BDSS-20007: Source PIM record data:

Cause: This message is simply used as a label to identify the source PIM record data that is logged immediately following this label text. This message is appended to a primary error message and is never logged by itself.
**BDSS-20009:** The target PIM connector failed to delete a PIM record. The Sync-Engine will attempt to push any additional delete-record actions to target PIM.

**Cause:** The Sync-Engine has detected an error while attempting to delete a PIM record.

**BDSS-20012:** Failed to delete a PIM record.

**Cause:** The Sync-Engine has detected an exception while in the process of deleting a PIM record. The failure may be due to a problem in the hub, rather than a connector issue.

**Action:** Examine the Sync-Engine log for the exception text that should give a clue as to why the failure occurred.
Type: ERROR
Impact: Data

BDSS-20013: Failed to update metadata to the BDSS hub-record.

Source Connector user = \{0\} Source PIM Connector Name = \{1\} Source PIM Record Identifier = \{2\}.

Cause: This error occurs when the Sync-Engine is unable to persist updated metadata to the BDSS database for a particular BDSS hub-record. In particular, this error occurs when the Sync-Engine catches an exception when invoking method SyncConfig::getHubRecordForPimRecord. This error could indicate corrupt metadata for a particular BDSS hub-record, or perhaps a network or database failure, or a problem with the SyncConfig component.

Action: Check that the database is accessible. Perhaps try restarting the BDSS hub. If corrupt metadata is suspected, then try removing all metadata for a user and perform initial synchronization for a user.

Level: 1
Type: ERROR
Impact: Data

BDSS-20014: Failed to update the error code for a record.

Cause: The Sync-Engine cannot find a hub record for the specified PIM record identifier and Connector. This problem is unexpected and should not occur under normal operating conditions. This error message signifies that either hub metadata is missing or incorrect, or there was some other problem - such as a database access error. The Sync-Engine detects this error by means of an Exception thrown from SyncConfig method getHubRecordForPimRecord.

Action: Examine the log for evidence of exception text that will give more specific information as to the cause of the problem. Ensure that all infrastructure, such as the database and network, are working correctly. Ensure that all configuration is correct. Ensure that metadata is not corrupt for the specified user, Connector user and PIM Connector Name and PIM Record identifier. If the problem is due to hub metadata corruption for a given user then try clearing that user hub metadata and perform first-time synchronization for the user.

Level: 1
Type: ERROR
Impact: Data

BDSS-20015: Failed to find an BDSS PIM metadata record for BDSS master hub record ID = \{0\}

Cause: This error message is logged when a PIM metadata record could not be found for the specified hub user ID, hub record ID and Connector. In particular, the Sync-Engine logs this message when it detects an exception from method SyncConfig::getPimRecordForHubRecord. This problem could be due to corrupt metadata (e.g. the PIM metadata record is actually missing) or some other cause.

Action: Examine the log for the exception text that should give a better clue as to the underlying cause of the error. Ensure that all infrastructure, such as the database and network, are working correctly. Ensure that all configuration is correct. Ensure that hub metadata is not corrupt for the logged hub record ID. If the problem is due to hub metadata corruption for a given user then try clearing that user hub metadata and perform first-time synchronization for the user.
Level: 1
Type: ERROR
Impact: Data

BDSS-20016: The Hub User [0] is already being synchronized and cannot be synchronized again until that session has ended.

BDSS-20017: (Target Connector user)
Cause: This message string is a label for a Connector user identifier that is a destination target for record events that are being pushed to a PIM connector. This string is never logged by itself but is only ever appended to another primary logged message string. The primary message may be an error or may simply be a debug message.

Level: 1
Type: NOTIFICATION
Impact: Other

BDSS-20019: BDSS queue message receiver timeout expired. Queue message not received.
Cause: This error indicates that the Sync-Engine ExtractResponseTimeout occurred because the Sync-Engine did not receive an ExtractResponse for which it was waiting. In particular, this error represents a failure to receive an ExtractResponse via a queue message in a timely fashion. The Sync-Engine uses the ExtractResponseTimeout as a time-trigger to determine when a connector has become unresponsive. In such a case, the Sync-Engine has determined that it will not receive an ExtractResponse in a timely fashion and thus takes recovery action to abort the synchronization. This problem could be caused when a connector does not correctly send an ExtractResponse to the Sync-Engine. Alternatively, the ExtractResponse was sufficiently large, or network latency slow enough, that the
timeout occurred before the ExtractResponse could be properly transferred to the Sync-Engine from a connector.

**Action:** Ensure that all connectors are properly working and can successfully send ExtractResponse objects to the Sync-Engine. Ensure that the Sync-Engine machine is not overloaded and can handle receiving ExtractResponse objects efficiently. Ensure that the amount of data transferred via an ExtractResponse is not too large, or the network latency too slow, to trigger the ExtractResponseTimeout. If necessary, increase the ExtractResponseTimeout timeout value. Determine whether an http webservice timeout is occurring when a connector sends an ExtractResponse to the Sync-Engine.

