listen address and port
create('AdminServer', 'SSL')
set('Enabled', 'true')
set('ListenPort', 7002)

# Set the domain password for the WebLogic Server administration user
setOption('OverwriteDomain', 'true')
writeDomain('/domains/mydomain')
closeTemplate()
exit()
```

Example 3-3 shows how to create a new domain using a domain template and one or more extension templates. This example creates the basic WebLogic Server domain from the wls.jar template and then extends the domain by adding the WebLogic Web Services Extension template to the domain.

**Example 3-3  Creating a Domain From Multiple Templates**

```
# Select the WebLogic domain template, and then load it
selectTemplate('Basic WebLogic Server Domain')
selectTemplate('WebLogic Advanced Web Services for JAX-RPC Extension')
loadTemplates()

# Set the listen address and listen port for the Administration Server
set('ListenAddress', 'admin_username')
set('ListenPort', 7001)

# Enable SSL on the Administration Server and set the SSL listen address and port
```
create('AdminServer', 'SSL')
cd('SSL/AdminServer')
set('Enabled', 'True')

set('ListenPort', 7002)

# Set the domain password for the WebLogic Server administration user
cd('/')
cd('/Security/base_domain/User/adminusername')
cmo.setPassword('adminpassword')

# If the domain already exists, overwrite the domain
setOption('OverwriteDomain', 'true')

# write the domain and close the templates
writeDomain('/domains/mydomain')

# Select the WebServices for JAX-RPC template, and
# then load it
selectTemplate('WebLogic Advanced Web Services for JAX-RPC Extension')
loadTemplates()
closeTemplate()
exit()

Browsing Information About the Configuration Hierarchy (Offline)

WLST offline provides read and write access to the configuration data that is persisted in the WebLogic domain's config directory or in a domain template JAR created using Template Builder. This data is a collection of XML documents and expresses a hierarchy of management objects.

The schemas that define a WebLogic domain's configuration document are in the following locations:

- [http://xmlns.oracle.com/weblogic/domain/1.0/domain.xsd](http://xmlns.oracle.com/weblogic/domain/1.0/domain.xsd)
- [http://xmlns.oracle.com/weblogic/security/1.0/security.xsd](http://xmlns.oracle.com/weblogic/security/1.0/security.xsd)
- [http://xmlns.oracle.com/weblogic/weblogic-diagnostics/1.0/weblogic-diagnostics.xsd](http://xmlns.oracle.com/weblogic/weblogic-diagnostics/1.0/weblogic-diagnostics.xsd)

- In JAR files under WL_HOME/server/lib/schema, where WL_HOME is the directory in which you install WebLogic Server. Within this directory:
  - The domain.xsd document is represented in the weblogic-domain-binding.jar under the pathname META-INF/schemas/schema-0.xsd.
  - The security.xsd document is represented in the weblogic-domain-binding.jar under the pathname META-INF/schemas/schema-1.xsd.
  - The weblogic-diagnostics.xsd document is represented in the diagnostics-binding.jar under the pathname META-INF/schemas/schema-0.xsd.

WLST represents this hierarchy as a file system. The root of the file system is the management object that represents the WebLogic domain. Below the domain directory
is a collection of directories for managed-object types; each instance of the type is a
subdirectory under the type directory; and each management attribute and operation is
a file within a directory. The name of an instance directory matches the value of the
management object's Name attribute. If the management object does not have a Name
attribute, WLST generates a directory name using the following pattern:
NO_NAME_number, where number starts at 0 (zero) and increments by 1 for each additional
instance.

**Note:**

As a performance optimization, WebLogic Server does not store most of its
default values in the domain's configuration files. In some cases, this
optimization prevents entire management objects from being displayed by
WLST offline (because WebLogic Server has never written the
Corresponding XML elements to the domain's configuration files). For
example, if you never modify the default logging severity level for a
WebLogic domain while the domain is active, WLST offline will not display
the domain's Log management object.

If you want to change the default value of attributes whose management
object is not displayed by WLST offline, you must first use the create
command to create the management object. Then you can cd to the
management object and change the attribute value. See create in WLST
Command Reference for WebLogic Server.

To navigate the hierarchy, you use such WLST commands as cd, ls, and pwd in a
similar way that you would navigate a file system in a UNIX or Windows command
shell (see Table 3-2).

<table>
<thead>
<tr>
<th>To...</th>
<th>Use this command...</th>
<th>See this section in WLST Command Reference for WebLogic Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Navigate the hierarchy of management objects</td>
<td>cd(path)</td>
<td>cd</td>
</tr>
<tr>
<td>List child attributes or management objects for the current management object</td>
<td>ls({'a'</td>
<td>'c'})</td>
</tr>
<tr>
<td>Toggle the display of the management object navigation path information at the prompt</td>
<td>prompt({'off'</td>
<td>'on'})</td>
</tr>
<tr>
<td>Display the current location in the configuration hierarchy</td>
<td>pwd()</td>
<td>pwd</td>
</tr>
<tr>
<td>Display all variables used by WLST</td>
<td>dumpVariables()</td>
<td>dumpVariables</td>
</tr>
<tr>
<td>Display the stack trace from the last exception that occurred while performing a WLST action</td>
<td>dumpStack()</td>
<td>dumpStack</td>
</tr>
</tbody>
</table>
Editing a WebLogic Domain (Offline)

You can edit a WebLogic domain offline.

To edit a WebLogic domain using WLST offline, you can perform any of the tasks defined in Table 3-3.

### Table 3-3 Editing a WebLogic Domain

<table>
<thead>
<tr>
<th>To...</th>
<th>Use this command...</th>
<th>See this section in WLST Command Reference for WebLogic Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add an application to a WebLogic domain</td>
<td>selectTemplate(templateName)</td>
<td>selectTemplate and loadTemplates</td>
</tr>
<tr>
<td></td>
<td>loadTemplate(templateName)</td>

<td>setOption(optionName, value)</td>
<td>setOption</td>
</tr>
<tr>
<td>Load SQL files into a database</td>
<td>loadDB(dbVersion, connectionPoolName)</td>
<td>loadDB</td>
</tr>
</tbody>
</table>

**Note:**

If you notice that it takes a long time to create or update a domain using WLST, set the `CONFIG_JVM_ARGS` environment variable to the following value to resolve this issue:

-Djava.security.egd=file:/dev/urandom
Alternative: Using the `configToScript` Command

WLST includes a command, `configToScript`, that reads an existing WebLogic domain and outputs a WLST script that can recreate the WebLogic domain. See `configToScript` in WLST Command Reference for WebLogic Server.

**Note:**

If you use `configToScript` for a domain that contains other Fusion Middleware components in addition to WebLogic Server, be aware that `configToScript` does not include the configuration for those components in the resulting WLST script. Only the WebLogic Server configuration is included in the script.

`configToScript` will be deprecated in a future release. Oracle recommends that you use `pack` and `unpack` to recreate the domain on remote servers. See Overview of the Pack and Unpack Commands in Creating Templates and Domains Using the Pack and Unpack Commands.

Unlike creating and using a domain template, the `configToScript` Command creates multiple files that must be used together. (A domain template is a single JAR file.) In addition, the script that the `configToScript` command creates:

- Can only be run by WLST.
  
  A domain template can be used by WLST or the Configuration Wizard.

- Requires a WebLogic Server instance to be running. If a server isn't running, the script starts one.
  
  WLST offline or the Configuration Wizard can use domain templates to create WebLogic domains without starting a server instance.

- Contains only references to applications and other resources. When you run the generated script, the applications and resources must be accessible to the WebLogic domain through the file system.
  
  A domain template is a JAR file that contains all applications and resources needed to create a WebLogic domain. Because the domain template is self-contained, you can use it to create WebLogic domains on separate systems that do not share file systems.

Considerations for Clusters, JDBC, and JMS Resources

When using WLST offline to create or extend a clustered WebLogic domain with a template that has applications containing application-scoped JDBC and/or JMS resources, you may need to perform additional steps (after the domain is created or extended) to make sure that the application and its application-scoped resources are targeted and deployed properly in a clustered environment. For more information on the targeting and deployment of application-scoped modules, see Deploying Applications and Modules with weblogic.deployer in Deploying Applications to Oracle WebLogic Server.
If you want to use JDBC resources to connect to a database, modify the environment as the database vendor requires. Usually this entails adding driver classes to the CLASSPATH variable and vendor-specific directories to the PATH variable. To set the environment that the sample Derby database requires as well as add an SDK to the PATH variable and the WebLogic Server classes to the CLASSPATH variable, invoke the following script:

(Windows) \ORACLE\HOME\user_projects\domains\wl_server\setExamplesEnv.cmd
(UNIX) \ORACLE\HOME\user_projects\domains\wl_server\setExamplesEnv.sh

Creating a Managed Server Domain on a Remote Machine

If your WebLogic domain contains multiple Managed Servers, and each Managed Server domain directory is located on a remote machine on which the Administration Server does not reside, you can use the WLST writeTemplate Command in online mode. When you execute the writeTemplate Command while connected to the Administration Server from a remote machine, it dynamically packs the domain on the Administration Server into a template JAR file and transfers the template JAR to the specified directory.

The following sample WLST script demonstrates how to use writeTemplate to create or update a Managed Server domain on a remote machine. Run the script on each remote machine in the domain.

```python
import os

wlsHome = os.getenv('WL_HOME')
mwHome = os.path.join(wlsHome, '..')

