# Using Application Programming Interfaces

This section contains the following topics:

- [Section 1.1, "About APIs"](#)
- [Section 1.2, "Tips"](#)
- [Section 1.3, "Calling APIs from Outside the Oracle Life Sciences Data Hub"](#)

**Views** All Oracle Life Sciences Data Hub (Oracle LSH) views are public and have names that begin with "cdr\_". You can see them in SQL Developer or a similar tool, or query for them using the string `cdr_`

---

---

**Note:** During its initial development, Oracle LSH was known as CDR. Therefore many internal names contain the string `cdr`. Please think of CDR as a synonym for LSH.

---

---

## 1.1 About APIs

Oracle LSH includes a set of APIs that enable you to do most of the things you can do through the user interface, including creating, modifying, and installing objects.

You can call Oracle LSH APIs from source code in a defined Program in Oracle LSH. In this case, no additional security or setup is required.

If you have an Oracle LSH database account with certain privileges, you can also develop programs that call APIs in a tool outside of Oracle LSH; such as SAS, Oracle SQL Developer, or SQL\*Plus. You can then see views of all the Oracle LSH data you need, including data from both the LSH (CDR) schema and, for classification data, the TMS schema. You can make the programs you write available to other people from the external tool. See "[Calling APIs from Outside the Oracle Life Sciences Data Hub](#)" on page 1-3.

**Example 1: Using APIs to Perform Multiple Tasks at Once** You can write a package that calls multiple APIs to do with one execution what it would take many tasks in the user interface (UI) to do; for example, create a Domain, an Application Area inside the Domain, a Work Area inside the Application Area, and multiple Load Sets, Tables, and Programs, each with a definition in the Application Area and an instance in the Work Area, and install the Work Area. If you have a standard structure for Project/Therapeutic Area Domains, for example, you may want to work this way.

However, remember that you can also copy a Domain and all its contents at once in the user interface.

Using APIs is even more attractive when you want to create, for example, multiple objects with variations or large complex objects such as Report Sets. You can create a spreadsheet to store all the variable information and load its data into an Oracle LSH Table instance using a Text Load Set. In your program, use a loop to read all the spreadsheet data and call the relevant Oracle LSH APIs to create the objects.

**Example 2: Calling APIs from an External System's UI** You may want to allow people in your company to perform actions on Oracle LSH objects from an external system.

For example, instead of requiring that SAS developers check out Source Code in Oracle LSH before opening the SAS IDE from an Oracle LSH Program, you may want to add a button to the SAS user interface that calls the API for checking out the Source Code object when clicked. Then, if the program is located in a schema with Execute privileges on the security API, any user with SAS, a database account in Oracle LSH, and normal Oracle LSH object security privileges on the Source Code definition, can check out the Source Code definition directly from SAS.

**Understand Oracle LSH Functionality** To use Oracle LSH APIs, you must understand basic Oracle LSH functionality including:

- **Object Ownership.** You must create container objects before creating the objects they contain, because to create any object you must identify its namespace (parent or container) object. For example, begin by defining a Domain, then an Application Area, then a Work Area, and then create a Table definition in the Application Area and an instance of it in the Work Area. You can use a single API to create both the Table definition and an instance of it. For details, see "Object Ownership" in the *Oracle Life Sciences Data Hub Application Developer's Guide*.
- **Installation.** You must create an instance of an object definition and install it before you can execute or store data in the object.
- **Mapping.** All executable objects must contain one Table Descriptor for each Table instance they read from and write to, and the Table Descriptors and Table instances must be mapped. For details, see "Defining and Mapping Table Descriptors" in the *Oracle Life Sciences Data Hub Application Developer's Guide*.
- **Checking Objects In and Out.** You must check objects out to modify them and check them in before you install and use them. For details, see "Understanding Object Versions and Checkin/Checkout" in the *Oracle Life Sciences Data Hub Application Developer's Guide*.
- **Security.** All objects require user group assignments to control user access. For details, see "Applying Security to Objects and Outputs" in the *Oracle Life Sciences Data Hub Application Developer's Guide*.
- **Classification.** To enable objects to appear in the Reports tab of the user interface for end users to run them and view their outputs, you must classify them. Classifications can also be used in searching for objects. For details, see "Classifying Objects and Outputs" in the *Oracle Life Sciences Data Hub Application Developer's Guide*.
- **Validation.** Objects should be validated according to your company policy whether they are created in the user interface or with APIs. For details, see "Validating Objects and Outputs" in the *Oracle Life Sciences Data Hub Application Developer's Guide*.

- **Object-Specific Information.** Further information on each object type is included in other chapters of the *Oracle Life Sciences Data Hub Application Developer's Guide*.

## 1.2 Tips

### 1.2.1 Committing APIs

The standard parameter P\_COMMIT is found in every API; see [Section 2.8, "Standard Parameters."](#) Its default value is FALSE, which prevents the API from committing. This is useful if you are creating multiple objects in a single program execution, to enable you to do a rollback. However, if you want the API to commit, pass the value FND\_API.G\_TRUE.

### 1.2.2 Get Attribute Values for Namespace Objects

Many APIs require internal IDs for the namespace object of the object you are creating. Use [Section 19.2.1, "Get a Naming Version Object."](#) to get these details. However, you must first determine what the namespace object is, using the object ownership diagram and explanation in the *Oracle Life Sciences Data Hub Application Developer's Guide* or *Oracle Health Sciences Data Management Workbench Study Setup Guide*, then query for the namespace object ID and object version using its name and its namespace's name and object type, in CDR\_DF\_NAMING\_V.

## 1.3 Calling APIs from Outside the Oracle Life Sciences Data Hub

This section contains the following topics:

- [Section 1.3.1, "Security Setup Required"](#)
- [Section 1.3.2, "Calling the Security API Package"](#)
- [Section 1.3.3, "Calling APIs from SAS"](#)
- [Section 1.3.4, "Using a Permanent Schema for Deploying Programs that Call APIs"](#)

### 1.3.1 Security Setup Required

To run any API package from a tool outside of Oracle LSH, such as SAS, SQL Developer, or SQL\*Plus, your system administrator needs to do the following:

1. Set up an Oracle LSH database account linked to your LSH user account; see "Creating Database Accounts" in the *Oracle Life Sciences Data Hub System Administrator's Guide*.
2. Grant your Oracle LSH database account Execute privileges on the API security package CDR\_PUB\_API\_INITIALIZATION.
3. To run APIs that insert, delete, or modify Oracle LSH classification hierarchy terms, you need security access to the Oracle Thesaurus Management System (TMS) instance that is installed as part of Oracle LSH. The Oracle LSH classification system is based on TMS.

---

**Note:** This step is not required for Oracle DMW custom programs. DMW does not use the LSH classification system.

---

Ask your system administrator to run the script `tmsadduser.sql` to do the following:

- Create a TMS user account with the same name as your Oracle LSH database account so that your account is entered in the `TMS_ACCOUNTS` and `OPA_ACCOUNTS` tables.
- Give your TMS user account superuser privileges in the `TMS_ACCOUNTS` table.
- Grant your TMS user account the `TMS_MAINTAIN_PRIV` database role.

