This preface describes the document accessibility features and conventions used in this guide—Developing and Securing RESTful Web Services for Oracle WebLogic Server 12.1.3.

Documentation Accessibility
For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support
Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Conventions
The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
What's New in This Guide

The following topics introduce the new and changed features of RESTful web services and provides pointers to additional information. This document was released initially in Oracle Fusion Middleware 12c Release 1 (12.1.1).

New and Changed Features for Release 12c (12.1.3)
Oracle Fusion Middleware Release 12c (12.1.3) includes the following new and changed features for this document.

- Reflects support of the Jersey 2.5.1 Java API for RESTful Web Services (JAX-RS) 2.0 Reference Implementation (RI) as a pre-built shared library. Because later versions of Jersey 2.x are not supported in this release, the section "Registering a More Recent Version of the Jersey 2.x JAX-RS RI" has been removed.
- Reflects support for the Jersey 1.18 JAX-RS 1.1. RI.

New and Changed Features for Release 12c (12.1.2)
Oracle Fusion Middleware 12c (12.1.3) includes the following new and changed features for this document.

- Secure RESTful web services using Oracle Web Services Manager (OWSM) policies. For more information, see "Securing RESTful Web Services and Clients Using OWSM Policies" on page 6-2.
- New standalone web service client JAR files that support basic RESTful web service client-side functionality and Oracle Web Services Manager (OWSM) security policy support. See "Invoking a RESTful Web Service from a Standalone Client" on page 4-10.
Introduction to RESTful Web Services

This chapter provides an overview of developing Java EE web services that conform to the Representational State Transfer (REST) architectural style using Java API for RESTful Web Services (JAX-RS) in WebLogic Server 12.1.3.

This chapter includes the following sections:

- Introduction to the REST Architectural Style
- What are RESTful Web Services?
- Standards Supported for RESTful Web Service Development on WebLogic Server
- Learn More About RESTful Web Services

For definitions of unfamiliar terms found in this and other books, see the Glossary.

1.1 Introduction to the REST Architectural Style

REST describes any simple interface that transmits data over a standardized interface (such as HTTP) without an additional messaging layer, such as Simple Object Access Protocol (SOAP). REST is an architectural style—not a toolkit—that provides a set of design rules for creating stateless services that are viewed as resources, or sources of specific information (data and functionality). Each resource can be identified by its unique Uniform Resource Identifiers (URIs).

A client accesses a resource using the URI and a standardized fixed set of methods, and a representation of the resource is returned. A representation of a resource is typically a document that captures the current or intended state of a resource. The client is said to transfer state with each new resource representation.

Table 1–1 defines a set of constraints defined by the REST architectural style that must be adhered to in order for an application to be considered "RESTful."

<table>
<thead>
<tr>
<th>Constraint</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressability</td>
<td>Identifies all resources using a uniform resource identifier (URI). In the English language, URIs would be the equivalent of a noun.</td>
</tr>
<tr>
<td>Uniform interface</td>
<td>Enables the access of a resource using a uniform interface, such as HTTP methods (GET, POST, PUT, and DELETE). Applying the English language analogy, these methods would be considered verbs, describing the actions that are applicable to the named resource.</td>
</tr>
<tr>
<td>Client-server architecture</td>
<td>Separates clients and servers into interface requirements and data storage requirements. This architecture improves portability of the user interface across multiple platforms and scalability by simplifying server components.</td>
</tr>
</tbody>
</table>
RESTful web services are services that are built according to REST principles and, as such, are designed to work well on the Web.

RESTful web services conform to the architectural style constraints defined in Table 1–1. Typically, RESTful web services are built on the HTTP protocol and implement operations that map to the common HTTP methods, such as GET, POST, PUT, and DELETE to create, retrieve, update, and delete resources, respectively.

### Table 1–1 (Cont.) Constraints of the REST Architectural Style

<table>
<thead>
<tr>
<th>Constraint</th>
<th>Description</th>
</tr>
</thead>
</table>
| Stateless interaction | Uses a stateless communication protocol, typically Hypertext Transport Protocol (HTTP). All requests must contain all of the information required for a particular request. Session state is stored on the client only. This interactive style improves:  
  - Visibility—Single request provides the full details of the request.  
  - Reliability—Eases recovery from partial failures.  
  - Scalability—Not having to store state enables the server to free resources quickly. |
| Cacheable           | Enables the caching of client responses. Responses must be identified as cacheable or non-cacheable. Caching eliminates some interactions, improving efficiency, scalability, and perceived performance. |
| Layered system      | Enables client to connect to an intermediary server rather than directly to the end server (without the client's knowledge). Use of intermediary servers improve system scalability by offering load balancing and shared caching. |

## 1.2 What are RESTful Web Services?

RESTful web services are services that are built according to REST principles and, as such, are designed to work well on the Web.

RESTful web services conform to the architectural style constraints defined in Table 1–1. Typically, RESTful web services are built on the HTTP protocol and implement operations that map to the common HTTP methods, such as GET, POST, PUT, and DELETE to create, retrieve, update, and delete resources, respectively.

## 1.3 Standards Supported for RESTful Web Service Development on WebLogic Server

The JAX-RS provides support for creating web services according to REST architectural style. JAX-RS uses annotations to simplify the development of RESTful web services. By simply adding annotations to your web service, you can define the resources and the actions that can be performed on those resources. JAX-RS is part of the Java EE 6 full profile, and is integrated with Contexts and Dependency Injection (CDI) for the Java EE Platform (CDI), Enterprise JavaBeans (EJB) technology, and Java Servlet technology.

WebLogic Server supports the following JAX-RS Reference Implementations (RIs):

- Jersey 1.18 (JAX-RS 1.1 RI) (the default implementation)
- Jersey 2.5.1 (JAX-RS 2.0 RI) (delivered as a shared library that you must register)

Each Jersey JAX-RS RI bundle includes the following functionality:

- Jersey
- JAX-RS API
- JSON processing and streaming

For more information about JAX-RS and samples, see Section 1.4, "Learn More About RESTful Web Services."
1.3.1 Jersey 1.18 (JAX-RS 1.1 RI)
Jersey 1.18 (JAX-RS 1.1 RI) is the default implementation and provides a production quality implementation of the JSR-311 JAX-RS 1.1 specification, defined at: https://jcp.org/en/jsr/summary?id=311.

The following table provides a roadmap of common tasks for developing, packaging and deploying, securing, testing, and monitoring RESTful web services and clients using Jersey 1.18 (JAX-RS 1.1 RI).

<table>
<thead>
<tr>

| Secure RESTful web services. | Chapter 6, "Securing RESTful Web Services and Clients" |
| Test RESTful web services. | Chapter 7, "Testing RESTful Web Services" |
| Monitor RESTful web services. | Chapter 8, "Monitoring RESTful Web Services and Clients" |
| (Optional) Update the version of the Jersey JAX-RS Reference Implementation (RI) used by your RESTful web service applications. | Chapter A, "Updating the Version of Jersey 1.x JAX-RS RI" |
| (Optional) Upgrade a RESTful web service that was built in the Oracle WebLogic Server 11g Release 1 (10.3.x) environment to run in the Oracle WebLogic Server 12c Release 1 (12.1.x) environment. | "Upgrading a 10.3.x RESTful Web Service (JAX-RS) to 12.1.x" in Upgrading Oracle WebLogic Server |

1.3.2 Jersey 2.5.1 (JAX-RS 2.0 RI)
WebLogic Server ships with a pre-built shared library, packaged as a Web application, that is required to run applications that are based on Jersey 2.5.1 (JAX-RS 2.0 RI). To take advantage of Jersey 2.5.1 (JAX-RS 2.0 RI) features, you need to register the shared library, as described in Chapter 2, "Registering Jersey 2.5.1 (JAX-RS 2.0 Reference Implementation)."

Table 1–3 lists key features delivered with Jersey 2.5.1 (JAX-RS 2.0 RI).

---

**Note:** RESTful web services and clients that are built using Jersey 2.5.1 (JAX-RS 2.0 RI) cannot be secured using Oracle Web Services Manager (OWSM) policies. If your applications require the use of OWSM security, then you will need to use the default implementation, Jersey 1.18 (JAX-RS 1.1 RI).
### Table 1–3  Key Features in Jersey 2.5.1 (JAX-RS 2.0 RI)

<table>
<thead>
<tr>
<th>Key Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| Client API                   | Communicate with RESTful web services in a standard way. The Client API facilitates the consumption of a web service exposed via HTTP protocol and enables developers to concisely and efficiently implement portable client-side solutions that leverage existing and well established client-side HTTP connector implementations. For complete details, see:  
  ■ "Client API" in *Jersey 2.5.1 User Guide*  
  ■ "Accessing Resources with the JAX-RS Client API" in *Java EE 7 Tutorial* |
| Asynchronous communication   | Invoke and process requests asynchronously. For complete details, see:   
  ■ "Asynchronous Services and Clients" in *Jersey 2.5.1 User Guide*  
  ■ "Advanced Features of the Client API" in *Java EE 7 Tutorial* |
| Filters and interceptors     | Using filters, modify inbound and outbound requests and responses, such as header information. Using interceptors, modify entity input and output streams. Filters and interceptors can be used on both the client and server side. For complete details, see "Filters and Interceptors" in *Jersey 2.5.1 User Guide*. |

Table 1–4 provides a roadmap of common tasks for registering and using Jersey 2.5.1 (JAX-RS 2.0 RI) to develop and secure RESTful web services and clients.

</table>
This chapter describes how to register and configure Jersey 2.5.1 Java API for RESTful Web Services (JAX-RS) 2.0 Reference Implementation (RI) for use with WebLogic Server 12.1.3.

This chapter includes the following sections:

- About Registering Jersey 2.5.1 (JAX-RS 2.0 RI)
- Registering the Jersey 2.5.1 (JAX-RS 2.0 RI) Shared Library With Your WebLogic Server Instances
- Configuring the Web Application to Use Jersey 2.5.1 (JAX-RS 2.0 RI)

2.1 About Registering Jersey 2.5.1 (JAX-RS 2.0 RI)

WebLogic Server ships with a pre-built shared library, packaged as a Web application, that is required to run applications that are based on Jersey 2.5.1 (JAX-RS 2.0 RI). To take advantage of Jersey 2.5.1 (JAX-RS 2.0 RI) features, you need to register the shared library and configure your Web applications, as described in the following sections:

- Section 2.2, "Registering the Jersey 2.5.1 (JAX-RS 2.0 RI) Shared Library With Your WebLogic Server Instances"
- Section 2.3, "Configuring the Web Application to Use Jersey 2.5.1 (JAX-RS 2.0 RI)"

**Note:** RESTful web services and clients that are built using Jersey 2.5.1 (JAX-RS 2.0 RI) cannot be secured using Oracle Web Services Manager (OWSM) policies in this release.

2.2 Registering the Jersey 2.5.1 (JAX-RS 2.0 RI) Shared Library With Your WebLogic Server Instances

Shared Java EE libraries are registered with one or more WebLogic Server instances by deploying them to the target servers and indicating that the deployments are to be shared. Shared Java EE libraries must be targeted to the same WebLogic Server instances you want to deploy applications that reference the libraries.

When a referencing application is deployed, WebLogic Server merges the shared library files with the application. If you try to deploy a referencing application to a server instance that has not registered a required library, deployment of the referencing application fails.
The following sections describe how to register Jersey 2.5.1 (JAX-RS 2.0 RI) shared library with your WebLogic Server instances using the following tools:

- "Using the Administration Console" on page 2-2
- "Using WLST" on page 2-2
- "Using Ant" on page 2-3
- "Using weblogic.Deployer" on page 2-3

2.2.1 Using the Administration Console

For each WebLogic Server instance to which you want to deploy Jersey 2.5.1 (JAX-RS 2.0 RI) applications, perform the following steps:

1. Log into the WebLogic Server Administration Console as described in "Accessing Oracle WebLogic Administration Console" in Administering Web Services with Oracle Fusion Middleware.
   
   For example:
   
   http://host:port/console

2. Select Deployments.

3. Click Install to install the shared library.

4. In the Path field, enter or navigate to the following directory: MW_HOME/wlservr/common/deployable-libraries.

5. Select the jax-rs-2.0.war file.

6. Click Next.

7. Select Install this deployment as a library.

8. Click Next.

9. Click Finish.

2.2.2 Using WLST

For each WebLogic Server instance to which you want to deploy Jersey 2.5.1 (JAX-RS 2.0 RI) applications, perform the following steps:

1. Invoke WLST, as described in "Invoking WLST" in Understanding the WebLogic Scripting Tool.

   For example:
   
   c:\Oracle\Middleware\wlservr\common\bin> wlst.cmd

2. Connect to the running instance using the connect command.

   For example:
   
   wls:/offline> connect('weblogic', 'welcome1', 't3://localhost:7001')

   For more information, see "connect" in WLST Command Reference for WebLogic Server

3. Deploy the shared library using the deploy command.

   For example:
   
   wls:/base_domain/serverConfig> deploy('jax-rs',
Registering Jersey 2.5.1 (JAX-RS 2.0 RI)

For more information, see "deploy" in WLST Command Reference for WebLogic Server.

4. Exit the WLST command session, as follows:

```
exit()
```

2.2.3 Using Ant

For each WebLogic Server instance to which you want to deploy Jersey 2.5.1 (JAX-RS 2.0 RI) applications, add an Ant task similar to the following to the build script:

```
<target name="deploy.jaxrs.2.0">
  <wldeploy action="deploy" source="${mw.home}/wlserver/common/deployable-libraries/jax-rs-2.0.war" name="jax-rs" user="${user}" password="${passwd}" adminurl="t3://${webServerHost}:${webServerPort}" verbose="true" targets="myserver" library="true" />
</target>
```

2.2.4 Using weblogic.Deployer

For each WebLogic Server instance for which you want to deploy JAX-RS 2.5.1 applications, use `weblogic.Deployer` to deploy the shared library files to the required target servers, and identify the deployment as a library using the `-library` option.

The following shows an example of how to deploy the Jersey 2.5.1 (JAX-RS 2.0 RI) shared library using `weblogic.Deployer`:

```
java weblogic.Deployer -verbose -noexit -source C:\Oracle\Middleware\wlserver\common\deployable-libraries\jax-rs-2.0.war -targets myserver -adminurl t3://localhost:7001 -user weblogic -password ******** -deploy -library
```

2.3 Configuring the Web Application to Use Jersey 2.5.1 (JAX-RS 2.0 RI)

You need to configure the Web application that contains the RESTful web services to use the Jersey shared libraries. Specifically, you need to update the `weblogic.xml` deployment descriptor files that are associated with your application to reference the shared library. The `weblogic.xml` file is located in the `WEB-INF` directory in the root directory of your application archive.

The following example shows how to update the `weblogic.xml` file to use Jersey 2.5.1 (JAX-RS 2.0 RI).

```xml
<?xml version="1.0" encoding="UTF-8"?>
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  <wls:library-ref>
    <library-name>jax-rs</library-name>
    <specification-version>2.0</specification-version>
  </wls:library-ref>
</wls:weblogic-web-app>
```
<exact-match>false</exact-match>
</wls:library-ref>
</wls:weblogic-web-app>
This chapter describes how to develop Java EE web services that conform to the Representational State Transfer (REST) architectural style using Java API for RESTful Web Services (JAX-RS) in WebLogic Server 12.1.3.

This chapter includes the following sections:

- About RESTful Web Service Development
- Defining the Root Resource Class
- Defining the Relative URI of the Root Resource and Subresources
- Mapping Incoming HTTP Requests to Java Methods
- Customizing Media Types for the Request and Response Messages
- Extracting Information From the Request Message
- Building Custom Response Messages
- Mapping HTTP Request and Response Entity Bodies Using Entity Providers
- Accessing the Application Context
- Building URIs
- Using Conditional GETs
- Accessing the WADL
- More Advanced RESTful Web Service Tasks

### 3.1 About RESTful Web Service Development

JAX-RS is a Java programming language API that uses annotations to simplify the development of RESTful web services. JAX-RS annotations are runtime annotations. When you deploy the Java EE application archive containing JAX-RS resource classes to WebLogic Server, as described in Chapter 5, "Building, Packaging, and Deploying RESTful Web Service Applications," the runtime configures the resources, generates the helper classes and artifacts, and exposes the resource to clients.

The following sections provide more information about RESTful web service development:

- Section 3.1.1, "Summary of Tasks to Develop RESTful Web Services"
- Section 3.1.2, "Example of a RESTful Web Service"
For information about developing RESTful web services using Oracle JDeveloper, see "Creating RESTful Web Services and Clients" in Developing Applications with Oracle JDeveloper.

### 3.1.1 Summary of Tasks to Develop RESTful Web Services

Table 3–1 summarizes a subset of the tasks that are required to develop RESTful web service using JAX-RS annotations. For more information about advanced tasks, see Section 3.13, "More Advanced RESTful Web Service Tasks."

**Note:** If you are using the Jersey 2.5.1 JAX-RS 2.0 Reference Implementation (RI), in addition to the development tasks described in Table 3–1, you may wish to take advantage of the new features available when developing your RESTful web services. For a list of key features available with Jersey 2.5.1 (JAX-RS 2.0 RI), see Table 1–3, "Key Features in Jersey 2.5.1 (JAX-RS 2.0 RI)."