#Substitute the administrator user name and password values below as needed
connect('adminusername','adminpassword','localhost:7001')

#The path on the local machine where the template will be created,
#it should not already exist.
templatePath = 'user_templates/myTemplate.jar'

#get the packed template from the Administration Server
writeTemplate(templatePath)

disconnect()

#select and load the template that was downloaded from the Administration Server.
selectCustomTemplate('templatethread')
loadTemplates()

domainPath = 'domains/myRemoteDomain'

create the domain
writeDomain(domainPath)
```
Managing the Server Life Cycle

You can use the WebLogic Scripting Tool (WLST) to manage and monitor the server life cycle. During its lifetime, a server can transition through a number of operational states, such as shutdown, starting, standby, admin, resuming, and running.

Topics:

• Using WLST and Node Manager to Manage Servers
• Starting and Managing Servers Without Node Manager

For more information about the server life cycle, see Understanding Server Life Cycle in *Administering Server Startup and Shutdown for Oracle WebLogic Server*.

For information on other techniques for starting and stopping server instances, see Starting and Stopping Servers in *Administering Server Startup and Shutdown for Oracle WebLogic Server*.

Using WLST and Node Manager to Manage Servers

Node Manager is a utility that enables you to control the life cycles of multiple servers through a single WLST session and a single network connection. (It can also automatically restart servers after a failure.)

For more information about Node Manager, see Node Manager Overview in *Administering Node Manager for Oracle WebLogic Server*.

You can use WLST to do the following with Node Manager:

• Start a Node Manager.
• Connect to a Node Manager, then use the Node Manager to start and stop servers on the Node Manager machine. See Figure 4-1.

Figure 4-1  Starting Servers on a Machine
A Node Manager process may be associated with a specific WebLogic domain or it may be associated with a particular machine. If associated with a domain, you can use the Node Manager process only to control server instances in that domain. If associated with a machine, you can use the same Node Manager process to control server instances in any WebLogic domain, as long as the server instances reside on the same machine as the Node Manager process.

For information about the commands that WLST can use while acting as a Node Manager client, see Node Manager Commands in *Administering Node Manager for Oracle WebLogic Server*. For information about Node Manager configuration, see *Default Node Manager Configuration* *Administering Node Manager for Oracle WebLogic Server*.

- Connect to an Administration Server and then use the Administration Server to start and stop servers in the domain. See Figure 4-2.

**Figure 4-2  Starting Servers in a WebLogic Domain**

In this case, WLST is a client of the Administration Server, and the Administration Server uses one or more Node Managers to start Managed Servers.

For information about the life cycle commands that WLST can use while acting as an Administration Server client, see Life Cycle Commands in *WLST Command Reference for WebLogic Server*.

### Using Node Manager to Start Servers on a Machine

WLST can connect to a Node Manager that is running on any machine and start one or more WebLogic Server instances on the machine. A WebLogic domain’s Administration Server does not need to be running for WLST and Node Manager to start a server instance using this technique.

To connect WLST to a Node Manager and start servers:
1. Configure Node Manager to start servers.
   See Configuring Java Node Manager in Administering Node Manager for Oracle WebLogic Server.

2. Start WLST.

3. Start Node Manager.
   If Node Manager is not already running, use the startNodeManager script in either
   $DOMAIN_HOME/bin or $WL_HOME/server/bin to start it. See Starting Java-based Node
   Manager Using Scripts in Administering Node Manager for Oracle WebLogic Server.

4. Connect WLST to a Node Manager by entering the nmConnect command.

   wls:/offline>nmConnect('username','password','nmHost','nmPort',
   'domainName','domainDir','nmType')

   For example,

   nmConnect('adminusername', 'adminpassword', 'localhost', '5556',
   'mydomain','c:/bea/user_projects/domains/mydomain','SSL')
   Connecting to Node Manager ...
   Successfully connected to Node Manager.
   wls:/nm/mydomain>

   For detailed information about the nmConnect command arguments, see
   nmConnect in WLST Command Reference for WebLogic Server.

5. Use the nmStart Command to start a server.

   wls:/nm/mydomain>nmStart('AdminServer')
   starting server AdminServer
   ...
   Server AdminServer started successfully
   wls:/nm/mydomain>

6. Monitor the status of the Administration Server by entering the nmServerStatus command.

   wls:/nm/mydomain>nmServerStatus('serverName')
   RUNNING
   wls:/nm/mydomain>

7. Stop the server by entering the nmKill command.

   wls:/nm/mydomain>nmKill('serverName')
   Killing server AdminServer
   Server AdminServer killed successfully
   wls:/nm/mydomain>

   For more information about WLST Node Manager commands, see Node Manager
   Commands in WLST Command Reference for WebLogic Server.

Using Node Manager to Start Managed Servers in a WebLogic Domain or Cluster

To start Managed Servers and clusters using Node Manager:

1. Configure Node Manager to start servers.
See Configuring Java Node Manager in *Administering Node Manager for Oracle WebLogic Server*.

2. Start WLST.

3. Start Node Manager.

   If Node Manager is not already running, use the `startNodeManager` script in either `domain_home/bin` or `WL_HOME/server/bin` to start it. For more information, see "Starting Java-based Node Manager Using Scripts" in *Administering Node Manager for Oracle WebLogic Server*.

4. Start an Administration Server.

5. Connect WLST to the Administration Server instance using the `connect` command.

```
wls:/offline> connect('username','password')
```

Connecting to weblogic server instance running at `t3://localhost:7001` as
username weblogic ...
Successfully connected to Admin Server 'myserver' that belongs to domain
'mydomain'.
Warning: An insecure protocol was used to connect to the server.
To ensure on-the-wire security, the SSL port or Admin port should be used
instead.

```wls:/mydomain/serverConfig>
```

For detailed information about `connect` command arguments, see `connect` in *WLST Command Reference for WebLogic Server*.

6. Do any of the following:

   - To start a Managed Server, enter the following command, where `managedServerName` is the name of the server.

     ```
     start('managedServerName','Server')
     ```

   - To start a cluster, enter the following command, where `clusterName` is the name of the cluster.

     ```
     start('clusterName','Cluster')
     ```

See start in *WLST Command Reference for WebLogic Server*.

---

### Starting and Managing Servers Without Node Manager

You can start and manage an Administration Server without Node Manager.

The following sections describe starting and managing server state without using the Node Manager:

- **Starting an Administration Server Without Node Manager**
- **Managing Server State Without Node Manager**

If you do not use Node Manager, WLST cannot start Managed Servers. For information on other techniques for starting and stopping server instances, see Starting and Stopping Servers in *Administering Server Startup and Shutdown for Oracle WebLogic Server*. 

---

*Oracle*
Starting an Administration Server Without Node Manager

To start an Administration Server without using Node Manager:

1. If you have not already done so, use WLST to create a WebLogic domain.  
   See Creating WebLogic Domains Using WLST Offline.

2. Open a shell (command prompt) on the computer on which you created the domain.

3. Change to the directory in which you located the domain.

4. Set up your environment by running one of the following scripts.
   • bin\setDomainEnv.cmd (Windows)
   • bin/setDomainEnv.sh (UNIX: Oracle recommends that you run this script from the Korn shell.)
   On Windows, you can use a shortcut on the Start menu to set your environment variables and invoke WLST (Tools > WebLogic Scripting Tool).

5. Invoke WLST by as described in Invoking WLST.  
   The WLST prompt appears.
   wls:\offline>

6. Use the WLST startServer command to start the Administration Server.

   startServer([adminServerName], [domainName], [url], [adminusername], [adminpassword], [domainDir], [block], [timeout], [serverLog], [systemProperties], [jvmArgs] [spaceAsJvmArgsDelimiter])

   For detailed information about startServer command arguments, see startServer in WLST Command Reference for WebLogic Server.

   For example,
   wls:offline/>startServer('AdminServer','mydomain','t3://localhost:7001', 'adminusername','adminpassword','c:/domains/mydomain', 'true',60000,'false')

   After WLST starts a server instance, the server runs in a separate process from WLST; exiting WLST does not shut down the server.

Managing Server State Without Node Manager

WLST life cycle commands enable you to control the states through which a server instance transitions. See Life Cycle Commands in Administering Node Manager for Oracle WebLogic Server. Oracle recommends that you enable and use the WebLogic domain’s administration port when you connect to servers and issue administrative commands. See Securing the WLST Connection.

The commands in Example 4-1 explicitly move a server instance through the following server states: RUNNING->ADMIN->RUNNING->SHUTDOWN.

Start WebLogic Server before running this script.
Example 4-1 WLST Life Cycle Commands

# Specify the SSL arguments when starting WLST
export WLST_PROPERTIES="-Dweblogic.security.TrustKeyStore=DemoTrust,  
-Dweblogic.security.SSL.ignoreHostnameVerification=true"

./wlst.sh

# Connect to the Administration Server
connect("username","password","t3://localhost:7001")

# First enable the Administration Port. This is not a requirement.
# After you enable the Administration Port in a domain, WebLogic Server
# persists the setting in its configuration files. You do not need to repeat
# the process in future WLST sessions.
e()
startEdit()
cmo.setAdministrationPortEnabled(1)
activate(block="true")

# check the state of the server
state("myserver")

# now move the server from RUNNING state to ADMIN
suspend("myserver", block="true")

# reconnect to the server
exit()
connect("username","password","t3://localhost:7001")

# check the state
state("myserver")

# now resume the server to RUNNING state
resume("myserver",block="true")

# check the state
state("myserver")

# now take a thread dump of the server
threadDump("./dumps/threadDumpAdminServer.txt")

# finally shutdown the server
shutdown(block="true")
Navigating MBeans (WLST Online)

You can navigate, interrogate, and edit MBeans using WebLogic Scripting Tool (WLST) online.

Topics:

• Navigating and Interrogating MBeans
• Browsing Runtime MBeans
• Navigating Among MBean Hierarchies
• Finding MBeans and Attributes
• Accessing Other WebLogic MBeans and Custom MBeans

Navigating and Interrogating MBeans

WLST online provides simplified access to MBeans. While JMX APIs require you to use JMX object names to interrogate MBeans, WLST enables you to navigate a hierarchy of MBeans in a fashion similar to navigating a hierarchy of files in a file system.

WebLogic Server organizes its MBeans in a hierarchical data model. In the WLST file system, MBean hierarchies correspond to drives; MBean types and instances are directories; MBean attributes and operations are files. WLST traverses the hierarchical structure of MBeans using commands such as `cd`, `ls`, and `pwd` in a way that’s similar to how you would navigate a file system in a UNIX or Windows command shell. After navigating to an MBean instance, you interact with the MBean using WLST commands.

In the configuration hierarchy, the root directory is `DomainMBean` (see `DomainMBean` in the MBean Reference for Oracle WebLogic Server). The MBean type is a subdirectory under the root directory. Each instance of the MBean type is a subdirectory under the MBean type directory and MBean attributes and operations are nodes (like files) under the MBean instance directory.

The name of the MBean instance directory matches the value of the MBean’s `Name` attribute. If the MBean does not have a `Name` attribute, WLST generates a directory name using the following pattern: `NO_NAME_number`, where `number` starts at 0 (zero) and increments by 1 for each additional MBean instance.
WLST first connects to a WebLogic Server instance at the root of the server's configuration MBeans, a single hierarchy whose root is `DomainMBean`. WLST commands provide access to all the WebLogic Server MBean hierarchies within a WebLogic domain, such as a server's run-time MBeans, run-time MBeans for domain-wide services, and an editable copy of all the configuration MBeans in the domain. See Tree Commands in WLST Command Reference for WebLogic Server.

For more information about MBean hierarchies, see WebLogic Server MBean Data Model in Developing Custom Management Utilities Using JMX for Oracle WebLogic Server.

### Changing the Current Management Object

WLST online provides a variable, `cmo`, that represents the current management object. You can use this variable to perform any `get`, `set`, or `invoke` method on the management object. For example, the `cmo` variable enables the following command:

```
<wlslinux1> connect('username','password')
Connecting to weblogic server instance running at t3://localhost:7001 as username weblogic ...
Successfully connected to Admin Server 'myserver' that belongs to domain 'mydomain'.
```

Warning: An insecure protocol was used to connect to the server. To ensure on-the-wire security, the SSL port or Admin port should be used instead.

