Oracle® Fusion Middleware
Administering Web Services
12c (12.1.3)
E47704-02

February 2015
Documentation for developers and administrators that describes how to administer Web services.
## Contents

**Preface** ................................................................................................................................................................................. ix  
  About this Guide ........................................................................................................................................................................... ix  
  Audience ......................................................................................................................................................................................... ix

  Related Documents ......................................................................................................................................................................... ix  
  Conventions ..................................................................................................................................................................................... x  

**What's New** .............................................................................................................................................................................. xi  
  New and Changed Features for Release 12c (12.1.3) .................................................................................................................... xi  
  New and Changed Features for Release 12c (12.1.2) .................................................................................................................... xi  
  Other Significant Changes in this Book for Release 12c (12.1.2) .............................................................................................. xii  

**1 Overview of Web Services Administration**  
  1.1 Web Services Administration in Oracle Fusion Middleware 12c ................................................................. 1-1  
  1.2 Roadmap for Web Service Administration Tasks ................................................................................................. 1-1  

**2 Accessing the Administration Tools**  
  2.1 Accessing Oracle Enterprise Manager Fusion Middleware Control ................................................................. 2-1  
  2.2 Accessing Oracle WebLogic Administration Console ............................................................................................ 2-2  
  2.3 Accessing the Web Services Custom WLST Commands ............................................................................................ 2-2  

**3 Deploying Web Service Applications**  
  3.1 Overview .............................................................................................................................................................................. 3-1  
  3.2 Deploying Web Service Applications ............................................................................................................................... 3-1  
  3.3 Undeploying Web Service Applications .......................................................................................................................... 3-6  
  3.4 Redeploying Web Service Applications .......................................................................................................................... 3-6  

**4 Administering Web Services**  
  4.1 Administering Web Services Using Fusion Middleware Control .............................................................................. 4-1  
    4.1.1 Understanding Access Privileges for the Supported User Roles ............................................................................. 4-1  
    4.1.2 Viewing Web Services Using Fusion Middleware Control ...................................................................................... 4-2  
    4.1.2.1 Viewing the Web Services for a Server Using Fusion Middleware Control ......................................................... 4-2  
    4.1.2.2 Viewing the Web Services in an Application Deployment Using Fusion Middleware Control ................................ 4-3
4.1.2.3 Viewing the Web Services Summary Page for an Application .................. 4-3
4.1.2.4 Viewing the Summary Page for a Java EE Web Service .......................... 4-6
4.1.2.5 Viewing the Web Services and References in a SOA Composite .............. 4-6
4.1.2.6 Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control ................................................................. 4-6
4.1.2.6.1 Viewing the Details for a SOA Composite Application ................. 4-6
4.1.2.6.2 Viewing the Details for an non-SOA Oracle Infrastructure Web Service Endpoint .............................................................. 4-7
4.1.2.6.3 Viewing the Details for a Java EE Web Service Endpoint .................. 4-8
4.1.2.6.4 Viewing the Details for a Java EE Web Service Operation .................. 4-8
4.1.2.6.5 Viewing the Details for a RESTful Service Application .................... 4-8
4.1.2.6.6 Viewing the Details for a RESTful Resource .................................... 4-9
4.1.3 Viewing Web Service Clients Using Fusion Middleware Control ............. 4-9
4.1.3.1 Viewing SOA References ................................................................. 4-9
4.1.3.2 Viewing Connection-Based Web Service Clients ................................ 4-10
4.1.3.3 Viewing Java EE Web Service Clients ............................................. 4-10
4.1.3.4 Viewing Asynchronous Web Service Callback Clients ....................... 4-11
4.1.4 Configuring Web Services Using Fusion Middleware Control ................. 4-11
4.1.4.1 Configuring Addressing Using Fusion Middleware Control .................. 4-12
4.1.4.2 Configuring Asynchronous Web Services Using Fusion Middleware Control ................................................................. 4-12
4.1.4.3 Changing the JMS System User for Asynchronous Web Services Using Fusion Middleware Control ................................................. 4-14
4.1.4.4 Configuring Reliable Messaging Using Fusion Middleware Control .......... 4-15
4.1.4.5 Configuring Atomic Transactions Using Fusion Middleware Control .......... 4-16
4.1.4.6 Configuring MTOM Using Fusion Middleware Control ....................... 4-17
4.1.4.7 Configuring Fast Infoset Using Fusion Middleware Control ................. 4-18
4.1.4.8 Configuring Persistence Using Fusion Middleware Control .................. 4-18
4.1.4.9 Configuring SOAP Over JMS Transport Using Fusion Middleware Control ......................................................... 4-19
4.1.4.10 Enabling or Disabling Web Services Using Fusion Middleware Control .......... 4-20
4.1.4.11 Enabling or Disabling Public Access to the Web Service WSDL Document Using Fusion Middleware Control ......................... 4-21
4.1.4.12 Enabling or Disabling SOAP Processing Using Fusion Middleware Control ................................................................. 4-22
4.1.4.13 Enabling or Disabling Non-SOAP XML Message Processing Using Fusion Middleware Control ......................................................... 4-22
4.1.4.14 Setting the Log Level for Diagnostic Logs Using Fusion Middleware Control ................................................................. 4-22
4.1.4.15 Enabling or Disabling the Web Services Test Client Using Fusion Middleware Control ................................................................. 4-23
4.1.4.15.1 Enabling or Disabling the Web Services Test Client at the Domain Level Using Fusion Middleware Control ................................................. 4-24
4.1.4.15.2 Enabling or Disabling the Web Service Test Client at the Web Service Endpoint Level Using Fusion Middleware Control ................................................. 4-25
4.1.4.16 Enabling or Disabling the Exchange of Metadata Using Fusion Middleware Control ................................................................. 4-26
4.1.4.17 Configuring MTOM-encoded Fault Messages Using Fusion Middleware Control ................................................................. 4-27
4.1.4.18 Validating the Request Message Using Fusion Middleware Control .......... 4-27

5 Testing Web Services

5.1 Overview of Web Services Testing | 5-1
5.2 Using the Web Services Test Client | 5-1
5.2.1 Invoking the Web Services Test Client ................................................................. 5-2
5.2.1.1 Invoking the Web Services Test Client From a Browser ................................. 5-2
5.2.1.2 Invoking the Web Services Test Client Using the Web Service Endpoint .... 5-3
5.2.1.3 Invoking the Web Services Test Client Using the Administration Console .... 5-3
5.2.2 Selecting the Web Service to Test ........................................................................ 5-3
5.2.3 Testing Web Service Operations ........................................................................... 5-4
5.2.4 Configuring Basic Test Settings .......................................................................... 5-4
5.2.5 Testing Advanced Web Service Features and Security ...................................... 5-5
5.2.5.1 Testing Addressing ....................................................................................... 5-5
5.2.5.2 Testing Atomic Transactions ........................................................................ 5-6
5.2.5.3 Testing MTOM ............................................................................................. 5-6
5.2.5.4 Testing Fast Infoset ..................................................................................... 5-7
5.2.5.5 Testing OWSM Security Policies ................................................................. 5-8
5.2.6 Viewing the WSDL and Imported Schemas .......................................................... 5-9
5.2.7 Configuring the Web Services Test Client .......................................................... 5-9
5.2.7.1 Configuring an HTTP Proxy ......................................................................... 5-9
5.2.7.2 Configuring the JKS Keystores .................................................................... 5-9
5.2.7.3 Configuring the Default Working Directory ............................................... 5-10
5.2.8 Editing the Input Arguments as XML Source ...................................................... 5-10
5.2.9 Viewing the History ............................................................................................ 5-10
5.2.10 Exporting and Importing Test Cases ................................................................. 5-10
5.2.10.1 Exporting a Test Case ................................................................................ 5-11
5.2.10.2 Importing a Test Case ................................................................................ 5-11
5.2.11 Enabling and Disabling the Web Services Test Client ........................................ 5-11
5.2.12 Logging Out of the Web Services Test Client .................................................... 5-12
5.3 Using the Test Web Service Page in Fusion Middleware Control .......................... 5-12
5.3.1 Accessing a Web Service for Testing ................................................................. 5-12
5.3.2 Testing a SOAP Web Service ............................................................................. 5-13
5.3.3 Testing an Asynchronous Web Service .............................................................. 5-17
5.3.4 Testing a RESTful Web Service ......................................................................... 5-19
5.3.5 Testing Security ................................................................................................. 5-22
5.3.5.1 Supported Client Security Policies for SOAP Services .............................. 5-26
5.3.5.2 Supported Client Security Policies for RESTful Services .......................... 5-27
5.3.6 Enabling Quality of Service Testing ................................................................. 5-27
5.3.7 Testing HTTP Headers ...................................................................................... 5-27
5.3.8 Editing the Input Arguments as XML Source .................................................. 5-28
5.3.9 Stress Testing the Web Service Operation ........................................................ 5-28

6 Monitoring and Auditing Web Services

6.1 Overview of Performance Monitoring, Auditing, and Tuning .............................. 6-1
6.2 Monitoring Web Services ........................................................................................ 6-1
6.2.1 When Are Web Service Statistics Started or Reset? ....................................... 6-2
6.2.2 Viewing Web Service Statistics for a Server Instance ..................................... 6-2
6.2.3 Viewing Web Service Statistics for an Application .......................................... 6-3
6.2.3.1 Viewing Web Service Statistics for a SOA Composite Application .......... 6-3
6.2.3.2 Viewing Web Service Statistics for a Non-SOA Oracle Infrastructure Web Service Application ............................ 6-4
7  Managing Diagnostic and Message Logs

7.1  Diagnosing Problems Using Logs ........................................ 7-1
    7.1.1  Using Diagnostic Logs for Web Services ...................... 7-1
    7.1.1.1  Setting the Log Level for Diagnostic Logs ............... 7-2
    7.1.1.2  Viewing Diagnostic Logs ...................................... 7-4
    7.1.1.3  Filtering Diagnostic Logs .................................... 7-5
    7.1.1.4  Logging OWSM Debug Messages ............................ 7-5
    7.1.2  Using Message Logs for Web Services ....................... 7-6
    7.1.2.1  Configuring Message Logs .................................... 7-6
    7.1.2.2  Viewing Message Logs ........................................ 7-7
    7.1.2.3  Filtering Message Logs ....................................... 7-7
    7.1.3  Reviewing Sample Logs .......................................... 7-7
    7.1.3.1  Sample Log: OWSM Policy Manager Not Available .... 7-7
    7.1.3.2  Sample Log: Security Keystore Not Configured .......... 7-7
    7.1.3.3  Sample Log: Certificate Not Available .................. 7-8
    7.2  Configuring Log Files for a Web Service ........................ 7-9

8  Managing Application Migration Between Environments

8.1  Overview of Web Service Application Migration .................. 8-1
8.2  Overview of Horizontal Policy Migration ............................ 8-2
8.3  Migrating Policies .......................................................... 8-3
8.4  Migrating Policy Configuration .......................................... 8-4
8.4.1  Migrating Keystores .................................................... 8-4
8.4.2  Migrating Users and Groups ....................................... 8-4
8.4.3  Migrating Credentials .................................................. 8-5
8.4.3.1  Migrating Username and Password .......................... 8-5
8.4.3.2  Migrating Keystores and Encryption Key Passwords ..... 8-5
8.4.4  Migrating Oracle Platform Security Services Application and System Policies ........... 8-5
8.4.5  Migrating Oracle Platform Security Services Configuration .............................................. 8-5
8.4.6  Migrating SSL ............................................................. 8-6
8.4.7  Migrating Kerberos Configuration .................................. 8-6
8.5  Migrating Assertion Templates ............................................ 8-6
9 Viewing, Registering, and Publishing Web Services

9.1 Registering Web Services and Sources ................................................................. 9-1
  9.1.1 Understanding UDDI Basics ........................................................................ 9-2
  9.1.2 Understanding WSIL Basics ........................................................................ 9-2
  9.1.3 Viewing Registered Sources and Web Services ........................................ 9-2
  9.1.4 Registering a Source .................................................................................... 9-3
  9.1.5 Registering Web Services from a UDDI Source ........................................ 9-5
  9.1.6 Registering Web Services from a WSIL Source .......................................... 9-6
  9.1.7 Deleting a Web Service or Web Service Source ....................................... 9-7
9.2 Publishing Web Services to UDDI ................................................................. 9-8
  9.2.1 Publishing a Web Service to UDDI from a Registered Source ................ 9-8
  9.2.2 Publishing a Web Service to UDDI from an Application ......................... 9-10
  9.2.3 Configuring the Proxy Server for UDDI .................................................... 9-11

A Web Service Audit Events Reference

A.1 Web Service Audit Events ................................................................................ A-1
  A.1.1 OWSM-AGENT Events and Attributes ..................................................... A-1
  A.1.2 OWSM-PM-EJB Events and Attributes ................................................... A-2
  A.1.3 Web Services Policy Attachment Events and Attributes ......................... A-4
  A.1.4 Oracle Web Services Events and Attributes ........................................... A-4
  A.2 Pre-built Audit Reports ................................................................................. A-5
Preface

This section describes the intended audience, how to use this guide, and provides information about documentation accessibility.

About this Guide
This guide describes the tasks required to administer Web services, providing details describing how to:

- Deploy, configure, test, and monitor Web services.
- Manage diagnostic and message logs.
- Manage policy lifecycle to transition from a test to production environment.
- Enable, publish, and register Web services.

Audience
This guide is intended for:

- System and security administrators who administer Web services and manage security
- Application developers who are developing Web services and testing the security prior to deployment of the Web services
- Security architects who create security policies

Documentation Accessibility
For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support
Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
What's New

The following topics introduce the new and changed features of Web services management and other significant changes that are described in this guide, and provides pointers to additional information.

New and Changed Features for Release 12c (12.1.3)

Oracle Fusion Middleware 12c (12.1.3) includes the following new and changed features for this document:

- Support for Oracle SOA Suite (SOAP/RESTful web services). References to these components are included throughout this document as necessary. Some specific sections include:
  - "Viewing the Web Services and References in a SOA Composite" on page 4-6
  - "Viewing the Details for a SOA Composite Application" on page 4-6
  - "Viewing SOA References" on page 4-9
  - "Configuring SOA References" on page 4-32
  - "Viewing Web Service Statistics for a SOA Composite Application" on page 6-3

- Support for the Deployer role for OWSM policy and policy set management in Fusion Middleware Control. For more information, see "Understanding Access Privileges for the Supported User Roles" on page 4-1.

- Ability to save and browse XML payload from Test Web Service Page in Fusion Middleware Control. For more information, see "Testing a SOAP Web Service" on page 5-13.

- Support for testing OWSM security policies on RESTful web services. For more information, see the following sections:
  - "Testing a RESTful Web Service" on page 5-19
  - "Testing Security" on page 5-22

New and Changed Features for Release 12c (12.1.2)

Oracle Fusion Middleware 12c (12.1.2) includes the following new and changed features for this document:

- Redesigned Web services WLST framework to provide consistency across Web service stacks. As a result, there are a number of new and deprecated WLST commands for Oracle Infrastructure Web services. The new commands are used in the examples throughout this document. For a complete list of deprecated
commands and their 12c equivalents, see "Deprecated Commands for Oracle Infrastructure Web Services" in Release Notes for Oracle Fusion Middleware Infrastructure.

- Support for SOAP over JMS transport as a connection protocol, as described in "Configuring SOAP Over JMS Transport Using Fusion Middleware Control" on page 4-19 and "Configuring SOAP Over JMS Transport Using WLST" on page 4-50.

- Fast Infoset support, providing a compressed binary encoding format that provides a more efficient serialization than the text-based XML format, as described in "Configuring Fast Infoset Using Fusion Middleware Control" on page 4-18 and "Configuring Fast Infoset Using WLST" on page 4-49.

- New predefined policies and annotation for configuring Web service features. For more information, see "Configuring Web Services Using Fusion Middleware Control" on page 4-11 and "Configuring Web Services Using WLST" on page 4-42.

- Enhanced Web Services Test Client for testing advanced features of Web services. See "Using the Web Services Test Client" on page 5-1.

- Enhancements to the Fusion Middleware Control Test Web Service page to support testing RESTful and asynchronous Web services. For more information, see "Using the Test Web Service Page in Fusion Middleware Control" on page 5-12.

- New summary screens in Fusion Middleware Control that enable you to view and monitor Java EE and RESTful Web services. For more information, see:
  - "Viewing the Web Services in an Application Deployment Using Fusion Middleware Control" on page 4-3
  - "Viewing the Summary Page for a Java EE Web Service" on page 4-6
  - "Viewing Statistics for a Java EE Web Service Operation" on page 6-8
  - "Viewing Statistics for RESTful Resources" on page 6-13

Other Significant Changes in this Book for Release 12c (12.1.2)

For 12c (12.1.2), this guide has been updated in several ways. Following are the sections that have been added or changed.

- In this release, the Security and Administrator’s Guide for Web Services delivered in Oracle Fusion Middleware 11g, has been split up into the following documents:
  - Understanding Oracle Web Services Manager
  - Securing Web Services and Managing Policies with Oracle Web Services Manager
  - Administering Web Services (this document)

- Summary of Web service and OWSM audit events has been added. For more information, see Appendix A, "Web Service Audit Events Reference."

- Summary of the Web service and OWSM events that can be audited using the Oracle Fusion Middleware Audit Framework have been moved into this guide, from Securing Applications with Oracle Platform Security Services. For more information, see Appendix A, "Web Service Audit Events Reference."
Overview of Web Services Administration

This chapter provides an overview of web services administration in Oracle Fusion Middleware 12c. Companies worldwide are actively deploying service-oriented architectures (SOA) using web services, both in intranet and internet environments. While web services offer many advantages over traditional alternatives (for example, distributed objects or custom software), deploying networks of interconnected web services still presents key challenges, particularly in terms of security and administration.

This chapter includes the following sections:

- **Web Services Administration in Oracle Fusion Middleware 12c**
- **Roadmap for Web Service Administration Tasks**

For definitions of unfamiliar terms found in this and other books, see the Glossary.

1.1 Web Services Administration in Oracle Fusion Middleware 12c

Oracle Fusion Middleware supports the categories and types of web services described in "Overview of Web Services in Oracle Fusion Middleware 12c" in *Understanding Web Services*.

At development time, application developers can secure web services by attaching policies using Oracle JDeveloper or programmatically using annotations. Post-deployment, system administrators can secure web services by attaching policies to the service endpoints or globally by reference to a range of endpoints. For details about securing the web services and managing web services policies, see *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

In addition to securing the web services, system administrators may need to:

- Deploy, configure, test, and monitor web services.
- Enable, publish, and register web services.
- Manage policy lifecycle to transition from a test to production environment.
- Test interoperability with other web services.

1.2 Roadmap for Web Service Administration Tasks

*Table 1–1* defines the tools that system administrators can use to secure and administer web services. For information about how to access these administration tools, see Chapter 2, "Accessing the Administration Tools."
### Table 1–1  Tools Used for Web Service Administration Tasks

<table>
<thead>
<tr>
<th>Use this tool...</th>
<th>To perform the following tasks...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Enterprise Manager Fusion Middleware Control</td>
<td>■ Deploy web service applications.</td>
</tr>
<tr>
<td></td>
<td>■ View and configure RESTful and Oracle Infrastructure web services and clients.</td>
</tr>
<tr>
<td></td>
<td>■ View Java EE (WebLogic) web services and clients.</td>
</tr>
<tr>
<td></td>
<td>■ Secure Java EE, RESTful, and Oracle Infrastructure web services with OWSM policies. For more information about securing web services using OWSM, see <em>Securing Web Services and Managing Policies with Oracle Web Services Manager</em>.</td>
</tr>
<tr>
<td></td>
<td>■ Test web services.</td>
</tr>
<tr>
<td></td>
<td>■ Monitor the run-time performance and audit web services.</td>
</tr>
<tr>
<td></td>
<td>■ Manage diagnostic and message logs.</td>
</tr>
<tr>
<td></td>
<td>■ Register web services and sources, and publish registered web services.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>■ Only a subset of OWSM policies are supported for Java EE web services, as described in “Which OWSM Policies are Supported for Java EE Web Services” in <em>Securing Web Services and Managing Policies with Oracle Web Services Manager</em>.</td>
</tr>

Accessing the Administration Tools

This chapter introduces the several administration tools you can use to secure and administer Fusion Middleware Web Services. This chapter describes how to access the security and administration tools.

This chapter includes the following sections:

- Accessing Oracle Enterprise Manager Fusion Middleware Control
- Accessing Oracle WebLogic Administration Console
- Accessing the Web Services Custom WLST Commands

2.1 Accessing Oracle Enterprise Manager Fusion Middleware Control

To access Oracle Enterprise Manager Fusion Middleware Control:

1. Start the Oracle WebLogic Server instance.

   For more information, see “Start and stop servers” in the Oracle WebLogic Server Administration Console Online Help.

2. Open a supported web browser and navigate to the following URL:

   http://hostname:port/em
   https://hostname:port/em

   hostname specifies the DNS name or IP address of Fusion Middleware Control and port specifies the address of the port on which Fusion Middleware Control is listening for requests (7001 by default).

   Use https if you started the Oracle Fusion Middleware using the Secure Sockets Layer (SSL).

   For a list of supported browsers, see Oracle Fusion Middleware System Requirements and Specifications at:

   The Login page displays.

3. Enter the username and password.

   The default user name for the administrator user is weblogic. This is the account you can use to log in to Fusion Middleware Control for the first time. The password is the one you supplied during the installation of Oracle Fusion Middleware.

4. Click Login.
2.2 Accessing Oracle WebLogic Administration Console

To access Oracle WebLogic Administration Console:

1. Start the Oracle WebLogic Server.
   
   For more information, see "Start and stop servers" in the Oracle WebLogic Server Administration Console Online Help.

2. Open a supported web browser and navigate to one of the following URLs:

   http://hostname:port/console
   https://hostname:port/console

   hostname specifies the DNS name or IP address of the Oracle WebLogic Administration Server and port specifies the address of the port on which the Oracle WebLogic Administration Server is listening for requests (7001 by default).

   Use https if you started the Oracle WebLogic Server using the Secure Sockets Layer (SSL).

   For a list of supported browsers, see Oracle Fusion Middleware System Requirements and Specifications at:

   The Login page displays.

3. Enter the username and password.

   You may have specified the username and password during the installation process. This may be the same username and password that you use to start the Oracle Administration Server. Or, a username that is granted one of the default global security roles.

4. Click Log In.

   For more information, see "Start the Console" in the Oracle WebLogic Server Administration Console Online Help.

2.3 Accessing the Web Services Custom WLST Commands

To access the web services WLST commands:

1. Go to the Oracle Common home directory for your installation, for example /home/Oracle/Middleware/oracle_common.

   For information about the Oracle Common home directory and installing Oracle Fusion Middleware, see the Planning an Installation of Oracle Fusion Middleware.

2. Start WLST using the WLST.sh/cmd command located in the oracle_common/common/bin directory. For example:
■ /home/Oracle/Middleware/oracle_common/common/bin/wlst.sh (UNIX)
■ C:\Oracle\Middleware\oracle_common\common\bin\wlst.cmd (Windows)

When executed, these commands start WLST in offline mode. To use the web services WLST commands, you must use WLST in online mode.

   For more information, see "Start and stop servers" in the Oracle WebLogic Server Administration Console Online Help.

4. Connect to the running WebLogic Server instance using the connect() command. For example, the following command connects WLST to the Admin Server at the URL myAdminServer.example.com:7001 using the username/password credentials weblogic/welcome1:
   
   connect("weblogic","welcome1","t3://myAdminServer.example.com:7001")

   For more information about using WLST, see "Using the WebLogic Scripting Tool" in Understanding the WebLogic Scripting Tool.

   For more information about the web Services WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.
Deploying Web Service Applications

This chapter provides a brief description of deploying and undeploying web service applications in Oracle Fusion Middleware.

This chapter includes the following sections:

- **Overview**
- **Deploying Web Service Applications**
- **Undeploying Web Service Applications**
- **Redeploying Web Service Applications**

### 3.1 Overview

As you work with web services, you will find that you can deploy and undeploy their associated applications in different ways. Follow these guidelines when deploying applications associated with web services:

- Use Oracle Enterprise Manager Fusion Middleware Control to deploy Java EE applications that require Oracle Metadata Services (MDS) or that take advantage of the Oracle Application Development Framework (Oracle ADF).
- If your application is a SOA composite, use the SOA Composite deployment wizard.
- If your application is not a SOA composite or it does not require an MDS repository or ADF connections, then you can deploy your application using Fusion Middleware Control or the Oracle WebLogic Server Administration Console.

This chapter provides an overview of the basic procedure for deploying a web service application. For more information about deploying applications, see "Deploying Applications" in *Administering Oracle Fusion Middleware*. In particular, take note of the following sections:

- **Deploying, Undeploying, and Redeploying Java EE Applications**
- **Deploying, Undeploying, and Redeploying Oracle ADF Applications**
- **Deploying, Undeploying, and Redeploying SOA Composite Applications**

### 3.2 Deploying Web Service Applications

The following is an overview of the basic procedure for deploying a web service application using the Oracle Enterprise Manager Fusion Middleware Control.
To deploy a web service application

1. In the navigation pane, expand WebLogic Domain.

2. Expand the domain in which you want to deploy the web service, and then select the instance of the server on which you want to deploy it.

3. In the content pane, select WebLogic Server then Deployments.

The first screen of the Deploy process is displayed, as shown in Figure 3–1.

Figure 3–1 Select Archive Page

5. Select one of the following Archive or Exploded Directory options:
   - Archive is on the machine where this web browser is running.
   - Archive or exploded directory is on the server where Enterprise Manager is running.

6. Select one of the following Deployment Plan options:
   - Automatically create a new deployment plan
   - Deployment plan is present on local host
   - Deployment plan is already present on the server where Enterprise Manager is running

A deployment plan is an XML file that you use to configure an application for deployment to a specific environment. If you do not already have a deployment plan for the web service application you are deploying, one is created for you when you deploy the application.

7. Select one of the following Deployment Type options:
Deploy this archive or exploded directory as an application
Deploy this archive or exploded directory as a library

8. Click Next.

9. On the Select Target page, select the target (WebLogic server or cluster) to which you want this application deployed, and click Next.

**Figure 3-2 Select Target Page**

10. On the Application Attributes page, enter the attributes for this web service application, and click Next. Application Name is the only required attribute.

However, if you want to be able to redeploy this web service application later without first having to undeploy it, you must also assign a version number.

The context root is the URI for the web module. Each web module or EJB module that contains web services may have a context root.
11. On the Deployment Settings page, edit the deployment settings for this web service application, as shown in Figure 3–4.
12. To save a copy of the deployment plan to your local system, click Save Deployment Plan.

13. To edit the deployment plan, possibly to add advanced deployment options, click Edit Deployment Plan. If you do so, the Edit Deployment Plan screen is displayed, as shown in Figure 3–5. After making changes to the deployment plan, click Apply to make the change effective.
3.3 Undeploying Web Service Applications

The procedure for undeploying or redeploying a web service is the same as the procedure for any application.

To undeploy a web service application
1. From the navigation pane, expand Application Deployments, then expand the application deployment and select the application name. The Application Deployment is displayed.
2. In the content pane, select Application Deployment then Deployments.
3. In the Deployments table, select the application and click Undeploy. The undeploy confirmation page is displayed.
4. Click Undeploy. Processing messages are displayed.
5. When the operation completes, click Close.

3.4 Redeploying Web Service Applications

When you redeploy a web service application, the running application is automatically stopped and then restarted.

Redeploy an application if:

■ You have made changes to the application and you want to make the changes available.
■ You have made changes to the deployment plan.
■ You want to redeploy an entirely new archive file in a new location.

When you redeploy an application, you can redeploy the original archive file or exploded directory, or you can specify a new archive file in place of the original one. You can also change the deployment plan that is associated with the application.

Note: Applications that were previously deployed without a version cannot be redeployed. To redeploy the not-versioned applications, you need to undeploy and deploy the application.

To redeploy a web service application

The steps that you follow to redeploy a web service application are identical to those required when you first deployed the application, as described in "Deploying Web Service Applications" on page 3-1, with two exceptions: you must redeploy the application with a new version, and you can optionally set the retirement policy for the current version. Both of these actions occur at Step 3 of redeployment process, as shown in Figure 3–6.
Figure 3–6 Setting Application Attributes During Redeploy
This chapter describes how to use Oracle Enterprise Manager Fusion Middleware Control and WebLogic Scripting Tool (WLST) commands to configure and manage Oracle Fusion Middleware Web Services.

This chapter includes the following sections:

- Administering Web Services Using Fusion Middleware Control
- Administering Web Services Using WLST

4.1 Administering Web Services Using Fusion Middleware Control

The following sections describe how to use Fusion Middleware Control to access and configure web services on the server and client.

- Understanding Access Privileges for the Supported User Roles
- Viewing Web Services Using Fusion Middleware Control
- Viewing Web Service Clients Using Fusion Middleware Control
- Configuring Web Services Using Fusion Middleware Control
- Configuring Web Service Clients Using Fusion Middleware Control
- Managing the WSDL Using Fusion Middleware Control

4.1.1 Understanding Access Privileges for the Supported User Roles

Fusion Middleware Control supports the notion of role-based access. Users are mapped to different roles, and each role corresponds to a different set of privileges. Fusion Middleware Control uses the Oracle WebLogic Server security realm and the roles defined in that realm.

