Preface

This preface describes the document accessibility features and conventions used in this guide—Creating Domain Templates Using the Domain Template Builder.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

You can access the documents referenced in this guide on Oracle Technology Network at http://www.oracle.com/technology:

- Creating Domains Using the Configuration Wizard

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface</td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>italic</td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>Convention</td>
<td>Meaning</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
This chapter provides an overview of how to create templates in WebLogic Server by using the Domain Template Builder.

This chapter includes the following sections:

- Section 1.1, "Overview of the Domain Template Builder"
- Section 1.2, "About Domain and Extension Templates"
- Section 1.3, "Additional Tools for Creating Templates"

### 1.1 Overview of the Domain Template Builder

You can create WebLogic domains by using domain and extension templates that contain the key attributes and files required for building or extending a WebLogic domain. To create domain or extension templates, you use the Domain Template Builder, which is a standalone Java application that guides you through the process. This process is illustrated in Figure 1–1.

#### Figure 1–1 Domain Template Builder

The Domain Template Builder is designed to be used off-line in graphical mode. It is not supported in console mode. Therefore, the console attached to the machine on which you are using the Domain Template Builder must support Java-based GUIs. All
consoles for Windows systems support Java-based GUIs; some UNIX-based consoles support Java-based GUIs.

Your product installation includes a set of predefined domain and extension templates. This set of templates includes the WebLogic Server Base Domain template, and various extension templates that allow you to add product features and samples to the base domain. For more information on the templates that are available for various products, see the Domain Template Reference.

After you create your domain and add new resources and applications to it, you can use the Domain Template Builder to create a custom domain template. You can also use the Domain Template Builder to customize an existing template. For example, you may want to remove applications from the template. To do so, select the existing domain or template as the source for your new custom template. When your custom domain templates are complete, you can use them to create domains by using the Configuration Wizard, WLST Offline, or the unpack command. For more information about these tools, see Section 1.3, "Additional Tools for Creating Templates."

1.2 About Domain and Extension Templates

In the context of the Domain Template Builder, the term template refers to a Java Archive (JAR) file. A template JAR contains the files and scripts that are needed to create or extend a WebLogic domain. The types of templates that can be used by the Configuration Wizard to create or extend domains include:

- **Domain template**—defines the full set of resources within a WebLogic domain, including infrastructure components, applications, services, security options, and general environment and operating system options. You can create this type of template from an existing domain by using the Domain Template Builder or the pack command. You can then create a domain based on the template.

  The product distribution includes the WebLogic Server Base Domain template. This template defines the core set of resources within a domain, including an Administration Server and basic configuration information, infrastructure components, and general environment and operating system options. It does not include sample applications. You can use this template to create a basic WebLogic Server domain, which you can then extend with applications and services, or additional product component functionality.

- **Extension template**—defines applications and services that can provide additional features, such as applications, or JDBC resources, JMS components, or deployed libraries. This type of template can be used to update an existing WebLogic domain.

- **Managed Server template**—defines the subset (within a domain) of resources that are required to create a Managed Server domain on a remote machine. This type of template can be created using the pack command.

Your product installation includes a set of predefined domain and extension templates. This set includes the WebLogic Server Base Domain template and various extension templates that allow you to add component features and samples to the base domain. For more information about these templates and how they relate to each other, see the Domain Template Reference.

1.3 Additional Tools for Creating Templates

As described earlier, you can create custom domain and extension templates by using the Domain Template Builder. You can also use the following tools to create templates:
- **pack**

  This command enables you to create a template archive (JAR file) that contains a snapshot of either an entire WebLogic domain or a subset of a WebLogic domain. You can use a template that contains a subset of a domain to create a Managed Server domain directory hierarchy on a remote machine.

  For more information, see *Creating Templates and Domains Using the Pack and Unpack Commands*.

- **WebLogic Scripting Tool (WLST):**

  WLST is a command-line scripting interface, which you can use to interact with and configure WebLogic Server instances and domains. When WLST is offline, you can create a WebLogic domain or update an existing WebLogic domain without connecting to a running WebLogic Server—supporting the same functionality as the Configuration Wizard.