### 1.3.2 Calling the Security API Package

For every program that you run from outside Oracle LSH to call an Oracle LSH API, you must first call a special security API: `CDR_PUB_API_INITIALIZATION`. This API contains three functions:

- `EnableApis`
- `DisableApis`
- `AreApisEnabled`

When you initialize any API, the `AreApisEnabled` function of the security API, `CDR_PUB_API_INITIALIZATION`, is called to check the calling program. If the program does not have the `EnableApis` flag set to `True`, the initialization fails.

To set the `EnableApis` flag to `True`, call the `EnableApis` function from your program. To call the `EnableApis` function, you need a schema/user account with an `Execute` privilege on the `CDR_PUB_API_INITIALIZATION` API granted by a system administrator.

Therefore, when you write a program that calls an API and is intended for use outside Oracle LSH, set the `EnableApis` flag to `True` in your program and then set it to `False` at the end to force the security check on the schema the next time the program is run:

1. Begin the body with the following code to call the function to enable APIs:

```
call CDR_PUB_API_INITIALIZATION.enableApis (arguments);
```

The arguments are described in `CDR_PUB_API_INITIALIZATION` itself.

2. At the end of the body, disable APIs with the following code:

```
CDR_PUB_API_INITIALIZATION.disableApis (arguments);
```

See [Example 1-1, "Program that Calls the API to Define a Work Area and Calls the Security and Error Message APIs"](#) on page 1-6.

### 1.3.3 Calling APIs from SAS

If you need to call multiple APIs from SAS, you may want to use a PL/SQL wrapper around the API calls so that you only call PL/SQL once. The *Oracle Life Sciences Data Hub Application Developer's Guide* has two examples. In the *Report Sets* chapter, see "Passing Values from a Program Instance to the Report Set for Post-Processing" and in the *Programs* chapter see "Calling an API to Capture Output Parameter Values."

### 1.3.4 Using a Permanent Schema for Deploying Programs that Call APIs

When you develop a program outside Oracle LSH that will call Oracle LSH APIs, you can use your own schema in the external tool (such as SQL\*Plus, SQL Developer, or SAS) to run and test the program, if you have `Execute` privileges on `CDR_PUB_API_`

INITIALIZATION. When you are ready to allow other people to run it, copy it into a different location.

Oracle recommends setting up one or more permanent, publicly available schemas in the Oracle LSH database for the purpose of compiling and storing programs that call Oracle LSH APIs. Grant each schema Execute privileges on CDR\_PUB\_API\_INITIALIZATION. This approach has the following advantages:

- If a user manually runs your program, he or she must enter the program location and name explicitly. This will be much easier if the user knows which schema contains such programs.
- If you set up the program to run automatically when a user clicks a button in the external system's user interface, for example, you must hardcode the program's name and location into the code.
- You can grant Execute on CDR\_PUB\_API\_INITIALIZATION to a controlled number of schemas.

## 1.4 Calling APIs from Defined Programs

If you develop and run a Program that calls an API within Oracle LSH—that is, in the defined Source Code of a defined Program object—no security is required beyond normal Oracle LSH object security. You do not need Execute privileges on the CDR\_PUB\_API\_INITIALIZATION API, and you do not need to enable APIs in your Program code.

---

---

**Note:** Within Oracle LSH, the calls to CDR\_PUB\_API\_INITIALIZATION are unnecessary and in fact a program that includes such a call will not compile because the Work Area schema does not have Execute privileges on CDR\_PUB\_API\_INITIALIZATION.

---

---

You do need to install the Program before you can run it, as you do any defined Program in Oracle LSH.

You can write packages in an Oracle LSH Program that do anything with APIs that you could do in a package outside Oracle LSH. For example, you could create an instance of a Program definition whose Source Code created a Work Area, several Load Sets, and a Program to merge the data, instead of defining the Work Area, Load Sets and Program through the Oracle LSH user interface.

## 1.5 Code Example Using Security and Error Message APIs

There are two utility Oracle LSH APIs that you call in conjunction with other Oracle LSH APIs:

- **CDR\_PUB\_API\_INITIALIZATION.** This API is required for developing and running programs that call any Oracle LSH API from outside Oracle LSH. See [Section 1.3.2, "Calling the Security API Package"](#) for further information.
- **CDR\_PUB\_MSG\_PUB.** This API returns error messages from other Oracle LSH APIs called in the same package.

The following code provides an example of calling the API to define a Work Area and each of the utility APIs.