```
<wlslinux1> cmo
[MBeanServerInvocationHandler] com.bea:Name=mydomain,Type=Domain
```

```
<wlslinux1> cd('Servers')
```

```
<wlslinux1> cmo
```
Navigating and Displaying Configuration MBeans Example

The commands in Example 5-2 instruct WLST to connect to an Administration Server instance and display attributes, operations, and child MBeans in DomainMBean.

Note:
The read, write, and execute indicators assume that there are no restrictions to the current user's access privileges. A specific user might not be able to read values that WLST indicates as readable because the user might not have been given appropriate permission by the policies in the WebLogic Security realm. See Default Security Policies for MBeans in the MBean Reference for Oracle WebLogic Server.

To navigate back to a parent MBean, enter the cd('..') command:

```
cmo
```

After navigating back to the parent MBean type, WLST changes the cmo from LogMBean to ServerMBean.

To get back to the root MBean after navigating to an MBean that is deep in the hierarchy, enter the cd('/') command.

Example 5-2    Navigating and Displaying Configuration MBeans

```
connect('username','password')
ls()
...     AdminServerName               myserver
     AdministrationMBeanAuditingEnabled false
     AdministrationPort               9002
     AdministrationPortEnabled        false
     AdministrationProtocol            t3s
```
-r-- ArchiveConfigurationCount 5
... wls:/mydomain/serverConfig> cd('Servers') wls:/mydomain/serverConfig/Servers> ls()
  dr-- AdminServer
dr-- managed1
dr-- myserver
wls:/mydomain/serverConfig/Servers> cd('myserver')
  wls:/mydomain/serverConfig/Servers/myserver>
  ls()
  dr-- COM
dr-- CandidateMachines
dr-- Cluster
dr-- CoherenceClusterSystemResource
dr-- DefaultFileStore

    dr-- RedirectStdoutToServerLogEnabled false
    dr-- RotateLogOnStartup true

Chapter 5
Navigating and Interrogating MBeans
In the `ls` command output information, `d` designates an MBean with which you can use the `cd` command (analogous to a directory in a file system), `r` indicates a readable property, `w` indicates a writeable property, and `x` an executable operation.

## Browsing Runtime MBeans

Similar to the configuration information, WebLogic Server run-time MBeans are arranged in a hierarchical data structure. When connected to an Administration Server, you access the run-time MBean hierarchy by entering the `serverRuntime` or the `domainRuntime` command.

The `serverRuntime` command places WLST at the root of the server run-time management objects, `ServerRuntimeMBean`; the `domainRuntime` command, at the root of the domain-wide run-time management objects, `DomainRuntimeMBean`. When connected to a Managed Server, the root of the run-time MBeans is `ServerRuntimeMBean`. The domain run-time MBean hierarchy exists on the Administration Server only; you cannot use the `domainRuntime` command when connected to a Managed Server.

See `ServerRuntimeMBean` and `DomainRuntimeMBean` in the *MBean Reference for Oracle WebLogic Server*.

Using the `cd` command, WLST can navigate to any of the run-time child MBeans. The navigation model for run-time MBeans is the same as the navigation model for configuration MBeans. However, run-time MBeans exist only on the same server instance as their underlying managed resources (except for the domain-wide run-time MBeans on the Administration Server) and they are all un-editable.

## Navigating and Displaying Runtime MBeans Example

The commands in Example 5-3 instruct WLST to connect to an Administration Server instance, navigate, and display server and domain run-time MBeans.

**Example 5-3  Navigating and Displaying Runtime MBeans**

```
ws:/offline > connect('username', 'password')
wls:/mydomain/serverConfig> serverRuntime()
Location changed to serverRuntime tree. This is a read-only tree with ServerRuntimeMBean as the root.
For more help, use help('serverRuntime')
wls:/mydomain/serverRuntime> ls()
dr-- ApplicationRuntimes
dr-- ClusterRuntime
dr-- ConnectorServiceRuntime
```
...  
-dr-- JDBCServiceRuntime  
-dr-- JMSRuntime  
-dr-- JTARuntime  
-dr-- JVMRuntime  
-dr-- LibraryRuntimes  
-dr-- MailSessionRuntimes  
-dr-- RequestClassRuntimes  
-dr-- ServerChannelRuntimes  
-dr-- ServerSecurityRuntime  
-dr-- ServerServices  
-dr-- ThreadPoolRuntime  
-dr-- WLDFAccessRuntime  
-dr-- WLDFRuntime  
-dr-- WTCRuntime  
-dr-- WorkManagerRuntimes  

-wls:/mydomain/serverRuntime> domainRuntime()  
Location changed to domainRuntime tree. This is a read-only tree with  
DomainRuntimeMBean  
as the root.  
For more help, use help('domainRuntime')  
wls:/mydomain/domainRuntime> ls()  
...  
-dr-- DeployerRuntime  
-dr-- ServerLifecycleRuntimes  
-dr-- ServerRuntimes  

-wls:/mydomain/domainRuntime> ls()  
...  
-rr-- ActivationTime: Tue Aug 31 09:27:22 EDT 2004  
-rr-- AdminServer: true  
-rr-- AdminServerHost:  
-rr-- AdminServerListenPort: 7001  
-rr-- AdminServerListenPortSecure: false  
-rr-- AdministrationPort: 9002  
-rr-- AdministrationPortEnabled: false  

The commands in Example 5-4 instruct WLST to navigate and display run-time  
MBeans on a Managed Server instance.  

Example 5-4    Navigating and Displaying Runtime MBeans on a Managed Server  

wls:/offline> connect('username','password','t3://localhost:7701')  
Connecting to weblogic server instance running at t3://localhost:7701 as username  
weblogic...  
Successfully connected to managed Server 'managed1' that belongs to domain  
'mydomain'.  
Warning: An insecure protocol was used to connect to the server.  
To ensure on-the-wire security, the SSL port or Admin port should be used instead.
Navigating Among MBean Hierarchies

You can navigate among the MBean hierarchies.

To navigate to a configuration MBean from the run-time hierarchy, enter the serverConfig command or, if connected to an Administration Server only, the domainConfig command. This places WLST at the configuration MBean to which you last navigated before entering the serverRuntime or domainRuntime command.

The commands in the following example instruct WLST to navigate from the run-time MBean hierarchy to the configuration MBean hierarchy and back:

```
wls:/mydomain/serverRuntime/JVMRuntime/managed1> serverConfig()
Location changed to serverConfig tree. This is a read-only tree with DomainMBean as the root.
For more help, use help('serverConfig')
wls:/mydomain/serverConfig> cd ('Servers/managed1')
wls:/mydomain/serverConfig/Servers/managed1> cd('Log/managed1')
wls:/mydomain/serverConfig/Servers/managed1/Log/managed1> serverRuntime()
wls:/mydomain/serverRuntime/JVMRuntime/managed1>
```

Entering the serverConfig command from the run-time MBean hierarchy again places WLST at the configuration MBean to which you last navigated.

```
wls:/mydomain/serverRuntime/JVMRuntime/managed1> serverConfig()
wls:/mydomain/serverConfig/Servers/managed1/Log/managed1>
```

See Tree Commands in WLST Command Reference for WebLogic Server.

Alternatively, you can use the currentTree command to store your current MBean hierarchy location and to return to that location after navigating away from it. See currentTree in WLST Command Reference for WebLogic Server.
Finding MBeans and Attributes

To locate a particular MBean and attribute, you use the find command. WLST returns the pathname to the MBean that stores the attribute and its value.

You can use the getMBean command to return the MBean specified by the path. See find and getMBean in WLST Command Reference for WebLogic Server.

For example:

```bash
wls:/mydomain/edit !> find('DebugEjbCaching')
finding ©DebugEjbCaching© in all registered MBean instances ... 
/Servers/AdminServer/ServerDebug/AdminServer                          false
/Servers/managed2/ServerDebug/managed2                           false
wls:/mydomain/edit !> bean=getMBean('Servers/managed2/ServerDebug/managed2')
wls:/mydomain/edit !> print bean
[MBeanServerInvocationHandler]bea.com:Name=managed2,Type=ServerDebug, 
Server=managed2
```

**Note:**

getMBean does not throw an exception when an instance is not found.

Alternatively, the getPath command returns the MBean path for a specified MBean instance or ObjectName for the MBean in the current MBean hierarchy. See getPath in WLST Command Reference for WebLogic Server.

For example:

```bash
wls:/mydomain/serverConfig> path=getPath('com.bea:Name=myserver,Type=Server')
wls:/mydomain/serverConfig> print path
Servers/myserver
```

Accessing Other WebLogic MBeans and Custom MBeans

In addition to accessing WebLogic Server MBeans, WLST can access MBeans that WebLogic Integration and WebLogic Portal provide. It can also access MBeans that you create and register (custom MBeans) to configure or monitor your own resources.

(For information on creating and registering your own MBeans, see Instrumenting and Registering Custom MBeans in Developing Manageable Applications Using JMX for Oracle WebLogic Server.)
To navigate other WebLogic MBeans or custom MBeans, enter the custom command or the domainCustom command, depending on the MBean server (Runtime or Domain Runtime) on which the custom MBean is registered. You can use custom when WLST is connected to an Administration Server or a Managed Server instance. You can use domainCustom only when WLST is connected to an Administration Server. See Accessing Custom MBeans in the Domain Runtime MBean Server, for information about domainCustom.

WLST treats all non-WebLogic Server MBeans as custom MBeans:

- Instead of arranging custom MBeans in a hierarchy, WLST organizes and lists custom MBeans by JMX object name. All MBeans with the same JMX domain name are listed in the same WLST directory. For example, if you register all of your custom MBeans with JMX object names that start with mycompany:, then WLST arranges all of your MBeans in a directory named mycompany.

- Custom MBeans cannot use the cmo variable because a stub is not available.

- Custom MBeans are editable, but not subject to the WebLogic Server change management process. You can use MBean get, set, invoke, and create and delete commands on them without first entering the startEdit command. See Using WLST Online to Update an Existing WebLogic Domain. Note that this applies to the custom() tree, but not to the editCustom() tree.

Here is an example of navigating custom MBeans on the Runtime MBean Server:

```
wlst:/mydomain/serverConfig> custom()
Location changed to custom tree. This is a writable tree with No root.
For more help, use help('custom')
wlst:/mydomain/custom> ls()
drw- mycompany
drw- anothercompany
wlst:/mydomain/custom> cd("mycompany")
wlst:/mydomain/custom/mycompany> ls()
drw- mycompany:y1=x
drw- mycompany:y2=x
wlst:/mydomain/custom/mycompany> cd("mycompany:y1=x")
wlst:/mydomain/custom/mycompany/mycompany:y1=x> ls()
-rw- MyAttribute 10
wlst:/mydomain/custom/mycompany/mycompany:y1=x>
```

Accessing Custom MBeans in the Domain Runtime MBean Server

Use the domainCustom() command to browse and invoke methods or perform operations on custom MBeans that are registered in the Domain Runtime MBean Server. This is similar to using the custom() command to access custom MBeans that are registered in the Runtime MBean Server, as described in Accessing Other WebLogic MBeans and Custom MBeans. You can use the domainCustom() command only when WLST is connected to the Administration Server.

For information on using domainCustom(), see domainCustom in WLST Command Reference for WebLogic Server.

For information on how to access custom MBeans in the Domain Runtime MBean server, see Make Local Connections to the Domain Runtime MBean Server in Developing Custom Management Utilities Using JMX for Oracle WebLogic Server. For information on creating and registering your own MBeans, see Instrumenting and Registering Custom MBeans in Developing Manageable Applications Using JMX for Oracle WebLogic Server.
Accessing Custom MBeans in the Edit MBean Server

Use the `editCustom()` command to browse, change and invoke methods or perform operations on custom MBeans that are registered in the Edit MBean Server. This is similar to using the `custom()` command, but custom MBeans in the Edit MBeanServer also allow edit operations. You can use the `editCustom()` command only when WLST is connected to the Administration Server.

For more information about `editCustom()`, see `editCustom` in the WLST Command Reference for WebLogic Server.

Oracle system components, such as Oracle HTTP Server, may define custom MBeans that are present in the Edit MBeanServer. These MBeans are editable and are subject to the WebLogic Server change-managed process.
Configuring Existing WebLogic Domains

You can use WebLogic Scripting Tool (WLST) both online and offline to update an existing WebLogic domain.

Topics:

- Using WLST Online to Update an Existing WebLogic Domain
- Using WLST Offline to Update an Existing WebLogic Domain
- Managing Security Data (WLST Online)
- Deploying Applications

Using WLST Online to Update an Existing WebLogic Domain

Because WLST online interacts with an active WebLogic domain, all online changes to a domain are controlled by the change management process, which loosely resembles a database transaction.

For more information on making and managing configuration changes, see Configuration Change Management Process in Understanding Domain Configuration for Oracle WebLogic Server.

Table 6-1 describes the steps for using WLST online to update an existing WebLogic domain.

Table 6-1 Steps for Updating an Existing WebLogic Domain (Online)

<table>
<thead>
<tr>
<th>To...</th>
<th>Use this command...</th>
<th>See this section in WLST Command Reference for WebLogic Server:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access the edit MBean hierarchy</td>
<td>edit()</td>
<td>edit</td>
</tr>
<tr>
<td>Obtain a lock on the current configuration</td>
<td>startEdit([waitTimeInMillis], [timeoutInMillis], [exclusive])</td>
<td>startEdit</td>
</tr>
<tr>
<td>Modify the WebLogic domain</td>
<td>Browsing and online editing commands</td>
<td>Browse Commands Editing Commands</td>
</tr>
<tr>
<td>(Optional) Validate your edits</td>
<td>validate()</td>
<td>validate</td>
</tr>
</tbody>
</table>
Table 6-1  (Cont.) Steps for Updating an Existing WebLogic Domain (Online)

<table>
<thead>
<tr>
<th>To...</th>
<th>Use this command...</th>
<th>See this section in WLST Command Reference for WebLogic Server:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your changes</td>
<td>save()</td>
<td>save</td>
</tr>
<tr>
<td>Distribute your changes to the working configuration MBeans on all servers in the WebLogic domain</td>
<td>activate([timeout], [block])</td>
<td>activate</td>
</tr>
<tr>
<td>Release your lock on the configuration</td>
<td>stopEdit([defaultAnswer])</td>
<td>stopEdit</td>
</tr>
<tr>
<td>(Optional) Determine if a change you made to an MBean attribute requires you to re-start servers</td>
<td>isRestartRequired([attributeName])</td>
<td>isRestartRequired</td>
</tr>
</tbody>
</table>

The WLST online script in Example 6-1 connects WLST to an Administration Server, initiates an edit session that creates a Managed Server, saves and activates the change, initiates another edit session, creates a startup class, and targets it to the newly created server.

**Example 6-1  Creating a Managed Server**

```python
connect("username","password")
edit()
startEdit()
svr = cmo.createServer("managedServer")
svr.setListenPort(8001)
svr.setListenAddress("address")
save()
activate(block="true")

startEdit()
sc = cmo.createStartupScriptClass("my-startupClass")
sc.setClassName("com.bea.foo.bar")
sc.setArguments("foo bar")

# get the server mbean to target it
tBean = getMBean("Servers/managedServer")
if tBean != None:
    print "Found our target"
    sc.addTarget(tBean)
save()
activate(block="true")
disconnect()
exit()
```

The interactive edit session in Example 6-2 changes an Administration Server running in development mode to production mode, and then to secured production mode. Note that your domain must be in production mode to enable secured production mode.

**Example 6-2  Changing to Production Mode or Secured Production Mode**

```python
wls:/offline> connect('username', 'password')
wls:/mydomain/serverConfig> edit()
```
Starting an edit session ...
Started edit session, please be sure to save and activate your changes once you are done.

Starting all your changes, this may take a while ...
The edit lock associated with this edit session is released once the activation is completed.

The following non-dynamic attribute(s) have been changed on MBeans that require server re-start:

MBean Changed : com.bea:Name=AdminServer,Type=WebServerLog,Server=AdminServer, WebServer=AdminServer
Attributes changed : RotateLogOnStartup
MBean Changed : com.bea:Name=AdminServer,Type=WebServerLog,Server=AdminServer, WebServer=AdminServer
Attributes changed : RotateLogOnStartup
MBean Changed : com.bea:Name=Domain1,Type=Log
Attributes changed : RotateLogOnStartup

Activation completed

Note:
When using WLST to change the Administration Server from development to production mode, the Java -Xverify option (if used) is not changed from none to all and must be changed manually to all to ensure that all classes are verified. In addition, it does not prevent an existing boot.properties file from being used when starting the servers.

Tracking Configuration Changes

For all changes that are initiated by WLST, you can use the showChanges Command, which displays all the changes that you made to the current configuration from the start of the WLST edit session, including any MBean operations that were implicitly performed by the server. See Example 6-3.

Example 6-3 Displaying Changes

connect("username","password")
wis:/mydomain/serverConfig> edit()
wls:/mydomain/edit> startEdit()
Starting an edit session ...
Started edit session, please be sure to save and activate your changes once you are done.
wls:/mydomain/edit !> cmo.createServer('managed2')
[MBeanServerInvocationHandler]mydomain:Name=managed2,Type=Server
wls:/mydomain/edit !> cd('Servers/managed2')
wls:/mydomain/edit/Servers/managed2 !> cmo.setListenPort(7702)
wls:/mydomain/edit/Servers/managed2 !> cmo.setListenAddress("localhost")
wls:/mydomain/edit/Servers/managed2 !> showChanges()
Changes that are in memory and saved to disc but not yet activated are:
All changes that are made but not yet activated are:

MBean Changed : com.bea:Name=Len,Type=Domain
Operation Invoked : create
Attribute Modified : Servers
Attributes Old Value : null
Attributes New Value : managed2
Server Restart Required : false

MBean Changed : com.bea:Name=managed2,Type=Server
Operation Invoked : modify
Attribute Modified : ListenPort
Attributes Old Value : null
Attributes New Value : 7702
Server Restart Required : false

wls:/mydomain/edit/Servers/managed2 !> save()
Saving all your changes ...
Saved all your changes successfully.
wls:/mydomain/edit !> activate()
Activating all your changes, this may take a while ...
The edit lock associated with this edit session is released once the activation is completed.
Activation completed
wls:/mydomain/edit/Servers/managed2>

The WLST online script in Example 6-4 connects WLST to a running server instance as an administrator, gets the activation task, and prints the user and the status of the task. It also prints all the changes that took place.

The getActivationTask function provides information about the activation request and returns the latest ActivationTaskMBean which reflects the state of changes that a user is currently making or made recently in the current WLST session. You invoke the methods that this interface provides to get information about the latest activation task in progress or just completed. For detailed information, see ActivationTaskMBean in the MBean Reference for Oracle WebLogic Server.

Example 6-4 Checking the Activation Task

```java
at = getActivationTask()
changes = at.getChanges()
newstate = at.getState()
print "The user for this Task is "+at.getUser()+ "and the state is:"
print newstate
print "The changes are:"
print changes
```

Undoing or Canceling Changes

WLST offers two commands to undo or cancel changes:

- **The undo command** reverts all unsaved or unactivated edits.
  
  You specify whether to revert all unactivated edits (including those that have been saved to disk), or all edits made since the last save operation. See undo in WebLogic Scripting Tool Command Reference.

- **The cancelEdit command** releases the edit lock and discards all unsaved changes. See cancelEdit in WLST Command Reference for WebLogic Server.
Additional Operations and Attributes for Change Management

The standard change-management commands described in the previous section are convenience commands for invoking operations in the `ConfigurationManagerMBean`. In addition to these operations, the `ConfigurationManagerMBean` contains attributes and operations that describe edit sessions. For detailed information, see `ConfigurationManagerMBean` in the `MBean Reference for Oracle WebLogic Server`.

To access this MBean, use the WLST `getConfigManager` command. See `getConfigManager` in `WLST Command Reference for WebLogic Server`.

The WLST online script in Example 6-5 connects WLST to a server instance as an administrator, checks if the current editor making changes is not the administrator, then cancels the configuration edits. The script also purges all the completed activation tasks. You can use this script to make a fresh start to edit changes, but you should verify that the changes made by other editors are not needed.

**Example 6-5   Using the Configuration Manager**