  For more information, see *Understanding the WebLogic Scripting Tool and WebLogic Scripting Tool Command Reference*. 
This chapter describes how to create a domain template using the Domain Template Builder.

This chapter includes the following sections:

- Starting the Domain Template Builder
- Creating a Domain Template Using the Domain Template Builder

## 2.1 Starting the Domain Template Builder

The console for the machine on which the product installation resides must support Java-based GUIs. All Windows-based consoles support Java-based GUIs; only a subset of UNIX-based consoles support Java-based GUIs.

You can start the Domain Template Builder in graphical mode from the command line.

1. Log in to the system on which the product is installed.
2. Open an MS-DOS command prompt window (on Windows) or a command shell (on UNIX).
3. Go to the following directory:
   - Windows: `ORACLE_HOME/oracle_common/common/bin`
   - UNIX: `ORACLE_HOME/oracle_common/common/bin`

   where `ORACLE_HOME` is the Oracle home directory you specified when installing WebLogic Server.
4. Execute the following command:
   - Windows: `config_builder.cmd`
   - UNIX: `sh config_builder.sh`

---

**Note:** When you run the `config_builder.cmd` or `config_builder.sh` command, the following error message might be displayed to indicate that the default cache directory is not valid:

```
*sys-package-mgr*: can't create package cache dir
```

You can change the cache directory by including the `-Dpython.cachedir=valid_directory` option in the command line.
The Template Type screen is displayed.

### 2.2 Creating a Domain Templates Using the Domain Template Builder

To create a new domain template using the Domain Template Builder in graphical mode, start the Domain Template Builder as described in Section 2.1, "Starting the Domain Template Builder."

**Note:** In situations where you cannot run the Domain Template Builder in GUI mode, Oracle recommends that you use a WLST script to create the domain template. For more information, see "Creating and Using a Domain Template (Offline)" in Understanding the WebLogic Scripting Tool.

The Domain Template Builder displays a sequence of screens, in the order listed in Table 2–1. For more information on each screen, refer to the related section in Chapter 4, "Domain Template Builder Screens," or click the link in the Screen column.

Table 2–1 summarizes the steps for creating a domain template by using the Domain Template Builder.

<table>
<thead>

<td>Always</td>
<td>Wait for the template to be generated, then click Finish.</td>
</tr>
<tr>
<td>End of Configuration</td>
<td>Always</td>
<td>Click Finish to exit the Domain Template Builder.</td>
</tr>
</tbody>
</table>
This chapter describes how to create an extension template using the Domain Template Builder.

The process for creating an extension template is similar to the process for creating a domain template. The resulting template does not configure the Administration Server, administrator username and password, security realm, and Node Manager, or specify Start menu entries. These domain settings are already defined in the domain you are extending.

This chapter includes the following sections:

- Starting the Domain Template Builder
- Creating an Extension Template Using the Domain Template Builder

### 3.1 Starting the Domain Template Builder

The console for the machine on which the product installation resides must support Java-based GUIs. All Windows-based consoles support Java-based GUIs; only a subset of UNIX-based consoles support Java-based GUIs.

You can start the Domain Template Builder in graphical mode from the command line.

1. Log in to the system on which the product is installed.
2. Open an MS-DOS command prompt window (on Windows) or a command shell (on UNIX).
3. Go to the following directory:
   - On Windows: `ORACLE_HOME/oracle_common/common/bin`
   - On UNIX: `ORACLE_HOME/oracle_common/common/bin`
4. Execute the following command:
   - On Windows: `config_builder.cmd`
   - On UNIX: `sh config_builder.sh`
3.2 Creating an Extension Template Using the Domain Template Builder

To create a new domain template using the Domain Template Builder in graphical mode, start the Domain Template Builder as described in Section 3.1, "Starting the Domain Template Builder." Then select the Create Extension Template option to display the Create Extension Template screen (similar to the Template Type screen).

