BEA-002002: Failed to parse method name {0}.
Cause: This can happen for a variety of reasons. Normally, it is because the caller made a request for a non-existent method. Alternatively, the IDL mangling of the method name may be ambiguous, so WebLogic Server cannot decide which method to call.

Action: If the IDL mangling is causing a problem, try changing the name of the method. In particular, names such as getSomedata() (where somedata is also the name of an attribute or method) can cause problems. Also, some bugs with name mangling exist in JDK 1.3.1. Try using a JDK 1.4 client.

BEA-003105: The asynchronous replication request timed out while attempting to add object {0} to the replication queue. This session has not been replicated to any backup at this point.

Cause: The asynchronous replication request timed out while attempting to add object {0} to the replication queue. Once full, the queue waits until it has space for the object. This wait took longer than the ClusterMBean specified AsyncSessionQueueTimeout, thus the session object was not put into the queue and will not be replicated at this time.

Action: This could be due to the secondary server or persistent store slowing down the replication process. To better handle this, the SessionFlushInterval and the SessionFlushThreshold can be reduced to replicate less at a time and to replicate more often. Checking the performance of the secondary server or persistent store is advised.

BEA-010080: An error occurred while attempting to process a message inside a Message-Driven Bean: [0] Exception is : [1]

Cause: This error usually occurs if the onMessage method of the MDB throws an exception.

Action: Check that the MDB is able to process messages by ensuring that any resources it uses (such as database connections) are available. Check the MDB source code to ensure that it does not have any bugs that cause an exception (such as a NullPointerException) to be generated.

BEA-011063: Stateless session beans with bean-managed transactions must commit or roll back their transactions before completing a business method. The method {0} of EJB {1} either returned or generated an Exception without properly completing a transaction.

Cause: A transaction started by the stateless session bean method did not complete before the method completed.

Action: Check the bean code to determine what caused the transaction to not commit or roll back, and fix code. Pay special attention to any exceptions that may be generated by the method, causing commit or rollback calls to be skipped. BEA-011073: An error occurred while the EJB container was attempting to obtain information about the table {0} from the database. This information is necessary to validate the mapping between the fields of the EJB {1} and the table. The exception is: {2}

Cause: The most likely cause is an error communicating with the database. The error message should include the specific error message.

Action: The action depends on the specific error that occurred. Actions may range from retrying the failed deployment to seeking help from your database administrator. Also, ensure that you are using a supported database.

Level: 1
BEA-011076: Unable to deploy the EJB {0} because the database table {1} is not accessible. Ensure that this table exists and is accessible.

Cause: A required database table was not accessible.

Action: Ensure that the database table exists and is accessible.

Level: 1

BEA-011077: The EJB deployment contains settings for automatically creating or altering database tables. However, the server is in production mode, so no database tables will be created or altered.

Cause: The server is in production mode so the create-default-dbms-tables settings are being ignored.

Action: No action is required. To suppress the warning, remove the create-default-dbms-tables setting from your EJB deployment.

BEA-011083: The EJB specification prohibits stateful session beans from using the TimerService.
Cause: An illegal call was made to the getTimerService() method on the stateful session beans SessionContext.
Action: Correct the stateful session bean code so that it does not call the getTimerService() method from the bean class.
Level: 1
Type: ERROR
Impact: EJB

BEA-011084: This EJB class does not support EJB timers and therefore is prohibited from using the TimerService. To use EJB timers, the bean class must implement javax.ejb.TimedObject or have a method that is annotated with @Timeout.
Cause: An illegal call to the getTimerService() method on the EJBContext.
Action: Correct the EJB class so it either implements the javax.ejb.TimedObject interface or ensure that it does not call the getTimerService() method on the EJBContext.
Level: 1
Type: ERROR
Impact: EJB

BEA-011085: This timer has either expired or been canceled and therefore cannot be invoked.

Impact: EJB

BEA-011087: This TimerHandle is being invoked outside of the context of the application in which it was created. Since timers are local objects, they can only be called from within the same application in which they were created.

Cause: This TimerHandle is being invoked outside of the context of the application in which it was created.

Action: Ensure that your application does not pass any TimerHandle references outside of the scope of the application.

Level: 1

Type: ERROR

Impact: EJB

BEA-011088: The following error occurred while invoking the ejbTimeout(javax.ejb.Timer) method of EJB {0}.

Cause: This could be caused by erroneous code in the ejbTimeout method or by the failure of a dependent resource.

Action: All exceptions that occur while invoking or attempting to invoke the ejbTimeout method should be investigated and resolved. If the ejbTimeout method is non-transactional, that is, has a transaction attribute of NotSupported, or if the bean uses bean-managed transactions, the ejbTimeout method may not be retried, leading to missed timeout notifications.