**BDSS-20020: Received queue message that is an unexpected message class type.**  
Expecting class type ObjectMessage. {0}.  
**Cause:** This error indicates that the Sync-Engine has received a queue message with an unexpected Java class type. This error suggests a communication protocol failure within the Sync-Engine.

**Action:** Ensure that the array of users sent to the Sync-Engine has a valid hub user for each element in the array.
Level: 1

Impact: Data

**BDSS-20024: Invalid Hub User ID detected in an element of UsersArray.**

**Cause:** The Sync-Engine has detected an invalid hub-user in the UsersArray. The Sync-Engine cannot synchronize an invalid hub user. In particular, a valid string array element has been detected, but the string is empty and does not specify a hub user.

Impact: Data

**BDSS-20028: Invalid ExtractResponse detected. The ExtractResponse sent by a connector indicates that it contains delete events but the delete events do not exist.**
**Cause:** This error occurs when the Sync-Engine detects that an ExtractResponse specifies a true value for member ExtractResponse.ExtractResponseData.hasDeletes and yet specifies a null value for member ExtractResponse.ExtractResponseData.deleteRecordIdArray. Thus, the ExtractResponse object is corrupt and cannot be processed.

**Action:** Fix the connector that is providing the invalid ExtractResponse.

**Impact:** Data

**BDSS-20029:** Invalid ExtractResponse detected. The ExtractResponse sent by a connector contains a null delete record ID.

**Cause:** An ExtractResultCode value of either PARTIAL_EXTRACT_COMPLETED_OK or PARTIAL_EXTRACT_COMPLETED_NOTOK has been detected in an ExtractResponse received from a connector. An ExtractResponse, with either of these ExtractResultCode values, is considered nonviable for synchronization by the Sync-Engine. Thus, the Sync-Engine cannot perform synchronization with the corresponding ExtractResponse.

**Action:** Examine the connector, PIM server and configuration corresponding to the failed ExtractResponse. Fix the problem with this connector-related error.

**Level:** 1  
**Type:** ERROR
Impact: Data

BDSS-20044: Unknown failure code detected in an ExtractResponse.
   ExtractResponse Result Code = {0}. ExtractResponse Error Description = {1}
Cause: The Sync-Engine detects an unknown ExtractResultCode value in an 
   ExtractResponse received from a connector.
Action: Examine the connector, PIM server and configuration corresponding to 
   the failed ExtractResponse. Fix the problem with this connector-related error.
Level: 1
Type: ERROR
Impact: Data

BDSS-20045: Unknown Connector detected when retrieving an extract response.
   Cause: The Sync-Engine recognizes only two Connectors - one for Exchange and 
   the other for Webcenter. The Connector, received in an ExtractResponse from a 
   connector, is not recognized by the Sync-Engine.
   Action: Examine the log entry for this message to obtain the Connector retrieved 
   from the problematic ExtractResponse. Examine the connector, PIM server and 
   configuration corresponding to the problematic ExtractResponse. Ensure that the 
   connector provides the correct PIM server type in the ExtractResponse objects it 
   sends to the Sync-Engine.
Level: 1
Type: ERROR
Impact: Data

BDSS-20046: Error getting ExtractResponse objects.
   Cause: This message indicates that the Sync-Engine detected an error while 
   receiving ExtractResponse objects during a synchronization session. The 
   underlying problem should already have been logged.

   the underlying problem.
Level: 1
Type: ERROR
Impact: Data

BDSS-20047: Null name-key object detected in PIM record description array.
   Cause: This error occurs when the Sync-Engine is comparing records using their 
   key fields and detects that the name of a field is invalid, in other words empty or 
   null, for an UpsertRecord provided by a connector ExtractResponse.
   Action: Ensure that key-field configuration is correct. Examine recent 
   ExtractRequests in the log to help determine which connector is providing an 
   invalid key-field. Ensure that all connectors are providing valid ExtractRequest 
   responses to the Sync-Engine.

**BEA-003105:** The asynchronous replication request timed out while attempting to add object \(\{0\}\) to the replication queue. This session has not been replicated to any backup at this point.

**Cause:** The asynchronous replication request timed out while attempting to add object \(\{0\}\) to the replication queue. Once full, the queue waits until it has space for the object. This wait took longer than the ClusterMBean specified AsyncSessionQueueTimeout, thus the session object was not put into the queue and will not be replicated at this time.

**Action:** This could be due to the secondary server or persistent store slowing down the replication process. To better handle this, the SessionFlushInterval and the SessionFlushThreshold can be reduced to replicate less at a time and to replicate more often. Checking the performance of the secondary server or persistent store is advised.