Note: In situations where you cannot run the Domain Template Builder in GUI mode, Oracle recommends that you use a WLST script to create the extension template. For more information, see "Creating and Using a Domain Template (Offline)" in Understanding the WebLogic Scripting Tool.

The Domain Template Builder displays a sequence of screens, in the order listed in Table 3–1. For more information on each screen, refer to the related section in Chapter 4, "Domain Template Builder Screens," or click the link in the Screen column.

<table>
<thead>
<tr>
<th>Screen</th>
<th>When Does This Screen Appear?</th>
<th>You Perform This Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template Type</td>
<td>Always</td>
<td>Choose Create Extension Template to create an extension template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Specify the source for the extension template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Specify the destination JAR file for the extension template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Click Next to continue.</td>
</tr>
<tr>
<td>Template Information</td>
<td>Always</td>
<td>Update each template information field as needed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Click Next to continue.</td>
</tr>
<tr>
<td>Applications</td>
<td>Only if applications are included in the domain or template source that you selected.</td>
<td>Select the check box for each application that you want to include in the extension template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Deselect the check box for each application that you do not want to include in the extension template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Click Next to continue.</td>
</tr>
<tr>
<td>Domain Content</td>
<td>Always</td>
<td>Review the files that are included in the template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If necessary, add more files to the template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If necessary, remove files from the template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Click Next to continue.</td>
</tr>
</tbody>
</table>

Note: When you run the config_builder.cmd or config_builder.sh command, the following error message might be displayed to indicate that the default cache directory is not valid:

*sys-package-mgr*: can't create package cache dir

You can change the cache directory by including the -Dpython.cachedir=valid_directory option in the command line.

The Template Type screen is displayed.
### Table 3–1 (Cont.) Steps for Creating a Domain Template by Using the Domain Template Builder

<table>
<thead>
<tr>
<th>Screen</th>
<th>When Does This Screen Appear?</th>
<th>You Perform This Action</th>
</tr>
</thead>
</table>
| Scripts and Files  | Always                        | From the Select File list on the left, open a file to which you want to add a replacement variable.  
Select a string that you want to replace with a variable.  
Right-click to display the Replacement Variable pop-up list.  
In the Select File list on the left, select the check box for the file to indicate that it has been changed.  
Click Next to continue. |
| Template Summary   | Always                        | Review the template summary. You can use the View drop-down list to restrict the view to a specific part of the template.  
If necessary, click Prev to return to a previous screen and make any changes that are needed.  
Click Create to continue. |
| Configuration Progress | Always                 | Wait for the template to be generated, then click Finish.                                                                                          |
| End of Configuration | Always                | Click Finish to exit the Domain Template Builder.                                                                                                  |
This chapter describes each of the Domain Template Builder screens.
It contains the following sections:

- Template Type
- Template Information
- Applications
- Domain Content
- Scripts and Files
- Template Summary
- Configuration Progress
- End of Configuration

4.1 Template Type
Use this page to specify whether or not you want to create a domain template or an extension template, and then specify the source and destination for the new template.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Domain Template</td>
<td>Select this option to create a new domain template that defines the full set of resources within a WebLogic domain, including infrastructure components, applications, services, security options, and general environment and operating system parameters. You can use the template that you create as the basis for creating a WebLogic domain, by specifying the template in the Configuration Wizard, WLST, or the <code>unpack</code> command.</td>
</tr>
<tr>
<td>Create Extension Template</td>
<td>Select this option to create a template that defines applications and services that can be used to extend existing WebLogic domains. You can import applications and services stored in extension templates into an existing WebLogic domain by using the Configuration Wizard. For information about the Configuration Wizard, see Creating Domains Using the Configuration Wizard.</td>
</tr>
</tbody>
</table>

**Create Domain Template From Existing Domain**

To create a domain template from an existing domain directory:

1. Select **Create Domain Template**.
2. Select **Use Domain as a Source**.
3. Enter the full path of the source domain directory in the **Source Location** field, or use the **Browse** button to navigate to the domain directory (for example, C:\domains\mydomain).
4. In the **Template Location** field, enter the full path and JAR file name for the new template, or use the **Browse** button to navigate to an existing directory. Ensure that you include the JAR file name, for example, C:\templates\domains\mynewtemplate.jar.
5. Click **Next** to continue.