**Example 1–1 Program that Calls the API to Define a Work Area and Calls the Security and Error Message APIs**

```

CDR_PUB_DF_WORKAREA.CREATEWORKAREA (
    P_API_VERSION=>1,
    P_INIT_MSG_LIST=>CDR_PUB_DEF_CONSTANTS.G_FALSE,

X_RETURN_STATUS => X_RETURN_STATUS,

    IF X_RETURN_STATUS <> 'S' THEN
        DBMS_OUTPUT.PUT_LINE('ERROR FOUND IN CREATEPROGRAM');
    END IF ;
    X_MSG_COUNT := CDR_PUB_MSG_PUB.COUNT_MSG(

### 2.1 CDR Naming Version Object Type

Object information is stored in two tables in the Oracle LSH database: `cdr_namings`, which contains one row for each defined Oracle LSH object, and `cdr_naming_versions`, which contains one row for each version of each defined Oracle LSH object.

Information from these two tables is stored in two composite database object types: `cdr_naming_version_obj_type` and `cdr_base_obj_type`.

For both the composite object types, the attributes `company_id`, `obj_id`, `obj_ver`, `namespace_obj_id`, and `namespace_obj_ver` form a composite primary key. You can refer to any existing object using this primary key.

Parameters of type `cdr_naming_version_obj_type` are required in APIs for creating and modifying an object. To get an object's naming version attribute values see ["Get a Naming Version Object"](#) on page 19-3.

The attributes of `cdr_naming_version_obj_type` are:

- **company\_id.** To get your company ID, use `CDR_PUB_DEF_FACTORY_UTILS.GetCompanyId`.
- **obj\_id** is the unique ID of the object. Oracle LSH generates this ID when you create a new object. Enter NULL if you are creating a new object.
- **obj\_ver** is the object's version number. Enter NULL if you are creating a new object.

---

---

**Note:** The attributes `company_id`, `obj_id`, `obj_ver`, `namespace_obj_id`, and `namespace_obj_ver` together constitute an object's primary key.

---

---

- **namespace\_obj\_id.** The unique ID of the object's parent object; for example, a Table instance is always contained in a Work Area, so its namespace\_obj\_id is the object ID of its Work Area.
- **namespace\_obj\_ver.** The version number of the object's parent object.

---

---

**Note:** You can create a child object only in the latest version of its parent object. If you pass a namespace version number that is not the latest when creating a child object, the system ignores the value you pass and creates the child in the latest version of the parent.

---

---

- **namespace\_start\_obj\_ver.** This attribute contains the version number of the parent object at the time the version represented by **obj\_ver** of the object represented by **obj\_id** was created.
- **namespace\_end\_obj\_ver.** This attribute contains the version number of the parent object at the time when the version represented by **obj\_ver** of the object represented by **obj\_id** was superseded by a higher version. If the object is still the most current version, then this attribute contains the value 999999. If you are creating a new object, enter 999999.
- **object\_type\_rc** This attribute defines what type of object you are creating or modifying. This value is mandatory for creating objects, but not for modifying objects. See "[Retrieving Reference Codelist Names and Values](#)" on page 2-4 for information on retrieving valid values.
- **name.** This is the name of the object.
- **owning\_location\_rc.** This attribute is entered in the system at LSH installation time and is stored as a profile in the system. The system automatically sets this value to the profile value for all objects. Enter NULL.
- **checked\_out\_flag\_rc.** This value indicates whether the object is currently checked out or not. The possible values are \$YESNO\$YES and \$YESNO\$NO. If you are creating a new object, enter NULL.
- **checked\_out\_id** is the user ID of the person who checked out the object, if it is currently checked out. If you are creating a new object, enter NULL.
- **object\_subtype\_id.** This attribute specifies the ID of the object's subtype. Use CDR\_PUB\_DF\_NAMING\_UTIL.GetObjectSubtypeID to retrieve an object's subtype ID. If you are creating a new object, enter NULL.
- **description.** This is an optional attribute but it is highly recommended that you provide a description for future reference. You can modify the description using appropriate API for the object.
- **ref\_company\_id.** If the object is an instance object, this attribute contains the company ID of the source definition.
- **ref\_obj\_id.** If the object is an instance object, this attribute contains the object ID of the source definition.
- **ref\_obj\_ver.** If the object is an instance object, this attribute contains the object version number of the source definition.
- **copied\_from\_company\_id.** If the object is a copy of another object, this attribute contains the company ID of the original object. If you are creating a new object, enter NULL.

- **copied\_from\_obj\_id.** If the object is a copy of another object, this attribute contains the object ID of the original object. If you are creating a new object, enter NULL.
- **copied\_from\_obj\_ver.** If the object is a copy of another object, this attribute contains the object version number of the original object. If you are creating a new object, enter NULL.
- **object\_version\_number.** This attribute is for Oracle LSH internal use only. Never enter a value for this attribute. If you are creating a new object, enter NULL.
- **status\_rc.** This attribute contains the current status of the object. See ["Retrieving Reference Codelist Names and Values"](#) on page 2-4 for information on retrieving valid values. If you are creating a new object, enter NULL.
- **validation\_status\_rc.** This attribute contains the current validation status of the object. See ["Retrieving Reference Codelist Names and Values"](#) on page 2-4 for information on retrieving valid values. If you are creating a new object, enter NULL.
- **version\_label.** This attribute stores the version label of the object, if any. If you are creating a new object, enter NULL.

## 2.2 CDR Base Object Type

For some operations on objects, only the identification contained in a CDR base object type (`cdr_base_obj_type`) is required. Some APIs allow you to operate on multiple objects at the same time by using a parameter based on a collection of CDR base object types called `cdr_base_obj_coll`.

A CDR Base Object Type contains a subset of the information contained in a CDR naming Version Object Type (see ["CDR Naming Version Object Type"](#) on page 2-1).

## 2.3 CDR Object-Specific Database Object Types

Each Oracle LSH object type has its own unique attributes beyond what is included in the CDR Naming Version Object Type and CDR Base Object Type. These unique attributes are included in a view for each object type. The view includes information on both definitions and instances of a particular object type. In the case of Tables, it includes Table Descriptors as well as Table definitions and instances.

APIs that are used to create or modify Oracle LSH defined objects contain parameters based on these supplementary database object types. You can set values for the object-specific attributes using these parameters.

For example, the supplementary database object type for Oracle LSH Programs is called `cdr_program_obj_type`. In the Create Program API, the parameter `pi_cdrprgobjtype` is of this type. Its attributes are:

- **company\_id.** To get your company ID, use `CDR_PUB_DEF_FACTORY_UTILS.GetCompanyId`.
- **obj\_id.** The unique ID of the Program.
- **obj\_ver.** The Program's version number.
- **tech\_type\_id.** Different executable object types have different technology types, which can be queried using the view `cdr_tech_types_v`. Use the column `program_type_rc` to see which tech type is valid for a particular object type. In the case of Programs, only the tech types whose value in the `program_type_rc` column is `$PROGRAMTYPES$PROGRAM` and which are present in the lookup type `cdr_tech_types`

are allowed. They are: \$TECHTYPES\$SAS, \$TECHTYPES\$SASCATALOGS, \$TECHTYPES\$SASFORMATS, \$TECHTYPES\$PLSQL, \$TECHTYPES\$REPORTS.

---

**Note:** Tech types that are not included in the lookup type `cdr_tech_` types are used internally only and should not be used with public APIs.

---

- **manual\_validation\_flag\_rc.** This flag determines whether a Program's outputs receive their validation status from their Execution Setup or must be validated manually. The valid values are: \$YESNO\$YES and \$YESNO\$NO.

See the chapter on "Defining Programs" in the *Oracle Life Sciences Data Hub Application Developer's Guide* for information about these attributes. Each object type has its own chapter in this manual where its attributes are described.

## 2.4 Retrieving Reference Codelist Names and Values

Some database object type attributes (those ending in the string `_rc`) have a fixed set of allowed values stored in a lookup (reference codelist). These attributes correspond to fields in the user interface with a drop-down or pop-up list of values. To supply or change one of these values you must enter the exact string stored in the reference codelist, with the codelist name surrounded by dollar signs and followed by a codelist value.

For example, the API to create any object includes a parameter of type `cdr_naming_version_obj_type`, one of whose attributes is `object_type_rc`. You must enter the correct string for the type of object you want to create.

Reference codelists are stored in a table you access through the view `cdr_lookups`. The following columns contain the following information:

- **lookup\_type:** reference codelist names
- **lookup\_code:** reference codelist values
- **meaning:** the text that is displayed in the user interface
- **description:** additional information (sometimes)

If you have LSH Setup Admin privileges you can look up reference codelists in the Applications user interface; see "Querying and Viewing Lookups" in the *Oracle Life Sciences Data Hub System Administrator's Guide*.

You can browse the view in a tool like SQL Developer to find these values. However, it is not always easy to guess the name of the reference codelist. In that case, you can go into the Oracle LSH user interface to where they are displayed and note one of the allowed values, then query.

For example, object types are displayed in the Add drop-down list in the Work Area Properties screen. You can see that one object type is Business Area, so you can use the following query:

```
select lookup_type, lookup_code, meaning from cdr_lookups where meaning
like '%Business Area%';
```

Now you know that the `lookup_type` for object types is `CDR_OBJECT_TYPES` and you can use the following query to get all the other values:

```
select distinct lookup_code, meaning from cdr_lookups where lookup_type =
'CDR_OBJECT_TYPES';
```

## 2.5 Retrieving the Instance Domain ID

While working with classification-related APIs, you may need the domain ID for the Oracle LSH environment you are working in. This is the ID for your Oracle LSH instance, which is created during installation. It has nothing to do with user-defined Domains that contain Application Areas.

Its value is normally 1.

## 2.6 Retrieving the ID of a User-Defined Domain

Query the CDR\_DF\_NAMING view for the domain ID and other attributes.