**BEA-003106:** An unexpected exception occurred during replication: \(\{0\}\). Future session updates should replicate as expected.

**Cause:** An unexpected runtime exception occurred during replication probably from the Remote Management Interface (RMI) stub. Future session updates should replicate as expected.

BEA-010206: The EJB module, {0}, will be rolled back and redeployed to update the class {1}. This bean implementation class could not be updated without redeploying the entire EJB module because it was changed incompatibly. Incompatible changes are any changes that cause the EJB compiler to be run. This includes modifying a public variable name or a public method signature.

Cause: A command was issued to update the specified class.

Action: No action is necessary. This is just an informative message to let the user know why the EJB module is being redeployed since this can cause disruption to clients using an EJB in this EJB module.

BEA-011127: Error deserializing one or more EJB timers from the persistent store for the EJB deployment {0}. An incompatible change to the class of a Serializable object associated with the timer may be the cause. If this is the case, you can either undeploy your application entirely to remove the EJB timers from the persistent store or revert the incompatible changes to the Serializable class so the EJB timer can be deserialized. The error was: {1}

**Cause:** A common cause of this error is an incompatible serializable class change in your application.

**Action:** If the error is due to an incompatible serializable class change in your application, there are two options for dealing with the serialization errors. The first option is to completely undeploy the EJB, which will cause all of the EJB timers in the persistent store to be permanently removed. The second option is to revert changes to the serializable class that is associated with the EJB timer and redeploy the application. This allows the EJB timer to be deserialized.

Cause: While compiling EJB generated classes, the Java compiler produced output.

A parameter can be passed using call-by-value only if the parameter type is serializable.

Cause: The EJB has call-by-reference set to false. A parameter can be passed using call-by-value only if the parameter type is serializable. As this parameter is not serializable, the parameter will be passed by reference.

Action: The parameter should implement the java.io.Serializable interface for it to be passed by value.

**BEA-014001:** RDBMS descriptor {0} contains transaction-isolation settings. These settings may conflict with isolation-level settings in your weblogic-ejb-jar.xml descriptor and will be lost if you edit this descriptor in the console.

**BEA-014003:** EJB {0} uses optimistic concurrency and contains a finder or select method, {1}, for which include-updates is true. This combination of features does not work properly with database {2}.

**Cause:** Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks, unless Oracle is used as the database. Oracle read consistency does not hold read locks, so in this case reads are performed using the current JTA transaction. When reads are performed in a local transaction updates that have been flushed prior to commit of the transaction are not visible.

**Action:** Set include-updates for the query to false to avoid this warning message, or if you are using Oracle as your database, set the database-type to Oracle in weblogic-cmp-jar.xml.

**Cause:** These are database limitations.

**Action:** Turn off automatic-key-generation in order to use batch operations.
BEA-014005: The configured dispatch policy {1} for Message-Driven Bean (MDB) {0} will be ignored: the MDB is not running in a WebLogic thread.

Cause: The queue MDB is driven asynchronously by a non-WebLogic JMS implementation and runs in a non-WebLogic thread mechanism, so the MDBs application thread pool is not configurable.

Action: To disable this warning, remove the dispatch-policy setting from the MDBs WebLogic descriptor file.

BEA-014006: The Message-Driven Bean (MDB) named {0} has a dispatch policy {1} that refers to an unknown execute queue thread pool. The default execute thread pool will be used instead.

Cause: The specified MDB named has a dispatch policy that refers to an unknown execute queue thread pool.

Action: Create an execute thread queue pool for the server named {1}, or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing execute queue thread pool.

BEA-014007: The bean named {0} contains BLOB or CLOB fields or both, and uses Optimistic Concurrency but no version or timestamp column has been specified. This may result in corruption of BLOB and CLOB data.

Cause: The specified bean contains BLOB or CLOB fields or both, and uses Optimistic Concurrency but no version or timestamp column has been specified.

Action: Specify "version" or "timestamp" in the <table-map> <verify-columns> element and specify the name of the <version> or <timestamp> column in the <optimistic-column> element.

BEA-014008: In EJB {0}, {1} references an SqlShape element {2} that is not defined. The list of SqlShape elements that are defined for this EJB is: {3}.

Cause: An undefined SqlShape element was referenced.

Action: Use an existing SqlShape or create the SqlShape that you wish to use.
BEA-014009: The Message-Driven Bean [0] of application [1] will now be suspended, as it listens to global JMS destination [2] and a new application version [3] is being redeployed.

Cause:

Action: No action is required.

Level: 1
Type: NOTIFICATION
Impact: EJB

BEA-014010: The Message-Driven Bean [0] of application [1] will now be suspended, as it listens to global JMS topic [2] and a new application version [3] is being redeployed. Note also that the current Message-Driven Bean is not a durable subscriber to the topic, and messages published by the topic after the currently active version of the Message-Driven Bean is suspended may not be received by the new application version.