**Create Extension Template From Existing Domain**

To create an extension template from an existing domain directory:

1. Select **Create Extension Template**.
2. Select **Use Domain as a Source**.
3. Enter the full path of the source domain directory in the **Source Location** field, or use the **Browse** button to navigate to the domain directory (for example, C:\domains\mydomain).
4. In the **Template Location** field, enter the full path and JAR file name for the new template, or use the **Browse** button to navigate to an existing directory. Ensure that you include the JAR file name, for example, C:\templates\domains\mynewtemplate.jar.
5. Click **Next** to continue.

**Create Domain Template From Existing Template**

To create a domain template from an existing template:
1. Select Create Domain Template.

2. Select Use Template as a Source.

3. Enter the full path of the source domain JAR file in the Source Location field, or use the Browse button to navigate to the domain directory and select the JAR file (for example, C:\domains\mydomain.jar).

4. In the Template Location field, enter the full path and JAR file name for the new template, or use the Browse button to navigate to an existing directory. Ensure that you include the JAR file name, for example, C:\templates\domains\mynewtemplate.jar.

5. Click Next to continue.

Create Extension Template From Existing Template
To create an extension template from an existing template:

1. Select Create Extension Template.

2. Select Select Template Source.

3. Enter the full path of the source application JAR file in the Select Source Location field, or use the Browse button to navigate to the application directory and select the jar file (for example, C:\applications\myapplication.jar).

4. In the Select Template Location field, enter the full path and JAR file name for the new template, or use the Browse button to navigate to an existing directory. Ensure that you include the JAR file name, for example, C:\templates\applications\mynewapplication.jar.

5. Click Next to continue.

4.2 Template Information
Use this screen to provide basic information about the template. The information you enter here is stored in the template-info.xml file that is generated for the domain or extension template. It is also stored in the config.xml file for the domain.

- If you selected a WebLogic domain or an application as the source for the new template, enter the information required for the domain and application, and click Next.
- If you selected a template as the source for the new template, information about the selected template is displayed. Review the information, and, if necessary, change it to suit the requirements of your domain or application template. When done, click Next.

### Field | Description
---|---
Name | Required. Enter a valid name for the template. The name must be a string of characters, and can include spaces.
Version | Required. Enter a version number for the template. The version number can be anything you want, as long as it contains four or five digits, for example, 12.1.2.0 or 12.1.2.0.0.
Author | Optional. Enter the name of the author of the template.
Category | Leave this field blank as it does not apply to custom templates. This field applies only to Oracle-provided templates that are selectable on the Templates screen of the Fusion Middleware Configuration Wizard.
Description | Optional. Enter a detailed description of the template. The description must be a string of characters, and can include spaces.

## 4.3 Applications

This screen is displayed only if applications are included in the template or domain that you selected. You can
Review the list of applications that are currently defined in your template source.

Review the paths of the current and imported applications. To do so, click on the name of the application in the Applications list.

If necessary, omit applications from the list of files to be imported. To do so, deselect the check box.

By default, the Domain Template Builder includes applications from the domain or template you specified as the source for the template that you are creating. For example:

- If you selected a template as the source for the new template, and if the source template has a separately defined applications directory, all the application files defined in the applications directory are included by default.

- If you selected a domain as the source for the new template, applications that fulfill the following conditions are included by default:
  - Applications that are defined in the config.xml file by the app-deployment element
  - Applications that are not considered internal applications in your product installation are included by default

When you create or extend a clustered domain (by using the Configuration Wizard or WLST) based on a template that contains applications with application-scoped JDBC or JMS resources, you may need to perform certain additional steps after creating or extending the domain. These steps are needed to ensure that the application and its application-scoped resources are targeted and deployed properly.