3.1.2 Example of a RESTful Web Service

Example 3–1 provides a simple example of a RESTful web service. In this example:

- The helloWorld class is a resource with a relative URI path defined as /helloworld. At runtime, if the context root for the WAR file is defined as http://examples.com, the full URI to access the resource is http://examples.com/helloworld. For more information, see Section 3.3, "Defining the Relative URI of the Root Resource and Subresources."

- The sayHello method supports the HTTP GET method. For more information, see Section 3.4, "Mapping Incoming HTTP Requests to Java Methods."

- The sayHello method produces content of the MIME media type text/plain. For more information, see Section 3.5, "Customizing Media Types for the Request and Response Messages."

Additional examples are listed in Section 1.4, "Learn More About RESTful Web Services."

Example 3–1  Simple RESTful Web Service

```java
package samples.helloworld;

import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.Produces;

@Path("/helloworld")
public class helloWorld {

    @GET
    @Produces("text/plain")
    public String sayHello() {
        return "Hello World!";
    }
}
```

3.2 Defining the Root Resource Class

A root resource class is a Plain Old Java Object (POJO) for which one or both of the following statements are true:

- Is annotated with @Path. For more information, see Section 3.3, "Defining the Relative URI of the Root Resource and Subresources."

- Has at least one method annotated with @Path or with a request method designator, such as @GET, @POST, @PUT, or @DELETE. A resource method is a method in the resource class that is annotated using a request method designator. For more information, see Section 3.4, "Mapping Incoming HTTP Requests to Java Methods."

3.3 Defining the Relative URI of the Root Resource and Subresources

Add the javax.ws.rs.Path annotation at the class level of the resource to define the relative URI of the RESTful web service. Such classes are referred to a root resource
classes. You can add @Path on methods of the root resource class as well, to define
subresources to group specific functionality.

The following sections describe how to define the relative URI of the root resource and
subresources:

- Section 3.3.1, "How to Define the Relative URI of the Resource Class (@Path)"
- Section 3.3.2, "How to Define the Relative URI of Subresources (@Path)"
- Section 3.3.3, "What Happens at Runtime: How the Base URI is Constructed"

### 3.3.1 How to Define the Relative URI of the Resource Class (@Path)

The @Path annotation defines the relative URI path for the resource, and can be
defined as a constant or variable value (referred to as "URI path template"). You can
add the @Path annotation at the class or method level.

To define the URI as a constant value, pass a constant value to the @Path annotation.
Preceding and ending slashes (/) are optional.

In Example 3–2, the relative URI for the resource class is defined as the constant value,
/helloworld.

#### Example 3–2  Defining the Relative URI as a Constant Value

```java
package samples.helloworld;
import javax.ws.rs.Path;
...
// Specifies the path to the RESTful service
@Path("/helloworld")
public class helloWorld {...}
```

To define the URI as a URI path template, pass one or more variable values enclosed in
braces in the @Path annotation. Then, you can use the javax.ws.rsPathParam
annotation to extract variable information from the request URI, defined by the @Path
annotation, and initialize the value of the method parameter, as described in
Section 3.6.1, "How to Extract Variable Information from the Request URI (@PathParam)."

In Example 3–3, the relative URI for the resource class is defined using a variable,
enclosed in braces, for example, /users/{username}.

#### Example 3–3  Defining the Relative URI as a Variable Value

```java
package samples.helloworld;
import javax.ws.rs.Path;
...
// Specifies the path to the RESTful service
@Path("/users/{username}")
public class helloWorld {...}
```

To further customize the variable, you can override the default regular expression of
"[^/]+?" by specifying the expected regular expression as part of the variable
definition. For example:

@Path("users/{username: [a-zA-Z][a-zA-Z_0-9]*}
```

In this example, the username variable will match only user names that begin with one
uppercase or lowercase letter followed by zero or more alphanumeric characters or the
underscore character. If the username does not match the requirements, a 404 (Not Found) response will be sent to the client.

For more information, see the @Path annotation in the Java EE 6 Platform API Specification.

3.3.2 How to Define the Relative URI of Subresources (@Path)

Add the javax.ws.rs.Path annotation to the method of a resource to define a subresource. Subresources enable users to group specific functionality for a resource.

In Example 3–3, if the request path of the URI is users/list, then the getUserList subresource method is matched and a list of users is returned.

Example 3–4  Defining a Subresource

package samples.helloworld;

import javax.ws.rs.GET;
import javax.ws.rs.Path;

// Specifies the path to the RESTful service
@Path("/users")
public class UserResource {
   ...
   @GET
   @Path("/list")
   public String getUserList() { ...
   }
}

3.3.3 What Happens at Runtime: How the Base URI is Constructed

The base URI is constructed as follows:

http://myHostName/contextPath/servletURI/resourceURI

- **myHostName**—DNS name mapped to the Web Server. You can replace this with host:port which specifies the name of the machine running WebLogic Server and the port used to listen for requests.

- **contextPath**—Name of the standalone Web application. The Web application name is specified in the META-INF/application.xml deployment descriptor in an EAR file or the weblogic.xml deployment descriptor in a WAR file. If not specified, it defaults to the name of the WAR file minus the .war extension. For more information, see "context-root" in Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server.

- **servletURI**—Base URI for the servlet context path. This path is configured as part of the packaging options defined in Table 5–1. Specifically, you can define the servlet context path by:
  - Updating the web.xml deployment descriptor to define the servlet mapping.
  - Adding a javax.ws.rs.ApplicationPath annotation to the class that extends javax.ws.rs.core.Application, if defined.

If the servlet context path is configured using both options above, then the servlet mapping takes precedence. If you do not configure the servlet context path in your
configuration using either of the options specified above, the WebLogic Server provides a default RESTful web service application context path, resources. For more information, see Chapter 5, "Building, Packaging, and Deploying RESTful Web Service Applications."

- **resourceURI**—@Path value specified for the resource or subresource. This path may be constructed from multiple resources and subresources @Path values.

In Example 3–2, at runtime, if the context path for the WAR file is defined as rest and the default URI for the servlet (resources) is in effect, the base URI to access the resource is http://myServer:7001/rest/resources/helloworld.

In Example 3–3, at runtime, the base URI will be constructed based on the value specified for the variable. For example, if the user entered johnsmith as the username, the base URI to access the resource is http://myServer:7001/rest/resources/users/johnsmith.

### 3.4 Mapping Incoming HTTP Requests to Java Methods

JAX-RS uses Java annotations to map an incoming HTTP request to a Java method. **Table 3–2** lists the annotations available, which map to the similarly named HTTP methods.

<table>
<thead>
<tr>
<th>Annotation</th>
<th>Description</th>
<th>Idempotent</th>
</tr>
</thead>
<tbody>
<tr>
<td>@GET</td>
<td>Transmits a representation of the resource identified by the URI to the client. The format might be HTML, plain text, JPEG, and so on. See Section 3.4.2, &quot;How to Transmit a Representation of the Resource (@GET).&quot;</td>
<td>Yes</td>
</tr>
<tr>
<td>@PUT</td>
<td>Creates or updates the representation of the specified resource identified by the URI. See Section 3.4.3, &quot;How to Create or Update the Representation of the Resource (@PUT).&quot;</td>
<td>Yes</td>
</tr>
<tr>
<td>@DELETE</td>
<td>Deletes the representation of the resource identified by the URI. See Section 3.4.4, &quot;How to Delete a Representation of the Resource (@DELETE).&quot;</td>
<td>Yes</td>
</tr>
<tr>
<td>@POST</td>
<td>Creates, updates, or performs an action on the representation of the specified resource identified by the URI. See Section 3.4.5, &quot;How to Create, Update, or Perform an Action on a Representation of the Resource (@POST).&quot;</td>
<td>No</td>
</tr>
<tr>
<td>@HEAD</td>
<td>Returns the response headers only, and not the actual resource (that is, no message body). This is useful to save bandwidth to check characteristics of a resource without actually downloading it. For more information, see the @HEAD annotation in the Java EE 6 Platform API Specification. The HEAD method is implemented automatically if not implemented explicitly. In this case, the runtime invokes the implemented GET method, if present, and ignores the response entity, if set.</td>
<td>Yes</td>
</tr>
<tr>
<td>@OPTIONS</td>
<td>Returns the communication options that are available on the request/response chain for the specified resource identified by the URI. The Allow response header will be set to the set of HTTP methods supported by the resource and the WADL file is returned. For more information, see the @OPTIONS annotation in the Java EE 6 Platform API Specification. The OPTIONS method is implemented automatically if not implemented explicitly. In this case, the Allow response header is set to the set of HTTP methods supported by the resource and the WADL describing the resource is returned.</td>
<td>Yes</td>
</tr>
<tr>
<td>@HttpMethod</td>
<td>Indicates that the annotated method should be used to handle HTTP requests. For more information, see the @HttpMethod annotation in the Java EE 6 Platform API Specification.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
The following sections provide more information about the JAX-RS annotations used for mapping HTTP requests to Java methods.

- **Section 3.4.1, "About the Jersey Bookmark Sample"**
- **Section 3.4.2, "How to Transmit a Representation of the Resource (@GET)"**
- **Section 3.4.3, "How to Create or Update the Representation of the Resource (@PUT)"**
- **Section 3.4.4, "How to Delete a Representation of the Resource (@DELETE)"**
- **Section 3.4.5, "How to Create, Update, or Perform an Action on a Representation of the Resource (@POST)"**

### 3.4.1 About the Jersey Bookmark Sample

The examples referenced in the following sections are excerpted from the bookmark sample that is delivered with Jersey 1.18 (JAX-RS 1.1 RI). The bookmark sample provides a Web application that maintains users and the browser bookmarks that they set.

The following table summarizes the resource classes in the sample, their associated URI path, and the HTTP methods demonstrated by each class.

<table>
<thead>
<tr>
<th>Resource Class</th>
<th>URI Path</th>
<th>HTTP Methods Demonstrated</th>
</tr>
</thead>
<tbody>
<tr>
<td>UsersResource</td>
<td>/users/</td>
<td>GET</td>
</tr>
<tr>
<td>UserResource</td>
<td>/users/{userid}</td>
<td>GET, PUT, DELETE</td>
</tr>
<tr>
<td>BookmarksResource</td>
<td>/users/{userid}/bookmarks</td>
<td>GET, POST</td>
</tr>
<tr>
<td>BookmarkResource</td>
<td>/users/{userid}/bookmarks/{bmid}</td>
<td>GET, PUT, DELETE</td>
</tr>
</tbody>
</table>

The bookmark sample, and other Jersey samples, can be accessed in one of the following ways:

- Downloading the Jersey 1.18 software at [https://jersey.java.net](https://jersey.java.net)
- Browsing the Maven repositories at: [https://maven.java.net/content/repositories/releases/com/sun/jersey/samples](https://maven.java.net/content/repositories/releases/com/sun/jersey/samples)

### 3.4.2 How to Transmit a Representation of the Resource (@GET)

The `javax.ws.rs.GET` annotation transmits a representation of the resource identified by the URI to the client. The format or the representation returned in the response entity-body might be HTML, plain text, JPEG, and so on. For more information, see the `@GET` annotation in the [Java EE 6 Platform API Specification](https://docs.oracle.com/javaee/6/api/javax/ws/rs/GET.html).

In Example 3–5, the annotated Java method, `getBookmarkAsJsonArray`, from the `BookmarksResource` class in the Jersey bookmark sample, will process HTTP GET requests. For more information about the Jersey bookmark sample, see **Section 3.4.1, "About the Jersey Bookmark Sample."**

**Example 3–5  Mapping the HTTP GET Request to a Java Method (BookmarksResource Class)**

```java
import javax.ws.rs.GET;
import javax.ws.rs.Produces;
import javax.ws.rs.Path;
```
public class BookmarksResource {
...
@Path("/{bmid: .+}")
public BookmarkResource getBookmark(@PathParam("bmid") String bmid) {
    return new BookmarkResource(uriInfo, em,
        userResource.getUserEntity(), bmid);
}

@GET
@Produces("application/json")
public JSONArray getBookmarksAsJsonArray() {
    JSONArray uriArray = new JSONArray();
    for (BookmarkEntity bookmarkEntity : getBookmarks()) {
        UriBuilder ub = uriInfo.getAbsolutePathBuilder();
        URI bookmarkUri = ub.
            path(bookmarkEntity.getBookmarkEntityPK().getBmid()).
            build();
        uriArray.put(bookmarkUri.toASCIIString());
    }
    return uriArray;
}
...
}

In Example 3–6, the annotated Java method, getBookmark, from the BookmarkResource class in the Jersey bookmark sample, will process HTTP GET requests. This example shows how to process the JSON object that is returned. For more information about the Jersey bookmark sample, see Section 3.4.1, "About the Jersey Bookmark Sample."

Example 3–6  Mapping the HTTP GET Request to a Java Method (BookmarkResource Class)

import javax.ws.rs.GET;
import javax.ws.rs.Produces;
import javax.ws.rs.Path;
...
public class BookmarksResource {
...
@GET
@Produces("application/json")
public JSONObject getBookmark() { return asJson(); }
}
...
public JSONObject asJson() {
    try {
        return new JSONObject()
            .put("userid", bookmarkEntity.getBookmarkEntityPK().getUserid())
            .put("sdesc", bookmarkEntity.getSdesc())
            .put("ldesc", bookmarkEntity.getLdesc())
            .put("uri", bookmarkEntity.getUri());
    } catch (JSONException je) {
        return null;
    }
}
3.4.3 How to Create or Update the Representation of the Resource (@PUT)

The `javax.ws.rs.PUT` annotation creates or updates the representation of the specified resource identified by the URI. For more information, see the @PUT annotation in the Java EE 6 Platform API Specification.

In Example 3–7, the annotated Java method, `putBookmark`, from the `BookmarkResource` class in the Jersey bookmark sample, will process HTTP PUT requests and update the specified bookmark. For more information about the Jersey bookmark sample, see Section 3.4.1, "About the Jersey Bookmark Sample."

```java
import javax.ws.rs.PUT;
import javax.ws.rs.Produces;
import javax.ws.rs.Path;
...
public class BookmarkResource {
  ...
  @PUT
  @Consumes("application/json")
  public void putBookmark(JSONObject jsonEntity) throws JSONException {
    bookmarkEntity.setLdesc(jsonEntity.getString("ldesc"));
    bookmarkEntity.setSdesc(jsonEntity.getString("sdesc"));
    bookmarkEntity.setUpdated(new Date());

    TransactionManager.manage(new Transactional(em) {
      public void transact() {
        em.merge(bookmarkEntity);
      }
    });
  }
}
```

3.4.4 How to Delete a Representation of the Resource (@DELETE)

The `javax.ws.rs.DELETE` annotation deletes the representation of the specified resource identified by the URI. The response entity-body may return a status message or may be empty. For more information, see the @DELETE annotation in the Java EE 6 Platform API Specification.

In Example 3–8, the annotated Java method, `deleteBookmark`, from the `BookmarkResource` class in the Jersey bookmark sample, will process HTTP DELETE requests, and delete the specified bookmark. For more information about the Jersey bookmark sample, see Section 3.4.1, "About the Jersey Bookmark Sample."