Level: 1

BEA-011092: In production mode, the DropAndCreate, DropAndCreateAlways, and AlterOrCreate options are ignored. The container will only attempt to verify the existence and increment value of the sequence [0].
Cause: Options that apply only to development mode are ignored in production mode.
Action: Do not use these values for Automatic Oracle SEQUENCE Generation in production mode.

BEA-011093: The SEQUENCE named [0] with INCREMENT [1] was not found in the database. This SEQUENCE was specified in the CMP deployment descriptor to be used for automatic primary key generation.
Cause: The SEQUENCE was not found.
Action: Examine the <automatic-key-generation> tag in the CMP deployment descriptor. In particular, re-examine the <generator-name> and verify that this is the correct name of the SEQUENCE. Also, re-examine the <key-cache-size> and verify that this is the correct size of the SEQUENCE INCREMENT value.

BEA-011098: No generated primary key was returned from the database insert statement as expected. Verify that the primary key database column for this EJB is an IDENTITY column as declared in the CMP deployment descriptor for this EJB.
Cause: This is most likely caused by a database configuration error. It may also be caused by a JDBC driver that does not support the getGeneratedKeys() method on java.sql.Statement.
Action: Verify that the primary key column in the database is marked as an IDENTITY column (or a functional equivalent is setup for the column such as a database trigger to insert a value into the primary key column).

Level: 1
Type: ERROR
Impact: EJB
BEA-011099: Multiple generated keys were returned from the database insert statement. The EJB container is unable to determine which generated key corresponds to the primary key column. To use the IDENTITY primary key generator, you must only have a single automatically generated database column per EJB.

**Cause:** This is most likely caused by a database configuration error. Each EJB may only have a single automatically generated database column.

**Action:** Verify that the database table corresponding to the EJB only has a single generated column.

**Level:** 1  
**Type:** ERROR  
**Impact:** EJB

BEA-011109: Failed to register JACC policy context handlers for the EJB container.

BEA-011110: The SEQUENCE named {0} has key-cache-size set to {1}, which is less than the INCREMENT_BY value for the sequence in the database. This may generate missing keys.

**Cause:** The SEQUENCE named {0} has key-cache-size set to {1}, which is less than the INCREMENT_BY value for the sequence in the database.

**Action:** In the <automatic-key-generation> tag, re-examine the <key-cache-size> and verify that it is set correctly.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

BEA-011111: The SEQUENCE named {0} has key-cache-size set to {1} which is greater than the INCREMENT_BY value for the sequence in the database. This is not allowed as it may generate duplicate keys.

**Cause:** The key-cache-set size for the SEQUENCE is not valid.

**Action:** In the <automatic-key-generation> tag, re-examine the <key-cache-size> and set it to a value less than or equal to the INCREMENT_BY value for the sequence in the database.

**Cause:** The plugin-class could not be found in the server classpath.

**Action:** Add the plugin-class in the server classpath.

**BEA-011122:** Error in Message-Driven Bean EJB {0}. The plugin-class {1} could not be instantiated.

**Cause:** The plugin-class could not be instantiated.

**Action:** Add the plugin-class in the server classpath.

**BEA-011123:** Error in Message-Driven Bean EJB {0}. The plugin-class {1} could not be found in the server classpath.

**Cause:** The plugin-class could not be accessed.

**BEA-011125:** An unexpected error was encountered while attempting to remove any EJB timers from the persistent store for the EJB {0}.

**Cause:** An unexpected error occurred while attempting to remove EJB timers from the persistent store.

**Action:** See the particular error message for details about the error. If your application is failing to deploy because of this error, it may be necessary to manually remove the timers from the store.
Type: ERROR
Impact: EJB
BEA-011126: The same exception has consecutively caused the expiration to fail for EJB timer {0}. Consecutive errors of this type will no longer be logged for the current timer expiration.
Cause: The same exception has consecutively caused expiration of an EJB timer to fail.
Action: Investigate what caused the ejbTimeout method to fail. The original exception will be logged in a previous error message.
Level: 1
Type: NOTIFICATION
Impact: EJB
BEA-011127: Error deserializing one or more EJB timers from the persistent store for the EJB deployment {0}. An incompatible change to the class of a Serializable object associated with the timer may be the cause. If this is the case, you can either undeploy your application entirely to remove the EJB timers from the persistent store or revert the incompatible changes to the Serializable class so the EJB timer can be deserialized. The error was: {1}
Cause: A common cause of this error is an incompatible serializable class change in your application.
Action: If the error is due to an incompatible serializable class change in your application, there are two options for dealing with the serialization errors. The first option is to completely undeploy the EJB, which will cause all of the EJB timers in the persistent store to be permanently removed. The second option is to revert changes to the serializable class that is associated with the EJB timer and redeploy the application. This allows the EJB timer to be deserialized.