Web service management tasks pertaining to assertion templates and policies can be restricted by role, as shown in Table 4–1.
Table 4–1  Oracle Web Services Manager Privileges for Supported Roles

<table>
<thead>
<tr>
<th>Privileges</th>
<th>Administrator</th>
<th>Deployer</th>
<th>Monitor</th>
<th>Operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read policies, assertion templates, and policy sets.</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Create, update, and delete policies and assertion templates.</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Note: None of the roles provide permission to update or delete the predefined policies and assertion templates, which are read-only. You must clone a predefined policy or assertion template before modifying it; and you can clone policies in the security and management categories only. For more information, see "Managing Web Service Policies with Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

| Create, update, and delete policy sets.            | Yes           | No       | No      | No       |
| Attach and detach OWSM policies.                   | Yes           | No       | No      | No       |
| Generate client policies.                          | Yes           | No       | No      | No       |
| Check compatibility of service policies and client policies. | Yes           | Yes      | Yes     | Yes      |

For more information about the above tasks, see Securing Web Services and Managing Policies with Oracle Web Services Manager.

For more information about users and roles in Fusion Middleware Control, see "Understanding Users and Roles for Fusion Middleware Control" in Administering Oracle Fusion Middleware.

4.1.2 Viewing Web Services Using Fusion Middleware Control

The following sections describe how to view web services on a server, and in an application deployment or application.

- Viewing the Web Services for a Server Using Fusion Middleware Control
- Viewing the Web Services in an Application Deployment Using Fusion Middleware Control
- Viewing the Web Services Summary Page for an Application
- Viewing the Summary Page for a Java EE Web Service
- Viewing the Web Services and References in a SOA Composite
- Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control

4.1.2.1 Viewing the Web Services for a Server Using Fusion Middleware Control

Follow the procedures below to view all of the currently deployed web services for a given server.

To view the web services for a server:

1. In the navigation pane, expand WebLogic Domain to show the domains.
2. Expand the domain name to see the list of servers.
3. Select the server for which you want to view all current web services.
4. In the content pane, select WebLogic Server and then Web Services. The Web Services server summary page displays, as shown in Figure 4–1.
You can view tabs for Java EE web services, Oracle Infrastructure web services, such as ADF, and RESTful services.

The tabs that are displayed depend on the web services deployed on that server.

**Figure 4–1 Web Services Summary Page for a Server**

4.1.2.2 Viewing the Web Services in an Application Deployment Using Fusion Middleware Control

Fusion Middleware Control allows you to view a summary of the currently deployed web services for a given application deployment. The summary appears on the Application Deployment home page.

**To view the web services in an application deployment:**

1. In the navigation pane, expand the Application Deployments folder to view the application deployments in the domain.

2. Select the application deployment.

The Web Services summary appears on the right side of the Domain Application Deployment page. For each service, the summary lists the name of the Web Service, the name of server it is running on, the name of the associated application running on the server, the name of the web service endpoint, and a link to a test page for the service.

**Note:** The Web Services summary does not include RESTful web services.

4.1.2.3 Viewing the Web Services Summary Page for an Application

Follow the procedure below to navigate to the page where you can see the list of web services for your application.

**To view the web services summary page for an application:**

1. In the navigation pane, expand the Application Deployments folder to expose the application deployments in the domain and select the domain application deployment target.

   The Domain Application Deployment home page is displayed in the content pane.

2. In the navigation pane, expand the selected application deployment (and any of its child nodes such as cluster application deployments, if applicable, to expose application deployments) and select the application deployment target.

   The Application Deployment home page is displayed in the content pane.
3. In the content pane, select **Application Deployment**, then **Web Services**.

The Web Services application summary page is displayed.

From the Web Services application summary page, you can do the following:

- View the web services in the application.
- View the web service configuration, endpoint status, policy faults, and more. (ADF applications only.)
- View and monitor web services faults, including Security, Reliable Messaging, MTOM, Management, and Service faults. (ADF applications only.)
- View and monitor Security violations, including authentication, authorization, message integrity, and message confidentiality violations. (ADF applications only.)
- Navigate to pages where you can configure your web services endpoints, including enabling and disabling the endpoint, and attaching policies to web services.

The Web Service Details table contains tabs where you can view more information about web services and ports, web service endpoints, RESTful services, and Java EE web service clients.

**Figure 4–2** shows the Web Services application summary page for an ADF application.

---

**Note:** The RESTful Services and Java EE Web Service Clients tabs are displayed only if there are RESTful services or Java EE Web Service client instances, respectively, in the application.
Figure 4–2  Web Services Summary Page for ADF Applications

Figure 4–3 shows the Web Services summary page for a Java EE application. The Web Services (Java EE) page displays information about the web services in this application, such as the numbers of web services, web service endpoints, web service clients and client ports, and the number of RESTful applications and resources.

Figure 4–3  Web Services Summary Page for Java EE Applications
4.1.2.4 Viewing the Summary Page for a Java EE Web Service

Follow this procedure to view summary information for a Java EE Web Service.

1. Navigate to the Web Services summary page for the Java EE application, as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.
2. In the Web Services tab, click the name of the web service for which you want to view summary information.

The Java EE Web Service summary page displays two tabs: Web Service Endpoints and Invocations. The Web Service Endpoints tab displays the endpoints associated with the web service. Invocation statistics are aggregated data for the Java EE web service. For more information on these statistics, see "Viewing Operation Statistics for a Web Service Endpoint" on page 6-7.

The Invocations tab provides statistics on the web service invocations, such as the invocation and response error count. For more information on these statistics, see "Viewing Statistics for a Java EE Web Service Operation" on page 6-8.

4.1.2.5 Viewing the Web Services and References in a SOA Composite

Use the following procedure to view the SOAP or RESTful web services, references, and components in a SOA composite application:

1. In the navigation pane, expand the SOA folder.
2. Expand soa-infra to view the SOA partitions, then expand the SOA partition (for example, the default partition) and select the target SOA composite application. The SOA composite home page displays.
3. Select the Dashboard tab if it is not already selected.

The Components section of this tab lists the SOA components being used in the composite application, and the Services and References section displays the web service and reference bindings.

4.1.2.6 Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control

In Fusion Middleware Control, the following sections describe the steps you follow to view the details for a web service endpoint:

- Viewing the Details for a SOA Composite Application
- Viewing the Details for an non-SOA Oracle Infrastructure Web Service Endpoint
- Viewing the Details for a Java EE Web Service Endpoint
- Viewing the Details for a Java EE Web Service Operation
- Viewing the Details for a RESTful Service Application
- Viewing the Details for a RESTful Resource

4.1.2.6.1 Viewing the Details for a SOA Composite Application

Follow this procedure to view the web service endpoint configuration for a SOA composite application.

1. Navigate to the home page for the SOA composite as described in "Viewing the Web Services and References in a SOA Composite" on page 4-6.
2. In the Services and References section of the page, click the name of the service or reference to display the Service Home or Reference Home page, as appropriate.
3. From the Service Home or Reference Home page, you can do the following:
   - Click the Dashboard tab, if it is not already selected, to see a graphic representation of the total incoming messages and faults since server startup, and recently rejected messages, including the message name, time of the fault, and the type of fault (business or system).
   - Click the Policies tab to view or change the policies attached to this endpoint.
   - Click the Properties tab to view and modify the configuration for this endpoint.
   
   **Note:** The Properties tab is not available for RESTful SOA component services.

   - Click the Adapter Reports tab to view and enable a list of diagnosability reports. This tab is only displayed for adapter endpoints.

For additional information about SOA composite endpoints, see "Administering Binding Components" in *Administering Oracle SOA Suite and Oracle Business Process Management Suite*.

### 4.1.2.6.2 Viewing the Details for an a non-SOA Oracle Infrastructure Web Service Endpoint

Follow this procedure to view the details for a non-SOA Oracle Infrastructure web service endpoint (such as ADF).

1. Navigate to the Web Services Application Summary page as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.

2. In the Web Service Details section of the page, click the Web Services tab and expand the web service to display the web service endpoints if they are not already displayed.

   Alternatively, click the Web Service Endpoints tab to view a list of web service endpoints.

3. Click the name of the endpoint to navigate to the Web Service Endpoint page.

4. From the Web Service Endpoint page, you can do the following:
   - Click the Operations tab to see the list of operations for this endpoint.
   - Click the WSM Policies tab to see the policies attached to this endpoint, if the endpoint has a valid configuration, and if it is secure.
   - Click the Charts tab to view a graphical view of the faults for this endpoint. There are two charts, one that shows the distribution of all faults, and a second that shows the distribution of only security faults. For more information, see "Viewing the Security Violations for a Web Service" on page 6-15.
   - Click the Configuration tab to configure properties for the web service endpoint. For more information, see "Configuring Web Services Using Fusion Middleware Control" on page 4-11.

As an alternative method of viewing the details for a web service endpoint, you can instead navigate to the Web Services Server Summary page, as described in "Viewing the Web Services for a Server Using Fusion Middleware Control" on page 4-2, which lists all of the web services, and click the name of the endpoint to navigate to the specific Web Service Endpoint page.
4.1.2.6.3 **Viewing the Details for a Java EE Web Service Endpoint**  Follow this procedure to view the details for a Java EE web service endpoint.

1. Navigate to the Web Services Summary page as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.

2. In the Web Service Details section of the page, click the **Web Services** tab and expand the web service to display the web service endpoints if they are not already displayed.

   Alternatively, click the **Web Service Endpoints** tab to view a list of web service endpoints.

3. Click the name of the endpoint to navigate to the Web Service Endpoint page.

4. From the Web Service Endpoint page, you can do the following:
   - Click the **Operations** tab to see the list of operations for this endpoint.
   - Click the **Invocations** tab to see the error, invocation, and response statistics associated with invoking the endpoint.
   - Click the **WSM Policies** tab to see the policies attached to this endpoint, if the endpoint has a valid configuration, and if it is secure.

**Note:** You can also view details about security violations for an endpoint. For more information, see "Viewing the Security Violations for a Web Service" on page 6-15.

As an alternative method of viewing the details for a web service endpoint, you can instead navigate to the server-wide Web Services Summary page, as described in "Viewing the Web Services for a Server Using Fusion Middleware Control" on page 4-2, which lists all of the web services, and click the name of the endpoint to navigate to the specific Web Service Endpoint page.

4.1.2.6.4 **Viewing the Details for a Java EE Web Service Operation**  Follow this procedure to view the operations belonging to a Java EE web service.

1. Navigate to the summary page for the Java EE web service as described in "Viewing the Summary Page for a Java EE Web Service" on page 4-6.

2. In the Web Services tab, select the name of the endpoint for which you want to view the details.

3. Click the **Operations** tab of the Web Service Endpoint page to display the operations associated with the endpoint.

4. Click the name of the operation to display more detailed information.

The Web Service Operation page displays information about the operation such as the endpoint URI, the names of the application, web service, and endpoint to which it is associated, and error, invocation, and response statistics.

For descriptions of the endpoint details and the statistics, see "Viewing Statistics for a Java EE Web Service Operation" on page 6-8.

4.1.2.6.5 **Viewing the Details for a RESTful Service Application**  Follow this procedure to view the details of a RESTful service application.

1. Navigate to the Web Services Application Summary page as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.
2. In the Web Service Details section of the page, click the RESTful Services tab.

3. Click the name of the RESTful application to navigate to the RESTful Service Application page.

4. From the RESTful Service Application page, you can do the following:
   - Click the RESTful Resources tab to view the list of resources associated with the RESTful service. For each resource, you can view its name, type, path, invocation count, and average execution time in milliseconds.
   - Click the WSM Policies tab to see the policies attached to this RESTful service, if the RESTful service has a valid configuration, and if it is secure.

4.1.2.6.6 Viewing the Details for a RESTful Resource

Follow this procedure to view the details of a RESTful resource.

1. Navigate to the Web Services Application Summary page as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.

2. In the Web Service Details section of the page, click the RESTful Services tab.

3. Click the name of the RESTful application to navigate to the RESTful Service Application page.

4. From the RESTful Service Application page, click the RESTful Resources tab to see the list of resources associated with the RESTful service.

5. Click the name of the RESTful resource for which you want to view more information.

   The RESTful Resource page displays information about the resource such as the application, module, and RESTful application name; the resource name, type, and path; the number of methods and suppressors locators; and statistics including invocation count and average execution time in milliseconds.

   The RESTful Methods tab displays the information about the resource methods, including the method name, return type, path, associated HTTP method, and media type produced. Statistics including invocation count, average execution time, and execution time totals are also displayed.

4.1.3 Viewing Web Service Clients Using Fusion Middleware Control

The steps you follow to view a web service client depend on the application type (SOA reference, ADF DC or asynchronous Callback client), as described in the following sections.

4.1.3.1 Viewing SOA References

Use the following procedure to view a SOA reference client:

1. In the navigation pane, expand the SOA folder.

2. Expand soa-infra, then expand the SOA partition (for example, the default partition) and select the target SOA composite application.

   The SOA composite home page displays.

3. Click the Dashboard tab, if it is not already selected.

4. In the Services and References portion of the page, select the SOA reference to view.

5. From the Reference Home page, you can do the following:
Click the Dashboard tab, if it is not already selected, to see a graphic representation of the total incoming messages and faults since server startup, and recently rejected messages, including the message name, time of the fault, and the type of fault (business or system).

Click the Policies tab to view or change the policies attached to this endpoint.

Click the Properties tab to view and modify the configuration for this endpoint.

Click the Adapter Reports tab to view and enable a list of diagnosability reports. This tab is only displayed for adapter endpoints.

For additional information about SOA composite endpoints, see "Administering Binding Components" in Administering Oracle SOA Suite and Oracle Business Process Management Suite.

4.1.3.2 Viewing Connection-Based Web Service Clients

Use the following procedure to view a connection-based web service client such as an ADF DC web service client or ADF JAX-WS Indirection Proxy:

1. In the navigation pane, expand the Application Deployments folder to expose the application deployments in the domain and select the domain application deployment target.

   The Domain Application Deployment home page is displayed in the content pane.

2. In the navigation pane, expand the selected application deployment (and any of its child nodes such as cluster application deployments, if applicable, to expose application deployments) and select the application deployment target.

   The Application Deployment home page is displayed in the content pane.

3. From the Application Deployment menu, select ADF, and then Configure ADF Connections.

4. On the ADF Connections Configuration page, select a connection from the Web Service Connections section of the page, and then select the endpoint from the Advanced Connection Configuration list.

5. In the Configure Web Service page, click the tabs to view the client data.

4.1.3.3 Viewing Java EE Web Service Clients

Use the following procedure to view Java EE web service clients:

1. In the navigation pane, expand the Application Deployments folder to expose the applications in the domain and select the domain application deployment target.

   The Domain Application Deployment home page is displayed in the content pane.

2. In the navigation pane, expand the selected application deployment (and any of its child nodes such as cluster application deployments, if applicable, to expose application deployments) and select the Java EE application deployment target.

   The Application Deployment home page is displayed in the content pane.

3. From the Application Deployment menu, select Web Services.

   The Web Services (Java EE) summary page is displayed.

4. Select the Java EE Web Service Clients tab to view the clients in the application.

   Use the Monitoring tab to view the run-time client instances in the application. For more information, see "Viewing Statistics for Java EE Web
Service Clients” on page 6-10.

- Use the **Configuration** tab to view the client ports and attach or detach policies. For more information, see “Attaching Policies Directly to Web Service Clients” in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

### 4.1.3.4 Viewing Asynchronous Web Service Callback Clients

Use the following procedure to view an asynchronous web service callback client. Callback clients are used only by asynchronous web services to return the response to the caller. For more information, see "Developing Asynchronous Web Services" in *Developing Oracle Infrastructure Web Services*.

1. Navigate to the endpoint for the asynchronous web service, as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click **Callback Client** in the upper right portion of the endpoint page.

### 4.1.4 Configuring Web Services Using Fusion Middleware Control

The following sections describe how to configure web services using Fusion Middleware Control.

- Configuring Addressing Using Fusion Middleware Control
- Configuring Asynchronous Web Services Using Fusion Middleware Control
- Changing the JMS System User for Asynchronous Web Services Using Fusion Middleware Control
- Configuring Reliable Messaging Using Fusion Middleware Control
- Configuring Atomic Transactions Using Fusion Middleware Control
- Configuring MTOM Using Fusion Middleware Control
- Configuring Fast Infoset Using Fusion Middleware Control
- Configuring SOAP Over JMS Transport Using Fusion Middleware Control
- Configuring Persistence Using Fusion Middleware Control
- Enabling or Disabling Web Services Using Fusion Middleware Control
- Enabling or Disabling Public Access to the Web Service WSDL Document Using Fusion Middleware Control
- Enabling or Disabling SOAP Processing Using Fusion Middleware Control
- Enabling or Disabling Non-SOAP XML Message Processing Using Fusion Middleware Control
- Setting the Log Level for Diagnostic Logs Using Fusion Middleware Control
- Enabling or Disabling the Web Services Test Client Using Fusion Middleware Control
- Enabling or Disabling the Exchange of Metadata Using Fusion Middleware Control
- Configuring MTOM-encoded Fault Messages Using Fusion Middleware Control
- Validating the Request Message Using Fusion Middleware Control
- Setting the Size of the Request Message Using Fusion Middleware Control
Enabling or Disabling Binary Content Caching Using Fusion Middleware Control

4.1.4.1 Configuring Addressing Using Fusion Middleware Control

Note: The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

To enable addressing using Fusion Middleware Control, attach the `oracle/wsaddr_policy` policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the addressing policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Attach the `oracle/no_addressing_policy` to disable an addressing policy configured at a higher scope.

For more information about the addressing policies, see "Addressing Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

4.1.4.2 Configuring Asynchronous Web Services Using Fusion Middleware Control

Note: The procedures described in this section apply to asynchronous non-SOA Oracle Infrastructure web services only.

When you invoke a web service synchronously, the invoking client application waits for the response to return before it can continue with its work. In cases where the response returns immediately, this method of invoking the web service might be adequate. However, because request processing can be delayed, it is often useful for the client application to continue its work and handle the response later on. By calling a web service asynchronously, the client can continue its processing, without interrupt, and will be notified when the asynchronous response is returned.

To configure asynchronous web services using Fusion Middleware Control, use one of the following methods:

- Attach the `oracle/async_web_service_policy` configuration policy to the web service, as described in "Attaching Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the asynchronous policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
Attach the oracle/no_async_web_service_policy to disable an asynchronous policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

Use the Configuration tab, as described below.

You can also configure asynchronous Callback client, as described in "Configuring Asynchronous Web Service Callback Clients" on page 4-33.

For information about developing asynchronous web services, see "Developing Asynchronous Web Services" in Developing Oracle Infrastructure Web Services.

To configure asynchronous web services using the Configuration tab:

1. Navigate to the Web Services Application Summary page.
2. In the Web Service Details section of the page, expand the web service to display the web service endpoints if they are not already displayed.
3. Click the name of the endpoint of the asynchronous web service to navigate to the Web Service Endpoint page.

For an asynchronous web service, the Asynchronous flag at the top of the page is set to True. Review the following flags, which provide more information about the asynchronous web service:

- Transaction Enabled for Request Queue—Flag that specifies whether transactions are enabled on the request queue.
- Using Response Queue—Flag that specifies whether a response queue is being used. If set to false, then the response is sent directly to the web service client, without being stored.
- Transaction Enabled for Response Queue—Flag that specifies whether transactions are enabled on the response queue.

These flags are configured at design time. For more information, see "Developing Asynchronous Web Services" in Developing Oracle Infrastructure Web Services.

4. From the Web Service Endpoint page, click the Configuration tab.
5. Under the Asynchronous Web Service section of the page, you can set the configuration properties defined in Table 4-2.

---

**Note:** The configuration properties defined in Table 4-2 appear and are valid only for asynchronous web services.

---

**Table 4–2 Configuration Properties for Asynchronous Web Services**

<table>
<thead>
<tr>
<th>Configuration Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JMS Request Queue Connection Factory Name</td>
<td>Name of the connection factory for the JMS request queue. The default JMS connection factory, weblogic.jms.XAConnectionFactory, provided with the base domain is used by default.</td>
</tr>
<tr>
<td>JMS Request Queue Name</td>
<td>Name of the request queue. The following queue is used by default: oracle.j2ee.ws.server.async.DefaultRequestQueue.</td>
</tr>
</tbody>
</table>
6. Click Apply.

4.1.4.3 Changing the JMS System User for Asynchronous Web Services Using Fusion Middleware Control

By default, the JMS System User is set as OracleSystemUser. For most users, this default value is sufficient.

To configure a custom user in your security realm using Fusion Middleware Control, use one of the following methods:

- Attach the oracle/async_web_service_policy configuration policy to the web service and override the jms.access.user configuration property, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the asynchronous policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Attach the oracle/no_async_web_service_policy to disable an asynchronous policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Use the Configuration tab, as described below.
To change the JMS System User using the Configuration tab:

1. Access the Configuration tab on the Web Service Endpoint page for the asynchronous web service as described in "Configuring Asynchronous Web Services Using Fusion Middleware Control" on page 4-12.

2. Enter the name of the custom user in the JMS System User field and click Apply.

   **Note:** The custom user must exist in the security realm and have the permissions required to access the JMS resources.

3. Access the WebLogic Server Administration Console. To do so from Fusion Middleware Control, select the domain in the navigation pane. From the WebLogic Domain menu, select WebLogic Server Administration Console.

4. Log into the WebLogic Server Administration Console using a valid username and password with the required administrative privileges.

5. Click Deployments in the Domain Structure pane and navigate to the corresponding service_AsynchronousRequestProcessorMDB or service_AsynchronousResponseProcessorMDB MDBs. In these MDB names, service is the name of the asynchronous service for which you are changing the user name.

6. In the Change Center, select Lock & Edit.

7. Select the MDB name for the request or response MDB. (You will need to update the user name for both the request and response MDBs.) In the Settings page, select the Configuration tab.

8. In the Enterprise Bean Configuration section of the page, enter the custom user name in the Run As Principal Name field and click Save.

   Note that the user name you enter in this field must match the user name you entered for the JMS System User in Fusion Middleware Control.

   The configuration changes need to be saved in a new deployment plan.

9. Use the Save Deployment Plan Assistant to save the new deployment plan.

10. Repeat steps 7 and 8 for the second MDB. The changes are automatically saved to the new deployment plan.

11. In the Change Center, click Activate Changes.

12. Redeploy the application. For more information, see Chapter 3, "Deploying Web Service Applications."

4.1.4.4 Configuring Reliable Messaging Using Fusion Middleware Control

   **Note:** The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

To enable web services reliable messaging using Fusion Middleware Control, attach the oracle/reliable_messaging_policy policy to the web service, as described in "Attaching Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the reliable messaging policy, perform one of the following steps:
4.1.4.5 Configuring Atomic Transactions Using Fusion Middleware Control

Note: The procedures described in this section:
- Apply to Oracle Infrastructure web services only.
- Do not apply to RESTful SOA component services.

Web services support the WS-Coordination and WS-AtomicTransaction (WS-AT) specifications. Therefore, you can configure web services atomic transactions to enable interoperability between Oracle WebLogic Server and other vendor’s transaction processing systems, such as WebSphere, Microsoft .NET, and so on.

To configure web services atomic transactions policy using Fusion Middleware Control, use one of the following methods:
- Use the Configuration or Properties tab, as described below.

Note: Configuration using the Properties tab is the only option available for SOA composites; the configuration policy, described below, is not available for SOA composites.

- Attach the oracle/atomic_transaction_policy policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the atomic transactions policy, perform one of the following steps:
- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Attach the oracle/no_atomic_transaction_policy to disable an atomic transaction policy configured at a higher scope.

For more information about the atomic transaction policies, see "Atomic Transaction Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
To configure atomic transactions for a web service using the Configuration or Properties tab:

1. Navigate to the Web Service Endpoint page, or the Service Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click the Configuration tab.

For SOA composites (SOAP only), click the Properties tab.

3. In the Atomic Transaction Version field, select the version of the web service atomic transaction coordination context that is supported. The value specified must be consistent across the entire transaction. Valid values are:

- WSAT10
- WSAT11
- WSAT12
- Default

If you select Default, all three versions are accepted.

---

**Note:** This property works with SOA web services that have synchronous-only operations and with web services that have both synchronous and asynchronous operations. It does not work with SOA web services with asynchronous-only operations.

---

4. In the Atomic Transaction Flow Option field, select whether the transaction coordination context is to be passed with the transaction flow into the web service. Valid values include:

- Never—Do not export transaction coordination context. This is the default.
- Supports—Export transaction coordination context if transaction is available.
- Mandatory—Export transaction coordination context. An exception is thrown if there is no active transaction.

5. Click Apply.

4.1.4.6 Configuring MTOM Using Fusion Middleware Control

---

**Note:** The procedures described in this section apply to Oracle Infrastructure web services only.

---

To enable MTOM using Fusion Middleware Control, attach the oracle/wsmtom_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the MTOM policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
4.1.4.7 Configuring Fast Infoset Using Fusion Middleware Control

Note: The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

To enable Fast Infoset using Fusion Middleware Control, attach the oracle/fast_infoset_service_policy policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the Fast Infoset policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Attach the oracle/no_fast_infoset_service_policy to disable a Fast Infoset policy configured at a higher scope.

For more information about the Fast Infoset policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

4.1.4.8 Configuring Persistence Using Fusion Middleware Control

Note: The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

To enable persistence using Fusion Middleware Control, attach the oracle/persistence_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the persistence policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
Attach the `oracle/no_persistence_policy` to disable a persistence policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

4.1.4.9 Configuring SOAP Over JMS Transport Using Fusion Middleware Control

**Note:** The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

Typically, web services and clients communicate using SOAP over HTTP/S as the connection protocol. You can, however, configure a web service so that client applications use JMS as the transport.

Using SOAP over JMS transport, web services and clients communicate using JMS destinations instead of HTTP connections, offering the following benefits:

- Reliability
- Scalability
- Quality of service

As with web service reliable messaging, if WebLogic Server goes down while the method invocation is still in the queue, it will be handled as soon as WebLogic Server is restarted. When a client invokes a web service, the client does not wait for a response, and the execution of the client can continue. Using SOAP over JMS transport does require slightly more overhead and programming complexity than HTTP/S.

You can enable and configure SOAP over JMS transport at design time using the `@JMSTransportService` annotation, as described in "Security and Policy Annotation Reference" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To configure SOAP over JMS transport policy using Fusion Middleware Control, use one of the following methods:

- Attach the `oracle/jms_transport_service_policy` policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the JMS transport policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Attach the `oracle/no_jms_transport_service_policy` to disable a SOAP over JMS transport policy configured at a higher scope.

For more information about the SOAP over JMS transport policies, see "SOAP Over JMS Transport Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Use the Configuration tab, as described below.

Note: The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.
To configure SOAP over JMS transport using the Configuration tab:

1. Navigate to the Web Service Endpoint page, or the Service Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

   When SOAP over JMS transport is enabled, the SOAP over JMS transport configuration properties are displayed in the summary area. The configuration properties are read-only.

2. Click the Configuration tab.

3. In the SOAP Over JMS Enable HTTP WSDL Access field, select True from the menu to enable WSDL access or select False to disable WSDL access.

4. Click Apply.

4.1.4.10 Enabling or Disabling Web Services Using Fusion Middleware Control

---

**Note:** The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

---

To enable or disable web services using Fusion Middleware Control, use one of the following methods:

- Attach the oracle/request_processing_service_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the web service request processing policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Attach the oracle/no_request_processing_policy to disable a web service request processing policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Use the Configuration tab, as described below.

To enable or disable a web service endpoint using the Configuration tab:

1. Navigate to the Web Services Application Summary page.

2. In the Web Service Details section of the page, expand the web service to display the web service endpoints if they are not already displayed.

3. Click the name of the endpoint to navigate to the Web Service Endpoint page.

4. From the Web Service Endpoint page, click the Configuration tab.

5. In the Endpoint Enabled field, select Enabled or Disabled from the menu to enable or disable the web service, respectively.
6. Click Apply.

### 4.1.4.11 Enabling or Disabling Public Access to the Web Service WSDL Document Using Fusion Middleware Control

**Note:** The procedures described in this section:
- Apply to Oracle Infrastructure web services only.
- Do not apply to RESTful SOA component services.

To enable public access to the web service WSDL document using Fusion Middleware Control, use one of the following methods:
- Use the Configuration or Properties tab, as described below.

**Note:** Configuration using the Properties tab is the only option available for SOA composites; the configuration policy, described below, is not available for SOA composites.

- Attach the `oracle/wsdl_request_processing_service_policy` configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

To disable the WSDL access policy, perform one of the following steps:
- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.
- Attach the `oracle/no_wsdl_request_processing_service_policy` to disable a WSDL access policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

**To enable or disable the display of the web service WSDL document using the Configuration or Properties tab:**

1. Navigate to the Web Service Endpoint page, or the Service Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.
2. Click the **Configuration** tab.
   - For SOA composites (SOAP only), click the **Properties** tab.
3. From the WSDL Enabled field, select **True** from the menu to enable the display of the WSDL or **False** to disable the display of the WSDL.
4. Click **Apply**.
4.1.4.12 Enabling or Disabling SOAP Processing Using Fusion Middleware Control

Note: The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

To enable the processing of SOAP requests on the web service endpoint using Fusion Middleware Control, attach the oracle/soap_request_processing_service_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the SOAP processing policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Attach the oracle/no_request_processing_service_policy to disable a SOAP processing policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

4.1.4.13 Enabling or Disabling Non-SOAP XML Message Processing Using Fusion Middleware Control

Note: The procedures described in this section:

- Apply to Oracle Infrastructure web services only.
- Do not apply to RESTful SOA component services.