```java
import javax.ws.rs.DELETE;
import javax.ws.rs.Produces;
import javax.ws.rs.Path;
...
public class BookmarkResource {
  ...
  @DELETE
  public void deleteBookmark() {
    TransactionManager.manage(new Transactional(em) {
      public void transact() {
        UserEntity userEntity = bookmarkEntity.getUserEntity();
        userEntity.getBookmarkEntityCollection().remove(bookmarkEntity);
        em.merge(userEntity);
      }
    });
  }
}
```
3.4.5 How to Create, Update, or Perform an Action on a Representation of the Resource (@POST)

The `javax.ws.rs.POST` annotation creates, updates, or performs an action on the representation of the specified resource identified by the URI. For more information, see the @POST annotation in the *Java EE 6 Platform API Specification*.

In **Example 3–9**, the annotated Java method, `postForm`, from the `BookmarksResource` class in the Jersey bookmark sample, will process HTTP POST requests, and update the specified information. For more information about the Jersey bookmark sample, see Section 3.4.1, "About the Jersey Bookmark Sample."

**Example 3–9  Mapping the HTTP POST Request to a Java Method**

```java
import javax.ws.rs.POST;
import javax.ws.rs.Produces;
...
public class BookmarksResource {
    ...
    @POST
    @Consumes("application/json")
    public Response postForm(JSONObject bookmark) throws JSONException {
        final BookmarkEntity bookmarkEntity = new BookmarkEntity(
            getBookmarkId(bookmark.getString("uri")),
            userResource.getUserEntity().getUserid());

        bookmarkEntity.setUri(bookmark.getString("uri"));
        bookmarkEntity.setUpdated(new Date());
        bookmarkEntity.setSdesc(bookmark.getString("sdesc"));
        bookmarkEntity.setLdesc(bookmark.getString("ldesc"));
        userResource.getUserEntity().getBookmarkEntityCollection().add(bookmarkEntity);

        TransactionManager.manage(new Transactional(em) {
            public void transact() {
                em.merge(userResource.getUserEntity());
            }
        });

        URI bookmarkUri = uriInfo.getAbsolutePathBuilder().
            path(bookmarkEntity.getBookmarkEntityPK().getBmid()).build();
        return Response.created(bookmarkUri).build();
    }
}
```

3.5 Customizing Media Types for the Request and Response Messages

Add the `javax.ws.rs.Consumes` or `javax.ws.rs.Produces` annotation at the class level of the resource to customize the request and response media types, as described in the following sections:

- Section 3.5.1, "How To Customize Media Types for the Request Message (@Consumes)"
Customizing Media Types for the Request and Response Messages

- Section 3.5.2, "How To Customize Media Types for the Response Message (@Produces)"
- Section 3.5.3, "What Happens At Runtime: How the Resource Method Is Selected for Response Messages"

3.5.1 How To Customize Media Types for the Request Message (@Consumes)

The javax.ws.rs.Consumes annotation enables you to specify the MIME media types of representations a resource can consume that were sent from the client. The @Consumes annotation can be specified at both the class and method levels and more than one media type can be declared in the same @Consumes declaration.

If there are no methods in a resource that can consume the specified MIME media types, the runtime returns an HTTP 415 Unsupported Media Type error.

For more information, see the @Consumes annotation in the Java EE 6 Platform API Specification.

In Example 3–11, the @Consumes annotation defined for the Java class, helloWorld, specifies that the class produces messages using the text/plain MIME media type.

Example 3–10  Customizing the Media Types for the Request Message Using @Consumes

```java
import javax.ws.rs.Consumes;
...
@Path("/helloworld")
public class helloWorld {
  ...  
  @POST
  @Consumes("text/plain")
  public void postMessage(String message) {
    // Store the message
  }
}
```

3.5.2 How To Customize Media Types for the Response Message (@Produces)

The javax.ws.rs.Produces annotation enables you to specify the MIME media types of representations a resource can produce and send back to the client. The @Produces annotation can be specified at both the class and method levels and more than one media type can be declared in the same @Produces declaration.

If there are no methods in a resource that can produce the specified MIME media types, the runtime returns an HTTP 406 Not Acceptable error.

For more information, see the @Produces annotation in the Java EE 6 Platform API Specification.

In Example 3–11, the @Produces annotation specified for the Java class, SomeResource, specifies that the class produces messages using the text/plain MIME media type.

The doGetAsPlainText method defaults to the MIME media type specified at the class level. The doGetAsHtml method overrides the class-level setting and specifies that the method produces HTML rather than plain text.
Example 3–11 Customizing the Media Types for the Response Using @Produces

```java
package samples.produces;
import javax.ws.rs.Produces;
import javax.ws.rs.Path;

@Path("/myResource")
@Produces("text/plain")
public class SomeResource {
    @GET
    public String doGetAsPlainText() { ... }

    @GET
    @Produces("text/html")
    public String doGetAsHtml() { ... }
}
```

3.5.3 What Happens At Runtime: How the Resource Method Is Selected for Response Messages

If a resource class is capable of producing more than one MIME media type, then the resource method that is selected corresponds to the acceptable media type declared in the `Accept` header of the HTTP request. In Example 3–11, if the `Accept` header is `Accept: text/plain`, then the `doGetAsPlainText` method is invoked.

If multiple MIME media types are included in the `@Produces` annotation and both are acceptable to the client, the first media type specified is used. In Example 3–11, if the `Accept header` is `Accept: application/html, application/text`, then the `doGetAsHtml` method is invoked and the `application/html` MIME media type is used as it is listed first in the list.

3.6 Extracting Information From the Request Message

The `javax.ws.rs` package defines a set of annotations, shown in Table 3–2, that enable you to extract information from the request message to inject into parameters of your Java method.

<table>
<thead>
<tr>
<th>Annotation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>@CookieParam</code></td>
<td>Extract information from the HTTP cookie-related headers to initialize the value of a method parameter. For more information, see the <code>@CookieParam</code> annotation in the Java EE 6 Platform API Specification.</td>
</tr>
<tr>
<td><code>@DefaultValue</code></td>
<td>Define the default value of the request metadata that is bound using one of the following annotations: <code>@CookieParam</code>, <code>@FormParam</code>, <code>@HeaderParam</code>, <code>@MatrixParam</code>, <code>@PathParam</code>, or <code>@QueryParam</code>. For more information, see Section 3.6.3, &quot;How to Define the DefaultValue (<code>@DefaultValue</code>).&quot;</td>
</tr>
<tr>
<td><code>@Encode</code></td>
<td>Enable encoding of a parameter value that is bound using one of the following annotations: <code>@FormParam</code>, <code>@MatrixParam</code>, <code>@PathParam</code>, or <code>@QueryParam</code>. For more information, see Section 3.6.4, &quot;Enabling the Encoding Parameter Values (<code>@Encode</code>).&quot;</td>
</tr>
<tr>
<td><code>@FormParam</code></td>
<td>Extract information from an HTML form of the type <code>application/x-www-form-urlencoded</code>. For more information, see the <code>@FormParam</code> annotation in the Java EE 6 Platform API Specification.</td>
</tr>
<tr>
<td><code>@HeaderParam</code></td>
<td>Extract information from the HTTP headers to initialize the value of a method parameter. For more information, see the <code>@HeaderParam</code> annotation in the Java EE 6 Platform API Specification.</td>
</tr>
</tbody>
</table>
Developing RESTful Web Services  3-13

3.6.1 How to Extract Variable Information from the Request URI (@PathParam)

Add the javax.ws.rsPathParam annotation to the method parameter of a resource to extract the variable information from the request URI and initialize the value of the method parameter. You can define a default value for the variable value using the @DefaultValue annotation, as described in Section 3.6.3, "How to Define the DefaultValue (@DefaultValue)."

In Example 3–3, the @PathParam annotation assigns the value of the username variable that is defined as part of the URI path by the @Path annotation to the userName method parameter.

Example 3–12 Extracting Variable Information From the Request URI

```java
package samples.helloworld;

import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.Produces;
import javax.ws.rsPathParam;

// Specifies the path to the RESTful service
@Path("/users")
public class helloWorld {
    . . .
    @GET
    @Path("/(username)")
    @Produces("text/xml")
    public String getUser(@PathParam("username") String userName) {
        . . .
    }
}
```

3.6.2 How to Extract Request Parameters (@QueryParam)

Add the javax.ws.rs.QueryParam annotation to the method parameter of a resource to extract information from the query portion of the request URI and initialize the value of the method parameter.

The type of the annotated method parameter can be any of the following:

- Primitive type (int, char, byte, and so on)
- User-defined type
- Constructor that accepts a single String argument
Static method named `valueOf` or `fromString` that accepts a single String argument (for example, `integer.valueOf(String)`)

- List<T>, Set<T>, or SortedSet<T>

If the `@QueryParam` annotation is specified but the associated query parameter is not present in the request, then the parameter value will set as an empty collection for List, Set, or SortedSet, the Java-defined default for primitive types, and NULL for all other object types. Alternatively, you can define a default value for the parameter using the `@DefaultValue` annotation, as described in Section 3.6.3, "How to Define the DefaultValue (@DefaultValue)."

For more information, see the `@QueryParam` annotation in the *Java EE 6 Platform API Specification*.

In *Example 3–13*, if the `step` query parameter exists in the query component of the request URI, the value will be assigned to the `step` method parameter as an integer value. If the value cannot be parsed as an integer value, then a 400 (Client Error) response is returned. If the `step` query parameter does not exist in the query component of the request URI, then the value is set to NULL.

### Example 3–13  Extracting Request Parameters (@QueryParam)

```java
import javax.ws.rs.Path;
import javax.ws.rs.GET;
import javax.ws.rs.QueryParam;
...
@Path("smooth")
@GET
public Response smooth(@QueryParam("step") int step)
{ ... }
}
```

### 3.6.3 How to Define the DefaultValue (@DefaultValue)

Add the `javax.ws.rs.DefaultValue` annotation to define the default value of the request metadata that is bound using one of the following annotations: `@CookieParam`, `@FormParam`, `@HeaderParam`, `@MatrixParam`, `@PathParam`, or `@QueryParam`. For more information, see the `@DefaultValue` annotation in the *Java EE 6 Platform API Specification*.

In *Example 3–14*, if the `step` query parameter does not exist in the query component of the request URI, the default value of 2 will be assigned to the `step` parameter.

### Example 3–14  Defining the Default Value (@DefaultValue)

```java
import javax.ws.rs.Path;
import javax.ws.rs.GET;
import javax.ws.rs.QueryParam;
...
@Path("smooth")
@GET
public Response smooth(@DefaultValue("2") @QueryParam("step") int step)
{ ... }
}
```
3.6.4 Enabling the Encoding Parameter Values (@Encode)

Add the `javax.ws.rs.Encode` annotation at the class or method level to enable the encoding of a parameter value that is bound using one of the following annotations: `@FormParam`, `@MatrixParam`, `@PathParam`, or `@QueryParam`. If specified at the class level, parameters for all methods in the class will be encoded. For more information, see the `@Encode` annotation in the Java EE 6 Platform API Specification.

In Example 3–15, the `@Encode` annotation enables the encoding of parameter values bound using the `@PathParam` annotation.

Example 3–15 Encoding Parameter Values

```java
package samples.helloworld;

import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.Produces;
import javax.ws.rs.PathParam;
import javax.ws.rs.Encode;

// Specifies the path to the RESTful service
@Path("/users")
public class helloWorld {

  // GET
  @Path("/(username)")
  @Produces("text/xml")
  @Encode
  public String getUser(@PathParam("username") String userName) {
    ...
  }
}
```

3.7 Building Custom Response Messages

By default, JAX-RS responds to HTTP requests using the default response codes defined in the HTTP specification, such as 200 OK for a successful GET request and 201 CREATED for a successful PUT request.

In some cases, you may want to customize the response codes returned or include additional metadata information in the response. For example, you might want to include the Location header to specify the URI to the newly created resource. You can modify the response message returned using the `javax.ws.rs.core.Response` class.

An application can extend the `Response` class directly or use one of the static `Response` methods, defined in Table 3–5, to create a `javax.ws.rs.core.Response.ResponseBuilder` instance and build the `Response` instance. For more information, see the `Response` methods in the Java EE 6 Platform API Specification.
Table 3–5  Creating a Response Instance Using the ResponseBuilder Class

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>created()</td>
<td>Creates a new ResponseBuilder instance and sets the Location header to the specified value.</td>
</tr>
<tr>
<td>fromResponse()</td>
<td>Creates a new ResponseBuilder instance and copies an existing response.</td>
</tr>
<tr>
<td>noContent()</td>
<td>Creates a new ResponseBuilder instance and defines an empty response.</td>
</tr>
<tr>
<td>notAcceptable()</td>
<td>Creates a new ResponseBuilder instance and defines an unacceptable response.</td>
</tr>
<tr>
<td>notModified()</td>
<td>Creates a new ResponseBuilder instance and returns a not-modified status.</td>
</tr>
<tr>
<td>ok()</td>
<td>Creates a new ResponseBuilder instance and returns an OK status.</td>
</tr>
<tr>
<td>seeOther()</td>
<td>Creates a new ResponseBuilder instance for a redirection.</td>
</tr>
<tr>
<td>serverError()</td>
<td>Creates a new ResponseBuilder instance and returns a server error status.</td>
</tr>
<tr>
<td>status()</td>
<td>Creates a new ResponseBuilder instance and returns the specified status.</td>
</tr>
<tr>
<td>temporaryRedirect()</td>
<td>Creates a new ResponseBuilder instance for a temporary redirection.</td>
</tr>
</tbody>
</table>

Once you create a ResponseBuilder instance, you can call the methods defined in Table 3–6 to build a custom response. Then, call the build() method to create the final Response instance. For more information, see the Response.ResponseBuilder methods in the Java EE 6 Platform API Specification.

Table 3–6  ResponseBuilder Methods for Building a Custom Response

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>build()</td>
<td>Creates the Response instance from the current ResponseBuilder instance.</td>
</tr>
<tr>
<td>cacheControl()</td>
<td>Sets the cache control.</td>
</tr>
<tr>
<td>clone()</td>
<td>Create a copy of the ResponseBuilder to preserve its state.</td>
</tr>
<tr>
<td>contentLocation()</td>
<td>Sets the content location.</td>
</tr>
<tr>
<td>cookie()</td>
<td>Add cookies to the response.</td>
</tr>
<tr>
<td>entity()</td>
<td>Defines the entity.</td>
</tr>
<tr>
<td>expires()</td>
<td>Sets the expiration date.</td>
</tr>
<tr>
<td>header()</td>
<td>Adds a header to the response.</td>
</tr>
<tr>
<td>language()</td>
<td>Sets the language.</td>
</tr>
<tr>
<td>lastModified()</td>
<td>Set the last modified date.</td>
</tr>
<tr>
<td>location()</td>
<td>Sets the location.</td>
</tr>
<tr>
<td>newInstance()</td>
<td>Creates a new ResponseBuilder instance.</td>
</tr>
<tr>
<td>status()</td>
<td>Sets the status.</td>
</tr>
<tr>
<td>tag()</td>
<td>Sets an entity tag.</td>
</tr>
<tr>
<td>type()</td>
<td>Sets the response media type.</td>
</tr>
<tr>
<td>variant()</td>
<td>Set representation metadata.</td>
</tr>
<tr>
<td>variants()</td>
<td>Add a Vary header that lists the available variants.</td>
</tr>
</tbody>
</table>

Example 3–16 shows how to build a Response instance using ResponseBuilder. In this example, the standard status code of 200 OK is returned and the media type of the
response is set to text/html. A call to the build() method creates the final Response instance.

**Example 3–16  Building a Custom Response**

```java
import javax.ws.rs.Path;
import javax.ws.rs.GET;
import javax.ws.rs.PathParam;
import javax.ws.rs.core.Response;
import javax.ws.rs.core.ResponseBuilder;
...
@Path("/content")
public class getDocs {
    @GET
    @Path("{id}")
    public Response getHTMLDoc(@PathParam("id") int docId) {
        Document document = ...;
        ResponseBuilder response = Response.ok(document);
        response.type("text/html");
        return response.build();
    }
}
```

If you wish to build an HTTP response using a generic type, to avoid type erasure at runtime you need to create a javax.ws.rs.core.GenericEntity object to preserve the generic type. For more information, see the GenericEntity methods in the Java EE 6 Platform API Specification.

**Example 3–17 provides an example of how to build an HTTP response using GenericEntity to preserve the generic type.**

**Example 3–17  Building a Custom Response Using a Generic Type**

```java
import javax.ws.rs.Path;
import javax.ws.rs.GET;
import javax.ws.rs.PathParam;
import javax.ws.rs.core.Response;
import javax.ws.rs.core.ResponseBuilder;
javax.ws.rs.core.GenericEntity;
...
@Path("/content")
public class getDocs {
    @GET
    @Path("\{id\}"")
    public Response getHTMLDoc(@PathParam("id") int docId) {
        Document document = ...;
        List<String> list = new ArrayList<String>();
        GenericEntity<List<String>> entity = new GenericEntity<List<String>>(list) {}
        ...;
        ResponseBuilder response = Response.ok(document);
        response.entity(entity);
        return response.build();
    }
}
```
3.8 Mapping HTTP Request and Response Entity Bodies Using Entity Providers

Table 3–7 lists the Java types that are supported automatically by HTTP request and response entity bodies.

<table>
<thead>
<tr>
<th>Java Type</th>
<th>Supported Media Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>byte[]</td>
<td>All media types (<em>/</em>)</td>
</tr>
<tr>
<td>java.lang.String</td>
<td>All media types (<em>/</em>)</td>
</tr>
<tr>
<td>java.io.InputStream</td>
<td>All media types (<em>/</em>)</td>
</tr>
<tr>
<td>java.io.Reader</td>
<td>All media types (<em>/</em>)</td>
</tr>
<tr>
<td>java.io.File</td>
<td>All media types (<em>/</em>)</td>
</tr>
<tr>
<td>javax.activation.DataSource</td>
<td>All media types (<em>/</em>)</td>
</tr>
<tr>
<td>javax.xml.transform.Source</td>
<td>XML media types (text/xml, application/xml, and application/<em>+xml) and JSON media types (application/json, application/</em>+json)</td>
</tr>
<tr>
<td>javax.xml.bind.JAXBElement and application-supplied JAXB classes</td>
<td>XML media types (text/xml, application/xml, and application/*+xml)</td>
</tr>
<tr>
<td>MultivaluedMap&lt;String,String&gt;</td>
<td>Form content (application/x-www-form-urlencoded)</td>
</tr>
<tr>
<td>StreamingOutput</td>
<td>All media types (<em>/</em>), MessageBodyWriter only</td>
</tr>
</tbody>
</table>

If your RESTful web service utilizes a type that is not listed in Table 3–7, you must define an entity provider, by implementing one of the interfaces defined in Table 3–8, to map HTTP request and response entity bodies to method parameters and return types.

<table>
<thead>
<tr>
<th>Entity Provider</th>
<th>Description</th>
</tr>
</thead>
</table>
| javax.ws.rs.ext.MessageBodyReader  | Maps an HTTP request entity body to a method parameter for an HTTP request. Optionally, you can use the @Consumes annotation to specify the MIME media types supported for the entity provider, as described in “Customizing Media Types for the Request and Response Messages” on page 3-10. For example:  
   @Consumes("application/x-www-form-urlencoded")  
   @Provider  
   public class FormReader implements MessageBodyReader<NameValuePair> { ... } |
| javax.ws.rs.ext.MessageBodyWriter  | Maps the return value to an HTTP response entity body for an HTTP response. Optionally, you can use the @Produces annotation to specify the MIME media types supported for the entity provider, as described in “Customizing Media Types for the Request and Response Messages” on page 3-10. For example:  
   @Produces("text/html")  
   @Provider  
   public class FormWriter implements MessageBodyWriter<Hashtable<String, String>> { ... } |
Note: Jersey JSON provides a set of JAX-RS MessageBodyReader and MessageBodyWriter providers distributed with the jersey-json module. For more information, see "JSON Support" in the Jersey 1.18 User Guide.

The following code excerpt provides an example of a class that contains a method (getClass) that returns a custom type, and that requires you to write an entity provider.