```java
connect('adminusername','adminpassword')
user = cmgr.getCurrentEditor()
if user != "weblogic":
    cmgr.undo()
    cmgr.cancelEdit()
    cmgr.purgeCompletedActivationTasks()
```

Using WLST Offline to Update an Existing WebLogic Domain

You can update an existing WebLogic domain using WLST offline.

---

**Note:**

Oracle recommends that you do not use WLST offline to manage the configuration of an active WebLogic domain. Offline edits are ignored by running servers and can be overwritten by JMX clients such as WLST online or the WebLogic Server Administration Console.

The commands in the following table are used to read an existing domain, update the domain as needed, and close the domain in offline mode. During this process, if a connection factory is targeted to a subdeployment, after running the `updateDomain` command and restarting the domain, `default-targeting-enabled` is set to `true` for the connection factory.

To update an existing WebLogic domain using WLST offline, perform the steps described in Table 6-2.
### Table 6-2  Steps for Updating an Existing WebLogic Domain (Offline)

<table>
<thead>
<tr>
<th>To...</th>
<th>Use this command...</th>
<th>See ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open an existing WebLogic domain for update</td>
<td><code>readDomain(domainDirName)</code></td>
<td><code>readDomain</code> in WLST Command Reference for WebLogic Server</td>

</tr>
</tbody>
</table>

### Managing Security Data (WLST Online)

You can manage security data, such as authentication providers, using WLST online.

In the WebLogic Security Service, an **Authentication provider** is the software component that proves the identity of users or system processes. An Authentication provider also remembers, transports, and makes that identity information available to various components of a system when needed.

A security realm can use different types of Authentication providers to manage different sets of users and groups. (See Authentication Providers in Developing Security Providers for Oracle WebLogic Server. You can use WLST to invoke operations on the following types of Authentication providers:

- The default WebLogic Server Authentication provider, `AuthenticatorMBean`. By default, all security realms use this Authentication provider to manage users and groups.
- Custom Authentication providers that extend `weblogic.security.spi.AuthenticationProvider` and extend the optional Authentication SSPI MBeans. See SSPI MBean Quick Reference in Developing Security Providers for Oracle WebLogic Server

The following sections describe basic tasks for managing users and groups using WLST:

- Determining If You Need to Access the Edit Hierarchy
- Creating a User
- Adding a User to a Group
- Verifying Whether a User Is a Member of a Group
- Listing Groups to Which a User Belongs
- Listing Users and Groups in a Security Realm
• Changing a Password
• Protecting User Accounts in a Security Realm
• Configuring Additional LDAP Authentication Providers

For information about additional tasks that the AuthenticationProvider MBeans support, see AuthenticationProviderMBean in the MBean Reference for Oracle WebLogic Server.

Determining If You Need to Access the Edit Hierarchy

If you are using WLST to change the configuration of a security MBean, you must access the edit hierarchy and start an edit session. For example, if you change the value of the LockoutThreshold attribute in UserLockoutManagerMBean, you must be in the edit hierarchy.

If you invoke security provider operations to add, modify, or remove data in a security provider data store, WLST does not allow you to be in the edit hierarchy. Instead, invoke these commands from the serverConfig or domainConfig hierarchy. For example, you cannot invoke the createUser operation in an AuthenticatorMBean MBean from the edit hierarchy. WLST enforces this restriction to prevent the possibility of incompatible changes. For example, an edit session could contain an unactivated change that removes a security feature and will invalidate modifications to the provider’s data.

Creating a User

To create a user, invoke the UserEditorMBean.createUser method, which is extended by the security realm’s AuthenticationProvider MBean. See the createUser method of the UserEditorMBean in the MBean Reference for Oracle WebLogic Server.

The method requires three input parameters. The password must be at least eight characters, with one special character or numeric character.

username password user-description

WLST cannot invoke this command from the edit hierarchy, but it can invoke the command from the serverConfig Of domainConfig hierarchy.

The following WLST online script invokes createUser on the default authentication provider.

Example 6-6 Creating a User

```python
from weblogic.management.security.authentication import UserEditorMBean

print "Creating a user ..."
atnr=cmo.getSecurityConfiguration().getDefaultRealm().lookupAuthenticationProvider("DefaultAuthenticator")
atnr.createUser('new_user','adminpassword','new_admin')
print "Created user successfully"
```

Adding a User to a Group

To add a user to a group, invoke the GroupEditorMBean.addMemberToGroup method, which is extended by the security realm’s AuthenticationProvider MBean. See the addMemberToGroup method in the MBean Reference for Oracle WebLogic Server.
The method requires two input parameters:

\textit{\texttt{groupname username}}

WLST cannot invoke this command from the edit hierarchy, but it can invoke the command from the serverConfig or domainConfig hierarchy.

The following WLST online script invokes \texttt{addMemberToGroup} on the default Authentication Provider. For information on how to run this script, see Invoking WLST.

\textbf{Example 6-7 Adding a User to a Group}

```python
from weblogic.management.security.authentication import GroupEditorMBean

print "Adding a user ..."
atnr=cmo.getSecurityConfiguration().getDefaultRealm().lookupAuthenticationProvider("DefaultAuthenticator")
atnr.addMemberToGroup('Administrators','my_user')
print "Done adding a user"
```

Verifying Whether a User Is a Member of a Group

To verify whether a user is a member of a group, invoke the \texttt{GroupEditorMBean.isMember} method, which is extended by the security realm's AuthenticationProvider MBean. See the isMember method in the \textit{MBean Reference for Oracle WebLogic Server}.

The method requires three input parameters:

\textit{\texttt{groupname username boolean}}

where boolean specifies whether the command searches within child groups. If you specify true, the command returns true if the member belongs to the group that you specify or to any of the groups contained within that group.

WLST cannot invoke this command from the edit hierarchy, but it can invoke the command from the serverConfig or domainConfig hierarchy.

The following WLST online script invokes \texttt{isMember} on the default Authentication Provider. For information on how to run this script, see Invoking WLST.

\textbf{Example 6-8 Verifying Whether a User is a Member of a Group}

```python
from weblogic.management.security.authentication import GroupEditorMBean

user = "my_user"
print "Checking if "+user+ " is a Member of a group ... "
atnr=cmo.getSecurityConfiguration().getDefaultRealm().lookupAuthenticationProvider("DefaultAuthenticator")
if atrnr.isMember('Administrators',user,true) == 0:
    print user+ " is not member of Administrators"
else:
    print user+ " is a member of Administrators"
```

Listing Groups to Which a User Belongs

To see a list of groups that contain a user or a group, invoke the \texttt{MemberGroupListerMBean.listMemberGroups} method, which is extended by the security realm's AuthenticationProvider MBean. See the listMemberGroups method of the MemberGroupListerMBean in the \textit{MBean Reference for Oracle WebLogic Server}.

The method requires one input parameter:
where `memberUserOrGroupName` specifies the name of an existing user or a group.

WLST cannot invoke this command from the edit hierarchy, but it can invoke the command from the `serverConfig` or `domainConfig` hierarchy.

The following WLST online script invokes `listMemberGroups` on the default Authentication provider. For information on how to run this script, see Invoking WLST.

**Example 6-9  Listing Groups to Which a User Belongs**

```python
from weblogic.management.security.authentication import MemberGroupListerMBean

print "Listing the member groups ..."
atnr=cmo.getSecurityConfiguration().getDefaultRealm().lookupAuthenticationProvider("DefaultAuthenticator")
x = atnr.listMemberGroups('my_user')
print x
```

The method returns a cursor value (for example, Cursor_16), which refers to a list of names. The `NameLister.haveCurrent`, `getCurrentName`, and `advance` operations iterate through the returned list and retrieve the name to which the current cursor position refers. See NameListerMBean in the *MBean Reference for Oracle WebLogic Server*.

**Listing Users and Groups in a Security Realm**

To see a list of user or group names, you invoke a series of methods, all of which are available through the `AuthenticationProvider` interface:

- The `GroupReaderMBean.listGroups` and `UserReaderMBean.listUsers` methods take two input parameters: a pattern of user or group names to search for, and the maximum number of names that you want to retrieve.

  Because a security realm can contain thousands (or more) of user and group names that match the pattern, the methods return a cursor, which refers to a list of names.

  See the `listGroups` operation in the `GroupReaderMBean` and the `listUsers` operation in the `UserReaderMBean` in the *MBean Reference for Oracle WebLogic Server*.

- The `NameLister.haveCurrent`, `getCurrentName`, and `advance` operations iterate through the returned list and retrieve the name to which the current cursor position refers. See NameListerMBean in the *MBean Reference for Oracle WebLogic Server*.

- The `NameLister.close` operation releases any server-side resources that are held on behalf of the list.

WLST cannot invoke these commands from the edit hierarchy, but it can invoke them from the `serverConfig` or `domainConfig` hierarchy.

The WLST online script in **Example 6-10** lists all the users in a realm and the groups to which they belong. For information on how to run this script, see Invoking WLST.

**Example 6-10  Listing Users and Groups**

```python
from weblogic.management.security.authentication import UserReaderMBean
from weblogic.management.security.authentication import GroupReaderMBean

realm=cmo.getSecurityConfiguration().getDefaultRealm()
```
atns = realm.getAuthenticationProviders()
for i in atns:
    if isinstance(i, UserReaderMBean):
        userReader = i
        cursor = i.listUsers("**", 0)
        print 'Users in realm ' + realm.getName() + ' are: '
        while userReader.haveCurrent(cursor):
            print userReader.getCurrentName(cursor)
        userReader.advance(cursor)
        userReader.close(cursor)

for i in atns:
    if isinstance(i, GroupReaderMBean):
        groupReader = i
        cursor = i.listGroups("**", 0)
        print 'Groups in realm are: '
        while groupReader.haveCurrent(cursor):
            print groupReader.getCurrentName(cursor)
        groupReader.advance(cursor)
        groupReader.close(cursor)

Changing a Password

To change a user's password, invoke the UserPasswordEditorMBean.changeUserPassword method, which is extended by the security realm's AuthenticationProvider MBean. See the changeUserPassword method in the MBean Reference for Oracle WebLogic Server.

WLST cannot invoke this command from the edit hierarchy, but it can invoke the command from the serverConfig or domainConfig hierarchy.

The following WLST online script invokes changeUserPassword on the default Authentication Provider. For information on how to run this script, see Invoking WLST.

Example 6-11    Changing a Password

from weblogic.management.security.authentication import UserPasswordEditorMBean

print "Changing password ..."
atnr=cmo.getSecurityConfiguration().getDefaultRealm().lookupAuthenticationProvider("DefaultAuthenticator")
atnr.changeUserPassword('my_user','my_password','new_password')
print "Changed password successfully"

Protecting User Accounts in a Security Realm

The UserLockoutManagerMBean provides a set of attributes to protect user accounts from intruders. By default, these attributes are set for maximum protection. You can decrease the level of protection for user accounts. For example, you can set whether or not lockout is enabled, increase the time period in which invalid login attempts are made before locking the user account, or change the amount of time a user account is locked.

The UserLockoutManagerRuntimeMBean provides a set of attributes for collecting lockout statistics, and operations for managing user lockouts. For example, you can get the number of users currently locked out, get the number of invalid login attempts since the server was started, or clear the lockout on a user account.
For more information about lockout configuration, see the UserLockoutManagerMBean interface in the *MBean Reference for Oracle WebLogic Server*. For information about collecting lockout statistics and performing lockout operations, see the UserLockoutManagerRuntimeMBean interface in the *MBean Reference for Oracle WebLogic Server*

The following tasks provide examples for invoking UserLockoutManagerRuntimeMBean methods:

- **Set Consecutive Invalid Login Attempts**
- **Unlock a User Account**

Note that because these tasks edit MBean attributes, WLST must connect to the Administration Server, navigate to the edit hierarchy, and start an edit session.

### Set Consecutive Invalid Login Attempts

The following WLST online script sets the number of consecutive invalid login attempts before a user account is locked out. For information on how to run this script, see *Invoking WLST*.

**Example 6-12  Setting Consecutive Invalid Login Attempts**