Impact: EJB
BEA-011128: Error creating an instance of the EJB {0}: {1}

Cause: It is illegal to deploy an EJB that uses clustered EJB timers to a server that is not part of a cluster.
Action: You must either set the timer-implementation attribute of your weblogic-ejb-jar.xml descriptor to Local or ensure that any servers to which you deploy the EJB are part of a cluster.
Level: 1
Type: ERROR
Impact: EJB

BEA-011130: Error deploying EJB {0}. This EJB is configured to use the clustered EJB timer implementation but the data-source-for-job-scheduler cluster attribute is not configured.
Cause: While deploying this EJB, the EJB container determined the data-source-for-job-scheduler cluster attribute has not been set.
Action: You must either set the timer-implementation attribute of your weblogic-ejb-jar.xml descriptor to Local or configure the data-source-for-job-scheduler attribute for your cluster.

**Cause:** While compiling EJB generated classes, the Java compiler produced output.

Though the EJB {1} has call-by-reference set to false, this parameter is not serializable and hence will be passed by reference. A parameter can be passed using call-by-value only if the parameter type is serializable.

**Cause:** The EJB has call-by-reference set to false. A parameter can be passed using call-by-value only if the parameter type is serializable. As this parameter is not serializable, the parameter will be passed by reference.

**Action:** The parameter should implement the java.io.Serializable interface for it to be passed by value.

**BEA-014003: EJB {0} uses optimistic concurrency and contains a finder or select method, {1}, for which include-updates is true. This combination of features does not work properly with database {2}.

**Cause:** Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks, unless Oracle is used as the database. Oracle read consistency does not hold read locks, so in this case reads are performed using the current JTA transaction. When reads are performed in a local transaction updates that have been flushed prior to commit of the transaction are not visible.

**Action:** Set include-updates for the query to false to avoid this warning message, or if you are using Oracle as your database, set the database-type to Oracle in weblogic-cmp-jar.xml.

**BEA-014004: In EJB {0}, <generator-type> is set to {1}. It is incompatible with Batch Operations due to database limitations. Both order-database-operations and enable-batch-operations are turned off by EJB container.

**Cause:** These are database limitations.

**Action:** Turn off automatic-key-generation in order to use batch operations.
BEA-014005: The configured dispatch policy {1} for Message-Driven Bean (MDB) {0} will be ignored: the MDB is not running in a WebLogic thread.

Cause: The queue MDB is driven asynchronously by a non-WebLogic JMS implementation and runs in a non-WebLogic thread mechanism, so the MDBs application thread pool is not configurable.

Action: To disable this warning, remove the dispatch-policy setting from the MDBs WebLogic descriptor file.

BEA-014006: The Message-Driven Bean (MDB) named {0} has a dispatch policy {1} that refers to an unknown execute queue thread pool. The default execute thread pool will be used instead.

Cause: The specified MDB named has a dispatch policy that refers to an unknown execute queue thread pool.

Action: Create an execute thread queue pool for the server named {1}, or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing execute queue thread pool.

BEA-014007: The bean named {0} contains BLOB or CLOB fields or both, and uses Optimistic Concurrency but no version or timestamp column has been specified. This may result in corruption of BLOB and CLOB data.

Cause: The specified bean contains BLOB or CLOB fields or both, and uses Optimistic Concurrency but no version or timestamp column has been specified.

Action: Specify ”version” or ”timestamp” in the <table-map> <verify-columns> element and specify the name of the <version> or <timestamp> column in the <optimistic-column> element.

BEA-014008: In EJB {0}, {1} references an SqlShape element {2} that is not defined.

The list of SqlShape elements that are defined for this EJB is: {3}.

Cause: An undefined SqlShape element was referenced.

Action: Use an existing SqlShape or create the SqlShape that you wish to use.

BEA-014009: The Message-Driven Bean [0] of application [1] will now be suspended, as it listens to global JMS destination [2] and a new application version [3] is being redeployed.

Cause:
Action: No action is required.
Level: 1
Type: NOTIFICATION
Impact: EJB

BEA-014010: The Message-Driven Bean [0] of application [1] will now be suspended, as it listens to global JMS topic [2] and a new application version [3] is being redeployed. Note also that the current Message-Driven Bean is not a durable subscriber to the topic, and messages published by the topic after the currently active version of the Message-Driven Bean is suspended may not be received by the new application version.

Cause: The specified Message-Driven Bean listens to the specified global JMS topic and a new application version is being redeployed.
Action: To ensure that the new application version will receive all messages published while the Message-Driven Bean was suspended, set the activation config property "subscriptionDurability" to "durable" in the deployment descriptor or annotation.
Level: 1
Type: WARNING
Impact: EJB

BEA-014011: EJB [0] uses optimistic-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. This combination of features is incompatible. The use-select-for-update is turned off by the EJB container in this case.