```java
public class Class1 {
    public String hello() { return "Hello"; }
    public Class2 getClass(String name) { return new Class2(); }
}

public class Class2 {
    public Class2() { }
}
```

### 3.9 Accessing the Application Context

The `javax.ws.rs.core.Context` annotation enables you to access information about the application deployment context and the context of individual requests. Table 3–9 summarizes the context types that you can access using the `@Context` annotation. For more information, see the `@Context` annotation in the Java EE 6 Platform API Specification.

<table>
<thead>
<tr>
<th>Use this context type . . .</th>
<th>To . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>HttpHeaders</td>
<td>Access HTTP header information.</td>
</tr>
<tr>
<td>Providers</td>
<td>Lookup Provider instances based on a set of search criteria.</td>
</tr>
<tr>
<td>Request</td>
<td>Determine the best matching representation variant and to evaluate whether the current state of the resource matches any preconditions defined. For more information, see Section 3.11, &quot;Using Conditional GETs.&quot;</td>
</tr>
<tr>
<td>SecurityContext</td>
<td>Access the security context and secure the RESTful web service. For more information, see Section 6.4, &quot;Securing RESTful Web Services Using SecurityContext.&quot;</td>
</tr>
<tr>
<td>UriInfo</td>
<td>Access application and request URI information. For more information, see Section 3.10, &quot;Building URIs.&quot;</td>
</tr>
</tbody>
</table>

### 3.10 Building URIs

You can use `javax.ws.rs.core.UriInfo` to access application and request URI information. Specifically, `UriInfo` can be used to return the following information:

- Deployed application’s base URI
- Request URI relative to the base URI
- Absolute path URI (with or without the query parameters)

Using `UriInfo` you can return a URI or `javax.ws.rs.core.UriBuilder` instance. `UriBuilder` simplifies the process of building URIs, and can be used to build new or extend existing URIs.
The UriBuilder methods perform contextual encoding of characters not permitted in the corresponding URI component based on the following rules:

- **application/x-www-form-urlencoded** media type for query parameters, as defined in "Forms" in the HTML specification at the following URL: http://www.w3.org/TR/html4/interact/forms.html#h-17.13.4.1
- RFC 3986 for all other components, as defined at the following URL: http://www.ietf.org/rfc/rfc3986.txt

Example 3–18 shows how to obtain an instance of UriInfo using @Context and use it to return an absolute path of the request URI as a UriBuilder instance. Then, using UriBuilder build a URI for a specific user resource by adding the user ID as a path segment and store it in an array. In this example, the UriInfo instance is injected into a class field. This example is excerpted from the bookmark sample, as described in Section 3.4.1, "About the Jersey Bookmark Sample."

```
Example 3–18  Building URIs

import javax.ws.rs.Path;
import javax.ws.rs.GET;
import javax.ws.rs.Produces;
import javax.ws.rs.core.UriBuilder;
import javax.ws.rs.core.UriInfo;
import javax.ws.rs.core.Context;
...
@Path("/users/")
public class UsersResource {

    @Context UriInfo uriInfo;

    ...

    @GET
    @Produces("application/json")
    public JSONArray getUsersAsJsonArray() {
        JSONArray uriArray = new JSONArray();
        for (UserEntity userEntity : getUsers()) {
            UriBuilder ub = uriInfo.getAbsolutePathBuilder();
            URI userUri = ub.path(userEntity.getUsername()).build();
            uriArray.put(userUri.toASCIIString());
        }
        return uriArray;
    }
}
```

### 3.11 Using Conditional GETs

A **conditional GET** enables you to evaluate one or more preconditions before processing a GET request. If the preconditions are met, a **Not Modified (304)** response can be returned rather than the normal response, potentially reducing bandwidth and improving server performance.

JAX-RS provides the javax.ws.rs.core.Request contextual interface enabling you to perform conditional GETs. You call the evaluatePreconditions() method and pass a javax.ws.rs.core.EntityTag, the last modified timestamp (as a java.util.Date object), or both. The values are compared to the If-None-Match or If-Not-Modified headers, respectively, if these headers are sent with the request.
If headers are included with the request and the precondition values match the header values, then the `evaluatePreconditions()` method returns a predefined `ResponseBuilder` response with a status code of `Not Modified (304)`. If the precondition values do not match, the `evaluatePreconditions()` method returns `null` and the normal response is returned, with `200, OK` status.

Example 3-19 shows how to pass the `EntityTag` to the `evaluatePreconditions()` method and build the response based on whether the preconditions are met.

Example 3-19  Using Conditional GETs

```java
... @Path("/employee/{joiningdate}")
public class Employee {

  Date joiningdate;
  @GET
  @Produces("application/xml")
  public Employee(@PathParam("joiningdate") Date joiningdate,
                  @Context Request req,
                  @Context UriInfo ui) {
    this.joiningdate = joiningdate;
    ...
    this.tag = computeEntityTag(ui.getRequestUri());
    if (req.getMethod().equals("GET")) {
      Response.ResponseBuilder rb = req.evaluatePreconditions(tag);
    // Preconditions met
      if (rb != null) {
        return rb.build();
      }
    // Preconditions not met
      rb = Response.ok();
      rb.tag(tag);
      return rb.build();
    }
  }
}
```

3.12 Accessing the WADL

The Web Application Description Language (WADL) is an XML-based file format that describes your RESTful web services application. By default, a basic WADL is generated at runtime and can be accessed from your RESTful web service by issuing a `GET` on the `/application.wadl` resource at the base URI of your RESTful application.

**Note:** The content type `application/vnd.sun.wadl+xml` is not recognized by Microsoft Internet Explorer 8. In this case, you can download a copy of the WADL to your local file system for viewing.

For example:

```
GET http://<path_to_REST_app>/application.wadl
```

Alternatively, you can use the `OPTIONS` method to return the WADL for particular resource.
More Advanced RESTful Web Service Tasks

Example 3–20 shows an example of a WADL for the simple RESTful web service shown in Example 3–1.

Example 3–20 Example of a WADL

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<application xmlns="http://research.sun.com/wadl/2006/10">
    <doc xmlns:jersey="http://jersey.dev.java.net/
        jersey:generatedBy='Jersey: 0.10-ea-SNAPSHOT 08/27/2008 08:24 PM'/>
    <resources base="http://localhost:9998/*">
        <resource path="/helloworld">
            <method name="GET" id='sayHello'>
                <response>
                    <representation mediaType='text/plain'/>
                </response>
            </method>
        </resource>
    </resources>
</application>
```

3.13 More Advanced RESTful Web Service Tasks

For more information about advanced RESTful web service development tasks, such as integrating JAX-RS with EJB technology and Contexts and Dependency Injection (CDI) and using JAXB and JSON, see the following resources:

- Jersey 1.18 User Guide
- Jersey 2.5.1 User Guide
Developing RESTful Web Service Clients

This chapter describes how to develop Java EE web service clients in WebLogic Server 12.1.3 that conform to the Representational State Transfer (REST) architectural style using Jersey 1.18 Java API for RESTful Web Services (JAX-RS) 1.1 reference implementation (RI).

This chapter includes the following sections:
- Developing RESTful Web Service Clients Using Jersey 1.18 (JAX-RS 1.1 RI)
- Developing RESTful Web Service Clients Using Jersey 2.5.1 (JAX-RS 2.0 RI)

4.1 Developing RESTful Web Service Clients Using Jersey 1.18 (JAX-RS 1.1 RI)

The following table summarizes a subset of the tasks that are required to develop RESTful web service clients. For more information about advanced tasks, see Section 4.1.6, "More Advanced RESTful Web Service Client Tasks."

<table>
<thead>
<tr>
<th>Task</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create and configure an instance of the weblogic.jaxrs.api.client.Client class.</td>
<td>Section 4.1.2, &quot;Creating and Configuring a Client Instance&quot;</td>
</tr>
<tr>
<td>Create an instance of the Web resource.</td>
<td>Section 4.1.3, &quot;Creating a Web Resource Instance&quot;</td>
</tr>
<tr>
<td>Send requests to the resource. For example, HTTP requests to GET, PUT, POST, and DELETE resource information.</td>
<td>Section 4.1.4, &quot;Sending Requests to the Resource&quot;</td>
</tr>
<tr>
<td>Receive responses from the resource.</td>
<td>Section 4.1.5, &quot;Receiving a Response from a Resource&quot;</td>
</tr>
</tbody>
</table>

For information about developing RESTful web service clients using Oracle JDeveloper, see "Creating RESTful Web Services and Clients" in Developing Applications with Oracle JDeveloper.
Note: Support for the client packages described in this section, including the com.sun.jersey package, its nested packages, and the weblogic.jaxrs.api.client package, is deprecated in this release of WebLogic Server.

It is recommended that you update your RESTful client applications to use the Jersey 2.5.1 (JAX-RS 2.0 RI) client APIs at your earliest convenience. For more information, see Section 4.2, "Developing RESTful Web Service Clients Using Jersey 2.5.1 (JAX-RS 2.0 RI)."

However, if you need to secure your RESTful client applications using Oracle Web Services Manager (OWSM) policies, you will not be able to update to the Jersey 2.5.1 (JAX-RS RI) client APIs at this time; this functionality will be supported in a future release.

4.1.1 Example of a RESTful Web Service Client

The following provides a simple example of a RESTful web service client that can be used to call the RESTful web service defined in Example 3–1, "Simple RESTful Web Service". In this example:

- The Client instance is created to access the client API. For more information, see Section 4.1.2, "Creating and Configuring a Client Instance."
- The WebResource instance is created to access the Web resource. For more information, see Section 4.1.3, "Creating a Web Resource Instance."
- A get request is sent to the resource. For more information, see Section 4.1.4, "Sending Requests to the Resource."
- The response is returned as a String value. For more information about receiving the response, see Section 4.1.5, "Receiving a Response from a Resource."

Additional examples are listed in Section 1.4, "Learn More About RESTful Web Services."

Example 4–1 Simple RESTful Web Service Client Using Jersey 1.18 (JAX-RS 1.1 RI)

```java
package samples.helloworld.client;

import weblogic.jaxrs.api.client.Client;
import com.sun.jersey.api.client.WebResource;

public class helloWorldClient {
    public helloWorldClient() {
        super();
    }

    public static void main(String[] args) {
        Client c = Client.create();
        WebResource resource = c.resource("http://localhost:7101/RESTfulService/jersey/helloworld");
        String response = resource.get(String.class);
        System.out.println(response);
    }
}
```

4-2 Developing and Securing RESTful Web Services for Oracle WebLogic Server 12.1.3
4.1.2 Creating and Configuring a Client Instance

To access the Jersey JAX-RS RI client API, create an instance of the weblogic.jaxrs.api.client.Client class.

**Note:** Alternatively, you can create an instance of the com.sun.jersey.api.client.Client class. However, you will not be able to take advantage of the Oracle extensions, such as securing the RESTful client using Oracle Web Services Manager (OWSM) policies, as described in Section 6.2, "Securing RESTful Web Services and Clients Using OWSM Policies."

Optionally, you can pass client configuration properties, defined in Table 4–2, when creating the client instance by defining a com.sun.jersey.api.client.config.ClientConfig and passing the information to the create method. For more information, see the ClientConfig interface in the jersey-bundle 1.18 API.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROPERTY_BUFFER_RESPONSE_ENTITY_ON_EXCEPTION</td>
<td>Boolean value that specifies whether the client should buffer the response entity, if any, and close resources when a UniformInterfaceException is thrown. This property defaults to true.</td>
</tr>
<tr>
<td>PROPERTY_CHUNKED_ENCODING_SIZE</td>
<td>Integer value that specifies the chunked encoding size. A value equal to or less than 0 specifies that the default chunk size should be used. If not set, then chunking will not be used.</td>
</tr>
<tr>
<td>PROPERTY_CONNECT_TIMEOUT</td>
<td>Integer value that specifies the connect timeout interval in milliseconds. If the property is 0 or not set, then the interval is set to infinity.</td>
</tr>
<tr>
<td>PROPERTY_FOLLOW_REDIRECTS</td>
<td>Boolean value that specifies whether the URL will redirect automatically to the URI declared in 3xx responses. This property defaults to true.</td>
</tr>
<tr>
<td>PROPERTY_READ_TIMEOUT</td>
<td>Integer value that specifies the read timeout interval in milliseconds. If the property is 0 or not set, then the interval is set to infinity.</td>
</tr>
</tbody>
</table>

Example 4–2 provides an example of how to create a client instance.

**Example 4–2  Creating a Client Instance**

```java
import weblogic.jaxrs.api.client.Client;
...
public static void main(String[] args) {
    Client c = Client.create();
    ...
```

Example 4–3 provides an example of how to create a client instance and pass configuration properties to the create method.

**Example 4–3  Creating and Configuring a Client Instance**

```java
import com.sun.jersey.api.client.*;
import weblogic.jaxrs.api.client.Client;
```
public static void main(String[] args) {
    ClientConfig cc = new DefaultClientConfig();
    cc.getProperties().put(ClientConfig.PROPERTY_FOLLOW_REDIRECTS, true);
    Client c = Client.create(cc);
    ...

    Alternatively, you can configure a client instance after the client has been created, by setting properties on the map returned from the `getProperties` method or calling a specific setter method.

    Example 4-4 provides an example of how to configure a client after it has been created. In this example:
    - `PROPERTY_FOLLOW_REDIRECTS` is configured by setting the property on the map returned from the `getProperties` method.
    - `PROPERTY_CONNECT_TIMEOUT` is configured using the setter method.

    **Example 4-4 Configuring a Client Instance After It Has Been Created**

    ```java
    import com.sun.jersey.api.client.*;
    import weblogic.jaxrs.api.client.Client;
    ...
    public static void main(String[] args) {
        Client c = Client.create();
        c.getProperties().put(ClientConfig.PROPERTY_FOLLOW_REDIRECTS, true);
        c.setConnectTimeout(3000);
        ...
    }
    ...
    ```

    Example 4-5 provides an example of how to configure a client instance to use basic authentication.

    **Example 4-5 Configuring a Client Instance to Use Basic Authentication**

    ```java
    import javax.ws.rs.core.MediaType;
    import com.sun.jersey.api.client.Client;
    import com.sun.jersey.api.client.WebResource;
    import com.sun.jersey.api.client.filter.HTTPBasicAuthFilter;
    ...
    Client c = Client.create();
    c.addFilter(new HTTPBasicAuthFilter("weblogic", "weblogic1"));
    String response = resource.accept("application/json").get(String.class); //application/xml
    // resource.accept(MediaType.APPLICATION_JSON_TYPE).get(String.class);
    System.out.println(response);
    ...
    ```

4.1.3 Creating a Web Resource Instance

Before you can issue requests to a RESTful web service, you must create an instance of `com.sun.jersey.api.client.WebResource` or `com.sun.jersey.api.client.AsyncWebResource` to access the resource specified by the URI. The `WebResource` or `AsyncWebResource` instance inherits the configuration defined for the client instance. For more information, see the following in the `jersey-bundle 1.18 API`:

- `WebResource`
Developing RESTful Web Service Clients Using Jersey 1.18 (JAX-RS 1.1 RI)

- AsyncWebResource

**Note:** Because clients instances are expensive resources, if you are creating multiple Web resources, it is recommended that you re-use a single client instance whenever possible.

Example 4–6 provides an example of how to create an instance to a Web resource hosted at http://example.com/helloworld.

**Example 4–6 Creating a Web Resource Instance**

import com.sun.jersey.api.client.*;
import weblogic.jaxrs.api.client.Client;
...
public static void main(String[] args) {
...
    Client c = Client.create();
    WebResource resource = c.resource("http://example.com/helloWorld");
...

Example 4–6 provides an example of how to create an instance to an asynchronous Web resource hosted at http://example.com/helloworld.

**Example 4–7 Creating an Asynchronous Web Resource Instance**

import com.sun.jersey.api.client.*;
import weblogic.jaxrs.api.client.Client;
...
public static void main(String[] args) {
...
    Client c = Client.create();
    AsyncWebResource asyncResource = c.resource("http://example.com/helloWorld");
...

### 4.1.4 Sending Requests to the Resource

Use the WebResource or AsyncWebResource instance to build requests to the associated Web resource, as described in the following sections:

- Section 4.1.4.1, "How to Build Requests"
- Section 4.1.4.2, "How to Send HTTP Requests"
- Section 4.1.4.4, "How to Configure the Accept Header"
- Section 4.1.4.3, "How to Pass Query Parameters"

#### 4.1.4.1 How to Build Requests

You can build a request using the methods defined in Table 4–3, followed by the HTTP request method, as described in Section 4.1.4.2, "How to Send HTTP Requests." Examples of how to build a request are provided in the sections that follow.