To enable an endpoint to receive non-SOAP XML messages that are processed by a user-defined javax.xml.ws.Provider<T>.invoke method using Fusion Middleware Control, use one of the following methods:

- Use the Configuration or Properties tab, as described below.

Note: Configuration using the Properties tab is the only option available for SOA composites; the configuration policy, described below, is not available for SOA composites.

- Attach the oracle/pox_http_binding_service_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the non-SOAP XML message processing policy, perform one of the following steps:
– Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

– Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

– Attach the oracle/no_pox_http_binding_service_policy to disable a non-SOAP XML message processing policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To enable non-SOAP XML message processing using the Configuration or Properties tab:

1. Navigate to the Web Service Endpoint page, or the Service Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click the Configuration tab.

   For SOA composites (SOAP only), click the Properties tab.

3. In the RESTful Enabled field, select True from the menu to enable the feature, or select False to disable the feature.

4. Click Apply.

4.1.4.14 Setting the Log Level for Diagnostic Logs Using Fusion Middleware Control

Note: The procedures described in this section:

  ■ Apply to Oracle Infrastructure web services only.
  ■ Do not apply to RESTful SOA component services.

To set the log level for diagnostic logs using Fusion Middleware Control, use one of the following methods:

■ Use the Configuration or Properties tab, as described below.

Note: Configuration using the Properties tab is the only option available for SOA composites; the configuration policy, described below, is not available for SOA composites.

■ Attach the oracle/ws_logging_level_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the logging level policy, perform one of the following steps:

– Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Attach the oracle/no_ws_logging_level_service_policy to disable a logging level policy configured at a higher scope.

For more information about the configuration policies, see “Configuration Policies” in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To set the logging level for diagnostic logs using the Configuration or Properties tab:

1. Navigate to the Web Service Endpoint page, or the Services Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click the Configuration tab.

   For SOA composites (SOAP only), click the Properties tab.

3. In the Logging Level field, select the logging level.

4. Click Apply.

4.1.4.15 Enabling or Disabling the Web Services Test Client Using Fusion Middleware Control

You can enable or disable the Web Service Test Client at the domain or web service endpoint level using Fusion Middleware Control, as described in the following sections:

- "Enabling or Disabling the Web Services Test Client at the Domain Level Using Fusion Middleware Control" on page 4-24

- "Enabling or Disabling the Web Service Test Client at the Web Service Endpoint Level Using Fusion Middleware Control" on page 4-25

For more information about the Web Services Test Client, see "Using the Web Services Test Client" on page 5-1.

Note: The procedures described in this section do not impact the availability of the Web Services Test link on the Web Service Endpoint page, which enables you to access the Fusion Middleware Control Test Web Service page. For more information, see "Using the Test Web Service Page in Fusion Middleware Control" on page 5-12.

4.1.4.15.1 Enabling or Disabling the Web Services Test Client at the Domain Level Using Fusion Middleware Control

To enable or disable the Web Services Test Client at the domain level using Fusion Middleware Control:

1. Select WebLogic Domain > Administration > General Settings.

2. Click Advanced to display the advanced settings.

3. Toggle the Enable Web Service Test Page flag to enable or disable the Web Services Test Client at the domain level.

4. Click Save.

5. Restart the WebLogic domain.
4.1.4.15.2 Enabling or Disabling the Web Service Test Client at the Web Service Endpoint Level Using Fusion Middleware Control

Note: The procedures described in this section:

- Apply to Oracle Infrastructure web services only.
- Do not apply to RESTful SOA component services.

To enable the Web Services Test Client using Fusion Middleware Control, use one of the following methods:

- Use the Configuration or Properties tab, as described below.

  Note: Configuration using the Properties tab is the only option available for SOA composites (SOAP only); the configuration policy, described below, is not available for SOA composites.

- Attach the oracle/test_page_processing_service_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the Web Services Test Client policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Attach the oracle/no_ws_logging_level_service_policy to disable a Web Services Test Client policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To enable the Web Service Test Client using the Configuration or Properties tab:

1. Navigate to the Web Service Endpoint page or the Services Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click the Configuration tab.

   For SOA composites (SOAP only), click the Properties tab.

3. In the Endpoint Test Enabled field, select True from the menu to enable the test endpoint or False to disable the test endpoint.

4. Click Apply.

Note: The procedures described in this section:

- Apply to Oracle Infrastructure web services only.
- Do not apply to RESTful SOA component services.
4.1.4.16 Enabling or Disabling the Exchange of Metadata Using Fusion Middleware Control

**Note:** The procedures described in this section:
- Apply to Oracle Infrastructure web services only.
- Do not apply to RESTful SOA component services.

To enable the exchange of metadata using Fusion Middleware Control, use one of the following methods:

- Use the Configuration or Properties tab, as described below.

**Note:** Configuration using the Properties tab is the only option available for SOA composites (SOAP only); the configuration policy, described below, is not available for SOA composites.

- Attach the `oracle/mex_request_processing_service_policy` configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

To disable the metadata exchange policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

- Attach the `oracle/no_mex_request_processing_service_policy` to disable a metadata exchange policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

**To enable or disable the exchange of metadata using the Configuration or Properties tab:**

1. Navigate to the Web Service Endpoint page, or the Services Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click the Configuration tab.

   For SOA composites (SOAP only), click the Properties tab.

3. In the Metadata Exchange Enabled field, select True from the menu to enable the exchange of metadata or False to disable the exchange of metadata.

4. Click Apply.
4.1.4.17 Configuring MTOM-encoded Fault Messages Using Fusion Middleware Control

**Note:** The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

To enable MTOM-encoded fault messages when MTOM is enabled using Fusion Middleware Control, attach the `oracle/mtom_encode_fault_service_policy` configuration policy to the web service, as described in “Attaching Policies to Web Services and Clients Using Fusion Middleware Control” in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

To disable the MTOM-encoded fault processing policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.
- Attach the `oracle/no_mtom_encode_fault_service_policy` to disable an MTOM-encoded fault processing policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

4.1.4.18 Validating the Request Message Using Fusion Middleware Control

**Note:** The procedures described in this section:

- Apply to Oracle Infrastructure web services only.
- Do not apply to RESTful SOA component services.

To validate the request message against the schema using Fusion Middleware Control, use one of the following methods:

- Use the Configuration or Properties tab, as described below.

**Note:** Configuration using the Properties tab is the only option available for SOA composites (SOAP only); the configuration policy, described below, is not available for SOA composites.

- Attach the `oracle/schema_validation_policy` configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

To disable the schema validation policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*. 
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

- Attach the `oracle/no_schema_validation_policy` to disable a schema validation policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

**To enable or disable schema validation using the Configuration or Properties tab:**

1. Navigate to the Web Service Endpoint page, or the Services Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click the **Configuration** tab.

   For SOA composites (SOAP only), click the **Properties** tab.

3. In the Schema validation field, select **True** from the menu to enable schema validation or **False** to disable schema validation.

4. Click **Apply**.

**4.1.4.19 Setting the Size of the Request Message Using Fusion Middleware Control**

---

**Note:** The procedures described in this section:

- Apply to Oracle Infrastructure web services only.

- Do not apply to RESTful SOA component services.

---

To set the maximum size of the request message using Fusion Middleware Control, use one of the following methods:

- Use the Configuration or Properties tab, as described below.

---

**Note:** Configuration using the Properties tab is the only option available for SOA composites (SOAP only); the configuration policy, described below, is not available for SOA composites.

---

- Attach the `oracle/max_request_size_policy` configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

To disable the maximum request size policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.
– Attach the oracle/no_max_request_size_policy to disable a maximum request size policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To set the size of the request message using the Configuration or Properties tab:

1. Navigate to the Web Service Endpoint page, or the Services Home page (for SOA composites), as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click the Configuration tab.

   For SOA composites (SOAP only), click the Properties tab.

3. Set the Maximum Request Size and the Unit of Maximum Request Size.

   -1 sets no limit to the size of the message. Or, you can set a maximum limit to the message by entering a number in the text box and selecting the unit of measurement.

   **Note:** If you set the Maximum Request Size to -1, indicating that there is no maximum request size, then the Unit of Maximum Request Size setting is irrelevant and defaults to bytes.

4. Click Apply.

4.1.4.20 Enabling or Disabling Binary Content Caching Using Fusion Middleware Control

   **Note:** The procedures described in this section apply to non-SOA Oracle Infrastructure web services only.

To enable binary content caching using Fusion Middleware Control, attach the oracle/cache_binary_content_policy configuration policy to the web service, as described in "Attaching Policies to Web Services and Clients Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the binary caching content policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see “Enabling and Disabling Directly Attached Policies Using Fusion Middleware Control” in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Attach the oracle/no_cache_binary_content_policy to disable a binary caching content policy configured at a higher scope.

For more information about the configuration policies, see "Configuration Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
4.1.5 Configuring Web Service Clients Using Fusion Middleware Control

**Note:** The procedures described in this section apply to Oracle Infrastructure web service clients only.

For the web service clients in your application, including SOA references, ADF data control, and asynchronous web service Callback clients, you can set the configuration properties defined in Table 4–3.

<table>
<thead>
<tr>
<th>Configuration Property</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| UDDI ServiceKey        | oracle.soa.uddi.serviceKey           | Specifies the service key of the Oracle Service Registry (OSR) if UDDI is used for runtime resolution of the endpoint.  
 For more information, see “Changing the Endpoint Reference and Service Key for Oracle Service Registry Integration” in Administering Oracle SOA Suite and Oracle Business Process Management Suite.  
 **Note:** This property is available for SOAP SOA reference clients only. |
| Endpoint Address        | javax.xml.ws.service.endpoint.address | Endpoint URL to which the client will send the request.  
 **Note:** This property is not available for asynchronous web service Callback clients. |
| WS Addressing Reply To  | oracle.webservices.wsaddressing.reply To | Specifies a callback URL for the ADF Web Services Data Control/Web Services Connection client. The value is used in the WS-addressing replyTo header in the outgoing message.  
 **Note:** This property is not available for RESTful SOA reference clients. |
| Maintain Session       | javax.xml.ws.session.maintain        | Flag that specifies whether the session should be maintained.  
 **Note:** This property is not available for asynchronous web service Callback clients or RESTful SOA reference clients. |
**Table 4–3 (Cont.) Configuration Properties for Web Service Clients**

<table>
<thead>
<tr>
<th>Configuration Property</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atomic Transaction Version</td>
<td>wsat.Version</td>
<td>Specifies the version of the SOA web service atomic transaction context used for outbound messages only. The value specified must be consistent across the entire transaction. Valid values are <strong>WSAT10</strong>, <strong>WSAT11</strong>, <strong>WSAT12</strong>, and <strong>Default</strong>. Note that if the flow option is set to <strong>WSDL Driven</strong>, you cannot specify a version. The version advertised in the WSDL is used. If the flow option is set to <strong>Supports</strong> or <strong>Mandatory</strong> and you specify the <strong>Default</strong> option, then WSAT10 is used. <strong>Note:</strong> In WLST, the valid values must be specified as &quot;WSAT10&quot;, &quot;WSAT11&quot;, &quot;WSAT12&quot;, and &quot;DEFAULT&quot;. Use of an invalid value results in an error message. <strong>Note:</strong> This property is applicable for SOAP SOA reference clients only.</td>
</tr>
</tbody>
</table>
| Atomic Transaction Flow Option | wsat.flowOption      | Specifies whether the transaction coordination context is passed with the transaction flow. Valid values on the SOA reference client are:  
  - **Never** (default) – Do not export transaction coordination context.  
  - **Supports** – Export transaction coordination context if transaction is available.  
  - **Mandatory** – Export transaction coordination context. An exception is thrown if there is no active transaction.  
  - **WSDL Driven** – Use the value set in the WSDL. **Note:** In WLST, the valid values must be specified as "NEVER", "SUPPORTS", "MANDATORY", and "WSDLDriven". Use of an invalid value results in an error message. **Note:** This property is applicable for SOAP SOA reference clients only. |

**HTTP Chunking**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stop Chunking</td>
<td>oracle.webservices.donotChunk</td>
</tr>
<tr>
<td>Chunking Size (bytes)</td>
<td>oracle.webservices.chunkSize</td>
</tr>
</tbody>
</table>

HTTP Timeout
The following procedures describe how to configure SOA reference, ADF DC and asynchronous web service callback clients using Fusion Middleware Control.

### 4.1.5.1 Configuring SOA References

The following procedure describes how to configure a SOA reference.

1. View the SOA reference, as described in "Viewing SOA References" on page 4-9.
2. Click the Properties tab.
3. Set the property values as required. Refer to Table 4–3.

4. Click Apply.

4.1.5.2 Configuring Connection-based Web Service Clients

The following procedure describes how to configure a connection-based web service client such as an ADF DC web service client or ADF JAX-WS Indirection Proxy.

1. View the connection-based web service client as described in "Viewing Connection-Based Web Service Clients" on page 4-10.

2. Click the Configuration tab.

3. Set the configuration values as required. Refer to Table 4–3.

4. Click Apply.

4.1.5.3 Configuring Asynchronous Web Service Callback Clients

The following procedure describes how to configure an asynchronous web service Callback client. Callback clients are used only by asynchronous web services to return the response to the caller. For more information, see "Developing Asynchronous Web Services" in Developing Oracle Infrastructure Web Services.

To configure an asynchronous web service callback client:

1. Navigate to the endpoint for the asynchronous web service, as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6.

2. Click Callback Client in the upper right portion of the endpoint page.

3. Click the Configuration tab.

4. Set the configuration values as required. Refer to Table 4–3.

5. Click Apply.

4.1.6 Managing the WSDL Using Fusion Middleware Control

In some cases, you might not want the web service WSDL to be accessible to the public. You can enable or disable public access to the WSDL from the Web Service Endpoint page.

Note: In some cases, a web service client needs to access a WSDL during invocation. If public access to the WSDL is disabled, the client will need to have a local copy of the WSDL.

4.1.6.1 Viewing the Web Service WSDL Document

Follow the procedure below to display the WSDL document for a web service.

To display the WSDL document for a web service:

1. Navigate to the Web Services Application Summary page.

2. In the Web Service Details section of the page, expand the web service to display the web service endpoints if they are not already displayed.

3. Click the name of the endpoint to navigate to the Web Service Endpoint page.
4. In the WSDL Document field, click the endpoint name to display the WSDL for the web service.

4.1.6.2 Enabling or Disabling Public Access to the Web Service WSDL Document
To enable or disable the display of the web service WSDL document:

- Using Fusion Middleware Control, see "Enabling or Disabling Public Access to the Web Service WSDL Document Using Fusion Middleware Control" on page 4-21.
- Using WLST, see "Enabling or Disabling Public Access to the Web Service WSDL Document Using WLST" on page 4-53.

4.2 Administering Web Services Using WLST
The following sections describe how to perform common web services administration tasks using WLST.

- Viewing the Web Services in a Domain Using WLST
- Viewing the Web Services in Your Application Using WLST
- Viewing the Details for a Web Service Endpoint Using WLST
- Viewing Web Service Clients Using WLST
- Configuring Web Services Using WLST
- Configuring Web Service Clients Using WLST

4.2.1 Viewing the Web Services in a Domain Using WLST
To view all the current web services in a domain:

1. Connect to the running instance of WebLogic Server for which you want to view the web services as described in "Accessing the Web Services Custom WLST Commands" on page 2-2.

2. Use either the `listWebServices()` or the `listWSMPolicySubjects()` WLST command to display a list of the web services. If you do not specify a web service application or a SOA composite, the command lists all services in all applications and composites for every server instance in the domain.

This is an example of the `listWebServices()` command:

```
wls:/base_domain/serverConfig> listWebServices()
```

```
/base_domain/AdminServer/jaxwsejb30ws :
    moduleName=jaxwsejb, moduleType=web,
    serviceName=JaxwsWithHandlerChainBeanService
/moduleName=jaxwsejb, moduleType=web, serviceName=Wsd1ConcreteService
/moduleName=jaxwsejb, moduleType=web, serviceName=EchoEJBService
/moduleName=jaxwsejb, moduleType=web, serviceName=DoclitWrapperWTJService
/moduleName=jaxwsejb, moduleType=web,
   serviceName=DoclitWrapperWTJService

/base_domain/AdminServer/webservicesJwsSimple :
    moduleName=webservicesJwsSimple!SimpleImplService, moduleType=wls,
    serviceName=examples.webservices.jws_basic.simple.SimpleImpl

/base_domain/AdminServer/CalWSBA :
    moduleName=CalWSBA#1!CalculatorService, moduleType=wls,
    serviceName=CalculatorService
```
This is an example of the \texttt{listWSMPolicySubjects()} command:

\begin{verbatim}
Application: /weblogic/base_domain/SimpleRestApp

Assembly: #SimpleRestApp

Subject:
WS-Service({http://rest.jaxws.ws.j2ee.oracle/}SimpleRestServiceService#SimpleRestServicePort)

Application: /weblogic/base_domain/jaxwsejb30ws

Assembly: #jaxwsejb

Subject:
WS-Service({http://host.example.com/targetNamespace}EchoEJBService#EchoEJBServicePort)

Subject:
WS-Service({http://host.example.com/jaxws/tests/concrete}Wsd1ConcreteService#Wsd1ConcretePort)

Subject:
WS-Service({http://host.example.com/jaxws/tests}CalculatorService#CalculatorPort)

Subject:
WS-Service({http://soapinterop.org/DoclitWrapperWTJ}DoclitWrapperWTJService#DoclitWrapperWTJPort)

Subject:
WS-Service({http://j2ee.tests.ejb.impl/}JaxwsWithHandlerChainBeanService#JaxwsWithHandlerChainBeanPort)

Application: /weblogic/base_domain/em

Assembly: #default

Subject:
WS-Client({http://host.example.com/jaxws/tests}CalculatorService#CalculatorPort)
\end{verbatim}

3. Set the \texttt{detail} argument of the \texttt{listWSMPolicySubjects} or \texttt{listWebServices} command to \texttt{true} to view the endpoint (port) and policy details for all applications and composites in the domain, the secure status of the endpoints, any configuration overrides and constraints, and if the endpoints have a valid
configuration. Because you can specify the priority of a global or directly attached policy (using the reference.priority configuration override), the effective field indicates if directly attached policies are in effect for the endpoint.

---

**Note:** To simplify endpoint management, all directly attached policies are shown in the output regardless of whether they are in effect for the endpoint. In contrast, only globally attached policies that are in effect for the endpoint are displayed.

---

An endpoint is considered secure if the policies attached to it (either directly or externally) enforce authentication, authorization, or message protection behaviors.

---

**Note:** The listWebServices command output does not include details on SOA components, including policy attachments.

---

```bash
wls:/base_domain/serverConfig> listWebServices(detail='true')
/weblogic/base_domain/jaxwsejb30ws :
   moduleName=jaxwsejb, moduleType=web,
   serviceName=JaxwsWithHandlerChainBeanService
   JaxwsWithHandlerChainBeanPort
http://host.example.com:17001/jaxwsejb/JaxwsWithHandlerChainIntf
   URI="oracle/mex_request_processing_service_policy",
   category=wsconfig, policy-status=enabled; source=local policy set;
   reference-status=enabled; effective=true
   Property name="local.policy.reference.source",
   value="IMPLIED_FEATURE"
   URI="oracle/mtom_encode_fault_service_policy",
   category=wsconfig, policy-status=enabled; source=local policy set;

Property name="local.policy.reference.source", value="IMPLIED_FEATURE"

The policy subject is not secure in this context.

For more information about the listWSMPolicySubjects and listWebServices commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.2 Viewing the Web Services in Your Application Using WLST

To view the web services in your application:

1. Connect to the running instance of WebLogic Server to which the application is deployed as described in "Accessing the Web Services Custom WLST Commands"
on page 2-2.

2. Use the listWebServices WLST command to display a list of the web services in your application. You must specify the complete application path name to identify the application and the server instance to which it is deployed.

```
listWebServices (application,composite,[detail]
```

For example:

```
wls:/wls-domain/serverConfig>listWebServices("wls-domain/AdminServer/jaxwsejb30ws")
/wls-domain/AdminServer/jaxwsejb30ws:

moduleName=jaxwsejb,moduleType=web,serviceName={http://namespace/}JaxwsWithHandlerChainBeanService
moduleName=jaxwsejb,moduleType=web,serviceName={http://namespace/}WsdlConcreteService
moduleName=jaxwsejb,moduleType=web,serviceName={http://namespace/}EchoEJBService
moduleName=jaxwsejb,moduleType=web,serviceName={http://namespace/}CalculatorService
moduleName=jaxwsejb,moduleType=web,serviceName={http://namespace/}DoclitWrapperWTJService
```

For details about the listWebServices command, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.3 Viewing the Details for a Web Service Endpoint Using WLST

To view the details for a web service endpoint (port):

1. Connect to the running instance of WebLogic Server to which the application is deployed as described in "Accessing the Web Services Custom WLST Commands" on page 2-2.

2. Use the listWebServices WLST command to display a list of the web services in your application as described in "Viewing the Web Services in Your Application Using WLST" on page 4-39.

3. Use the listWebServicePorts command to display the endpoint name and endpoint URL for a web service.

```
listWebServicePorts (application,moduleOrCompName,moduleType,serviceName)
```

For example, to display the endpoint for the WsdlConcreteService:

```
wls:/wls-domain/serverConfig> listWebServicePorts ('jaxwsejb30ws','jaxwsejb','web','WsdlConcreteService')
WsdlConcretePort   http://host.example.com:7001/jaxwsejb/WsdlAbstract
```

4. Use the listWebServicePolicies command to view the policies that are attached to a web service endpoint.

```
listWebServicePolicies (application,moduleOrCompName,moduleType,serviceName,subjectName)
```

For example, to view the policies attached to the WsdlConcretePort endpoint and any policy override settings:

```
wls:/wls_domain/serverConfig> listWebServicePolicies ("jaxwsejb30ws", "jaxwsejb", "web", "WsdlConcreteService", "WsdlConcretePort")
```
Wsd1ConcretePort:
  URI="oracle/mex_request_processing_service_policy",
category=wsconfig, policy-status=enabled; source=local policy set;
  reference-status=enabled; effective=true
  URI="oracle/mtom_encode_fault_service_policy",
category=wsconfig, policy-status=enabled; source=local policy set;
  reference-status=enabled; effective=true
  URI="oracle/max_request_size_policy", category=wsconfig,
policy-status=enabled; source=local policy set; reference-status=enabled;
  effective=true
    Property name="max.request.size", value="-1"
  URI="oracle/request_processing_service_policy",
category=wsconfig, policy-status=enabled; source=local policy set;
  reference-status=enabled; effective=true
  URI="oracle/soap_request_processing_service_policy",
category=wsconfig, policy-status=enabled; source=local policy set;
  reference-status=enabled; effective=true
  URI="oracle/ws_logging_level_policy", category=wsconfig,
policy-status=enabled; source=local policy set; reference-status=enabled;
  effective=true
    Property name="logging.level", value=""
  URI="oracle/test_page_processing_service_policy",
category=wsconfig, policy-status=enabled; source=local policy set;
  reference-status=enabled; effective=true
  URI="oracle/wsdl_request_processing_service_policy",
category=wsconfig, policy-status=enabled; source=local policy set;
  reference-status=enabled; effective=true
  URI="oracle/wss_saml_or_username_token_over_ssl_service_
policy", category=security, policy-status=enabled; source=global policy set
  "test_PS", scope="DOMAIN('')"; reference-status=enabled; effective=true

The policy subject is secure in this context.

For more information about these WLST commands and their arguments, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.4 Viewing Web Service Clients Using WLST

Use the following procedure to view the web service clients using WLST commands:

1. Connect to the running instance of WebLogic Server to which the application is deployed as described in "Accessing the Web Services Custom WLST Commands" on page 2-2.

2. Use the `listWebServiceClients` WLST command to display a list of the web service clients.

   `listWebServiceClients(application,composite,[detail])`

This command enables you to list the clients for an application, a SOA composite, or a domain. To list the client information for an application or SOA composite, specify the appropriate argument. If you do not specify an application or SOA composite, the command outputs information, including the module name, module type, and SOA reference name for all the web service clients in all applications and composites in every server instance in the domain. To view details about each client, including the endpoint and policies, set the `detail` argument to `true`. 
For example:

```
wlst:/soainfra/serverConfig> listWebServiceClients(detail='true')
```

```
/soainfra soa_server1/soa-infra :
    compositeName=default/SampleSOAFirstPrj[1.0], moduleType=soa,
    serviceRefName=ReferenceToSecondSOA
        BPELProcess1.pt  serviceWSDLURI=
            http://localhost:8001/soa-infra/services/default/
            SampleSOASecondPrj/BPELProcess1.wsdl
        oracle.webservices.contentTransferEncoding=base64
        oracle.webservices.charsetEncoding=UTF-8
        oracle.webservices.operationStyleProperty=document
        oracle.webservices.soapVersion=soap1.1
        oracle.webservices.chunkSize=4096
        oracle.webservices.preemptiveBasicAuth=false
        oracle.webservices.session.maintain=false
        oracle.webservices.encodingStyleProperty=
            http://schemas.xmlsoap.org/soap/encoding/
        oracle.webservices.donotChunk=true
    No attached policies found; endpoint is not secure.
```

```
/soainfra/AdminServer/ADFDCDecoupling_Project1_ADFDCDecoupling-1 :
    moduleName=testadfbc, moduleType=wsconn,
    serviceRefName=AppModuleService
        AppModuleServiceSoapHttpPort
        serviceWSDLURI=http://adc1140275.example.com:7001/ADFBCDecoupling-ADFBCDecoupling-context-root/AppModuleService?wsdl
          URI="oracle/wss10_saml_token_with_message_protection_client_policy", category=security, policy-status=enabled; source=local policy set; reference-status=enabled; effective=true
    The policy subject is secure in this context.
```

Note that the output displays SOA references (using the `serviceRefName` argument) for the SOA composites `default/SampleSOAFirstPrj[1.0]`. To list the SOA references for a SOA composite, specify the composite name in the command, for example

```
listWebServiceClients(None,'default/SampleSOAFirstPrj[1.0]')
```

ADF clients are specified by the `moduleType=wsconn` argument in the output.

For more information about the WLST commands and their arguments, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

### 4.2.5 Configuring Web Services Using WLST

**Note:** The procedures described in this section apply to non-SOA Oracle Infrastructure web services and providers only.

Oracle Infrastructure web service providers implement the `java.xml.ws.Provider` interface. On the Web Service Endpoint page, they display the Implementation Class and provide a subset of configuration properties.
You configure the web service endpoint using WLST by attaching one of the configuration policies defined in "Configuration Policies" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

The following sections describe how to perform common web services configuration tasks using WLST.

- Configuring Addressing Using WLST
- Configuring Asynchronous Web Services Using WLST
- Configuring the JMS System User for Asynchronous Web Services Using WLST
- Configuring Reliable Messaging Using WLST
- Configuring Atomic Transactions Using WLST
- Configuring MTOM Using WLST
- Configuring Fast Infoset Using WLST
- Configuring SOAP Over JMS Transport Using WLST
- Configuring Persistence Using WLST
- Enabling or Disabling Web Services Using WLST
- Enabling or Disabling Public Access to the Web Service WSDL Document Using WLST
- Enabling or Disabling the Processing of SOAP Requests Using WLST
- Enabling or Disabling Non-SOAP XML Message Processing Using WLST
- Setting the Log Level for Diagnostic Logs Using WLST
- Enabling or Disabling the Web Services Test Client Using WLST
- Enabling or Disabling MTOM-encoded SOAP Fault Messages Using WLST
- Validating the Request Message Using WLST
- Setting the Maximum Size of the Request Message Using WLST
- Configuring Binary Caching of Content

4.2.5.1 Configuring Addressing Using WLST

To configure web services addressing using WLST:

1. Attach the oracle/wsaddr_policy policy using the `attachWSMPolicy` command.
   For complete details, see "Attaching Policies Directly Using WLST" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.
   
   For example:
   ```
   Policy reference *oracle/wsaddr_policy* added.
   ```

   ```
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/wsaddr_policy")
   ```

2. Configure the policy using the `setWSMPolicyOverride` command. For a list of configuration properties that you can override, see "oracle/wsaddr_policy" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.
   
   ```
   wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/wsaddr_policy','reference.priority','10')
   ```

   The configuration override property "reference.priority" having value "10" has
been added to the reference to policy with URI "oracle/wsaddr_policy".

For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3. Commit the session using the commitWSMSession command, for example:

```
wls:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|jaxwsejb|WS-Service{http://ejb.oracle.com/targetNamespace }EchoEJBService#EchoEJBServicePort" was saved successfully.

To disable the addressing policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- To disable an addressing policy configured at a higher scope, attach the oracle/no_addressing_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_addressing_policy")
```

Policy reference "oracle/no_addressing_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.2 Configuring Asynchronous Web Services Using WLST

To configure asynchronous web services:

1. Attach the oracle/async_web_service_policy policy using the attachWSMPolicy command. For complete details, see “Attaching Policies Directly Using WLST” in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/async_web_service_policy")
```

Policy reference "oracle/async_web_service_policy" added.