Cause: The specified Message-Driven Bean listens to the specified global JMS topic and a new application version is being redeployed.

Action: To ensure that the new application version will receive all messages published while the Message-Driven Bean was suspended, set the activation config property "subscriptionDurability" to "durable" in the deployment descriptor or annotation.

Type: WARNING
Impact: EJB

BEA-014011: EJB [0] uses optimistic-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. This combination of features is incompatible. The use-select-for-update is turned off by the EJB container in this case.

Cause: Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks. The element use-select-for-update in the RDBMS deployment descriptor when set to true, will cause SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the table. This conflicts with the Optimistic Concurrency strategy.

Action: Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014012: EJB [0] uses optimistic-concurrency and disables cluster invalidation, but does not have verify-rows set to Read. This combination will prevent detection of stale data if the bean is never modified in a transaction.

Cause: Optimistic concurrency beans verify consistency of data only if the bean has been modified, unless verify-rows is set to Read. If some other member of a cluster modifies a bean, other members will not be notified of this modification and will continue to store stale data unless the other members also attempt to modify the bean.
**Action:** Set either of the elements verify-rows to Read or cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

BEA-014013: EJB {0} does not have a concurrency-strategy of either optimistic or readOnly and disables cluster invalidation. Cluster invalidation is relevant only for these concurrency strategies.  
**Cause:** When an EJB is using either optimistic or readOnly concurrency-strategy and is deployed to a cluster, the container invalidates such beans on modification to avoid throwing OptimisticConcurrencyExceptions. This invalidation can be turned off by setting the cluster-invalidation-disabled to true in the RDBMS deployment descriptor.  
**Action:** Set cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

BEA-014014: The Message-Driven Bean (MDB) named {0} has a dispatch policy {1} that refers to an unknown work manager. The default work manager will be used instead.  
**Cause:** The specified MDB has a dispatch policy that refers to an unknown work manager.  
**Action:** Create a work manager for the server named {1}, or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing work manager.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

BEA-014016: EJB {0} uses readonly-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is read-only, select-for-update is unnecessary.  
**Cause:** Read-only beans cannot be updated. Therefore, use-select-for-update is unnecessary.  
**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

BEA-014017: EJB {0} uses exclusive-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is locked at the server level during a transaction, select-for-update on the database is unnecessary.
**Cause:** Exclusive concurrency is implemented by locking the bean at the server level when the bean participates in a transaction. Setting the element use-select-for-update in the RDBMS deployment descriptor to true causes SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the row in the database too. This may be unnecessary, as the bean is locked by the container.

**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

**BEA-014018:** EJB {0} uses a verify-columns element in the RDBMS deployment descriptor. This element is applicable only for optimistic concurrency beans. Since this bean does not use optimistic concurrency, this element will be ignored.

BEA-040456: An entity of type "\{3\}" with name "\{2\}" in JMS module "\{0\}" is not targeted. There is no subdeployment with name "\{1\}" in the configuration repository (config.xml). Therefore, this entity will not exist anywhere in the domain.

Cause: The entity of the given name and type in the given JMS module does not have a corresponding subdeployment in the configuration repository (config.xml).
In order for this entity to exist in the domain, it must be targeted with a sub-deployment element.

**Action:** Add a sub-deployment stanza to the appropriate deployment descriptor in config.xml. This will either be a jms-system-resource for a system module, or an app-deployment for a stand-alone JMS deployable module. If the JMS module is inside a J2EE application (an EAR file), then you must add the sub-deployment stanza to the subdeployment that represents this JMS module in the J2EE application. You do not necessarily have to target the subdeployment yet. Simply adding the subdeployment with no targets will remove this warning. However, if you wish for this entity to exist somewhere in your domain you must target the sub-deployment.

**BEA-040505:** The JMS module named "{0}" inside application "{1}" does not have a sub-deployment stanza named "{0}". Without such a stanza, no entities inside the module will be deployed, since the subdeployments inside of the sub-deployment stanza named "{0}" control where JMS entities inside this module are targeted.

**Cause:** When a JMS module is inside an EAR file, the targeting information for entities inside that module are nested within a sub-deployment named after the name of the JMS module found in the weblogic-application.xml file of the EAR file. If no sub-deployment exists with the name of the JMS module, then no targeted entities inside the module will become available. This is usually an oversight on the part of the administrator.

**Action:** Add a sub-deployment stanza with the name of the JMS module as specified in the weblogic-application.xml file to the app-deployment stanza. Nested inside that sub-deployment, you can target the entities in the module as you normally would.

BEA-045119: A JMS message send request failed for distributed destination {0}. Neither Unit-of-Order (UOO) nor Unit-of-Work (UOW) messages are supported for distributed destinations that have a member hosted by a clustered JMS Server. Distributed destination {0} has one or more of its members hosted by a clustered JMS server.