For more information, see the RequestBuilder methods in the jersey 1.18 bundle API.
Table 4–3  Building a Request

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accept()</td>
<td>Defines the acceptable media types. See Section 4.1.4.4, &quot;How to Configure the Accept Header.&quot;</td>
</tr>
<tr>
<td>acceptLanguage()</td>
<td>Defines the acceptable languages using the acceptLanguage method.</td>
</tr>
<tr>
<td>cookie()</td>
<td>Adds a cookie to be set.</td>
</tr>
<tr>
<td>entity()</td>
<td>Configures the request entity. See Section 4.1.4.6, &quot;How to Configure the Request Entity.&quot;</td>
</tr>
<tr>
<td>header()</td>
<td>Adds an HTTP header and value. See Section 4.1.4.4, &quot;How to Configure the Accept Header.&quot;</td>
</tr>
<tr>
<td>type()</td>
<td>Configures the media type. See Section 4.1.4.6, &quot;How to Configure the Request Entity.&quot;</td>
</tr>
</tbody>
</table>

4.1.4.2 How to Send HTTP Requests

Table 4–4 list the WebResource and AsyncWebResource methods that can be used to send HTTP requests.

In the case of AsyncWebResource, a java.util.concurrent.Future<V> object is returned, which can be used to access the result of the computation later, without blocking execution. For more information, see the Future<V> interface methods in the Java EE 6 Platform API Specification.

Table 4–4  WebResource Methods to Send HTTP Requests

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get()</td>
<td>Invoke the HTTP GET method to get a representation of the resource.</td>
</tr>
<tr>
<td>post()</td>
<td>Invoke the HTTP POST method to create or update the representation of the specified resource.</td>
</tr>
<tr>
<td>put()</td>
<td>Invoke the HTTP PUT method to update the representation of the resource.</td>
</tr>
<tr>
<td>delete()</td>
<td>Invoke the HTTP DELETE method to delete the representation of the resource.</td>
</tr>
</tbody>
</table>

If the response has an entity (or representation), then the Java type of the instance required is declared in the HTTP method.

Example 4–8 provides an example of how to send an HTTP GET request. In this example, the response entity is requested to be an instance of String. The response entity will be de-serialized to a String instance.

Example 4–8  Sending an HTTP GET Request

```java
import com.sun.jersey.api.client.WebResource;
...
    public static void main(String[] args) {
        ...
        WebResource resource = c.resource("http://example.com/helloWorld");
        String response = resource.get(String.class);
        ...
```

Example 4–9 provides an example of how to send an HTTP PUT request and put the entity foo:bar into the Web resource. In this example, the response entity is requested to be an instance of com.sun.jersey.api.client.ClientResponse.

```java
Example 4–9 provides an example of how to send an HTTP PUT request and put the entity foo:bar into the Web resource. In this example, the response entity is requested to be an instance of com.sun.jersey.api.client.ClientResponse.
```
Example 4–9  Sending an HTTP PUT Request

```java
import com.sun.jersey.api.client.WebResource;
import com.sun.jersey.api.client.ClientResponse;
...
    public static void main(String[] args) {
        ...
            WebResource resource = c.resource("http://example.com/helloWorld");
            ClientResponse response = resource.put(ClientResponse.class, "foo:bar");
    ...
```

If you wish to send an HTTP request using a generic type, to avoid type erasure at runtime, you need to create a `com.sun.jersey.api.client.GenericType` object to preserve the generic type. For more information, see the `GenericType` class in Java EE 6 Platform API Specification.

Example 4–10 provides an example of how to send an HTTP request using a generic type using `GenericType` to preserve the generic type.

Example 4–10  Sending an HTTP GET Request Using a Generic Type

```java
import com.sun.jersey.api.client.WebResource;
...
    public static void main(String[] args) {
        ...
            WebResource resource = c.resource("http://example.com/helloWorld");
            List<String> list = resource.get(new GenericType<List<String>>() {});
    ...
```

4.1.4.3 How to Pass Query Parameters

You can pass query parameters in the GET request by defining a `javax.ws.rs.core.MultivaluedMap` and using the `queryParams` method on the Web resource to pass the map as part of the HTTP request.

For more information, see the `MultivaluedMap` interface in Java EE 6 API Specification.

Example 4–11 provides an example of how to pass parameters in a GET request to a Web resource hosted at `http://example.com/helloworld`, resulting in the following request URI: `http://example.com/base?param1=val1&param2=val2`

Example 4–11  Passing Query Parameters

```java
import com.sun.jersey.api.client.WebResource;
import javax.ws.rs.core.MultivaluedMap;
import javax.ws.rs.core.MultivaluedMapImpl;
...
    public static void main(String[] args) {
        ...
            WebResource resource = c.resource("http://example.com/helloWorld");
            MultivaluedMap queryParams = new MultivaluedMapImpl();
            queryParams.add("param1", "val1");
            queryParams.add("param2", "val2");
            String response = resource.queryParams(queryParams).get(String.class);
    ...
```

4.1.4.4 How to Configure the Accept Header

Configure the `Accept` header for the request using the `accept` method on the Web resource.
Example 4–12 provides an example of how to specify text/plain as the acceptable MIME media type in a GET request to a Web resource hosted at http://example.com/helloworld.

Example 4–12  Configuring the Accept Header
import com.sun.jersey.api.client.WebResource;
...
    public static void main(String[] args) {
        ...
            WebResource resource = c.resource("http://example.com/helloWorld");
            String response = resource.accept("text/plain").get(String.class);
        ...

4.1.4.5 How to Add a Custom Header
Add a custom header to the request using the header method on the Web resource.
Example 4–13 provides an example of how to add a custom header FOO with the value BAR in a GET request to a Web resource hosted at http://example.com/helloworld.

Example 4–13  Adding a Custom Header
import com.sun.jersey.api.client.WebResource;
...
    public static void main(String[] args) {
        ...
            WebResource resource = c.resource("http://example.com/helloWorld");
            String response = resource.header("FOO", "BAR").get(String.class);
        ...

4.1.4.6 How to Configure the Request Entity
Configure the request entity and type using the entity method on the Web resource. Alternatively, you can configure the request entity type only using the type method on the Web resource.
Example 4–14 provides an example of how to configure a request entity and type.

Example 4–14  Configuring the Request Entity
import com.sun.jersey.api.client.WebResource;
...
    public static void main(String[] args) {
        ...
            WebResource resource = c.resource("http://example.com/helloWorld");
            String response = resource.entity(request, MediaType.TEXT_PLAIN_TYPE).get(String.class);
        ...

Example 4–15 provides an example of how to configure the request entity media type only.

Example 4–15  Configuring the Request Entity Media Type Only
import com.sun.jersey.api.client.WebResource;
...
    public static void main(String[] args) {
        ...
            WebResource resource = c.resource("http://example.com/helloWorld");

4-8  Developing and Securing RESTful Web Services for Oracle WebLogic Server 12.1.3
4.1.5 Receiving a Response from a Resource

You define the Java type of the entity (or representation) in the response when you call the HTTP method, as described in Section 4.1.4.2, "How to Send HTTP Requests."

If response metadata is required, declare the Java type `com.sun.jersey.api.client.ClientResponse` as the response type. The `ClientResponse` type enables you to access status, headers, and entity information.

The following sections describe the response metadata that you can access using the `ClientResponse`. For more information, see `ClientResponse` class in `jersey-bundle 1.18 bundle API`.

- Section 4.1.5.1, "How to Access the Status of Request"
- Section 4.1.5.2, "How to Get the Response Entity"

4.1.5.1 How to Access the Status of Request

Access the status of a client response using the `getStatus` method on the `ClientResponse` object. For a list of valid status codes, see `ClientResponse.Status` in `jersey-bundle 1.18 API`.

Example 4–12 provides an example of how to access the status code of the response.

Example 4–16 Accessing the Status of the Request

```java
import com.sun.jersey.api.client.WebResource;
import com.sun.jersey.api.client.ClientResponse;
...
public static void main(String[] args) {
...
    WebResource resource = c.resource("http://example.com/helloWorld");
    ClientResponse response = resource.get(ClientResponse.class);
    int status = response.getStatus();
...
```

4.1.5.2 How to Get the Response Entity

Get the response entity using the `getEntity` method on the `ClientResponse` object. Example 4–12 provides an example of how to get the response entity.

Example 4–17 Getting the Response Entity

```java
import com.sun.jersey.api.client.WebResource;
import com.sun.jersey.api.client.ClientResponse;
...
public static void main(String[] args) {
...
    WebResource resource = c.resource("http://example.com/helloWorld");
    ClientResponse response = resource.get(ClientResponse.class);
    String entity = response.getEntity(String.class);
...
```
4.1.6 More Advanced RESTful Web Service Client Tasks

For more information about advanced RESTful web service client tasks, including those listed below, see the Jersey 1.18 User Guide.

- Adding new representation types
- Using filters
- Enabling security with HTTP(s) URLConnection

4.1.7 Invoking a RESTful Web Service from a Standalone Client

When invoking a RESTful web service from an environment that does not have Oracle Fusion Middleware or WebLogic Server installed locally, with the entire set of Oracle Fusion Middleware or WebLogic Server classes in the CLASSPATH, you can use the standalone client JAR file when invoking the web service.

The standalone client JAR supports basic JAX-RS client-side functionality and OWSM security policies.

To use the standalone client JAR file with your client application, perform the following steps:

1. Create a Java SE client using your favorite IDE, such as Oracle JDeveloper. For more information, see "Developing and Securing Web Services and Clients" in Developing Applications with Oracle JDeveloper.

2. Copy the file ORACLE_HOME/oracle_common/modules/clients/com.oracle.jersey.fmw.client_12.1.3.jar from the computer hosting Oracle Fusion Middleware to the client computer, where ORACLE_HOME is the directory you specified as Oracle Home when you installed Oracle Fusion Middleware.

   For example, you might copy the file into the directory that contains other classes used by your client application.

3. Add the JAR file to your CLASSPATH.

   **Note:** Ensure that your CLASSPATH includes the JAR file that contains the Ant classes (ant.jar) as a subset are used by the standalone client JAR files. This JAR file is typically located in the lib directory of the Ant distribution.

4. Configure your environment for Oracle Web Services Manager (OWSM) policies. This step is optional, required only if you are attaching OWSM security policies to the RESTful client.

   **Note:** This step does not apply to RESTful web services and clients that are built using Jersey 2.5.1 (JAX-RS 2.0 RI) as they cannot be secured using OWSM policies in this release.

   The configuration steps required vary based on the type of policy being attached. Examples are provided below. For additional configuration requirements, see "Configuring Java SE Applications to Use OPSS" in Securing Applications with Oracle Platform Security Services.
Note: To access the Jersey JAX-RS RI client API, ensure that you create an instance of the `weblogic.jaxrs.api.client.Client` class. Alternatively, you can create an instance of the `com.sun.jersey.api.client.Client` class. However, you will not be able to take advantage of the Oracle extensions, such as securing the RESTful client using Oracle Web Services Manager (OWSM) policies, as described in Section 6.2, "Securing RESTful Web Services and Clients Using OWSM Policies."

Example: Basic Authentication

For example, to support basic authentication using the `oracle/wss_http_token_client_policy` security policy, perform the following steps:

a. Copy the `jps-config-jse.xml` and `audit-store.xml` files from the `domain_home/config/fmwconfig` directory, where `domain_home` is the name and location of the domain, to a location that is accessible to the RESTful client.

b. Create a wallet (`cwallet.sso`) in the same location that you copied the files in step 2 that defines a map called `oracle.wsm.security` and the credential key name that the client application will use (for example, `weblogic-csf-key`).

   The location of the file `cwallet.sso` is specified in the configuration file `jps-config-jse.xml` with the element `<serviceInstance>`. For more information, see "Using a Wallet-based Credential Store" in Securing Applications with Oracle Platform Security Services.

c. On the Java command line, pass the following property defining the JPS configuration file copied in step 1:

   ```
   -Doracle.security.jps.config=<pathToConfigFile>
   ```

   For more information, see "Scenario 3: Securing a Java SE Application" in Securing Applications with Oracle Platform Security Services.

Example: SSL

For example, to support SSL policies, perform the following steps:

a. Copy the `jps-config-jse.xml` and `audit-store.xml` files from the `domain_home/config/fmwconfig` directory, where `domain_home` is the name and location of the domain, to a location that is accessible to the RESTful client.

b. On the Java command line, pass the following properties defining the JPS configuration file copied in step 1:

   ```
   -Doracle.security.jps.config=<pathToConfigFile>
   -Djavax.net.ssl.trustStore=<trustStore>
   ```

   For more information, see "Setting Up the WebLogic Server in Case of a Java SE Application" in Setting Up a One-Way SSL Connection to the LDAP in Securing Applications with Oracle Platform Security Services.

Define the JPS configuration file copied in step 1:

```bash
-Doracle.security.jps.config=<pathToConfigFile>
```

For more information, see "Scenario 3: Securing a Java SE Application" in Securing Applications with Oracle Platform Security Services.

Define the trust store containing the trusted certificates:

```bash
-Djavax.net.ssl.trustStore=<trustStore>
```

For more information, see "Setting Up the WebLogic Server in Case of a Java SE Application" in Setting Up a One-Way SSL Connection to the LDAP in Securing Applications with Oracle Platform Security Services.
Define the trust store password:
-Djavax.net.ssl.trustStorePassword=<password>

4.2 Developing RESTful Web Service Clients Using Jersey 2.5.1 (JAX-RS 2.0 RI)

The following table summarizes a subset of the tasks that are required to develop RESTful web service clients.

<table>
<thead>
<tr>
<th>Task</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create and configure an instance of the javax.ws.rs.client.Client class.</td>
<td>&quot;Creating and configuring a Client instance&quot; in Jersey 2.5.1 User Guide</td>
</tr>
<tr>
<td>Target the Web resource.</td>
<td>&quot;Targeting a web resource&quot; in Jersey 2.5.1 User Guide</td>
</tr>
<tr>
<td>Identify resources on WebTarget.</td>
<td>&quot;Targeting a web resource&quot; in Jersey 2.5.1 User Guide</td>
</tr>
<tr>
<td>Invoke an HTTP request.</td>
<td>&quot;Invoking a HTTP request&quot; in Jersey 2.5.1 User Guide</td>
</tr>
</tbody>
</table>

For information about developing RESTful web service clients using Oracle JDeveloper, see "Creating RESTful Web Services and Clients" in Developing Applications with Oracle JDeveloper.

The following provides a simple example of a RESTful web service client that can be used to call the RESTful web service defined in Example 3–1, "Simple RESTful Web Service". In this example:

- The Client instance is created and a WebTarget defined.
- The resource path is defined to access the Web resource.
- The Invocation.Builder is used to send a get request to the resource.
- The response is returned as a String value.

Example 4–18 Simple RESTful Web Service Client Using Jersey 2.5.1 (JAX-RS 2.0 RI)

```java
package samples.helloworld.client;
...
import javax.ws.rs.client.Client;
import javax.ws.rs.client.ClientBuilder;
import javax.ws.rs.client.Invocation;
import javax.ws.rs.client.WebTarget;
import javax.ws.rs.core.MediaType;
import javax.ws.rs.core.Response;
public class helloWorldClient{
    public static void main(String[] args) {
        Client client = ClientBuilder.newClient();
        WebTarget target = client.target("http://localhost:7101/restservice");
        WebTarget resourceWebTarget;
        resourceWebTarget = target.path("resources/helloworld");
        Invocation.Builder invocationBuilder;
        invocationBuilder = resourceWebTarget.request(MediaType.TEXT_PLAIN_TYPE);
        Response response = invocationBuilder.get();
        System.out.println(response.getStatus());
    }
}
```
System.out.println(response.readEntity(String.class));
...
}
...
}

For complete details, see "Client API" in Jersey 2.5.1 User Guide.
This chapter describes how to package and deploy Java EE web services in WebLogic Server 12.1.3 that conform to the Representational State Transfer (REST) architectural style using the Jersey 1.18 Java API for RESTful Web Services (JAX-RS) 1.1 reference implementation (RI).

- Building RESTful Web Service Applications
- Packaging RESTful Web Service Applications
- Deploying RESTful Web Service Applications

5.1 Building RESTful Web Service Applications

Build your RESTful web service and client applications using the compilation tools, such as Apache Ant, Maven, or your favorite IDE, such as Oracle JDeveloper. For more information, see “Overview of WebLogic Server Application Development” in Developing Applications for Oracle WebLogic Server. For more information about JDeveloper, see “Building Java Projects” in Developing Applications with Oracle JDeveloper.

5.2 Packaging RESTful Web Service Applications

All RESTful web service applications must be packaged as part of a Web application. If your web service is implemented as an EJB, it must be packaged and deployed within a WAR.

Table 5–1 summarizes the specific packaging options available for RESTful web service applications.
Table 5–1  Packaging Options for RESTful Web Service Applications

<table>
<thead>
<tr>
<th>Packaging Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application subclass</td>
<td>Define a class that extends javax.ws.rs.core.Application to define the components of a RESTful web service application deployment and provide additional metadata. You can add a javax.ws.rs.ApplicationPath annotation to the subclass to configure the servlet context path. For more information, see Section 5.2.1, &quot;Packaging With an Application Subclass&quot;.</td>
</tr>
</tbody>
</table>
| Servlet               | Update the web.xml deployment descriptor to configure the servlet and mappings. The method used depends on whether your Web application is using Servlet 3.0 or earlier. For more information, refer to one of the following sections based on the Jersey version:  
  - Section 5.2.2, "Packaging With a Servlet Using Jersey 1.18 (JAX-RS 1.1 RI)"
  - Section 5.2.3, "Packaging With a Servlet Using Jersey 2.5.1 (JAX-RS 2.0 RI)"
| Default resource      | If you do not configure the servlet context path in your configuration using either of the options specified above, the WebLogic Server provides a default RESTful web service application servlet context path, resources. For more information, see Section 5.2.4, "Packaging as a Default Resource."