```python
from weblogic.management.security.authentication import UserLockoutManagerMBean

edit()
startEdit()

#You have two choices for getting a user lockout manager to configure
# 1 - to configure the default realm's UserLockoutManager:
ulm=cmo.getSecurityConfiguration().getDefaultRealm().getUserLockoutManager()

# 2 - to configure another realm's UserLockoutManager:
#ulm=cmo.getSecurityConfiguration().lookupRealm("anotherRealm").getUserLockoutManager()

ulm.setLockoutThreshold(3)
save()
activate()
```

### Unlock a User Account

The following WLST online script unlocks a user account. For information on how to run this script, see *Invoking WLST*.

**Example 6-13  Unlocking a User Account**

```python
from weblogic.management.runtime import UserLockoutManagerRuntimeMBean

defaultrealm()
ulm=cmo.getServerSecurityRuntime().getDefaultRealmRuntime().getUserLockoutManagerRuntime()

#note1 : You can only manage user lockouts for the default realm starting from
#when the server was booted (versus other non-active realms).
#note2 : If the default realm's user lockout manager's LockoutEnabled attribute
#is false, then the user lockout manager's runtime MBean will be null.
#That is, you can only manage user lockouts in the default realm if its user
#lockout manager is enabled.
```
if ulm != None:
    ulm.clearLockout("myuser")

Configuring Additional LDAP Authentication Providers

In some cases, such as when installing some Oracle Fusion Middleware products, you must add an additional external LDAP authentication providers to the WebLogic Server security providers. This can be done either by using the WebLogic Server Administration Console (see Configure Authentication and Identity Assertion Providers) or by using WLST.

Example 6-14 shows how to use WLST to add an Oracle Internet Directory (OID) authentication provider. To add other types of LDAP authentication providers, substitute the appropriate class type in the `createAuthenticationProvider` command, as shown in Table 6-3.

![Note:](image)

For important information about switching LDAP authentication providers if the corresponding LDAP server will contain the user or users who start the domain, see Requirements for Using an LDAP Authentication Provider in Administering Security for Oracle WebLogic Server.

Example 6-14 Adding an Authentication Provider

```python
connect ('adminUser','adminPassword','t3://'+adminServerHost+':'+adminServerPort)
edit()
startEdit()
cd('/SecurityConfiguration/'+domainName+'/Realms/myrealm')
# In the following command, substitute the appropriate class type
cmo.createAuthenticationProvider(LDAPProviderName,
    'weblogic.security.providers.authentication.OracleInternetDirectoryAuthenticator')
cd('/SecurityConfiguration/'+domainName+'/Realms/myrealm/AuthenticationProviders/'+LDAPProviderName)
cmo.setControlFlag('SUFFICIENT')
cd('/SecurityConfiguration/'+domainName+'/Realms/myrealm/
    AuthenticationProviders/'+LDAPProviderName)
cmo.setHost(LDAPHost)
cmo.setPort(LDAPPort)
cmo.setPrincipal(LDAPAdmin)
set("Credential", LDAPAdminPassword)
cmo.setGroupBaseDN(LDAPGroupBase)
cmo.setUserBaseDN(LDAPUserBase)
cmo.setUserNameAttribute(usernameattribute)
cmo.setObjectClass("inetOrgPerson")
cd('/SecurityConfiguration/'+domainName+'/Realms/myrealm/AuthenticationProviders/
    DefaultAuthenticator')
cmo.setControlFlag('SUFFICIENT')
cd('/SecurityConfiguration'+domainName+'/Realms/myrealm')
set('AuthenticationProviders',jarray.array([ObjectName('Security:Name=myrealm'
    +LDAPProviderName), ObjectName('Security:Name=myrealmDefaultAuthenticator'),
    ObjectName('Security:Name=myrealmDefaultIdentityAsserter')], ObjectName))
activate()
```

Table 6-3 lists the class types to specify for each type of Authentication Provider
Table 6-3  Class Types for External LDAP Authentication Providers

<table>
<thead>
<tr>
<th>Provider</th>
<th>Class Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Internet Directory</td>
<td>weblogic.security.providers.authentication.OracleInternetDirectoryAuthenticator</td>

<tr>
<td>Microsoft AD</td>
<td>weblogic.security.providers.authentication.ActiveDirectoryAuthenticator</td>
</tr>
<tr>
<td>OpenLDAP</td>
<td>weblogic.security.providers.authentication.OpenLDAPAuthenticator</td>
</tr>
<tr>
<td>eDirectory</td>
<td>weblogic.security.providers.authentication.NovellAuthenticator</td>
</tr>
<tr>
<td>SunOne LDAP</td>
<td>weblogic.security.providers.authentication.IPlanetAuthenticator</td>
</tr>
</tbody>
</table>

Deploying Applications

The process for deploying applications varies depending on whether you use WLST offline or WLST online.

The following topics describe the process:

- Using WLST Online to Deploy Applications
- Using WLST Offline to Deploy Applications

Using WLST Online to Deploy Applications

When WLST is connected to a domain’s Administration Server, use the deploy command to deploy applications. (See deploy in WLST Command Reference for WebLogic Server.)

The command in Example 6-15 deploys a sample application from the WebLogic Server ExamplesServer domain.

Example 6-15  Deploying Applications

```bash
# Deploying Applications

deploy("examplesWebApp","C:/Oracle/Middleware/wlserver/samples/server/examples/build/examplesWebApp")
```

Note:

Please note the following when using WLST online to deploy applications:

- Deployment operations must be performed through the Administration Server. Your WLST client must connect to the Administration Server to invoke deployment commands.
- You do not need to be in an edit session to deploy applications.

For more information about using WLST for deploying applications, see Deployment Tools in Deploying Applications to Oracle WebLogic Server.
Using WLST Offline to Deploy Applications

Table 6-4 describes the steps for using WLST offline to deploy applications in an existing domain.

Table 6-4    Steps for Deploying Applications (Offline)

<table>
<thead>
<tr>
<th>To...</th>
<th>Use this command...</th>
<th>See ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the Template Builder to create an application template.</td>
<td>not applicable</td>
<td>Creating an Extension Template Using the Domain Template Builder in Creating Domain Templates Using the Domain Template Builder</td>
</tr>
<tr>
<td>Open an existing WebLogic domain or template</td>
<td>readDomain(domainDirName)</td>
<td>readDomain and readTemplate in WLST Command Reference for WebLogic ServerWebLogic Scripting Tool Command Reference</td>
</tr>
<tr>
<td>Add an extension template to the WebLogic domain</td>
<td>selectTemplate(templateName)</td>
<td>selectTemplate and loadTemplates in WLST Command Reference for WebLogic Server</td>
</tr>
<tr>
<td>Add an extension template to the WebLogic domain</td>
<td>loadTemplates()</td>
<td></td>
</tr>
<tr>
<td>Save the WebLogic domain</td>
<td>updateDomain()</td>
<td>updateDomain in WLST Command Reference for WebLogic Server</td>
</tr>
<tr>
<td>Close the WebLogic domain</td>
<td>closeDomain()</td>
<td>closeDomain in WLST Command Reference for WebLogic Server</td>
</tr>
</tbody>
</table>

For an example of using the `addTemplate` command, see the following sample WLST script, where `WL_HOME` refers to the top-level installation directory for WebLogic Server:

`WL_HOME\common\templates\scripts\wlst\clusterMedRecDomain.py`
Updating the Deployment Plan

You can use WebLogic Scripting Tool (WLST) to retrieve and update an application's deployment plan. When using WLST to update an application's deployment plan, you define variable definitions and variable assignments. A variable definition identifies a new value; a variable assignment associates the new value with the descriptor entity to be changed.

The following procedure describes how to use WLST in interactive mode. For information about using WLST in script or embedded mode, see Using the WebLogic Scripting Tool.

To update a deployment plan using WLST in interactive mode, perform the following steps:

1. Create a deployment plan for the application.
   See Create a deployment plan in the Oracle WebLogic Server Administration Console Online Help.

2. Start WLST in interactive mode.

3. Enter the following command to load the application and deployment plan. For example:

   ```
   plan=loadApplication(loadApplication('c:/Oracle/Middleware/user_projects/applications/mydomain/modules/medrec/assembly/target/medrec.ear', 'c:/Oracle/Middleware/user_projects/applications/mydomain/modules/medrec/assembly/target/Plan.xml')
   ```

   The WLST loadApplication command returns a WLSTPlan object that you can access to make changes to the deployment plan. For more information about the WLSTPlan object, see WLSTPlan Object.

4. Identify the configuration options that you want to update and their corresponding XPath values. You can determine the XPath value for configuration options by using the weblogic.PlanGenerator utility. You can copy and paste the XPath from the generated plan into your active deployment plan. See weblogic.PlanGenerator Command Line Reference in Deploying Applications to Oracle WebLogic Server.

5. Determine if variable definitions and variable assignments are currently defined in your deployment plan for the configuration options identified in the previous step. To do so, enter one of the following commands:

   a. To display variables:
**plan.showVariables()**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionDescriptor_cookieMaxAgeSecs_12910569321171</td>
<td>-1</td>
</tr>
<tr>
<td>SessionDescriptor_invalidationIntervalSecs_12910568567990</td>
<td>75</td>
</tr>
<tr>
<td>SessionDescriptor_maxInMemorySessions_12910569321170</td>
<td>-1</td>
</tr>
<tr>
<td>SessionDescriptor_timeoutSecs_12900890060180</td>
<td>3600</td>
</tr>
</tbody>
</table>

**b. To display variable assignments:**