Cause: Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks. The element use-select-for-update in the RDBMS deployment descriptor when set to true, will cause SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the table. This conflicts with the Optimistic Concurrency strategy.
Action: Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.
Level: 1
Type: WARNING
Impact: EJB

BEA-014012: EJB [0] uses optimistic-concurrency and disables cluster invalidation, but does not have verify-rows set to Read. This combination will prevent detection of stale data if the bean is never modified in a transaction.

Cause: Optimistic concurrency beans verify consistency of data only if the bean has been modified, unless verify-rows is set to Read. If some other member of a cluster modifies a bean, other members will not be notified of this modification and will continue to store stale data unless the other members also attempt to modify the bean.
Action: Set either of the elements verify-rows to Read or cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014013: EJB {0} does not have a concurrency-strategy of either optimistic or readOnly and disables cluster invalidation. Cluster invalidation is relevant only for these concurrency strategies.

Cause: When an EJB is using either optimistic or readOnly concurrency-strategy and is deployed to a cluster, the container invalidates such beans on modification to avoid throwing OptimisticConcurrencyExceptions. This invalidation can be turned off by setting the cluster-invalidation-disabled to true in the RDBMS deployment descriptor.

Action: Set cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014014: The Message-Driven Bean (MDB) named {0} has a dispatch policy {1} that refers to an unknown work manager. The default work manager will be used instead.

Cause: The specified MDB has a dispatch policy that refers to an unknown work manager.

Action: Create a work manager for the server named {1}, or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing work manager.

Level: 1
Type: WARNING
Impact: EJB

BEA-014016: EJB {0} uses readonly-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is read-only, select-for-update is unnecessary.

Cause: Read-only beans cannot be updated. Therefore, use-select-for-update is unnecessary.

Action: Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014017: EJB {0} uses exclusive-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is locked at the server level during a transaction, select-for-update on the database is unnecessary.
Cause: Exclusive concurrency is implemented by locking the bean at the server level when the bean participates in a transaction. Setting the element use-select-for-update in the RDBMS deployment descriptor to true causes SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the row in the database too. This may be unnecessary, as the bean is locked by the container.

Action: Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014018: EJB {0} uses a verify-columns element in the RDBMS deployment descriptor. This element is applicable only for optimistic concurrency beans. Since this bean does not use optimistic concurrency, this element will be ignored.

Cause: verify-columns is applicable only for optimistic concurrency beans. As the bean does not use optimistic concurrency, this element will be ignored.

Action: Remove verify-columns element in the RDBMS deployment descriptor to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014019: EJB {0} uses a verify-rows element in the RDBMS deployment descriptor. This element is applicable only for optimistic concurrency beans. Since this bean does not use optimistic concurrency, this element will be ignored.

repository (config.xml). Therefore, this entity will not exist anywhere in the domain.

**Cause:** The entity of the given name and type in the given JMS module does not have a corresponding subdeployment in the configuration repository (config.xml). In order for this entity to exist in the domain, it must be targeted with a sub-deployment element.

**Action:** Add a sub-deployment stanza to the appropriate deployment descriptor in config.xml. This will either be a jms-system-resource for a system module, or an app-deployment for a stand-alone JMS deployable module. If the JMS module is inside a J2EE application (an EAR file), then you must add the sub-deployment stanza to the subdeployment that represents this JMS module in the J2EE application. You do not necessarily have to target the subdeployment yet. Simply adding the subdeployment with no targets will remove this warning. However, if you wish for this entity to exist somewhere in your domain you must target the sub-deployment.

BEA-040475: The destination {0} does not have an associated quota object. The setting of bytesMaximum to {1} will have no effect.
   Cause: Quotas have been reworked. They are no longer hierarchical in nature. Instead, they are objects that can be pointed to explicitly and can be optionally shared between destinations. Hence quotas no longer work as they did in previous releases. When converting from older releases, a decision is made about how to handle quotas based on the setting of the old parameters. These decisions may have been wrong, which would cause this warning to happen.
   Action: Please consider removing this destination from the interop module. Put it in another module. This will allow you to use the new quota features.

BEA-040490: (0) {1} has a conflicting name attribute value, which is now changed to have a unique name with its JMSServer name. The new destination-name attribute now holds the original name value.

Cause: A name conflict has been detected during upgrade for JMS destinations, maybe because in WebLogic Server versions prior to 9.2, more than one destination was allowed to have the same name, as long as the destinations belonged to different JMS servers.

Action: Ensure that destinations are created with their name decorated with the target JMS server name to avoid conflict.

BEA-040491: A {0} {1} with multiple targets has been split into multiple deployments one for each unique target.

Cause: A JMS Deployment found with multiple unique targets configured.