```
select * from cdr_df_naming_v where object_type_rc like '%$objtypes$libdomain%';
```

## 2.7 CDR\_DF\_NAMING\_V View

Query the CDR\_DF\_NAMING\_v view for object types.

```
select distinct OBJECT_TYPE_RC, from cdr_df_naming_v;
```

Then query for the object type you need, for example:

```
select * from cdr_df_naming_v where object_type_rc like '%$objtypes$object_type%';
```

## 2.8 Standard Parameters

Some or all of the following standard Oracle Applications parameters are included in each function and procedure:

**P\_API\_VERSION** (Mandatory) Enter 1.

**P\_INIT\_MSG\_LIST** (Optional) Accept the default value (FND\_API.G\_FALSE) to ensure that this individual API does not initialize the message list when the procedure is entered. Pass FND\_API.G\_TRUE to override the default behavior.

**P\_COMMIT** (Optional) Accept the default value (FND\_API.G\_FALSE) to ensure that this individual API does not commit upon completion. Pass FND\_API.G\_TRUE to override the default behavior.

**P\_VALIDATION\_LEVEL** (Optional) Accept the default value to perform full validation. No other values are currently supported.

**X\_RETURN\_STATUS** This output parameter returns the end status of the API: (S) Success, (E) Error or (U) Unexpected Error.

**X\_MSG\_COUNT** This output parameter returns the count of error messages if the return status is other than Success.

**X\_MSG\_DATA** This output parameter returns the text of the error message, if the message count is 1. If there are more than one messages, use `cdr_pub_msg_pub.get` to retrieve the messages.

);
```

**Parameters** This API has standard parameters (see ["Standard Parameters"](#) on page 5) and the following parameters:

- **PIO\_SOURCECDRNAMING** (Mandatory) This is a parameter of table type CDR\_NAMING\_VERSION\_OBJ\_TYPE. Enter values for the Application Area you want to create.

The following attributes are required: `company_id`, `namespace_obj_id`, `namespace_obj_ver`, `object_type_rc`. For `object_type_rc` enter `$objtypes$appliance`.

If you want to explicitly assign one or more terms for a particular level, initialize a `CDR_CLA_OBJ_TYPE` for each term, entering the classification level ID and, for the `CLASSIFICATION_ID`, the term ID. The `PAR_` attributes are not relevant to Application Areas. Do not enter any values for them.

If you are creating an instance of an existing definition, enter values to identify the definition. For OBJECT\_TYPE\_RC enter \$OBJTYPES\$BUSAREA if you are creating a definition only; \$OBJTYPES\$BUSAREAREF if you are creating an instance of an existing definition; and NULL if you are creating a new definition and an instance of it.
- **PI\_CDRPRGOBJTYPE** (Optional) This is a parameter of table type CDR\_BUSAREA\_OBJ\_TYPE specific to Business Areas.

If you are creating a new definition, enter values for the new Business Area.

The following attributes are required: ADAPTER\_COMPANY\_ID, ADAPTER\_OBJ\_ID, ADAPTER\_OBJ\_VER.

If you are creating an instance of an existing Business Area, do not enter any values here.
- **PI\_CREATEOBJECT** (Mandatory) Enter DEFN to create a definition only; INST to create a instance of an existing definition; or BOTH to create a new definition and an instance of it.
- **PI\_INSTANCE\_SUBTYPE\_ID** (Optional) If you are creating a new instance, enter the ID for the subtype you want to give the instance.

If you are creating a definition only, do not enter a value for this parameter.
- **PI\_DEFCLASSIFICATIONCOLL** (Optional) By default, the new definition is classified according to the subtype you assigned it in the CDR\_NAMING\_VERSION\_OBJ\_TYPE.

If you want to override the default classifications for one or more classification levels, use this parameter. This is a collection of CDR\_CLA\_OBJ\_TYPES, which have 5 attributes, including CLA\_LEVEL\_ID and CLASSIFICATION\_ID.

If you want the definition to inherit its classifications for a particular level from its parent, enter the classification level ID and, for the CLASSIFICATION\_ID, enter 0 (zero).

If you want to explicitly assign one or more terms for a particular level, initialize a CDR\_CLA\_OBJ\_TYPE for each term, entering the classification level ID and, for the CLASSIFICATION\_ID, the term ID. The PAR\_ attributes are not relevant to Business Areas. Do not enter any values for them.

- **PI\_INSTCLASSIFICATIONCOLL** (Optional) By default, the new instance is classified according to the subtype you assigned it in the PI\_INSTANCE\_SUBTYPE\_ID.

If you want to override the default classifications for one or more classification levels, use this parameter. This is a collection of CDR\_CLA\_OBJ\_TYPES, which have 5 attributes, including CLA\_LEVEL\_ID and CLASSIFICATION\_ID.

If you want the instance to inherit its classifications for a particular level from its parent Work Area, enter the classification level ID and, for the CLASSIFICATION\_ID, enter 0 (zero).

If you want to explicitly assign one or more terms for a particular level, initialize a CDR\_CLA\_OBJ\_TYPE for each term, entering the classification level ID and, for the CLASSIFICATION\_ID, the term ID. The PAR\_ attributes are not relevant to Business Areas. Do not enter any values for them.

## 4.4 Public APIs and Naming Views for Generic Visualization Adapter (GVA)

This is a public interface for operations related to Generic Visualization Business Areas including initializing and resetting them.

For more information on integrating a data visualization tool, see *Oracle® Health Sciences Data Management Workbench Data Visualization Integration Guide* on My Oracle Support, ID E87987-01.

- [Section 4.4.1, "Initialize a Generic Visualization Business Area Instance"](#)
- [Section 4.4.2, "Reset a Generic Visualization Business Area Instance"](#)
- [Section 4.4.3, "Get Possible Blinding Types of a Business Area Instance"](#)
- [Section 4.4.4, "Get Snapshot Labels Common to all Tables in a BA Instance for a Given Blinding AccessType"](#)
- [Section 4.4.5, "Get Custom Listing Business Area ID"](#)

### 4.4.1 Initialize a Generic Visualization Business Area Instance

Use this API to initialize a business area instance with a given currency and blinding access type to determine which data is displayed. The visualization tool must run this API each time:

- A user logs in.
- The user changes the currency or blinding setting.
- A user selects a business area to view. Users can view multiple business areas in a single session as long as the user selects compatible blinding settings for all business areas.

If the user selects a blinding access type for a business area that is incompatible with the blinding access types selected for other business areas in the same session, the API errors out with the message, "There is a change in reading dummy data to blinded data or vice-versa. Please reset access to all business areas using resetBAAccess api and try again." See ["Reset a Generic Visualization Business Area Instance"](#) on page 4-14.