```python
plan.showVariableAssignments()
```

```xml
medrec.ear

<table>
<thead>
<tr>
<th>META-INF/weblogic-application.xml</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionDescriptor_timeoutSecs_12900890060180</td>
</tr>
</tbody>
</table>

medrec.ear

<table>
<thead>
<tr>
<th>META-INF/weblogic-application.xml</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionDescriptor_invalidationIntervalSecs_12910568567990</td>
</tr>
</tbody>
</table>

medrec.ear

<table>
<thead>
<tr>
<th>META-INF/weblogic-application.xml</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionDescriptor_maxInMemorySessions_12910569321170</td>
</tr>
</tbody>
</table>

medrec.ear

<table>
<thead>
<tr>
<th>META-INF/weblogic-application.xml</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionDescriptor_cookieMaxAgeSecs_12910569321171</td>
</tr>
</tbody>
</table>
```

6. If the variable definition and assignment are not defined, create them and set the XPath value for the variable assignment, as follows:

**a. Create the variable definition.** Use the `createVariable()` method to specify the variable name and value. For example:

```python
v = plan.createVariable('new_var', '3')
```

**b. Create the variable assignment.** Use the `createVariableAssignment()` method to specify the name of the variable, the application to which it applies, and the corresponding deployment descriptor. For example:

```python
va = plan.createVariableAssignment('new_var', 'medrec.ear', 'META-INF/weblogic-application.xml')
```

Creating VariableAssignment for ModuleOverride medrec.ear and ModuleDescriptor with URI META-INF/weblogic-application.xml. Created VariableAssignment with name new_var successfully.

**c. Set the XPath value for the variable assignment by pasting the XPath value from the deployment plan you generated with `weblogic.PlanGenerator` in Step 4.** For example:

```python
va.setXpath('weblogic-application/session-descriptor/new_var')
```
**Note:**

To get the correct XPath values for the desired variable assignment, Oracle recommends that you use the `weblogic.PlanGenerator` utility to generate a template deployment plan with empty values. You can then cut or copy the XPath values from the template deployment plan and paste them into the WLST script.

7. Save the deployment plan. For example:

```java
plan.save()
```
Getting Runtime Information

You can use the WebLogic Scripting Tool (WLST) to retrieve information that
WebLogic Server instances produce to describe their run-time state, configure logging,
and use the WebLogic Diagnostic Framework.

Topics:

- Accessing Runtime Information: Main Steps
- Configuring Logging
- Working with the WebLogic Diagnostics Framework

Accessing Runtime Information: Main Steps

The Administration Server hosts the domain run-time hierarchy which provides access
to any MBean on any server in the WebLogic domain. You can access the runtime
information using WLST.

If the Administration Server is not running for a WebLogic domain, WLST can connect
to individual Managed Servers to retrieve run-time data.

Accessing the run-time information for a WebLogic domain includes the following main steps:

1. Invoke WLST and connect to a running Administration Server instance. See
   Invoking WLST.

2. Navigate to the domain run-time MBean hierarchy by entering the domainRuntime
   command.

   wls:/mydomain/serverConfig> domainRuntime()

   The domainRuntime command places WLST at the root of the domain-wide run-time
   management objects, DomainRuntimeMBean.

3. Navigate to ServerRuntimes and then to the server instance which you are
   interested in monitoring.

   wls:/mydomain/domainRuntime> cd('ServerRuntimes/myserver')

4. At the server instance, navigate to and interrogate run-time MBeans.

   wls:/mydomain/domainRuntime/ServerRuntimes/myserver> cd('JVMRuntime/myserver')>
   wls:/mydomain/domainRuntime/ServerRuntimes/myserver/JVMRuntime/myserver> ls()

   -r--  HeapFreeCurrent                              191881368
   -r--  HeapFreePercent                              87
   -r--  HeapSizeCurrent                              259588096
   -r--  HeapSizeMax                                  518979584
   -r--  JavaVMVendor                                 Sun Microsystems Inc.
   -r--  JavaVendor                                   Sun Microsystems Inc.
   -r--  JavaVersion                                  1.6.0_21
   -r--  Name                                         AdminServer
   -r--  OSName                                       Windows XP
The following sections provide example scripts for retrieving run-time information about WebLogic Server server instances and WebLogic domain resources.

Script for Monitoring Server State

The WLST online script in Example 8-1 navigates the domain run-time hierarchy and checks the status of a Managed Server every 5 seconds. It restarts the server if the server state changes from **RUNNING** to any other status. It assumes that WLST is connected to the WebLogic domain's Administration Server.

**Example 8-1  Monitoring Server State**

```python
# Node Manager needs to be running to run this script.
import thread
import time

def checkHealth(serverName):
    while 1:
        slBean = getSLCRT(serverName)
        status = slBean.getState()
        print 'Status of Managed Server is ' + status
        if status != "RUNNING":
            print 'Starting server ' + serverName
            start(serverName, block="true")
        time.sleep(5)

def getSLCRT(svrName):
    domainRuntime()
    slrBean = cmo.lookupServerLifecycleRuntime(svrName)
    return slrBean

cHECKHealth("myserver")
```

Script for Monitoring the JVM

The WLST online script in Example 8-2 monitors the **HJVMHeapSize** for all running servers in a WebLogic domain; it checks the heap size every 3 minutes and prints a warning if the heap size is greater than a specified threshold. It assumes that the URL for the WebLogic domain's Administration Server is `t3://localhost:7001`.

For information on how to run this script, see Invoking WLST.

**Example 8-2  Monitoring the JVM Heap Size**

```python
waiting=180000
THRESHOLD=300000000
uname = "adminusername"
pwd = "adminpassword"
url = "t3://localhost:7001"
def monitorJVMHeapSize():
    connect(uname, pwd, url)
    while 1:
```
serverNames = getRunningServerNames()
domainRuntime()
for name in serverNames:
    print 'Now checking '+name.getName()
    try:
        cd("/ServerRuntimes/+name.getName()+""/JVMRuntime/+name.getName())
        heapSize = cmo.getHeapSizeCurrent()
        if heapSize > THRESHOLD:
            # do whatever is necessary, send alerts, send email etc
            print 'WARNING: The HEAPSIZE is Greater than the Threshold'
            else:
                print heapSize
    except WLSTException,e:
        # this typically means the server is not active, just ignore
        # pass
        print "Ignoring exception " + e.getMessage()
java.lang.Thread.sleep(waitTime)

def getRunningServerNames():
    # only returns the currently running servers in the domain
    return domainRuntimeService.getServerRuntimes()

if __name__ == "main":
    monitorJVMHeapSize()

---

Configuring Logging

Using WLST, you can configure a server instance's logging and message output.

To determine which log attributes can be configured, see LogMBean and LogFileMBean in the MBean Reference for Oracle WebLogic Server. The reference also indicates valid values for each attribute.

The WLST online script in Example 8-3 sets attributes of LogMBean (which extends LogFileMBean). For information on how to run this script, see Invoking WLST.

**Example 8-3 Configuring Logging**

```python
# Connect to the server
connect("adminusername","adminpassword","t3://localhost:7001")
edit()
startEdit()