Action: In WebLogic Server versions prior to 9.2, both JMSCredential and ForeignJMSServer were allowed to be targeted to more than one server, cluster, or both. During upgrade of this configuration to WebLogic Server 9.2, these configuration entities are split into more than one entity, one for each unique target.

BEA-040503: The delivery mode override value of destination "{0}" hosted on JMS server "{1}" has been changed from {2} to {3}.

Cause: During the upgrade process, a configuration was detected that would force all messages through the given destination to be non-persistent. Therefore, the upgrade process made that override explicit.

Action: Review your application code and configuration. If you need a behavior other than the one that the upgrade process chose, you can modify the resulting configuration using the DeliveryMode parameter of the OverridesParams of the destination, or with the HasStore or AllowsPersistentDowngrade parameters of the JMS server on which the destination is targeted.

BEA-040504: While attempting to add an entity with name "{0}", an error occurred while trying to convert the old style entity to the new style entity. The error was "{1}".

Cause: See the description of the exception that occurred for more information on the cause of this failure.

Action: Take appropriate action based on the determined cause.

Level: 1
Type: WARNING
Impact: JMS

BEA-040505: The JMS module named "{0}" inside application "{1}" does not have a sub-deployment stanza named "{0}". Without such a stanza, no entities inside the module will be deployed, since the subdeployments inside of the sub-deployment stanza named "{0}" control where JMS entities inside this module are targeted.

Cause: When a JMS module is inside an EAR file, the targeting information for entities inside that module are nested within a sub-deployment named after the name of the JMS module found in the weblogic-application.xml file of the EAR file. If no sub-deployment exists with the name of the JMS module, then no targeted entities inside the module will become available. This is usually an oversight on the part of the administrator.

Action: Add a sub-deployment stanza with the name of the JMS module as specified in the weblogic-application.xml file to the app-deployment stanza. Nested inside that sub-deployment, you can target the entities in the module as you normally would.
BEA-040506: The JMS store-and-forward (SAF) forwarder has successfully connected to the remote destination "[0]".
Cause: This is an informational message.
Action: No action is required.

BEA-040507: The JMS store-and-forward (SAF) forwarder failed to connect to the remote destination "[0]", because of [1].
Cause: This is either due to a configuration error, a network failure, or the remote destination being temporarily unavailable.
Action: Check the configuration, network connection, or remote destination.

BEA-040508: BridgeDestinationMBean has been deprecated. The BridgeDestination "[0]" has been replaced in the configuration with a JMSBridgeDestination with the same name.
Cause: A deprecated MBean is being replaced in the configuration.
Action: No action is required.

BEA-040509: Failed to $[1] JMS Server "[0]" because the earlier attempt to $[2] was failed.
Cause: This error occurred during deployment of the JMS server.
Action: Fix any deployment errors related to this JMS server.

BEA-040511: The system is waiting to unbind connection factory "[0]". An attempt is being made to change the JNDI name of this connection factory from "[1]" to "[2]".

Cause: An attempt is being made to unbind a connection factory from a JNDI name in order to dynamically change the JNDI from one name to another. This message will repeat every twenty seconds for five minutes.

Action: No action is required.

Level: 1

Type: NOTIFICATION

BEA-040512: An attempt is being made to change the JNDI name of connection factory "[0]" from "[1]" to "[2]". The system has waited to unbind "[1]" for five minutes. The new JNDI name "[2]" may or may not be bound properly.

Cause: The connection factory was not fully unbound after five minutes. Some error may have occurred while attempting to unbind this connection factory.

Action: In order to maintain the integrity of the connection factory it is recommended you untarget and retarget the connection factory that failed. Otherwise, the connection factory is in an indeterminate state.

Cause: The SubDeploymentMBean of the given name cannot be targeted to anything but a single JMS server because an element of the JMS module that points to that subdeployment can only be targeted to a single JMS server.

Cause: The temporary template for a JMS server must come from a JMSSystemResourceMBean. A common mistake is to put the temporary template into an AppDeployment. - `Dweblogic.security.TrustKeyStore=JavaStandardTrust`
- `Dweblogic.security.JavaStandardTrustKeyStorePassPhrase=passphrase` defaults to no passphrase which means read-only access to the JDK’s cacerts. To use the trusted CAs from another keystore, specify:
- `Dweblogic.security.TrustKeyStore=CustomTrust`
- `Dweblogic.security.CustomTrustKeyStoreFileName=filename` either an absolute pathname or a pathname relative to the directory in which the server was started.
- `Dweblogic.security.CustomTrustKeyStoreType=type` defaults to the default keystore type specified in the JDK’s java.security file.
- `Dweblogic.security.CustomTrustKeyStorePassPhrase=passphrase` defaults to no passphrase. Some keystore types allow this but only grant read-access (for example, JKS). Other keystore types require a keystore passphrase even for read-access. If specifying the server’s trust keystore via boot.properties, set the same properties as for the command line to boot.properties but remove the weblogic.security prefix. For example, set `TrustKeyStore=JavaStandardTrust`.