Cause: A JMS message send request failed for distributed destination {0}. Neither Unit-of-Order (UOO) nor Unit-of-Work (UOW) messages are supported for distributed destinations that have a member hosted by a clustered JMS Server. Distributed destination {0} has one or more of its members hosted by a clustered JMS server.
**Action:** To produce either UOO or UOW messages on a distributed destination, either use a distributed destination that is hosted only on one or more non-dynamic JMS servers, or send messages directly to a member of the distributed destination. **BEA-090173:** The server's trust keystore configuration (specified on the command line or in boot.properties) is incorrect.

**Cause:** Either TrustKeyStores was set to an illegal value or TrustKeyStores was set to CustomTrust but CustomTrustKeyStoreFileName was not specified.

**Action:** If specifying the server's trust keystore on the command line: To use the trusted CAs in DemoTrust.jks and in the JDK’s cacerts, specify:
- `Dweblogic.security.TrustKeyStore=DemoTrust` defaults to DemoTrust
- `Dweblogic.security.JaJavaStandardTrustKeyStorePassPhrase=passphrase` defaults to no passphrase which means read-only access to the JDK’s cacerts. To use the trusted CAs in the JDK’s cacerts, specify:
- `Dweblogic.security.TrustKeyStore=JavaStandardTrust` 
- `Dweblogic.security.JavaStandardTrustKeyStorePassPhrase=passphrase` defaults to no passphrase which means read-only access to the JDK’s cacerts. To use the trusted CAs from another keystore, specify:
- `Dweblogic.security.TrustKeyStore=CustomTrust` 
- `Dweblogic.security.CustomTrustKeyStoreFileName=filename` either an absolute pathname or a pathname relative to the directory in which the server was started. 
- `Dweblogic.security.CustomTrustKeyStoreType=type` defaults to the default keystore type specified in the JDK’s `java.security` file. 
- `Dweblogic.security.CustomTrustKeyStorePassPhrase=passphrase` defaults to no passphrase. Some keystore types allow this but only grant read-access (for example, JKS). Other keystore types require a keystore passphrase even for read-access. If specifying the server’s trust keystore via boot.properties, set the same properties as for the command line to boot.properties but remove the `weblogic.security` prefix. For example, set TrustKeyStore=JavaStandardTrust.

**Type:** INTERNAL_ERROR

**Impact:** Security

**BEA-090174:** The trust keystore configuration specified on the command line or in boot.properties does not match the trust keystore configuration specified in config.xml.

**Cause:** Either the trust keystore type does not match (for example, one specifies CustomTrust and the other specifies JavaStandardTrust) or the configuration
values do not match (for example, the CustomTrustKeyStoreFileName values are not the same).

**Action:** To always specify the trusted CA keystore for the server on the command line or the boot.properties file, set the server’s Keystores value in the config.xml file to CustomIdentityAndCommandLineTrust. Otherwise, ensure that the trust keystore configuration for this server in config.xml matches the trust keystore configuration specified on the command line or in boot.properties.

*Level:* 1

**Type:** WARNING
**Impact:** Security

**BEA-090482:** BAD_CERTIFICATE alert was received from {0}. Check the peer to determine why it rejected the certificate chain (trusted CA configuration, hostname verification). SSL debug tracing may be required to determine the exact reason for which the certificate was rejected.

*Cause:* The certificate chain sent to the peer may not be valid, or the peer may not be configured to accept the certificates.

*Action:* Check the peer configuration to see if the certificate chain was rejected because the certificate was not trusted or because there was a hostname violation. **Type:** WARNING
**Impact:** Security
BEA-090483: CERTIFICATE_REVOKED alert was received from {0}. The certificate chain sent to the peer was rejected because it was revoked by the certificate authority.

**Cause:** A certificate in the configured certificate chain was revoked by the certificate authority and is no longer valid.

**Level:** 1

**Type:** WARNING

**Impact:** Security

BEA-090484: CERTIFICATE_EXPIRED alert was received from {0}. A certificate in the certificate chain expired or is not yet valid, or the peer and local machine have a date/time mismatch.

**Cause:** A certificate in the chain is either expired or is not yet valid. Another possible cause is the peer machine date/time is not set properly causing the check to fail.

**Action:** Verify the certificate validity and expiration dates in the certificate chain are correct. If they are not, obtain new certificates issued by the certificate authority and update the SSL configuration with the new certificates and private key. If the dates are valid, check the peer machine date/time setup.

**Level:** 1

**Cause:** This problem could be caused by an incorrect type of certificate in the certificate chain or the peer not being able to handle certain attributes in a valid certificate.

**Action:** The certificate chain should first be checked to ensure the certificates are all valid X.509 RSA certificates and are using the proper strength. If that is correct, SSL debug tracing may be required on the peer to see if it gives more detail on what was specifically not supported.