5.2.1 Packaging With an Application Subclass

In this packaging scenario, you create a class that extends javax.ws.rs.core.Application to define the components of a RESTful web service application deployment and provides additional metadata. For more information, see javax.ws.rs.core.Application in the Java Platform, Enterprise Edition API Specification Javadoc.

Within the Application subclass, override the getClasses() and getSingletons() methods, as required, to return the list of RESTful web service resources. A resource is bound to the Application subclass that returns it.

Note that an error is returned if both methods return the same resource.

Use the javax.ws.rs.ApplicationPath annotation to define the base URI pattern that gets mapped to the servlet. For more information about how this information is used in the base URI of the resource, see Section 3.3.3, "What Happens at Runtime: How the Base URI is Constructed." For more information, see the @ApplicationPath annotation in the Java Platform, Enterprise Edition 6 API Specification Javadoc.

For simple deployments, no web.xml deployment descriptor is required. For more complex deployments, for example to secure the web service or specify initialization parameters, you can package a web.xml deployment descriptor with your application, as described in Section 5.2.2, "Packaging With a Servlet Using Jersey 1.18 (JAX-RS 1.1 RI)."

Example 5–1 provides an example of a class that extends javax.ws.rs.core.Application and uses the @ApplicationPath annotation to define the base URI of the resource.

Example 5–1  Example of a Class that Extends javax.ws.rs.core.Application

```java
import javax.ws.rs.core.Application;
import javax.ws.rs.ApplicationPath;

...  
@ApplicationPath("resources")
public class MyApplication extends Application {
    public Set<Class<?>> getClasses() {
        Set<Class<?>> s = new HashSet<Class<?>>();
        s.add(HelloWorldResource.class);
    }
}
```
Alternatively, use one of the following APIs to scan for root resource and provider classes for a specified classpath or a set of package names:

- `com.sun.jersey.api.core.PackagesResourceConfig`, as described in "Deploying a RESTful Web Service" in *Jersey 1.18 User Guide*

  **Note:** Support for the `com.sun.jersey` package, its nested packages, and the `weblogic.jaxrs.api.client` package, is deprecated in this release of WebLogic Server. It is recommended that you update your RESTful applications to use the Jersey 2.5.1 (JAX-RS 2.0 RI) APIs at your earliest convenience.

- `org.glassfish.jersey.server.ResourceConfig`, as described in "JAX-RS Application Model" in *Jersey 2.5.1 User Guide*

5.2.2 Packaging With a Servlet Using Jersey 1.18 (JAX-RS 1.1 RI)

**Note:** Support for the `com.sun.jersey` package, its nested packages, and the `weblogic.jaxrs.api.client` package, is deprecated in this release of WebLogic Server. It is recommended that you update your RESTful applications to use the Jersey 2.5.1 (JAX-RS 2.0 RI) APIs at your earliest convenience.

The following sections describe how to package the RESTful web service application, built using Jersey 1.18 (JAX-RS 1.1 RI), with a servlet using the `web.xml` deployment descriptor, based on whether your Web application is using Servlet 3.0 or earlier.

- Section 5.2.2.1, "How to Package the RESTful Web Service Application with Servlet 3.0"
- Section 5.2.2.2, "How to Package the RESTful Web Service Application with Pre-3.0 Servlets"

The `web.xml` file is located in the `WEB-INF` directory in the root directory of your application archive. For more information about the `web.xml` deployment descriptor, see "web.xml Deployment Descriptor Elements" in *Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server*.

5.2.2.1 How to Package the RESTful Web Service Application with Servlet 3.0

To package the RESTful Web Service application with Servlet 3.0, update the `web.xml` deployment descriptor to define the elements defined in the following sections. The elements vary depending on whether you include in the package a class that extends `javax.ws.rs.core.Application`.

- Section 5.2.2.1.1, "Packaging the RESTful Web Service Application Using web.xml With Application Subclass"
- Section 5.2.2.1.2, "Packaging the RESTful Web Service Application Using web.xml Without Application Subclass"
For more information about any of the elements, see “servlet” in Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server.

### 5.2.2.1.1 Packaging the RESTful Web Service Application Using web.xml With Application Subclass

If a class that extends `javax.ws.rs.core.Application` is packaged with `web.xml`, then define the elements as described in Table 5–2. For an example, see Example 5–2.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;servlet-name&gt;</code></td>
<td>Set this element to the fully qualified name of the class that extends <code>javax.ws.rs.core.Application</code>. You can specify multiple servlet entries to define multiple Application subclass names.</td>
</tr>
<tr>
<td><code>&lt;servlet-class&gt;</code></td>
<td>Not required.</td>
</tr>
<tr>
<td><code>&lt;init-param&gt;</code></td>
<td>Not required.</td>
</tr>
</tbody>
</table>
| `<servlet-mapping>` | Set as the base URI pattern that gets mapped to the servlet.  
If not specified, one of the following values are used, in order of precedence:  
  - `@ApplicationPath` annotation value defined in the `javax.ws.rs.core.Application` subclass. For example:  
    ```java
    package test; 
    @ApplicationPath("res")
    public class MyJaxRsApplication extends java.ws.rs.core.Application
    ...
    ```  
    For more information, see Section 5.2.1, “Packaging With an Application Subclass.”  
  - The value `resources`. This is the default base URI pattern for RESTful web service applications. For more information, see Section 5.2.4, “Packaging as a Default Resource.”  
If both the `<servlet-mapping>` and `@ApplicationPath` are specified, the `<servlet-mapping>` takes precedence.  
For more information about how this information is used in the base URI of the resource, see Section 3.3.3, “What Happens at Runtime: How the Base URI is Constructed.” |

The following provides an example of how to update the `web.xml` file if a class that extends `javax.ws.rs.core.Application` is packaged with `web.xml`.

**Example 5–2 Updating web.xml for Servlet 3.0 If Application Subclass is in Package**

```xml
<web-app>
  <servlet>
    <servlet-name>org.foo.rest.MyApplication</servlet-name>
  </servlet>
  ...  
  <servlet-mapping>
    <servlet-name>org.foo.rest.MyApplication</servlet-name>
    <url-pattern>/resources</url-pattern>
  </servlet-mapping>
</web-app>
```

### 5.2.2.1.2 Packaging the RESTful Web Service Application Using web.xml Without Application Subclass

If a class that extends `javax.ws.rs.core.Application` is not packaged with `web.xml`, then define the elements as described in Table 5–3.
Table 5–3 Packaging the RESTful Web Service Application Using web.xml Without Application Subclass

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;servlet-name&gt;</td>
<td>Set this element to the desired servlet name.</td>
</tr>
</tbody>
</table>
| <servlet-class> | Set this element to one of the following classes to delegate all Web requests to the Jersey servlet:  
  ■ weblogic.jaxrs.server.portable.servlet.ServletContainer  
  ■ com.sun.jersey.spi.container.servlet.ServletContainer |
| <init-param>   | Not required. |
| <servlet-mapping> | Set as the base URI pattern that gets mapped to the servlet. If not specified, this value defaults to resources. For more information, see Section 5.2.4, "Packaging as a Default Resource."  
  For more information about how this information is used in the base URI of the resource, see Section 3.3.3, "What Happens at Runtime: How the Base URI is Constructed." |

The following provides an example of how to update the web.xml file if a class that extends javax.ws.rs.core.Application is not packaged with web.xml.

Example 5–3 Updating web.xml for Servlet 3.0 If Application Subclass is Not in Package

```xml
<web-app>
  <servlet>
    <servlet-name>Jersey Web Application</servlet-name>
    <servlet-class>com.sun.jersey.spi.container.servlet.ServletContainer</servlet-class>
  </servlet>
  <servlet-mapping>
    <servlet-name>Jersey Web Application</servlet-name>
    <url-pattern>/*</url-pattern>
  </servlet-mapping>
</web-app>
```

5.2.2.2 How to Package the RESTful Web Service Application with Pre-3.0 Servlets

Table 5–4 describes the elements to update in the web.xml deployment descriptor to package the RESTful web service application with a pre-3.0 servlet.
Table 5–4  Packaging the RESTful Web Service Application with Pre-3.0 Servlets

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;servlet-name&gt;</td>
<td>Set this element to the desired servlet name.</td>
</tr>
<tr>
<td>&lt;servlet-class&gt;</td>
<td>Set this element to one of the following classes to delegate all Web requests to the Jersey servlet:</td>
</tr>
<tr>
<td></td>
<td>■ weblogic.jaxrs.server.portable.servlet.ServletContainer</td>
</tr>
<tr>
<td></td>
<td>■ com.sun.jersey.spi.container.servlet.ServletContainer</td>
</tr>
<tr>
<td>&lt;init-param&gt;</td>
<td>Set this element to define the class that extends the javax.ws.rs.core.Application:</td>
</tr>
<tr>
<td></td>
<td>&lt;init-param&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;param-name&gt; javax.ws.rs.Application</td>
</tr>
<tr>
<td></td>
<td>&lt;/param-name&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;param-value&gt; ApplicationSubclassName</td>
</tr>
<tr>
<td></td>
<td>&lt;/param-value&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;/init-param&gt;</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can declare the packages in your application, as follows:</td>
</tr>
<tr>
<td></td>
<td>&lt;init-param&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;param-name&gt; com.sun.jersey.config.property.packages</td>
</tr>
<tr>
<td></td>
<td>&lt;/param-name&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;param-value&gt; project1</td>
</tr>
<tr>
<td></td>
<td>&lt;/param-value&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;/init-param&gt;</td>
</tr>
<tr>
<td>&lt;servlet-mapping&gt;</td>
<td>Set as the base URI pattern that gets mapped to the servlet.</td>
</tr>
<tr>
<td></td>
<td>If not specified, one of the following values are used, in order of precedence:</td>
</tr>
<tr>
<td></td>
<td>■ @ApplicationPath annotation value defined in the javax.ws.rs.core.Application subclass. For example:</td>
</tr>
<tr>
<td></td>
<td>package test;</td>
</tr>
<tr>
<td></td>
<td>@ApplicationPath(&quot;res&quot;)</td>
</tr>
<tr>
<td></td>
<td>public class MyJaxRsApplication extends java.ws.rs.core.Application</td>
</tr>
<tr>
<td></td>
<td>...)</td>
</tr>
</tbody>
</table>
|                      |     For more information, see Section 5.2.1, "Packaging With an Application Subclass."
|                      |   ■ The value resources. This is the default base URI pattern for RESTful web service applications. For more information, see Section 5.2.4, "Packaging as a Default Resource."
|                      | If both the <servlet-mapping> and @ApplicationPath are specified, the <servlet-mapping> takes precedence.                                                                                                    |
|                      | For more information about how this information is used in the base URI of the resource, see Section 3.3.3, "What Happens at Runtime: How the Base URI is Constructed."

The following provides an example of how to update the web.xml file if an class that extends javax.ws.rs.core.Application is not packaged with web.xml.

**Example 5–4  Updating web.xml for Pre-3.0 Servlets**

```xml
<web-app>
    <servlet>
        <servlet-name>Jersey Web Application</servlet-name>
    </servlet>
</web-app>
```
5.2.3 Packaging With a Servlet Using Jersey 2.5.1 (JAX-RS 2.0 RI)

The following sections describe how to package the RESTful web service application, built using Jersey 2.5.1 (JAX-RS 2.0 RI), with a servlet using the `web.xml` deployment descriptor, based on whether your Web application is using Servlet 3.0 or earlier.

- Section 5.2.3.1, "How to Package the RESTful Web Service Application with Servlet 3.0"
- Section 5.2.3.2, "How to Package the RESTful Web Service Application with Pre-3.0 Servlets"

The `web.xml` file is located in the `WEB-INF` directory in the root directory of your application archive. For more information about the `web.xml` deployment descriptor, see "web.xml Deployment Descriptor Elements" in Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server.

5.2.3.1 How to Package the RESTful Web Service Application with Servlet 3.0

To package the RESTful Web Service application with Servlet 3.0, update the `web.xml` deployment descriptor to define the elements defined in the following sections. The elements vary depending on whether you include in the package a class that extends `javax.ws.rs.core.Application`.

- Section 5.2.3.1.1, "Packaging the RESTful Web Service Application Using web.xml With Application Subclass"
- Section 5.2.3.1.2, "Packaging the RESTful Web Service Application Using web.xml Without Application Subclass"

For more information about any of the elements, see "servlet" in Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server.

5.2.3.1.1 Packaging the RESTful Web Service Application Using web.xml With Application Subclass

If a class that extends `javax.ws.rs.core.Application` is packaged with `web.xml`, then define the elements as described in Table 5–5. For an example, see Example 5–5.
### Table 5–5  Packaging the RESTful Web Service Application Using web.xml With Application Subclass

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;servlet-name&gt;</code></td>
<td>Set this element to the fully qualified name of the class that extends <code>javax.ws.rs.core.Application</code>. You can specify multiple servlet entries to define multiple Application subclass names.</td>
</tr>
<tr>
<td><code>&lt;servlet-class&gt;</code></td>
<td>Not required.</td>
</tr>
<tr>
<td><code>&lt;init-param&gt;</code></td>
<td>Not required.</td>
</tr>
<tr>
<td><code>&lt;servlet-mapping&gt;</code></td>
<td>Set as the base URI pattern that gets mapped to the servlet. If not specified, one of the following values are used, in order of precedence:</td>
</tr>
<tr>
<td></td>
<td>- @ApplicationPath annotation value defined in the <code>javax.ws.rs.core.Application</code> subclass. For example:</td>
</tr>
</tbody>
</table>
|                          |       ```
|                          |       package test;
|                          |       @ApplicationPath("res")
|                          |       public class MyJaxRsApplication extends java.ws.rs.core.Application
|                          |       ...```                                                                                                                                                                                                |
|                          |       For more information, see Section 5.2.1, "Packaging With an Application Subclass."                                                                                                                    |
|                          |   - The value resources. This is the default base URI pattern for RESTful web service applications. For more information, see Section 5.2.4, "Packaging as a Default Resource."                                      |
|                          |       If both the `<servlet-mapping>` and @ApplicationPath are specified, the `<servlet-mapping>` takes precedence.                                                                                           |
|                          |       For more information about how this information is used in the base URI of the resource, see Section 3.3.3, "What Happens at Runtime: How the Base URI is Constructed."                                      |

The following provides an example of how to update the `web.xml` file if a class that extends `javax.ws.rs.core.Application` is packaged with `web.xml`.

### Example 5–5  Updating web.xml for Servlet 3.0 If Application Subclass is in Package

```xml
<web-app>
  <servlet>
    <servlet-name>org.foo.rest.MyApplication</servlet-name>
  </servlet>
  ...
  <servlet-mapping>
    <servlet-name>org.foo.rest.MyApplication</servlet-name>
    <url-pattern>/resources</url-pattern>
  </servlet-mapping>
  ...
</web-app>
```

### 5.2.3.1.2  Packaging the RESTful Web Service Application Using web.xml Without Application Subclass

If a class that extends `javax.ws.rs.core.Application` is **not** packaged with `web.xml`, then define the elements as described in Table 5–3.

**Note:** In this scenario, you cannot support multiple RESTful web service applications.
Table 5–6  Packaging the RESTful Web Service Application Using web.xml Without Application Subclass

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;servlet-name&gt;</td>
<td>Set this element to the desired servlet name.</td>
</tr>
<tr>
<td>&lt;servlet-class&gt;</td>
<td>Set this element to org.glassfish.jersey.servlet.ServletContainer to delegate all Web requests to the Jersey servlet.</td>
</tr>
<tr>
<td>&lt;init-param&gt;</td>
<td>Not required.</td>
</tr>
<tr>
<td>&lt;servlet-mapping&gt;</td>
<td>Set as the base URI pattern that gets mapped to the servlet. If not specified, this value defaults to resources. For more information, see Section 5.2.4, &quot;Packaging as a Default Resource.&quot; For more information about how this information is used in the base URI of the resource, see Section 3.3.3, &quot;What Happens at Runtime: How the Base URI is Constructed.&quot;</td>
</tr>
</tbody>
</table>

The following provides an example of how to update the web.xml file if an class that extends javax.ws.rs.core.Application is not packaged with web.xml.