If the currency and the blinding access values are not set by the user, the API uses the default values, which are to show current and nonblinded data.

**Tip:** There are two versions of API CDR\_PUB\_API\_GVA.setInitializeBa with the same name. One allows entering a timestamp for the currency, while the other one accepts either the value CURRENT or a snapshot label.

#### Signature for Version 1

```
PROCEDURE SETINITIALIZEBA(

PI_VBLINDINGACCESSTYPE IN VARCHAR2,
X_RETURN_STATUS      OUT NOCOPY VARCHAR2,
X_MSG_COUNT          OUT NOCOPY NUMBER,
X_MSG_DATA           OUT NOCOPY VARCHAR2)

```

**Parameters**

**PI\_COMPANYID.** Enter the business area instance's company ID.

**PI\_OBJID.** Enter the business area instance's object ID.

**PI\_OBJVER.** Enter the business area instance's object version.

**PI\_VCURRENCY.** Enter Current or a snapshot label common to all Table instances. See [Section 4.4.4, "Get Snapshot Labels Common to all Tables in a BA Instance for a Given Blinding AccessType"](#).

OR

**PI\_DREFRESHTS** Timestamp of the data currency required. Use any valid Oracle date or datetime format. The system displays data that was current at the date and time specified. For example, if data was loaded for the first time at 1:00 pm and then again at 2:00 pm:

- If the user specifies a timestamp of 1:30 pm, the visualization displays data loaded at 12:00.
- If the user specifies a timestamp of 12:00 pm, the visualization displays no data.
- If the user specifies a timestamp of 4:00 pm, the visualization displays data loaded at 2:00 pm.

**PI\_VBLINDINGACCESSTYPE.** Enter the blinding access type. The allowed values are: *NA/Dummy*, *Masked Data*, *Real (Unblinded)*, and *Real (BlindBreak)*. Note that there is no space between *Real* and the parentheses/brackets.

- **NA/Dummy:** The user sees dummy data for data blinded at the table level.
- **Masked Data:** The user sees masking values for data blinded at the column, row, or cell level.
- **Real (Unblinded):** The user sees real data in unblinded table instances. This option is available only if *all* the business area's table instances whose Blinding flag is set to Yes have a Blinding Status of Unblinded.
- **Real (Blind Break):** The user sees currently blinded data in blinded table instances.

### 7.1.7 Synchronize Table Descriptors in a Load Set

Use this API to synchronize all the existing table descriptors in a Load Set with the Table definition at the source. When you use this API, it performs different tasks according to the situation:

- If the API finds no changes to be synchronized, it displays a message indicating that there are no changes to the table descriptors.
- If the API finds changes to be synchronized and the Load Set definition is checked out, it synchronizes the changes and displays a message indicating that changes were identified and synchronized.
- If the API finds changes to be synchronized and the Load Set definition is checked in, then it checks out the Load Set, completes synchronization and leaves the Load Set checked out.

Table descriptors (and corresponding Table definitions) are checked out only if changes are detected. After synchronization is complete, the API returns a collection of Table descriptor objIDs and obj versions that were changed.

The API does not create a new table descriptor in the Load Set but only synchronizes the existing Table Descriptors. The updated Table Descriptor generates the same outcome as when columns are uploaded for a Table Descriptor.

**Name** CDR\_PUB\_DF\_LOADSET.SynchronizeTablesWithinLS

#### Signature

```
PROCEDURE SYCHRONIZETABLESWITHINLS(
P_API_VERSION IN NUMBER,
P_INIT_MSG_LIST IN VARCHAR2 DEFAULT CDR_PUB_DEF_CONSTANTS.G_FALSE,

```

**Parameters** This API has standard parameters (see ["Standard Parameters"](#) on page 5) and the following parameter:

- `PARAM P_VALIDATION_LEVEL` (Optional). Accept the default value to perform full validation. No other values are currently supported.
- `PARAM X_RETURN_STATUS`. This output parameter returns the end status of the API: (S) Success, (E) Error or (U) Unexpected Error
- `PARAM X_MSG_COUNT`. This output parameter returns the count of error messages if the return status is other than Success.
- `PARAM X_MSG_DATA`. If the message count is 1, this output parameter returns the text of the error message. If there are more than one message, use `cdr_pub_msg_pub.get` to retrieve the messages.

- `PARAM PI_BFILEBLOB` (Optional). Provide the BLOB that holds the file content for SAS and TEXT Load Sets.
- `PARAM PO_TDESCLIST`. This list contains the table descriptors that were updated.
- `PARAM PO_OUTMSG`. Returns the error/confirmation messages.

The required attributes are: OBJECT\_TYPE\_RC,NAME,NAMESPACE\_OBJ\_ID,NAMESPACE\_OBJ\_VER,NAMESPACE\_START\_OBJ\_VER,NAMESPACE\_END\_OBJ\_VER,OWNING\_LOCATION\_RC,OBJECT\_SUBTYPE\_ID.

For OBJECT\_TYPE\_RC enter \$OBJTYPES\$PROGRAM if you are creating a definition only; \$OBJTYPES\$PROGRAMINST if you are creating an instance of an existing definition; and NULL if you are creating a new definition and an instance of it.

If you want the definition to inherit its classifications for a particular level from its parent, enter the classification level ID and, for the CLASSIFICATION\_ID, enter 0 (zero).

If you want to explicitly assign one or more terms for a particular level, initialize a CDR\_CLA\_OBJ\_TYPE for each term, entering the classification level ID and, for the CLASSIFICATION\_ID, the term ID. Do not enter any values for them.

If you are not creating a new definition, do not enter values here.

- **PI\_INSTCLASSIFICATIONCOLL** (Optional) By default the new instance is classified according to the subtype you assigned it in the CDR\_NAMING\_VERSION\_OBJ\_TYPE.