**Level:** 1

**Type:** WARNING
Impact: Security

**BEA-090546:** The server is configured to use custom identity and command line trust, but either demo trust or no trust was specified on the command line or in boot.properties.

**Cause:** The server's KeyStore value in config.xml is CustomIdentityAndCommandLineTrust, but, on the command line to boot the server or in boot.properties, either no trust or DemoTrust was specified.

**Action:** To correct the problem, either specify -Dweblogic.security.TrustKeyStore=JavaStandardTrust or -Dweblogic.security.TrustKeyStore=CustomTrust and -Dweblogic.security.CustomTrustKeyStoreFileName on the command line when booting the server (or specify TrustKeyStore=JavaStandardTrust or TrustKeyStore=CustomTrust and CustomTrustKeyStoreFileName in boot.properties).

BEA-090547: The certificate chain received from {0} contained a V3 CA certificate which had basic constraints that were not marked critical. This is being rejected due to the strict enforcement of basic constraints.

**Cause:** Strict basic constraints checking was explicitly enabled, and a certificate chain received by the peer contained a CA that failed due to the strict check but would have passed the strong check.

**Action:** If strict compliance of RFC 2459 for basic constraints is really required, then the peer certificate chain was correctly rejected and needs to be corrected. If strict compliance is not really required, consider setting the constraints checking back to the default value of strong to accept the certificate chain.

**Level:** 1  
**Type:** WARNING  
**Impact:** Security

BEA-090548: The certificate chain received from {0} contained a V3 CA certificate that was missing the basic constraints extension

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that does not contain a basic constraints extension indicating that it really is a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA was missing the basic constraints extension. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Level:** 1  
**Type:** WARNING  
**Impact:** Security

BEA-090549: The certificate chain received from {0} contained a V3 CA certificate that did not indicate it really is a CA.

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that contained a basic constraints extension which was not marked as being a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA is not correct. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Level:** 1  
**Type:** WARNING  
**Impact:** Security

BEA-090550: The certificate chain received from {0} contained a V3 CA certificate that indicated a certificate chain path length in the basic constraints that was exceeded.

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that specified a path length in the basic constraints that was exceeded. This is
rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA indicated the path length limit that was exceeded. The path length, if specified, limits how many CA certificates are allowed to follow a CA certificate in a certificate chain. A path length of 0 indicates only an end entity certificate may follow it in the chain, positive values indicate how many CA certificates may be in the chain between that CA and the end entity certificate. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090551:** The certificate chain received from {0} contained a V3 CA certificate that could not be converted to be checked for basic constraints.

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that could not be converted to a format which allows the basic constraints to be checked. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to confirm they are valid. If the certificates are all valid, this indicates an internal coding error or limitation in the server. Contact Oracle support. If the certificate can not be processed, you can disable the basic constraints checking as a workaround to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Type:** WARNING

**Impact:** Security

**BEA-090552:** The public and private key could not be checked for consistency.

**Cause:** The failure could be due to a keystore being used to hold the private key that does not allow access to private key material. Hardware keystores generally do not give access to the private key material that is needed to perform this operation.

**Action:** If a keystore is being used the warning should be ignored. If handshaking errors occurs with all clients, check that the private key and public key match.

**BEA-090823: Could not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory for this JVM.**

Cause: The WebLogic Server X509CertificateFactory could not be registered as the default X509CertificateFactory for this JVM.

Action: The WebLogic Server X509CertificateFactory orders the certificates in a CertPath that was created from PKCS7. Specify -Dweblogic.security.RegisterX509CertificateFactory=false on the command line for booting this server to indicate that WebLogic Server should not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory when the server boots (since your JDK does not support this). Also, since the WebLogic Server X509CertificateFactory cannot be registered with the JDK as the default X509CertificateFactory, the JDK will use its current default X509CertificateFactory. The default one (for example, the SUN implementation) may not properly convert PKCS7 to an ordered CertPath.

BEA-110486: Transaction [0] cannot complete commit processing because resource [[1]] is unavailable. The transaction will be abandoned after [2] seconds unless all resources acknowledge the commit decision.

Cause: The resource may have been undeployed or is unresponsive and declared unavailable.

Action: Check for related server log messages that may provide additional details regarding the state of the resource. If the resource is undeployed, deploy the resource or the application module if the resource is application scoped. If a problem exists with the resource manager, correct the problem and redeploy the resource.

BEA-110487: Transaction [0] cannot complete rollback processing because the pending resource [[1]] is unavailable. The transaction will be abandoned after [2] seconds unless all resources acknowledge the rollback decision.

Cause: The resource may have been undeployed or is unresponsive and declared unavailable.

Action: Check for related server log messages that may provide additional detail regarding the state of the resource. If the resource is undeployed, deploy the resource or the application module if the resource is application scoped. If a problem exists with the resource manager, correct the problem and redeploy the resource.