Example 5–6  Updating web.xml for Servlet 3.0 If Application Subclass is Not in Package

```xml
<web-app>
  <servlet>
    <servlet-name>Jersey Web Application</servlet-name>
    <servlet-class>org.glassfish.jersey.servlet.ServletContainer</servlet-class>
  </servlet>
  <servlet-mapping>
    <servlet-name>Jersey Web Application</servlet-name>
    <url-pattern>/*</url-pattern>
  </servlet-mapping>
</web-app>
```

5.2.3.2 How to Package the RESTful Web Service Application with Pre-3.0 Servlets
Table 5–7 describes the elements to update in the web.xml deployment descriptor to package the RESTful web service application with a pre-3.0 servlet.
### Table 5–7  Packaging the RESTful Web Service Application with Pre-3.0 Servlets

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;servlet-name&gt;</td>
<td>Set this element to the desired servlet name.</td>
</tr>
<tr>
<td>&lt;servlet-class&gt;</td>
<td>Set this element to <code>org.glassfish.jersey.servlet.ServletContainer</code> to delegate all Web requests to the Jersey servlet.</td>
</tr>
<tr>
<td>&lt;init-param&gt;</td>
<td>Set this element to define the class that extends the <code>javax.ws.rs.core.Application</code>:</td>
</tr>
<tr>
<td></td>
<td>&lt;init-param&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;param-name&gt;</td>
</tr>
<tr>
<td></td>
<td><code>javax.ws.rs.Application</code></td>
</tr>
<tr>
<td></td>
<td>&lt;param-value&gt;</td>
</tr>
<tr>
<td></td>
<td><code>ApplicationSubclassName</code></td>
</tr>
<tr>
<td></td>
<td>&lt;/init-param&gt;</td>
</tr>
<tr>
<td>&lt;servlet-mapping&gt;</td>
<td>Set as the base URI pattern that gets mapped to the servlet.</td>
</tr>
<tr>
<td></td>
<td>If not specified, one of the following values are used, in order of precedence:</td>
</tr>
<tr>
<td></td>
<td>- @ApplicationPath annotation value defined in the <code>javax.ws.rs.core.Application</code> subclass. For example:</td>
</tr>
<tr>
<td></td>
<td>package test;</td>
</tr>
<tr>
<td></td>
<td>@ApplicationPath(&quot;res&quot;)</td>
</tr>
<tr>
<td></td>
<td>public class MyJaxRsApplication extends java.ws.rs.core.Application</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td>For more information, see Section 5.2.1, &quot;Packaging With an Application Subclass.&quot;</td>
</tr>
<tr>
<td></td>
<td>- The value resources. This is the default base URI pattern for RESTful web service applications. For more information, see Section 5.2.4, &quot;Packaging as a Default Resource.&quot;</td>
</tr>
<tr>
<td></td>
<td>If both the <code>&lt;servlet-mapping&gt;</code> and <code>@ApplicationPath</code> are specified, the <code>&lt;servlet-mapping&gt;</code> takes precedence.</td>
</tr>
<tr>
<td></td>
<td>For more information about how this information is used in the base URI of the resource, see Section 3.3.3, &quot;What Happens at Runtime: How the Base URI is Constructed.&quot;</td>
</tr>
</tbody>
</table>

The following provides an example of how to update the `web.xml` file if an class that extends `javax.ws.rs.core.Application` is not packaged with `web.xml`. 
Example 5-7  Updating web.xml for Pre-3.0 Servlets

```xml
<web-app>
    <servlet>
        <servlet-name>Jersey Web Application</servlet-name>
        <servlet-class>org.glassfish.jersey.servlet.ServletContainer</servlet-class>
        <init-param>
            <param-name>jersey.config.server.provider.packages</param-name>
            <param-value>org.foo.myresources,org.bar.otherresources</param-value>
        </init-param>
        <init-param>
            <param-name>jersey.config.server.provider.scanning.recursive</param-name>
            <param-value>false</param-value>
        </init-param>
    </servlet>
    ...
</web-app>
```

5.2.4 Packaging as a Default Resource

By default, WebLogic Server defines a default RESTful web service application context path, resources. The default RESTful web service application context path is used if the following are true:

- You did not update the web.xml deployment descriptor to include a Servlet mapping, as described in Section 5.2.2, "Packaging With a Servlet Using Jersey 1.18 (JAX-RS 1.1 RI)."
- The @ApplicationPath annotation is not defined in the javax.ws.rs.core.Application subclass, as described in Section 5.2.1, "Packaging With an Application Subclass."

Note: If a servlet is already registered at the default context path, then a warning is issued.

For example, if the relative URI of the root resource class for the RESTful web service application is defined as @Path('/helloworld') and the default RESTful web service application context path is used, then the RESTful web service application resource will be available at:

http://<host>:<port>/<contextPath>/resources/helloworld

5.3 Deploying RESTful Web Service Applications

For information about deploying a Web application, see "Understanding WebLogic Server Deployment" in Deploying Applications to Oracle WebLogic Server.
Securing RESTful Web Services and Clients

This chapter describes how to secure Java EE web services in WebLogic Server 12.1.3 that conform to the Representational State Transfer (REST) architectural style using Java API for RESTful Web Services (JAX-RS) reference implementation (RI).

This chapter includes the following sections:

- Section 6.1, "About RESTful Web Service Security"
- Section 6.2, "Securing RESTful Web Services and Clients Using OWSM Policies"
- Section 6.3, "Securing RESTful Web Services Using web.xml"
- Section 6.4, "Securing RESTful Web Services Using SecurityContext"
- Section 6.5, "Securing RESTful Web Services Using Java Security Annotations"

6.1 About RESTful Web Service Security

You can secure your RESTful web services using one of the following methods to support authentication, authorization, or encryption:

- Attaching Oracle Web Services Manager (OWSM) policies. See Section 6.2, "Securing RESTful Web Services and Clients Using OWSM Policies".

  Note: This section applies to RESTful web services and clients that are built using Jersey 1.x JAX-RS RI only. RESTful web services and clients that are built using Jersey 2.5.1 (JAX-RS 2.0 RI) cannot be secured using OWSM policies in this release.

- Updating the web.xml deployment descriptor to access information about the authenticated users. See Section 6.3, "Securing RESTful Web Services Using web.xml".

- Using the javax.ws.rs.core.SecurityContext interface to access security-related information for a request. See Section 6.4, "Securing RESTful Web Services Using SecurityContext".

- Applying annotations to your JAX-RS classes. See Section 6.5, "Securing RESTful Web Services Using Java Security Annotations".

For information about developing RESTful web service clients using Oracle JDeveloper, see "How to Attach Policies to RESTful Web Services and Clients" in Developing Applications with Oracle JDeveloper.
6.2 Securing RESTful Web Services and Clients Using OWSM Policies

Note: You can attach OWSM policies to RESTful web services and clients that are built using Jersey 1.x JAX-RS RI only. RESTful web services and clients that are built using Jersey 2.5.1 (JAX-RS 2.0 RI) cannot be secured using OWSM policies in this release.

Only a subset of OWSM security policies are supported for RESTful web services, as described in "Which OWSM Policies Are Supported for RESTful Web Services" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

You can attach OWSM security policies to RESTful web services using one of the following methods:

- Programmatically, at design time, as described in "Attaching Policies to RESTful Web Services and Clients at Design Time" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

- Post-deployment, both directly and globally, using:
  - Fusion Middleware Control, as described in "Attaching Policies Using Fusion Middleware Control" in Securing Web Services and Managing Policies with Oracle Web Services Manager.
  - WLST, as described in "Attaching Policies Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

Example 6–1 provides an example of using WLST to attach the oracle/http_basic_auth_over_ssl_service_policy policy to a RESTful service. For more information, see "Attaching Policies Directly Using WLST" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

Example 6–1  Securing RESTful Web Services Using OWSM Policies With WLST

C:\Oracle\Middleware\oracle_common\common\bin> wlst.cmd
...

-wls://offline> connect("weblogic","password","t3://myAdminServer.example.com:7001")
Connecting to t3://myAdminServer.example.com:7001' with userid weblogic ... Successfuly connected to Admin Server 'AdminServer' that belongs to domain "my_domain".

Warning: An insecure protocol was used to connect to the server. To ensure on-the-wire security, the SSL port or Admin port should be used instead.

-wls://my_domain/serverConfig> beginWSMSession()
Location changed to domainRuntime tree. This is a read-only tree with DomainMBean as the root. For more help, use help('domainRuntime')

Session started for modification.
-wls://my_domain/serverConfig> selectWSMPolicySubject('weblogic/my_domain/jaxrs_pack', '#jaxrs_pack.war', 'REST-Resource(Jersey)')

The policy subject is selected for modification.

-wls://my_domain/serverConfig> attachWSMPolicy('oracle/http_basic_auth_over_ssl_service_policy')

Policy reference 'oracle/http_basic_auth_over_ssl_service_policy' added.

-wls://my_domain/serverConfig> commitWSMSession()
The policy set for subject "*/weblogic/my_domain/jaxrs_pack#/jaxrs_pack.war|REST-Resource(Jersey)" was saved successfully.

## 6.3 Securing RESTful Web Services Using web.xml

You secure RESTful web services using the `web.xml` deployment descriptor as you would for other Java EE Web applications. For complete details, see:

- "Developing Secure Web Applications" in *Developing Applications with the WebLogic Security Service*.
- "Securing Web Applications" in *The Java EE 6 Tutorial*

For example, to secure your RESTful web service using basic authentication, perform the following steps:

1. Define a `<security-constraint>` for each set of RESTful resources (URIs) that you plan to protect.
2. Use the `<login-config>` element to define the type of authentication you want to use and the security realm to which the security constraints will be applied.
3. Define one or more security roles using the `<security-role>` tag and map them to the security constraints defined in step 1. For more information, see "security-role" in *Developing Applications with the WebLogic Security Service*.
4. To enable encryption, add the `<user-data-constraint>` element and set the `<transport-guarantee>` subelement to `CONFIDENTIAL`. For more information, see "user-data-constraint" in *Developing Applications with the WebLogic Security Service*.

The following shows an example of how to secure a Jersey 1.18 (JAX-RS 1.1) RESTful web service using basic authentication. To secure a Jersey 2.5.1 (JAX-RS 2.0) RESTful web service, replace the `<servlet-class>` element, as follows:

```xml
<web-app>
  <servlet>
    <servlet-name>RestServlet</servlet-name>
    <servlet-class>com.sun.jersey.spi.container.servlet.ServletContainer</servlet-class>
  </servlet>
  <servlet-mapping>
    <servlet-name>RestServlet</servlet-name>
    <url-pattern>/*</url-pattern>
  </servlet-mapping>
  <security-constraint>
    <web-resource-collection>
      <web-resource-name>Orders</web-resource-name>
      <url-pattern>/orders</url-pattern>
      <http-method>GET</http-method>
      <http-method>POST</http-method>
    </web-resource-collection>
    <http-method>GET</http-method>
    <http-method>POST</http-method>
  </security-constraint>
</web-app>
```

---

**Note:** Support for the `com.sun.jersey` package, its nested packages, and the `weblogic.jaxrs.api.client` package, is deprecated in this release of WebLogic Server. It is recommended that you update your RESTful applications to use the Jersey 2.5.1 (JAX-RS 2.0 RI) APIs at your earliest convenience.

---

**Example 6–2  Securing RESTful Web Services Using Basic Authentication**
6.4 Securing RESTful Web Services Using SecurityContext

The `javax.ws.rs.core.SecurityContext` interface provides access to security-related information for a request. The `SecurityContext` provides functionality similar to `javax.servlet.http.HttpServletRequest`, enabling you to access the following security-related information:

- `java.security.Principal` object containing the name of the user making the request.
- Authentication type used to secure the resource, such as `BASIC_AUTH`, `FORM_AUTH`, and `CLIENT_CERT_AUTH`.
- Whether the authenticated user is included in a particular role.
- Whether the request was made using a secure channel, such as HTTPS.

You access the `SecurityContext` by injecting an instance into a class field, setter method, or method parameter using the `@Context` annotation.

For more information, see the following in the Java EE 6 Platform API Specification:

- `SecurityContext` interface
- `@Context` annotation

Example 6–3 shows how to inject an instance of `SecurityContext` into the `sc` method parameter using the `@Context` annotation, and check whether the authorized user is included in the `admin` role before returning the response.

Example 6–3  Securing RESTful Web Service Using SecurityContext

```java
package samples.helloworld;

import javax.ws.rs.GET;
import javax.ws.rs.POST;
import javax.ws.rs.Path;
import javax.ws.rs.core.SecurityContext;
import javax.ws.rs.core.Context;

@Path("/stateless")
@Stateless(name = "JaxRSStatelessEJB")
public class StlsEJBApp {
    ...
    @GET
    ...
}`
Securing RESTful Web Services Using Java Security Annotations

The `javax.annotation.security` package provides annotations, defined in Table 6-1, that you can use to secure your RESTful web services.

<table>
<thead>
<tr>
<th>Annotation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>@DenyAll</code></td>
<td>Specifies that no security roles are allowed to invoke the specified methods.</td>
</tr>
<tr>
<td><code>@PermitAll</code></td>
<td>Specifies that all security roles are allowed to invoke the specified methods.</td>
</tr>
<tr>
<td><code>@RolesAllowed</code></td>
<td>Specifies the list of security roles that are allowed to invoke the methods in the application.</td>
</tr>
</tbody>
</table>

Before you can use the annotations defined in Table 6-1, you must register the roles-allowed feature, as described in the following sections:

- Jersey 1.18 (JAX-RS 1.1 RI):

  **Note:** Support for the `com.sun.jersey` package, its nested packages, and the `weblogic.jaxrs.api.client` package, is deprecated in this release of WebLogic Server. It is recommended that you update your RESTful applications to use the Jersey 2.5.1 (JAX-RS 2.0 RI) APIs at your earliest convenience.

- Jersey 2.5.1 (JAX-RS 2.0 RI): "Securing JAX-RS resources with standard `javax.annotation.security` annotations" in *Jersey 2.5.1 User Guide*

  Example 6-4 shows how to define the security roles that are allowed, by default, to access the methods defined in the `helloWorld` class. The `sayHello` method is annotated with the `@RolesAllowed` annotation to override the default and only allow users that belong to the ADMIN security role.

**Example 6-4  Securing RESTful Web Service Using Java Security Annotations**

```java
package samples.helloworld;