If you want to override the default classifications for one or more classification levels, use this parameter. This is a collection of CDR\_CLA\_OBJ\_TYPES, which have 5 attributes, including CLA\_LEVEL\_ID and CLASSIFICATION\_ID.

```

**Parameters** This API has standard parameters (see "Standard Parameters" on page 5) and the following parameters:

- **PIO\_SCREF\_SOURCECDRNAMING** (Mandatory) This is a parameter of table type CDR\_NAMING\_VERSION\_OBJ\_TYPE. Enter values to identify the Source Code definition or instance and enter new values for the attributes you want to modify.

You can change the name or description for either the definition or instance. For an instance you can also change to a different underlying source definition by entering values for the new definition in the three REF attributes.

---

---

**Note:** Neither Source Code definitions nor instances can have a validation status or a version label. All attributes are required.

---

---

- **PI\_CDRSCOBJTYPE** (Mandatory) This is a parameter of table type CDR\_SRCCODE\_OBJ\_TYPE that contains object attributes specific to Source Code definitions.

If you are modifying a Source Code definition, enter values to identify the definition and enter new values for the attributes you want to modify.

You can modify SHAREABLE\_FLAG\_RC, ORACLE\_PACKAGE\_NAME, and ORACLE\_PROCEDURE\_NAME. All attributes are required.

- **PIO\_CDRSCREFOBJTYPE** (Mandatory) This is a parameter of table type CDR\_SRCCODE\_REF\_OBJ\_TYPE that contains object attributes specific to Source Code instances.

- **PI\_VLOBMODE** Enter 'DIRECT' if your source code is already contained in a BLOB or CLOB file. You enter information about it in one of the next two parameters and the API uploads it immediately.

If you enter anything other than 'DIRECT' the API creates a new, empty BLOB and CLOB in the next parameters. It prompts you to paste in your source code and then uploads the BLOB or CLOB.

- **PIO\_CDRSCBLOB** This is a compound object of type CDR\_SRCCODE\_BLOB\_OBJ\_TYPE.

If the source code is binary, enter its name for the FILE\_NAME attribute value and the BLOB itself for the FILE\_BLOB attribute value.

**Parameters** This API has standard parameters (see ["Standard Parameters"](#) on page 2-5) and the following parameters. See ["Functional Rules"](#) below for more information.

- **PI\_WA\_COMPANY\_ID** (Mandatory) Enter the Company ID.
- **PI\_WA\_OBJ\_ID** (Mandatory) Enter the Work Area object ID.
- **PI\_WA\_OBJ\_VER** (Mandatory) Enter the latest object version.

- **PI\_LABEL** (Mandatory) Label text.
- **PI\_FORCEFLAG** (Mandatory)
  - If set to **\$YESNO\$YES**, the API overwrites the previous snapshot label.
  - If set to **\$YESNO\$NO** the label is not applied.
- **PI\_BLIND\_FLAG** (Mandatory) The Blind Break flag (**\$YESNO\$YES**, **\$YESNO\$NO**).
- **PI\_DATE** (Optional) If this value is used, the API labels only those tables with latest data loads less than or equal to entered value.
- **PI\_SCR\_TAB\_COL** (Optional) Naming details of source table(s) of view in given Work Area and corresponding view naming details (to match value with **CDR\_WA\_TABLES\_COLL**).

This parameter is of type **CDR\_SRC\_TABLE\_OBJ\_TYPE** and contains the following naming attributes:

- **SRC\_TI\_COMPANY\_ID NUMBER(6)** Enter the Table or view Company ID.
- **SRC\_TI\_OBJ\_ID NUMBER(22)** Enter the Table or view object ID.
- **SRC\_TI\_OBJ\_VER NUMBER(7)** Enter the Table or view object version.
- **SRC\_TI\_LABEL VARCHAR2(4000)** Source table's already applied label to any given load.
- **VW\_TI\_COMPANY\_ID NUMBER(6)** Enter the view Company ID.
- **VW\_TI\_OBJ\_ID NUMBER(22)** Enter the view object ID.
- **VW\_TI\_OBJ\_VER NUMBER(7)** Enter the view object version.
- **PI\_WA\_TABLES\_COLL** (Optional) This is a parameter of type **CDR\_WA\_TABLES\_TYPE** that contains table naming attributes.

Use this parameter if the API call is intended to set the label for only a subset of table(s) of an Work Area. It contains following naming attributes:

  - **TI\_COMPANY\_ID NUMBER(6)** Table **COMPANY\_ID** to which label need to be set.
  - **TI\_OBJ\_ID NUMBER(22)** Enter the object ID for the Table for which the label needs to be set.
  - **TI\_OBJ\_VER NUMBER(7)** Enter the object version for the Table for which the label needs to be set.
  - **TI\_RET\_STATUS VARCHAR2(4000)** This is return status, should be passed as null.

**Functional Rules** The following rules outline the API's behavior depending on parameter usage in the API call:

- If **PI\_WA\_TABLES\_COLL** is used, it will apply the label only to the entered table(s) and/or view(s).
- If **PI\_WA\_TABLES\_COLL** is null, the label is applied to all table(s)/view(s) in the Work Area.
- Multiple labels cannot be applied to the same table/view in one API call.
- If **PI\_DATE** is used, the label is applied to the latest Table data load, less than equals to the used date.

- If PI\_DATE is not used, the label is applied to latest Table data load.
- If PI\_FORCEFLAG is set to \$YESNO\$YES, the API overwrites the Snapshot Label if already applied, otherwise the label is not applied.
- If PI\_FORCEFLAG is set to \$YESNO\$YES, non-blinded Tables are always included to be labeled.
- If PI\_SRC\_TAB\_COLL is null, and PI\_WA\_TABLES\_COLL has view information or is null (if view exists), the view is loaded and labeled with latest loaded data from the source table.
- If PI\_SRC\_TAB\_COLL has a partial set of source table or views, and PI\_WA\_TABLES\_COLL has view information, the view is loaded and labeled with the latest loaded data from the source table that has non-passed source information.
- If PI\_SRC\_TAB\_COLL is used, the view details should be part of PI\_WA\_TABLES\_COLL.
- If PI\_SRC\_TAB\_COLL is null label will be applied to all table(s) in given Work Area.
- If collection PI\_SRC\_TAB\_COLL is passed with source table's label then view will be loaded and labeled with that data of source table.
- If PI\_SRC\_TAB\_COLL is used with the source table's label as null, then the view is loaded and labeled with latest loaded data of source table.

  X_MSG_COUNT OUT NUMBER,  
  X_MSG_DATA OUT VARCHAR2  
);
```

**Parameters** This API has standard parameters (see "Standard Parameters" on page 5).

## 19.9 Change Tablespaces

Use this API to alter the tablespace of Table instances and indexes in a single container—Domain, Application Area, or Work Area—identified recursively. This may be helpful if you want to archive data or if the current tablespace runs out of room. You can associate Table instances and indexes with the same tablespace or two different ones.

The API generates a script to change the tablespace attribute of all table instances and indexes in the container you specify. It also analyzes the effect of the change and generates a log file that may include errors or warnings.

### To Use this API:

1. Take a backup of the database.
2. Run the API with a database account associated with an application user.
3. Check the generated log file for errors and warnings before running the generated script.
4. Run the script with a database account with DBA privileges.

---

**Note:** If a Work Area is installed after its Table instances and indexes have been changed to a different tablespace, some of the new tablespace associations are lost:

- Table instances remain in the new tablespace.
- Temporary tables revert to the default tablespace.
- Nonunique and bitmap indexes are associated with the new tablespace of the Table instances, even if they had been in a different new tablespace.
- All other indexes revert to the default tablespace.

You can run the script again to properly reassociate all objects with the preferred tablespaces.

  x_msg_count       OUT NOCOPY NUMBER,
```

```
x_msg_data OUT NOCOPY VARCHAR2);
```

**Parameters** This API has standard parameters (see the *Oracle Health Sciences Life Sciences Data Hub API Guide*) and the following parameters:

---

---

**Note:** Unlike other LSH public APIs, this API has the standard P\_COMMIT parameter permanently set to FALSE.

---

---

- **PI\_COMPANYID** (Mandatory). Enter the company ID of the container object—Domain, Application Area, or Work Area—that contains the table instances whose tablespace you want to change. To get your company ID, use CDR\_PUB\_DEF\_FACTORY\_UTILS.GetCompanyId.