BEA-110488: The LLR resource(s) {0} are not available and may contain transaction commit records required for recovery processing. Recovery of XA resources will not occur until these resources are deployed.

Cause: Prior to server restart, one or more global transactions were processed that had a LLR participant and may not have completed before the server was restarted. This potentially left a commit record in a LLR resource and prepared resource transaction branches that are awaiting a commit or rollback decision from the coordinator.
Action: Redeploy the specified LLR resources, wait for all in progress transactions to complete, and shut down the server gracefully.

Cause: The cache may be too small or a specific item might be very large. The worst case is that this indicates a denial of service attack.
Action: No action is required. However, performance will be best if items are cached.

Level: 1
Type: WARNING
Impact: XML

BEA-130001: Entity cache appears to be broken. This impacts the performance of XML parsing.
Cause: Unknown
Action: No action is required. However, performance will increase if items are cached. Also the cache provides a backup in the case of a network failure. While the cache is not operating, this backup is not in effect.

Level: 1
Type: WARNING
Impact: XML

BEA-130002: The entity that was just put in the cache cannot be retrieved: "{0}". Timeout may be too short.
Cause: Usually this indicates that the entity timeout was set to a very small value. Otherwise, there is some unknown problem with the cache module itself.
Action: No action is required, but XML parse performance will be impacted. Also, there is no cached copy to act as a backup in the event of a network failure.

BEA-150000: An error occurred while establishing a connection back to the Administration Server {0} during startup. Since bootstrap succeeded, check that {0} uniquely identifies the Administration Server.
Causes: An improper Administration Server URL has been specified, or the Administration Server is not available at the specified URL. Commonly this is because the Managed Server shares an administration URL with the Administration Server. Another possibility is that the host identified by {0}, or the
local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

**Action:** Verify that the URL specified for the Administration Server is valid, unique and that the Administration Server is available and listening at the specified URL. A common problem is that the administration port is enabled and both the Administration Server and Managed Server are running on the same machine. In this instance a different administration port should be selected for the Managed Server. Another possibility is that the host identified by {0}, or the local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

BEA-220103: Async Web service support is not fully configured. The async response Web service {0} for this server was not fully deployed because the JMS reliability queue was not defined/deployed: {1}. The server will periodically retry completing the deploy for the service. This message can usually be ignored unless there are async Web service applications. To completely disable async Web service support, thus avoiding this message, set -Dweblogic.wsee.skip.async.response=true.

Cause: The JMS queue JNDI name specified in the WebservicesMBean (or allowed to default) was not found on this server. The async response service requires this JMS queue in order to operate. To avoid obscure errors while processing Web service async responses, this service was not fully deployed. Not having this JMS queue available can indicate that Web services have not been configured/enabled for this domain. The server will periodically retry deploying the service, so there is no need to restart the server once the JMS queue is made available.

Action: If you do not intend to use async Web services in this domain, no action is required. To avoid seeing this message and completely disable async Web service support, set -Dweblogic.wsee.skip.async.response=true. If you intend to use async Web services in this domain, define a non-distributed JMS queue with the local JNDI name given in WebservicesMBean (which has a default value), and after a short delay, the async response service will be fully deployed to use the newly defined queue. Oracle recommends that the JMS queue be located on a JMS server that is targeted to the same server as the Web service. Note that you can easily add async response Web services support to an existing domain by extending your domain with the Configuration Wizard and applying the wls_webbservice.jar extension template. For more information, see the WebLogic Server online documentation in the ‘Web Services->Get Started Using JAX-RPC’ section.

Level: 1
Type: NOTIFICATION

BEA-220105: Web services async/reliable invocations for service {0} are NOT available because the async/reliability queue was not found: {1}

**Cause:** You have deployed a Web service that indicates it can use async/reliable features, but the queue for async/reliable invocations (specified in WebservicesMBean, @Buffer or @ReliabilityBuffer annotations, or allowed to default) is not deployed to the local server. Therefore, async and reliable invocations will fail if attempted. Standard synchronous invocations will still work correctly despite this problem.

**Action:** Remove any async or reliable features from the Web service (e.g. @AsyncResponse, @Buffer, @ReliabilityBuffer annotations or @Policy annotations specifying reliable policy) or properly configure this server for async/reliable invocations. See the WebLogic Server online documentation in the 'Web Services->Get Started Using JAX-RPC' section for help on fixing this configuration problem. Once you have defined the proper async/reliable resources, you must redeploy your application.

**Cause:** While a WSDL is being retrieved through http protocol, the server requires replacing the service port address in WSDL with the actual address for the server. For any web service which defines one or more service ports bound to https transport, if the domain does not enable SSL functionality then the service port address could not be replaced correctly because https address for the server cannot be resolved.