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/async_web_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/async_web_service_policy','jms.queue','myDefaultRequestQueue')
```

The configuration override property "jms.queue" having value "myDefaultRequestQueue" has been added to the reference to policy with URI
"oracle/async_web_service_policy".

3. Commit the session using the commitWSMSession command, for example:

   wls:/wls_domain/serverConfig> commitWSMSession()

   The policy set for subject '/weblogic/base_domain/jaxws#jaxws|WS-Service(http://ejb.oracle.com/targetNamespace/EchoEJBService#EchoEJBServicePort)' was saved successfully.

To disable the asynchronous policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- To disable an asynchronous policy configured at a higher scope, attach the oracle/no_async_web_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_async_web_service_policy")

   Policy reference "oracle/no_async_web_service_policy" added.

   For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.3 Configuring the JMS System User for Asynchronous Web Services Using WLST

To configure the JMS system user for asynchronous web services:

1. Attach the oracle/async_web_service_policy policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/async_web_service_policy")

   Policy reference "oracle/async_web_service_policy" added.

2. Configure the jms.access.user policy configuration property using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/async_web_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/async_web_service_policy','jms.access.user','OracleSystemUser')

   The configuration override property 'jms.access.user' having value 'OracleSystemUser' has been added to the reference to policy with URI 'oracle/async_web_service_policy'.

   For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.
3. Commit the session using the commitWSMSession command, for example:

```
   wls:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|#jaxwsejb|WS-Service({http://ejb.oracle.com/targetNamespace}EchoEJBService#EchoEJBServicePort)" was saved successfully.

To disable the asynchronous policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable an asynchronous policy configured at a higher scope, attach the oracle/no_async_web_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_async_web_service_policy")
```

Policy reference "oracle/no_async_web_service_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.4 Configuring Reliable Messaging Using WLST

To configure web services reliable messaging using WLST:

1. Attach the oracle/reliable_messaging_policy policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/reliable_messaging_policy")
```

Policy reference "oracle/reliable_messaging_policy" added.

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/reliable_messaging_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```
   wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/reliable_messaging_policy','acknowledgement.interval','P0DT01S')
```

The configuration override property "acknowledgement.interval" having value "P0DT01S" has been added to the reference to policy with URI "oracle/reliable_messaging_policy".

3. Commit the session using the commitWSMSession command, for example:
The policy set for subject '/weblogic/base_domain/jaxwejb30ws|#jaxwejb|WS-Service(http://ejb.oracle.com/targetNamespace )EchoEJBService#EchoEJBServicePort)' was saved successfully.

To disable the web service reliable messaging policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a reliable messaging policy configured at a higher scope, attach the oracle/no_reliable_messaging_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_reliable_messaging_policy")
Policy reference "oracle/no_reliable_messaging_policy" added.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

### 4.2.5.5 Configuring Atomic Transactions Using WLST

To configure web services atomic transactions:

1. Attach the oracle/atomic_transaction_policy policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/atomic_transaction_policy")
Policy reference "oracle/atomic_transaction_policy" added.
```

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/atomic_transaction_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/atomic_transaction_policy','version','WSAT11')
The configuration override property 'version' having value 'WSAT11' has been added to the reference to policy with URI 'oracle/atomic_transaction_policy'.
```

3. Commit the session using the commitWSMSession command, for example:

   ```
wls:/wls_domain/serverConfig> commitWSMSession()
```

To configure web services atomic transactions:

1. Attach the oracle/atomic_transaction_policy policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/atomic_transaction_policy")
Policy reference "oracle/atomic_transaction_policy" added.
```

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/atomic_transaction_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/atomic_transaction_policy','version','WSAT11')
The configuration override property 'version' having value 'WSAT11' has been added to the reference to policy with URI 'oracle/atomic_transaction_policy'.
```

3. Commit the session using the commitWSMSession command, for example:

   ```
wls:/wls_domain/serverConfig> commitWSMSession()
```
The policy set for subject "/weblogic/base_domain/jaxwsejb30ws#/jaxwsejb|WS-Service(http://ejb.oracle.com/targetNamespace)EchoEJBService#EchoEJBServicePort" was saved successfully.

To disable the web service atomic transaction policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable an atomic transaction policy configured at a higher scope, attach the oracle/no_atomic_transaction_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_atomic_transaction_policy")
```

Policy reference "oracle/no_atomic_transaction_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

### 4.2.5.6 Configuring MTOM Using WLST

To configure MTOM on the web service using WLST:

1. Attach the oracle/wsmtom_policy to the web service using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/wsmtom_policy")
```

   Policy reference "oracle/wsmtom_policy" added.

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/wsmtom_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/wsmtom_policy','reference.priority','10')
```

   The configuration override property "reference.priority" having value "10" has been added to the reference to policy with URI "oracle/wsmtom_policy".

   For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3. Commit the session using the commitWSMSession command, for example:

   ```
wls:/wls_domain/serverConfig> commitWSMSession()
```

   The policy set for subject "/weblogic/base_
domain/jaxws/WS-Service(#{http://ejb.oracle.com/targetNamespace EJBService#EJBServicePort})' was saved successfully.

To disable the web service atomic transaction policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable an MTOM policy configured at a higher scope, attach the oracle/no_mtom_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_mtom_policy")
Policy reference "oracle/no_mtom_policy" added.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

### 4.2.5.7 Configuring Fast Infoset Using WLST

To configure Fast Infoset on the web service or client using WLST:

1. Attach the oracle/fastinfoset_service_policy or oracle/fastinfoset_client_policy policy to the web service or client, respectively, using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/fast_infoset_service_policy")
Policy reference "oracle/fast_infoset_service_policy" added.
```

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/fastinfoset_service_policy" and "oracle/fastinfoset_client_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/fast_infoset_client_policy','fast.infoset.content.negotiation','OPTIMISTIC')
The configuration override property "fast.infoset.content.negotiation" having value "OPTIMISTIC" has been added to the reference to policy with URI "oracle/fast_infoset_client_policy".
```

3. Commit the session using the commitWSMSession command, for example:

   ```
wls:/wls_domain/serverConfig> commitWSMSession()
The policy set for subject '/weblogic/base_domain/jaxws/WS-Service(#{http://ejb.oracle.com/targetNamespace EJBService#EJBServicePort})' was saved successfully.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.
To disable the web service Fast Infoset policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a Fast Infoset policy configured at a higher scope, attach the oracle/no_fast_infoset_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wlst:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_fast_infoset_service_policy")
Policy reference "oracle/no_fast_infoset_service_policy" added.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

### 4.2.5.8 Configuring SOAP Over JMS Transport Using WLST

To configure SOAP over JMS transport on the web service or client using WLST:

1. Attach the oracle/jms_transport_service_policy or oracle/jms_transport_client_policy policy to the web service or client, respectively, using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wlst:/wls_domain/serverConfig> attachWSMPolicy("oracle/jms_transport_service_policy")
Policy reference "oracle/jms_transport_service_policy" added.
```

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/jms_transport_service_policy" and "oracle/jms_transport_client_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/jms_transport_service_policy','jndi.connection.factory.name','com.oracle.webservices.jms.ConnectionFactory')
```

The configuration override property "jndi.connection.factory.name" having value "com.oracle.webservices.jms.ConnectionFactory" has been added to the reference to policy with URI "oracle/jms_transport_service_policy".

3. Commit the session using the commitWSMSession command, for example:

```
wls:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject "/weblogic/base_
domain/jaxwsejb30ws|#jaxwsejb|WS-Service{(http://ejb.oracle.com/targetNamespace )EchoEJBService#EchoEJBServicePort}' was saved successfully.

To disable the SOAP over JMS transport policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- To disable a SOAP over JMS transport policy configured at a higher scope, attach the oracle/no_jms_transport_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

  For example:

  ```
  wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_jms_transport_service_policy")
  Policy reference "oracle/no_jms_transport_service_policy" added.
  ```

  For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.9 Configuring Persistence Using WLST

To configure the persistence using WLST:

1. Attach the oracle/persistence_policy to the web service using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/persistence_policy")
   Policy reference "oracle/persistence_policy" added.
   ```

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/persistence_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```
   wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/persistence_policy','providerName', 'oracle:jrf:Coherence')
   The configuration override property 'persistence_policy' having value "oracle:jrf:Coherence" has been added to the reference to policy with URI 'oracle/persistence_policy'.
   ```

   **Note:** For Java SE clients, you can configure oracle:jrf:Coherence only.

   ```
   wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/persistence_policy','providerName', 'oracle:jrf:Coherence')
   ```

3. Commit the session using the commitWSMSession command, for example:

   ```
   wls:/wls_domain/serverConfig> commitWSMSession()
   ```
The policy set for subject "/weblogic/base_domain/jaxwsejb30ws#/jaxwsejb|WS-Service{http://ejb.oracle.com/targetNamespace }EchoEJBService#EchoEJBServicePort)" was saved successfully.

To disable the persistence policy, perform one of the following steps:

■ Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

■ Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

■ To disable a persistence policy configured at a higher scope, attach the oracle/no_persistent_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_persistent_policy")
Policy reference "oracle/no_persistent_policy" added.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.10 Enabling or Disabling Web Services Using WLST

When a web service application is deployed, the web service endpoint is enabled by default if no errors are encountered. If there are errors, the web service application is deployed, but the web service endpoint is not enabled.

You may need to temporarily make a web service unavailable by disabling the web service. For example, you may need to correct an invalid policy reference. When you disable a web service, requests to the web service will fail. To disable a web service, you must make the endpoint on which the web service receives requests unavailable.

To enable a web service endpoint using WLST:

1. Attach the oracle/request_processing_service_policy policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/request_processing_service_policy")
   Policy reference "oracle/request_processing_service_policy" added.
   ```

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/request_processing_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```
   wls:/wls_domain/serverConfig> setWSMPolicyOverride("oracle/request_processing_service_policy", "reference.priority", "10")
   ```
For more information about overriding the `reference.priority` configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To disable the web service access policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a web service access policy configured at a higher scope, attach the `oracle/no_pox_http_binding_service_policy` using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_request_processing_service_policy")
```

Policy reference "oracle/no_request_processing_service_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.11 Enabling or Disabling Public Access to the Web Service WSDL Document Using WLST

To enable public access to the web service WSDL document using WLST:

1. Attach the `oracle/wsdl_request_processing_service_policy` to the web service using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/wsdl_request_processing_service_policy")
```

Policy reference "oracle/wsdl_request_processing_service_policy" added.

2. Configure the policy using the `setWSMPolicyOverride` command. For a list of configuration properties that you can override, see "oracle/wsdl_request_processing_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/wsdl_request_processing_service_policy','reference.priority','10')
```

The configuration override property "reference.priority" having value "10" has been added to the reference to policy with URI "oracle/wsdl_request_processing_service_policy".

For more information about overriding the `reference.priority` configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
3. Commit the session using the `commitWSMSession` command, for example:

   `wls:/wls_domain/serverConfig> commitWSMSession()`

   The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|jaxwsejb|WS-Service([http://ejb.oracle.com/targetNamespace ]EchoEJBService#EchoEJBServicePort)" was saved successfully.

   To disable the WSDL access policy, perform one of the following steps:

   - Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
   - Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
   - To disable a WSDL access policy configured at a higher scope, attach the `oracle/no_wsdl_request_processing_service_policy` using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   `wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_wsdl_request_processing_service_policy")`

   Policy reference "oracle/no_wsdl_request_processing_service_policy" added.

   For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.12 Enabling or Disabling the Processing of SOAP Requests Using WLST

To enable the processing of SOAP requests using WLST:

1. Attach the `oracle/soap_request_processing_service_policy` to the web service using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   `wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/soap_request_processing_service_policy")`

   Policy reference "oracle/soap_request_processing_service_policy" added.

2. Configure the policy using the `setWSMPolicyOverride` command. For a list of configuration properties that you can override, see "oracle/soap_request_processing_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   `wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/soap_request_processing_service_policy','reference.priority', '10')`

   The configuration override property "reference.priority" having value "10" has been added to the reference to policy with URI "oracle/soap_request_processing_service_policy".
For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3. Commit the session using the commitWSMSession command, for example:

```
wls:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|#jaxwsejb|WS-Service({http://ejb.oracle.com/targetNamespace }EchoEJBService#EchoEJBServicePort)" was saved successfully.

To disable the SOAP request processing policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a SOAP request processing policy configured at a higher scope, attach the oracle/no_wsd1_request_processing_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_soap_request_processing_service_policy")
Policy reference "oracle/no_soap_request_processing_service_policy" added.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.13 Enabling or Disabling Non-SOAP XML Message Processing Using WLST

To enable an endpoint to receive non-SOAP XML messages that are processed by a user defined javax.xml.ws.Provider<T>.invoke method using WLST:

1. Attach the oracle/pox_http_binding_service_policy to the web service using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/pox_http_binding_service_policy")
Policy reference "oracle/pox_http_binding_service_policy" added.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/pox_http_binding_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/pox_http_binding_service_policy','reference.priority','10')
```

Administering Web Services Using WLST
The configuration override property "reference.priority" having value "10" has been added to the reference to policy with URI "oracle/pox_http_binding_service_policy".

For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3. Commit the session using the commitWSMSession command, for example:

```java
wls:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|jaxwsejb|WS-Service{http://ejb.oracle.com/targetNamespaceEchoEJBService#EchoEJBServicePort}" was saved successfully.

To disable the non-SOAP XML message policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a non-SOAP XML message policy configured at a higher scope, attach the oracle/no_pox_http_binding_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```java
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_pox_http_binding_service_policy")
Policy reference "oracle/no_pox_http_binding_service_policy" added.
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.14 Setting the Log Level for Diagnostic Logs Using WLST

To set the logging level for diagnostic logs for the web service endpoint using WLST:

1. Attach the oracle/ws_logging_level_policy to the web service using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```java
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/ws_logging_level_policy")
Policy reference "oracle/ws_logging_level_policy" added.
```

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/ws_logging_level_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```java
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/ws_logging_level_policy','logging.level', 'INFO')
```
The configuration override property 'logging.level' having value 'INFO' has been added to the reference to policy with URI 'oracle/ws_logging_level_policy'.

3. Commit the session using the commitWSMSession command, for example:

```plaintext
wls:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject '/weblogic/base_domain/jaxwsejb30ws|jaxwsejb|WS-Service(http://ejb.oracle.com/targetNamespace,EchoEJBService,EchoEJBServicePort)' was saved successfully.

To disable the log level policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- To disable a log level policy configured at a higher scope, attach the oracle/no_ws_logging_level_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

  For example:

  ```plaintext
  wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_ws_logging_level_policy")
  ```

  Policy reference "oracle/no_ws_logging_level_policy" added.

  For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.15 Enabling or Disabling the Web Services Test Client Using WLST

You can enable or disable the Web Services Test Client, as described in "Using the Web Services Test Client" on page 5-1, at the domain or web service endpoint level:

- "Enabling or Disabling the Web Services Test Client at the Domain Level Using WLST" on page 4-57

- "Enabling or Disabling the Web Services Test Client at the Web Service Endpoint Level Using WLST" on page 4-58

---

**Note:** The procedures described in this section do not impact the availability of the Web Services Test link on the Web Service Endpoint page, which enables you to access the Fusion Middleware Control Test Web Service page. For more information, see "Using the Test Web Service Page in Fusion Middleware Control" on page 5-12.

---

4.2.5.15.1 Enabling or Disabling the Web Services Test Client at the Domain Level Using WLST

To enable or disable the web services Test Client at the domain level, use set the WebServiceTestEnable property for the domain to true to enable the test client and to false to disable it.
For example, to enable the Web Services Test Client at the domain level using WLST:

```
For example, to enable the Web Services Test Client at the domain level using WLST:

wls:/wls-domain/serverConfig> edit()
Location changed to edit tree. This is a writable tree with
DomainMBean as the root. To make changes you will need to start
an edit session via StartEdit().

For more help, use help('edit')

wls:/mydomain/edit> startEdit()
Starting an edit session ...
Started edit session, please be sure to save and activate
your changes once you are done.

wls:/mydomain/edit> cd('WebserviceTestpage')

wls:/mydomain/edit/WebserviceTestpage !> cd('new_domain')

wls:/mydomain/edit/WebserviceTestpage/new_domain !> set('Enabled','true')

wls:/mydomain/edit/WebserviceTestpage/new_domain !> save()

Saving all your changes ...
Saved all your changes successfully.

wls:/mydomain/edit/WebserviceTestpage/new_domain !> activate()

Activating all your changes, this may take awhile ...
The edit lock associated with the edit session is released
once the activation is complete.
Activation completed

wls:/mydomain/edit/WebserviceTestpage/new_domain !>
```

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

### 4.2.5.15.2 Enabling or Disabling the Web Services Test Client at the Web Service Endpoint Level Using WLST

To enable the web services test client at the web service endpoint level using WLST:

1. **Attach the oracle/test_page_processing_service_policy to the web service using the attachWSMPolicy command.** For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/test_page_processing_service_policy")
   Policy reference "oracle/test_page_processing_service_policy" added.
   ```

2. **Configure the policy using the setWSMPolicyOverride command.** For a list of configuration properties that you can override, see "oracle/test_page_processing_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```
   wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/test_page_processing_service_policy','reference.priority','10')
   ```

   The configuration override property "reference.priority" having value "10" has been added to the reference to policy with URI "oracle/test_page_processing_service_policy".

   For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
3. Commit the session using the `commitWSMSession` command, for example:

   ```bash
   wls:/wls_domain/serverConfig> commitWSMSession()
   ```

   The policy set for subject "/weblogic/base_domain/jaxwsejb30wa|#jaxwejb|WS-Service(http://ejb.oracle.com/targetNamespace
   )EchoEJBService#EchoEJBServicePort" was saved successfully.

   To disable the Web Services Test Client policy, perform one of the following steps:
   - Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
   - Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
   - To disable a Web Services Test Client policy configured at a higher scope, attach the `oracle/no_ws_logging_level_policy` using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```bash
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_test_page_processing_service_policy")
   ```

   Policy reference "oracle/no_test_page_processing_service_policy" added.

   For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.16 Enabling or Disabling the Exchange of Metadata Using WLST

To enable the exchange of web service metadata using WLST:

1. Attach the `oracle/mex_request_processing_service_policy` to the web service using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```bash
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/mex_request_processing_service_policy")
   ```

   Policy reference "oracle/mex_request_processing_service_policy" added.

2. Configure the policy using the `setWSMPolicyOverride` command. For a list of configuration properties that you can override, see "oracle/mex_request_processing_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   ```bash
   wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/mex_request_processing_service_policy','reference.priority','10')
   ```

   The configuration override property "reference.priority" having value "10" has been added to the reference to policy with URI "oracle/mex_request_processing_service_policy".
For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3. Commit the session using the commitWSMSession command, for example:

```
localhost:admin:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject "/weblogic/base_domain/jaxws10ws#jaxws10ws|WS-Service|{http://ejb.oracle.com/targetNamespace}EchoEJBService#EchoEJBServicePort" was saved successfully.

To disable the metadata exchange policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a metadata exchange policy configured at a higher scope, attach the oracle/no_mex_request_processing_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
localhost:admin:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_mex_request_processing_service_policy")
```

Policy reference "oracle/no_mex_request_processing_service_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.17 Enabling or Disabling MTOM-encoded SOAP Fault Messages Using WLST

To enable the creation of MTOM-encoded SOAP fault messages when MTOM is enabled using WLST:

1. Attach the oracle/mtom_encode_fault_service_policy to the web service using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
localhost:admin:/wls_domain/serverConfig> attachWSMPolicy("oracle/mtom_encode_fault_service_policy")
```

Policy reference "oracle/mtom_encode_fault_service_policy" added.

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/mtom_encode_fault_service_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```
localhost:admin:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/mtom_encode_fault_service_policy','reference.priority','10')
```

The configuration override property "reference.priority" having value "10" has...
been added to the reference to policy with URI "oracle/mtom_encode_fault_service_policy".

For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3. Commit the session using the commitWSMSession command, for example:

   wls:/wls_domain/serverConfig> commitWSMSession()

   The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|#jaxwsejb|WS-Service({http://ejb.oracle.com/targetNamespace }EchoEJBService#EchoEJBServicePort)" was saved successfully.

   To disable the MTOM-encoded fault message policy, perform one of the following steps:
   - Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
   - Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
   - To disable an MTOM-encoded fault message policy configured at a higher scope, attach the oracle/no_mtom_encode_fault_service_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_mtom_encode_fault_service_policy")

   Policy reference "oracle/no_mtom_encode_fault_service_policy" added.

   For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.18 Validating the Request Message Using WLST

To enable the validation of request messages using WLST:

1. Attach the oracle/schema_validation_policy to the web service using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/schema_validation_policy")

   Policy reference "oracle/schema_validation_policy" added.

   For a list of configuration properties that you can override, see "oracle/schema_validation_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/schema_validation_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
Administering Web Services Using WLST

```
setWSMPolicyOverride('oracle/schema_validation_policy','reference.priority', '10')
```

The configuration override property "reference.priority" having value "10" has been added to the reference to policy with URI "oracle/schema_validation_policy".

For more information about overriding the reference.priority configuration property, see "Specifying the Priority of a Policy Attachment" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

3. Commit the session using the `commitWSMSession` command, for example:

```
commitWSMSession()
```

The policy set for subject "/weblogic/base_domain/jaxwsejb30ws#jaxwsejb|WS-Service({http://ejb.oracle.com/targetNamespace )EchoEJBService#EchoEJBServicePort}" was saved successfully.

To disable the schema validation policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a schema validation policy configured at a higher scope, attach the `oracle/no_schema_validation_policy` using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
attachWSMPolicy("oracle/no_schema_validation_policy")
```

Policy reference "oracle/no_schema_validation_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.5.19 Setting the Maximum Size of the Request Message Using WLST

To set the maximum size of the request message using WLST:

1. Attach the `oracle/max_request_size_policy` to the web service using the `attachWSMPolicy` command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```
attachWSMPolicy("oracle/max_request_size_policy")
```

Policy reference "oracle/max_request_size_policy" added.

2. Configure the policy using the `setWSMPolicyOverride` command. For a list of configuration properties that you can override, see "oracle/max_request_size_
policy” in Securing Web Services and Managing Policies with Oracle Web Services Manager.

```java
wls:/wls_domain/serverConfig> setWSMPolicyOverride('oracle/max_request_size_policy','max.request.size', '-1')
```

The configuration override property "max.request.size" having value "-1" has been added to the reference to policy with URI "oracle/max_request_size_policy".

3. Commit the session using the commitWSMSession command, for example:

```java
wls:/wls_domain/serverConfig> commitWSMSession()
```

The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|#jaxwsejb|WS-Service(http://ejb.oracle.com/targetNamespace com/o methodologies/echo)EchoEJBService#EchoEJBServicePort" was saved successfully.

To disable the maximum request size policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
- To disable a maximum request size policy configured at a higher scope, attach the oracle/no_max_request_size_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For example:

```java
wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_max_request_size_policy")
```

Policy reference "oracle/no_max_request_size_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

### 4.2.5.20 Configuring Binary Caching of Content

To enable and configure the binary caching of content using WLST:

1. Attach the oracle/cache_binary_content_policy to the web service using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   ```java
   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/cache_binary_content_policy")
   ```

   Policy reference "oracle/cache_binary_content_policy" added.

2. Configure the policy using the setWSMPolicyOverride command. For a list of configuration properties that you can override, see "oracle/cache_binary_content_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
The configuration override property "mode" having value "com.oracle.webservices.api.CacheBinaryContentMode.BINARY" has been added to the reference to policy with URI "oracle/cache_binary_content_policy".

3. Commit the session using the commitWSMSession command, for example:

   wls:/wls_domain/serverConfig> commitWSMSession()

   The policy set for subject "/weblogic/base_domain/jaxwsejb30ws|3|WS-Service(http://ejb.oracle.com/targetNamespace|3|EchoEJBService#EchoEJBServicePort)" was saved successfully.

To disable the binary content caching policy, perform one of the following steps:

- Detach the policy. For more information, see "Detaching Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Disable the policy. For more information, see "Enabling and Disabling Directly Attached Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- To disable a binary content caching policy configured at a higher scope, attach the oracle/no_cache_binary_content_policy using the attachWSMPolicy command. For complete details, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

   For example:

   wls:/wls_domain/serverConfig> attachWSMPolicy("oracle/no_cache_binary_content_policy")

   Policy reference "oracle/no_cache_binary_content_policy" added.

For more information about the WLST commands, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.

4.2.6 Configuring Web Service Clients Using WLST

Use the following procedure to configure the web service client endpoint (port) using WLST:

1. Connect to the running instance of WebLogic Server to which the application is deployed as described in "Accessing the Web Services Custom WLST Commands" on page 2-2.

2. Use the listWebServiceClients WLST command to display a list of the web service clients in your application as described in "Viewing Web Service Clients Using WLST" on page 4-41.

3. Use the listWebServiceClientPorts command to display the endpoint name and endpoint URL for a web service client.

   listWebServiceClientPorts(application,moduleOrModuleName,moduleType,serviceReference)

   For example, to display the endpoint for the service reference client:

   wls:/wls-domain/serverConfig> listWebServiceClientPorts('/base_
4. Use the listWebServiceClientStubProperties command to view the configuration details for a web service client endpoint.

```
listWebServiceClientStubProperties(application, moduleOrCompName, moduleType, serviceRefName, portInfoName)
```

For example, to view the configuration details for the `HelloWorld_pt`:

```
wls:/wls-domain/serverConfig> listWebServiceClientStubProperties('/base_domain/AdminServer/application1#V2.0', 'test1', 'wsconn', 'client', 'HelloWorld_pt')
```

- `keystore.recipient.alias=A1`
- `saml.issuer.name=B1`
- `user.roles.include=C1`

Alternatively, you can set the detail argument to `true` in the listWebServiceClients command to view the configuration details for the endpoint as shown in "Viewing Web Service Clients Using WLST" on page 4-41.

5. Do one of the following:

- Use the setWebServiceClientStubProperty command to set or change a single stub property of a web service client endpoint. Specify the property to be set or changed using the propName and propValue arguments. To remove a property, specify a blank value for the propValue argument.

```
setWebServiceClientStubProperty(application, moduleOrCompName, moduleType, serviceRefName, portInfoName, propName, [propValue])
```

For example, to change the `keystore.recipient.alias` to `oracle` for the `HelloWorld_pt`, use the following command:

```
wls:/wls-domain/serverConfig> setWebServiceClientStubProperty('/base_domain/AdminServer/application1#V2.0', 'test1', 'wsconn', 'client', 'HelloWorld_pt', 'keystore.recipient.alias', 'oracle')
```

- Use the setWebServiceClientStubProperties command to configure the set of properties of a web service client endpoint. Specify the properties to be set or changed using the properties argument.