Otherwise, ensure that the trust keystore configuration for this server in config.xml matches the trust keystore configuration specified on the command line or in boot.properties.

BEA-090484: CERTIFICATE_EXPIRED alert was received from {0}. A certificate in the certificate chain expired or is not yet valid, or the peer and local machine have a date/time mismatch.

**Cause:** A certificate in the chain is either expired or is not yet valid. Another possible cause is the peer machine date/time is not set properly causing the check to fail.

**Action:** Verify the certificate validity and expiration dates in the certificate chain are correct. If they are not, obtain new certificates issued by the certificate authority and update the SSL configuration with the new certificates and private key. If the dates are valid, check the peer machine date/time setup.

**Level:** 1

**Type:** WARNING

**Impact:** Security

BEA-090485: CERTIFICATE_UNKNOWN alert was received from {0}. The peer has an unspecified issue with the certificate. SSL debug tracing should be enabled on the peer to determine what the issue is.

**Cause:** The exact cause is unclear. To determine the cause, check messages from the peer to see if they explain the problem.

**Action:** Review the SSL messages from the peer by turning on SSL debug tracing.

**Level:** 1

**Type:** WARNING

**Impact:** Security

BEA-090486: UNSUPPORTED_CERTIFICATE alert was received from {0}. The peer rejected a certificate in the chain because it was an unsupported type. Verify all certificates in the chain are valid X.509 RSA certificates.

**Cause:** This problem could be caused by an incorrect type of certificate in the certificate chain or the peer not being able to handle certain attributes in a valid certificate.

**Action:** The certificate chain should first be checked to ensure the certificates are all valid X.509 RSA certificates and are using the proper strength. If that is correct, SSL debug tracing may be required on the peer to see if it gives more detail on what was specifically not supported.

**Level:** 1

**Type:** WARNING
**Impact:** Security

**BEA-090487:** UNKNOWN_CA alert received from [0]. The peer is rejecting the certificate chain as being untrusted or incomplete.

**Cause:** The peer is not configured to trust the CA that signed the certificate chain.

**Action:** Review the certificate chain and the peer trusted CA configuration to determine whether the peer should be trusting the certificate chain or whether a new certificate chain is required that is trusted by the peer.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090488:** PROTOCOL_VERSION alert received from [0]. Check that the peer supports the same level of the SSL/TLS protocol being used (SSL V3.0 and TLS V1.0).

**Cause:** The peer may not support the same level of the SSL/TLS protocol, or there was some sort of data corruption occurring with the low-level SSL records.

**Action:** The peer needs to be checked to determine whether it supports SSL V3.0 and TLS V1.0. If it does, SSL debug tracing may be required to see if the SSL record was rejected for another reason.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090489:** NO_RENEGOTIATION alert was received from [0]. The peer does not support renegotiation.

BEA-090547: The certificate chain received from {0} contained a V3 CA certificate which had basic constraints that were not marked critical. This is being rejected due to the strict enforcement of basic constraints.

Cause: Strict basic constraints checking was explicitly enabled, and a certificate chain received by the peer contained a CA that failed due to the strict check but would have passed the strong check.

Action: If strict compliance of RFC 2459 for basic constraints is really required, then the peer certificate chain was correctly rejected and needs to be corrected. If strict compliance is not really required, consider setting the constraints checking back to the default value of strong to accept the certificate chain.

Level: 1
Type: WARNING
Impact: Security

BEA-090548: The certificate chain received from {0} contained a V3 CA certificate that was missing the basic constraints extension

Cause: The certificate chain received by the peer contained a V3 CA certificate that does not contain a basic constraints extension indicating that it really is a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

Action: The peer certificate chain needs to be looked at carefully to determine which CA was missing the basic constraints extension. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

Level: 1
Type: WARNING
Impact: Security

BEA-090549: The certificate chain received from {0} contained a V3 CA certificate that did not indicate it really is a CA.

Cause: The certificate chain received by the peer contained a V3 CA certificate that contained a basic constraints extension which was not marked as being a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

Action: The peer certificate chain needs to be looked at carefully to determine which CA is not correct. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

Level: 1
Type: WARNING
Impact: Security

BEA-090550: The certificate chain received from {0} contained a V3 CA certificate that indicated a certificate chain path length in the basic constraints that was exceeded.