For more information about targeting and deploying application-scoped modules, see Deploying Applications to Oracle WebLogic Server.

To include an application (or omit it from) the template, select or deselect the check box for the application as appropriate.

The listed applications reside in the directory specified in the Location box. The applications are copied into your template from this location. If more than one application is selected, the Location box contains the location of the first one in the list. To see the location of a specific application, click on the application name in the Applications column.
4.4 Domain Content

Use the Domain Content screen to review the files in the domain, add files to the domain, and remove files from the domain.

By default, the Domain Template Builder includes files from the WebLogic domain or template you specified as the source for the new template. You may also need to include other files from your domain or file system that are required by the applications in the domain.

- If you selected an existing template as the source for the new template, all files from the source template are automatically included. If the existing template defines a separate applications directory, the applications in the template are listed under the Applications Root Directory in the Template section on the right.
- If you selected a domain as the source for your new template, the following files and directories are included by default:
  - All files in the root directory with the following extensions: .cmd, .sh, .xml, .properties, and .ini
  - All files with the .pem extension defined in the SSL configuration for your domain
  - bin directory
  - lib directory
  - All files in the security directory that are not created automatically during domain creation

For example, in WebLogic, XACMLRoleMapperInit.ldift is not created automatically, and therefore is included in the template by default when creating a template.
All files and subdirectories in the `config` directory that are not included by the Domain Template Builder automatically during template creation. For example, `config.xml` and any JDBC and JMS resources defined in `config.xml` are not displayed in the Template section by default because the Domain Template Builder automatically includes them in the template when creating the template.

**Note:** By default, the `servers` directory is not included in the template. If you have configured additional security data such as users, groups, or roles, through the WebLogic Server Administration Console or other online tools, it is stored in the LDAP server and is not included in the template. You must export the data first and then import it into the target domain.

### Reviewing Files in the Template

To view the current list of files in your template, expand the Domain Root Directory and Applications Root Directory under **Domain Contents** in the Template section on the right.

### Adding Files and Directories to the Template

To add files to the template:

1. In the **File System** section on the left, navigate to the file you want to add. You can use the **Show File Types** drop-down list to restrict the list to a specific file type. For example, to display only files with the `.cmd` extension, select `*.cmd` from the drop-down list.

2. Select one or more files or directories to move into a specific subdirectory of either the Domain Root Directory or the Application Root Directory. The files you select must all be either domain or application files, not a mix of both. Select only those files that you want to move to a given subdirectory.

3. In the **Template** section on the right, select either the Domain Root Directory or Application Root Directory as appropriate for the files or directories you are adding.

4. Expand the directory and navigate to the subdirectory in which you want to store the selected files or directories.

5. Click the right arrow button to move the files or directories into the selected template directory.

   If you attempt to add a file that is created automatically by the Configuration Wizard at domain creation time, an error message is displayed.

6. Repeat steps 2 through 5 for any additional files or directories you need to add to the template.

### Removing Files and Directories From the Template

To remove files and directories:

1. In the **Template** section, navigate to and select all files and directories that you want to remove from the template.

2. Click the left arrow to remove the selected files or directories. The files are removed from the template. They are not copied or moved into any directory that may be currently selected in the **File System** section.
You cannot remove files shown in red or their parent directories as they consist of the applications defined in the config.xml file in the template source. These files are included by default in the template being created. If you do not want these files included in your template, you must remove the application with which they are associated. To do so, click Previous to return to the Applications screen and deselect the appropriate check box for the application.

4.5 Scripts and Files

When you are creating a template, you want the scripts and files that you are packaging with your template to be free of local domain environment settings and therefore be ready for use by the Configuration Wizard.

The Domain Template Builder automatically updates any standard scripts included in a template (such as start scripts) by replacing hard-coded values for various domain environment settings with replacement variables. The Configuration Wizard can replace these variables with new hard-coded values during the configuration of a new WebLogic domain.