```
setWebServiceClientStubProperties(application, moduleOrCompName, moduleType, serviceRefName, portInfoName, properties)
```

This command configures or resets all of the stub properties for the OWSM client security policy attached to the client. Each property that you list in the command is set to the value you specify. If a property that was previously set is not explicitly specified in this command, it is reset to the default for the property. If no default exists, the property is removed.

For example, to configure atomic transactions for the `TaskReference_pt` SOA reference endpoint of the `default/SimpleRef[1.0]` SOA composite application, use the following command:

```
wls:soainfra/serverConfig> setWebServiceClientStubProperties('soa-infra', 'default/SimpleRef[1.0]',
```
'soa', 'client', 'TaskReference_pt', ["wsat.flowOption","SUPPORTS"),
("wsat.Version", "DEFAULT")]

To verify that the reference is properly configured, enter the following command:

wls:soainfra/serverConfig> listWebServiceClients(None, None, true)

/soinfra/soa_server1/soa-infra:
   compositeName=default/SimpleRef[1.0], moduleType=soa,
   serviceRefName=client
   TaskReference_pt
   wsat.version=DEFAULT
   wsat.flowOption=SUPPORTS

For more information about the client properties that you can set, see Table 4–3, "Configuration Properties for Web Service Clients". When specifying these properties, use the format shown in the Property Name column.

You can also set the properties described in "Overview of Policy Configuration Overrides" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

For more information about these WLST commands and their arguments, see "Web Services Custom WLST Commands" in WLST Command Reference for Infrastructure Components.
This chapter describes how to test basic and advanced features of your web service. The features you can test include security, quality of service (QoS), HTTP header options, and so on. You can also perform stress testing of the security features.

This chapter includes the following sections:

- **Overview of Web Services Testing**
- **Using the Web Services Test Client**
- **Using the Test Web Service Page in Fusion Middleware Control**

### 5.1 Overview of Web Services Testing

After you have deployed a web service to WebLogic Server, you can use one of the following tools to test your web service:

- Web Services Test Client, as described in "Using the Web Services Test Client" on page 5-1.
- Fusion Middleware Control Test Web Service Page, as described in "Using the Test Web Service Page in Fusion Middleware Control" on page 5-12.

### 5.2 Using the Web Services Test Client

Using the Web Services Test Client, you can:

- Test basic functionality to ensure that the web service was deployed and is operating as expected.
- Test basic authentication security.
- Test advanced features, such as web services addressing, atomic transactions, SOAP Message Transmission Optimization Mechanism (MTOM), Fast Infoset, and Oracle Web Service Manager (OWSM) security policies.

---

**Note:** For web services that use SOAP over Java Messaging Service (JMS) transport as the connection protocol, you can test only basic features.

---

- View the WSDL for the web service and the imported schemas, if applicable.
- Export and import test cases.
- Configure Java keystores (JKS) for use in testing security.
Configure and use HTTP proxy settings, as required by your environment.

The following sections describe how to use the Web Services Test Client:

- "Invoking the Web Services Test Client" on page 5-2
- "Selecting the Web Service to Test" on page 5-3
- "Testing Web Service Operations" on page 5-4
- "Configuring Basic Test Settings" on page 5-4
- "Testing Advanced Web Service Features and Security" on page 5-5
- "Viewing the WSDL and Imported Schemas" on page 5-9
- "Configuring the Web Services Test Client" on page 5-9
- "Editing the Input Arguments as XML Source" on page 5-10
- "Viewing the History" on page 5-10
- "Exporting and Importing Test Cases" on page 5-10
- "Enabling and Disabling the Web Services Test Client" on page 5-11

5.2.1 Invoking the Web Services Test Client

You can invoke the Web Services Test Client from any browser, using the web service endpoint, or using the Administration Console, as described in the following sections:

- "Invoking the Web Services Test Client From a Browser" on page 5-2
- "Invoking the Web Services Test Client Using the Web Service Endpoint" on page 5-3
- "Invoking the Web Services Test Client Using the Administration Console" on page 5-3

---

**Note:** When you first invoke the Web Services Test Client, there will be a brief delay while the application deploys.

To test web services that use SOAP over JMS transport as the connection protocol, the test page must be invoked from the server on which the web service is deployed.

---

5.2.1.1 Invoking the Web Services Test Client From a Browser

You can invoke the Web Services Test Client from any browser by entering the following URL:

http://host:port/ws_utc

where:

- **host** refers to the computer on which WebLogic Server is running.
- **port** refers to the port number on which WebLogic Server is listening (default value is 7001).

When prompted, enter the login credentials for the Web Services Test Client.

The Web Services Test Client home page is invoked. To select the web service WSDL, see "Selecting the Web Service to Test" on page 5-3.
5.2.1.2 Invoking the Web Services Test Client Using the Web Service Endpoint
You can invoke the Web Services Test Client by navigating to the web service endpoint.

- For an Oracle Infrastructure web service, when you navigate to the web service endpoint, the Web Services Test Client is invoked with the web service WSDL selected.
- For JAX-WS and JAX-RPC web services, an intermediary page is invoked. Click Test to invoke the Web Services Test Client with the web service WSDL selected.

When prompted, enter the login credentials for the Web Services Test Client.

To test the web service operations, see "Testing Web Service Operations" on page 5-4.

5.2.1.3 Invoking the Web Services Test Client Using the Administration Console
To test a deployed web service using the Administration Console, follow these steps:

1. Invoke the Administration Console in your browser using the following URL:

   http://[host]:[port]/console

   where:
   - host refers to the computer on which WebLogic Server is running.
   - port refers to the port number on which WebLogic Server is listening (default value is 7001).

2. Select the web service in the Deployments table that you would like to test. For more information, see "How Web Services Are Displayed in the Administration Console" in Understanding WebLogic Web Services for Oracle WebLogic Server.

3. Select the Testing tab and click the Test Point link next to the web service endpoint that you want to test.

4. When prompted, enter the login credentials for the Web Services Test Client.

5. Follow the procedure described in "Test a Web Service" in Oracle WebLogic Server Administration Console Online Help.

The Web Services Test Client is invoked with the web service WSDL selected. To test the web service operations, see "Testing Web Service Operations" on page 5-4.

5.2.2 Selecting the Web Service to Test
From the Web Services Test Client home page, enter the WSDL corresponding to the web service that you want to test. Return to this page at anytime by selecting Choose Another WSDL.

To select the web service to test:

1. Enter the WSDL in the Enter WSDL URL field.

2. To use the configured HTTP proxy, click the HTTP Proxy check box.

   For information about configuring the proxy, see "Configuring an HTTP Proxy" on page 5-9.

3. Click Test.

Alternatively, you can select a WSDL that was previously loaded from the WSDL list. To toggle the list, click Show WSDL List or Hide WSDL List.
The web service operations that are available to test are displayed. For more information, see "Testing Web Service Operations" on page 5-4.

### 5.2.3 Testing Web Service Operations

To test a web service operation:

1. Select the web service operation to test using one of the following methods:
   - Select the operation in the Operations pane.
   - With the web service port folder selected in the Operations pane, click Test associated with the web service operation that you want to test.

2. Enter a value for each of the parameters in the Parameters section. Required parameters are identified using .
   
   For information about editing the XML source, see "Editing the Input Arguments as XML Source" on page 5-10.

3. Configure the basic settings for the test client, such as the endpoint URL, basic authentication settings, encoding and binding types, and whether or not you want to use the configured HTTP proxy. For information, see "Configuring Basic Test Settings" on page 5-4.

4. Test the advanced features of your web service by configuring settings (as applicable), as described in "Testing Advanced Web Service Features and Security" on page 5-5.
   
   Ensure that the advanced feature settings are compatible with the web service endpoint that you are testing. If they are not, the test will fail and the stack error displays in the Test Results section.

   **Note:** For web services that use SOAP over JMS transport as the connection protocol, you can test only basic features.

5. Click Invoke.

   The Test Results section is displayed at the bottom of the content area, displaying the SOAP request and response messages. If the test fails, the stack error information is displayed in the Test Results section.

### 5.2.4 Configuring Basic Test Settings

You can configure basic settings for the Web Services Test Client, including the username and password for basic authentication, by clicking the Basic Settings tab in the Settings section, setting the values defined in Table 5-1, and clicking Invoke to invoke the web service.
To test the advanced features of a web service, refer to the following sections:

- “Testing Addressing” on page 5-5
- “Testing Atomic Transactions” on page 5-6
- “Testing MTOM” on page 5-6
- “Testing Fast Infoset” on page 5-7
- “Testing OWSM Security Policies” on page 5-8

**Note:** For web services that use SOAP over JMS transport as the connection protocol, you can test only basic features.

### 5.2.5.1 Testing Addressing

WS-Addressing provides a transport-neutral mechanism to address web services and their associated messages. Using WS-Addressing, endpoints are uniquely and unambiguously defined in the SOAP header. For more information, see “Using Web Services Addressing” in Developing JAX-WS Web Services for Oracle WebLogic Server.

You can test WS-Addressing, if enabled on the web service, by clicking the **Addressing** tab in the Settings section, setting the values defined in Table 5–2, and clicking **Invoke** to invoke the web service.
5.2.5.2 Testing Atomic Transactions

Web services enable interoperability with other external transaction processing systems, such as Websphere, Microsoft .NET, and so on, through the support of the following specifications:

- Web Services Atomic Transaction (WS-AtomicTransaction) Versions 1.0, 1.1, and 1.2:
  http://docs.oasis-open.org/ws-tx/wstx-wsat-1.2-spec-cs-01/wstx-wsat-1.2-spec-cs-01.html

- Web Services Coordination (WS-Coordination) Versions 1.0, 1.1, and 1.2:
  http://docs.oasis-open.org/ws-tx/wstx-wscoor-1.2-spec-cs-01/wstx-wscoor-1.2-spec-cs-01.html

For more information about web services atomic transactions, see "Using Web Services Atomic Transactions" in Developing JAX-WS Web Services for Oracle WebLogic Server.

You can test atomic transactions, if enabled on the web service, by clicking the Atomic Transaction tab in the Settings section, setting the values defined in Table 5–3, and clicking Invoke to invoke the web service.

### Table 5–2 Test Settings for WS-Addressing

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Flag that specifies whether WS-Addressing is enabled on the Web Service Test Client.</td>
</tr>
<tr>
<td>Version</td>
<td>WS-Addressing version. Valid values include:</td>
</tr>
<tr>
<td></td>
<td>- W3C. For more information, see: <a href="http://www.w3.org/2002/ws/addr/">http://www.w3.org/2002/ws/addr/</a></td>
</tr>
<tr>
<td></td>
<td>- Member Submission. For more information, see</td>
</tr>
<tr>
<td></td>
<td><a href="http://www.w3.org/Submission/ws-addressing/">http://www.w3.org/Submission/ws-addressing/</a></td>
</tr>
<tr>
<td>ReplyTo</td>
<td>Type of the ReplyTo header. Valid values include: anonymous, non-anonymous, and Addressing None.</td>
</tr>
<tr>
<td>FaultTo</td>
<td>Type of the FaultTo header. Valid values include: anonymous, non-anonymous, and Addressing None.</td>
</tr>
</tbody>
</table>

### Table 5–3 Test Settings for Atomic Transactions

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Flag that specifies whether atomic transactions are enabled on the Web Service Test Client.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the web services atomic transaction coordination context that is used for the Web Service Test Client. Valid values include: default, wsat, wsat11, and wsat12. The default value for web service clients is wsat (equivalent to WS-AT 1.0).</td>
</tr>
<tr>
<td>Transaction Flow Type</td>
<td>Flag that specifies whether the web services atomic transaction coordination context is passed with the transaction flow. For information about setting this value, see &quot;Enabling Web Services Atomic Transactions on Web Services&quot; in Developing JAX-WS Web Services for Oracle WebLogic Server.</td>
</tr>
<tr>
<td>Action After Invocation</td>
<td>Action required after invocation. Valid values include commit or rollback the transaction.</td>
</tr>
</tbody>
</table>

5.2.5.3 Testing MTOM

SOAP Message Transmission Optimization Mechanism/XML-binary Optimized Packaging (MTOM/XOP) defines a method for optimizing the transmission of XML data of type xs:base64Binary or xs:hexBinary in SOAP messages. When the transport protocol is HTTP, Multipurpose Internet Mail Extension (MIME) attachments are used to carry that data while at the same time allowing both the sender and the...
receiver direct access to the XML data in the SOAP message without having to be aware that any MIME artifacts were used to marshal the `base64Binary` or `hexBinary` data.

For more information about MTOM, see:

- JAX-WS: "Optimizing Binary Data Transmission Using MTOM/XOP" in Developing JAX-WS Web Services for Oracle WebLogic Server

You can test MTOM, if enabled on the web service, by clicking the MTOM tab in the Settings section, setting the values defined in Table 5–4, and clicking Invoke to invoke the web service.

### Table 5–4 Test Settings for MTOM

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Flag that specifies whether MTOM is enabled on the Web Service Test Client.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Attachment threshold (in bytes) that specifies whether <code>xs:binary64</code> data is sent inline or as an attachment. This value defaults to 0 (all data is sent as an attachment).</td>
</tr>
</tbody>
</table>

#### 5.2.5.4 Testing Fast Infoset

Fast Infoset is a compressed binary encoding format that provides a more efficient serialization than the text-based XML format. For more information about Fast Infoset, see

You can test Fast Infoset, if enabled on the web service, by clicking the Fast Infoset tab in the Settings section, setting the values defined in Table 5–5, and clicking Invoke to invoke the web service.

### Table 5–5 Test Settings for Fast Infoset

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Flag that specifies whether atomic transactions are enabled on the Web Service Test Client.</td>
</tr>
<tr>
<td>Negotiation Type</td>
<td>Negotiation strategy. Valid values include:</td>
</tr>
<tr>
<td></td>
<td>- none—No negotiation strategy.</td>
</tr>
<tr>
<td></td>
<td>- optimistic—Client assumes that Fast Infoset is enabled.</td>
</tr>
<tr>
<td></td>
<td>- pessimistic—Initial client request, Fast Infoset is not enabled. Subsequent requests will use Fast Infoset if enabled on the service.</td>
</tr>
</tbody>
</table>

For more information about the content negotiation strategy, see:

- Oracle Infrastructure Web Services: "Configuring the Content Negotiation Strategy" in Developing Oracle Infrastructure Web Services.
## 5.2.5.5 Testing OWSM Security Policies

You can test OWSM security policies by clicking the OWSM tab in the Settings section, setting the values defined in Table 5–6, and clicking **Invoke** to invoke the web service.

### Notes:
For Java EE web services, this tab is available only if you have OWSM installed.

Only a subset of the OWSM predefined policies is available, and you can configure only the attributes presented for those policies. All of the other policy attributes use only the policy defaults.

This means that copies you made of the predefined policies are not available. It also means that you cannot enable Secure Conversation, change the message security algorithm suite, and so forth.

### Table 5–6 Test Settings for OWSM

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Flag that specifies whether OWSM policies are enabled on the Web Service Test Client.</td>
</tr>
<tr>
<td>Policies</td>
<td>Select the policies that you want to test on the client by selecting the associated check box. You can test only a subset of security policies.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For the policy selected, you must configure the required properties below. Otherwise, an exception is thrown.</td>
</tr>
<tr>
<td>Username</td>
<td>Username used for basic authentication.</td>
</tr>
<tr>
<td>Password</td>
<td>Password used for basic authentication.</td>
</tr>
<tr>
<td>Keystore Location</td>
<td>Location of the keystore file. Click <strong>Choose File</strong> to navigate to the file in your local directory, which is typically in <code>DOMAIN_HOME\domain_name\config\fmwconfig</code>.</td>
</tr>
<tr>
<td>Remote Keystore Location</td>
<td>Location of the remote keystore. If not specified, the keystore local to the server is used.</td>
</tr>
<tr>
<td>Keystore Password</td>
<td>Password used for keystore access.</td>
</tr>
<tr>
<td>Encryption Key Alias</td>
<td>Alias of the key within the keystore that will be used to decrypt the response from the service. This property is not used in WSS11 policies.</td>
</tr>
<tr>
<td>Encryption Key Password</td>
<td>Password for the key within the keystore that will be used for decryption. This property is not used in WSS11 policies.</td>
</tr>
<tr>
<td>Signature Key Alias</td>
<td>Alias of the key within the keystore that is used for digital signatures. For WSS11 policies, this property is used for mutual authentication only.</td>
</tr>
<tr>
<td>Signature Key Password</td>
<td>Password for the alias of the key within the keystore that is used for digital signatures.</td>
</tr>
<tr>
<td>Recipient Key Alias</td>
<td>Alias for the recipient's public key that is used to encrypt type outbound message.</td>
</tr>
<tr>
<td>SAML Audience URI</td>
<td>Relying party, as a comma-separated URI. This property accepts wildcards.</td>
</tr>
<tr>
<td>SAML Issuer Name</td>
<td>SAML issuer name to use when trying access a service that is protected using SAML mechanism.</td>
</tr>
<tr>
<td>Include User Roles</td>
<td>User roles in a SAML assertion.</td>
</tr>
<tr>
<td>Attesting Mapping Attribute</td>
<td>Mapping attribute used to represent the attesting entity. Only the DN is currently supported. This attribute is applicable only to sender vouches message protection use cases. It is not applicable to SAML over SSL policies.</td>
</tr>
</tbody>
</table>
5.2.6 Viewing the WSDL and Imported Schemas

To view the WSDL for the current web service, click WSDL.

To view the imported WSDL and schemas, click Imported WSDL and Schema. From the dialog box, click the imported file that you wish to view. Click x in the upper right corner to close the dialog box.

5.2.7 Configuring the Web Services Test Client

Note: Configuration settings are available in development only.

You can configure the Web Services Test Client to define an HTTP proxy, set the default working directory, or define a Java Keystore (JKS), as described in the following sections:

■ "Configuring an HTTP Proxy” on page 5-9
■ "Configuring the JKS Keystores” on page 5-9
■ "Configuring the Default Working Directory” on page 5-10

5.2.7.1 Configuring an HTTP Proxy

You configure an HTTP proxy for your Web Services Test Client on the General Settings page.

To configure an HTTP proxy:

1. Click in the upper-right corner of the Web Services Test Client.
2. Click General in the navigation pane.
3. Enter the proxy host in the Http Proxy Host field.
4. Enter the proxy port in the Http Proxy Port field.
5. Click Submit.

5.2.7.2 Configuring the JKS Keystores

You configure the JKS keystores that are associated with the OWSM security policies that you are testing on the Web Services Test Client Security Settings page.

For more information about defining the JKS keystores on WebLogic Server, see "How to Configure a JKS Keystore on WebLogic Server” in Securing Web Services and Managing Policies with Oracle Web Services Manager.

To configure the Java Keystores (JKS):

1. Click in the upper-right corner of the Web Services Test Client.
2. Click Security in the navigation pane.
3. To add a new JKS keystore:
   a. Click Add.
   b. Enter a name for the JKS keystore in the Setting Name field.
   c. Enter the password for the JKS keystore in the Keystore Password field.
Using the Web Services Test Client

**5.2.7.3 Configuring the Default Working Directory**

You can configure the default working directory for the Web Services Test Client. By default, the working directory is set to the following subdirectory within the domain directory:

<domain-directory>/tmp/WSTestPageWorkDir

To configure the default working directory:

1. Click 🔄 in the upper-right corner of the Web Services Test Client.
2. Click General in the navigation pane.
3. Edit the Current Working Home field to reflect the desired working home directory.
4. Click Submit.

**5.2.8 Editing the Input Arguments as XML Source**

You can view the input arguments in a user-friendly form, or you can edit the XML source code directly. If you edit the XML source directly, you must enter valid XML. To view the input argument as XML, click Raw Message. To toggle back to the user-friendly form, click Form Entry.

**5.2.9 Viewing the History**

**Note:** The Invocation History pane displays only after you invoke your first test operation and is available in development mode only.

You can view the results for tests executed previously within the current session by clicking on the operation in the Invocation History pane. Failed test instances appear in red in the Invocation History pane.

**5.2.10 Exporting and Importing Test Cases**

**Note:** This feature is available in development mode only.
You can export individual test cases from the Web Services Test Client and then import them into another test environment, as described in the following sections:

- "Exporting a Test Case" on page 5-11
- "Importing a Test Case" on page 5-11

5.2.10.1 Exporting a Test Case

To export a test case, click  in the upper-right corner of the Web Services Test Client. The test case is saved as an XML file using the following filename: ws-testcase.xml. If you save multiple test cases, a suffix is added to the filename as follows: ws-testcase(n).xml, where n is incremented each time a new test case is saved.

5.2.10.2 Importing a Test Case

To import a test case:

1. Click  in the upper-right corner of the Web Services Test Client.
2. Click Choose File.
3. Navigate to the test case file, and click Open.
4. Click Import.

5.2.11 Enabling and Disabling the Web Services Test Client

In a development environment, the Web Services Test Client is enabled, by default. In a production environment, the Web Services Test Client is disabled (and undeployed), by default.

You can enable or disable the Web Services Test Client in one of the following ways:

- Using the Administration Console, as described below.
- Using Fusion Middleware Control at the domain or web service endpoint level, as described in "Enabling or Disabling the Web Services Test Client Using Fusion Middleware Control" on page 4-24.
- Using WLST, as described in "Enabling or Disabling the Web Services Test Client Using WLST" on page 4-57.

You should disable the Web Services Test Client to increase security by reducing the externally visible details of an application that exposes web services.

---

**Note:** It is recommended that you *not* enable the Web Services Test Client in production mode. For information about production mode, see "Domain Modes" in *Understanding Domain Configuration for Oracle WebLogic Server*.

---

To enable or disable the Web Services Test Client at the domain level using the Administration Console:

1. Invoke the Administration Console, as described in "Accessing Oracle WebLogic Administration Console" on page 2-2.
2. Click Domain in the Domain Configurations section of the console home page.
3. Select Configuration > General to display the general configuration options for the domain.
4. Click **Advanced** to view the advanced configuration settings.

5. Toggle the **Enable Web Service Test Page** configuration flag to enable or disable the Web Services Test Client.

6. Click **Save**.

7. Restart the server so that the configuration settings take effect.

   When enabling the Web Service Test Client in a production environment, the client will be deployed when you restart the server.

---

### 5.2.12 Logging Out of the Web Services Test Client

You can log out of the Web Services Test Client at any time by clicking the sign-out icon in the upper-right corner of the Web Services Test Client.

---

### 5.3 Using the Test Web Service Page in Fusion Middleware Control

This section describes how to use the Test Web Service page in Fusion Middleware Control to verify that you are receiving the expected results from a SOAP web service (WSDL) or a RESTful (WADL) service.

Using the Test Web Service page, you can:

- Test basic functionality to ensure that the web service was deployed and is operating as expected.
- Test advanced features, such as web services addressing, MTOM, and HTTP headers.
- Test security features.
- Stress test the web service endpoint.

The Test Web Service page allows you to test any of the operations exposed by a WSDL or WADL document. You can test web services that are deployed on any accessible host; the web service does not have to be deployed on this host.

---

**Note:** The Test Web Service page can parse WSDL or WADL URLs that contain ASCII characters only. If the URL contains non-ASCII characters, the parse operation fails. To test a web service that has non-ASCII characters in the URL, allow your browser to convert the WSDL or WADL URL and use the resulting encoded WSDL or WADL URL in the Test Web Service page.

When testing web services that use policies, the OWSM component must be installed in the same domain from which Fusion Middleware Control is being run. Otherwise, an invalid policy exception will be returned.

---

### 5.3.1 Accessing a Web Service for Testing

You can navigate to the Test Web Service page in many ways. The following sections describes two typical ways to do so.

#### Access your web service from the Oracle WebLogic Server Domain Home page

1. In the navigation pane, expand **WebLogic Domain** to show the domain in which you want to test a web service.
2. Select the domain.

3. From the **WebLogic Domain** menu, select **Web Services**, and then **Test Web Service**. The Test Web Service input page appears.

4. Enter the WSDL or WADL URL of the web service you want to test. If you do not know the WSDL or WADL, click the search icon and select from the registered web services, if any.

5. Click **Parse WSDL or WADL**.
   
   If the WSDL or WADL is secured with HTTP Basic Authentication, click **HTTP Basic Auth Option for WSDL or WADL Access** and enter the username and password before parsing the WSDL or WADL.

   The complete Test Web Services page displays, as shown in Figure 5–1 for a WSDL and in Figure 5–8 for a WADL.

**Access your web service from the Web Service Application Home page**

1. In the navigation pane, expand **Application Deployments** to view the applications in the domain.

2. Select the application for which you want to test the web service.

3. In the Web Services section of the page, click **Test** for the web service endpoint you want to test.

   The Test Web Service page displays, as shown in Figure 5–1 for a WSDL and in Figure 5–8 for a WADL. Note that the WSDL or WADL field is automatically populated with the WSDL or WADL for the endpoint.

**5.3.2 Testing a SOAP Web Service**

When the Test Web Services page refreshes with the WSDL details for the SOAP web service, you can select the Service, Port, and Operation type that you want to test, as well as specify a variety of input parameters.

1. Access the Test Web Service page using one of the methods described in Section 5.3.1, "Accessing a Web Service for Testing."

2. Click **Parse WSDL or WADL**.

   If the WSDL is secured with HTTP Basic Authentication, click **HTTP Basic Auth Option for WSDL or WADL Access** and enter the username and password before parsing the WSDL.
3. Select the service and port to be tested. As shown in Figure 5–1, if the WSDL has multiple services and ports, these fields are available as drop-down menus. If the WSDL has only one service and port, these fields are read-only.

4. Select the operation that you want to test from the Operation menu. The available operations are determined from the WSDL.

5. If you want to change the endpoint URL of the test, click Edit Endpoint URL and edit the URL.

6. Select the Request tab if it is not already selected.

7. Expand the test option sections. The expanded view of the Test Web Service page is shown in Figure 5–2.
8. In the Security section, specify whether you want to test a web service using OWSM security policies, basic HTTP authentication, authentication from a custom policy, or no credentials. The security setting is not determined from a policy in the WSDL; you can specify the type of security you want to test. The default is **None**. Depending on the option selected, additional fields are displayed. For details about the options available, see Section 5.3.5, "Testing Security."

9. In the Quality of Service section, specify whether you want to explicitly test a WS-Addressing, or MTOM policy. For details about the options available, see "Enabling Quality of Service Testing" on page 5-27.

10. In the HTTP Header section, you can add, modify, or delete HTTP headers to pass request information to a web service. For more information, see "Testing HTTP Headers" on page 5-27.

11. In the Additional Test Options section, select the **Enable Stress Test** option if you want to invoke the web service multiple times simultaneously. If you select this option, you can also provide values for the stress test options, or accept the defaults. For more information, see "Stress Testing the Web Service Operation" on page 5-28.

**Note:** The Asynchronous Test Response and Response Key fields are unique for testing asynchronous web services. For more information, see Section 5.3.3, "Testing an Asynchronous Web Service".

12. In the Input Arguments section, enter the input arguments for the web service in the **Value** fields. The parameters and type, and the required input values, are determined from the WSDL.
Select **Tree View** or **XML View** to toggle between a hierarchical list of input parameters and the XML content.

For SOAP web services, you can save the payload as XML and can load a previously saved payload. Click **Save Payload** to save the current payload as an XML file on your local file system. To load a saved payload, click **Browse** to find and select one, or click **Update** to replace the currently loaded payload. (**Browse** is replaced by **Update** when a saved payload is loaded.)

13. Click **Test Web Service** to initiate the test.

The test results appear in the **Response** tab upon completion.

If the test is successful, the **Test Status** field indicates *Request Successfully received* and the response time is displayed, as shown in **Figure 5–3**.

**Note:** When running SOA composite tests, the Response tab will indicate whether a new composite was generated. You can also click the **Launch Flow Trace** button to open the Flow Trace window, where you can view the flow of the message through various composite and component instances.

**Figure 5–3  Successful Test for a WSDL**

If the test fails, an error message is displayed. For example, **Figure 5–4** shows an error resulting from a type error in the *var-Int* parameter. In this particular instance, *string* data was entered when an *int* was expected.

**Note:** The results on the **Response** tab are a simplified version of the standard web service results.
5.3.3 Testing an Asynchronous Web Service

When the Test Web Services page refreshes with the WSDL details for an asynchronous web service, it is nearly identical the Test Web Services page for a SOAP web service, except that the following test response options are available in the Additional Test Options section, as shown in (Figure 5–5).

- Asynchronous Test Response – Specifies whether to request an asynchronous response upon running the test.
- Response Key – Enter a value (for example, \text{myasynctest}), which will correlate with the test’s asynchronous response. Each response key must be unique. The asynchronous response can also be tracked later on the Asynchronous Test Response page by specifying the corresponding response key.

If the test is successful, the Test Status field indicates \text{Request Successfully received} with the response time. The user-defined Response Key value that corresponds with the asynchronous response is also displayed.

Click \text{Show Response} to display the test response, if a response exists, in the Response field in XML format, as shown in Figure 5–6.
Accessing an asynchronous test response after testing

1. In the navigation pane, expand **WebLogic Domain** to show the domain in which you want to access an asynchronous web service test response.

2. Select the domain.

3. From the **WebLogic Domain** menu, select **Web Services**, and then **Asynchronous Test Response**.

4. On the Asynchronous Test Response page, specify the corresponding response key by either:
   - Using the Response Key List to select an existing, user-defined response key.
   - Using Search Response Key field to search for an existing, user-defined response key.

5. Click **Show Response** to display the test response, if a response exists, in the Response field in XML format.

---

**Note:** An asynchronous request can only have a response if the server has not been restarted.

If the response is not available, it can also be tracked later on the Asynchronous Test Response page by using the corresponding response key.
5.3.4 Testing a RESTful Web Service

The Web Application Description Language (WADL) is an XML-based file format that describes a RESTful web services application. When the Test Web Services page refreshes with the WADL details for the RESTful web service, it is similar to the Test Web Services page for a WSDL, except that you can select the Resource, Method, and Media type that you want to test. You can also specify a variety of input parameters, though for this release they are more limited compared to a WSDL page.

1. Access the Test Web Service page using one of the methods described in Section 5.3.1, "Accessing a Web Service for Testing."

2. Click Parse WSDL or WADL.

   If the WADL is secured with HTTP Basic Authentication, click HTTP Basic Auth Option for WSDL or WADL Access and enter the username and password before parsing the WADL.

---

**Note:** An asynchronous request can only have a response if the server has not been restarted.

---

6. Repeat step 4 to access and view any other asynchronous test responses that have a response key.
3. Select the resource and method type to be tested. The Method field displays the corresponding HTTP method for the selected resource path in the Resource field. If the WADL has multiple resources methods, these fields are available as drop-down menus, as shown in Figure 5–8. If the WADL has only one resource and method, these fields are read-only.

**Note:** Only the GET and POST methods are supported in this release. (Other methods are ignored if they are present in the WADL.)

4. Select the MIME media type that you want to use for the test request from the Representation Media Type for Request menu. The available types, if one exists, are determined from the WADL.

5. Select the MIME media type that you want to use for the test response from the Representation Media Type for Response menu. The available types, if one exists, are determined from the WADL. The following media types are supported in this release:
   - application/xml
   - application/json
   - text/plain
   - text/xml
   - application/x-www-form-urlencoded

6. Select the Request tab if it is not already selected.

7. In the Security section, the options are OWSM Security Policies, HTTP Basic Authentication, and None. The default is None. For more information, see "Testing Security" on page 5-22.
8. In the HTTP Header section you can add, modify, or delete HTTP headers to pass request information to a RESTful web service. For more information, see "Testing HTTP Headers" on page 5-27.

9. In the Input Arguments section, enter the input arguments for the RESTful web service in the Value fields. The parameters and type and the required input values, are determined from the WADL.

Select Tree View or Raw View to toggle between a hierarchical list of input parameters and the raw data view, where you can provide input directly to the request Header and Body sections.

**Note:** Tree View is available only for GET methods.

10. Click Test Web Service to initiate the test.

The test results appear in the Response tab upon completion. A message and an icon indicates the status of the response: a green flag for success, a red flag for failure, and a yellow flag for not yet executed.

If the test is successful, the Test Status field indicates Request Successfully received, with the green flag, and the response time is displayed, as shown in Figure 5–9.

**Figure 5–9  Successful Test for a WADL**

Only the Raw View is available on the Response tab, which will display the entire response from the request invocation.

If the test fails, an error message is displayed. For example, Figure 5–10 shows an error resulting from a type error.

**Figure 5–10  Data Validation Error**
5.3.5 Testing Security

You can use the Test Web Service Page to test web services security using OWSM security policies, HTTP basic authentication, or custom policies including copies of predefined policies. You can choose the type of test by selecting one of the options in the Security section of the page.

The security setting is not determined from a policy in the WSDL or WADL; you can specify the type of security you want to test. The default is None.

The following options are available. They are described in more detail in subsequent sections:

- **OWSM Security Policies** – Uses the credentials and other security options required by the OWSM security policies for authentication and message protection.
  
The options available when you select OWSM Security Policies differ slightly, depending on whether you are testing a RESTful web service or a SOAP web service, as described later in this section.

- **HTTP Basic Auth** – Inserts the username and password credentials in the HTTP transport header. Both the username and password are required.
  
  If you do specify a username and password, they must exist and be valid.

- **Advanced** – Uses a custom policy to authenticate the user. You must specify the URI for the policy. You can also specify configuration overrides.
  
  **Note:** This option is not available for RESTful web services.

- **None** – No credentials are included.

**OWSM Security Policies**

Only a subset of the OWSM predefined policies is available, and you can configure only the attributes presented for those policies. All of the other policy attributes use the policy defaults. For example, you cannot enable Secure Conversation, change the message security algorithm suite, and so forth.

**Note:** For a list of client policies supported by the test function, see "Supported Client Security Policies for SOAP Services" on page 5-26 and "Supported Client Security Policies for RESTful Services" on page 5-27.

Non-security policies and policies not supported by the test function are shown as read-only and cannot be selected. If a service has service policies whose corresponding client policies are not supported, including copies, those policies are shown as read only. This means that copies you made of the predefined policies are not directly listed and are available only through the Advanced option.

For example, assume that your web service has a copy of the oracle/wss11_message_protection_service_policy policy attached, and you have made a copy of the oracle/wss11_message_protection_client_policy. The test client displays both the oracle/wss11_message_protection_client_policy and oracle/wss11_message_protection_client_policy_copy policies, but the oracle/wss11_message_protection_client_policy_copy policy is unavailable and grayed out.
You can choose one of two approaches:

- If for testing purposes the predefined oracle/wss11_message_protection_client_policy policy satisfies your requirements, select the oracle/wss11_message_protection_client_policy.

  The **JKS Keystore Location** and **JKS Keystore Password** fields are required and presented on the page. Enter the location and password and click **Load Keys**.

- If you want to use your own oracle/wss11_message_protection_client_policy_copy policy:
  1. Select **Advanced**.
  2. Enter the policy URI, in this case oracle/wss11_message_protection_client_policy_copy.
  3. For message protection and SSL policies, the **JKS Keystore Location** and **JKS Keystore Password** properties are required.

    Enter the JKS keystore location and password values using the full property names from “Client Policy Configuration Properties That Can Be Overridden at Design Time” in *Securing Web Services and Managing Policies with Oracle Web Services Manager*:

    oracle.wsm.security.util.SecurityConstants.ClientConstants.WSS_KEYSTORE_LOCATION
    oracle.wsm.security.util.SecurityConstants.ClientConstants.WSS_KEYSTORE_PASSWORD

**SOAP and RESTful OWSM Security Policies**

The options available when you select **OWSM Security Policies** differ slightly, depending on whether you are testing a SOAP web service or a RESTful web service.

The options for a SOAP web service are shown in **Figure 5-11**. The options for a RESTful web service are shown in **Figure 5-12**, with the **Advanced Options** field selected to display all of the available fields.

**Figure 5–11 OWSM Security Policies Test Options for SOAP Web Services**
To test the web service security using OWSM security policies:

1. Select the policies with which you want to test the service. The policies available differ, depending on whether you are testing a SOAP web service or a RESTful web service.

   - **Selecting Policies for Testing a SOAP Web Service**
     
     From the **Compatible Client Policies** list, which displays the compatible client policies as specified in the WSDL, select the client policy to test.
     
     Alternatively, to perform a negative test on the endpoint, you can select a non-compatible policy, or **All** from the **Other Client Policies** list.

   - **Selecting Policies for Testing a RESTful Web Service**
     
     From the **Client Policies** list, select the client policy to test.

   **Notes:** Service policies that support multiple client security policies are not supported by the test function.

The Configuration Properties required by the selected policy are indicated with an asterisk (*). For example:

- For username_token and http_token policies, the **Username** and **Password** fields are required; for SAML policies only the **Username** field is required.

- For message protection and SSL policies, the **JKS Keystore Location** and **JKS Keystore Password** fields are required. (The KSS keystore is not supported.)

2. Provide values for the required fields as determined by the policy.

   If the **JKS Keystore Location** and **JKS Keystore Password** fields are required by the policy, enter the location and password of a user-created keystore that is NFS accessible and click **Load Keys**. The associated keystore fields under **Advanced Options** are populated with the aliases specified in the keystore.

   For more information about creating a keystore, see "Generating Private Keys and Creating the Java Keystore" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*. 

---

**Figure 5–12 OWSM Security Policies Test Options for RESTful Web Services**
3. Click **Advanced Options**. Additional keystore alias and SAML properties fields are displayed. Properties required by the selected policies are indicated with an asterisk. Enter the required values, or provide override values in the applicable fields.

**HTTP Basic Auth**

This option requires **Username** and **Password** credentials that are inserted into the HTTP transport header. The username and password must exist and be valid for the WebLogic Server.

**Advanced**

---

**Note:** The Advanced option is not available for RESTful web services.

---

The options available when you select the **Advanced** option are shown in **Figure 5–13**.

**Figure 5–13  Advanced Test Options**

![Advanced Test Options](image)

The Advanced option allows you to use a custom policy, including a copy of a predefined policy, to test the web service security. To do so:

1. Specify the URI of the custom policy in the **Policy URI** field. For example, oracle/wss11_message_protection_client_policy_copy. This field is required.

2. Specify any configuration overrides for the policy in the **Name** and **Value** fields.

   For username_token and http_token policies, Username and Password properties are required; for SAML policies only the username property is required.

   For message protection and SSL policies, the JKS Keystore Location and JKS Keystore Password properties are required. (The KSS keystore is not supported.)

   To add properties, click **Add** and provide the name/value pair for the configuration override. To delete a property, select it in the table and click **Delete**.
Note: Properties must be specified using the full name of each property, for example
oracle.wsm.security.util.SecurityConstants.ClientConstants.WSS_KEYSTORE_LOCATION. For a complete list of property names for properties that can be overridden, see "Overriding Client Policy Configuration Properties at Design Time" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

All of the other policy attributes use the policy defaults. For example, if you enabled Secure Conversation or changed the message security algorithm suite, those policy values are used.

5.3.5.1 Supported Client Security Policies for SOAP Services
The following OWSM client security policies SOAP services are supported by the test function. Copies of these predefined policies are not directly listed and are available only through the Advanced option.

- oracle/wss_http_token_client_policy
- oracle/wss_http_token_over_ssl_client_policy
- oracle/wss_saml_token_bearer_over_ssl_client_policy
- oracle/wss_saml_token_over_ssl_client_policy
- oracle/wss_saml20_token_bearer_over_ssl_client_policy
- oracle/wss_saml20_token_over_ssl_client_policy
- oracle/wss_username_token_client_policy
- oracle/wss_username_token_over_ssl_client_policy
- oracle/wss10_message_protection_client_policy
- oracle/wss10_saml_token_with_message_integrity_client_policy
- oracle/wss10_saml_token_with_message_protection_client_policy
- oracle/wss10_saml_token_with_message_protection_ski_basic256_client_policy
- oracle/wss10_saml20_token_with_message_protection_client_policy
- oracle/wss10_username_id_propagation_with_msg_protection_client_policy
- oracle/wss10_username_token_with_message_protection_client_policy
- oracle/wss10_x509_token_with_message_protection_client_policy
- oracle/wss11_message_protection_client_policy
- oracle/wss11_saml_token_identity_switch_with_message_protection_client_policy
- oracle/wss11_saml_token_with_message_protection_client_policy
- oracle/wss11_saml20_token_with_message_protection_client_policy
- oracle/wss11_username_token_with_message_protection_client_policy
- oracle/wss11_x509_token_with_message_protection_client_policy
5.3.5.2 Supported Client Security Policies for RESTful Services

The following OWSM client security policies for RESTful services are supported by the test function:

- oracle/http_basic_auth_over_ssl_client_policy
- oracle/http_saml20_token_bearer_client_policy
- oracle/http_saml20_token_bearer_over_ssl_client_policy
- oracle/wss_http_token_client_policy

5.3.6 Enabling Quality of Service Testing

*Note:* This section is not applicable when testing RESTful web services.

Three characteristics of Quality of Service (QoS) can be tested: WS-Addressing, and MTOM in the Quality of Service section of the Test Web Service Page (Figure 5–14). For each type of Quality of Service, there are three options:

- **WSDL Default** – Execute the default behavior of the WSDL. For example, if WSDL Default is selected for MTOM, and the WSDL contains a reference to an MTOM policy, the policy is enforced. If the WSDL does not contain a reference to an MTOM policy, then no MTOM policy is enforced.

- **None** – No policy for the specific QoS, even if it is included in the WSDL, is executed.

- **Custom** – Enforce a custom policy. For example, if a WS-Addressing policy is referenced in the WSDL, this policy will be ignored, and the policy specified in URI will be used instead.

- **URI** – Specify the location of the policy to be enforced.

*Figure 5–14 Quality of Service Parameters on the Test Web Service Page*

5.3.7 Testing HTTP Headers

The HTTP Header section allows you to add, modify, or delete HTTP headers to pass request information to a SOAP or RESTful web service. After the service invocation, the HTTP headers should be displayed as part of the message response.

*Figure 5–15 HTTP Header on the Test Web Service Page*
5.3.8 Editing the Input Arguments as XML Source

You can view the input arguments in a user-friendly form, or you can edit the XML source code directly. If you edit the XML source directly, you must enter valid XML.

Figure 5–16  Input Arguments - XML View

Use the drop-down list in the Input Arguments section of the page to toggle between Tree View and XML View.

Figure 5–17  Input Arguments - Tree View

5.3.9 Stress Testing the Web Service Operation

Select the Enable Stress Test check box (Figure 5–18) to invoke a continuous series of invocations of the web service operation (Figure 5–18). The following options are available:

■ **Concurrent Threads** – The number of concurrent threads on which the invocations should be sent. The default is 5 threads.

■ **Loops per Thread** – The number of times to invoke the operation. The default is 10 times.

■ **Delay in Milliseconds** – The number of milliseconds to wait between operation invocations. The default is 1000 milliseconds (1 second).

Figure 5–18  Stress Testing Parameters on the Test Web Service Page

When you invoke the test, a progress box indicates the test status. When the stress test is complete, a confirmation page displays the results of the test.

The Response tab provides additional information about the stress test, including the number of tests with errors, and the average, minimum, and maximum response
times. Details about each test are provided in tabular form. For each test, you can view the thread and loop numbers, the duration of the test, the start and end times for the test, and the invocation status. You can filter the fields displayed in the table using the View menu.

Figure 5–19  Stress Test Results on Test Web Service Page
This chapter describes how to monitor the performance of a web service using Fusion Middleware Control.

This chapter includes the following sections:

- **Overview of Performance Monitoring, Auditing, and Tuning**
- **Monitoring Web Services**
- **Auditing Web Services**

### 6.1 Overview of Performance Monitoring, Auditing, and Tuning

**Note:** Only a subset of the monitoring features described in this chapter apply to Java EE web services.

From the Web Services application summary page in Fusion Middleware Control, you can do the following:

- Monitor web services faults, including Security, Reliable Messaging, MTOM, Management, and Service faults.
- Monitor Security failures, including authentication, authorization, message integrity, and message confidentiality failures.
- Configure your web services ports, including enabling and disabling the port, attaching policies to web services, and enabling or disabling policies.

The Application home page also displays select web service details if the application includes web services.

### 6.2 Monitoring Web Services

This section contains the following sections:

- **When Are Web Service Statistics Started or Reset?**
- **Viewing Web Service Statistics for a Server Instance**
- **Viewing Web Service Statistics for an Application**
- **Viewing Web Service Statistics for an Individual Web Service**
- **Viewing Operation Statistics for a Web Service Endpoint**
- **Viewing Statistics for a Java EE Web Service Operation**
Monitoring Web Services

- Viewing Statistics for Java EE Web Service Clients
- Viewing Statistics for RESTful Resources
- Viewing Statistics for SOA Binding Components
- Viewing the Security Violations for a Web Service

In addition to the monitoring features described in this chapter, see "Analyzing Policy Usage" in Securing Web Services and Managing Policies with Oracle Web Services Manager to analyze how policies are used by one or more web services.

6.2.1 When Are Web Service Statistics Started or Reset?
The statistics described in this chapter are started or reset when any one of the following events occur:
- When the application is being deployed for the first time.
- When the application is redeployed.
- If the application is already deployed, and the hosting server is restarted.

6.2.2 Viewing Web Service Statistics for a Server Instance
The server-side web services page displays statistics for all of the web services on that server.

To view the web service statistics for a server:
1. In the navigation pane, expand WebLogic Domain to show the domain for which you want to see the policies and select the domain.
2. Expand the domain to show the servers in that domain. Select the server for which you want to view the statistics.
3. In the content pane, select WebLogic Server, and then Web Services.
4. The Web Services Server Summary page, which displays the statistics for the web services deployed on the server, is displayed.

Depending on the types of web services you have deployed, tabs are available for the following web service types: Java EE, Oracle Infrastructure Web Services, and RESTful Services.

For Java EE web services, the following statistics are displayed in tabular format for each web service running on the server:
- Web Service Name—Name of the web service.
- Application name—Name of the application that contains the web service.
- Endpoint name—Name of the web service endpoint. Click the endpoint name to view the Web Service Endpoint page.
- Invocation count—Number of invocation requests to this endpoint.
- Response count—Number of responses generated from
- Response error count—Number of errors encountered during responses.
- Average execution time—Average time, in milliseconds, to execute the web service.
- Average response time—Average time, in milliseconds, to receive a response from the web service.
For Oracle Infrastructure web services, the following statistics are displayed in tabular format for each web service running on the server:

- Web Service Name—Name of the web service.
- Application name—Name of the application that contains the web service.
- Endpoint name—Name of the web service endpoint. Click the endpoint name to view the Web Service Endpoint page.
- Invocations completed—Total number of completed requests to this endpoint.
- Average invocation time—Average time (in milliseconds) for the web service to send a response, in milliseconds.
- Total faults—Total number of failed requests.

For RESTful services, the following statistics are displayed in tabular format for each web service running on the server:

- Application name—Name of the application that contains the RESTful web service.
- Module name—Name of the module for the RESTful service.
- Name—RESTful application name. Click the name to view the RESTful Service Application page.
- Invocation count—Number of times that the RESTful web service was invoked.
- Error count—Number of errors that the RESTful web service incurred.
- Average execution time—Average time (in milliseconds) for all RESTful web service executions.

### 6.2.3 Viewing Web Service Statistics for an Application

The following sections describe how to view web services statistics based on the type of application:

- "Viewing Web Service Statistics for a SOA Composite Application" on page 6-3
- "Viewing Web Service Statistics for a Non-SOA Oracle Infrastructure Web Service Application" on page 6-4
- "Viewing the Web Service Statistics for a Java EE Application" on page 6-5

### 6.2.3.1 Viewing Web Service Statistics for a SOA Composite Application

In Fusion Middleware Control, the dashboard for a SOA composite application displays the basic monitoring information for all services and references in the composite application, as shown in Figure 6–1.

#### To navigate to the dashboard page for a SOA composite application

1. In the navigation pane, expand the SOA folder.
2. Expand `soa-infra` to view the SOA partitions, then expand the SOA partition (for example, the default partition) and select the target SOA composite application. The SOA composite home page displays.
3. Select the **Dashboard** tab if it is not already selected.
The Components section of this tab lists the SOA components being used in the composite application, and the Services and References section displays the web service and reference bindings.

For the SOA composite services and references, the following web service application-level statistics are displayed:

- **Name**—Name of the service or reference.
- **Type**—Type of service or reference
- **Usage**—Service or reference.
- **Total Messages**—Total number of messages.
- **Average Processing Time (sec)**—Average processing time, in seconds.

*Figure 6–1  Dashboard for SOA Composite Application*

6.2.3.2 Viewing Web Service Statistics for a Non-SOA Oracle Infrastructure Web Service Application

In Fusion Middleware Control, the Web Services summary page for an application displays the collective Summary and fault/violation information for all web services in the application, as shown in Figure 6–2.

The Charts section shows a graphical view of all security faults for a web service.

To navigate to the Web Service Summary page for a non-SOA Oracle Infrastructure web service application

1. In the navigation pane, expand the Application Deployments folder to expose the applications in the domain and select the application deployment.
   
   The Domain Application Deployment home page is displayed in the content pane.

2. In the navigation pane, expand the application deployment and select the application name.
   
   The Application Deployment home page is displayed in the content pane.

3. In the content pane, select Application Deployment, then Web Services.

   The Web Services Summary page for an application is displayed.
The page displays web service endpoints as well as application-level metrics. For Oracle Infrastructure web services, the following web service application-level statistics are displayed:

- **Web Services**—Total number of web services in the application.
- **Web Service Endpoints**—Total number of endpoints used by web services in this application.
- **Web Service Endpoints Disabled**—Total number of endpoints assigned to web services which have been disabled.
- **Policy Faults**—Number of web service requests that failed due to a policy fault. Specifies the total number since the application was last restarted.
- **Total Faults**—Total number of failed requests, including security, reliable messaging, MTOM, management, and service faults. Specifies the total number since the application was last restarted.
- **Invocations Completed**—Total number of client requests to the web service since the application was last restarted.

![Figure 6–2  Web Services Performance Summary and Charts for an Application](image)

6.2.3.3 Viewing the Web Service Statistics for a Java EE Application

In Fusion Middleware Control, the Web Services summary page for a Java EE application, including SOAP and RESTful services, displays the collective summary and fault/violation information for all web services in the application, as shown in Figure 6–3.

To navigate to the Web Service Summary page for a Java EE web service application

1. In the navigation pane, expand the Application Deployments folder to expose the applications in the domain and select the application deployment.
   
The Domain Application Deployment home page is displayed in the content pane.

2. In the navigation pane, expand the application deployment and select the application name.
   
The Application Deployment home page is displayed in the content pane.

3. In the content pane, select Application Deployment, then Web Services.
   
The Web Services Summary page for an application is displayed.
The page displays web service endpoints as well as application-level metrics. For Java EE web services, including SOAP and RESTful web services, the following web service application-level statistics are displayed:

- **Server Name**—Server on which the application is deployed.
- **Web Services**—Number of web services in the application.
- **Web Service Endpoints**—Total number of endpoints used by web services in this application.
- **Number of RESTful Applications**—Total number of RESTful applications registered with this web service.
- **Number of RESTful Resources**—The number of resources available to the RESTful application.
- **Java EE Web Service Clients**—Number of run-time client instances in the application.
- **Java EE Web Service Client Ports**—Number of web service client ports in the application to which you can attach OWSM policies.

![Figure 6–3 Java EE Web Services Summary](image)

This figure shows the SOAP or RESTful Web Services summary for a Java EE application.

6.2.4 Viewing Web Service Statistics for an Individual Web Service

The **Web Service Details** section of the Web Services Summary page for an application displays statistics on a per-web service basis, as shown in Figure 6–4. For information about navigating to the Web Services Summary page for an application, see "Viewing Web Service Statistics for an Application" on page 6-3.

The following statistics are displayed for Java EE web services:

- **Name**—Name of the web service. Expand the web service to display the web service endpoint.
- **Invocation Count**—Number of invocation requests to this endpoint.
- **Response Error Count**—Number of errors encountered during responses.
- **Response Count**—Number of responses
- **Average Execution Time (ms)**—Average time, in milliseconds, to execute the web service.
- **Average Response Time (ms)**—Average time, in milliseconds, to receive a response from the web service.

The following statistics are displayed for RESTful web services:
- Module Name and RESTful Application Name—Name of the module and
  RESTful application. Click the RESTful application name to view the RESTful
  Service Application page.
- Resource Name—Name of the RESTful resource.
- Resource Type—Type of the RESTful resource.
- Resource Path—URI of the RESTful resource.
- Invocation Count—Number of invocation requests to this endpoint.
- Average Execution Time (ms)—Average time, in milliseconds, to execute web
  services.

The following statistics are displayed for Oracle Infrastructure web services:
- Name—Name of the web service. Expand the web service to display the web
  service endpoint.
- Endpoint Enabled—Flag that specifies whether the web service is enabled or
  disabled. For Oracle Infrastructure web service providers, this field displays n/a.
- Start Time—Time the web service was started.
- Invocations Completed—Number of completed requests to this endpoint.
- Average Invocation Time—Average time for all web service invocations to be
  processed.
- Policy Faults—Number of failed requests because a policy was not successfully
  executed.
- Total Faults—Total number of failed requests.

Figure 6–4 Web Service Statistics for Individual Oracle Infrastructure Web Services

6.2.5 Viewing Operation Statistics for a Web Service Endpoint

Follow this procedure to view statistics for a web service endpoint. To view statistics
for individual operations, see "Viewing Statistics for a Java EE Web Service Operation"
on page 6-8.

To display operation statistics for a particular web service endpoint:
1. Navigate to the Web Service Summary page as described in "Viewing the Web
   Services Summary Page for an Application" on page 4-3.
2. In the Web Services Details section of the Web Services summary page, select the
   Web Service Endpoints tab.
3. Select the endpoint for which you want to display the statistics.
The Web Service Endpoint page is displayed.

4. Select the **Operations** tab if it is not already selected.

The following statistics are presented for Oracle Infrastructure web services:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation Name</td>
<td>Name of the operation.</td>
</tr>
<tr>
<td>One Way</td>
<td>Flag that specifies whether the operation returns a value to the calling operation.</td>
</tr>
<tr>
<td>Action</td>
<td>URI of the action.</td>
</tr>
<tr>
<td>Input Encoding</td>
<td>Encoding style of the input message.</td>
</tr>
<tr>
<td>Output Encoding</td>
<td>Encoding style of the output message.</td>
</tr>
<tr>
<td>Invocations Completed</td>
<td>Number of completed requests to this endpoint.</td>
</tr>
<tr>
<td>Average Invocation Time</td>
<td>Average time for all web service invocations to be processed.</td>
</tr>
<tr>
<td>Faults</td>
<td>Total number of faults for this endpoint.</td>
</tr>
</tbody>
</table>

The following statistics are presented for Java EE web services:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the operation.</td>
</tr>
<tr>
<td>Invocation Count</td>
<td>Number of times that the web service was invoked.</td>
</tr>
<tr>
<td>Average Dispatch Time (ms)</td>
<td>Average time, in milliseconds, for all web service invocations to be processed.</td>
</tr>
<tr>
<td>Average Execution Time (ms)</td>
<td>Average time, in milliseconds, for all web service executions.</td>
</tr>
<tr>
<td>Average Response Time (ms)</td>
<td>Average time, in milliseconds, for all responses generated.</td>
</tr>
<tr>
<td>Response Count</td>
<td>Total number of responses generated from the web service invocations.</td>
</tr>
<tr>
<td>Response Error Count</td>
<td>Total number of errors from responses generated from the web service invocations.</td>
</tr>
</tbody>
</table>

### 6.2.6 Viewing Statistics for a Java EE Web Service Operation

The individual web service operations are displayed on the **Operations** tab of the Web Service Endpoint page. This procedure applies only to Java EE web service operations.

To view the statistics for an individual Java EE web service operation:

1. Navigate to the Web Service Operation page as described in "Viewing the Details for a Java EE Web Service Operation" on page 4-8.

2. Click the name of an operation to view its statistics.

The Web Service Operation page displays the following statistics:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Name</td>
<td>The name of the application that this operation is associated with.</td>
</tr>
<tr>
<td>Web Service Name</td>
<td>The name of the web service that this operation is associated with.</td>
</tr>
</tbody>
</table>
### Errors

The Errors section of the Web Service Operation page displays the following error statistics:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Count</td>
<td>Number of errors sending or receiving a request.</td>
</tr>
<tr>
<td>Last Error</td>
<td>Last error that occurred processing a request.</td>
</tr>
<tr>
<td>Last Error Time</td>
<td>Time on WebLogic Server of the last error for a request (sending or receiving) was detected expressed as the number of milliseconds since midnight, January 1, 1970 UTC.</td>
</tr>
<tr>
<td>Response Error Count</td>
<td>Total number of errors from responses generated from operation invocations.</td>
</tr>
<tr>
<td>Last Response Error</td>
<td>Last response error to arrive for this client/service (or null if no errors have occurred).</td>
</tr>
<tr>
<td>Last Response Error Time</td>
<td>Time on WebLogic Server of the last error sending or receiving a response (0 if no failures have occurred) expressed as the number of milliseconds since midnight, January 1, 1970 UTC.</td>
</tr>
</tbody>
</table>

### Invocation Statistics

The Invocation Statistics section of the Web Service Operation page displays the following invocation statistics:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invocation Count</td>
<td>Total number of operation invocations in the current measurement period.</td>
</tr>
<tr>
<td>Last Invocation Time</td>
<td>Time of the last operation request to be sent or received (0 if no requests have been sent or received).</td>
</tr>
<tr>
<td>Average Dispatch Time (ms)</td>
<td>Average operation dispatch time (in milliseconds) for the current measurement period. Dispatch time refers to the time for WebLogic Server to process the invocation. The measurement period typically starts when WebLogic Server is first started.</td>
</tr>
<tr>
<td>Dispatch Time Total (ms)</td>
<td>Total time (in milliseconds) for all operation dispatches in the current measurement period. Dispatch time refers to the time for WebLogic Server to process the invocation. The measurement period typically starts when WebLogic Server is first started.</td>
</tr>
<tr>
<td>Dispatch Time High</td>
<td>Longest operation dispatch time for the current measurement period. Dispatch time refers to the time for WebLogic Server to process the invocation. The measurement period typically starts when WebLogic Server is first started.</td>
</tr>
</tbody>
</table>
To display web service statistics for the run-time client instances in a Java EE application:

1. Navigate to the Java EE web service application summary page, as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.

2. Select the Java EE Web Service Clients tab to view the clients in the application.

3. Select the Monitoring tab, if it is not already selected to view the statistics for all run-time client instances in the application.

Note: This tab is available only if the application contains Java EE web service clients.
4. Select the client in the Client column to display web service statistics for that client.

The Java EE Web Service Client page is displayed, as shown in Figure 6–5.

**Note:** For JAX-WS web services, the web services run time creates system-defined client instances within a web service endpoint that are used to send protocol-specific messages as required by that endpoint. These client instances are named after the web service endpoint that they serve with the following suffix: -SystemClient. Monitoring information relevant to the system-defined client instances is provided to assist in evaluating the application.

![Figure 6–5 Java EE Web Service Client Statistics](image)

The following summary information is presented for the run-time client instance:

- Application Name—The name of the application with which the client is associated.
- Module Name—Name of the Java EE module in which the endpoint is running.
- Web Service Endpoint—Name of the port which the client invokes.
- Transport Protocol Type—Transport protocol required by the service.

5. Select the **Invocations** tab to view the invocation statistics for the client.

**Table 6–1** lists the invocation statistics displayed for the run-time client instance.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Errors</td>
<td></td>
</tr>
<tr>
<td>Error Count</td>
<td>Total number of security faults and violations.</td>
</tr>
<tr>
<td>Response Error Count</td>
<td>Total number of errors from responses generated from invocations of this client instance</td>
</tr>
<tr>
<td>Invocation Statistics</td>
<td></td>
</tr>
<tr>
<td>Response Count</td>
<td></td>
</tr>
<tr>
<td>Response Time Average (ms)</td>
<td></td>
</tr>
<tr>
<td>Response Time Total (ms)</td>
<td></td>
</tr>
<tr>
<td>Execution Time Average (ms)</td>
<td></td>
</tr>
<tr>
<td>Execution Time Total (ms)</td>
<td></td>
</tr>
</tbody>
</table>

![Table 6–1 Invocation Statistics for Java EE Web Service Client](table)
6. Select the **WebLogic Policy Violations** tab to view the policy violations for this client run-time instance.

**Note:** This tab appears only if there are WebLogic web service policies attached to the Java EE web service client.

Table 6–2 lists the policy violations for the client run-time instance.

### Table 6–1 (Cont.) Invocation Statistics for Java EE Web Service Client

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invocation Count</td>
<td>Total number of times that operations on service side have been invoked by the client instance in the current measurement period.</td>
</tr>
<tr>
<td>Average Dispatch Time (ms)</td>
<td>Average dispatch time for the current measurement period.</td>
</tr>
<tr>
<td>Dispatch Time Total (ms)</td>
<td>Total time for all dispatches of this operation in the current measurement period.</td>
</tr>
<tr>
<td>Average Execution Time (ms)</td>
<td>Average execution time of this operation.</td>
</tr>
<tr>
<td>Execution Time Total (ms)</td>
<td>Total time for all executions of this operation.</td>
</tr>
</tbody>
</table>

**Response Statistics**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response Count</td>
<td>Total number of responses generated from invocations of this operation.</td>
</tr>
<tr>
<td>Average Response Time (ms)</td>
<td>Average response time from the responses generated from invocations of this operation.</td>
</tr>
<tr>
<td>Response Time Total (ms)</td>
<td>Total time for all responses generated from invocations of this operation.</td>
</tr>
</tbody>
</table>

### Table 6–2 WebLogic Policy Violations for Java EE Web Service Client

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td></td>
</tr>
<tr>
<td>Total Faults</td>
<td>Total number of failed requests.</td>
</tr>
<tr>
<td>Policy Faults</td>
<td>Total number of policy faults.</td>
</tr>
<tr>
<td>Total Security Faults</td>
<td>Total number of security faults and violations.</td>
</tr>
<tr>
<td>Violations</td>
<td></td>
</tr>
<tr>
<td>Authentication Violations</td>
<td>Total number of authentication violations generated for this port. Only incoming message processing can add to the violation count.</td>
</tr>
<tr>
<td>Confidentiality Violations</td>
<td>Total number of confidentiality violations generated for this port. Both outgoing and incoming message processing can add to the violation count.</td>
</tr>
<tr>
<td>Integrity Violations</td>
<td>Total number of integrity violations generated for this port. Both outgoing and incoming message processing can add to the violation count.</td>
</tr>
<tr>
<td>Successes</td>
<td></td>
</tr>
<tr>
<td>Authentication Successes</td>
<td>Total number of authentication successes detected for this port. Only incoming message processing can add to the success count.</td>
</tr>
</tbody>
</table>
6.2.8 Viewing Statistics for RESTful Resources

To display web service statistics for the resources in a RESTful web service:

1. Navigate to the Web Services application summary page, as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.
2. Select the RESTful Services tab to view the RESTful applications.

Table 6–3 lists the summary information that is provided.

5. In the RESTful Methods tab, view the statistics for the methods.

Table 6–4 lists the statistics for each RESTful method.
6.2.9 Viewing Statistics for SOA Binding Components

You can monitor service and reference binding components in SOA composite applications, including instances, faults, and rejected messages. For complete details, refer to the following sections in Administering Oracle SOA Suite and Oracle Business Process Management Suite:

- "Monitoring Service and Reference Binding Components"
- "Monitoring Service and Reference Binding Components in the SOA Infrastructure"

To view statistics for SOA binding components:

1. Navigate to the SOA composite application, as described in "Viewing the Web Services and References in a SOA Composite" on page 4-6.

2. In the Services and References section, select a specific service or reference.

If you select a service binding component that is a JCA adapter, web service, or REST service, the Dashboard page displays a graphic representation of the total number of incoming messages and faults since server startup, as shown in Table 6–6.

---

**Table 6–4 Statistics for RESTful Resources**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method Name</td>
<td>Name of the method.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Return type of the method.</td>
</tr>
<tr>
<td>Path</td>
<td>Path of the method.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>HTTP method to which the method is mapped.</td>
</tr>
<tr>
<td>Producing Media Type</td>
<td>Total time for all dispatches of this operation in the current measurement period.</td>
</tr>
<tr>
<td>Invocation Count</td>
<td>Number of invocations of the RESTful method.</td>
</tr>
<tr>
<td>Average Execution Time (ms)</td>
<td>Average execution time, in milliseconds, of this operation.</td>
</tr>
<tr>
<td>Execution Time Total (ms)</td>
<td>Total time for all executions of the method.</td>
</tr>
</tbody>
</table>

---

[Image of a graph showing statistics for instances and faults over time.]

---

6-14 Administering Web Services
6.2.10 Viewing the Security Violations for a Web Service

Follow the procedure below to view security violations for a web service.

**To view the security violations for an Oracle Infrastructure web service:**

1. Navigate to the Web Services Summary page as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.

2. In the Charts section of the page, select the Security Violations tab.
   
   A graphical representation of the authentication, authorization, confidentiality, and integrity faults for all web services in the application is displayed in the pie chart.

3. In the Web Service Details section of the page, expand the web service to display the web service endpoints if they are not already displayed.

4. Click the name of the endpoint to navigate to the Web Service Endpoint page.

5. Click the Charts tab to see a graphical representation of all faults and all security violations for the endpoint.

6. Click the OWSM Policies tab.
   
   Two tables are displayed.

   The Globally Attached Policies table displays the name of the policy and the policy set that references it.

   The Directly Attached Policies table displays the name of the policy and the policy status (whether the policy is enabled or disabled).

   Both tables list the category to which the policy belongs (security, MTOM attachments, reliable messaging, WS-addressing, and management).

   **Table 6–5** lists the violation information provided for each type of policy attachment.

<table>
<thead>
<tr>
<th>Violation Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Violations</td>
<td>Total number of faults for this policy.</td>
</tr>
<tr>
<td><strong>Note:</strong> Total violations may not be equal to the sum of the security violations shown below (for example, Authentication, Authorization, Confidentiality, and Integrity). Other security violations that do not fall into these major categories and non-security violations are also captured in the total violations count.</td>
<td></td>
</tr>
<tr>
<td>Security Violations</td>
<td></td>
</tr>
<tr>
<td>Authentication</td>
<td>Number of authentication failures since the server was restarted.</td>
</tr>
<tr>
<td>Authorization</td>
<td>Number of authorization failures since the server was restarted.</td>
</tr>
<tr>
<td>Confidentiality</td>
<td>Number of message confidentiality failures since the server was restarted.</td>
</tr>
<tr>
<td>Integrity</td>
<td>Number of message integrity failures since the server was restarted.</td>
</tr>
</tbody>
</table>

**To view the security violations for a Java EE JAX-WS web service:**

1. Navigate to the Web Services Summary page as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.
2. In the Web Service Details section of the page, expand the web service to display the web service endpoints if they are not already displayed.

3. Click the name of the endpoint to navigate to the Web Service Endpoint page.

4. Do one of the following, depending on the type of policies attached to the endpoint:
   - If OWSM policies are attached to the endpoint, click the OWSM Policies tab.
     A list of the policies that are attached to the endpoint is displayed. For each policy, the table displays the name of the policy, the category of the policy (security, MTOM attachments, reliable messaging, WS-addressing, and management), and the policy status (whether the policy is enabled or disabled). Table 6–5 describes the violation information that is displayed for each OWSM policy attached to the endpoint.
   - If WebLogic policies are attached to the endpoint, click the WebLogic Policy Violations tab.
     This tab shows policy violation details about WebLogic policies attached to a JAX-WS endpoint. Table 6–6 describes the information provided on this page.

<table>
<thead>
<tr>
<th>Table 6–6 WebLogic Policy Violation Data</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Element</strong></td>
</tr>
<tr>
<td><strong>Summary</strong></td>
</tr>
<tr>
<td>Total Faults</td>
</tr>
<tr>
<td>Policy Faults</td>
</tr>
<tr>
<td>Total Violations</td>
</tr>
<tr>
<td><strong>Violations</strong></td>
</tr>
<tr>
<td>Authentication Violations</td>
</tr>
<tr>
<td>Confidentiality Violations</td>
</tr>
<tr>
<td>Integrity Violations</td>
</tr>
<tr>
<td><strong>Successes</strong></td>
</tr>
<tr>
<td>Authentication Successes</td>
</tr>
<tr>
<td>Confidentiality Successes</td>
</tr>
<tr>
<td>Integrity Successes</td>
</tr>
</tbody>
</table>

To view the security violations for a Java EE JAX-RPC web service:
1. Navigate to the Web Services Summary page for the application.
2. In the Web Service Details section of the page, expand the web service to display the web service endpoints if they are not already displayed.
3. Click the name of the endpoint to navigate to the Web Service Endpoint page.
4. Click the WebLogic Policy Violations tab.
This tab shows policy violation details about WebLogic policies attached to a JAX-RPC endpoint, as shown in Figure 6–7. For a description of the information displayed on this tab, see Table 6–6.

Figure 6–7  Security Violations for a Java EE JAX-RPC Web Service Endpoint

6.3 Auditing Web Services

Auditing describes the process of collecting and storing information about security events and the outcome of those events. An audit provides an electronic trail of selected system activity.

An audit policy defines the type and scope of events to be captured at run time. Although a very large array of system and user events can occur during an operation, the events that are actually audited depend on the audit policies in effect at run time. You can define component- or application-specific policies, or audit individual users.

You configure auditing for system components, including web services, and applications at the domain level using the Audit Policy page. You can audit SOA and ADF services.

The following table summarizes the events that you can audit for web services and the relevant component.

<table>
<thead>
<tr>
<th>Enable auditing for the following web service events. . .</th>
<th>Using this system component. . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>■ User authentication.</td>
<td>OWSM—Agent</td>
</tr>
<tr>
<td>■ User authorization.</td>
<td>For more information, see &quot;OWSM-AGENT Events and Attributes&quot; on page A-1.</td>
</tr>
<tr>
<td>■ Policy enforcement, including message confidentiality, message integrity, and security policy.</td>
<td>Oracle web services</td>
</tr>
<tr>
<td>■ Web service requests sent and responses received.</td>
<td>For more information, see &quot;Oracle Web Services Events and Attributes&quot; on page A-4.</td>
</tr>
<tr>
<td>■ SOAP faults incurred.</td>
<td></td>
</tr>
</tbody>
</table>

Note: In this case, events are logged for both security and non-security web service invocations.
You can also audit the events for a specific user, for example, you can audit all events by an administrator.

For more information about configuring audit policies, see "Configuring and Managing Auditing" in Securing Applications with Oracle Platform Security Services.

The following sections describe how to define audit policies and view audit data:

- **Configuring Audit Policies**
- **Managing Audit Data Collection and Storage**
- **Viewing Audit Reports**

### 6.3.1 Configuring Audit Policies

Follow the steps in this section to configure audit policies. For more information, see "Manage Audit Policies for Java Components with Fusion Middleware Control" in Securing Applications with Oracle Platform Security Services.

1. From the WebLogic Domain menu, select **Security > Audit Policy**.

   The Audit Policy Settings page is displayed.

   The audit policies table, at the center of the page, displays the audits that are currently in effect.

2. Select the component that you want to audit from the Audit Component Name menu.

3. Select an audit level from the Audit Level menu.

   Valid audit levels include:
   - None—Disables auditing.
   - Low, Medium, High—Audits subsets of event categories representing pre-defined levels of auditing.
   - Custom—Enables you to provide a custom auditing policy.

---

**Table 6–7 (Cont.) Auditing Events for Web Services**

<table>
<thead>
<tr>
<th>Enable auditing for the following web service events. . .</th>
<th>Using this system component. . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>■ OWSM assertion template creation, deletion, or modification.</td>
<td>OWSM—Policy Manager</td>
</tr>
<tr>
<td>■ OWSM policy intent creation, deletion, or modification.</td>
<td>Note: The Policy Manager audits both local policy attachments and global policy attachments for policy sets.</td>
</tr>
<tr>
<td>■ OWSM policy creation, deletion, or modification.</td>
<td>For more information, see &quot;OWSM-PM-EJB Events and Attributes&quot; on page A-2.</td>
</tr>
<tr>
<td>■ OWSM policy set authoring creation, deletion, or modification.</td>
<td></td>
</tr>
<tr>
<td>■ OWSM policy attachment.</td>
<td>OWSM—Policy Attachment</td>
</tr>
<tr>
<td></td>
<td>Note: The Policy Attachment audits only local policy attachments.</td>
</tr>
<tr>
<td></td>
<td>For more information, see &quot;Web Services Policy Attachment Events and Attributes&quot; on page A-4.</td>
</tr>
</tbody>
</table>

You can also audit the events for a specific user, for example, you can audit all events by an administrator.

For more information about configuring audit policies, see "Configuring and Managing Auditing" in Securing Applications with Oracle Platform Security Services.

The following sections describe how to define audit policies and view audit data:

- **Configuring Audit Policies**
- **Managing Audit Data Collection and Storage**
- **Viewing Audit Reports**

### 6.3.1 Configuring Audit Policies

Follow the steps in this section to configure audit policies. For more information, see "Manage Audit Policies for Java Components with Fusion Middleware Control" in Securing Applications with Oracle Platform Security Services.

1. From the WebLogic Domain menu, select **Security > Audit Policy**.

   The Audit Policy Settings page is displayed.

   The audit policies table, at the center of the page, displays the audits that are currently in effect.

2. Select the component that you want to audit from the Audit Component Name menu.

3. Select an audit level from the Audit Level menu.

   Valid audit levels include:
   - None—Disables auditing.
   - Low, Medium, High—Audits subsets of event categories representing pre-defined levels of auditing.
   - Custom—Enables you to provide a custom auditing policy.
You can view the components and applications that are selected for audit at each level in the audit policies list. For all audit levels other than Custom, the information in the audit policies list is greyed out, as you cannot customize other audit level settings.

4. To customize the audit policy, select the Custom option and perform one of the following steps:

- Select the information that you want to audit by clicking the associated checkbox in the Select for Audit column.

  You can audit at the following levels of granularity: All events for a component, all events within a component event category, an individual event, or a specific outcome of an individual event (such as, success or failure).

  Click **Select All** to select all categories, **None** to deselect all categories, or **Audit All Events** to audit all events, including specific outcome of individual events (such as, successes and failures).

  At the event outcome level, you can specify an edit filter. Filters are rules-based expressions that you can define to control the events that are returned. For example, you might specify an Initiator as a filter for policy management operations to track when policies were created, modified, or deleted by a specific user. To define a filter for an outcome level, click the **Edit Filter** icon in the appropriate column, specify the filter attributes, and click **OK**. The filter definition appears in the Filter column.

  Deselect the checkbox for a component at a higher level to customize auditing for its subcomponents. You can select all components and applications by checking the checkbox adjacent to the column name.

- At the event outcome level, you can specify an edit filter. Filters are rules-based expressions that you can define to control the events that are returned. For example, you might specify an Initiator as a filter for policy management operations to track when policies were created, modified, or deleted by a specific user. To define a filter for an outcome level, click the **Edit Filter** icon in the appropriate column, specify the filter attributes, and click **OK**. The filter definition appears in the Filter column.

- To audit only success or failures for all system components and applications, select **Select Successes Only** or **Select Failures Only** from the Select menu, respectively. To clear all selections, select **None**.

5. If required, enter a comma-separated list of users in the Users to Always Audit text box.

  Specified users will always be audited, regardless of whether auditing is enabled or disabled, and at what level auditing is set.

6. Click **Apply**.

  To revert all changes made during the current session, click **Revert**.

### 6.3.2 Managing Audit Data Collection and Storage

To manage the data collection and storage of audit information, you need to perform the following tasks:

- Set up and manage an audit data repository.

  You can store records using one of two repository modes: file and database. It is recommended that you use the database repository mode. The Oracle Business
Intelligence Publisher-based audit reports only work in the database repository mode.

- Set up audit event collection.

For more information, see "Managing the Audit Data Store" in *Securing Applications with Oracle Platform Security Services*.

### 6.3.3 Viewing Audit Reports

For database repositories, data is exposed through pre-defined reports in Oracle Business Intelligence Publisher.

A number of predefined reports are available, such as: authentication and authorization history, OWSM policy enforcement and management, and so on. For details about generating and viewing audit reports using Oracle Business Intelligence Publisher, see "Using Audit Analysis and Reporting" in *Securing Applications with Oracle Platform Security Services*.

For file-based repositories, you can view the bus-stop files using a text editor and create your own custom queries.
This chapter describes how to manage and configure diagnostic and message logs. Oracle Fusion Middleware components, including web services, generate log files containing messages that record all types of events, including startup and shutdown information, errors, warning messages, access information on HTTP requests, and so on. Each log message includes specific information such as time, component ID, and user to assist you in pinpointing and diagnosing problems that arise.

This chapter includes the following sections:
- Diagnosing Problems Using Logs
- Configuring Log Files for a Web Service

7.1 Diagnosing Problems Using Logs

You can review log messages to diagnose problems with specific components, such as web services. There are two categories of log files that you can reference to assist in diagnosing problems with web services:

- **Diagnostic logs**—Enable you to access diagnostic data about specific feature components in Oracle Fusion Middleware. For more information, see "Using Diagnostic Logs for Web Services" on page 7-1.

  There is a set of predefined diagnostic loggers. You can configure your own diagnostic logger, as described in "Configuring Log Files for a Web Service" on page 7-9.

- **Message logs**—Enable you to view elements of the SOAP message request. You control message log creation using policies. For more information, see "Using Message Logs for Web Services" on page 7-6.

For more information about logging in Oracle Fusion Middleware, see "Managing Log Files and Diagnostic Data" in *Administering Oracle Fusion Middleware*.

The following sections describe how to use diagnostic and message logs to diagnose problems. A set of sample logs is provided at the end of this section.

- Using Diagnostic Logs for Web Services
- Using Message Logs for Web Services
- Reviewing Sample Logs

7.1.1 Using Diagnostic Logs for Web Services

Diagnostic logs enable you to access diagnostic data about specific feature components in Oracle Fusion Middleware.
The following sections describe how to view and manage diagnostic log files:

- Setting the Log Level for Diagnostic Logs
- Viewing Diagnostic Logs
- Filtering Diagnostic Logs
- Logging OWSM Debug Messages

7.1.1.1 Setting the Log Level for Diagnostic Logs
You set the logging level for web service and OWSM components at the WebLogic Server level, using the Log Configuration page.

In addition, you can override the log levels set at the server level for a specific web service endpoint from the Web Service Endpoint page. The logging level set at the web service endpoint level must be “finer grained” than the level set at the WebLogic Server level. Otherwise, the logging level set at the WebLogic Server level will be used.

The following procedures describe how to set the log level for diagnostic logs at the WebLogic Server and web service endpoint levels. For more information, see “Setting the Level of Information Written to Log Files” in Administering Oracle Fusion Middleware.

**To set the log level for diagnostics logs at the WebLogic Server level:**

1. Navigate to the WebLogic Server for which you want to configure a logger.
   a. In the navigation pane, expand WebLogic Domain.
   b. Expand the domain.
   c. Select the desired server from the list.
      The WebLogic Server home page is displayed.

2. From the WebLogic Server menu, select Logs, then Log Configuration.
   The Log Configuration page is displayed.

3. Select the Log Levels tab.
   The list of loggers is displayed, as shown in Figure 7–1.
   The Log Levels page shows the name of the logger, the current logging level, which you can edit, and the associated log file (for example, olh-handler). For information about configuring the log files, see "Configuring Log Files for a Web Service" on page 7-9.
4. Expand Root Logger.

5. Expand oracle.

6. Set the logging level for one or more of the following components:
   - oracle.webservices—web service components.
   - oracle.wsm—OWSM components.

   You can fine tune the logging level by expanding either of the above components and specifying the logging level at the subcomponent level.

   To change the logging level for a logger, navigate to the logger in the Logger Name column and select the desired logging level from the Oracle Diagnostic Logging Level (Java Level) drop-down menu.

   For example, select TRACE:32 from the drop-down menu associated with the oracle.wsm logger.

   By default, the logging levels are inherited from the parent and set to NOTIFICATION: 1 (INFO) for the web service and OWSM components and subcomponents.

7. Click Apply to store the new logging level.

To set the log level for diagnostic logs at the web service endpoint level:

1. Navigate to the Web Service Endpoint page, as described in “Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control” on page 4-6.
2. Click the **Configuration** tab.

3. Set the **Logging Level** field to one of the following settings: Severe, Warning, Information, Configuration, Fine, Finer, Finest or NULL.

### 7.1.1.2 Viewing Diagnostic Logs

You can view the diagnostic log files for an ADF web service endpoint from the Log Messages page.

**To view diagnostic logs for a web service endpoint:**

Navigate to the Web Service Endpoint page, as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6, and in the Quick Links section of the Web Services Endpoint page (top right), click **Diagnostic Log**.

---

**Note:** You can view a summary of all faults incurred by the web services in your application. For more information, see "Monitoring Web Services" on page 6-1.

The Log Messages page is displayed, as shown in the following figure.

**Figure 7–2 Log Messages Page**

![Log Messages Page](image)

Click on a message in the message area to view more details at the bottom of the page. If desired, you can export a message to a text, XML, or CSV file by selecting the messages on the list and clicking **Export Messages to File**.

You can control the message content displayed using the following controls:

- **Search**—Modify the search criteria. For more information, see "Filtering Diagnostic Logs" on page 7-5.
- **View menu**—Select the columns to display in the table. Click on a particular column to sort contents up or down.
- **Show menu**—Group messages by type or ID, or view them in chronological order.
■ **View Related Messages**—View messages related to those selected on the list.

■ 📦—Broaden the scope of messages displayed. You can broaden the scope to include all messages for the domain, cluster, application deployment, or WebLogic Server.

■ **Refresh menu**—Specify an automatic or manual refresh rate.

To view the contents of a generated log file:

■ Click the log file icon associated with a message to view the contents of that log file.

■ Click **Target Log Files**... to display the Log Files page and view or download the contents of all generated log files.

For more information, see "Viewing and Searching Log Files" in *Administering Oracle Fusion Middleware*.

### 7.1.1.3 Filtering Diagnostic Logs

By default, the Log Messages page displays a summary of diagnostic messages logged over the last hour.

**To filter diagnostic logs:**

1. Filter the messages that are displayed by updating the search criteria using the following fields:
   - **Date Range**—Set the date range to one of the following:
     - Most Recent—Set the amount of time to define the duration.
     - Time Interval—Set the start and end dates to define the interval.
   - **Message Types**—Select the message types that you want to display.
   - **Add Fields**—Add other message fields to your search criteria, such as Message ID, Component, and so on.

2. Click **Search** once you have set the fields, as desired.

   The messages area is updated with the filtered results.

For more information, see "Viewing and Searching Log Files" in *Administering Oracle Fusion Middleware*.

### 7.1.1.4 Logging OWSM Debug Messages

To debug OWSM, pass one of the following properties when starting WebLogic Server, as required. For more information, see "Starting and Stopping Servers" in *Administering Server Startup and Shutdown for Oracle WebLogic Server*.

---

**Note:** Enabling one or more of these properties may negatively impact performance for very large messages. When enabled, OWSM creates temporary buffers which will result in additional load on the Java garbage collector.

---
7.1.2 Using Message Logs for Web Services

Message logs enable you to access the contents of the SOAP message requests and responses for ADF web services and clients. Messages logs are stored in a log file separate from the diagnostic messages, by default.

The following sections describe how to view and manage message log files:

- Configuring Message Logs
- Viewing Message Logs
- Filtering Message Logs

7.1.2.1 Configuring Message Logs

You configure message logs for a web service or client in one of the following ways:

- Attach a policy that contains a logging assertion to the web service or client.

  There is one predefined logging assertion template: oracle/security_log_template, described in "oracle/security_log_template" in Securing Web Services and Managing Policies with Oracle Web Services Manager. This template is configured to log the entire SOAP message for the web service request and response. By default, all predefined web service security policies use this logging assertion to capture the entire SOAP message before and after the primary security assertion is executed. By default, the log assertion is not enforced. You must enable it in order for the SOAP message to be logged in message logs, as described in “Enabling or Disabling Assertions Within a Policy” in Securing Web Services and Managing Policies with Oracle Web Services Manager. It is recommended that the logging assertion be enabled for debugging and auditing purposes only.

- Attach the oracle/log_policy policy to the web service or client. For more information, see "oracle/log_policy" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Create your own logging policy or assertion template to further refine the elements of the SOAP message that are logged for the web service request and response.

  For example, you may wish to view only the SOAP body of the request message. To create a new policy, following the procedure described in “Creating a New Web Service Policy” in Securing Web Services and Managing Policies with Oracle Web Services Manager. You may wish to create a copy of the oracle/security_log_template assertion template and configure it for use in the new policy. For more
information about creating a new assertion template, see "Cloning an Assertion Template" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

### 7.1.2.2 Viewing Message Logs
You can view the message log files for an ADF web service endpoint from the Log Messages page.

**To view message logs for a web service endpoint:**
Navigate to the Web Service Endpoint page, as described in "Viewing the Details for a Web Service Endpoint Using Fusion Middleware Control" on page 4-6, and in the Quick Links section of the Web Services Endpoint page (top right), click **Message Logs**.

The Log Messages page is displayed, similar to Figure 7–2. For more details about the contents of the Log Messages page, see "Viewing Diagnostic Logs" on page 7-4.

### 7.1.2.3 Filtering Message Logs
By default, the Log Messages page displays a summary of SOAP messages logged over the last hour. You can filter the messages that are displayed by updating the search criteria. The process is the same as for diagnostic logs; for more information, see "Filtering Diagnostic Logs" on page 7-5.

By default, the Component and Module message fields are included as part of the search criteria for message logs. The Component field is set to the WebLogic Server name; the Module field is set to oracle.wsm.msg.logging, which is the name of the message logging component.

### 7.1.3 Reviewing Sample Logs
The following sections provide excerpts from sample logs, demonstrating how to diagnose specific problems using the log entries.

- **Sample Log: OWSM Policy Manager Not Available**
- **Sample Log: Security Keystore Not Configured**
- **Sample Log: Certificate Not Available**

#### 7.1.3.1 Sample Log: OWSM Policy Manager Not Available
The following sample log excerpt indicates that the OWSM Policy Manager is down. To resolve this issue, restart the wsm-pm application, as described in "Starting and Stopping Applications" in Administering Oracle Fusion Middleware.