Cause: The certificate chain received by the peer contained a V3 CA certificate that specified a path length in the basic constraints that was exceeded. This is
rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA indicated the path length limit that was exceeded. The path length, if specified, limits how many CA certificates are allowed to follow a CA certificate in a certificate chain. A path length of 0 indicates only an end entity certificate may follow in the chain; positive values indicate how many CA certificates may be in the chain between that CA and the end entity certificate. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**Level:** 1

**BEA-090551:** The certificate chain received from {0} contained a V3 CA certificate that could not be converted to be checked for basic constraints.

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that could not be converted to a format which allows the basic constraints to be checked. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to confirm they are valid. If the certificates are all valid, this indicates an internal coding error or limitation in the server. Contact Oracle support. If the certificate cannot be processed, you can disable the basic constraints checking as a workaround to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**BEA-090823: Could not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory for this JVM.**  
**Cause:**  The WebLogic Server X509CertificateFactory could not be registered as the default X509CertificateFactory for this JVM.  
**Action:**  The WebLogic Server X509CertificateFactory orders the certificates in a CertPath that was created from PKCS7. Specify -Dweblogic.security.RegisterX509CertificateFactory=false on the command line for booting this server to indicate that WebLogic Server should not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory when the server boots (since your JDK does not support this). Also, since the WebLogic Server X509CertificateFactory cannot be registered with the JDK as the default X509CertificateFactory, the JDK will use its current default X509CertificateFactory. The default one (for example, the SUN implementation) may not properly convert PKCS7 to an ordered CertPath.

BEA-101367: An error occurred while extracting archived file for "{0}", located at

Cause: An error occurred while extracting the archived WAR file, due to path length limitations on some OS's.

Action: Some OS's only allow a certain number of characters in the file name. This limitation can be noticed when extracting an archive in a deeply nested directory. Since the default temporary directory for extracting all archives is relative to the server root directory, it is recommended that one use the system property weblogic.j2ee.application.tmpDir and set it to a shorter file path, or one could ensure that the server is started in a directory with a shorter file path.

**BEA-150000: An error occurred while establishing a connection back to the Administration Server \[0\] during startup. Since bootstrap succeeded, check that \[0\] uniquely identifies the Administration Server.**  
**Cause:** An improper Administration Server URL has been specified, or the Administration Server is not available at the specified URL. Commonly this is because the Managed Server shares an administration URL with the Administration Server. Another possibility is that the host identified by \[0\], or the
local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

**Action:** Verify that the URL specified for the Administration Server is valid, unique and that the Administration Server is available and listening at the specified URL. A common problem is that the administration port is enabled and both the Administration Server and Managed Server are running on the same machine. In this instance a different administration port should be selected for the Managed Server. Another possibility is that the host identified by {0}, or the local host, is not configured properly. BEA-220103: Async Web service support is not fully configured. The async response Web service {0} for this server was not fully deployed because the JMS reliability queue was not defined/deployed: {1}. The server will periodically retry completing the deploy for the service. This message can usually be ignored unless there are async Web service applications. To completely disable async Web service support, thus avoiding this message, set -Dweblogic.wsee.skip.async.response=true.
  Cause: The JMS queue JNDI name specified in the WebservicesMBean (or allowed to default) was not found on this server. The async response service requires this JMS queue in order to operate. To avoid obscure errors while processing Web service async responses, this service was not fully deployed. Not having this JMS queue available can indicate that Web services have not been configured/enabled for this domain. The server will periodically retry deploying the service, so there is no need to restart the server once the JMS queue is made available.
Action: If you do not intend to use async Web services in this domain, no action is required. To avoid seeing this message and completely disable async Web service support, set -Dweblogic.wsee.skip.async.response=true. If you intend to use async Web services in this domain, define a non-distributed JMS queue with the local JNDI name given in WebservicesMBean (which has a default value), and after a short delay, the async response service will be fully deployed to use the newly defined queue. Oracle recommends that the JMS queue be located on a JMS server that is targeted to the same server as the Web service. Note that you can easily add async response Web services support to an existing domain by extending your domain with the Configuration Wizard and applying the wls_webservice.jar extension template. For more information, see the WebLogic Server online documentation in the 'Web Services->Get Started Using JAX-RPC' section.

BEA-220104: Web services async response service {0} for this server was just deployed because the reliability queue was found: {1}

Action: No action is required.

Level: 1
Type: NOTIFICATION
Impact: WebService

BEA-220105: Web services async/reliable invocations for service {0} are NOT available because the async/reliability queue was not found: {1}
Cause: You have deployed a Web service that indicates it can use async/reliable features, but the queue for async/reliable invocations (specified in WebservicesMBean, @Buffer or @ReliabilityBuffer annotations, or allowed to default) is not deployed to the local server. Therefore, async and reliable invocations will fail if attempted. Standard synchronous invocations will still work correctly despite this problem.
Action: Remove any async or reliable features from the Web service (e.g., @AsyncResponse, @Buffer, @ReliabilityBuffer annotations or @Policy annotations specifying reliable policy) or properly configure this server for async/reliable invocations. See the WebLogic Server online documentation in the 'Web Services->Get Started Using JAX-RPC' section for help on fixing this configuration problem. Once you have defined the proper async/reliable resources, you must redeploy your application.