```

**Parameters** This API has standard parameters (see ["Standard Parameters"](#) on page 5) and the following parameters:

- **PARAM P\_API\_VERSION.** The API uses this parameter to compare the version numbers of incoming calls to its current version number, and returns an unexpected error if the versions are incompatible.
- **PARAM P\_INIT\_MSG\_LIST.** Use this parameter to request that the API initialize the message list. By default, this parameter is set to FND\_API.G\_FALSE, meaning that APIs do not initialize the message list unless specifically instructed by the user.
- **PARAM P\_COMMIT.** Use this parameter to instruct the API to commit after performing its function. By default, this parameter is set to FND\_API.G\_FALSE, meaning that APIs do not commit unless instructed by the user.
- **PARAM P\_VALIDATION\_LEVEL.** This parameter helps the API to determine those validation steps to execute and those to skip. The current behavior is that the API performs a full validation.

For Report Sets and Report Set Entries, enter the PRREF\_IDs of those selected Report Sets that may be included for execution. Use PRREF\_ID, PRREF\_VER of Objects to OBJ\_ID, OBJ\_VER of CDR\_PARAMETER\_OBJ\_TYPE. Set DEFAULT\_VALE as 'Y'. You do not need to assign other attributes except COMPANY\_ID, OBJ\_ID, OBJ\_VER and DEFAULT\_VALUE.

This is a public interface for mapping-related operations; including—creating and modifying mappings at the Table Descriptor and Column levels, creating a Table Descriptor from a Table instance, or a Table instance from a Table Descriptor, and mapping the two. It also includes functions for getting the unique PRREF\_ID and PRREF\_VER for the executables and Business Areas that contain Table Descriptors. You need these identifiers to run most of the mapping APIs.

- **PI\_OCLASSIFICATIONS** This is a collection of CDR\_CLA\_OBJ\_TYPEs, which have 5 attributes, including CLA\_LEVEL\_ID and CLASSIFICATION\_ID.

If you want the OBJECT to inherit its classifications for a particular level from its parent, enter the classification level ID and, for the CLASSIFICATION\_ID, enter 0 (zero).

If you want to explicitly assign one or more terms for a particular level, initialize a CDR\_CLA\_OBJ\_TYPE for each term, entering the classification level ID and, for the CLASSIFICATION\_ID, the term ID. The PAR\_ attributes are relevant only to Planned Outputs.

If you are not classifying a Planned Output, do not enter any values for them.

If you are classifying a Planned Output and want to use a Parameter with a classification-driven list of values, use the PAR attributes to identify the Parameter you want to use.

This is a public interface for validation-related operations.

This section contains the following topics:

- [Section 27.1, "Validate Objects"](#)
- [Section 27.2, "Create and Modify Validation Supporting Documents"](#)

## 27.1 Validate Objects

This section contains one API for updating the validation status of an object.

### 27.1.1 Update an Object's Validation Status

Use this API to update an object's validation status. The API performs a cascade validation on this object and its related objects.

If this object is an instance, the API also validates its source definition. If this object contains other objects with a validation status, the API updates the validation status of all of them; and if they are instances, their source definitions.

The operation fails if any of the underlying definitions are checked out. If you are validating a Report Set, the operation also fails if any of the Program instances in the Report Set have a validation status lower than the one to which the Report Set is being upgraded.

**Name** CDR\_PUB\_VL\_VALIDATION.UpdateValStatus

#### Signature

```
PROCEDURE UPDATEVALSTATUS (
  P_API_VERSION IN NUMBER,
  P_INIT_MSG_LIST IN VARCHAR2 := CDR_PUB_DEF_CONSTANTS.G_FALSE,

  PO_ERRORNAMINGCOLL OUT CDR_BASE_OBJ_COLL
);
```

**Parameters** This API has standard parameters (see ["Standard Parameters"](#) on page 5) and the following parameters:

- **PI\_VALOBJ** (Mandatory) This is a parameter of table type CDR\_VAL\_STATUS\_OBJ\_TYPE. Enter values to identify the object whose validation status you want to update.  
The following attributes are required: COMPANY\_ID,OBJ\_ID,OBJ\_VER,OBJ\_TYPE\_RC,VALIDATION\_STATUS\_RC,OBJECT\_VERSION\_NUMBER.
- **PO\_CASCADEDOBJCOLL** This output parameter is a collection of all the objects whose validation status was updated due to cascading. If this parameter contains a value, the validation update operation succeeded.
- **PO\_ERRORNAMINGCOLL** This output parameter is a collection of objects whose validation status could not be updated. If this parameter contains a value, the validation update operation failed.

## 27.2 Create and Modify Validation Supporting Documents

This section contains the following topics:

## Oracle Health Sciences Data Management Workbench APIs

This part of the Oracle Life Sciences Data Hub (Oracle LSH) API guide contains public APIs included in Oracle Health Sciences Data Management Workbench (Oracle DMW). You can call these APIs from custom programs used in Oracle DMW.

To use these APIs you need to understand defined objects in Oracle LSH. Refer to [Part I, "Essential Information"](#) to know more about running APIs in Oracle LSH. Part 1 includes [Reference Information](#), which contains details about the Standard Parameters required to call APIs.

[Setup Utilities](#) contains information on utility APIs that you can use to get the information and IDs you need, to invoke Oracle DMW APIs.

This part includes the following chapters:

- [Chapter 28, "Introduction to Oracle DMW APIs"](#)
- [Section 29, "Clinical Data Models"](#)
- [Chapter 30, "Codelists"](#)
- [Chapter 31, "Flags, Categories, and Actions"](#)
- [Chapter 32, "Transformations"](#)
- [Chapter 33, "Validation Checks"](#)

---

---

## Introduction to Oracle DMW APIs

Oracle Health Sciences Data Management Workbench (Oracle DMW) is built on top of Oracle Life Sciences Data Hub (Oracle LSH) and shares the same database and execution engine. Be sure to read the following sections, which apply to Oracle DMW as well as Oracle LSH APIs:

- [Chapter 1, "Using Application Programming Interfaces"](#)
- [Chapter 2, "Reference Information"](#)
- [Chapter 19, "Setup Utilities"](#)

For information on Oracle DMW functionality and structure, see the user documentation, including information on object ownership (namespaces).

---

---

**Note:** Even though an Oracle DMW Study is an Oracle LSH domain, it has additional attributes and you cannot create a study using the API for creating a domain. The API for creating a study is not public. Create studies in the user interface.

---

---

---

---

**Note:** During its initial development, Oracle DMW was known as DME. Therefore many internal names contain the string `dme`. Please think of DME as a synonym for DMW—just as CDR was the early name for Oracle LSH.