```
ERROR policymgr.PolicyManagerModelBean logp.251 - Service lookup failed with URL: t3://host.example.com:7001/wsm-pm oracle.wsm.policymanager.PolicyManagerException: WSM-02118 : The query service cannot be created.
```

#### 7.1.3.2 Sample Log: Security Keystore Not Configured
The following sample log excerpt indicates that an OWSM security policy with message protection was applied, but the keystore was not configured. To resolve this
security fault, configure the keystore, as described in "Configuring Keystores for Message Protection" in *Securing Web Services and Managing Policies with Oracle Web Services Manager*.

Feb 16, 2009 5:29:56 PM oracle.wsm.common.logging.WsmMessageLogger logSevere
SEVERE: The specified Keystore file /scratch/sbollapa/stage131/user_projects/domains/sai131_domain/config/fmwconfig/default-keystore.jks cannot be found; it either does not exist or its path is not included in the application classpath.

Feb 16, 2009 5:29:56 PM oracle.wsm.common.logging.WsmMessageLogger logSevere
SEVERE: Keystore is not properly configured in jps config.

Feb 16, 2009 5:29:56 PM oracle.wsm.common.logging.WsmLogUtil log
SEVERE: failure in OWSM Agent processRequest, category=security, function=agent.function.client, application=default, composite=p3test3, modelObj=Servicel, + policy=null, policyVersion=null, assertionName=null 
oracle.wsm.common.sdk.WSMException: WSM-00101 : The specified Keystore file /scratch/sbollapa/stage131/user_projects/domains/sai131_domain/config/fmwconfig/default-keystore.jks cannot be found; it either does not exist or its path is not included in the application classpath.

...
used for the signature is invalid.

### 7.2 Configuring Log Files for a Web Service

To further organize your logging data, you can configure the log files for a web service. You can configure log files for SOA and ADF services.

The following table defines the default log files that are relevant to OWSM.

<table>
<thead>
<tr>
<th>Default Log File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>odl-handler</td>
<td>Logs general diagnostic data for the Java EE components in the server.</td>
</tr>
<tr>
<td>owsm-message-handler</td>
<td>Logs SOAP messages as per OWSM logging policies.</td>
</tr>
</tbody>
</table>

The following procedure describes how to set the log level for diagnostic logs at the WebLogic Server and web service endpoint levels.

For more information about using Fusion Middleware Control or WLST to set the log levels, see "Setting the Level of Information Written to Log Files" in *Administering Oracle Fusion Middleware*.

**To configure the log files for a web service:**

1. Navigate to the WebLogic Server for which you want to configure a logger.
   a. In the navigation pane, expand **WebLogic Domain** to view the domain name.
   b. Expand the domain to see the list of servers.
   c. Select the desired server from the list.

   The WebLogic Server home page is displayed.

2. From the **WebLogic Server** menu, select **Logs > Log Configuration**.

   The Log Configuration page is displayed.

3. Select the **Log Files** tab.

   The current list of log files is displayed. The Log Configuration page shows the currently configured log path, file format, and rotation policy.

4. If you wish to edit the log policy configuration, select the log file in the list and click **Edit Configuration** . . .

   The Edit Log File page is displayed.
5. Edit the log file information, as required.

**Table 7-3 Fields in Edit Log File Page**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log Path</td>
<td>Path to the log file. This field is required.</td>
</tr>
<tr>
<td>Log File Format</td>
<td>Format of the log file. Valid values are text or XML.</td>
</tr>
<tr>
<td>Log Level</td>
<td>Default log level for the logger. Select a log level from the list.</td>
</tr>
<tr>
<td></td>
<td>Valid values include:</td>
</tr>
<tr>
<td></td>
<td>■ INCIDENT_ERROR:1 (SEVERE+100)</td>
</tr>
<tr>
<td></td>
<td>■ ERROR:1 (SEVERE)</td>
</tr>
<tr>
<td></td>
<td>■ WARNING:1 (WARNING)</td>
</tr>
<tr>
<td></td>
<td>■ NOTIFICATION:1 (INFO)</td>
</tr>
<tr>
<td></td>
<td>■ NOTIFICATION:16 (CONFIG)</td>
</tr>
<tr>
<td></td>
<td>■ TRACE:1 (FINE)</td>
</tr>
<tr>
<td></td>
<td>■ TRACE:16 (FINER)</td>
</tr>
<tr>
<td></td>
<td>■ TRACE:32 (FINEST)</td>
</tr>
<tr>
<td>Use Default Attributes</td>
<td>Flag that specifies whether to use default attributes for the logger.</td>
</tr>
<tr>
<td>Supplemental Attributes</td>
<td>Supplemental attributes required.</td>
</tr>
<tr>
<td>Loggers to Associate</td>
<td>Components to associate with the logger.</td>
</tr>
<tr>
<td>Rotation Policy</td>
<td>Specify whether you wish to rotate log files based on file size or length of time. For more information, see &quot;Configuring Log File Rotation&quot; in <em>Administering Oracle Fusion Middleware</em>.</td>
</tr>
<tr>
<td></td>
<td>If Size Based is selected as the rotational policy, Maximum Log Files Size is a required field. If Time Based is selected as the rotational policy, Frequency is a required field.</td>
</tr>
</tbody>
</table>

6. Click **OK** to edit the log file configuration.
Managing Application Migration Between Environments

This chapter describes how to migrate web service applications between environments, such as from development or test to production. It includes the following sections:

This chapter includes the following sections:

- Overview of Web Service Application Migration
- Overview of Horizontal Policy Migration
- Migrating Policies
- Migrating Policy Configuration
- Migrating Assertion Templates

For information about moving from a test environment to a production environment, see "Moving from a Test to a Production Environment" in *Administering Oracle Fusion Middleware*.

### 8.1 Overview of Web Service Application Migration

To migrate web service applications independently between environments, such as from test to production, or in a scaled clustered environment, you must export the policies and the deployment configuration information to the new environment so that you can deploy the application. Depending on your configuration, you may also need to migrate policy configuration artifacts and policy assertion templates.

A deployment descriptor is an XML file that contains the basic deployment configuration for an application. For WebLogic Server and Java EE web service applications, you create a deployment plan that contains the necessary deployment descriptors for deploying the application in a new environment.

For ADF Business Components, however, run-time policy changes are persisted in proprietary deployment descriptor (PDD) files: `oracle-webservices.xml` and `oracle-webservices-client.xml`. Because these files are not included in the WebLogic deployment plan or exported with any other deployment descriptors, you must export and import these PDD files separately. You must also export and import these PDD files separately if you are scaling your application in a clustered environment.

Note that the following Oracle Infrastructure web services components provide different configuration management mechanisms.
Overview of Horizontal Policy Migration

For a SOA composite, web services and OWSM configurations are persisted in a composite.xml file which is included in a configuration plan used for deployment configuration. The SOA framework provides its own mechanism for composite services and configuration lifecycle and synchronizations.

ADF Web Service data control configuration stores connection details for WebCenter services in a connections.xml file and all post-deployment changes as customizations in the Metadata Services (MDS) repository.

The general steps for migrating a web service application from a development or test environment to a production environment are as follows:

1. Install and configure the production environment with the components that you need.
2. Migrate security information, such as users and groups, the identity and policy stores, and credentials. For more information, see "Migrating Policy Configuration" on page 8-4.
3. Migrate policies and deployment configuration data as required. For more information, see "Migrating Policies" on page 8-3. Modify any information that is specific to the new environment such as host name or ports.
4. Deploy the applications in the new environment.

For information about migrating Fusion Middleware applications between environments, see "Advanced Administration: Expanding Your Environment" in Administering Oracle Fusion Middleware.

8.2 Overview of Horizontal Policy Migration

The following steps describe a typical scenario for how to create a policy and migrate the policy horizontally through the different stages of the application development and deployment cycles.

1. Use Oracle Enterprise Manager Fusion Middleware Control to create a policy.
   For more information, see "Creating and Editing Web Service Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
2. Export the policy to a zip archive.
   For more information, see "Migrating Policies" on page 8-3.
3. Extract the contents of the META-INF directory in the zip archive to the policy store location in the Oracle JDeveloper environment. For more information, see "Exporting Policies from the OWSM Repository for Use in JDeveloper" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
4. Create a web service in Oracle JDeveloper and attach the policy to the web service.
   For more information, see "Developing and Securing Web Services" in Developing Applications with Oracle JDeveloper.
5. Deploy the web service to the staging server, and test the web service.
   For more information, see "Developing and Securing Web Services" in Developing Applications with Oracle JDeveloper.
6. Import the policy to the production server environment.
   For more information, see "Migrating Policies" on page 8-3.
7. Migrate the following information, as required:
8.3 Migrating Policies

You can export one or more user-created policies to an archive file using Fusion Middleware Control. You can then import the archive to move it to another repository.

---

**Note:** Read-only documents, such as predefined policies and assertion templates, will not be imported or exported using either Fusion Middleware Control or WLST because they will already be present in the target environment.

---

For details about exporting and importing user-created policies using Fusion Middleware Control, refer to the following topics in *Securing Web Services and Managing Policies with Oracle Web Services Manager*:

- Exporting Web Service Policies
- Importing Web Service Policies

Alternatively, you can use the `exportWSMRepository` and `importWSMArchive` WLST commands to export and import the policies. The following describes the steps required:

To migrate policies using WLST commands:

1. Export the OWSM policies to a supported archive file, such as a zip file, using the `exportWSMRepository` command.
   
   For example, to export all user-created OWSM policies named in the test/directory to an archive named `policies.zip`, enter the following:
   
   ```
   wls:/jrfServer_domain/serverConfig> exportWSMRepository('/tmp/policies.zip', ['policies:test/%'])
   ```
   
   Exporting */policies/test/wss11_x509_token_with_message_protection_service_policy_test*
   
   Exporting */policies/test/wss_username_token_over_ssl_service_policy_Test*
   
   Successfully exported "2" documents.

2. Optionally, you can edit the archive after it has been created. If, for example, you do not want to migrate all the policies to the new environment, you can manually remove them from the archive.

3. Move the archive to the new machine. Ensure that the OWSM Policy Manager is deployed on the new machine.

4. Import the OWSM policies using the `importWSMArchive` command. For example, to import the policies exported in the previous step:
   
   ```
   wls:/jrfServer_domain/serverConfig> importWSMArchive('/tmp/policies.zip')
   ```
   
   Importing "META-INF/policies/test/wss11_x509_token_with_message_protection_service_policy_test"
8.4 Migrating Policy Configuration

The following sections describe how to migrate the configuration artifacts for OWSM policies. Sections include:

- Migrating Keystores
- Migrating Users and Groups
- Migrating Credentials
- Migrating Oracle Platform Security Services Application and System Policies
- Migrating Oracle Platform Security Services Configuration
- Migrating SSL
- Migrating Kerberos Configuration

8.4.1 Migrating Keystores

If you are using message protection policies, you need to migrate your keystores. To migrate keystores:

1. Manually copy your keystores to the new environment.
   
   For Java SE applications, copy the keystore to a user-defined location. For Java EE applications, copy the keystore to the same directory as the jps-config.xml file, namely DOMAIN_HOME/config/fmwconfig.

2. By default, the keystore is named default-keystore.jks. If you have renamed the keystore, you must configure the keystore name in the Oracle Platform Security Services keystore service instance.

For information about configuring the keystore, see "Configuring Keystores for Message Protection" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

8.4.2 Migrating Users and Groups

Users and groups are maintained as part of the WebLogic Server security realm.

To migrate users and groups in embedded LDAP, you can migrate the data using either the Oracle WebLogic Administration Console or WLST. For a complete description of the steps required, see "Migrating Security Data" in Administering Security for Oracle WebLogic Server.

To migrate users and groups in an LDAP store, there is no migration path. You need to recreate the users and groups and specify the assignments in the LDAP store in the new environment. See "Configuring Authentication Providers" in Administering Security for Oracle WebLogic Server.
8.4.3 Migrating Credentials

There are two types of credentials maintained in the credential store that you may need to migrate:

- Username and password
- Keystore and encryption key passwords

The migration steps are described in the sections below.

8.4.3.1 Migrating Username and Password

If users are stored in an embedded LDAP and migrated, as described in "Migrating Users and Groups" on page 8-4, then you simply migrate the existing credentials to the new credential store. For a complete description of the steps required, see "Migrating Security Data" in Administering Security for Oracle WebLogic Server.

If users are stored in an LDAP store, there is no automated migration path. You need to recreate the credentials in the credential store. For more information about configuring credentials, see "Configuring the Credential Store" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

8.4.3.2 Migrating Keystores and Encryption Key Passwords

You can migrate keystores and encryption key passwords manually using the procedure described in "Migrating Credentials Manually" in "Deploying Secure Applications" in Securing Applications with Oracle Platform Security Services.

8.4.4 Migrating Oracle Platform Security Services Application and System Policies

If your web service uses authorization policies, you must migrate the Oracle Platform Security Services application and system policies that grant permissions. For more information, see "Migrating with the Script migrateSecurityStore" in "Configuring the OPSS Security Store" in Securing Applications with Oracle Platform Security Services.

8.4.5 Migrating Oracle Platform Security Services Configuration

There is no automated migration path for Oracle Platform Security Services configuration. You must recreate the configuration in the new environment.

There are three types of configurations in the Oracle Platform Security Services that you may need to recreate:

- SAML trusted assertion issuer names (applicable for all SAML policies).
  
  If you use the default configuration for SAML trusted issuer configuration, then no migration is required. For information about configuring SAML in the new environment, see "Configuring the SAML and SAML2 Login Modules Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Keystore locations and CSF key configuration for keystore and keystore password (applicable for message protection policies only).
  
  If you use the default configuration for keystores, then no migration is required. For information about configuring keystores in the new environment, see "Configuring Keystores for Message Protection" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Keytab location and service principal name (applicable to Kerberos policy).
For information about configuring the keytab location and service principal name in the new environment, see the following topics in Securing Web Services and Managing Policies with Oracle Web Services Manager:

- Configuring the SAML and SAML2 Login Modules Using Fusion Middleware Control
- Configuring the Kerberos Login Module Using Fusion Middleware Control

8.4.6 Migrating SSL

There is no automated migration path for SSL configuration. You must configure SSL keystores and settings in the new environment. For more information about configuring SSL keystores and settings in the new environment, see "Configuring Keystores for SSL" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

8.4.7 Migrating Kerberos Configuration

To migrate the Kerberos configuration:

1. Copy the Kerberos configuration file to the new environment, matching the directory structure. The Kerberos configuration file is located in the following locations, based on your operating system:
   - UNIX: /etc/krb5.conf
   - Windows: C:\windows\krb5.ini
2. Initialize the ticket cache with the correct credentials.
   For more information, see "Configuring Kerberos Tokens" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

8.5 Migrating Assertion Templates

You can export individual assertion templates from Oracle Enterprise Manager Fusion Middleware Control. You can then copy the policy to a directory or import the policy to move it to another repository.

For details about exporting and importing assertion templates, see "Managing Policy Assertion Templates" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
This chapter describes how to register web services and sources in Enterprise Manager from a WSIL or UDDI registry. It also describes how to publish registered resources to the UDDI registry. Topics include:

This chapter includes the following sections:

- Registering Web Services and Sources
- Publishing Web Services to UDDI

### 9.1 Registering Web Services and Sources

A key feature of the web services model is the ability to make web services widely available and discoverable. UDDI is one approach to publishing and discovery of web services that centralizes information about businesses and their services in registries. Another emerging alternative standard is the Web Services Inspection Language (WSIL) specification.

Oracle Enterprise Manager Fusion Middleware Control can register web services that are published in WSIL documents and UDDI v3 registries. Any service that is available in a WSIL document or a UDDI v3 registry can be registered within Enterprise Manager.

You can also register meta information, or a profile, for sources of services to help you manage your registered services within Enterprise Manager. Once you register a source and assign it a logical name, you do not need to specify connectivity information, such as a URL for a WSDL, in the future. A domain can have multiple registered sources, and each registered source can have multiple registered services. Once you register a source, you can easily look up services that you can register to the source.

Service names and corresponding WSDLs must be unique within a registered single source. Once you have registered a service, an attempt to register another service with the same name, or a different name but the same WSDL URL as another service, is not valid.

Once you register a web service, you can later, more conveniently, reference the service from a selection list within Enterprise Manager. For example, when testing a web service as described in Chapter 5, "Testing Web Services," instead of specifying a WSDL, you can click the Search icon and then select the WSDL from the list of registered services.
9.1.1 Understanding UDDI Basics

Universal Description Discovery & Integration (UDDI) is an industry initiative that aims to enable businesses to quickly, easily, and dynamically find and carry out transactions with one another. A populated UDDI registry contains cataloged information about businesses; the services that they offer; and communication standards and interfaces they use to conduct transactions.

The owners of web services publish them to the UDDI registry. Once published, the UDDI registry maintains pointers to the web service description and to the service. The UDDI allows clients to search this registry, find the intended service, and retrieve its details. These details include the service invocation point as well as other information to help identify the service and its functionality.

9.1.2 Understanding WSIL Basics

WSIL defines an Extensible Markup Language (XML) format for referencing web service descriptions. These references are contained in a WSIL document, and refer to web service descriptions (for example, WSDL files) and to other aggregations of web services (for example, another WSIL document or a UDDI registry).

WSIL documents are typically distributed by the web service provider. These documents describe how to inspect the provider's web site for available web services. Therefore, the WSIL standard also defines rules for how WSIL documents should be made available to consumers of web services.

The WSIL model decentralizes web service discovery. In contrast to UDDI registries, which centralize information on multiple business entities and services, WSIL makes it possible to provide web service description information from any location. Unlike UDDI, WSIL is not concerned about business entity information, and does not require a specific service description format. It assumes that you know who the service provider is and relies on other standards for web service description, such as WSDL.

9.1.3 Viewing Registered Sources and Web Services

Follow the steps in this section to view and edit a registered source and web service.

1. In the navigation pane, expand WebLogic Domain to show the domain in which you want to view the registered sources and web services.

2. Select the domain.

3. From the WebLogic Domain menu, select web Services then Registered Services. The Registered Sources and Services page appears, as shown in Figure 9–1.
In the Sources table, you can view the following information about each registered source:

- **Name**—Logical name for the source
- **Description**—Description of the source
- **Source URL**—Location of the source in URL format
- **Type**—Source type: UDDI v3 registry import, WSIL import from file, WSIL import from URL
- **User ID**—User ID for the external source

You can customize the information that is displayed using the View menu. From this section of the page, you can also add new sources, edit or delete sources, register web services for a source, and publish a web service from a source to a predefined UDDI registry.

4. **Select a source in the Sources table.**

Each registered source can have multiple registered services. In the Services table, you can view the following information about the registered services imported from the selected source location:

- **Name**—Name of the registered service
- **Description**—Description of the service
- **Service location**—Location of the service in URL format

You can customize the information that is displayed using the View menu. You can also display the WSDL for the selected service and test the selected web service.

### 9.1.4 Registering a Source

You can register web service sources of the following types:

- UDDI v3 registry import
- WSIL import from URL
- WSIL import from file
Follow the steps in this section to register a source.

**To register a source**

1. In the navigation pane, expand **WebLogic Domain** to show the domain in which you want to register a web service source.
2. Select the domain.
3. From the **WebLogic Domain** menu, select **Web Services** then **Registered Services**. The Registered Sources and Services page appears, as shown in Figure 9–1.
4. Click **Add** to register a new source. The Register New Source page appears, as shown in Figure 9–2.

**Figure 9–2 Register New Source Page**

5. Enter the following information for the new source.
   - **Name**—A logical name for the source.
   - **Description**—A description of the source.
   - **Type**—choose from one of three options: UDDI v3 registry import, WSIL import from URL, or WSIL import from File
     Additional information that you need to enter differs based on the option you select.

6. If you selected **UDDI v3 registry import**, enter the following information:
   - In the **Source URL** field, enter the UDDI inquiry URL, for example, http://somehost/uddi/inquiry.
   - To allow the services to be published to a UDDI source (which is an external UDDI registry), select the **Enable** box and complete the fields as follows:
     - In the **Publication URL** field, enter URL location of the registry to which you want to publish the service.
     - In the **Security URL** field, enter the URL location of the security port required to access the registry.
     - In the **User ID** and **Password** fields, enter the security credentials required to access the registry.

7. If you selected **WSIL import from URL**, enter the following information:
   - In the **Source URL** field, enter the location of the WSIL in URL form.
   - If a username and password are required to access the WSIL, select the **Enable** box in the **Basic Authorization** field. In the **User ID** and **Password** fields, enter the username and password.
8. If you selected **WSIL import from File**, click **Browse** (next to the **WSIL File** field) to select the WSIL file to be imported.

9. Click **OK** to register the source.

### 9.1.5 Registering Web Services from a UDDI Source

Follow the steps in this section to register web services from a registered UDDI source.

1. In the navigation pane, expand **WebLogic Domain** to show the domain in which you want to register a web service.

2. Select the domain.

3. From the **WebLogic Domain** menu, select **Web Services** then **Registered Services**. The Registered Sources and Services page displays, as shown in Figure 9–1.

4. Select the UDDI source from which you want to register services. Note that the Type for a UDDI source is specified as UDDI v3 registry import.

5. Select **Register Web Services**.

   The Register New Service page displays, as shown in Figure 9–3.

**Figure 9–3 Register New Service from UDDI Source**

The Register New Service page displays the source information, in read-only format, and a list of the services that are available in UDDI that you can register.

You can filter the list of available services that are displayed using the **Service Name** and **Service Key** fields. For example, to find calculator services, enter `calc` in the **Service Name** field. Only services that contain the `calc` string, such as calculator services are displayed. The search is not case-sensitive.

In the Services available in UDDI section of the page, you can view service details from UDDI for each service in the table by clicking the **View Service Details** icon. The Service Details from UDDI window displays information about the service such as the Service Name, Service Description, Service WSDL, Service Key, Business Key, and Service Location, among others.

You can edit the details of a service by clicking the **Edit** icon, which allows you to change the name and description of the selected service.
6. In the Services available in UDDI section of the page, select the service or services that you want to register from the source and click **Register**.
A confirmation message displays indicating that the service was registered successfully.

9.1.6 Registering Web Services from a WSIL Source

Follow the steps in this section to register web services from a registered WSIL source.

1. In the navigation pane, expand **WebLogic Domain** to show the domain in which you want to register a web service.

2. Select the domain.

3. From the **WebLogic Domain** menu, select **Web Services** then **Registered Services**. The Registered Sources and Services page displays, as shown in Figure 9–1.

4. Select the WSIL source from which you want to register services. Note that the Type for a WSIL source is specified as either WSIL import from File or WSIL import from URL.

5. Select **Register Web Services**.
   The Register New Service page displays, as shown in Figure 9–4.

![Figure 9–4 Register New Service from WSIL Source](image)

The Register New Service page displays the Source information, in read-only format, and a list of available services, if any, in the WSIL that you can register, shown in the Services Available in WSIL table. If there are any WSIL references in the WSIL, they are listed in the References Available in WSIL table.

In the Services Available in WSIL table, you can edit the details of a service by clicking the **Edit** icon, which allows you to change the name and description of the selected service.

6. To register a service available from the current WSIL, select the service in the Services Available in WSIL table and click **Register**.
A confirmation message displays indicating that the service was registered successfully.
7. If the current WSIL also references other WSIL URLs or references, expand **References Available in WSIL** to display them. You can register the referenced web services as well.

To register a service from a referenced WSIL instead of the current WSIL, click the **Process** icon for the reference in the References Available in WSIL table.

If the WSIL parses successfully, a new source is registered and the current WSIL source is replaced by the referenced WSIL. The services available in the referenced WSIL source are listed in the Services Available in WSIL table. You can then register services from the referenced WSIL.

---

**Note:** For each new source created, _n_ is appended to the parent source name. For example, if the parent source name is `wsil_file_1`, then referenced new sources are named `wsil_file_1_1`, `wsil_file_1_2`) with source type WSIL URL. The new sources are listed in the Sources table in the Registered Sources and Services page.

---

If the WSIL does not parse successfully, an error message displays. Usually, in such cases, the system successfully registers the new source for the selected WSIL reference. However, because the system could not parse the WSIL document, the error message displays. Close the error dialog and click **OK** to return to the Registered Sources and Services page.

WSIL parsing can fail if the reference is bad or it needs authorization credentials. You can enable authorization for the WSIL source as described in "Registering a Source" on page 9-3.

---

**Note:**

When the system fails to retrieve web services from a registered source, because of connection or other failures, the Register New Service page is displayed with read only information for the source, but does not show any web services. In such cases, click **OK** in the error dialog, if an error dialog is displayed, then click **OK** in the Register New Service page to return to the Registered Sources and Services page. To troubleshoot, you can then view the registered sources through other means. For example, if the source is a:

- WSIL URL source, copy the URL to a browser address bar to view its contents.
- WSIL file source, examine the WSIL file using an XML editor.
- UDDI source, try to access the UDDI registry directly to investigate.

You can also review any related Enterprise Manager error logs.

---

### 9.1.7 Deleting a Web Service or Web Service Source

Follow the steps in this section to delete a web service or a web service source.

1. In the navigation pane, expand **WebLogic Domain** to show the domain in which you want to delete a web service.

2. Select the domain.
3. From the **WebLogic Domain** menu, select **Web Services** then **Registered Services**. The Registered Sources and Services page displays, as shown in Figure 9–1.

4. Do one of the following:
   - To delete a source, select the source from the Sources table and click **Delete**. A confirmation message displays. Click **OK** to delete the source.
   - To delete a service from a source, select the source in the Sources table. The registered web services are displayed in the Services table. Select the service to be deleted from the Services table and click **Delete**. A confirmation message displays. Click **OK** to delete the service.

### 9.2 Publishing Web Services to UDDI

You can publish web services to UDDI from a registered UDDI source and from the web services summary page for ADF and Java EE applications. Registered UDDI sources are listed in the Registered Sources and Services page, which includes all sources and services registered in a domain. The Web Services summary page lists the web services in an application.

**Notes:** You need to use a proxy to publish a service to UDDI, since this requires access to URLs outside of your firewall. For more information about the required proxy settings, see "Configuring the Proxy Server for UDDI" on page 9-11.

If your services are already in Oracle Enterprise Repository (OER) then you should use the OER Exchange Utility to publish those services to Oracle Service Registry.

The following procedures describe how to publish web services to UDDI.

- "Publishing a Web Service to UDDI from a Registered Source" on page 9-8
- "Publishing a Web Service to UDDI from an Application" on page 9-10
- "Configuring the Proxy Server for UDDI" on page 9-11

#### 9.2.1 Publishing a Web Service to UDDI from a Registered Source

**To publish a web service to UDDI from a registered source:**

1. Navigate to the Registered Sources and Services page as described in "Viewing Registered Sources and Web Services" on page 9-2.
2. Select the source row in the Sources table and then **Publish to UDDI**.
3. In the Publish Service to UDDI window, enter the information about the service to be published:
   - **Service Name** is the name of the web service to be published to the UDDI registry. This field is required.
   - **Service Description** is a description of the selected web service.
   - **Service Definition Location** is the URL location of the service definition. This field is required.
   - **UDDI Source** is the name of the UDDI source from which the service is to be registered. This field is read only.
   - **Business Name** is the name of the data structure in the UDDI registry. It is assumed that the business has already been registered in the UDDI. Choose the Business name from the list. This field is required.

4. Click **OK** in the Publish Service to UDDI window.

   The system verifies that the service specified has a valid WSDL and that the UDDI registry has accepted the new entry or updated an existing one. If it is successful, a confirmation message displays and the service is published to the registry.

   Once the service is published in the UDDI, it becomes available to be registered to a source, as described in “Registering Web Services from a UDDI Source” on page 9-5.

   Any errors during the operation will result in an error message.

   Note that you can only register the service to a source if it uses a unique WSDL.
9.2.2 Publishing a Web Service to UDDI from an Application

To publish a web service to UDDI from an application:

1. Navigate to the Web Services application summary page as described in "Viewing the Web Services Summary Page for an Application" on page 4-3.

2. From the Web Service Details section of the page, select the **Web Services** tab, if it is not already selected, then select the service to be published.

3. Select **Actions**, then **Publish to UDDI**. See Figure 9–7.

4. In the Publish Service to UDDI dialog box (Figure 9–8), enter the information about the service to be published:
   - **Service Name** is the name of the web service to be published to the UDDI registry. This field is required.
   - **Service Description** is a description of the selected web service.
   - **Service Definition Location** is prepopulated with the URL location of the service definition (This field is read-only.)
   - **UDDI Source** is a logical name for the UDDI registry source. Choose the UDDI source from the list. This field is required.

   **Note:** The list contains the UDDI sources registered in the domain that have been enabled for publishing. For more information about registered sources, see "Registering Web Services and Sources" on page 9-1.

   - **Business Name** is the name of the data structure in the UDDI registry. It is assumed that the business has already been registered in the UDDI. Choose the business name from the list. This field is required.
5. Click OK to connect to the external UDDI registry and register the web service.
Upon successfully registering the service, a confirmation message displays. Any errors during the operation will result in an error message.

9.2.3 Configuring the Proxy Server for UDDI

To access URLs outside of your firewall, you must use a proxy to publish a service to UDDI.

Before starting Oracle WebLogic, you must set the Java system properties defined in Table 9–1. You can set them as environment variables, or in Oracle WebLogic startup files.

Table 9–1  Java System Properties Used to Specify the Proxy Server for UDDI

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxySet=true</td>
<td>Flag that specifies that the WebLogic proxy properties should be used.</td>
</tr>
<tr>
<td>http.proxyHost=proxyHost</td>
<td>Name of the host computer on which the proxy server is running.</td>
</tr>
<tr>
<td>http.proxyPort=proxyPort</td>
<td>Port to which the proxy server is listening.</td>
</tr>
<tr>
<td>http.nonProxyHosts=hostname1 hostname2 ...</td>
<td>List of hosts that should be reached directly, bypassing the proxy. Separate each host name using a</td>
</tr>
</tbody>
</table>

For example:

```
set PROXY_SETTINGS="-DproxySet=true -Dhttp.proxyHost=www-proxy.example.com -Dhttp.proxyPort=80 -Dhttp.nonProxyHosts=localhost|${HOST}|*.example.com"
```
This appendix provides reference information about the Web service and OWSM events that can be audited using the Oracle Fusion Middleware Audit Framework, as described in "Auditing Web Services" on page 6-17.

For complete details on using the Oracle Fusion Middleware Audit Framework, see "Using Audit Analysis and Reporting" in Securing Applications with Oracle Platform Security Services.

This appendix contains the following sections:

- Web Service Audit Events
- Pre-built Audit Reports

## A.1 Web Service Audit Events

This section describes the components that are audited and the types of events that can be audited.

- "OWSM-AGENT Events and Attributes" on page A-1
- "OWSM-PM-EJB Events and Attributes" on page A-2
- "Web Services Policy Attachment Events and Attributes" on page A-4
- "Oracle Web Services Events and Attributes" on page A-4

### A.1.1 OWSM-AGENT Events and Attributes

The following table summarizes the OWSM-AGENT event types that can be audited.
### Table A–1  OWSM-AGENT Events

<table>
<thead>
<tr>
<th>Event Category</th>
<th>Event Type</th>
<th>Attributes used by Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>UserSession</td>
<td>Authentication</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventType,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>MessageText, FailureCode, RemoteIP, Resource, AssertionName, CompositeName, Endpoint,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>AgentMode, ModelObjectName, Operation, ProcessingStage, Version, Protocol</td>
</tr>
<tr>
<td>Authorization</td>
<td>Check Authorization</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance,</td>

</tbody>
</table>

### A.1.2 OWSM-PM-EJB Events and Attributes

The following table summarizes the OWSM-PM-EJB event types that can be audited.
<table>
<thead>
<tr>
<th>Event Category</th>
<th>Event Type</th>
<th>Attributes used by Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assertion Template</td>
<td>Create Assertion</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version</td>
</tr>
<tr>
<td></td>
<td>Delete Assertion</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version, ToVersion</td>
</tr>
<tr>
<td></td>
<td>Modify Assertion</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version</td>
</tr>
<tr>
<td>Intent Authoring</td>
<td>Create Intent</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version</td>
</tr>
<tr>
<td></td>
<td>Delete Intent</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version, ToVersion</td>
</tr>
<tr>
<td></td>
<td>Modify Intent</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version</td>
</tr>
<tr>
<td>Policy Authoring</td>
<td>Create Policy</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version</td>
</tr>
<tr>
<td></td>
<td>Delete Policy</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version, ToVersion</td>
</tr>
</tbody>
</table>
A.1.3 Web Services Policy Attachment Events and Attributes

The following table summarizes the WS-Policy attachment event types that can be audited.

<table>
<thead>
<tr>
<th>Event Category</th>
<th>Event Type</th>
<th>Attributes used by Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modify Policy</td>
<td>Policy Attachment Event</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventType, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, RemoteIP, Target, Resource, PolicyChangeType, PolicyURI, PolicyCategory, PolicyStatus, ServiceEndPoint, PolicySubjRescPattern</td>
</tr>
<tr>
<td>PolicySet Authoring</td>
<td>Create PolicySet</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventType, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version</td>
</tr>
<tr>
<td></td>
<td>Delete PolicySet</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventType, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version, ToVersion</td>
</tr>
<tr>
<td></td>
<td>Modify PolicySet</td>
<td>ComponentType, InstanceId, HostId, HostNwaddr, ProcessId, OracleHome, HomeInstance, ECID, RID, ContextFields, SessionId, TargetComponentType, ApplicationName, EventType, EventCategory, EventStatus, TstzOriginating, ThreadId, ComponentName, Initiator, MessageText, FailureCode, Resource, Version</td>
</tr>
</tbody>
</table>

A.1.4 Oracle Web Services Events and Attributes

The following table summarizes the Oracle Web Services event types that can be audited.
A.2 Pre-built Audit Reports

Oracle Fusion Middleware Audit Framework provides a range of out-of-the-box reports that are accessible through Oracle Business Intelligence Publisher. The OWSM audit reports are organized as follows:

- **User Activities**
  - Authentication History
  - Authorization History

- **Errors and Exceptions**
  - All Errors and Exceptions
  - Authentication Failures
  - Authorization Failures

- **All Events**

- **Policy Management**
  - Assertion Template Management
  - Web Services Policy Management

- **Policy Enforcements**
  - Confidentiality Enforcements
  - Policy Enforcements
  - Message Integrity Enforcements
  - Violations

---

### Table A–4 Oracle Web Services Events