import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.Produces;
import javax.annotation.Security.RolesAllowed;
@Path("/helloworld")
@RolesAllowed("ADMIN", "ORG1")
public class helloWorld {
    @Produces("text/plain;charset=UTF-8")
    @Path('/hello')
    public String sayHello(@Context SecurityContext sc) {
        if (sc.isUserInRole("admin")) return "Hello World!";
        throw new SecurityException("User is unauthorized.");
    }
}
```
For more information, see:
  ■ "Specifying Authorized Users by Declaring Security Roles" in *The Java EE Tutorial*.
  ■ javax.annotation.security Javadoc
This chapter describes how to test Java EE web services in WebLogic Server 12.1.3 that conform to the Representational State Transfer (REST) architectural style using Java API for RESTful Web Services (JAX-RS).

After you have deployed a Web application that contains a RESTful web service to WebLogic Server, you can test your application.

Table 7–1 lists the methods that can be employed to test your RESTful web service.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Manager Fusion Middleware Control</td>
<td>Use the test interface provided with Enterprise Manager Fusion Middleware Control to test the RESTful web service resource methods. For more information, see “Testing a RESTful Web Service” in Securing Web Services and Managing Policies with Oracle Web Services Manager.</td>
</tr>
<tr>
<td>WebLogic Server Administration Console</td>
<td>Navigate to the Testing tab for your application deployment in the WebLogic Server Administration Console to validate the application deployment and view the WADL file. For more information, see “Test RESTful Web services” in Oracle WebLogic Server Administration Console Online Help.</td>
</tr>
</tbody>
</table>
This chapter describes how to monitor Java EE web services in WebLogic Server 12.1.3 that conform to the Representational State Transfer (REST) architectural style using Java API for RESTful Web Services (JAX-RS).

This chapter includes the following sections:

- Section 8.1, "About Monitoring RESTful Web Services"
- Section 8.2, "Monitoring RESTful Web Services Using Enterprise Manager Fusion Middleware Control"
- Section 8.3, "Monitoring RESTful Web Services Using the Administration Console"
- Section 8.4, "Monitoring RESTful Web Services Using WLST"
- Section 8.5, "Enabling the Tracing Feature"

### 8.1 About Monitoring RESTful Web Services

To monitor your RESTful web services, you can use one of the methods defined in Table 8–1.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fusion Middleware Control Enterprise Manager</td>
<td>Access run-time information and monitor run-time statistics, as described in Section 8.2, &quot;Monitoring RESTful Web Services Using Enterprise Manager Fusion Middleware Control.&quot;</td>
</tr>
<tr>
<td>WebLogic Server Administration Console</td>
<td>Access run-time information and monitor run-time statistics, as described in Section 8.3, &quot;Monitoring RESTful Web Services Using the Administration Console.&quot;</td>
</tr>
<tr>
<td>WebLogic Scripting Tool (WLST)</td>
<td>Access run-time information and monitor run-time statistics, as described in Section 8.4, &quot;Monitoring RESTful Web Services Using WLST.&quot;</td>
</tr>
<tr>
<td>Logging filter</td>
<td>Monitor how a request is processed and dispatched to Jersey JAX-RS RI components, as described in Section 8.5, &quot;Enabling the Tracing Feature.&quot;</td>
</tr>
</tbody>
</table>

In addition to the monitoring methods described in Table 8–1, Jersey 2.5.1 JAX-RS 2.0 Reference Implementation (RI) provides additional monitoring features, including support for event listeners and statistics monitoring. For more information, see "Monitoring Jersey Applications" in Jersey 2.5.1 User Guide.
8.2 Monitoring RESTful Web Services Using Enterprise Manager Fusion Middleware Control

Using Enterprise Manager Fusion Middleware Control, you can monitor statistics for your RESTful Applications and resources, such as error and invocation counts, execution times, and so on. For complete information, see "Monitoring Web Services" in Administering Web Services.

8.3 Monitoring RESTful Web Services Using the Administration Console

Using the WebLogic Server Administration Console, you can monitor statistics for your RESTful Applications and resources, such as error and invocation counts, execution times, and so on.

To monitor your deployed RESTful web services using the WebLogic Server Administration Console, follow these steps:

1. Invoke the WebLogic Server Administration Console in your browser using the following URL:
   
   http://[host]:[port]/console

   where:
   
   - host refers to the computer on which WebLogic Server is running.
   - port refers to the port number on which WebLogic Server is listening (default value is 7001).

2. Follow the procedure described in "Monitor RESTful Web Services" in Oracle WebLogic Server Administration Console Online Help.

8.4 Monitoring RESTful Web Services Using WLST

WebLogic Server provides several run-time MBeans, including those defined in Table 8–2, that capture run-time information and let you monitor run-time statistics for your RESTful web service applications.

<table>
<thead>
<tr>
<th>Run-time MBean</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JaxRsApplication</td>
<td>Displays monitoring information for the RESTful web service application. For more information, see &quot;JaxRsApplicationRuntimeBean&quot; in the WebLogic Server MBean Reference.</td>
</tr>
<tr>
<td>ResourceConfig</td>
<td>Displays monitoring information about the RESTful web service application resource configuration. For more information, see &quot;JaxRsResourceConfigTypeRuntimeBean&quot; in the WebLogic Server MBean Reference.</td>
</tr>
<tr>
<td>RootResources</td>
<td>Displays monitoring information about the RESTful web service resource. Any object that is managed by a container (such as EJB) will have application scope. All other resources by default will have request scope. For more information, see &quot;JaxRsResourceRuntimeBean&quot; in the WebLogic Server MBean Reference.</td>
</tr>
<tr>
<td>Servlet</td>
<td>Displays monitoring information for the servlet that hosts the RESTful web service application. For more information, see &quot;ServletRuntimeMBean&quot; in the WebLogic Server MBean Reference.</td>
</tr>
</tbody>
</table>
To monitor RESTful web services using WLST, perform the steps provided in the following procedure.

In this procedure, the example steps provided demonstrate how to monitor the RESTful Web Services sample delivered with the WebLogic Server Samples Server, described at "Sample Application and Code Examples" in Understanding Oracle WebLogic Server.

1. Invoke WLST, as described in "Invoking WLST" in Understanding the WebLogic Scripting Tool.
   For example:
   ```
c:\Oracle\Middleware\wlserver\common\bin> wlst
   ```

2. Connect to the Administration Server instance, as described in "connect" in WLST Command Reference for WebLogic Server.
   For example:
   ```
wls:/offline> connect('weblogic','password','t3://localhost:8001')
   ```

3. Navigate to the server run-time MBean, as described in "serverRuntime" in WLST Command Reference for WebLogic Server.
   For example:
   ```
wls:/wl_server/serverConfig> serverRuntime()
   Location changed to serverRuntime tree. This is a read-only tree with ServerRuntimeMBean as the root.
   For more help, use help('serverRuntime')
   wls:/wl_server/serverRuntime>
   ```

4. Navigate to the Web application component runtime MBean.
   For example, to navigate to runtime MBean for the application named jaxrs:
   ```
wls:/wl_server/serverRuntime> cd('ApplicationRuntimes/jaxrs')
wls:/wl_server/serverRuntime/ApplicationRuntimes/jaxrs> cd('ComponentRuntimes')
wls:/wl_server/serverRuntime/ApplicationRuntimes/jaxrs/ComponentRuntimes> cd('examplesServer_/jaxrs')
   ```

5. Navigate to the application run-time MBean for the RESTful web service servlet.
   For example:
   ```
wls:/wl_server/serverRuntime/ApplicationRuntimes/jaxrs/ComponentRuntimes/examplesServer_/jaxrs/JaxRsApplications/RestServlet>
   ls()
   dr-- ResourceConfig
   dr-- RootResources
   dr-- Servlet
   -r-- ErrorCount                                   0
   -r-- ExecutionTimeAverage                         0
   ```

6. Review the monitoring information displayed for the RESTful web service application. For more information, see "JaxRsApplicationRuntimeBean" in the WebLogic Server MBean Reference.
   For example:
   ```
wls:/wl_server/serverRuntime/ApplicationRuntimes/jaxrs/ComponentRuntimes/examplesServer_/jaxrs/JaxRsApplications/RestServlet> ls()
   ```
Enabling the Tracing Feature

---

Developing and Securing RESTful Web Services for Oracle WebLogic Server 12.1.3

---

7. Navigate to any of the following run-time MBeans to view additional monitoring information. For more information about the MBeans, see Table 8–2 or the WebLogic Server MBean Reference.
   - ResourceConfig
   - RootResources
   - Servlet

8. Exit WLST, as described in "Exiting WLST" in Understanding the WebLogic Scripting Tool.
   For example:
   ```
   wls:/wl_server/runtime/ApplicationRuntimes/jaxrs/ComponentRuntimes/exampleServer_/jaxrs/JaxRsApplications/RestServlet> exit()
   Exiting WebLogic Scripting Tool ...
   c:\>
   ```

8.5 Enabling the Tracing Feature

The Jersey tracing feature provides useful information that describes how a request is processed and dispatched to Jersey JAX-RS RI components. Trace messages are output in the same order as they occur, so the numbering is useful to reconstruct the tracing order.

The following sections describe how to enable tracing based on whether you are using Jersey 1.18 or 2.5.1 JAX-RS Reference Implementation (RI).

- Section 8.5.1, "Enabling Tracing Using Jersey 1.18 (JAX-RS 1.1 RI)"
- Section 8.5.2, "Enabling Tracing Using Jersey 2.5.1 (JAX-RS 2.0 RI)"

8.5.1 Enabling Tracing Using Jersey 1.18 (JAX-RS 1.1 RI)

Using Jersey 1.18 (JAX-RS 1.1 RI), you can enable the tracing feature server-wide or on a per-request basis, as described in the following sections:
Enabling the Tracing Feature

- **Section 8.5.1.1, "How to Enable Server-wide Tracing"
- **Section 8.5.1.2, "How to Enable Per-request Tracing"

The following provides an example of a trace message. The message shows the request path and the initial set of regular expressions that will be matched, in order from left to right.

**Example 8–1  Example of a Trace Message**

Trace 001:
X-Jersey-Trace-001  match path "/items/3/tracks/2/"  \*application\wadl(\.\*)?", "/happy(\./.*)?", "/(.\*)?"

**8.5.1.1  How to Enable Server-wide Tracing**

You can enable server-wide tracing for RESTful web service applications that are packaged with servlets, as described in **Section 5.2.2, "Packaging With a Servlet Using Jersey 1.18 (JAX-RS 1.1 RI),”** and the following elements are present in the web.xml file:

- **Servlet class, defined as follows:**
  ```xml
  <servlet-class>com.sun.jersey.spi.container.servlet.ServletContainer</servlet-class>
  ```

- **One of the following <init-param>s, set to True:**
  - com.sun.jersey.config.feature.TracePerRequest
  - com.sun.jersey.config.feature.Trace

To enable server-wide tracing:

- **Update the web.xml deployment descriptor that is packaged with your application to add the following <init-param> element:**
  ```xml
  <init-param>
    <param-name>com.sun.jersey.config.feature.Trace</param-name>
    <param-value>true</param-value>
  </init-param>
  ```

  For more information about the <init-param> element, see "servlet" in Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server.

- **Enable the com.sun.jersey.api.core.ResourceConfig.FEATURE_TRACE property.**
  For more information, see FEATURE_TRACE field description in the jersey-bundle 1.18 API Javadoc.

**8.5.1.2  How to Enable Per-request Tracing**

You can enable per-request tracing for RESTful web service applications that are packaged with servlets, as described in **Section 5.2.2, "Packaging With a Servlet Using Jersey 1.18 (JAX-RS 1.1 RI),”** and the following elements are present in the web.xml file:

- **Servlet class, defined as follows:**
  ```xml
  <servlet-class>com.sun.jersey.spi.container.servlet.ServletContainer</servlet-class>
  ```

- **One of the following <init-param> parameters, set to True:**
  - com.sun.jersey.config.feature.TracePerRequest
  - com.sun.jersey.config.feature.Trace
With per-request tracing, trace messages are output if a request header is present with the header name of \texttt{X-Jersey-Trace-Accept}.

Trace messages are output primarily as response headers with a header name of the form \texttt{X-Jersey-Trace-XXX}, where \texttt{XXX} is a decimal value corresponding to the trace message number, and a header value that is the trace message. In certain cases, trace messages will be logged to the server if they cannot be included in the response headers, for example if the messages are too long.

To enable tracing on a per-request basis:

- Update the web.xml deployment descriptor that is packaged with your application to add the following \texttt{<init-param>} element:

  \begin{verbatim}
  <init-param>
    <param-name>com.sun.jersey.config.feature.TracePerRequest</param-name>
    <param-value>true</param-value>
  </init-param>
  \end{verbatim}

  For more information about the \texttt{<init-param>} element, see "servlet" in \textit{Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server}.

- Enable the \texttt{com.sun.jersey.api.core.ResourceConfig.FEATURE_TRACE_PER_REQUEST} property. For more information, see \texttt{FEATURE_TRACE_PER_REQUEST} field description in the jersey-bundle 1.18 API.

\subsection*{8.5.2 Enabling Tracing Using Jersey 2.5.1 (JAX-RS 2.0 RI)}

When enabled, the Jersey 2.5.1 tracing facility collects for individual requests useful information from all components of the JAX-RS server-side request processing pipeline. The information collected may provide vital details for troubleshooting your Jersey or JAX-RS application.

The tracing information for a single request is returned to the requesting client in the HTTP headers of the response. In addition, the information is logged on the server-side using a dedicated Java Logger instance.

For more information about enabling the Jersey 2.5.1 tracing facility, see "Tracing Support" in \textit{Jersey 2.5.1 User Guide}. 

This chapter explains how to use server-sent events in WebLogic Server 12.1.3. Support for server-sent events in WebLogic Server is provided through the integration of the Jersey 2.5.1 library. The Jersey 2.5.1 library provides the Reference Implementation (RI) of JSR-399 (JAX-RS 2.0: Java API for RESTful Web Services) and is delivered as a shared library.

This chapter includes the following sections:

- Section 9.1, "Overview of Server-Sent Events (SSE)"
- Section 9.2, "Understanding the WebLogic Server-Sent Events API"
- Section 9.3, "Building and Deploying SSE-Enabled Applications in WebLogic Server"
- Section 9.4, "Sample Applications for Server-Sent Events"

### 9.1 Overview of Server-Sent Events (SSE)

Server-sent events enable servers to push data to Web pages over standard HTTP or HTTPS through a uni-directional client-server connection. In the server-sent events communication model, the browser client establishes the initial connection, and the server provides the data and sends it to the client. For general information about server-sent events, see the [Server-Sent Events W3C Candidate Recommendation](https://www.w3.org/TR/eventsource/).

Server-sent events are part of the HTML 5 specification, which also includes WebSocket technology. Both communication models enable servers to send data to clients unsolicited. However, server-sent events establish one-way communication from server to clients, while a WebSocket connection provides a bi-directional, full-duplex communication channel between servers and clients, promoting user interaction through two-way communication. The following key differences exist between WebSocket and server-sent events technologies:

- Server-sent events can only push data to the client, while WebSocket technology can both send and receive data from a client.
- The simpler server-sent events communication model is better suited for server-only updates, while WebSocket technology requires additional programming for server-only updates.
- Server-sent events are sent over standard HTTP and therefore do not require any special protocol or server implementation to work. WebSocket technology requires the server to understand the WebSocket protocol to successfully upgrade an HTTP connection to a WebSocket connection.
9.2 Understanding the WebLogic Server-Sent Events API

WebLogic Server supports server-sent events through the integration of the Jersey 2.5.1 shared library. The use of server-sent events through Jersey 2.5.1 is supported only in JAX-RS resources. For more information about server-sent events in Jersey 2.5.1, see "Server-Sent Events (SSE) Support" in the Jersey 2.5.1 User Guide.

The WebLogic Server Server-Sent Events API is in the package org.glassfish.jersey.media.sse. For information about the interfaces and classes included in this package, see the API documentation for org.glassfish.jersey.media.sse in the Jersey 2.5.1 API Documentation.

9.3 Building and Deploying SSE-Enabled Applications in WebLogic Server

To use the server-sent events implementation, register the Jersey 2.5.1 shared library, which is packaged as a Web application. To reference the shared library, declare the shared library in the weblogic.xml deployment descriptor files that are associated with your Web application. For more information, see the following sections:

- Section 2.2, "Registering the Jersey 2.5.1 (JAX-RS 2.0 RI) Shared Library With Your WebLogic Server Instances"
- Section 2.3, "Configuring the Web Application to Use Jersey 2.5.1 (JAX-RS 2.0 RI)"

For information about deploying a Web application, see "Understanding WebLogic Server Deployment" in Deploying Applications to Oracle WebLogic Server.

9.4 Sample Applications for Server-Sent Events

Sample applications for server-sent events are available through the Jersey project at the following locations:

- https://github.com/jersey/jersey/tree/2.5.1/examples/server-sent-events
- https://github.com/jersey/jersey/tree/2.5.1/examples/sse-item-store-webapp
- https://github.com/jersey/jersey/tree/2.5.1/examples/sse-twitter-aggregator
Updating the Version of Jersey 1.x JAX-RS RI

This appendix describes how to update the version of the Jersey 1.x JAX-RS Reference Implementation (RI) used by your RESTful web service applications in WebLogic Server 12.1.3.

This appendix includes the following sections:

- Section A.1, "About Updating the Version of Jersey 1.x JAX-RS RI"
- Section A.2, "Updating the Version of Jersey 1.x JAX-RS RI at the Application Level"

A.1 About Updating the Version of Jersey 1.x JAX-RS RI

WebLogic Server supports Jersey 1.18 JAX-RS 1.1 Reference Implementation (RI), which is a production quality implementation of the JSR-311 JAX-RS 1.1 specification, defined at: https://jcp.org/en/jsr/summary?id=311. As required, you can use a more recent version of the Jersey 1.x JAX-RS RI at the application level.

In WebLogic Server, any JAR file present in the system classpath is loaded by the WebLogic Server system classloader. All applications running within a server instance are loaded in application classloaders which are children of the system classloader. If a third-party JAR exists in the system classloader, applications must use a filtering classloader to load and use a different version.

The filtering classloader provides a mechanism for you to configure deployment descriptors to explicitly specify that certain packages should always be loaded from the application, rather than being loaded by the system classloader. For more information about using a filtering classloader, see "Using a Filtering Classloader" in Developing Applications for Oracle WebLogic Server.

A.2 Updating the Version of Jersey 1.x JAX-RS RI at the Application Level

To update the version of Jersey JAX-RS RI at the application level, use one of the following procedures based on whether you are updating an EAR or WAR file:

- Section A.2.1, "How to Update the Version of Jersey 1.x JAX-RS RI in an EAR File"
- Section A.2.2, "How to Update the Version of Jersey 1.x JAX-RS RI in a WAR File"

A.2.1 How to Update the Version of Jersey 1.x JAX-RS RI in an EAR File

To update the version of Jersey JAX-RS RI in an EAR file:

1. Include the preferred Jersey JAX-RS RI packages with the deployed Web application.
2. Edit the weblogic-application.xml deployment descriptor packaged with your application EAR file to include a <prefer-application-packages> element with the preferred library packages listed. For more information about adding the <prefer-application-packages> element to weblogic-application.xml, see "weblogic-application.xml Deployment Descriptor Elements" in Developing Applications for Oracle WebLogic Server.

Example A–1 provides an example of how to update the weblogic-application.xml file.

Example A–1 Updating the Version of Jersey 1.x JAX-RS RI in a weblogic-application.xml File

```xml
<weblogic-web-app
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.oracle.com/technology/weblogic/weblogic-web-app/1.1/weblogic-web-app.xsd"
xmlns="http://xmlns.oracle.com/weblogic/weblogic-web-app">
  <prefer-application-packages>
    <!-- jersey-bundle-*.jar -->
    <package-name>com.sun.jersey.*</package-name>
    <package-name>com.sun.research.ws.wadl.*</package-name>
    <package-name>com.sun.ws.rs.ext.*</package-name>
    <!-- Jackson-*.jar -->
    <package-name>org.codehaus.jackson.*</package-name>
    <!-- jettison-*.jar -->
    <package-name>org.codehaus.jettison.*</package-name>
    <!-- jsr311*.jar -->
    <package-name>javax.ws.rs.*</package-name>
    <!-- asm.jar -->
    <package-name>org.objectweb.asm.*</package-name>
  </prefer-application-packages>
  ...
</weblogic-web-app>
```

A.2.2 How to Update the Version of Jersey 1.x JAX-RS RI in a WAR File

To update the version of Jersey JAX-RS RI in an WAR file (packaged standalone or within an EAR file):

1. Include the preferred Jersey JAX-RS RI packages with the deployed Web application.

2. Edit the weblogic.xml deployment descriptor packaged with your application WAR file to include a <prefer-application-packages> element with the preferred library packages listed. For more information about adding the <prefer-application-packages> element to weblogic.xml, see "prefer-application-packages" in Developing Web Applications, Servlets, and JSPs for Oracle WebLogic Server.

Example A–2 provides an example of how to update the weblogic.xml file.

Example A–2 Updating the Version of Jersey 1.x JAX-RS RI in a weblogic.xml File

```xml
<?xml version="1.0" encoding="UTF-8"?><wls:weblogic-web-app
```

A-2 Developing and Securing RESTful Web Services for Oracle WebLogic Server 12.1.3
Updating the Version of Jersey 1.x JAX-RS RI at the Application Level

...<wls:prefer-application-packages>
  <!-- jersey-bundle-*.jar -->
  <wls:package-name>com.sun.jersey.*</wls:package-name>
  <wls:package-name>com.sun.research.ws.wadl.*</wls:package-name>
  <wls:package-name>com.sun.ws.rs.ext.*</wls:package-name>