**Action:** Enable SSL functionality for the server.

BEA-220505: Implicit/generated Client Identity {0} has been used in multiple calls to Service.getPort()/createDispatch() where these calls have used different services and/or sets of features. Monitoring statistics for this client will include all these different usages. Validation failures were: {1}
Cause: WebLogic JAX-WS web service clients are assigned a unique identity that is intended to represent the business purpose of that client. This identity can be specified directly using weblogic.jws.jaxws.client.ClientIdentityFeature or it can be allowed to be implicit. Implicit identity is generated automatically based on environmental information at the point where a Port/Dispatch instance is created. Your code has received an implicit client identity that is getting used (again implicitly) across multiple services or sets of features. All statistics gathered for a given client instance are rolled up under the client instance’s client identity. If client instances using different services and/or feature sets contribute statistics to the same client identity, this can be confusing. It is even possible for clients to behave incorrectly when more advanced web service features are used.
Action: Best practice is to create a specific client identity (with a name representing a logical business purpose) for the client and denote this identity by passing weblogic.jws.jaxws.client.ClientIdentityFeature to the call to Service.getPort()/createDispatch. Further, it is recommended that you pass a single/global set of web service feature objects to that call (e.g. CreateWebServiceFeature instances as static class members or in a method annotated with @PostConstruct for containers compatible with this annotation). The actual call to Service.getPort()/createDispatch() should still be made in any way that makes sense for your uses (e.g. calling getPort on demand in a web service method, with Service created as a static class member).

BEA-280094: The size "{1}" specified by the property "{0}" is not power of 2. Rounding down to "{2}" instead.

BEA-280095: Opening existing file store "{1}". The block size value specified by the property "{0}" is ignored because the block size of preexisting files cannot change.

Cause:

Action: Refer to the JMS chapter of the Performance and Tuning for Oracle WebLogic Server guide for details of this setting.

Level: 1
Type: WARNING
Impact: Store

BEA-280096: Opening existing file store "{2}". The direct IO mode "{1}" specified by the property "{0}" is invalid and will be ignored. Using the default value "{3}".

Cause:

Action: Use a valid direct I/O mode. The valid values are: "read-buffered", "single-handle-unbuffered", and "single-handle-buffered".

Level: 1
Type: WARNING
Impact: Store

BEA-280097: A file store failed to open file "{0}" in the Direct-Write read-buffered/write-unbuffered mode and is instead opening the file in a purely unbuffered mode. When there are high request loads, this may reduce file store performance. However, the store is still operating in a transactionally safe synchronous mode.

Cause:

Action: To fix this problem, configure a different synchronous write policy, or if using the Direct-Write policy, force the store into read-write-buffered mode using the AvoidDirectIO command line property documented in the store chapter of the Performance and Tuning Guide.

Level: 1
Type: WARNING
Impact: Store

BEA-280101: The persistent file store "{0}" is forced to use buffered I/O because the Operating System or hardware environment does not support unbuffered I/O. The store is still operating in a transactionally safe synchronous mode. See store open log messages for the final write policy.

Cause: See the message body.
Action: See the documentation for store synchronous write policy configuration.

Level: 1
Type: NOTIFICATION
Impact: Store

BEA-280102: The persistent file store "[0]" must reinitialize its cache: recovery may take longer than usual. The signature in the cache file "[1]" for the persistent store file "[0]" could not be verified, or the cache file is missing. Ignore this Warning if this is the first time the store has ever booted. Possible causes include: first boot of store (potentially after using a write policy different from Direct-Write-With-Cache), store migration, unclean shutdown, off-line store compression, and manual removal of cache files.

Cause: The cache file is missing, or the signature stored in the cache file does not match the signature of the primary file.

Action: Make sure that the configuration is correct, do not delete cache files, and ensure a clean shutdown.

Level: 1
Type: WARNING
Impact: Store

BEA-280103: The persistent file store "[0]" will cache in {1}.

Cause: This is an informational message.

Action: No action is required.

Level: 1
Type: NOTIFICATION
Impact: Store

BEA-280104: The persistent file store "[0]" will use buffered writes instead of direct IO because the configured block size "[2]" is not a multiple of the environment's direct IO alignment "[1]". When there are high request loads, this may reduce file store performance. The store is still operating in a transactionally safe synchronous mode.

Cause: Direct I/O requires the block size to be a multiple of directIO granularity.

Action: Reconfigure the store with a block size that is a multiple of the direct I/O alignment for your environment. If the store is not empty and contains useful data, use the store admin compact utility to change block size, otherwise make sure that all store files are removed before starting WebLogic Server again.

Level: 1

Cause: An IOException occurred.

Action: No action is required.

Level: 1

Impact: Store

BEA-280106: The persistent file store "[0]" cannot memory-map the locked file "[1]" and has to downgrade to explicit buffered IO. For example, in some NFS environments memory-mapping and locking are not compatible. Consider configuring a local cache directory.
Cause: See the message body.
Action: Consult your storage vendor and operating system documentation.