Use the Scripts and Files screen to replace hard-coded strings with replacement variables in files that have not been updated by the Domain Template Builder. The check box for any file that was automatically updated by the Domain Template Builder is already selected.

To insert replacement variables into your files:

1. Open the file in one of the following ways:
   - Double-click the appropriate filename in the Select File list.
   - Select the appropriate filename in the list and click Edit.

The Instructions pane is replaced by an Edit File pane, in which the file is displayed. An editing toolbar is provided at the top of the Edit File pane.
2. To insert a replacement variable:
   a. Select the string to be replaced.
   b. Click the right mouse button. A list of replacement variables is displayed.
   c. Select the required variable.

The replacement variable replaces the selected string. The Configuration Wizard later substitutes literal strings for the replacement variables to set up a specific WebLogic domain.

For definitions of the available replacement variables, see Section 4.5.1, "Replacement Variable Definitions."

3. Repeat steps 1 and 2 for each string for which you want to substitute a variable.

4. Review the changes and click Save to preserve your changes, or Revert to replace the current version of the file with the last saved version. If you edited the file since the last time you saved it, you are prompted to confirm the revert operation.

   **Note:** You can also click Reset in the Select File pane to revert to the saved version of the file.

5. If you saved the edited file, select the check box next to the filename in the Select File pane.

6. Repeat steps 1 through 5 for each file in which you want to insert replacement variables.

7. Click Next.
   The Template Summary screen is displayed.

### 4.5.1 Replacement Variable Definitions

The following table defines the replacement variables most commonly used in files.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADMIN_SERVER_URL</td>
<td>URL specifying the listen address (host name or IP address) and port number of the Administration Server for the WebLogic domain.</td>
</tr>
<tr>
<td>APPLICATIONS_DIRECTORY</td>
<td>Directory containing the applications required by the domain. By default, the path name for this directory is ORACLE_HOME\user\projects\applications\domain_name.</td>
</tr>
<tr>
<td>BEAHOME</td>
<td>The Oracle Home directory (ORACLE_HOME) in which the products associated with the domain are installed. On a Windows system, the default path for this directory is C:\Oracle\Middleware.</td>
</tr>
<tr>
<td>DOCSWEBROOT</td>
<td>The URL specifying the location of the product documentation on the Internet.</td>
</tr>
<tr>
<td>DOMAIN_HOME</td>
<td>Directory in which the domain resides.</td>
</tr>
<tr>
<td>DOMAIN_NAME</td>
<td>Name of the domain.</td>
</tr>
<tr>
<td>DOMAIN_USER</td>
<td>Administration username required to start the server.</td>
</tr>
<tr>
<td>JAVA_HOME</td>
<td>Location of the JDK used to start WebLogic Server.</td>
</tr>
<tr>
<td>JAVA_VENDOR</td>
<td>Vendor of the JVM, for example, Oracle, HP, IBM, and Sun.</td>
</tr>
</tbody>
</table>
4.6 Template Summary

Use the Template Summary screen to review the settings for the new template before it is created.
1. Select an item in the **Template Summary** pane on the left and review the associated details in the **Details** pane on the right. If you need to change any settings that you defined in previous windows, select **Previous** to return to the required configuration window.

**Note:** You can limit the type of information displayed in the Template Summary screen by using the **View** drop-down list.

2. Click **Create**.

The **Configuration Progress** screen is displayed.

### 4.7 Configuration Progress

The Configuration Progress screen displays status messages during the template creation process. The Domain Template Builder generates a JAR file that contains all the components required to generate a new WebLogic domain, including the template settings that you provided.

When the process completes, click **Finish**.

The files included in a template vary, depending on the WebLogic domain or template on which the template is based.

For more information, see "Files Typically Included in a Template" in the *Domain Template Reference*. 
This screen displays the final configuration status.

- If the template was created successfully, a link to the template JAR file is provided under Template Location.
- If the template was not created successfully, an error message and error code are displayed. In this case, try to determine the cause of the failure from the message and correct the issue.