---

---

This section includes:

- [Set Up the Study Environment](#)
- [Create or Modify an Expression](#)

### 28.1 Set Up the Study Environment

The program you are writing must call `DME_PUB_INITIALIZATION.SetupAPIStudyEnvironment` before it calls any other Oracle DMW API or uses any public view.

This procedure checks that the study ID and lifecycle value you pass in are valid and then uses those values and the study's partition ID for the lifecycle to set `SYS_CONTEXT` appropriately. Call it again to change the study or lifecycle context.

## 28.1.1 Initialize a Study and Lifecycle

**Name** DME\_PUB\_INITIALIZATION.SetupAPIStudyEnvironment

### Signature

```
PROCEDURE SETUPAPISTUDYENVIRONMENT,
( P_API_VERSION IN NUMBER,
  P_INIT_MSG_LIST IN VARCHAR2 DEFAULT CDR_PUB_DEF_CONSTANTS.G_FALSE,
  P_COMMIT IN VARCHAR2 DEFAULT CDR_PUB_DEF_CONSTANTS.G_FALSE,
  P_VALIDATION_LEVEL IN NUMBER DEFAULT CDR_PUB_DEF_CONSTANTS.G_VALID_LEVEL_FULL,
  X_RETURN_STATUS OUT NOCOPY VARCHAR2,
  X_MSG_COUNT OUT NOCOPY NUMBER,
  X_MSG_DATA OUT NOCOPY VARCHAR2,
  PI_COMPANY_ID IN NUMBER,
  PI_STUDY_ID IN NUMBER,
  PI_LIFECYCLE IN VARCHAR2,
);
```

**Parameters** This API has standard parameters (see "[Standard Parameters](#)" on page 2-5) and the following parameters:

- **PI\_COMPANY\_ID** (Mandatory). Enter COMPANY\_ID of Study.
- **PI\_STUDY\_ID** (Mandatory). Enter OBJ\_ID of Study.
- **PI\_LIFECYCLE** (Mandatory). Enter Lifecycle context values like \$LIFECYCLE\$DEV, \$LIFECYCLE\$QC or \$LIFECYCLE\$PROD.

## 28.2 Create or Modify an Expression

In Oracle DMW, expressions in both validation checks and transformations are defined in the `EXPR_OBJ_TYPE` attribute of the `DME_MAP_ENTITY_OBJ_TYPE`. The `EXPR_OBJ_TYPE` attribute is of the `DME_XFORM_EXPR_OBJ_TYPE` object and its required values are:

- **EXPRESSION\_ID**: If you are modifying an expression, enter the expression object ID.
- **EXPRESSION\_MODE**: Enter one:
  - \$EXPRMODE\$CRITERIA if it is a criteria expression.
  - \$EXPRMODE\$EXPR if it is a column expression.
- **EXPRESSION\_TEXT**: Enter the string representation of expression, adhering to the following rules:
  - All the values should be single quoted. Numeric values can be applied without single quotes.
  - The column names should be specified in the following format: *{ModelName.TableName.ColumnName}*. For example, to specify a condition on the 'AGE' column from 'DM' table in 'Source' data model that AGE should be greater than 30, the expression\_text should be passed as: {Source.DM.AGE} > 30
  - To specify a user-defined functions, the package should be available in the view `DME_PUB_XFM_EXPR_STATIC_PKGS_V`. Refer to the static reference details for the package that contains the function.

- **EXPRESSION\_ITEM\_COLL** - Use this parameter only if you are calling a function in the expression. This is a parameter of collection type `DME_XFORM_EXPR_ITEM_OBJ_COLL` which is a table of `DME_XFORM_EXPR_ITEM_OBJ_TYPE` object type.

For each `expression_text`, the collection must be populated with one record with the following attribute assignments:

```
PARENT_ROW_ID = -1; ROW_ID=0; ROW_POS=1; ITEM_TYPE_RC=' $EXPITEMTYPE$GROUP'
```

If user-defined functions are used in `expression_text`, the collection should be populated with a separate record for each distinct user-defined function used in expression. The following attributes should be assigned for a record used for the user defined function:

- **PARENT\_ROW\_ID** = 0;
- **ROW\_POS** = 1;

---

---

**Note:** The above two values should always be 0 and 1, respectively.

---

---

- **ROW\_ID** - The `row_id` must be unique and sequential starting from 1 for each distinct user defined function used in the given expression.
- **ITEM\_TYPE\_RC** = ' \$EXPITEMTYPE\$FUNCTION';

Enter values for the following two attributes from the `DME_XFM_EXPR_STATIC_PKGS_V` view.

- **ITEM** - Enter the name of the user-defined function.
- **STATIC\_REFS** - Enter the function ID corresponding to the function used in expression.

---

---

### 29.1 Create and Modify Clinical Data Models

This is a public interface for clinical data model-related operations, including creating, modifying, and removing models, and checking models in and out. It also includes APIs for adding, modifying, and removing tables and constraints to tables within models.

---

---

**Note:** You can also create tables with columns and constraints within a model by uploading metadata files. See the *Oracle Health Sciences Data Management Workbench User's Guide* for more information.

### 29.1.1 Create a Study Clinical Data Model

Use this API to create a study clinical data model in a study domain. The model contains no tables. Use ["Add a Table to a Clinical Data Model"](#) on page 29-10 to add tables to the model. You can use this API to create either target models, whose data is populated from other Oracle DMW study models, or input models, whose data is loaded from InForm or from files. However, for input models you must complete the configuration in the user interface.

The procedure returns an S if the model is created successfully. Otherwise it returns an error.

If the library model is modified, you can upgrade the study model to the new version—see "[Upgrade a Clinical Data Model to the Latest Library Model Version](#)" on page 29-9. However, any local changes you have made to the study model are lost.

## 29.2 Get a Custom Listing Business Area ID for a Model

When a user logs into a visualization tool, the visualization tool must call an API to initialize the primary data model schema and, if the user wants to see custom listings through the tool, the schema for custom listings. The initialization API requires the business area instance ID, which is not available to a user in DMW.

Use this API to fetch the ID of the business area instance that contains all the custom listings defined in the model.

**Name** CDR\_PUB\_API\_GVA.getCustomListingBA

### Signature

```
FUNCTION getCustomListingBA(
pi_nDataModelId IN NUMBER,
pi_vContext IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**pi\_nDataModelId** Enter the ID of the data model.

**pi\_vContext** Enter the life cycle context value. The allowed values are: \$LIFECYCLE\$DEV, \$LIFECYCLE\$PROD, or \$LIFECYCLE\$QC.

### 29.2.1 Required Profile for Custom Listing BAs

You must set profile DMW : Synch Custom Listing BA synonyms with Primary Datamodel Business Area to Yes to generate custom listing business areas.

- If set to **No**, custom listing business area synonyms are not added to the primary business area for the model. This is the default value.
- If set to **Yes**, and if the data model is set to allow business areas, during installation of either the model or any custom listing that reads from it, the system creates synonyms in the primary schema based on custom listing names.

This is a public interface for all operations related to codelists, including creation, deletion, modification, and checking in and out of these objects.