# set CMO to the server log config
cd("Servers/myserver/Log/myserver")
ls ()

# change LogMBean attributes
set("FileCount", 5)
set("FileMinSize", 400)

# list the current directory to confirm the new attribute values
ls ()

# save and activate the changes
save()
activate()

# all done...
exit()
```
Working with the WebLogic Diagnostics Framework

The WebLogic Diagnostic Framework (WLDF) is a monitoring and diagnostic framework that can collect diagnostic data that servers and applications generate. You configure WLDF to collect the data and store it in various sources, including log records, data events, and harvested metrics.

To view example scripts that demonstrate using WLST to configure the WebLogic Diagnostic Framework, see WebLogic Scripting Tool Examples in Configuring and Using the Diagnostics Framework for Oracle WebLogic Server.

To view the collected diagnostics information using WLST, use one of the following commands to export the data from the WLDF repositories:

- From WLST offline, use the exportDiagnosticData command, described in WLST Command Reference for WebLogic Server.
- From WLST online, use exportDiagnosticDataFromServer command, described in WLST Command Reference for WebLogic Server.
WLST Deployment Objects

WLST provides deployment objects that enable you to make changes to a deployment plan and to check the status of a deployment command.

Topics:

- WLSTPlan Object
- WLSTProgress Object

WLSTPlan Object

The WLSTPlan object enables you to make changes to an application deployment plan after loading an application using the loadApplication command.

loadApplication in WLST Command Reference for WebLogic Server describes the command in more detail.

The following table Table A-1 describes the WLSTPlan object methods that you can use to operate on the deployment plan.

Table A-1   WLSTPlan Object Methods

<table>
<thead>
<tr>
<th>To operate on the...</th>
<th>Use this method...</th>
<th>To...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deployment Plan</td>
<td>DeploymentPlanBean getDeploymentPlan()</td>
<td>Return the DeploymentPlanBean for the current application.</td>
</tr>
<tr>
<td>Deployment Plan</td>
<td>void save() throws FileNotFoundException, ConfigurationException</td>
<td>Save the deployment plan to a file from which it was read.</td>
</tr>
<tr>
<td>Module Descriptors</td>
<td>ModuleDescriptorBean createModuleDescriptor(String uri, String moduleOverrideName)</td>
<td>Create a ModuleDescriptorBean with the specified uri for the ModuleOverrideBean moduleOverrideName</td>
</tr>
<tr>
<td>Module Overrides</td>
<td>ModuleOverrideBean[] getModuleOverride(String name)</td>
<td>Return the ModuleOverrideBean name.</td>
</tr>
<tr>
<td>Module Overrides</td>
<td>ModuleOverrideBean[] getModuleOverrides()</td>
<td>Return all ModuleOverrideBean objects that are available in the deployment plan.</td>
</tr>
<tr>
<td>Module Overrides</td>
<td>void showModuleOverrides()</td>
<td>Print all of the ModuleOverrideBean objects that are available in the deployment plan as name/type pairs.</td>
</tr>
</tbody>
</table>
### Table A-1 (Cont.) WLSTPlan Object Methods

<table>
<thead>
<tr>
<th>To operate on</th>
<th>Use this method...</th>
<th>To...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variables</strong></td>
<td>VariableBean createVariable(String name, String value)</td>
<td>Create a VariableBean name with this specified value that can override the value in the deployment plan.</td>
</tr>
<tr>
<td><strong>Variables</strong></td>
<td>void destroyVariable(String name)</td>
<td>Destroy the VariableBean name.</td>
</tr>
<tr>
<td><strong>Variables</strong></td>
<td>VariableBean getVariable(String name)</td>
<td>Return the VariableBean name.</td>

<td>Return all VariableBean objects that are available in the deployment plan.</td>
</tr>
<tr>
<td><strong>Variables</strong></td>
<td>void setVariableValue(String name, String value)</td>
<td>Set the variable name to the specified value.</td>
</tr>
<tr>
<td><strong>Variables</strong></td>
<td>void showVariables()</td>
<td>Print all of the VariableBean objects in the deployment plan as name/value pairs.</td>
</tr>
<tr>
<td><strong>Variable Assignment</strong></td>
<td>VariableAssignmentBean createVariableAssignment(String name, String moduleOverrideName, String moduleDescriptorUri)</td>
<td>Create a VariableAssignmentBean for the ModuleDescriptorBean moduleDescriptorUri for the ModuleOverrideBean moduleOverrideName.</td>
</tr>
<tr>
<td><strong>Variable Assignment</strong></td>
<td>void destroyVariableAssignment(String name, String moduleOverrideName, String moduleDescriptorName)</td>
<td>Destroy the VariableAssignmentBean name for the ModuleDescriptorBean moduleOverrideName for the ModuleDescriptorBean moduleDescriptorName.</td>
</tr>
<tr>
<td><strong>Variable Assignment</strong></td>
<td>VariableAssignmentBean getVariableAssignment(String name, String moduleOverrideName, String moduleDescriptorName)</td>
<td>Return the VariableAssignmentBean name for the ModuleDescriptorBean moduleOverrideName for the ModuleDescriptorBean moduleDescriptorName.</td>
</tr>
</tbody>
</table>

### WLSTProgress Object

The WLSTProgress object enables you to check the status of an executed deployment command.

The WLSTProgress object is returned by the following commands (refer to the associated command section in WLST Command Reference for WebLogic Server):

- `deploy`
- `distributeApplication`
- `redeploy`
• startApplication
• stopApplication
• updateApplication

Table A-2 describes the WLSTProgress Object methods that you can use to check the status of the current deployment action.

Table A-2  WLSTProgress Object Methods

<table>
<thead>
<tr>
<th>Use this method...</th>
<th>To...</th>
</tr>
</thead>
<tbody>
<tr>
<td>String getCommandType()</td>
<td>Return the deployment CommandType of this event. This command returns one of the following values: distribute, redeploy, start, stop, or undeploy.</td>
</tr>
<tr>
<td>String getMessage()</td>
<td>Return information about the status of this event.</td>
</tr>
<tr>
<td>ProgressObject getProgressObject()</td>
<td>Return the ProgressObject that is associated with the current deployment action.</td>
</tr>
<tr>
<td>String getState()</td>
<td>Retrieve the state of the current deployment action. CommandType of this event. This command returns one of the following values: running, completed, failed, or released (indicating that the object has been released into production).</td>
</tr>
<tr>
<td>boolean isCompleted()</td>
<td>Determine if the current deployment action has been completed.</td>
</tr>
<tr>
<td>boolean isFailed()</td>
<td>Determine if the current deployment action has failed.</td>
</tr>
<tr>
<td>boolean isRunning()</td>
<td>Determine if the current deployment action is running.</td>
</tr>
<tr>
<td>void printStatus()</td>
<td>Print the current status of the deployment action, including the command type, the state, additional messages, and so on.</td>
</tr>
</tbody>
</table>
FAQs: WLST

Frequently asked questions relating to WLST tend to fall into three categories: General WLST questions, Jython support questions and using WLST questions.

Topics:

• General WLST
• Jython Support
• Using WLST

General WLST

General questions about WLST are addressed.

What is the relationship between WLST and the existing WebLogic Server command-line utilities, such as wlconfig and weblogic.Deployer?

WLST functionality includes the capabilities of the following WebLogic Server command-line utilities:

• wlconfig Ant task tool for making WebLogic Server configuration changes (see Using Ant Tasks to Configure and Use a WebLogic Server Domain in Developing Applications for Oracle WebLogic Server)
• weblogic.Deployer utility for deploying applications. (see Deployment Tools in Deploying Applications to Oracle WebLogic Server)

When would I choose to use WLST over the other command-line utilities or the WebLogic Server Administration Console?

You can create, configure, and manage WebLogic domains using WLST, command-line utilities, and the WebLogic Server Administration Console interchangeably. The method that you choose depends on whether you prefer using a graphical or command-line interface, and whether you can automate your tasks by using a script.

What is the distinction between WLST online and offline?

You can use WLST online (connected to a running Administration Server or Managed Server instance) and offline (not connected to a running server).

 WLST online interacts with an active WebLogic domain and provides simplified access to Managed Beans (MBeans), WebLogic Server Java objects that you can also manage through JMX. Online, WLST provides access to information that is persisted as part of the internal representation of the configuration.

 WLST offline enables you to create a new WebLogic domain or update an existing WebLogic domain without connecting to a running WebLogic Server—supporting the same functionality as the Configuration Wizard. Offline, WLST only provides access to information that is persisted in the config directory.
Jython Support

WLST supports Jython.

What version of Jython is used by WLST?

The WLST scripting environment is based on the Java scripting interpreter, Jython 2.2.1.

Can I run regular Jython scripts from within WLST?

Yes. WebLogic Server developers and administrators can extend the WebLogic scripting language to suit their environmental needs by following the Jython language syntax. See http://www.jython.org.

Using WLST

General questions about using WLST are addressed.

If I have SSL or the administration port enabled for my server, how do I connect using WLST?

To connect to a WebLogic Server instance through an SSL listen port on a server that is using the demonstration SSL keys and certificates, invoke WLST using the following command:

```java
java -Dweblogic.security.SSL.ignoreHostnameVerification=true -Dweblogic.security.TrustKeyStore=DemoTrust weblogic.WLST
```

Otherwise, at a command prompt, enter the following command:

```java
java weblogic.WLST
```

In the event of an error, can I control whether WLST continues or exits?

Yes, using the `exitonerror` Variable. Set this variable to `true` to specify that execution should exit when WLST encounters an error, or to `false` to continue execution. This variable defaults to `true`. See WLST Variable Reference in WLST Command Reference for WebLogic Server.

Why do I have to specify (and) after each command, and enclose arguments in single- or double-quotes?

This is the proper Jython syntax. See http://www.jython.org.

Can I start a server, deploy applications, and then shut down the server using WLST?

Yes, see the documentation for the following groups of WLST commands:

- Life Cycle Commands in WLST Command Reference for WebLogic Server
- Deployment Commands in WLST Command Reference for WebLogic Server

Can WLST connect to a Managed Server?

Yes. You can connect to a Managed Server using the `connect` command. While connected to a Managed Server, you can view run-time data for the server and manage the security data that is in your Authentication provider’s data store (for
example, you can add and remove users). You cannot modify the WebLogic domain's configuration. See connect in *WLST Command Reference for WebLogic Server*.

**Can WLST use variables that I define in a properties file?**

Yes. You can use the `loadProperties` command to load your variables and values from a properties file. When you use the variables in your script, during execution, the variables are replaced with the actual values from the properties file. See `loadProperties` in *WLST Command Reference for WebLogic Server*.

**Does the `configToScript` command convert security MBeans in config.xml?**

Yes, the security MBeans are converted. However, the information within the Embedded LDAP is not converted.

**How can I access custom MBeans that are registered in the WebLogic MBeanServer?**

To navigate to the custom MBean hierarchy on the Runtime MBean Server, use the `custom` command. To navigate to the custom MBean hierarchy on the Domain Runtime MBean Server, use the `domainCustom` command. See Tree Commands in *WLST Command Reference for WebLogic Server*.

**Why am I not seeing all the MBeans that are registered in the MBeanServer?**

There are internal and undocumented MBeans that are not shown by WLST.

**Why does WLST offline not display the same MBeans as WLST online?**

As a performance optimization, WebLogic Server does not store most of its default values in the WebLogic domain's configuration files. In some cases, this optimization prevents entire management objects from being displayed by WLST offline (because WebLogic Server has never written the corresponding XML elements to the WebLogic domain's configuration files). For example, if you never modify the default logging severity level for a WebLogic domain while the domain is active, WLST offline will not display the domain's Log management object.

If you want to change the default value of attributes whose management object is not displayed by WLST offline, you must first use the `create` command to create the management object. Then you can `cd` to the management object and change the attribute value. See `create` in *WLST Command Reference for WebLogic Server*.

**When browsing custom MBeans, why do I get the following error message: No stub Available?**

When browsing the custom MBeans, the `cmo` variable is not available.

**Can I connect to a WebLogic Server instance through HTTP?**

If you are connecting to a WebLogic Server instance through HTTP, ensure that the `TunnelingEnabled` attribute is set to `true` for the WebLogic Server instance. See `TunnelingEnabled` in *MBean Reference for Oracle WebLogic Server*.

**Can I invoke WLST through Ant?**

Yes, you can initiate a new `weblogic.WLST` process inside an Ant script and pass your script file as an argument.

**Can WLST scripts execute on the server side?**
Yes. You can create an instance of the WLST interpreter in your Java code and use it to run WLST commands and scripts. You can then call the WLST scripts as a startup class or as part of `ejbCreate` so that they execute on the server side. See Embedded Mode.

**Can I customize WLST?**

Yes. You can update the WLST home directory to define custom WLST commands, WLST commands within a library, and WLST commands as a Jython module. For more information, see Customizing WLST.

**How do I execute custom WLST commands?**

You execute custom WLST commands in the same way as WebLogic Server WLST commands. Once you define custom commands in a `.py` file, they are available for use from the WLST command line and within scripts.

Similarly, if you have installed Fusion Middleware (FMW) components that include custom WLST commands, the commands are available for use from the WLST command line or within scripts.

For pointers to the documentation for the custom WLST commands, see Related Documentation in WLST Command Reference for WebLogic Server.

You can display help for these commands by entering the `help()`, `help('commandGroup')`, and `help('commandName')` commands on the WLST command line.
WLST Deprecated Features

Some WLST features are deprecated.

Topics
• Implicit Imports

Implicit Exports

Implicit imports are deprecated, beginning in Release 12.2.1.2.

Currently, by default, when WLST is started, the weblogic.jar is automatically added to the Jython sys.path so that all weblogic-related classes referenced in weblogic.jar are loaded into the WLST namespace. You can just reference these weblogic classes in your py script by calling weblogic.class directly. There is no need to import those weblogic classes explicitly by calling them using from weblogic import class. This provides a convenient way to reference weblogic classes in your py script.

However, loading weblogic classes into the WLST namespace during WLST startup adds execution time during startup and can cause performance issues.

Currently, you can disable auto-loading during the WLST startup by setting the following system property to true:

python.cachedir.skip

In a future release, WLST will disable weblogic class auto-loading during WLST startup. At that point, you will need to explicitly import classes using from weblogic import class. For example:

from weblogic.security.service import EJBResource
jRes = EJBResource('DDPoliciesEar', 'DDPoliciesEarMiniAppBean.jar', 'DDRolesAndPolicies', 'getSubject', 'Remote', None)