BEA-220501: The service port {1} bound to https transport in service {0} is NOT available, the https address cannot be resolved because SSL is not enabled for the server. The service port definition will be removed from WSDL that is being accessed through {2}.
Cause: While a WSDL is being retrieved through http protocol, the server requires replacing the service port address in WSDL with the actual address for the server. For any web service which defines one or more service ports bound to https transport, if the domain does not enable SSL functionality then the service port address could not be replaced correctly because https address for the server cannot be resolved.
Action: Enable SSL functionality for the server.

BEA-220505: Implicit/generated Client Identity {0} has been used in multiple calls to Service.getPort()/createDispatch() where these calls have used different services and/or sets of features. Monitoring statistics for this client will include all these different usages. Validation failures were: [1]

Cause: WebLogic JAX-WS web service clients are assigned a unique identity that is intended to represent the business purpose of that client. This identity can be specified directly using weblogic.jws.jaxws.client.ClientIdentityFeature or it can be allowed to be implicit. Implicit identity is generated automatically based on environmental information at the point where a Port/Dispatch instance is created. Your code has received an implicit client identity that is getting used (again implicitly) across multiple services or sets of features. All statistics gathered for a given client instance are rolled up under the client instance's client identity. If client instances using different services and/or feature sets contribute statistics to the same client identity, this can be confusing. It is even possible for clients to behave incorrectly when more advanced web service features are used.

Action: Best practice is to create a specific client identity (with a name representing a logical business purpose) for the client and denote this identity by passing weblogic.jws.jaxws.client.ClientIdentityFeature to the call to Service.getPort/createDispatch. Further, it is recommended that you pass a single/global set of web service feature objects to that call (e.g. CreateWebServiceFeature instances as static class members or in a method annotated with @PostConstruct for containers compatible with this annotation). The actual call to Service.getPort()/createDispatch() should still be made in any way that makes sense for your uses (e.g. calling getPort on demand in a web service method, with Service created as a static class member).

BEA-280096: Opening existing store "(2)". The direct IO mode "(1)" specified by the property "(0)" is invalid and will be ignored. Using the default value "(3)"
Cause:
Action: Use a valid direct I/O mode. The valid values are: "read-buffered", "single-handle-unbuffered", and "single-handle-buffered".

Level: 1
Type: WARNING
Impact: Store

BEA-280097: A file store failed to open file "{0}" in the Direct-Write read-buffered/write-unbuffered mode and is instead opening the file in a purely unbuffered mode. When there are high request loads, this may reduce file store performance. However, the store is still operating in a transactionally safe synchronous mode.

Cause:
Action: To fix this problem, configure a different synchronous write policy, or if using the Direct-Write policy, force the store into read-write-buffered mode using the AvoidDirectIO command line property documented in the Tuning JMS Store-and-forward chapter of the Tuning Performance of WebLogic Server guide.

Level: 1
Type: WARNING
Impact: Store

BEA-280101: The persistent file store "{0}" is forced to use buffered I/O because the Operating System or hardware environment does not support unbuffered I/O. The store is still operating in a transactionally safe synchronous mode. See store open log messages for the final write policy.

Cause: See the message body.
Action: Refer to the documentation for information about the store synchronous write policy configuration.

Level: 1
Type: NOTIFICATION
Impact: Store

BEA-280102: The persistent file store "{0}" must reinitialize its cache: recovery may take longer than usual. The signature in the cache file "{2}" for the persistent store file "{1}" could not be verified, or the cache file is missing. Ignore this Warning if this is the first time the store has ever booted. Possible causes include: first boot of store (potentially after using a write policy different from Direct-Write-With-Cache), store migration, unclean shutdown, off-line store compression, and manual removal of cache files.

Cause: The cache file is missing, or the signature stored in the cache file does not match the signature of the primary file.
Action: Make sure that the configuration is correct, do not delete cache files, and ensure a clean shutdown.

**Impact:** Store

**BEA-280104:** The persistent file store "[0]" will use buffered writes instead of direct IO because the configured block size "[2]" is not a multiple of the environment's direct IO alignment "[1]". When there are high request loads, this may reduce file store performance. The store is still operating in a transactionally safe synchronous mode.

**Cause:** Direct I/O requires the block size to be a multiple of directIO granularity.

**Action:** Reconfigure the store with a block size that is a multiple of the direct I/O alignment for your environment. If the store is not empty and contains useful data, use the store administration compact utility to change block size, otherwise make sure that all storage areas are removed before starting WebLogic Server again.
